Value for Money Assessment and Project Report on Public Private Partnership (P3) for 18 New Schools

June 2010

1. Summary: Using a P3 for 18 new schools - did it work?

By using a Public Private Partnership (P3) to design, build, finance and maintain 18 schools in Calgary and Edmonton, the Alberta government saved $97 million over 32 years (in today's dollars) compared to a traditional approach ($634 million instead of $731 million, a 13% savings)[1]. It will also deliver the schools two years earlier than with traditional methods. The government chose a P3 to deliver the Alberta Schools Alternative Procurement Phase 1 project, known as ASAP 1. The following assessment shows that using a P3 delivered value for money and that it was the right way to procure the 18 schools.

In June 2007, the Minister of Education announced the ASAP 1 project as an innovative approach to new school construction by the government, the largest Kindergarten to Grade 9 (K-9) schools project in Canada.

The P3 project was developed to consolidate the design and construction of the new schools. They are built on a standard core design to allow for future expansion if needed. The 18 schools were identified by Edmonton and Calgary school boards as essential to meet demand for educational programming in outlying areas of the cities where students live.

The government signed the P3 contract, with a 32-year term, in September 2008 with BBPP Alberta Schools Limited (the contractor). The contract requires the schools to be ready for school boards in June 2010 so they can be available for students in September 2010, two years earlier than with traditional methods.

The cost savings and earlier completion were due to:

- economies of scale
- construction efficiencies
- building innovations
- risks shifted from government to the contractor
- fixed cost contract

This report explains what a P3 is and why it may be used, provides a value for money assessment of the P3 for 18 new schools, and provides a project report.[2]

---

[1] This savings calculation is based on the amounts in the bids for the ASAP 1 Request for Proposals.

[2] This report was developed by Alberta Infrastructure and Alberta Education following the value for money methodology in the Government of Alberta's *Management Framework: Assessment Process*.

2. Background

What is a P3?

A P3 is a different, non-traditional way for government to create capital assets (such as roads, schools, and other types of government facilities). In the case of ASAP 1, the government entered into one agreement with a contractor, responsible for designing, building, partially financing, and maintaining the schools over a 32-year period (2 years design and construction; 30 years maintenance). [3]

A P3 can save time, money and reduce risk to the government by having one contractor design, build, finance, and maintain a facility. For Alberta P3 projects, the public sector owns the facility and provides public services to Albertans, the same as it does with a traditional approach. In this P3, the school boards own the 18 schools and deliver education as they do in their other schools.

What is a traditional approach?

In a traditional approach, the public sector hires an architect to design a school or other facility, and then hires a construction contractor to build it. Once the facility is built, the public sector operates it and maintains it, typically by awarding numerous individual contracts for repairs and renewal. The government pays for the construction of the facility by making progress payments (for its own infrastructure) or by making capital grants to entities such as school boards, health authorities, and post-secondary institutions. Grant funding is also used to operate and maintain the facility.

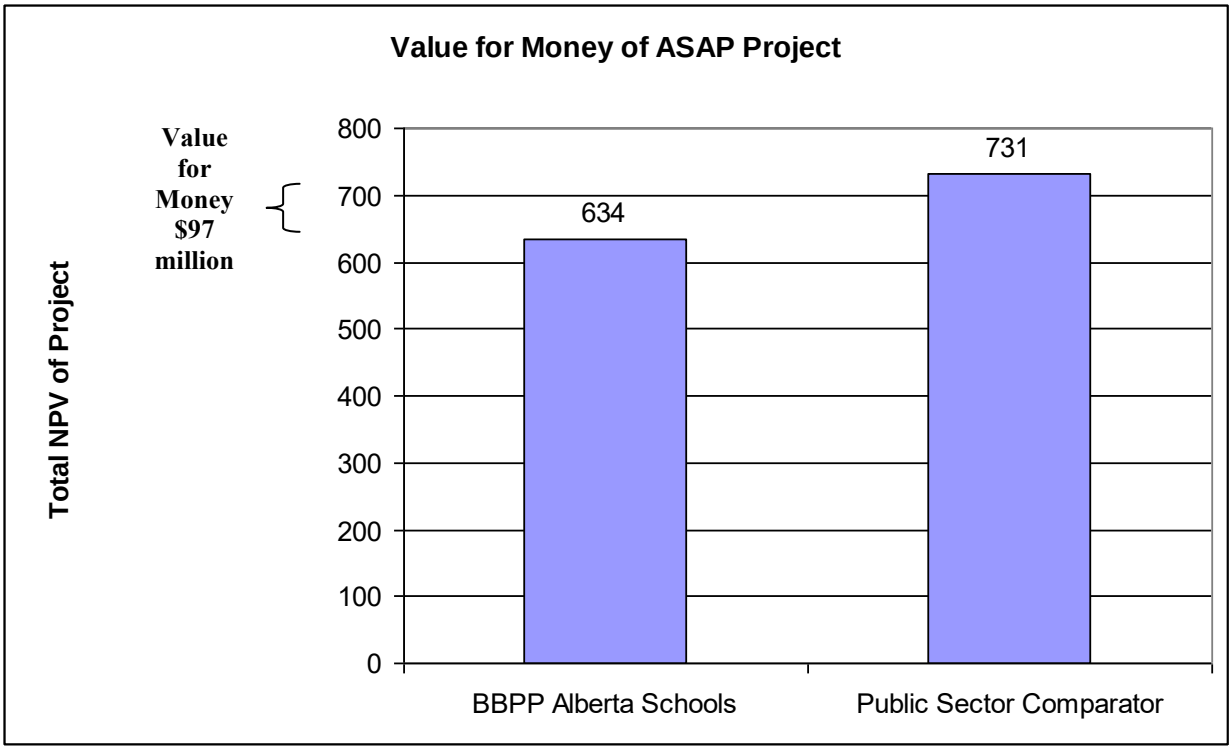
What does a Value for Money (VFM) Assessment do?

A VFM assessment measures whether a P3 is the best option for a particular project. In the case of ASAP 1, it compared the cost of building and maintaining the same schools using the two different methods: traditional and P3. The VFM for a project is the difference between the two costs. The goal of a P3 is to provide value: to do so, the P3 must cost less – measured by net present value – than the traditional method over the life of the contract.

What is net present value?

Net present value is the current value of a future sum of money. It is a standard method to compare the value of money over time (a dollar today is worth more than a dollar tomorrow because of interest and inflation) to assess long-term projects. It is produced by applying an interest rate and an inflation rate (collectively called the "discount rate") to a future sum. The amount and timing of cash flows differ in the two options for producing the schools (traditional and P3) and the calculation of net present value accounts for those differences. The net present value of the cost to produce and maintain a facility using the traditional approach is called the Public Sector Comparator, or PSC.

---



[3] For detailed discussion on P3s, see the Annual Report of the Auditor General of Alberta 2003–2004, at pages 49 to 72 (www.oag.ab.ca/files/oag/ar2003-2004.pdf).

3. VFM Assessment of the P3 used for 18 new schools

Money and time saved by using P3: Quantitative measures of value

This VFM assessment uses net present value as of July 4, 2008, when bids were received. It includes the costs to design, build, partially finance, and maintain the schools for the 32-year life of the contract. It also includes the impact of risk transfer (as discussed later in this section) but excludes costs common to both methods, such as broadband connections, land costs, and furniture and equipment.[4]

The government saved about $97 million[5] in today's dollars (13%) by using this P3 (confirmed by PricewaterhouseCoopers – see Appendix A). The 18 schools are scheduled to be ready two years earlier than with the traditional method.

[4] Capital and renewal costs for both methods were developed by Tech-Cost Consultants Ltd. Inflation and discount rates were provided by the Ministry of Finance and Enterprise. PricewaterhouseCoopers LLP developed the financial model.

[5] Original VFM estimate of $118m was $21m too high because it included furniture and equipment for PSC but not for P3.

Private financing by the contractor costs more than public financing by government, but in the case of ASAP 1, that cost was more than offset by the following factors:

1. **Allocating risks to the party who can best manage them** means that the contractor bore many of the costs that the government would have borne in the traditional approach. For example, the contractor paid for any changes needed during the construction period due to design errors. The contractor also bore any cost increases for labour and material during the construction period. In addition, for the 30-year maintenance and renewal term, the contractor will pay to replace any defective building parts or parts that have reached the end of their useful life. A list of some of the major risks that the P3 contract allocated to the contractor is on pages 7 and 8 of this report.

2. **Using innovative building techniques and materials** will save the government money over the contract term. In the Request for Proposals (RFP) stage, the three proponents presented several innovations to meet stringent, long-term quality requirements set in the technical documents. The contractor incorporated many of these techniques into the final design. For example, each school was designed to meet the Canada Green Building Council LEED™ (Leadership in Energy and Environmental Design) Silver standard for sustainability by using state-of-the-art materials, systems and processes. The contractor used a high-performance roof membrane with a warranty available for the full term of the contract.

   The members of the contractor's design, building, and maintenance team collaborated to develop innovations and efficiencies that reduced costs over the life of the contract.

3. **Achieving economies of scale by designing and building 18 schools** in two large cities on a tight schedule. For example, it costs much less (per boiler) to buy 36 boilers at the same time than two. Similarly, key parts such as structural steel, brick and block, windows, doors, floor finishes, and electrical and mechanical equipment cost far less when bought and installed in bulk. Because the contractor had a guaranteed group of 18 schools, it could secure a supply of most parts early in the construction period, avoiding higher costs for labour, material, equipment and sub-trades later in the construction period.

4. **Developing construction schedules that allow continuous and efficient workflow** between construction sites to minimize downtime between operations and reduce mobilization costs for work crews and equipment. For example, buying over 200 high-performance manufactured classrooms allowed manufacturing plants to schedule production runs well ahead of time. In turn, that allowed for timely delivery and installation of the classrooms.

Qualitative measures of value

1. **Controlled scope**. By bundling 18 schools with standardized designs into one package, the government controlled the scope of the project and managed the risk of any potential scope changes. The government worked closely with each school board to ensure that their program needs were met early in the design process, and that these requirements were clearly expressed to proponents during the RFP phase. This ensured that all school

boards were treated equally, and that they each received schools with consistently high quality.

2. **Earlier opening.** The scheduling advantages explained earlier will let the 18 schools open in September 2010, two years earlier than if the government used the traditional method. Students in these schools will no longer have to take long bus rides to other communities; instead, they can spend more time in play and community based activities before and after school.

3. **30-year maintenance and renewal period.** This gives the government and school boards assurance that schools will be maintained in good condition for 30 years. The P3 contract transfers maintenance of the schools from the school board (government) to the contractor for the term of the contract. This effectively gives the government a 30-year warranty for all 18 schools, and schools with no deferred maintenance at the end of 30 years.

4. **Better workforce management.** The relatively long time to set up a P3 (just over five months) allows proponents to establish labour and equipment supply and to lock in contracts for materials supply. Traditional contracts, typically with a four- to six-week tender period, introduce a lot of risk into the process, as the bidding contractor has only a short time to negotiate scheduling of labour, materials and equipment to arrive onsite at the right time. The P3 results in a single contractor for all 18 schools; for traditional contracts, contractors could be bidding several jobs at the same time. The P3 contractor can offer continued, attractive employment to workers.

Major risks allocated in P3 contract

An important factor in the delivery of P3 projects is an acceptable allocation of risks to the party or parties best able to manage them. In some cases, the contractor is the appropriate party to manage a risk; in others, the government can better manage the risk; in yet a third case, the risk may be best shared between the two parties.

Table 1 (Appendix B) shows a sample of the risk allocation between the government and the contractor in the P3 contract and schedules. This list is not comprehensive. The P3 contract shows all the allocated risks.

Cost overruns: the contractor bears the risk of any construction costs above the bid price in the P3 contract. Maintenance and renewal payments are indexed based on the contract formula, so the contractor pays any increased maintenance costs above the index during the contract.

Schedule certainty: the contractor agreed to have the 18 schools available for use by the school boards by June 30, 2010 or receive reduced payments. The contractor has to manage the construction schedule to meet this date.

Weather: the contractor bears any costs of project delays caused by bad weather.

Scope changes: the government pays for any scope changes that it or a school board want during construction. The government will pay for this work in accordance with the change order process set out in the P3 contract.

During the maintenance and renewal period, the government or school boards may consider changes to schools. For example, changes in local demographics may require a school board to request approval from the government to add or remove high-performance classrooms. The government will pay for this work, as long as the contractor accepts competitive pricing based on a tendering process as specified in the P3 contract.

Interest rates and financing: during the maximum two-month period between notifying a preferred proponent (which becomes the contractor when it signs the P3 contract) and signing the contract, the government shares the risk of any changes in base borrowing rates with the preferred proponent.

The contractor has to arrange for partial financing for the whole term of the contract and is solely responsible for the impact of the financing arrangements. No matter how much rates increase during the contract, the contractor must pay any increased refinancing costs. Conversely, the contractor can benefit from any rate drops.

Permitting: in the project's procurement phase, the government worked with the two cities to ensure that development permits for all 18 schools were in place, with as few conditions as possible. Once the contractor signed the contract, it was responsible to have the cities transfer the development permits to it. The contractor assumed any schedule risks of not being able to obtain the building permits on time.

---

4. Project report

Project goals

- **Create 18 schools for K-4, K-6 and K-9 students in high-growth areas of Edmonton and Calgary for the school year starting September 2010**. Many young families are moving into new subdivisions in Edmonton and Calgary. With existing schools closer to the city centres, students must bus to school and many of these schools are overcrowded. The ASAP 1 project aims to put new schools in the areas that need them—quickly. Both Edmonton and Calgary will get nine new schools.

- **Ensure short-term cost certainty** for building the 18 schools and **long-term cost certainty** for maintaining them. Construction rates were increasing between 18 and 25% per year at the time this project was bid. The project shifts the risk of increased costs to the contractor.

- **Use innovative design, project delivery, and funding** to meet the need for schools in Edmonton and Calgary.

- **Ensure standard and consistent schools by using three standard core school designs with flexible student capacity.** The three designs (developed under a separate project) are of a consistent quality for all 18 schools. Flexible student capacity comes from high-performance classrooms that can be added to or subtracted from the core schools, as enrolments change over the life of the schools.

Table 2 (Appendix C) lists the 18 new schools in the project.

The project does not include daily building services (movement of desks, chairs and other furniture, usually done by a custodial team), cleaning, or routine, daily custodial work in schools. These services remain the responsibility of the school boards.

Project outcomes

- **Cost certainty for the life of the schools**—shifting the risk of increasing construction rates and other financial risks to the contractor ensured cost certainty for the design, building, maintenance and renewal of the schools.

- **An innovative, repeatable, transparent, and accountable process to produce and maintain schools**—the same process can now be used for other projects in Alberta.

- **Less time and lower cost to produce schools**—to plan, design, and build from three to six schools is a significant undertaking for each school board. Using the traditional approach, it could take as long as five to six years for all the schools to be ready for students. In contrast, the P3's coordinated, comprehensive approach will produce18 schools ready in only three years, at lower cost.

- **A 30-year "warranty" for each school**—the contractor is responsible for ongoing maintenance and renewal of building parts for the 30-year maintenance phase.

Approaches considered

The government considered two alternative approaches to deliver the 18 schools:

1. ***Traditional Design-Bid-Build*** **approach**, with the usual "pay-as-you-go" financing by the government and delivery by school boards. Private-sector architects and consultants, hired by school boards, design the schools. Stipulated-price construction contracts are awarded through a traditional open-bidding process tendered by school boards to private-sector contractors, likely in six bundles of three projects. The province approves the contracts under the *School Buildings and Tendering Regulation*. Daily operations and maintenance, and infrastructure maintenance and renewal, are funded by provincial grants.

2. ***Design-Build-Finance-Maintain*** **approach** (the basis of the P3), with the winning private-sector proponent (the contractor) forming a consortium or group to handle the project from start to the end of the contract. Then the contractor is responsible for the ongoing maintenance of the schools for a set time (in this project, 30 years), and for having a renewal plan for school components to ensure they meet the performance requirements. School boards still handle daily cleaning and operations of the schools. The government makes monthly payments to the contractor during the 30-year maintenance phase of the contract. Payments start after the schools are ready to use and cover both capital and maintenance and renewal costs. The government can reduce payments based on criteria such as the whether the schools are available for use and whether the buildings meet certain standards.

Selection process

The government's selection process was open, competitive, timely, fair and transparent. A Fairness Auditor, Mr. Richard Innes, CA, prepared a report on the fairness of the process (Appendix D).

A Request for Qualifications was publicly issued on November 1, 2007. Four teams responded and were evaluated on experience, personnel qualifications, past performance and financial capability. The three teams asked to submit proposals were B&B Alberta Schools, New Alberta Schools, and Plenary Education Alberta.[6]

The Request for Proposal (RFP) process ran from February 1, 2008 to July 4, 2008. The "made-in-Alberta" approach to P3s ensures the process is competitive throughout. During the RFP process, the teams made financial and technical submissions to ensure that they met the project's minimum specifications. The government issued a draft form of the contract during the RFP process. The teams provided comments on it. Before receiving financial bids, the government issued the final form of the contract that the successful proponent signed. There were no negotiations on this contract after financial bids were received.
Once the three teams provided RFP submissions, they all submitted financial bids based on the final form of the contract. These bids are summarized in Table 3 (Appendix E). B&B Alberta Schools submitted the lowest price, on a net present value basis, and won the

[6] The companies that make up the teams are listed in Table 5 (Appendix G).

contract. B&B Alberta Schools then created a special purpose company, known as BBPP Alberta Schools Limited, to carry out the work of the contract.

Key terms of P3 contract

What the government must pay: The total cost of the 32-year contract is about $1.157 billion, or in 2008 dollars, about $634 million.

If all 18 schools are ready by June 30, 2010, the government will pay to the contractor:

- $125 million toward the capital cost of the schools;
- monthly amounts in three separate streams (capital, maintenance, and renewal) over the contract term; and
- An early completion bonus based on a daily rate per school, up to $1 million.

Capital payments are fixed, while maintenance and renewal payments are indexed[7].

If any school is not ready by June 30, 2010, the government will pay only that part of the $125 million attributable to completed schools. It will pay the rest as the remaining schools become available. Additionally, the government will make monthly maintenance and renewal payments and 80% of the monthly capital payment only for completed schools, until all 18 schools are completed. The contractor will thus lose capital, maintenance, and renewal payments for every school not complete by the target date, plus 20% of the monthly capital payment for completed schools.

What the contractor must do: The 32-year contract between the government and the contractor has a two-year construction period and a 30-year maintenance period. It requires the contractor to:

- complete the design and construction of the 18 schools in Edmonton and Calgary; described in Table 2 (Appendix C) by June 30, 2010;
- partially finance the construction over the contract term;
- maintain the 18 schools to the standard specified in the contract;
- have a renewal plan for school components to ensure they meet the performance requirements; and
- hand back responsibility for maintenance and renewal of the 18 schools to the school boards in June 2040, in a condition prescribed in the contract.

Payments reduced for non-performance: The government can reduce all monthly payments (capital, maintenance, renewal) if the contractor does not meet performance standards in the contract. For example, if a roof does not meet performance criteria and the contractor does not repair it within the allowed time, the government can reduce monthly payments to the contractor.

[7] Four indices are used to calculate maintenance and renewal payments: AUPE Maintenance Service Worker II published hourly salary; NAICS repair and maintenance hourly rate; Statistics Canada consumer price statistics (excluding food and energy); and Statistics Canada non-residential building construction price index for Edmonton and Calgary.

A detailed description of all the payment adjustments is in Schedule 15 of the P3 contract, and a sample appears in Table 4 (Appendix F). The final form of the P3 contract is at http://www.infrastructure.alberta.ca/3865.htm.

School boards own the schools: The contractor has a license from the government to access the schools for construction, maintenance, and renewal activities. The school boards can use the schools for education purposes and for community and other purposes as defined in long-standing joint use agreements between the cities and the respective school boards that apply to all schools. School boards remain publicly accountable for delivering education programs for all schools in their jurisdictions.

Monitoring during and after construction

During construction, the government is using ACI Architecture as its consultant to review the designs and ensure that construction standards have been met. The contractor has to provide monthly reports on design and construction issues.

In the maintenance and renewal period, the contractor will self-monitor and report on its compliance with the technical requirements. The government will also do its own inspections and testing to ensure the standards continue to be met. In addition, the contractor's lender has a consultant review its performance.

Accounting treatment

The accounting treatment for P3 projects follows generally accepted accounting principles set out by the Public Sector Accounting Board of the Canadian Institute of Chartered Accountants. The obligation is "on-book", so the province records the obligation as the schools are built and records the cost of building the schools as a capital expense because school boards own the schools.

Project schedule

The P3 contract was signed on September 10, 2008 and construction started on some sites by the end of September 2008. The contractor must deliver the 18 schools by June 30, 2010 or face a payment reduction. An independent certifier will certify when the schools are available for use. The 18 schools are due to open to students by September 1, 2010.

The maintenance period starts after the schools are available and continues until June 2040, when the license granted to the contractor to access the schools for maintenance and renewal activities will expire. The contractor must hand back the responsibility for maintenance and renewal of the18 schools to the school boards in the condition specified in the contract. The government and the contractor will assess the schools to ensure they are in the condition specified in the contract when the contract expires. After the contract expires, the school boards will be responsible for operating, maintaining, and renewing the schools.

John Gibson
ASAP Project Office
Alberta Infrastructure and Transportation
1st Floor, 6950- 113th Street
Edmonton, AB
T6H 5V7

Dear Mr. Gibson:

Alberta Schools Alternative Procurement Initiative: revised Value for Money analysis April 8th 2010.

PricewaterhouseCoopers LLP ("PwC") has prepared a Value for Money ("VfM") assessment of procuring the Alberta Schools Alternative Procurement Initiative ("ASAP Initiative") through a Public Private Partnership ("P3") arrangement compared to the traditional procurement arrangements.

At the Financial Close stage of the procurement, our analysis indicates a projected VfM saving of 13% by using the P3 approach with the Preferred Proponent to deliver the ASAP Initiative compared to using the traditional delivery approach.

The VfM assessment is based on the comparison of the total estimated project costs[1] of delivering the ASAP Initiative under:

1) Traditional procurement arrangements, as reflected in the Public Sector Comparator model; and

2) P3 procurement arrangements, based on the profile of payments to the Preferred Proponent as reflected in the Form G1 as on July 4th, 2008.

The VfM analysis has been prepared based on estimated costs and various other assumptions provided by the ASAP Project Team and its advisors as well as the Preferred Proponent bid submission and the Form G1 that was agreed at Financial Close, (collectively the "Information").

[1] Calculated on a net present value basis, applying a base date of July 4th, 2008

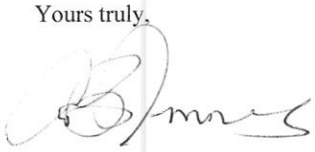
Diane Dalgleish,
Assistant Deputy Minister, Capital Projects
Alberta Infrastructure
2nd Floor, 6950 – 113th Street
Edmonton, Alberta, Canada
T6H 5V7

Dear Ms Dalgleish;

Re: Fairness Auditor's Report upon completion and Financial Close of the Alberta Schools Alternative Procurement (ASAP I) Project.

This Fairness Report is being provided to you as Chair of the Project Review Committee in accordance with the Fairness Auditor Terms of Reference

In order to ensure that the transaction is being conducted fairly and consistently, the following fairness principles are used as guidelines throughout the transaction process:



- All Interested Parties, Respondents and Proponents have the same opportunity made available to them to access information.
- The information made available to Interested Parties, Respondents and Proponents is sufficient to ensure that they have the opportunity to fully understand the opportunity.
- All Interested Parties, Respondents and Proponents have reasonable access to the opportunity.
- The criteria established in the invitation documents truly reflect the needs and objectives in respect of the project.
- The evaluation criteria and the evaluation process are established prior to the evaluation of submissions.
- The evaluation criteria, RFQ/RFP, and evaluation processes are internally consistent.
- The pre-established evaluation criteria and evaluation process are followed.
- The evaluation criteria and process are consistently applied to all submissions.

In carrying out my responsibilities as Fairness Auditor within the framework of the fairness principles set out above, I have:

- Reviewed transaction documents including the Request for Qualifications (RFQ), Request for Proposal (RFP), and the Design, Build, Finance, and Manage (DBFM) Agreement, Schedules, and Addenda thereto. I also reviewed the Process Framework, Submission Requirements, and the Evaluation Procedures used throughout the procurement.
- Reviewed Respondent and Proponent questions and answers thereto throughout the process.
- Attended all meetings between the Respondents, Proponents and the Project Team as well as weekly ASAP Team Meetings, DBFM review meetings, Project Review Committee meetings, Liaison Committee meetings, and Evaluation Team meetings,
- Observed and monitored the various selection activities throughout the process including attendance at the Financial Close with the Preferred Proponent.
- Reviewed meeting minutes, email, and reports of the various committees and teams involved in the process.
- Provided advice on fairness matters when required.
- Reported to the ASAP Team and Project Review Committee on a regular basis.

It is my opinion that the ASAP Team has dealt with all Respondents and Proponents in an open and transparent manner throughout the ASAP I process through to Financial Close and has carried out the selection process in an unbiased, fair and consistent manner.

Yours truly,

R.B.(Dick) Innes, CA
Fairness Auditor
ASAP I Project

Value for Money Assessment and Project Report on Public Private Partnership (P3) for ASAP II

September 2010

1. **Summary:** Using a P3 for 10 new schools - did it work?

By using a Public Private Partnership (P3) to design, build, finance and maintain 10 schools in Edmonton and the Calgary region, the Government of Alberta saved $105 million (in today's dollars) over 32 years compared to a traditional approach ($253 million instead of $358 million, a 29% savings).[1] These schools will also be delivered up to two years earlier than with the traditional method. The government chose a P3 approach to deliver the Alberta Schools Alternative Procurement Phase 2 project, known as ASAP II. The following assessment shows that using a P3 delivered value for money and that it was the right way to procure the 10 schools.

Following the success of the ASAP I project, the government, on January 30, 2008, announced the building of 14 new schools in the Edmonton and Calgary regions. The project was later split to deliver 10 K-9 schools as a P3 and four high schools as a design-bid-build project. This report addresses the procurement of the 10 K-9 schools only, to be delivered through a P3. Knowledge gained from and the business structures used for ASAP I served as a basis for the procurement of the ASAP II project.

The P3 project will utilize core school designs that provide equitable facilities meeting provincial school standards and guidelines and will support the Alberta curriculum. This standardized approach will provide a high degree of equality for all school boards involved in the project.

The government signed the P3 contract, with a 32-year term, in April 2010 with B2L Partnership (the Contractor) to design, build, finance, and maintain the 10 new schools. The contract requires the schools to be ready for school boards on June 30, 2012 so they can be available for students in September 2012.

The cost savings and earlier completion were achieved due to:

- economies of scale
- allocation of risks to the sector best able to manage them
- fixed cost contract
- construction process efficiencies

This report explains what a P3 is and why it may be used, provides a value for money assessment of the P3 for 10 new schools, and provides a project report.[2]

[1] This savings calculation is based on the amounts in the bids for the ASAP II Request for Proposals

[2] This report was developed by Alberta Infrastructure and Alberta Education following the value for money methodology in the Government of Alberta's *Management Framework: Assessment Process*.

2. Background

What is a P3?

A P3 is a non-traditional way for government to create capital assets (such as roads, schools, and other types of government facilities). In the case of ASAP II, the government entered into one agreement with a contractor, responsible for designing, building, partially financing and maintaining the schools over a 32 year period (2 years of design and construction; 30 years of maintenance).[3]

A P3 can save time, money and reduce risk to the government by having one contractor design, build, finance, and maintain a facility, which is why the abbreviation "DBFM" is sometimes used. For Alberta P3 projects, the public sector owns the facility and provides public services to Albertans, the same as it does with a traditional approach. In this P3, the school boards own the 10 schools and deliver education as they do in their other schools.

What is a traditional approach?

In a traditional approach, the public sector hires an architect to design a school or other facility, then hires a construction contractor to build it. Once the facility is built, the public sector operates and maintains it, typically by awarding numerous individual contracts for repairs and renewal. The government pays for the construction of the facility by making progress payments (for its own infrastructure) or by making capital grants to entities such as school boards, health authorities, and post-secondary institutions. Grant funding is also used to operate and maintain the facility.

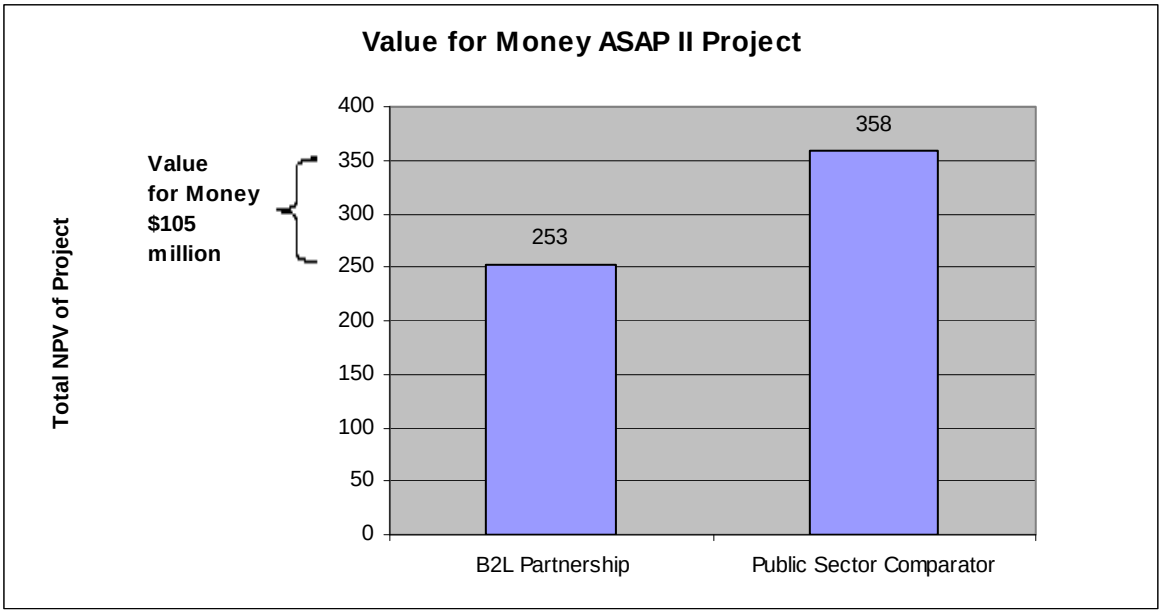
What does a Value for Money (VFM) Assessment do?

A VFM assessment measures whether a P3 is the best option for a particular project. In the case of the ASAP II project, it compared the cost of building and maintaining the same schools using the two different methods: traditional and P3. The VFM for a project is the difference between the two costs. The goal of a P3 is to provide value; to do so, the P3 must cost less – measured by net present value – than the traditional method over the life of the contract.

What is net present value?

Net present value is the current value of a future sum of money. It is a standard method to compare the value of money over time (a dollar today is worth more than a dollar tomorrow because of interest and inflation) to assess long-term projects. It is produced by applying an interest rate and an inflation rate (collectively called the "discount rate") to a future sum. The amount and timing of cash flows differ in the two options for producing the schools (traditional and P3) and the calculation of net present value accounts for those differences. The net present value of the cost to produce and maintain a facility using the traditional approach is called the Public Sector Comparator, or PSC.

Nominal payment reflects the total payments made over the life of the asset at face value (unadjusted for interest and inflation).



[3] For detailed discussion on P3s, see the Annual Report of the Auditor General of Alberta 2003–2004, at pages 49 to 72 (www.oag.ab.ca/files/oag/ar2003-2004.pdf).

3. VFM Assessment of the P3 used for 10 new schools

Money and time saved by using P3: Quantitative measures of value

This VFM assessment uses net present value as of March 1, 2010, when bids were received. It includes the costs to design, build, partially finance and maintain the schools over the 32-year life of the contract. It also includes the impact of risk transfer (as discussed later in this section) but excludes costs common to both methods, such as furniture and equipment, broadband connections and land costs.[4]

The cost of doing the project through P3 delivery method is tendered at $253 million, saving Alberta taxpayers $105 million (29%) in today's dollars (confirmed by Deloitte & Touche LLP – see Appendix A). The 10 schools are scheduled to be ready about two years earlier than with the traditional method. As a result, the Alberta government entered into the contract to design, build, and finance the 10 new schools and maintain them for a 30-year term. The P3 selection process is based on the net present value of the project or the total value of all aspects of the project over the life of the agreement, expressed in today's dollars.

[4] Capital and renewal costs for both methods were developed by Tech-Cost Consultants Ltd. Inflation and discount rates were provided by the Ministry of Finance and Enterprise. Deloitte & Touche LLP developed the financial model.

Private financing by the contractor costs more than public financing by government but in the case of ASAP II that cost was more than offset by the following factors:

1. **Allocating risks to the party who can best manage them** means that the contractor bore many of the costs that the government would have borne in the traditional approach. For example, the contractor will pay for any changes needed during the construction period due to design errors. The contractor will also bear any cost increases for labor and material during the construction period. In addition, for the 30-year maintenance and renewal term, the contractor will pay to replace any defective building parts or parts that have reached the end of their useful life. A list of some of the major risks that the P3 contract allocated to the contractor is in Table 1 (Appendix B) of this report and discussed on pages 17, 18 and 19.

2. **Using innovative building techniques and materials** will save the government money over the contract term. In the Request for Proposals (RFP) stage, the three proponents presented several innovations to meet stringent, long-term quality requirements set in the technical documents. The contractor incorporated many of these techniques into the final design.

   The members of the contractor's design, building, and maintenance team collaborated to develop innovations and efficiencies that reduced costs over the life of the contract.

3. **Achieving economies of scale by designing and building 10 schools** in different locations on a tight schedule. For example, it costs much less (per boiler) to buy 20 boilers at the same time than two. Similarly, key parts such as structural steel, brick and block, windows, doors, floor finishes, and electrical and mechanical equipment cost far less when bought and installed in bulk. Because the contractor would have a guaranteed group of 10 schools, it could secure a supply of most parts early in the construction period, avoiding higher costs for labor, material, equipment and sub-trades later in the construction period.

4. **Developing construction schedules that allow continuous and efficient workflow** between construction sites to minimize downtime between operations and reduce mobilization costs for work crews and equipment. For example, buying over 100 manufactured high-performance[5] modular classrooms allows manufacturing plants to schedule production runs well ahead of time resulting in timely delivery and installation of the classrooms.

[5] The modular classrooms are based on specificattions that ensure significantly improved heating, ventilation, soundproofing, resistance to mould, ease of serviceability and several other factors that differentiate them from the older portables (see Alberta Educations' *School Capital Manual – September 2009*, page 6)

Qualitative measures of value

1. **Controlled scope.** By bundling 10 schools with standardized designs into one package, the government controlled the scope of the project and managed the risk of any potential scope changes. The government worked closely with each school board to ensure that their program needs were met early in the design process, and that these requirements were clearly expressed to proponents during the RFP phase. This ensured the government's equal treatment of school boards, with each receiving schools of consistently high quality.

2. **Earlier opening.** The scheduling advantages explained earlier will have the 10 schools open in September 2012, about two years earlier than if the government used the traditional method. Students in these schools will no longer have to take long bus rides to other communities; instead, they can spend more time in play and community based activities before and after school.

3. **30-year maintenance and renewal period.** This gives the government and school boards assurance that schools will be maintained in good condition for 30 years. The P3 contract transfers maintenance of the schools from the school board (government) to the contractor for the term of the contract. This effectively gives the government a 30-year warranty for all 10 schools, with no deferred maintenance at the end of 30 years.

4. **Better workforce management.** The relatively long time to set up a P3 (just over six months) allows proponents to establish labor and equipment supply and to negotiate contracts for materials supply. Traditional contracts, typically with a four- to six-week tender period, introduce a lot of risk into the process, as the bidding contractor has only a short time to negotiate scheduling of labor, materials and equipment to arrive onsite at the right time. The P3 results in a single contractor for all 10 schools; for traditional contracts, contractors could be bidding several jobs at the same time. The P3 contractor can offer continued, attractive employment to workers.

Major risks allocated in P3 contract

An important factor in the delivery of P3 projects is an acceptable allocation of risks to the party or parties best able to manage them. In some cases, the contractor is the appropriate party to manage a risk; in others, the government can better manage the risk; in yet a third case, the risk may be best shared between the two parties.

Table 1 (Appendix B) shows a sample of the risk allocation between the government and the contractor in the P3 contract and schedules. This list is not comprehensive. The P3 contract shows all the allocated risks.

Cost overruns: the contractor bears the risk of any construction costs above the bid price in the P3 contract. Maintenance and renewal payments are indexed based on the contract formula, so the contractor pays any increased maintenance costs above the index during the contract.

Schedule certainty: the contractor agreed to have the 10 schools available for use by the school boards by June 30, 2012 or receive reduced payments. The contractor has to manage the construction schedule to meet this date.

Weather: the contractor bears any costs of project delays caused by bad weather.

Scope changes: the government pays for any scope changes that it or a school board wants during construction. The government will pay for this work in accordance with the change order process set out in the P3 contract.

During the maintenance and renewal period, the government or school boards may consider changes to schools. For example, changes in local demographics may require a school board to request approval from the government to add or remove high-performance classrooms. The government will pay for this work, as long as the contractor accepts competitive pricing based on a tendering process as specified in the P3 contract.

Interest rates and financing: during the maximum two-month period between notifying the preferred proponent (which became the contractor when it signed the P3 contract) and signing the contract, the government shared the risk of any changes in base borrowing rates with the preferred proponent.

The contractor had to arrange for partial financing for the whole term of the contract and is solely responsible for the impact of the financing arrangements. No matter how much rates increase during the contract, the contractor must pay any increased refinancing costs. Conversely, the contractor can benefit from any rate drops.

Permitting: during the procurement phase of the project, the government worked with the four municipalities to ensure that development permits for the schools were in place, with as few conditions as possible. Once the contractor signed the contract, it was responsible to have the municipalities transfer the development permits to it. The contractor assumed any schedule risks of not being able to obtain the building permits on time.

4. Project report

Project goals

1. **Deliver ten K-4, K-9 and Grades 5-9 schools in high-growth areas in Edmonton and Calgary regions** and adapt to the particular program needs of the individual boards. The ASAP II project aims to put new schools in the areas that need them—quickly, while also providing flexibility in planning to accommodate jurisdictions' individual learning priorities. Edmonton will receive three new schools, Calgary will receive five, and Langdon and Okotoks will each receive one new school.

2. **Use efficient and environmentally sustainable (LEED Silver) school design** as part of a new approach to construction. Core school designs for K-4, K-9 and Grades 5-9 school configurations will be used to build the 10 new schools in Edmonton, Calgary, Okotoks and Langdon. High-performance modular classrooms can be added or removed from the core building as needed, allowing schools greater flexibility to respond to changes in student enrolment. The designs will also be easily adaptable to different sites across the province.

3. **Equality of facilities** where standard core elementary,–middle and elementary/junior high schools will be designed and constructed for the school boards to be of a consistent standard and configuration across the project bundle. This standardized approach will provide a high degree of equality for all school boards involved in the project.

4. **Ensure short-term cost certainty** for building the 10 schools and **long-term cost certainty** for maintaining them. Construction rates had increased between 18 and 25% and then decreased by 15 – 18% per year in recent years. As the project shifts the risk of increased construction costs to the contractor any increase in construction rates is borne by them. The cost of maintenance and renewal is adjusted according to a prescribed process; any increases above the rate prescribed by the process will be borne by the contractor.

Table 2 (Appendix C) lists the 10 new schools in the project

The school boards remain responsible for daily operations which include daily custodial work, movement of desks and other furniture, and cleaning.

Project outcomes

The following outcomes will be achieved by delivering ASAP II as a P3:

- **Cost certainty over the life of the schools:** shifting the risk of increasing construction rates and other financial risks to the contractor ensured cost certainty for the design, building, maintenance and renewal of the schools.

- **An innovative, repeatable and accountable process for school facility project delivery:** the successful implementation of the P3 process resulted in a project delivery mechanism that leverages innovation and can potentially be repeated in various locations and with different types of infrastructure around the province.

- **Less time and lower cost to produce schools:** to allow the K-4, K-9, and 5-9 middle schools to open in September 2012, enabling full school operations at the beginning of the school year. To plan, design, and build from three to five schools is a significant undertaking for each school board. Using the traditional approach, it could take as long as five years for all the schools to be ready for students. In contrast, the P3's coordinated, comprehensive approach will produce 10 schools ready in only three years, at lower cost.

- **A 30-year "warranty" for each school:** the contractor is responsible for ongoing maintenance and renewal of building parts for the 30-year maintenance phase which is, in effect, a 30-year "warranty" for each school.

Approaches considered

The alternative procurement approaches considered to deliver the 10 schools in this project proposal are shown below:

1. **Traditional Design-Bid-Build approach** with the usual "pay-as-you-go" financing by the government and delivery by school boards. Private-sector architects and consultants, hired by school boards, design the schools. Stipulated-price construction contracts are awarded through a traditional open-bidding process tendered by school boards to private-sector contractors. The province approves the contracts under the *School Buildings and Tendering Regulation*. Daily operations and maintenance, and infrastructure maintenance and renewal, are funded by provincial grants. Although, this approach is most familiar for the government and school boards, it is probable that all schools would not be completed until 2014 and could be subject to "scope creep" and budget overruns.

2. **Design-Build-Finance-Maintain approach**, the basis of the P3, follows the procurement of the 10 K-4, K-9 and Grade 5-9 schools utilizing similar principles and processes to the ASAP-I procurement. The winning private-sector proponent (the contractor) forms a consortium or group to handle the project from start to the end of the contract. Then the contractor is responsible for the ongoing maintenance of the schools for a set time (in this project, 30 years), and for having a renewal plan for school components to ensure they meet the performance requirements. School boards still handle daily cleaning and operations of the schools. The government makes monthly payments to the contractor during the 30-year maintenance phase of the contract. Payments start after the schools are ready to use and cover both capital and maintenance and renewal costs. The government can reduce payments based on criteria such as the whether the schools are available for use and whether the buildings meet certain standards.

Selection process

The government's selection process was open, competitive, timely and transparent. A fairness Auditor, Mr. Richard Innes, CA, oversaw the process to ensure it was fair and provided an independent report by observing and reviewing the process (Appendix D).

A Request for Qualifications was publicly issued on May 1, 2009. Four teams responded and were evaluated on experience, personnel qualifications, past performance and financial capability. The three teams asked to submit proposals were Alberta Public-Private Learning Experience (APPLE) Group, Build II Learn and Plenary Lend Lease Education Alberta.[6]

The Request for Proposal (RFP) process ran from July 2, 2009 to March 1, 2010. The "made-in-Alberta" approach to P3s ensures the process is competitive throughout. During the RFP process, the teams made financial and technical submissions to ensure that they met the project's minimum specifications. The government issued a draft form of the contract during the RFP process. The teams provided comments on it. Before receiving financial bids, the government issued the final form of the contract that the successful proponent signed. There were no negotiations on this contract after financial bids were received.

Once the three teams successfully completed all submissions, they all submited financial bids based on the final form of the contract. These bids are summarized in Table 4 (Appendix F). Build II Learn submitted the lowest price, on a net present value basis, and won the contract. Build II Learn then created a special purpose company, known as B2L Partnership, to carry out the work of the contract.

Key terms of P3 contract

What the government must pay: The total cost of the 32-year contract is about $415 million in nominal dollars, or $253 million in 2010 dollars.

The contractor will be paid about 50% of the construction cost as progress payments. Once all schools are complete, the government will pay the contractor monthly amounts in three separate streams: capital, maintenance and renewal, over the life of the contract.

Capital payments are fixed, while maintenance and renewal payments are indexed.[7]

If any school is not ready by June 30, 2012, the government will pay only that part of the progress payment attributable to completed schools. The rest of the payment will be made upon school availability. Additionally the government will make monthly maintenance and renewal payments and 80% of the monthly capital payment only for completed schools, until all 10 schools are completed. The contractor will thus lose capital, maintenance, and renewal payments for every school not completed by the target date, plus 20% of the monthly capital payment for completed schools.

What the contractor must do: The 32-year contract between the government and the contractor has a two-year construction period and a 30-year maintenance period. It requires the contractor to:

- Complete the design and construction of the 10 schools in the Edmonton and Calgary regions described in Table 2 (Appendix C) by June 30, 2012;

[6] The companies that make up the teams are listed in Table 3 (Appendix E).
[7] Four indices are used to calculate maintenance and renewal payments. AUPE Maintenance Service Worker II published hourly salary; NAICS repair and maintenance hourly rate; Statistics Canada consumer price statistics (excluding food and energy); and Statistics Canada Non-residential building construction price index.

- Partially finance the construction over the term of the contract;
- Maintain the 10 schools to the standards specified in the contract;
- Have a renewal plan for school components to ensure they meet the performance requirements; and
- Hand back responsibilities for maintenance and renewal of the schools to the school boards in June 2042, ensuring facilities are turned over in the condition prescribed in the contract.

Payments reduced for non-performance: The government can reduce all monthly payments (capital, maintenance, renewal) if the contractor does not meet performance specifications in the contract. For example, if a boiler does not perform efficiently and the contractor fails to repair or replaced it within the allowed time, the government can reduce monthly payments to the contractor.

A detailed description of all the payment adjustments is in schedule 15 of the DBFM contract, and a sample appears on Table 5 (Appendix G) of this report. A final form of the DBFM contract is at http://www.education.alberta.ca/department/ipr/p3project/asapii.aspx.

School Boards own the schools: Ownership of the facilities rests with the school boards while the contractor has a license from the government to access the schools for construction, maintenance, and renewal activities. The school boards will be responsible for day-to-day operations of the facilities, including ongoing custodial services, lighting, heating, and all other ongoing traditional operational activities. The school boards can use the schools for education purposes and for community and other purposes as defined in long-standing joint use agreements between the cities and the respective school boards that apply to all schools. The boards can also lease excess space for education related purposes such as day-care and assume the related risks. School boards will remain publicly accountable for delivering education programs for all schools in their jurisdiction.

Monitoring during and after construction

During construction, the government is using Barr Ryder Architects as its consultant to review the designs and ensure that construction standards have been met. The contractor has to provide monthly reports on design and construction issues.

In the maintenance and renewal period, the contractor will self-monitor and report on its compliance with the technical specifications. The government will also perform its own inspections and testing to ensure the standards continue to be met. In addition, the contractor's lender has a consultant review its performance.

Accounting treatment

The accounting treatment for P3 projects follows generally accepted accounting principles set out by the Public Sector Accounting Board of the Canadian Institute of Chartered Accountants. The obligation is "on-book", so the province records the obligation as the asset is built and records the cost of building the asset as a capital expense because school boards own the schools.

Project schedule

The P3 contract was signed on April 15, 2010 and construction is expected to start on some sites by the end of summer 2010. The contractor must deliver the schools by June 30, 2012

or face a payment reduction. An independent certifier will certify when the schools are available for use. The schools are due to open to students by September 2012.

The maintenance period starts after the schools are available and continues until June 2042, when the license granted to the contractor to access the schools for maintenance and renewal activities will expire and all payments cease. The contractor must hand back the responsibility for maintenance and renewal of the schools in the condition specified in the contract. The government and the contractor will assess the schools to ensure they are in the condition specified in the contract when the contract expires. After the contract expires, the schools boards will be responsible for operating, maintaining, and renewing the schools in their jurisdiction.

Appendix A: Commentary by Deloitte & Touche LLP

Amended March 2, 2010

Introduction

Scope of Report

This report presents the comparison of the Financial Offers received from ASAP II Proponents in their SR3 submissions to determine the Preferred Proponent. It also calculates the Value for Money realized by the Preferred Proponent's Financial Offer. The purpose of this report is to provide a concise summary of the bid evaluation process to identify the Preferred Proponent and to facilitate the notification of the Preferred Proponent.

Timing and PSC Updates

The cost estimates that form the basis of the Public Sector Comparator (PSC) were updated by Alberta Infrastructure on January 5, 2010. The financing assumptions were updated by CIBC on January 18, 2010. Using the updated assumptions, the PSC was finalized prior to receipt of the Proponents' SR2B submissions, and was deposited with the Deputy Minister of Justice on January 27, 2010. The PSC expressed as a net present value (NPV) as of January 1, 2010 was $352.98 million.

The PSC was recalculated on February 25, 2010, using the discount rate and inflation rate that was determined by Alberta Finance as the basis for calculating the net present value of the Proponents' Financial Offers. None of the other input assumptions (costs, etc.) were altered. The PSC expressed as an NPV as of January 1, 2010 based on the updated discount rate and inflation rate was $355.83 million.

The Financial Offers from Proponents were received on March 1, 2010.

For purposes of evaluation, the NPV of the PSC was recalculated to a base date of March 1, 2010 to match the date that financial offers were received. None of the other input assumptions (costs, discount rate, inflation rate, etc.) were altered. The PSC expressed as an NPV as of March 1, 2010 is $358.59[1] million. The PSC referred to herein is this recalculated value.

Limitations

This Report was prepared for the exclusive use of Alberta Infrastructure, and is not to be reproduced or used without written permission of Deloitte with the exception of its use with regard to the procurement process for the ASAP II P3 project. No third party is entitled to rely, in any manner or for any purpose, on this Report. Deloitte's services may include advice or recommendations, but all decisions in connection with the implementation of such advice and recommendations shall be the responsibility of, and be made by, Alberta Infrastructure.

Deloitte's scope of work related to the PSC was limited to the review and updating of a PSC spreadsheet model provided by Alberta Infrastructure. The PSC's financial assumptions and cost estimates are those of Alberta Infrastructure. Deloitte's scope of work related to the VfM was limited to development of a spreadsheet to calculate and compare the net present value of the financial offers using Alberta Infrastructure's methodology.

This Report relies on certain information provided by Alberta Infrastructure and the Project's Proponents, and Deloitte has not performed an independent review of this information. It does not constitute an audit conducted in accordance with generally accepted auditing standards, an examination or compilation of, or the performance of agreed upon procedures with respect to prospective financial information, an examination of or any other form of assurance with respect to internal controls, or other attestation or review services in accordance with standards or rules established by the CICA or other regulatory body.

[1] The previous version of this report dated March, 1, 2010 which was in draft form and under review stated the recalculated PSC as $360.79 million. The value of $358.59 million in this report is based on final review of the draft report and underlying calculations.

© Deloitte & Touche LLP and affiliated entities.

Method

The Financial Offers consist of the following payments:

- Monthly payment stream over the operating period July 1, 2012 to June 30, 2042 inclusive), consisting of:
  - Capital Payments (identical monthly payments stated in nominal dollars)
  - Maintenance Payments (monthly payments for Maintenance, stated in 2010 dollars)
  - Renewal Payments (monthly payments with timing as needed for Renewal, stated in 2010 dollars)
- Total Provincial Funding, calculated by multiplying the amount of one full month's Capital Payment by 137.

The total cost of the Financial Offers on a net present value basis was determined by calculating the sum of the net present values (as at the SR3 submission date of March 1, 2010) of:

- the Capital Payments;
- the Maintenance Payments, after first adjusting each payment for inflation using a fixed estimated inflation rate of 2.45% per annum determined by Alberta Finance;
- the Renewal Payments, after first adjusting each payment for inflation using the fixed estimated inflation rate of 2.45% per annum determined by Alberta Finance; and
- the Provincial Funding, after first distributing the amount into a number of separate progress payments using a pre-determined schedule of payment dates and payment amounts (with each amount defined as a percentage of Provincial Funding). The schedule of payment dates and amounts is taken from the Shadow Bid, which has monthly payments of an average of 0.71% of Provincial Funding commencing in July 31, 2012[2].

The discount rate used to calculate net present values is 4.9% per annum, determined by Alberta Finance based on the Province's borrowing costs.

Process and results

To determine the Proponent that provided the Financial Offer with the lowest total cost on a net present value basis, the Proponent's Form G1 cashflows (Columns B, D, and E) were value-copied into the bid comparison spreadsheet that was developed in advance.

The payment cashflows as copied into the bid comparison spreadsheet were compared to and spot-checked against each Proponent's Form G1 (paper version) to confirm agreement between the Proponent's electronic and paper financial offers and the accuracy of the value-copy process. The sum of each cashflow in the bid comparison spreadsheet was also compared to the sum of the cashflow in the Proponent's Form G1 spreadsheet to again ensure the accuracy of the value-copy process. These comparisons confirm that the NPVs of each bid have been calculated according to the payments indicated on the paper version of each Proponent's Form G1.

The bid comparison spreadsheet calculates the NPV of the cashflows to the Proponents as of March 1, 2010, which is the basis for determination of the Preferred Proponent. The results are as follows:

Net Present Values for Offer Comparison *(NPVs to 01-Mar-2010)*	PSC	APPLE	Build II Learn	Plenary
Total Cost on Net Present Value Basis	$358,591,853.55	$273,460,772.90	$253,241,536.77	$296,454,547.45
		Rank: 2	Rank: 1	Rank: 3

The result as indicated in the above table is that B2L has the lowest NPV, and absent any SR3 submission compliance concerns, B2L would be the Preferred Proponent.

Calculation of final value for money

Overview

Value for Money (VfM) is determined by comparing the Preferred Proponent's Financial Offer to the PSC and is defined by Alberta Infrastructure and Transportation's P3 Management Framework as follows:

> *... net present value comparison of the comparable costs and risks of the proposed P3 project with the conventional project delivery over the same life cycle*

The cost of conventional project delivery for the Project is established as the PSC. The cost of P3 project delivery is estimated at several points in the project development process with a Shadow Bid, allowing VfM to be estimated and refined as project information improves. The final VfM analysis replaces the Shadow Bid's estimated cost with the cost of the Preferred Proponent's Financial Offer (i.e. the actual bid rather than the Shadow Bid).

Calculation

The VfM compares the cost of the Preferred Proponent's Financial Offer to the cost of the PSC. The VfM is therefore as follows:

	NPV (in millions)
Public Sector Comparator	$358.59 million
Preferred Proponent's Financial Offer	$253.24 million
Difference	$105.35 million

The VfM is therefore $105.35 million, or 29.38% of the PSC.

Appendix D: Commentary by Fairness Auditor

June 24, 2010

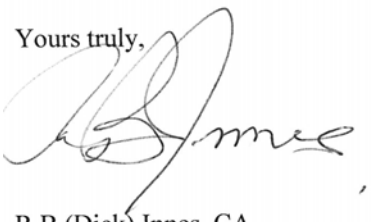
Barry Day
Deputy Minister
Alberta Infrastructure
3rd Floor, 6950 – 113th Street
Edmonton, Alberta, Canada
T6H 5V7

Dear Sir

Re: Fairness Auditor's Report upon completion and Financial Close of the second Alberta Schools Alternative Procurement (ASAP II) Project.

This Fairness Report is being provided in accordance with the Fairness Auditor Terms of Reference

In order to ensure that the transaction is being conducted fairly and consistently, the following fairness principles were used as guidelines throughout the transaction process:



- All Interested Parties, Respondents and Proponents have the same opportunity made available to them to access information.
- The information made available to Interested Parties, Respondents and Proponents is sufficient to ensure that they have the opportunity to fully understand the opportunity.
- All Interested Parties, Respondents and Proponents have reasonable access to the opportunity.
- The criteria established in the invitation documents truly reflect the needs and objectives in respect of the project.
- The evaluation criteria and the evaluation process are established prior to the evaluation of submissions.
- The evaluation criteria, RFQ/RFP, and evaluation processes are internally consistent.
- The pre-established evaluation criteria and evaluation process are followed.
- The evaluation criteria and process are consistently applied to all submissions.

In carrying out my responsibilities as Fairness Auditor within the framework of the fairness principles set out above, I have:

- Reviewed transaction documents including the Request for Qualifications (RFQ), Request for Proposal (RFP), and the Design, Build, Finance, and Manage (DBFM) Agreement, Schedules, and Addenda thereto. I also reviewed the Process Framework, Submission Requirements, the Evaluation Procedures used throughout the procurement as well as information provided on the Sharepoint site.
- Reviewed Respondent and Proponent clarifications, questions and answers thereto throughout the process.
- Attended all meetings between the Respondents, Proponents and the Project Team as well as weekly ASAP Team Meetings, DBFM review meetings, Project Review Committee meetings, Deputy Minister meetings, Evaluation Team meetings, and Selection Committee meetings.
- Observed and monitored the various selection activities throughout the process including attendance at the Financial Close with the Preferred Proponent.
- Reviewed meeting minutes and reports of the various committees and teams involved in the process.
- Provided advice on fairness matters when required.
- Reported to the ASAP Team and Project Review Committee on a regular basis.

It is my opinion that the ASAP II Team has dealt with all Respondents and Proponents in an open and transparent manner throughout the ASAP II process through to Financial Close and has carried out the selection process in an unbiased, fair and consistent manner.

Yours truly,

R.B.(Dick) Innes, CA
Fairness Auditor
ASAP II Project

Item	Public Sector Comparator ($million)	P3 Procurement ($million)		
		Build II Learn[9]	**Alberta Public-Private Learning Experience (APPLE)**	**Plenary Lend Lease Education Alberta**
Total net present value of design, construction, finance and operations and maintenance	358	253	273	296
Value for money of P3 procurement $ %	 Not applicable Not applicable	 105 29.4%	 85 23.7%	 62 17.3%

[9] Build II Learn was the proponent group that developed and submitted the successful proposal. Once the RFP process was completed, the project leads for Build II Learn formed a special purpose company, B2L Partnership to carry out the work of the contract.

Appendix G: Payment adjustments

Table 5: Sample of key payment adjustments included in P3 contract [10]

Issue	Payment Adjustment
Failure to correct a deficiency or deficiencies identified by an External Audit within the specified time	$5,000/week for the first four weeks and $10,000/week thereafter
Failure by the Contractor to develop and provide the Province with an annually updated 5-year Maintenance Plan on or before the first day of each School Year	$1,200/week
Failure to provide the Province with an updated Emergency Response Plan by October 1 of every year for each School following School Availability of a School	$1,200/week
Failure to register each school with Canada Green Building Council for LEED™ Silver Certification within the time stipulated	$200/day/school
Failure to deliver to the Province any of the schedules indicated regarding construction schedules and submittals	$1,500/day
Failure to rectify any default of its obligations under M&R waste disposal requirements	$300/day/default
Failure to provide an updated “as-built” drawings and updated Operation and Maintenance Manuals to the Province within the time stipulated	$2,000/month/undelivered set
Failure to comply with any requirement referenced in Security Clearance and School Access Protocol	$4,000/incident
Failure to make repairs to exterior doors or windows within the repair period or install temporary protection and measures	Emergency failures - $2,000/day or partial day/school Routine failures - $500/day or partial day/school
Failure to make repairs within the repair period or install temporary protection and measures to the fire prevention equipment and Fire Alarm system	Emergency failures - $4,000/day or partial day/school Routine failures - $1,000/day or partial day/school
Failure to provide access to a School Building	$5,000 to $20,00/day or partial day ($30,000 during examination periods)

[10] The project agreement should be consulted for details on all payment adjustments. The final form of the project agreement and schedules is available at http://www.education.alberta.ca/department/ipr/p3project/asapii.aspx.

Value for Money Assessment and Project Report on Public Private Partnership (P3) for 12 New Schools

March 2013

1. Summary: Using a P3 for 12 new schools - did it work?

By using a Public Private Partnership (P3) to design, build, finance and maintain 12 schools in Airdrie, Chestermere, Brooks, Cochrane, Penhold, Beaumont, Medicine Hat and Red Deer, the Alberta government saved $43 million over 32 years (in today's dollars) compared to a traditional design-bid-build approach ($289 million instead of $332 million, a 13% savings)[1]. It will also deliver the schools at a guaranteed fixed date earlier than it could have achieved with the traditional procurement approach. The following assessment shows that using a P3 Model delivered value for money and that it was the correct choice to procure these 12 new schools.

On May 18, 2011, Treasury Board agreed to provide the Ministry of Education with a $550 million budget to address the highest priority school projects and directed that the schools be delivered using a combination of procurement methods, including a public-private partnership (P3), subject to a value for money assessment. The value for money assessment confirmed the P3 model could add value so the procurement commenced on October 14, 2011.

The P3 schools are predominantly built based on a standard core design to allow for future expansion if needed. The 12 schools were identified by their respective school boards as high priority projects essential to meet demand for educational programming in areas of the communities experiencing high enrolment growth.

The government signed the P3 contract, with a 32-year term, in September 2012 with ABC Schools Partnership (the contractor). The contract requires the schools to be ready for school boards by June 2014 so they can be available for students in September 2014.

The cost savings and earlier completion were due to:

- life-cycle optimization
- economies of scale
- construction efficiencies
- building innovations
- risks shifted from government to the contractor
- fixed cost contract

This report explains what a P3 is and why it may be used and provides a value for money assessment of the P3 for 12 new schools

[1] This savings calculation is based on the amounts in the bids for the ASAP 3 Request for Proposals.

2. Background

What is a P3?

A P3 is a non-traditional way for government to create capital assets such as roads, schools, and other types of government facilities. In the case of Alberta Schools Alternative Procurement III (ASAP III), the government entered into one agreement with a contractor responsible for designing, building, partially financing, and maintaining the schools over a 32-year period (2 years design and construction; 30 years maintenance). [2]

A P3 can save time, money and reduce risk to the government by having one contractor design, build, finance, and maintain a facility. For Alberta P3 projects, the public sector owns the facility and provides public services to Albertans, the same as it does with a traditional approach. In this P3, the school boards own the 12 schools and deliver education as they do in their other schools.

What is a traditional approach?

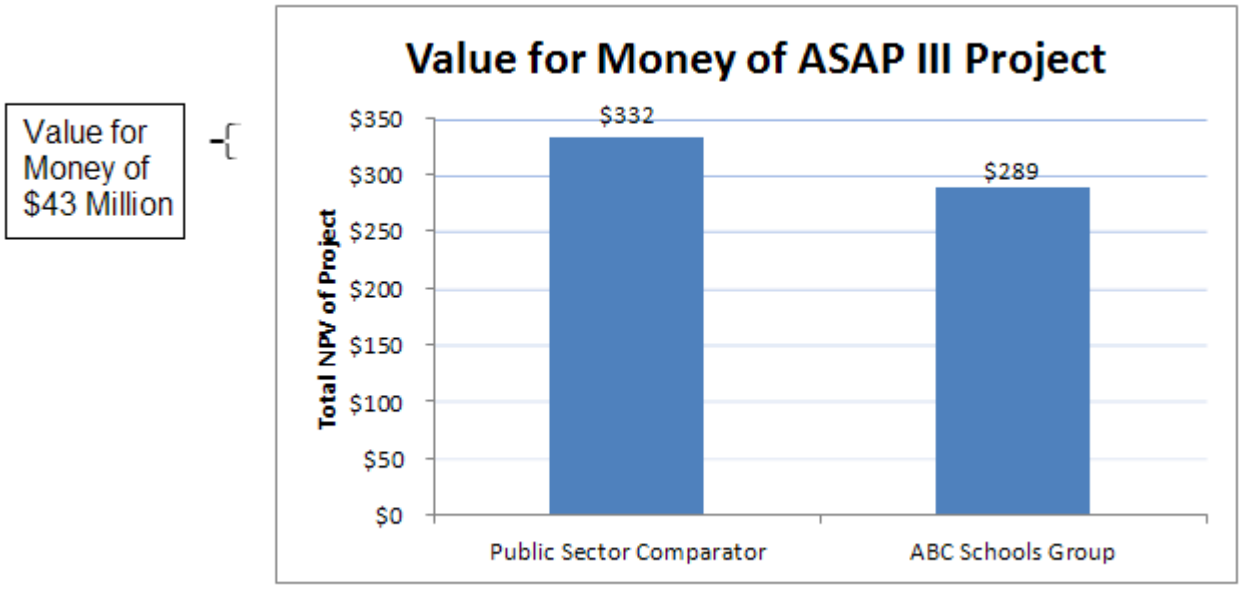
In a traditional approach, the public sector hires an architect to design a school or some other facility, and then hires a construction contractor to build it. Once the facility is built, the public sector operates it and maintains it, typically by awarding numerous individual contracts for repairs and renewal. The government pays for the construction of the facility by making progress payments (for its own infrastructure) or by making capital grants to entities such as school boards, health authorities, and post-secondary institutions. Provincial grant funding is also used to operate and maintain the facility.

What does a Value for Money (VFM) assessment do?

A VFM assessment measures whether a P3 is the best option for a particular project. In the case of ASAP III, it compared the estimated costs of building and maintaining the same schools using the two different methods: traditional and P3. The VFM for a project is the difference between these two costs. The goal of a P3 is to provide value: to do so, the P3 must cost less – measured by net present value – than the traditional method over the life of the contract.

What is net present value?

Net present value is the current value of a future sum of money. It is a standard method to compare the value of money over time (a dollar today is worth more than a dollar tomorrow because of interest and inflation) to assess long-term projects. It is produced by applying an interest rate and an inflation rate (collectively called the “discount rate”) to a future sum. The amount and timing of cash flows differ in the two options for producing the schools (traditional and P3) and the calculation of net present value accounts for those differences. The net present value of the cost to produce and maintain a facility using the traditional approach is called the Public Sector Comparator, or PSC.



[2] For detailed discussion on P3s, see the Annual Report of the Auditor General of Alberta 2003–2004, at pages 49 to 72 (www.oag.ab.ca/files/oag/ar2003-2004.pdf).

3. VFM Assessment of the P3 used for 12 new schools

Money and time saved by using P3: Quantitative measures of value

This VFM assessment uses net present value as of July 11, 2012, when bids were received. It includes the costs to design, build, partially finance, and maintain the schools for the 32-year agreement term. It also includes the impact of risk transfer (as discussed later in this section) but excludes costs common to both methods, such as broadband connections, land costs, and furniture and equipment.

The low bid received for this project was $289 million and the PSC was estimated at $332 million (both in 2012 dollars). The VFM is therefore $43 million or 13% of the PSC. A Value for Money Analysis prepared by the financial advisor, PWC, retained for this project is attached in Appendix A. The 12 schools are scheduled to be ready earlier than with the traditional method.

Private financing by the contractor costs more than public financing by government, but in the case of ASAP III, that cost was more than offset by the following factors:

1. **Allocating risks to the party who can best manage them** means that the contractor bore many of the costs that the government would have borne in the traditional approach. For example, the contractor pays for any changes needed during the construction period due to design errors. The contractor also bears any cost increases for labour and material during the construction period. In addition, for the 30-year maintenance and renewal term, the contractor will pay to replace any defective building parts or parts that have reached the end of their useful life. A list of some of the major risks that the P3 contract allocated to the contractor is in Appendix B attached to this report.

2. **Using innovative building techniques and materials** will save the government money over the contract term. In the Request for Proposals (RFP) stage, the three proponents presented several innovations to meet stringent, long-term quality requirements set out in the technical documents. The contractor will incorporate many of their innovative techniques into the final design.

3. **Achieving economies of scale by designing and building 12 schools** in various parts of Alberta on a tight schedule. For example, it costs much less (per boiler) to buy 24 boilers at the same time than two. Similarly, key parts such as structural steel, brick and block, windows, doors, floor finishes, and electrical and mechanical equipment cost far less when bought and installed in bulk. Because the contractor had a guaranteed group of 12 schools, it could secure a supply of most parts early in the construction period, avoiding higher costs for labour, material, equipment and sub-trades later in the construction period.

4. **Developing construction schedules that allow continuous and efficient workflow** between construction sites to minimize downtime between operations and reduce mobilization costs for work crews and equipment. For example, buying over 50 modular classrooms allows manufacturing plants to schedule production runs well ahead of time. In turn, that allows for timely delivery and installation of the classrooms.

Qualitative measures of value

1. **Controlled scope**. By bundling 12 schools into one package, the government controlled the scope of the project and managed the risk of any potential scope changes. The government worked closely with each school board to ensure that their program needs were met early in the design process, and that these requirements were clearly expressed to proponents during the RFP phase. This ensures that all school boards are treated equally, and that they each receive schools with consistently high quality.

2. **Earlier opening.** The scheduling advantages explained earlier will let the 12 schools open in September 2014, earlier than if the government used the traditional method. Students in these schools will no longer have to take long bus rides to other communities; instead, they can spend more time in play and community based activities before and after school.

3. **30-year maintenance and renewal period.** This gives the government and school boards assurance that schools will be maintained in good condition for 30 years. The P3 contract transfers maintenance of the schools from the school board (government) to the contractor for the term of the contract. This effectively gives the government a 30-year warranty for all 12 schools and schools with no deferred maintenance at the end of 30 years.

4. **Better workforce management.** The relatively long time to set up a P3 allows proponents time to establish labour and equipment supply and to lock in contracts for materials supply. Traditional contracts, typically with a four- to six-week tender period, introduce additional risk into the process, as the bidding contractor has only a short

time to negotiate scheduling of labour, materials and equipment to arrive onsite at the right time. The P3 results in a single contractor for all 12 schools; for traditional contracts, contractors could be bidding several jobs at the same time. The P3 contractor can offer continued, attractive employment to workers.

Major risks allocated in P3 contract

An important factor in the delivery of P3 projects is an acceptable allocation of risks to the party or parties best able to manage them. In some cases, the contractor is the appropriate party to manage a risk; in others, the government can better manage the risk; in yet a third case, the risk may be best shared between the two parties.

Table 1 (Appendix B) shows a sample of the risk allocation between the government and the contractor in the P3 contract and schedules. This list is not comprehensive. The P3 contract identifies all the allocated risks.

Cost overruns: the contractor bears the risk of any construction costs above the bid price in the P3 contract. Maintenance and renewal payments are indexed based on the contract formula, so the contractor pays any increased maintenance costs above the index during the contract.

Schedule certainty: the contractor agrees to have the 12 schools available for use by the school boards by June 30, 2014 or receive reduced payments. The contractor will manage the construction schedule to meet this date.

Weather: the contractor bears any costs of project delays caused by bad weather.

Scope changes: the government pays for any scope changes that it or a school board want during construction. The government will pay for this work in accordance with the change order process set out in the P3 contract.

During the maintenance and renewal period, the government or school boards may consider changes to schools. For example, changes in local demographics may require a school board to request approval from the government to add or remove modular classrooms. The government may pay for this work, as long as the contractor accepts competitive pricing based on a tendering process as specified in the P3 contract. Other changes requested by school boards may be the responsibility of the school board.

Interest rates and financing: during the period between notifying a preferred proponent (which becomes the contractor when it signs the P3 contract) and signing the contract, the government shares the risk of any changes in base borrowing rates with the preferred proponent.

The contractor has to arrange for partial financing for the whole term of the contract and is solely responsible for the impact of the financing arrangements. No matter how much rates increase during the contract, the contractor must pay any increased refinancing costs. Conversely, the contractor can benefit from any rate drops.

Permitting: in the project's procurement phase, the government worked with the various applicable municipalities to ensure that development permits for all 12 schools were in place, with as few conditions as possible. Once the contractor signed the contract, it was responsible to have the municipalities transfer the development permits to it. The contractor assumed any schedule risks of not being able to obtain the building permits on time.

4. Project Report

Government of Alberta Goals

Goal 1 Under "Investing in Communities and Families" – Honour Alberta Communities - Our Communities are safe, prosperous, welcoming, culturally diverse and desirable places to live or destinations to visit. New schools provided by ASAP III help to enhance communities and their desirability as places to live and visit.

Goal 4 Under "Securing Alberta's Economic Future" – Invest in Learning- Build a knowledge-inspired economy by offering a sustainable education system that meets the needs of our province and Albertans throughout their lives. ASAP III is a significant step toward better offering a sustainable education system that meets the needs of Alberta.

Alberta Education Ministry Goals

Develop a long-term strategy to provide the educational infrastructure needed to support the success of all Alberta students. (Goal 2: Strategic Priority 2.4). The ASAP III project supports Alberta students by providing new schools in areas where they are needed.

Project goals

- **Build 12 schools for students in the K-12 education system, in high-growth areas of Alberta for completion by June 30, 2014**. The ASAP III project aims to put new schools in the areas that need them.

- **Ensure short-term cost certainty** for building the 12 schools and **long-term cost certainty** for maintaining them. The project shifts the risk of increased costs to the contractor.

- **Use innovative design, project delivery, and funding** to meet the need for schools in various regions across Alberta.

- **Ensure standard and consistent schools by modifying core school designs with flexible student capacity.** The designs are of a consistent quality for all 12 schools. Flexible student capacity comes from modular classrooms that can be added to or subtracted from the core schools, as enrolments change over the life of the schools.

Table 2 (Appendix C) lists the 12 new schools in the project.

The contract does not include daily building services (movement of desks, chairs and other furniture), cleaning, or routine, daily custodial work in schools. These services remain the responsibility of the school boards.

Project outcomes

- **Construction of schools in some of the fastest growing communities.** Across Alberta, many areas have experienced significant growth in population.. One of the main outcomes of this project is to build schools in these communities to address the needs of increasing school-aged populations.

- **Continued support for improving high school completion rates.** This project supports the goal of Alberta Education to improve high school completion rates. Improved high school completion is a key component of Alberta Education's Accountability Framework. Students are considered high school completers if they have received a high school diploma or equivalent, or have enrolled in an Alberta post-secondary institution or apprenticeship program within the tracking period. Provision of new schools in communities where students live is considered a positive outcome towards this Ministry's goal.

- **Enhanced Partnership Opportunities.** This project provides enhanced opportunities for partnership contributions to the design, use and funding of the schools under ASAP III, resulting in increased gymnasium space for both students and the community, links to recreational facilities and multiplex facilities to enhance community relationships between the school and community and sharing of facilities with post-secondary and child care facilities.

Approaches considered

The government considered two approaches to deliver the 12 schools:

1. ***Traditional Design-Bid-Build* approach**, with the usual "pay-as-you-go" financing by the government and delivery by school boards. Private-sector architects and consultants, hired by school boards, design the schools. Stipulated-price construction contracts are awarded through a traditional open-bidding process tendered by school boards to private-sector contractors, likely in 12 individual projects. The province approves the contracts under the *School Buildings and Tendering Regulation*. Daily operations and maintenance, and infrastructure maintenance and renewal, are funded by provincial grants.

2. ***Design-Build-Finance-Maintain* approach** (the basis of the P3), with the winning private-sector proponent (the contractor) forming a consortium or group to handle the project from start to the end of the contract. Once construction is complete, the contractor is responsible for the ongoing maintenance of the schools for a set period of time (in this project, 30 years), and for having a renewal plan for school components to ensure they

meet the performance requirements. School boards still handle daily cleaning and operations of the schools. The government makes monthly payments to the contractor during the 30-year maintenance phase of the contract. Payments start after the schools have reached total availability in June 2014 and cover the three capital, maintenance and renewal costs. The government can reduce payments based on performance criteria such as whether the schools are available for use and whether the buildings meet certain standards.

Selection process

The government's selection process was open, competitive, timely, fair and transparent. A Fairness Auditor, Mr. Richard Innes, an independent CA, was appointed Fairness Auditor for this project and prepared a report on the fairness of the process (Appendix D).

A Request for Qualifications was publicly issued on October 14, 2011. Five teams responded and were evaluated on experience, personnel qualifications, past performance and financial capability. The three best qualified proponents selected to submit proposals were ABC Schools Group, Alberta Consortium for Education, and Build to Learn[3] (Appendix E).

The Request for Proposal (RFP) process ran from December 1, 2011 to July 11, 2012. The "made-in-Alberta" approach to P3s ensures the process is competitive throughout. During the RFP process, the proponents made financial and technical submissions to ensure that they met the project's minimum specifications. The government issued a draft form of the contract during the RFP process. The proponents provided comments on it. Before receiving financial bids, the government issued the final form of the contract that the successful proponent signed. No negotiations on this contract were allowed after financial bids were received.

Once the three proponents provided RFP submissions, they all submitted financial bids based on the final form of the contract. These bids are summarized in Table 3 (Appendix F). ABC Schools Group submitted the lowest price, on a net present value basis, and won the contract. ABC Schools Group then created a special purpose company, known as ABC Schools Partnership, to carry out the work of the contract.

Key terms of P3 contract

What the government must pay: The total cost of the 32-year contract is $289 million in 2012 dollars.

The government will pay to the contractor approximately $100 million toward the capital cost of the schools over the course of construction. Once the schools are ready by June 30, 2014, monthly amounts in three separate streams (capital, maintenance, and renewal) will be paid over the contract term.

Capital payments are fixed, while maintenance and renewal payments are indexed[7].

[7] Four indices are used to calculate maintenance and renewal payments: AUPE Maintenance Service Worker II published hourly salary; NAICS repair and maintenance hourly rate; Statistics Canada consumer price statistics (excluding food and energy); and Statistics Canada non-residential building construction price index for Edmonton and Calgary.

If any of the 12 schools is not ready by June 30, 2014, the government will pay only that part of the remaining progress payment attributable to completed schools. The rest of the payment will be made upon total school availability. Additionally, the government will make monthly maintenance and renewal payments and 80% of the monthly capital payment only for completed schools, until all 12 schools are completed. The contractor will thus lose capital, maintenance, and renewal payments for every school not complete by the target date, plus 20% of the monthly capital payment for completed schools.

What the contractor must do: The 32-year contract between the government and the contractor has a two-year construction period and a 30-year maintenance period. It requires the contractor to:

- complete the design and construction of the 12 schools across Alberta; described in Table 2 (Appendix C) by June 30, 2014;
- partially finance the construction over the contract term;
- maintain the 12 schools to the standard specified in the contract;
- have a renewal plan for school components to ensure they meet the performance requirements; and
- hand back responsibility for maintenance and renewal of the 12 schools to the school boards in June 2044, in a condition as prescribed in the contract.

Payments reduced for non-performance: The government can reduce all monthly payments (capital, maintenance, renewal) if the contractor does not meet performance standards in the contract. For example, if a roof does not meet performance criteria and the contractor does not repair it within the allowed time, the government can reduce monthly payments to the contractor.

A detailed description of all the payment adjustments is in Schedule 15 of the P3 contract, and a sample appears in Table 5 (Appendix G).

School boards own the schools: The contractor has a license from the government to access the schools for construction, maintenance, and renewal activities. The school boards can use the schools for education purposes and for community and other purposes as defined between the municipalities and the respective school boards. School boards remain publicly accountable for delivering education programs for all schools in their jurisdictions.

Monitoring during and after construction

During construction, the government is using ACI Architecture Ltd. and Quinn Young Architects Ltd. as its consultants to review the designs and ensure that construction standards have been met. The contractor has to provide monthly reports on design and construction issues.

In the maintenance and renewal period, the contractor will self-monitor and report on its compliance with the technical requirements. The government will also do its own inspections and testing to check reports and ensure the standards continue to be met. In addition, the contractor's lender will also have a consultant review its performance.

Accounting treatment

The accounting treatment for P3 projects follows generally accepted accounting principles set out by the Public Sector Accounting Board of the Canadian Institute of Chartered Accountants. The obligation is “on-book”, so the province records the amount owing for the private financing over the construction period and also records the cost of building the schools on its consolidated balance sheet as a capital asset.

Project schedule

The P3 contract was signed on September 13, 2012 and construction started on some sites by the end of September 2012. The contractor must deliver the 12 schools by June 30, 2014 or payment reductions will be imposed. An independent certifier will certify when the schools are available for use. The 12 schools are anticipated to open by the school boards to students in September 2014.

The maintenance period starts after the schools are available and continues until June 2044, when the license granted to the contractor to access the schools for maintenance and renewal activities will expire. The contractor must hand back the responsibility for maintenance and renewal of the 12 schools to the school boards in the condition specified in the contract. The government and the contractor will assess the schools, starting three years before contract expiry, to ensure they are in the condition specified in the contract. After the contract expires, the school boards will assume responsibility for operating, maintaining, and renewing the schools, using traditional grant funding.

Note to Readers

This report has been prepared solely for Alberta Infrastructure. This report should not be shown to any other party beyond Alberta Infrastructure without the prior written consent of PricewaterhouseCoopers LLP ("PwC"). PwC accepts no liability of any kind and disclaims all responsibility for the consequences of any person other than Alberta Infrastructure acting or refraining to act in reliance on the report or for any decision made or not made based on the report.

The information included in this report contains confidential and competitive information, the release of which would be harmful to Alberta Infrastructure and PwC. The information/data shall not be duplicated, used or disclosed in whole or in part for any other purposes other than to approve the project or to enter into procurement and for internal use by Alberta Infrastructure if such approval is received. Any other duplication, use or disclosure in whole or in part of this information without the express written permission of PwC is prohibited.

Our work was based primarily on information supplied by Alberta Infrastructure and its consultants. It was carried out on the basis that such information is accurate and complete. Information was not subject to checking or verification procedures, except to the extent expressly stated to form part of the scope of our work. We did not examine, compile or apply agreed upon procedures to such information in accordance with standards established by the CICA, and we express no assurance of any kind on such information. The financial analysis presented herein is based on information provided by Alberta Infrastructure and its external advisors and is based upon assumed sites and scope for the project.

Actual results may vary from those presented, and the variations may be material. The outputs of our analysis are provided only for planning purposes. No assurances are provided that the results indicated in the various analyses discussed in this report will be borne in practice. These forecasts may change based on additional analysis and data.

It should be noted that the cost assumptions used in this report are of a preliminary nature and not the result of a detailed costing exercise and actual Project costs may be different from the estimates used for this report.

We make no representation regarding the sufficiency of our work either for the purposes for which this report has been requested or for any other purpose. Had we been requested to perform additional work, additional matters might have come to our attention that would have been reported to Alberta Infrastructure.

1. Introduction

Scope of Report

This report presents the comparison of the Financial Offers received from ASAP III Proponents in the SR3 submissions. The purpose of this report is to summarize the bid evaluation process and to identify the Preferred Proponent. It also calculates the Value for Money (VfM) for the Proponents' Financial Offers.

Value for Money is assessed by comparing the Preferred Proponent's Financial Offer with the Public Sector Comparator (PSC) and is defined by Alberta Infrastructure and Transportation's P3 Management Framework as follows:

... net present value comparison of the comparable costs and risks of the proposed P3 project with the conventional project delivery over the same life cycle.

The PSC is the estimated cost of traditional project delivery.

Timing and PSC Updates

The cost estimates that form the basis of the Public Sector Comparator (PSC) were updated in June 2012 by Alberta Infrastructure and its consultants. The PSC at the SR2b submission was $348.08 million, based on a discount rate of 3.70% and a base date of July 1, 2012.

Between the SR2b and SR3 submissions, the Airdrie GSPD K-12 School was removed from the project scope. The PSC was recalculated on July 6, 2012 and the revised PSC value, excluding the Airdrie School, was $329.28 million.

On July 9, 2012, Alberta Finance issued an updated discount rate of 3.60% based upon the Province of Alberta's borrowing costs. This resulted in a final PSC value of $331.64 million. No other changes were made to the PSC.

The Financial Offers from Proponents were received on July 11, 2012 and compared against the final PSC value of $331.64 million.

2. Comparison of Financial Offers

Method

The Financial Offers consist of the following payments:

- Monthly payment stream over the operating period (July 1, 2014 to June 30, 2044 inclusive), consisting of:
  - Capital Payments (identical monthly payments stated in nominal dollars)
  - Maintenance Payments (monthly payments for Maintenance, stated in 2012 dollars)
  - Renewal Payments (monthly payments with timing as needed for Renewal, stated in 2012 dollars)
- Total Provincial Funding, calculated by multiplying the amount of one full month's Capital Payment by 187.

The total cost of the Financial Offers on a net present value basis was determined by calculating the sum of the net present values (discounted at 3.60% to July 1, 2012) of:

- the Capital Payments;
- the Maintenance Payments, after first adjusting each payment for inflation using a fixed estimated inflation rate of 2.00% per annum determined by Alberta Finance;
- the Renewal Payments, after first adjusting each payment for inflation using the fixed estimated inflation rate of 2.00% per annum determined by Alberta Finance; and
- the Provincial Funding.

Process and results

To determine the Proponent that provided the Financial Offer with the lowest total cost on a NPV basis, the Proponents' Form G1 cashflows (Columns B and C) and the Provincial Funding were copied into a bid evaluation spreadsheet which was developed prior to bid submission. The following steps were taken:

- the Capital Payments (Column B) were expressed in nominal dollars and no changes were made to those cashflows.
- the Maintenance and Renewal Payments (Column C) were expressed in real 2012 dollars. These values were inflated based on a 2.00% annual indexation factor with the first increase commencing April 1, 2014.
- the Provincial Funding was calculated based upon one full month's capital payment multiplied by 187. The Provincial Funding profile used in the models was copied for the evaluation spreadsheet. The formula governing the Provincial Funding prohibits payment of the Provincial Funding until 30% of the construction has been completed. This was verified in each of the Proponents' models.

Spot checking

The Proponents' Form G1 paper version was spot checked with the form G1 in their respective models for accuracy.

The following steps were taken:

- Totals for each of the columns were verified;
- The first and final payment of each column was verified; and
- Totals for random dates were verified.

No errors were found.

3. NPV Summary of Financial Offers

The bid comparison spreadsheet calculates the NPV of the cashflows to the Proponents as of July 1, 2012, which is the basis for determination of the Preferred Proponent. The results are as follows:

	Public Sector Comparator (PSC)	ABC Schools Group (ABC)	Alberta Consortium for Education (ACE)	Build to Learn 3 (B2L[3])
NPV ($ millions)	$331.64	$288.78[1]	$294.19	$294.58

4. Calculation of final Value for Money

The VfM compares the cost of the Preferred Proponent's Financial Offer with the cost of the PSC. The VfM for the ASAP III project is as follows:

	NPV ($ millions)
Public Sector Comparator	$331.64
Preferred Proponent's Financial Offer	$288.78[1]
Difference	$42.86

The VfM is therefore $42.86M or 12.9% of the PSC.

[1] Adjusted to remove one additional year of indexation assumed by the proponent. This adjustment has no overall impact on the ranking of the proponent financial offers.

APPENDIX D

R.B. (Dick) Innes, CA

Private and Confidential

October 16, 2012

Ray Gilmour Deputy
Minister Alberta
Infrastructure
3rd Floor, 6950 – 113th Street
Edmonton, Alberta, Canada
T6H 5V7

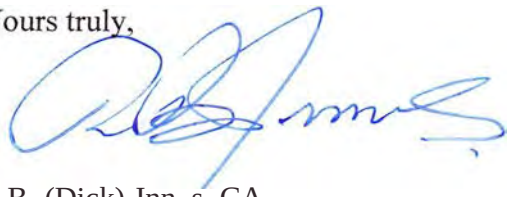
Dear Sir;

Re: Fairness Report upon completion and Financial Close of the third Alberta Schools Alternative Procurement Project DBFM (ASAP III DBFM).

This Fairness Report is being provided in accordance with the Fairness Auditor Scope of Work.

"The following definition of fairness will be used throughout the transaction process.

- Alberta Infrastructure, in its execution of the procurement, adhered to the process set out by the Alberta Infrastructure in the applicable RFQ and RFP.
- The evaluation criteria and evaluation procedures of Alberta Infrastructure were defined and applied in accordance with the RFQ and RFP, where applicable;
- The procurement process and outcome were not influenced by any biases.
- All Respondents and Proponents were treated consistently throughout the procurement process, and in accordance with the RFQ and RFP, as applicable."



I have provided a draft copy of this Report to John Gibson, Program Director and Fred Demott, Project Director for comment and their input has been considered in completion of this Report.

In carrying out my responsibilities as Fairness Auditor I have done the following:

- Reviewed transaction documents including the Request for Qualifications (RFQ), Request for Proposal (RFP), and the Design, Build, Finance, and Maintain (DBFM) Agreement, Schedules, and Addenda thereto. I also reviewed the Process Framework, Submission Requirements, and the Evaluation Procedures used throughout the procurement as well as information provided on the Sharepoint site.
- Reviewed Respondent and Proponent clarifications, questions and answers thereto throughout the process.
- Attended all meetings between the Respondents, Proponents and the Project Team as well as weekly ASAP Team Meetings, School Board Liaison Committee meetings, document review meetings, Project Review Committee meetings, Evaluation Team meetings, and Selection Committee meetings.
- Canvassed all Respondents and Proponents individually at the end of every meeting and confirmed they were satisfied with the fairness of the procurement process.
- Observed and monitored the various selection activities throughout the process including attendance at the Financial Close with the Preferred Proponent.
- Reviewed meeting minutes and reports of the various committees and teams involved in the process.
- Provided advice on fairness matters when required.
- Reported to the ASAP Project Team and the Deputy Minister, Alberta Infrastructure as required.

It is my opinion that the ASAP Project Team has been diligent in executing the ASAP III DBFM procurement on a fair basis as defined above and that all Respondents and Proponents have been dealt with consistently, fairly, and in an unbiased manner.

Yours truly,

R.B. (Dick) Inn s, CA
Fairness Auditor
ASAP III DBFM

CC: Diane Dalgleish ADM, John Gibson, Fred Demott

Appendix F: NPV Summary of Financial Offers

The bid comparison spreadsheet calculates the NPV of the cash flows to the Proponents as of July 1, 2012, which is the basis for determination of the Preferred Proponent. The results are as follows:

Table 4

	Public Sector Comparator (PSC)	ABC Schools Group (ABC)	Alberta Consortium for Education (ACE)	Build to Learn 3 ($B2L^3$)
NPV ($ millions)	$331.64	288.78	294.19	294.58
Value for Money ($ millions)	-	42.86	37.45	37.07
Value for Money (%)	-	12.9%	11.3%	11.2%

The above table shows that all three Proponents' Financial Offers were below the PSC with ABC having the lowest NPV of the three Proponents.

Appendix G: Payment adjustments

Table 4: Sample of key payment adjustments included in P3 contract [9]

Issue	Payment Adjustment
Failure to correct deficiencies identified by External Audit within specified time	$5,000 / week for first four weeks; $10,000 / week thereafter
Failure to develop and provide 5 year Maintenance Plan on first day of school year	$1,200 / week
Failure to develop and provide 5 year Renewal Management Plan on first day of school year	$1,200 / week
Failure to register each school with Canada Green Building Council (LEED™ Requirement)	$200 / day / school
Failure to obtain LEED™ Silver Certification within 24 months from school availability	$100,000 / uncertified school
Failure to deliver required construction schedules and submittals to province within time specified	$1,500 / undelivered schedule
Failure to rectify any default with respect to site requirements within time specified	$1,500 / day / default
Failure to rectify any default with respect to maintenance and renewal waste disposal requirements within time specified	$300 / day / default
Failure to provide as-built drawings and updated operations and maintenance manuals to province within time specified	$2,000 / month / undelivered set
School is inaccessible	$5,000 to $20,000 per day or partial day ($30,000 during examination periods)
Failure to make repairs within the repair period or install temporary protection and measures	Emergency failures - $2,000 per day or partial day per school Routine failures - $500 per day or partial day per school

[9] The project DBFM agreement should be consulted for details on all payment adjustments. The final form of the project DBFM agreement is available at http://www.infrastructure.alberta.ca/3869.htm

Value for Money Assessment and Project Report on Public Private Partnership (P3) for SEST

September 2010

1. Summary: Using a P3 for Southeast Stoney Trail - did it work?

By using a Public Private Partnership (P3) to design, build, finance and operate Southeast Stoney Trail (SEST), the Alberta government saved $1.063 billion over 34 years (in today's dollars) compared to a traditional approach ($769 million instead of $1.832 billion, a 58% savings). It will also deliver SEST two years earlier than with traditional methods. The following assessment shows that using a P3 delivered value for money and that it was the right way to procure SEST.

The government signed the P3 contract, with a 34-year term in March 2010, with Chinook Roads Partnership (the contractor) for the design, construction, partial financing, operation and maintenance of SEST. The contract requires the road to be ready for public use by October 1, 2013, which is two years earlier than could be achieved with traditional methods. The cost savings and earlier completion can be attributed to:

- economies of scale,
- construction efficiencies,
- construction innovations,
- risks shifted from government to the contractor, and
- fixed-cost contract.

The Government of Alberta uses P3s to deliver needed infrastructure to Albertans. The P3 procurement approach is used to provide benefits that can include an extended warranty, fixed pricing and earlier delivery of infrastructure compared to procuring the asset using a traditional approach. The government also requires P3 projects to deliver value for money. This report provides information to show that the Southeast Stoney Trail (SEST) indeed delivered value for money through P3 procurement.[1]

The Calgary Southeast Stoney Trail ring road segment along with the recently completed Northeast Stoney Trail will provide a complete eastern bypass around the city, alleviating congestion along Deerfoot Trail through Calgary.

This report explains what a P3 is and why it may be used, provides a value for money assessment of the P3 and provides a project report.

[1] This report was developed by Alberta Transportation following the value for money methodology in the Government of Alberta's *Management Framework: Assessment Process*.

2. Background

What is a P3?

A P3 is a different, non-traditional way for government to create capital assets such as roads, schools, and other types of government facilities. In the case of SEST, the government entered into one agreement with a contractor responsible for designing, building, partially financing, operating and maintaining the road over a 34-year period (four years design and construction; 30 years operations and maintenance). [2]

A P3 can save time and money and reduce risk to the government by having one contractor design, build, finance, operate and maintain a road. For Alberta P3 projects, the public sector owns the facility and provides public services to Albertans, the same as it does with a traditional design-bid-build approach.

What is a traditional approach?

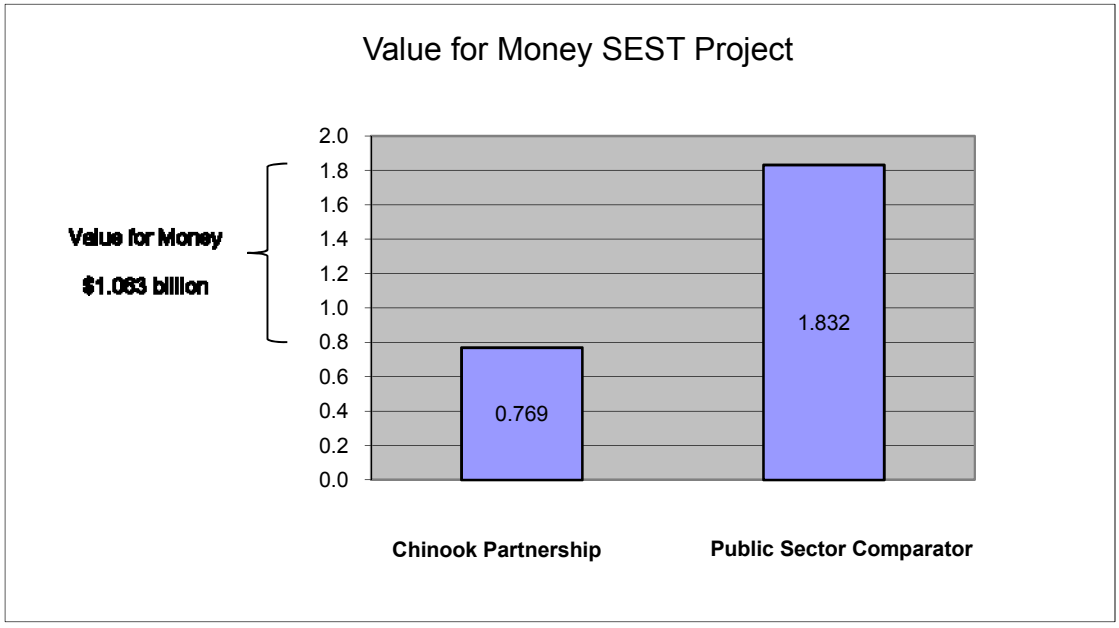
In a traditional approach, the public sector hires an engineering firm to design a road, bridge, or other related facilities, and then hires a construction contractor through a public tender process to build them. Once the infrastructure is built, the public sector operates and maintains it typically by awarding numerous individual contracts for routine repairs and rehabilitation. The government pays for the construction of the infrastructure by making progress payments (for its own infrastructure) or by making capital grants to entities such as school boards, health authorities, and post-secondary institutions. Government funding is also used to operate and maintain the facility.

What does a Value for Money (VFM) assessment do?

A VFM assessment measures whether a P3 is the best option for a particular project. In the case of SEST, the estimated costs of the traditional and P3 options were compared. The VFM for a project is the difference between the two costs. The goal of a P3 is to provide value; to do so, the P3 must cost less – measured by net present value – than the traditional method over the life of the contract.

What is net present value?

Net present value is the current value of a future sum of money. It is a standard method to compare the value of money over time (a dollar today is worth more than a dollar tomorrow because of interest and inflation) to assess long-term projects. It is produced by applying an interest rate and an inflation rate (collectively called the “discount rate”) to a future sum. The amount and timing of cash flows differ in the two options for producing the road (traditional and P3) and the calculation of net present value accounts for those differences. The net present value of the cost to produce and maintain a facility using the traditional approach is called the Public Sector Comparator, or PSC.



[2] For detailed discussion on P3s, see the Annual Report of the Auditor General of Alberta 2003–2004, at pages 49 to 72 (www.oag.ab.ca/files/oag/ar2003-2004.pdf).

3. VFM Assessment of the P3 used for SEST

Money and time saved by using P3: Quantitative measures of value

This VFM assessment uses net present value as of January 27, 2010, when bids were received. It includes the costs to design, build, partially finance, operate and maintain the road over the 34-year agreement term. It also includes the impact of risk transfer (as discussed later in this section) but excludes costs common to both methods, such as land. [3]

The low bid received for this project was $769 million and the PSC was estimated at $1.832 billion (both in 2010 dollars). The VFM is therefore $1.063 billion or 58% of the PSC. A Value for Money Analysis prepared by the financial advisor, Deloitte & Touche LLP, retained for this project is attached in Appendix A.

Private financing by the contractor costs more than public financing by government, but in the case of SEST, that cost was more than offset by the following factors:

1. **Earlier Completion** – Completing the project two years earlier than could be achieved using traditional delivery can equate to savings on cost escalation. Market forces continually drive up costs related to labour, equipment, fuel, construction materials, etc. Earlier completion reduces the exposure to this phenomenon. Earlier completion also provides savings to the road users in travel time and fuel costs over the 2 years of earlier completion.

[3] Capital and rehabilitation costs for both methods were developed by CH2M HILL Canada Ltd. Inflation and discount rates were provided by the Ministry of Finance and Enterprise. Deloitte & Touch LLP developed the financial model.

2. **Economies of Scale** – Given the 365 lane kilometers of road construction and 27 bridge structures, the contractor is able to secure large volume long term contracts for material such as asphalt, concrete, and steel which are significantly discounted relative to the smaller quantities secured in traditional contracts.

3. **Risk Allocation** – Allocating risks to the party best able to manage them means the contractor bears many of the costs that the government would have borne in the traditional approach. For example, the contractor will pay for any changes needed during the construction period due to design changes and errors. The contractor will also bear any cost increases for labour and material during the construction period. In addition, for the 30-year operation and maintenance term, the contractor will pay to rehabilitate or replace any defective component of the infrastructure. A list of some of the major risks that the P3 contract allocated to the contractor is on pages 6 and 7 of this report.

Qualitative measures of value

1. **Long Term Warranty** – The P3 effectively gives the government a 30-year warranty by transferring responsibility for operation and maintenance of the road to the contractor for the term of the contract. The 30-year operation and maintenance period gives the government assurance that the road will be maintained in good condition with no deferred maintenance at the end of 30 years.

2. **Life Cycle View** – By linking the design, construction, operation and maintenance obligations into a single contract ensures that there is a high degree of discipline in achieving a quality product. For example, any compromise in quality would result in a more substantive maintenance obligation for the P3 contractor. Therefore the combination of design, construction, and operation and maintenance of the infrastructure is highly optimized to suit the infrastructure's entire life cycle.

Major risks allocated in P3 contract

An important factor in the delivery of P3 projects is an acceptable allocation of risks to the party or parties best able to manage them. In some cases, the contractor is the appropriate party to manage a risk; in others, the government can better manage the risk; in yet a third case, the risk may be best shared between the two parties.

Table 1 (Appendix B) shows a sample of the risk allocation between the government and the contractor in the P3 contract and schedules. This list is not comprehensive. The P3 contract referenced in Appendix B shows all the allocated risks.

Schedule certainty – The contractor agrees to have the road available for traffic by October 1, 2013 or receive reduced payments. The contractor has to manage the construction schedule to meet this date.

Weather – The contractor bears any costs of project delays caused by bad weather.

Scope changes – The government pays for any scope changes that it requests during construction. The government will pay for this work in accordance with the change order process set out in the P3 contract. During the operation and maintenance period the

government may consider changes to road. For example, continued residential growth in the area may require the government to add another interchange or more freeway lanes. The government will pay for this work as long as the contractor provides competitive pricing based on a tendering process as specified in the P3 contract.

Interest rates and financing – During the maximum two month period between notifying a preferred proponent (which becomes the contractor when it signs the P3 contract) and signing the contract, the government shares the risk of any changes in base borrowing rates with the preferred proponent. The contractor has to arrange for partial financing for the whole term of the contract and is solely responsible for the impact of the financing arrangements. No matter how much rates increase during the contract, the contractor must pay any increased refinancing costs. Conversely, the contractor can benefit from any rate drops.

4. Project report

Project goals

The SEST project assists in meeting a number of Alberta Transportation and Government of Alberta (GoA) goals and strategic priorities, referenced in Alberta Transportation's Business Plan 2010-13 [4], as follows:

1. **Government of Alberta Strategic Business Plan Goal 1: "Alberta will have a prosperous economy"** – SEST will contribute to growth in the Gross Domestic Product, provide job opportunities, enhance movement of goods, and strengthen tourism.

2. **Alberta Transportation Strategic Priority 2: "Develop the provincial transportation system to support Alberta's regional and provincial economic development**" – SEST is a major addition to the City of Calgary road network and a major connector of the north-south trade corridor. Connectivity with the regional highway network will be improved with new interchanges at Highway 1A (17 Avenue SE), Highway 22X (Marquis of Lorne), and Highway 2 (Deerfoot Trail). With the completion of SEST, a high standard north-south bypass of Calgary will be provided thus alleviating traffic congestion on Deerfoot Trail.

3. **Alberta Transportation Strategic Priority 5 "Continue to implement a provincial Traffic Safety Plan to reduce the number of collisions, injuries and fatalities on Alberta roads"** – SEST will reduce traffic, especially truck traffic, on key arterial roads within the city. The free-flow SEST mainline will permit a safer and more efficient route for both local commuters and through-traffic.

Appendix C provides a drawing showing the project route and lists the associated interchanges and crossings.

Project outcomes

The following outcomes will be achieved by delivering SEST as a P3:

- **Cost certainty for the life of the road** – Shifting the risk of increasing construction costs and other financial risks to the contractor ensured cost certainty for the design, construction, operation and maintenance of the new road.

- **An innovative, repeatable, transparent, and accountable process to produce and maintain roads** – The same process can be used for other projects in Alberta.

- **Less time and lower cost to build**– To plan, design, and build this amount of infrastructure using the traditional approach would take at least six years before being available to the travelling public. In contrast, the P3's coordinated and comprehensive approach will produce SEST in only four years and at a lower cost.

[4] Transportation Business Plan 2008-11:
http://www.finance.alberta.ca/publications/budget/budget2010/transportation.pdf

- **A 30-year warranty** – The contractor is responsible for ongoing operation, maintenance and rehabilitation for the 30-year operation and maintenance phase.

Approaches considered

The government considered two alternative approaches to deliver SEST:

1. **Traditional Design-Bid-Build approach**, with the usual pay-as-you-go financing by the government and delivery by Alberta Transportation. Private-sector engineering consultants hired by Alberta Transportation design the roads and bridges. Construction contracts are awarded through a traditional open-bidding process tendered by Alberta Transportation to private sector contractors, typically in work packages of unique tasks (such as grading, paving, bridge construction, lighting, etc.) and/or of geographically distinct sections. A project of this size under a traditional procurement would involve up to 20 separate construction contracts. Upon construction completion, operations, maintenance and infrastructure rehabilitation responsibility is tendered through a traditional open-bidding process to private sector contractors specializing in this type of work.

2. **Design-Build-Finance-Operate-Maintain approach (the basis of the P3)**, with the winning private-sector proponent (the contractor) forming a consortium or group to handle the project from start to end of the contract. The contractor is responsible for the ongoing operation and maintenance of the road for a set time (in this project, 30 years), and for having a rehabilitation plan to ensure performance requirements are met. The government makes monthly payments to the contractor during the 30-year maintenance phase of the contract. Payments start after the road is ready to use and cover capital, operations, maintenance and rehabilitation costs. The government can reduce payments based on criteria such as whether the roadway remains available for use and whether the performance of the infrastructure meets certain standards.

Selection process

The government's selection process was open, competitive, timely, fair and transparent. A Fairness Auditor, Mr. Gary Campbell, QC, prepared a report on the fairness of the process (Appendix D).

A Request for Qualifications was publicly issued on March 11, 2009. Five teams responded and were evaluated on experience, personnel qualifications, past performance and financial capability. The three teams asked to submit proposals were Southeast Calgary Connector Group, SEConnect, and Chinook Partnership as shown in Appendix E.[5]

The Request for Proposal (RFP) process ran from May 19, 2009 to January 27, 2010. The made-in-Alberta approach to P3s ensures the process is competitive throughout. During the RFP process, the teams made financial and technical submissions to ensure that they met the project's minimum specifications. The government issued a draft form of the contract during the RFP process. The teams provided comments on it. Before receiving financial bids, the government issued the final form of the contract that the successful proponent would sign.

[5] The companies that make up the teams are listed in Table 2 (Appendix E).

Once the three teams provided RFP submissions, they all submitted financial bids based on the final form of the contract. There were no negotiations on this contract after financial bids were received. These bids are summarized in Table 3 (Appendix F). Chinook Partnership submitted the lowest price, on a net present value basis, and won the contract. Chinook Partnership then created a special purpose company, known as Chinook Roads Partnership, to carry out the work of the contract.

Key terms of P3 contract

What the government must pay: The sum of the payments for the 34-year contract is approximately $1.226 billion or in 2010 dollars, about $769 million.

The Alberta government will pay $232 million for construction costs during the construction phase while the federal government is providing $100 million through the Major Infrastructure Component of the Building Canada Plan for a total of $332 million. Once the road opens to traffic, the Alberta government will make monthly payments over the remaining 30 years of the contract. Of this monthly payment, capital payments are fixed, while operation, maintenance and rehabilitation payments are indexed.[6] This is the same index that is used for Alberta Transportation's traditionally delivered provincial highway maintenance contracts.

If the contractor fails to achieve traffic availability by the October 1, 2013 target date, the contractor will incur severe penalties, achieved by reduction in the overall capital payments payable by the government. The penalty is loss of the full amount of the monthly capital payment that would otherwise become due, except that during December 2013 through May 2014 the penalty is one-third of the capital payment.

What the contractor must do: The 34-year contract between the government and the contractor has a four-year construction period and a 30-year operation, maintenance, and rehabilitation period. It requires the contractor to:

- complete the design and construction of the SEST as described in Appendix C by October 1, 2013;
- partially finance the construction over the contract term;
- operate, maintain, and rehabilitate the road to the performance standards specified in the contract;
- operate and maintain (but not rehabilitate) a portion of existing highway infrastructure already constructed by Alberta Transportation. The existing infrastructure includes a specific segment of Highway 2 (Deerfoot Trail) between SEST (currently Highway 22X) and the Highway 2A junction, which is adjacent to SEST; and
- hand back the roadway to Alberta Transportation in September 2043 in a condition as prescribed in the contract.

[6] Four indices are used to calculate operation and maintenance payments: Manpower, Consumer Goods, Construction, and Diesel Fuel. Additional detail can be found in Schedule 10 of the P3 Agreement.

Payments reduced for non-performance:

The government can reduce all monthly payments (capital, operation and maintenance, and rehabilitation) if the contractor does not meet performance standards in the contract. For example, if pavement does not meet performance criteria and the contractor does not repair it within the allowed time, the government can reduce monthly payments to the contractor.

A detailed description of all the payment adjustments is in Schedule 15 of the P3 contract, and a sample appears in Table 4 (Appendix G). The final form of the P3 contract is at http://www.transportation.alberta.ca/eastgp.htm.

The Government owns the road

The contractor has a licence from the government for the term of the P3 agreement, subject to the paramount obligation to keep the road open for the free use by the public (except for specifically permitted lane closures due to accidents, emergencies, repair work, etc.). Tolls are expressly prohibited, as are commercial signage and any other commercial use of the road.

Monitoring during and after construction

During construction, the government is using CH2M HILL Canada Ltd. as its consultant to review the designs and ensure that construction standards have been met. The contractor has to provide monthly reports on design and construction issues. In the operation, maintenance, and rehabilitation period, the contractor will self-monitor and report on its compliance with the technical requirements. The government will also do its own inspections and testing to ensure the standards continue to be met. In addition, the contractor's lender has a consultant review the contractor's performance.

Accounting treatment

The accounting treatment for P3 projects follows generally accepted accounting principles set out by the Public Sector Accounting Board of the Canadian Institute of Chartered Accountants. The obligation is "on-book", so the province records the obligation as the asset is built and records the cost of building the asset as a capital asset.

Project schedule

The P3 contract was signed on March 30, 2010 and construction started in earnest on June 7, 2010. The contractor must deliver SEST by October 1, 2013 or face a payment reduction. An independent certifier will certify when SEST is available for use.

The operation, maintenance, and rehabilitation period starts after the road is made available to traffic and continues until September 2043, when the license granted to the contractor to access the road for operation, maintenance, and rehabilitation activities will expire. The contractor then must hand back the road in the condition specified in the contract. The government and the contractor will assess SEST to ensure it is in the condition specified in the contract when the contract expires. After the contract expires, the Alberta government will be responsible for operating, maintaining, and rehabilitating the road.

Southeast Stoney Trail P3

Comparison of Financial Offers and Calculation of Final Value for Money

Confidential

January 28, 2010

Table of contents

Introduction 1
Comparison of Financial Offers 2
Calculation of final value for money 4

© Deloitte & Touche LLP and affiliated entities.

Introduction

Scope of Report

This report presents the comparison of the Financial Offers received from SEST Proponents in their SR3 submissions to determine the Preferred Proponent. It also calculates the Value for Money realized by the Preferred Proponent's Financial Offer. The purpose of this report is to provide a concise summary of the bid evaluation process to identify the Preferred Proponent and to facilitate the notification of the Preferred Proponent.

Timing

The assumptions and cost estimates that form the basis of the Public Sector Comparator (PSC) were updated by Alberta Transportation ("TRANS") on November 18, 2009. The debt rate only was further updated on January 8, 2010. The PSC was finalized prior to receipt of the Proponents' proposals, and was deposited with the Deputy Minister of Justice on January 8, 2010.

The PSC was recalculated on January 25, 2010, using the discount rate and inflation rate that were determined by Alberta Finance as the basis for calculating the net present value of the Proponents' Financial Offers. None of the other input assumptions (costs, etc.) were altered. The PSC referred to herein is this recalculated value.

The Financial Offers from Proponents were received on January 27, 2010.

Limitations

This Report was prepared for the exclusive use of TRANS, and is not to be reproduced or used without written permission of Deloitte with the exception of its use with regard to the procurement process for the Southeast Stoney Trail P3 project. No third party is entitled to rely, in any manner or for any purpose, on this Report. Deloitte's services may include advice or recommendations, but all decisions in connection with the implementation of such advice and recommendations shall be the responsibility of, and be made by, TRANS.

Deloitte's scope of work related to the PSC was limited to the review and updating of a PSC spreadsheet model provided by TRANS. The PSC's financial assumptions and cost estimates are those of TRANS. Deloitte's scope of work related to the VfM was limited to development of a spreadsheet to calculate and compare the net present value of the financial offers using TRANS' methodology.

This Report relies on certain information provided by TRANS and the Project's Proponents, and Deloitte has not performed an independent review of this information. It does not constitute an audit conducted in accordance with generally accepted auditing standards, an examination or compilation of, or the performance of agreed upon procedures with respect to prospective financial information, an examination of or any other form of assurance with respect to internal controls, or other attestation or review services in accordance with standards or rules established by the CICA or other regulatory body.

© Deloitte & Touche LLP and affiliated entities.

Comparison of Financial Offers

Method

The Financial Offers consist of the following payments:

- Monthly payment stream over the operating period (October 2013 to September 2043 inclusive), consisting of:
  - Capital Payments (identical monthly payments stated in nominal dollars)
  - O&M Payments (monthly payments for O&M, stated in 2010 dollars)
  - Major Rehabilitation Payments (monthly payments with timing as needed for Major Rehabilitation, stated in 2010 dollars)
- Total Provincial Funding, calculated by multiplying the amount of one full month's Capital Payment by 257.

The total cost of the Financial Offers on a net present value basis was determined by calculating the sum of the net present values (as at the SR3 submission date of January 27, 2010) of:

- the Capital Payments;
- the O&M Payments, after first adjusting each payment for inflation using a fixed estimated inflation rate of 2.40% per annum determined by Alberta Finance;
- the Major Rehabilitation Payments, after first adjusting each payment for inflation using the fixed estimated inflation rate of 2.40% per annum determined by Alberta Finance; and
- the Provincial Funding, after first distributing the amount into a number of separate progress payments using a pre-determined schedule of payment dates and payment amounts (with each amount defined as a percentage of Provincial Funding). The schedule of payment dates and amounts is taken from the Shadow Bid, which has monthly payments of Provincial Funding commencing in January 2011[1].

The discount rate used to calculate net present values is 4.95% per annum, determined by Alberta Finance based on the Province's borrowing costs.

Process and results

To determine the Proponent that provided the Financial Offer with the lowest total cost on a net present value basis, the Proponent's Form G1 cashflows (Columns B, D, and E) were value-copied into the bid comparison spreadsheet that was developed in advance.

The payment cashflows as copied into the bid comparison spreadsheet were compared to and spot-checked against each Proponent's Form G1 (paper version) to confirm agreement between the Proponent's electronic and paper financial offers and the accuracy of the value-copy process. The sum of each cashflow in the bid comparison spreadsheet was also compared to the sum of the cashflow in the Proponent's Form G1 spreadsheet to again ensure the accuracy of the value-copy process. These comparisons confirm that the NPVs of each bid have been calculated according to the payments indicated on the paper version of each Proponent's Form G1.

---

[1] Since actual progress payments will be made according to the Contractor's verified progress in the field, which cannot be known in advance, an assumed schedule is required in order to evaluate the bids. The same schedule is used for all three because Proponents do not bid an enforceable construction schedule. The Preferred Proponent's schedule of Progress Payments as evidence in its financial model may be used for calculating the book value and for budgeting purposes.

© Deloitte & Touche LLP and affiliated entities.

The bid comparison spreadsheet calculates the NPV of the cashflows to the Proponents as of January 27, 2010, which is the basis for determination of the Preferred Proponent. The results are as follows:

Determination of Preferred Proponent

Net Present Values for Offer Comparison *(NPVs to 27-Jan-2010)*	PSC	CP	SEC	SCC
Total Cost on Net Present Value Basis	**$1,831,577,325.74**	**$769,149,796.85**	**$1,133,940,752.10**	**$1,162,648,393.53**

CP=Chinook Partnership, SEC=SEConnect, SCC=Southeast Calgary Connector Group

The result as indicated in the above table is that Chinook Partnership (CP) has the lowest NPV, and absent any SR3 submission compliance concerns, Chinook Partnership would be the Preferred Proponent.

© Deloitte & Touche LLP and affiliated entities.

Calculation of final value for money

Overview

Value for Money (VfM) is determined by comparing the Preferred Proponent's Financial Offer to the PSC and is defined by Alberta Infrastructure and Transportation's P3 Management Framework as follows:

> *... net present value comparison of the comparable costs and risks of the proposed P3 project with the conventional project delivery over the same life cycle*

The cost of conventional project delivery for the Project is established as the PSC. The cost of P3 project delivery is estimated at several points in the project development process with a Shadow Bid, allowing VfM to be estimated and refined as project information improves. The final VfM analysis replaces the Shadow Bid's estimated cost with the cost of the Preferred Proponent's Financial Offer (i.e. the actual bid rather than the Shadow Bid).

Calculation

The VfM compares the cost of the Preferred Proponent's Financial Offer to the cost of the PSC. The VfM is therefore as follows:

	NPV (in millions)
Public Sector Comparator	$ 1,832
Preferred Proponent's Financial Offer	$ 769
Difference	$ 1,063

The VfM is therefore $ 1,063 million, or 58% of the PSC.

Personal & Confidential

January 28, 2010

Mr. Tom Loo, P. Eng.
Executive Director, Major Capital Projects
Alberta Transportation
3rd Floor, Twin Atria Building
4999 – 98th Avenue
Edmonton AB T6B 2X3

Dear Tom:

Re: Fairness Auditor's Report on the Completion of the RFP Evaluation and Recommendation of the Preferred Proponent for Calgary's South East Stoney Trail Ring Road ("SEST").

This Report is being provided to the Executive Director/Project Steering Committee of the above-noted, as stipulated in the Alberta Infrastructure and Transportation Terms of Reference for the Fairness Auditor.

Further to our Letter of Opinion dated May 19, 2009, the Fairness Auditor has familiarized himself with the appropriate documentation in this matter, including the ***Request for Qualification***, ***Instructions to Proponents***, ***Transaction Process Framework***, terms of the ***Request for Proposal, Agreement to Design, Build, Finance and Operate North West Anthony Henday Drive Ring Road*** **("*DBFO Agreement*"),** and the appropriate minutes and memoranda pertaining to this process.

In order to ensure that the transaction was conducted fairly and consistently, the following fairness principles were used as guidelines throughout the transaction process:

1. The Proponents in this matter were given the same opportunity for the availability to access information.

2. The information made available to the Proponents was sufficient to ensure that they had the opportunity to fully understand the opportunity.

3. All the Proponents had reasonable access to the opportunity.

4. The criteria established in the invitation documents truly reflect the needs and objectives of the project.

5. The evaluation criteria and the evaluation process were established prior to the evaluation of submissions.

6. The evaluation criteria, and evaluation processes were internally consistent.

7. The pre-established criteria and evaluation process were followed.

8. The evaluation criteria and process were consistently applied to all submissions.

The Fairness Auditor attended several Evaluation Committee Meetings, and in addition reviewed the evaluation criteria used by that group.

The Fairness Auditor attended the Selection Committee Meetings, Working Committee Meetings, and was present for interviews between the Selection Committee/Working Committee and the RFP Proponents. It was observed that the interface with each group was open, unbiased, transparent, consistent in approach, and ultimately a fair process in my opinion. In addition, at every meeting with any of the RFP Proponents, the Fairness Auditor asked the Proponent whether there were any fairness issues and the response in every case was that there were no fairness issues.

As the Fairness Auditor in this procurement, I hereby certify that, in my opinion, the selection process in this matter conducted by Alberta Transportation, to the completion of its recommendation of the Preferred Proponent, was open, consistent in approach, and fair.

Yours truly,

GGC CONSULTANTS INC.

PER:

GARY G. CAMPBELL, Q.C.

%	Not applicable	58%	38%	37%

Appendix G: Payment adjustments

Table 4: Sample of key payment adjustments included in P3 contract [9]

Issue	Payment Adjustment
If an external audit has not been completed within the specified time:	$2,400/week or any partial week, for the first four weeks and $6,000/week or any partial week, thereafter
If any deficiencies identified by the Environmental Management System external auditor have not been corrected within the specified time:	$6,000/week or any partial week, for the first four weeks and $12,000/week or any partial week, thereafter
If the contractor fails to undertake roadway inspections:	• $2,500 for the first occurrence; • $5,000 for the second occurrence; • $10,000 for the third occurrence; and • $20,000 for the fourth occurrence and each occurrence thereafter.
If during the Operating Period, the roadway superelevation and cross-slope rates are measured and are found not to be maintained within ±1.0% of the design rates:	• $3,600/week or any partial week, for the first four weeks the deficiency is not remedied; then • $11,000/week or any partial week, thereafter.
If localized pavement repairs (e.g. for spalling, roughness, cracking, or potholes), permanent or otherwise, are not completed within the stipulated time period:	$600/localized repair for each seven day period or any partial week, until the deficiency is corrected.

[9] The project agreement should be consulted for details on all payment adjustments. The final form of the project agreement is available at http://www.transportation.alberta.ca/eastgp.htm

Issue	Payment Adjustment
If lamps or components of the roadway lighting system are not adjusted, maintained, repaired/replaced within the stipulated time:	• Lamp repair/replacement, $120/lamp/day or any partial day, that the lamp remains in need of repair/replacement; and • Repair or adjustment of any pole, base or other lighting system component, $120/component/day or any partial day, that the component needs adjustment.
If grass is in excess of the specified maximum height:	$120/hectare or any partial hectare/month or any partial month,
If the contractor fails to commence work within 60 days of identification of a structural or operational deficiency on bridges:	$1,200/day or any partial day, per deficiency shall be assessed until the contractor commences and diligently pursues completion of the work.
If the contractor is non-compliant with respect to snow clearing and ice control:	• $12,000 for each occurrence of non-compliance during a Storm Event (to a maximum of $72,000 total for the Infrastructure); • $24,000 for each occurrence of non-compliance during a subsequent Storm Event in any consecutive 12 month period (to a maximum of $145,000 total for the Infrastructure); and • The third occurrence of any non-compliance within a consecutive 12 month period but in a separate third Storm Event shall be a potential Termination Event for the purposes of and having the consequences set out in section 16.8(k) of the DBFO Agreement.

Value for Money Assessment and Project Report on Public Private Partnership (P3) for NEAHD

October 2012

1. Summary: Using a P3 for Northeast Anthony Henday Drive - did it work?

By using a Public Private Partnership (P3) to design, build, finance and operate Northeast Anthony Henday Drive (NEAHD), the Alberta government will save an estimated $371 million (in 2012 dollars) over 34.5 years when compared to a traditional design-bid-build procurement approach ($1.809 billion instead of $2.180 billion, a 17% savings). It will also deliver NEAHD three years earlier than it could have achieved with traditional procurement methods. The following assessment shows that using a P3 delivered value for money and that it was the right way to procure NEAHD.

The government signed the P3 contract, with a 34.5-year term in May 2012, with Capital City Link General Partnership (the contractor) for the design, construction, partial financing, operation and maintenance of NEAHD. The contract requires the road to be ready for public use by October 1, 2016. The cost savings and earlier completion can be attributed to:

- life-cycle optimization,
- economies of scale,
- construction efficiencies,
- construction innovations,
- risks shifted from government to the contractor, and
- fixed-price contract.

The Government of Alberta uses P3s, when deemed appropriate, to deliver needed infrastructure to Albertans. The P3 procurement approach is used to provide benefits that can include an extended warranty, fixed pricing and earlier delivery of infrastructure compared to procuring the asset using a traditional approach. The government also requires P3 projects to deliver value for money. This report provides information to show that the Northeast Anthony Henday Drive (NEAHD) indeed delivered value for money through P3 procurement.[1]

The Northeast Anthony Henday Drive is the final segment of the ring road in Edmonton. It will provide an alternate route for bypass traffic along the north and east edges of the city, thereby alleviating congestion along Yellowhead Trail through Edmonton.

This report explains what a P3 is and why it may be used, provides a value for money assessment of the P3 and provides a project summary.

[1] This report was developed by Alberta Transportation following the value for money methodology in the Government of Alberta's *Public-Private Partnership Framework and Guideline* which can be viewed at. http://www.finance.alberta.ca/business/alternative-capital-financing/documents-resources.html

2. Background

What is a P3?

A P3 is a different, non-traditional way for government to create capital assets such as roads, schools, and other types of government facilities. In the case of NEAHD, the government entered into one agreement with a contractor responsible for designing, building, partially financing, operating and maintaining the road over a 34.5-year period (four and a half years design and construction; 30 years operations and maintenance). [2]

A P3 can save time and money and reduce risk to the government by having one contractor design, build, finance, operate and maintain a road. For Alberta P3 projects, the public sector owns the facility and provides public services to Albertans, the same as it does with a traditional design-bid-build approach.

What is a traditional approach?

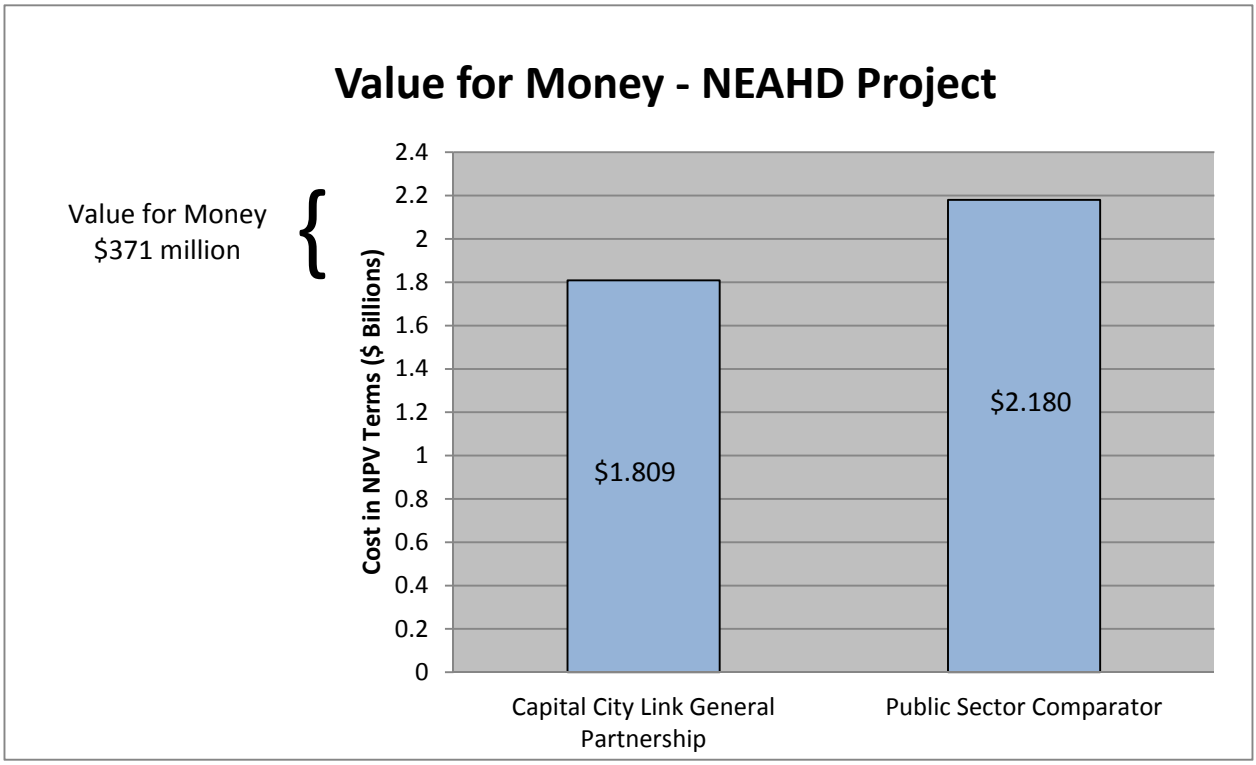
In a traditional approach, the public sector hires an engineering firm to design a road, bridge, or other related facilities, and then hires a construction contractor through a public tender process to build them. Once the infrastructure is built, the public sector operates and maintains it typically by awarding numerous individual contracts for routine repairs and rehabilitation. The government pays for the construction of the infrastructure by making progress payments (for its own infrastructure) or by making capital grants to entities such as school boards, health authorities, and post-secondary institutions. Government funding is also used to operate and maintain the facility.

What does a Value for Money (VFM) assessment do?

A VFM assessment measures whether a P3 is the best option for a particular project. In the case of NEAHD, the estimated costs of the traditional and P3 options were compared. The VFM for a project is the difference between these two costs. The goal of a P3 is to provide value; to do so, the P3 must cost less – measured by net present value – than the traditional method over the life of the contract.

What is net present value?

Net present value is the current value of a future sum of money. It is a standard method to compare the value of money over time (a dollar today is worth more than a dollar tomorrow because of interest and inflation) to assess long-term projects. It is produced by applying an interest rate and an inflation rate (collectively called the “discount rate”) to a future sum. The amount and timing of cash flows differ in the two options for producing the road (traditional and P3) and the calculation of net present value accounts for those differences. The net present value of the cost to produce and maintain a facility using the traditional approach is called the Public Sector Comparator, or PSC.



[2] For detailed discussion on P3s, see the Annual Report of the Auditor General of Alberta 2003–2004, on pages 49 to 72 (www.oag.ab.ca/files/oag/ar2003-2004.pdf).

3. VFM Assessment of the P3 used for NEAHD

Money and time saved by using P3: Quantitative measures of value

This VFM assessment uses net present value as of March 14, 2012, when bids were received. It includes the costs to design, build, partially finance, operate and maintain the road over the 34.5-year agreement term. It also includes the impact of risk transfer (as discussed later in this section) but excludes costs common to both methods, such as land. [3]

The low bid received for this project was $1.809 billion and the PSC was estimated at $2.180 billion (both in 2012 dollars). The VFM is therefore $371 million or 17% of the PSC. A value for money analysis prepared by the financial advisor, Deloitte & Touche LLP, retained for this project is attached in Appendix A.

[3] Capital and rehabilitation costs for both methods were developed by ISL Engineering Ltd. Inflation and discount rates were provided by the Ministry of Finance and Enterprise. Deloitte & Touch LLP developed the financial model.

Private financing by the contractor costs more than public financing by government, but in the case of NEAHD, that cost was more than offset by the following factors:

1. **Life-Cycle Optimization** – Having one contract that includes design, construction and a 30-year maintenance period encourages the contractor to consider different construction and maintenance solutions that would optimize the life-cycle of the infrastructure and reduce costs over the life of the project.

2. **Earlier Completion** – Completing the project three years earlier than could be achieved using traditional delivery can equate to savings on cost escalation. Market forces continually drive up costs related to labour, equipment, fuel, construction materials, etc. Earlier completion reduces the exposure to this phenomenon. Earlier completion also provides savings to the road users in travel time and fuel costs over the three years of earlier completion.

3. **Economies of Scale** – Given the 355 lane kilometers of road construction and 47 bridge structures, the contractor is able to secure large volume long term contracts for material such as asphalt, concrete, and steel which are significantly discounted relative to the smaller quantities secured in traditional contracts.

4. **Construction Efficiencies** – As with many large projects, the contractor is able to apply standardized design approaches and construction methodologies to numerous elements within the project scope. The project can be completed using fewer person-hours by capitalizing on the streamlining of processes.

5. **Construction Innovation** - A P3 contract requires the contractor to perform both the design and construction processes. The contractor can use its knowledge and experience to develop innovative solutions in either design or construction that accelerate the completion of the project and reduce costs.

6. **Risk Allocation** – Allocating risks to the party best able to manage them means the contractor bears many of the costs that the government would have borne in the traditional approach and can manage them at a lower cost than government. For example, the contractor will pay for any changes needed during the construction period due to design changes and errors. The contractor will also bear any cost increases for labour and material during the construction period. In addition, for the 30-year operation and maintenance term, the contractor will pay to rehabilitate or replace any defective component of the infrastructure. A list of some of the major risks that the P3 contract allocated to the contractor is on pages 6 and 7 of this report.

7. **Fixed-Price Contract** – By entering into a fixed-price contract for the project, the contractor bears the risk for increases to project costs during construction. The government is protected from any anomalies in construction pricing and can effectively budget for the price of the project. As well, the operations and maintenance costs for the 30-year maintenance period are fixed with an index factor applied to adjust for inflation. The contractor's payments over the 30 years cannot be modified if the price of various maintenance materials or equipment increases.

Qualitative measures of value

1. **Long Term Warranty** – The P3 effectively gives the government a 30-year warranty by transferring responsibility for operation and maintenance of the road to the contractor for the term of the contract. The 30-year operation and maintenance period gives the government assurance that the road will be maintained in good condition with no deferred maintenance at the end of 30 years.

2. **Life Cycle View** – By linking the design, construction, operation and maintenance obligations into a single contract ensures that there is a high degree of discipline in achieving a quality product. For example, any compromise in quality would result in a more substantive maintenance obligation for the P3 contractor. Therefore the combination of design, construction, and operation and maintenance of the infrastructure is highly optimized to suit the infrastructure's entire life cycle.

Major risks allocated in P3 contract

An important factor in the delivery of P3 projects is an acceptable allocation of risks to the party or parties best able to manage them. In some cases, the contractor is the appropriate party to manage a risk; in others, the government can better manage the risk; in yet a third case, the risk may be best shared between the two parties.

Table 1 (Appendix B) shows a sample of the risk allocation between the government and the contractor in the P3 contract and schedules. This list is not comprehensive. The P3 contract referenced in Appendix B shows all the allocated risks.

Schedule certainty – The contractor agrees to have the road available for traffic by October 1, 2016 or receive reduced payments. The contractor has to manage the construction schedule to meet this date.

Weather – The contractor bears any costs of project delays caused by bad weather.

Scope changes – The government pays for any scope changes that it requests during construction. The government will pay for this work in accordance with the change order process set out in the P3 contract. During the operation and maintenance period the government may consider changes to the road. For example, continued residential growth in the area may require the government to add another interchange or more freeway lanes. The government will pay for this work as long as the contractor provides competitive pricing based on a tendering process as specified in the P3 contract.

Interest rates and financing – During the maximum two month period between notifying a preferred proponent (which becomes the contractor when it signs the P3 contract) and signing the contract, the government shares the risk of any changes in base borrowing rates with the preferred proponent. The contractor has to arrange for partial financing for the whole term of the contract and is solely responsible for the impact of the financing arrangements. No matter how much rates increase during the contract, the contractor must pay any increased refinancing costs. Conversely, the contractor can benefit from any rate drops.

4. Project report

Project goals

The NEAHD project assists in meeting a number of Government of Alberta (GoA) goals and strategic priorities[4] and Alberta Transportation Priority Initiatives (referenced in Alberta Transportation's Business Plan 2012-15[5]), as follows:

1. **Government of Alberta Strategic Plan Goal 5: "Preserve the Province's Finances"** – the delivery of NEAHD will be done in a fiscally responsible manner, will support growth in the Gross Domestic Product, provide job opportunities, and enhance movement of goods and people.

2. **Alberta Transportation Goal 1: "Alberta's provincial highway network connects communities and supports economic and social growth"** – NEAHD is a major addition to the City of Edmonton road network and a major connector of the north-south movement of goods. Connectivity with the regional highway network will be improved with new highway-to-highway interchanges at Highway 16 and Highway 15 (Manning Drive). With the completion of NEAHD, a high standard north-south bypass of Edmonton will be provided and will facilitate the movement of goods and people to northern Alberta, including Fort McMurray.

Appendix C provides a drawing showing the project route and lists the associated interchanges and crossings.

Project outcomes

The following outcomes will be achieved by delivering NEAHD as a P3:

- **Cost certainty for the life of the road** – Shifting the risk of increasing construction costs and other financial risks to the contractor ensured cost certainty for the design, construction, operation and maintenance of the new road.

- **An innovative, repeatable, transparent, and accountable process to produce and maintain roads** – The same process can be used for other projects in Alberta.

- **Less time and lower cost to build**– To plan, design, and build this amount of infrastructure using the traditional approach would take at least seven and a half years before being available to the travelling public. In contrast, the P3's coordinated and comprehensive approach will produce NEAHD in only four and a half years and at a lower cost.

- **A 30-year warranty** – The contractor is responsible for ongoing operation, maintenance and rehabilitation for the 30-year operation and maintenance phase.

[4] GOA Government Strategic Plan 2012:
http://www.finance.alberta.ca/publications/budget/budget2012/goa-business-plan.pdf

[5] Transportation Business Plan 2012-15:
http://www.finance.alberta.ca/publications/budget/budget2012/transportation.pdf

Approaches considered

The government considered two alternative approaches to deliver NEAHD:

1. **Traditional Design-Bid-Build approach**, with the usual pay-as-you-go financing by the government and delivery by Alberta Transportation. Private-sector engineering consultants hired by Alberta Transportation design the roads and bridges. Construction contracts are awarded through a traditional open-bidding process tendered by Alberta Transportation to private sector contractors, typically in work packages of unique tasks (such as grading, paving, bridge construction, lighting, etc.) and/or of geographically distinct sections. A project of this size under a traditional procurement would involve up to 30 separate construction contracts. Upon construction completion, operations, maintenance and infrastructure rehabilitation responsibility is tendered through an ongoing traditional open-bidding process to private sector contractors specializing in this type of work.

2. **Design-Build-Finance-Operate-Maintain approach (the basis of the P3)**, with the winning private-sector proponent (the contractor) forming a consortium or group to handle the project from start to end of the contract. The contractor is responsible for the ongoing operation and maintenance of the road for a set time (in this project, 30 years), and for having a rehabilitation plan to ensure performance requirements are met. The government makes monthly payments to the contractor during the 30-year maintenance phase of the contract. Payments start after the road is ready to use and cover capital, operations, maintenance and rehabilitation costs. The government can reduce payments based on criteria such as whether the roadway remains available for use and whether the performance of the infrastructure meets certain standards.

Selection process

The government's selection process was open, competitive, timely, fair and transparent. The Fairness Auditor, GGC Consultants Inc., as represented by Mr. Gary Campbell, QC, prepared a report on the fairness of the process (Appendix D).

A Request for Qualifications was publicly issued on March 2, 2011. Five teams responded and were evaluated on experience, personnel qualifications, past performance and financial capability. The three teams asked to submit proposals were Alberta Roads Consortium, Capital City Link Group, and Edmonton Connect Partners, as shown in Appendix E.[6]

The Request for Proposal (RFP) process ran from May 13, 2011 to March 14, 2012. The made-in-Alberta approach to P3s ensures the process is competitive throughout. During the RFP process, the teams made financial and technical submissions to ensure that they met the project's minimum specifications. The government issued a draft form of the contract during the RFP process and the teams provided comments on it. Before receiving financial bids, the government issued the final form of the contract that the successful proponent would sign.

Once the three teams provided RFP submissions, they all submitted financial bids based on the final form of the contract. There were no negotiations on this contract after financial bids

[6] The companies that make up the teams are listed in Table 2 (Appendix E).

were received. These bids are summarized in Table 3 (Appendix F). Capital City Link Group submitted the lowest price, on a net present value basis, and won the contract. Capital City Link Group then created a special purpose company, known as Capital City Link General Partnership, to carry out the work of the contract.

Key terms of P3 contract

What the government must pay: The sum of the payments for the 34.5-year contract is approximately $1.809 billion in 2012 dollars.

During the construction phase the Alberta government will pay $924.9 million for construction costs while P3 Canada will provide up to $36.8 million through the PPP Canada Fund. This funding covers only part of the overall construction (capital) cost. Once the road opens to traffic, the Alberta government will make monthly payments over the remaining 30 years of the contract. Of these monthly payments, the portion representing the remaining capital amount is fixed, while operation, maintenance and rehabilitation payments are indexed.[7] This is the same index that is used for Alberta Transportation's traditionally delivered provincial highway maintenance contracts.

If the contractor fails to achieve traffic availability by the October 1, 2016 target date, the contractor will incur severe penalties, achieved by reduction in the overall capital payments payable by the government. The penalty is loss of the full amount of the monthly capital payments or a portion thereof that the government would otherwise have paid the contractor, except that during December 2016 through May 2017 the penalty is one-third of the capital payment.

What the contractor must do: The 34.5-year contract between the government and the contractor has a four and a half year construction period and a 30-year operation, maintenance, and rehabilitation period. It requires the contractor to:

- complete the design and construction of the NEAHD as described in Appendix C by October 1, 2016;
- partially finance the construction over the contract term;
- operate, maintain, and rehabilitate the road to the performance standards specified in the contract;
- operate and maintain (but not rehabilitate) a portion of existing bridge infrastructure already constructed by Alberta Transportation. The existing infrastructure includes two bridges at Whitemud Drive, two bridges carrying Sherwood Park Freeway over the Canadian National Railway and one bridge carrying 34 Street over Sherwood Park Freeway; and
- hand back the roadway to Alberta Transportation in September 2046 in a condition as prescribed in the contract.

Payments reduced for non-performance:

The government can reduce all monthly payments (capital, operation and maintenance, and rehabilitation) if the contractor does not meet performance standards in the contract. For

[7] Four indices are used to calculate operation and maintenance payments: Manpower, Consumer Goods, Construction, and Diesel Fuel. Additional detail can be found in Schedule 10 of the P3 Agreement.

example, if pavement does not meet performance criteria and the contractor does not repair it within the allowed time, the government can reduce monthly payments to the contractor.

A detailed description of all the payment adjustments is in Schedule 15 of the P3 contract, and a sample appears in Table 4 (Appendix G). The final form of the P3 contract is at http://www.transportation.alberta.ca/3787.htm.

The Government owns the road

The contractor has a licence from the government for the term of the P3 agreement, subject to the paramount obligation to keep the road open for the free use by the public (except for specifically permitted lane closures due to accidents, emergencies, repair work, etc.). Tolls are expressly prohibited, as are commercial signage and any other commercial use of the road.

Monitoring during and after construction

During construction, the government is using ISL Engineering Ltd. as its consultant to review the designs and ensure that construction standards have been met. The contractor has to provide monthly reports on design and construction issues. In the operation, maintenance, and rehabilitation period, the contractor will self-monitor and report on its compliance with the technical requirements. The government will also do its own inspections and testing to ensure the standards continue to be met. In addition, the contractor's lender has a consultant review the contractor's performance.

Accounting treatment

The accounting treatment for P3 projects follows generally accepted accounting principles set out by the Public Sector Accounting Board of the Canadian Institute of Chartered Accountants. The obligation is "on-book", so the province records the amount owing for the private financing over the construction period and also records the cost of building the asset on its balance sheet as a capital asset.

Project schedule

The P3 contract was signed on May 8, 2012 and construction started in earnest in June 2012. The contractor must deliver NEAHD by October 1, 2016 or face a payment reduction. An independent certifier will certify when NEAHD is available for use.

The operation, maintenance, and rehabilitation period starts after the road is made available to traffic and continues until September 2046, when the license granted to the contractor to access the road for operation, maintenance, and rehabilitation activities will expire. The contractor then must hand back the road in the condition specified in the contract. The government and the contractor will assess NEAHD to ensure it is in the condition specified in the contract when the contract expires. After the contract expires, the Alberta government will be responsible for operating, maintaining, and rehabilitating the road.

Introduction 1

Comparison of Financial Offers 2

Calculation of final value for money 4

© Deloitte & Touche LLP and affiliated entities.

Introduction

Scope of Report

This report presents the comparison of the Financial Offers received from NEAHD Proponents in their SR3 submissions to determine the Preferred Proponent. It also calculates the Value for Money ("VfM") realized by the Preferred Proponent's Financial Offer. The purpose of this report is to provide a concise summary of the bid evaluation process to identify the Preferred Proponent and to facilitate the notification of the Preferred Proponent.

Timing

The PSC was finalized prior to receipt of the Proponents' proposals, and was deposited with the Deputy Minister of Justice on February 14, 2012. The finalized PSC comprises assumptions and cost estimates last updated by Alberta Transportation ("AT") on September 8, 2011. The discount rate, inflation rate and P3 debt financing rate were further updated on February 9, 2012 using information from Alberta Finance and Enterprise.

The PSC was recalculated on March 14, 2012, using the discount rate and inflation rate that were determined by Alberta Finance and Enterprise as the basis for calculating the net present value of the Proponents' Financial Offers. None of the other input assumptions (costs, etc.) were altered. The PSC referred to herein is this recalculated value.

The Financial Offers from Proponents were received on March 14, 2012.

Limitations

This report was prepared for the exclusive use of AT, and is not to be reproduced or used without written permission of Deloitte with the exception of its use with regard to the procurement process for the Northeast Anthony Henday Drive P3 project. No third party is entitled to rely, in any manner or for any purpose, on this Report. Deloitte's services may include advice or recommendations, but all decisions in connection with the implementation of such advice and recommendations shall be the responsibility of, and be made by, AT.

Deloitte's scope of work related to the PSC was limited to the review and updating of a PSC spreadsheet model provided by AT. The PSC's financial assumptions and cost estimates are those of AT. Deloitte's scope of work related to the VfM was limited to development of a spreadsheet to calculate and compare the net present value of the financial offers using AT's methodology.

This report relies on certain information provided by AT and the Project's Proponents, and Deloitte has not performed an independent review of this information. It does not constitute an audit conducted in accordance with generally accepted auditing standards, an examination or compilation of, or the performance of agreed upon procedures with respect to prospective financial information, an examination of or any other form of assurance with respect to internal controls, or other attestation or review services in accordance with standards or rules established by the CICA or other regulatory body.

© Deloitte & Touche LLP and affiliated entities.

Comparison of Financial Offers

Method

The Financial Offers consist of the following payments:

- Monthly payment stream over the operating period (October 2016 to September 2046 inclusive), consisting of:
  - Capital Payments (identical monthly payments stated in nominal dollars)
  - O&M Payments (monthly payments for O&M, stated in 2012 dollars)
  - Major Rehabilitation Payments (monthly payments with timing as needed for Major Rehabilitation, stated in 2012 dollars)
- Total Provincial Funding, calculated by multiplying the amount of one full month's Capital Payment by 266.

The total cost of the Financial Offers on a net present value basis was determined by calculating the sum of the net present values (as at the SR3 submission date of March 14, 2012) of:

- the Capital Payments;
- the O&M Payments, after first adjusting each payment for inflation using a fixed estimated inflation rate of 2.15% per annum determined by Alberta Finance and Enterprise;
- the Major Rehabilitation Payments, after first adjusting each payment for inflation using the fixed estimated inflation rate of 2.15% per annum determined by Alberta Finance and Enterprise; and
- the Provincial Funding, after first distributing the amount into a number of separate progress payments using a pre-determined schedule of payment dates and payment amounts (with each amount defined as a percentage of Provincial Funding). The schedule of payment dates and amounts is taken from the Shadow Bid, which has monthly payments averaging 2.8% of Provincial Funding commencing in January 2014[1].

The discount rate used to calculate net present values is 3.75% per annum, determined by Alberta Finance and Enterprise based on the Province's borrowing costs.

Proponents were advised of the discount rate and inflation rate to be used on March 12, 2012.

Process and results

To determine the Proponent that provided the Financial Offer with the lowest total cost on a net present value basis, the Proponent's Form G1 cashflows (Columns B, D, and E) were value-copied into the bid comparison spreadsheet that was developed in advance.

The payment cashflows as copied into the bid comparison spreadsheet were compared to and spot-checked against each Proponent's Form G1 (paper version) to confirm agreement between the Proponent's electronic and paper financial offers and the accuracy of the value-copy process. The sum of each cashflow in the bid comparison spreadsheet was also compared to the sum of the cashflow in the Proponent's Form G1 spreadsheet to again ensure the accuracy of the value-copy process. These comparisons confirm that the NPVs of each bid have been calculated according to the payments indicated on the paper version of each Proponent's Form G1.

[1] Since actual progress payments will be made according to the Contractor's verified progress in the field, which cannot be known in advance, an assumed schedule is required to evaluate the bids. The same schedule is used for all three because Proponents do not bid an enforceable construction schedule. The Preferred Proponent's schedule of Progress Payments as evidenced in its financial model may be used for calculating the book value and for budgeting purposes.

© Deloitte & Touche LLP and affiliated entities.

The bid comparison spreadsheet calculates the NPV of the cashflows to the Proponents as of March 14, 2012, which is the basis for determination of the Preferred Proponent. The results are as follows:

	Public Sector Comparator	Cashflows to Proponents		
		ARC	ECP	CCLG
Total Cost on a Net Present Value Basis (NPVs to 14-Mar 2012, in millions)	$2,179.97	$2,033.93	$2,218.51	$1,808.87

ARC=Alberta Roads Consortium, CCLG=Capital City Link Group, ECP=Edmonton Connect Partners

The result as indicated in the above table is that Capital City Link Group has the lowest NPV, and absent any SR3 submission compliance concerns, Capital City Link Group would be the Preferred Proponent.

© Deloitte & Touche LLP and affiliated entities.

Calculation of final value for money

Overview

VfM is determined by comparing the Preferred Proponent's Financial Offer to the PSC and is defined by Alberta's Public-Private Partnership Framework and Guideline as:

> *…a net present value comparison of the comparable costs and risks of the proposed P3 project with the Public Sector Comparator (PSC).*

The cost of traditional project delivery for the Project is established as the PSC. The cost of P3 project delivery is estimated at several points in the project development process with a Shadow Bid, allowing VfM to be estimated and refined as project information improves. The final VfM analysis replaces the Shadow Bid's estimated cost with the cost of the Preferred Proponent's Financial Offer (i.e. the actual bid rather than the Shadow Bid).

Calculation

The VfM compares the cost of the Preferred Proponent's Financial Offer to the cost of the PSC. The VfM is therefore as follows:

	NPV (in millions)
Public Sector Comparator	$ 2,179.97
Preferred Proponent's Financial Offer	$ 1,808.87
Difference	$ 371.1

The VfM is therefore $ 371.1 million, or 17% of the PSC.

Appendix C: Project Scope

NEAHD Location and Features

Project Feature:

- 27 kilometres of six- and eight-lane divided roadway (9 kilometres of new highway construction and 18 kilometres of highway reconstruction)
- nine interchanges
- two road flyovers
- eight railway crossings (flyovers)
- two bridges across the North Saskatchewan River
- 47 total bridge structures

Interchanges locations:

- Manning Drive (partly completed with the Northwest Anthony Henday Drive project)
- 153 Avenue
- 130 Avenue
- Highway 16 (Yellowhead Trail)
- Broadmoor Boulevard at Highway 16
- Sherwood Drive at Highway 16
- Baseline Road
- Sherwood Park Freeway/Wye Road
- 17 Street at Sherwood Park Freeway

Flyover locations:

- Various CNR/CPR Rail Crossings

March 14, 2012

Tom Loo, P.Eng.
Executive Director
Major Capital Projects Branch
Alberta Transportation
2nd Floor, Twin Atria Building
4999 – 98 Avenue
Edmonton, AB, T6B 2X3

Dear Sir:

Re: Fairness Auditor's Report on Completion of the RFP Evaluation and Recommendation of the Preferred Proponent for North East Anthony Henday Drive ("NEAHD")

This Report is being provided to the Executive Director, Major Capital Projects Branch and Project Steering Committee of the above-noted, as stipulated in the Alberta Infrastructure and Transportation Terms of Reference for the Fairness Auditor.

Further to our Letter of Opinion dated May 10, 2011, the Fairness Auditor has familiarized himself with the appropriate documentation in this matter, including the **Request for Qualification, Instructions to Proponents, Transaction Process Framework,** terms of the **Request for Proposal, Agreement to Design, Build, Finance and Operate North East Anthony Henday Drive ("NEAHD"),** and the appropriate minutes and memoranda pertaining to this process.

In order to ensure that the transaction was conducted fairly and consistently, the following fairness principles were used as guidelines throughout the transaction process:

1. The Proponents in this matter were given the same opportunity for the availability to access information.

2. The information made available to the Proponents was sufficient to ensure that they had the opportunity to fully understand the opportunity.

3. All the Proponents had reasonable access to the opportunity.

4. The criteria established in the invitation documents truly reflect the needs and objectives of the project.

5. The evaluation criteria and the evaluation process were established prior to the evaluation of submissions.

6. The evaluation criteria, and evaluation processes were internally consistent.

7. The pre-established criteria and evaluation process were followed.

8. The evaluation criteria and process were consistently applied to all submissions.

The Fairness Auditor attended several Evaluation Committee Meetings, and in addition reviewed the evaluation criteria used by that group.

The Fairness Auditor attended the Selection Committee Meetings and Working Committee Meetings, and was present for interviews between the Selection Committee/Working Committee and the RFP Proponents. It was observed that the interface with each group was open, unbiased, transparent, consistent in approach, and ultimately a fair process in my opinion. In addition, at every meeting with any of the RFP Proponents, the Fairness Auditor asked the Proponent whether there were any fairness issues and the response in every case was that there were no fairness issues.

As the Fairness Auditor in this procurement, I hereby certify that, in my opinion, the selection process in this matter conducted by Alberta Transportation, to the completion of its recommendation of the Preferred Proponent, was open, consistent in approach and fair.

Yours very truly,

GGC CONSULTANTS INC.

Per:
GARY G. CAMPBELL, Q.C.

Appendix G: Payment adjustments

Table 4: Sample of key payment adjustments included in P3 contract [10]

Issue	Payment Adjustment
If an external audit has not been completed within the specified time:	$2,400/week or any partial week, for the first four weeks and $6,000/week or any partial week, thereafter
If any deficiencies identified by the Environmental Management System external auditor have not been corrected within the specified time:	$6,000/week or any partial week, for the first four weeks and $12,000/week or any partial week, thereafter
If the contractor fails to undertake roadway inspections:	• $2,500 for the first occurrence; • $5,000 for the second occurrence; • $10,000 for the third occurrence; and • $20,000 for the fourth occurrence and each occurrence thereafter.
If during the Operating Period, the roadway superelevation and cross-slope rates are measured and are found not to be maintained within ±1.0% of the design rates:	• $3,600/week or any partial week, for the first four weeks the deficiency is not remedied; then • $11,000/week or any partial week, thereafter.
If localized pavement repairs (e.g. for spalling, roughness, cracking, or potholes), permanent or otherwise, are not completed within the stipulated time period:	$600/localized repair for each seven day period or any partial week, until the deficiency is corrected.

[10] The project agreement should be consulted for details on all payment adjustments. The final form of the project agreement is available at http://www.transportation.alberta.ca/3787.htm.

Issue	Payment Adjustment
If lamps or components of the roadway lighting system are not adjusted, maintained, repaired/replaced within the stipulated time:	• Lamp repair/replacement, $120/lamp/day or any partial day, that the lamp remains in need of repair/replacement; and • Repair or adjustment of any pole, base or other lighting system component, $120/component/day or any partial day, that the component needs adjustment.
If grass is in excess of the specified maximum height:	$120/hectare or any partial hectare/month or any partial month,
If the contractor fails to commence work within 60 days of identification of a structural or operational deficiency on bridges:	$1,200/day or any partial day, per deficiency shall be assessed until the contractor commences and diligently pursues completion of the work.
If the contractor is non-compliant with respect to snow clearing and ice control:	• $12,000 for each occurrence of non-compliance during a Storm Event (to a maximum of $72,000 total for the Infrastructure); • $24,000 for each occurrence of non-compliance during a subsequent Storm Event in any consecutive 12 month period (to a maximum of $145,000 total for the Infrastructure); and • The third occurrence of any non-compliance within a consecutive 12 month period but in a separate third Storm Event shall be a potential Termination Event for the purposes of and having the consequences set out in section 16.8(k) of the DBFO Agreement.

1.0 Summary of Board Findings

By this Order, the Public Utilities Board ("Board") approves new rates for Manitoba Hydro (or the "Utility") for the 2019/20 fiscal year. The Board finds that it is just and reasonable to approve a 2.5% rate increase for most customer classes, effective June 1, 2019. The Board finds that Manitoba Hydro does not require an increase to its revenues in 2019/20 fiscal year. All revenues from the 2.5% rate increase are to be placed in a deferral account for major capital projects currently under construction. The deferral account will partially mitigate future rate increases required when new major capital projects are in-service, consistent with the principles of rate stability and predictability. This increase will contribute additional revenues to Manitoba Hydro in 2019/20 and in future years.

The evidence in this proceeding demonstrates that Manitoba Hydro does not require a rate increase for its operations in 2019/20. Manitoba Hydro's initial General Rate Application ("GRA") for a rate increase of 3.5% for all customer classes, to be effective April 1, 2019, was filed on November 30, 2018 . It was based on the position that, without any rate increase, Manitoba Hydro was projecting a net loss of $28 million in the 2019/20 fiscal year (which runs from April 1, 2019 to March 31, 2020). Manitoba Hydro filed supplemental information on February 14, 2019, which showed a $92 million improvement in its financial forecast for 2019/20 with an updated projection of $64 million in positive net income in 2019/20 without any rate increase. With its requested 3.5% increase effective June 1, 2019, net income is projected to be $115 million in 2019/20.

A rate increase at the level of 2.5% with all revenues directed to a major capital project deferral account is just and reasonable. The Board will determine how the deferral account will be brought into Manitoba Hydro's operating revenues at a future GRA. The deferral account will help to offset higher rate increases when new capital projects enter into service in the next few years.

The Board anticipates the bill impact of the 2.5% rate increase to be a $2.34 increase in the monthly bill of a residential customer without electric space heat using 1,000 kilowatt-

hours per month, and a $4.47 increase in the monthly bill for a residential customer with electric space heat using 2,000 kilowatt-hours per month.

The Board finds that it is just and reasonable to differentiate the June 1, 2019 rate increase to the General Service Small Non-Demand class such that a 2.5% increase to the class revenue target is reduced by an amount that will gradually move this class's Revenue to Cost Coverage ratio into the zone of reasonableness of 95-105% over a period of nine years.

A majority of the Board further finds that it is just and reasonable to approve no rate increase for the First Nations On-Reserve Residential and Diesel Zone Residential customer classes effective June 1, 2019.

The Board directs Manitoba Hydro to provide a compliance filing to the Board pursuant to the directives in this Order. The compliance filing shall be provided in a timely fashion to allow the Board no less than two business days to review and approve consumer rates effective June 1, 2019.

2.0 Background and Procedural History

Background

Under Manitoba law, the Board must set electricity rates for Manitoba Hydro's customers that are just and reasonable and in the public interest. In so doing, as confirmed by the Manitoba Court of Appeal, the Board balances the interests of Manitoba Hydro's ratepayers and the financial health of Manitoba Hydro. Together and in the broadest interpretation these interests represent the general public interest.

Pursuant to subsection 25(1) of *The Crown Corporations Governance and Accountability Act*, CCSM c C336, the prices charged by Manitoba Hydro with respect to the provision of power ("rates for services") are reviewed by the Board. No changes in rates for services can be made and no new rates for services can be introduced without the approval of the Board. Manitoba Hydro is required to submit proposals regarding rates to the Board for its review and approval.

When Manitoba Hydro applies to the Board for rate increases, Manitoba Hydro bears the statutory onus of demonstrating that the increases sought are just and reasonable.

Procedural History

By letter dated November 12, 2018, Manitoba Hydro advised of its intentions with respect to the filing of a 2019/20 GRA and requested the Board's concurrence with Manitoba Hydro's proposed approach to the process and the filing. In the November 12, 2018 letter, Manitoba Hydro stated that, based on its financial projections at the time and without any rate relief, it would experience a projected net loss in the 2019/20 fiscal year (the "test year"). Manitoba Hydro further advised that, with the most recent appointments to the new Manitoba Hydro-Electric Board of Directors ("MHEB"), a comprehensive review of Manitoba Hydro's operations, forecasts, and financial plans was being undertaken to allow the MHEB to establish a long-term financial plan for the Utility. As such, Manitoba Hydro was not in a position to file a long-term Integrated Financial Forecast ("IFF") for

review by the Board. Manitoba Hydro further advised that, upon completion of the IFF incorporating the direction of the MHEB for Manitoba Hydro's financial plan, the Utility would submit a full GRA to the Board, anticipated to be filed in late 2019.

Manitoba Hydro proposed a limited process for the Board's review of an Application for a rate increase in the 2019/20 year "sufficient to generate a minimum level of net income such that the Corporation would avoid a projected net loss in the 2019/20 fiscal year." In support of such an Application, Manitoba Hydro proposed to file information based upon Manitoba Hydro's 2018/19 outlook (combining actual financial position as at March 31, 2018 and actual financial performance and water flow conditions to September 30, 2018) and an interim 2019/20 budget (incorporating fall 2017 planning assumptions and operating expenditures).

On November 21, 2018, the Board communicated by letter its willingness to consider a one-year rate increase application based on the financial information outlined in Manitoba Hydro's November 12, 2018 letter. The Board further stated that, as Manitoba Hydro would be seeking a final rate increase, the Utility would be required to file financial and economic information sufficient to satisfy its onus to demonstrate that the rate increase sought for the test year would be just and reasonable. Additionally the Board indicated that it required Manitoba Hydro to provide the most current information available.

On November 30, 2018, Manitoba Hydro filed its 2019/20 GRA, seeking a rate increase of 3.5% for all components of the rates of all customer classes (except the non-grid portion of Diesel Zone General Service rates), to be effective April 1, 2019. Manitoba Hydro projected the increase would generate additional annual revenues of $59 million and would result in what Manitoba Hydro described as a "modest contribution to financial reserves" and which results in a "modest level of net income" of $31 million in 2019/20. Without the requested 3.5% rate increase, Manitoba Hydro projected that it would experience a net loss of $28 million from electric operations.

On February 14, 2019, and as requested by the Board, Manitoba Hydro filed a Supplement to its 2019/20 GRA, which included updated financial statements and revenue information for 2018/19 and 2019/20, based on actual results as of December 31, 2018. Rather than the $28 million loss previously projected, without any rate increase, Manitoba Hydro now projected an improvement of $92 million, with positive net income of $64 million in 2019/20. Additionally for the 2018/19 fiscal year which ends March 31, 2019, Manitoba Hydro projected net income of $95 million, rather than the $51 million originally projected in the November 30, 2018 filing.

The improvement in financial results was attributed to improved water flow conditions and related higher net export revenues, as well as to lower levels of capital spending than planned in 2018/19 with associated lower borrowing requirements and finance expense. Despite the improved projected financial results, Manitoba Hydro submitted that the 3.5% proposed rate increase continued to be necessary and in the public interest. Manitoba Hydro took the position that, with a 3.5% rate increase in 2019/20, the Utility would be able to continue to plan for a modest level of net income in the event of low water flow conditions, and would reduce the likelihood of future rate shock to ratepayers given the anticipated additional net costs associated with the in-service of Keeyask.

By procedural Orders 1/19 and 9/19, the Board approved Intervener Status for Assembly of Manitoba Chiefs, Consumers Coalition, Manitoba Industrial Power Users Group, and Manitoba Keewatinowi Okimakanak, as well as the issues in scope for the hearing of the GRA. In Order 40/19, the Board confirmed the process and scope for the oral evidentiary portion of the hearing.

The oral evidentiary hearing was held on April 23, 24, 25, and 29, 2019. The Board heard closing submissions from Manitoba Hydro and all Interveners as well as reply submissions from Manitoba Hydro on May 1 and 2, 2019.

3.0 Rate Increase for 2019/20

In Order 59/18, the Board approved a 3.6% overall rate increase effective June 1, 2018. In that Order, the Board commented that the Integrated Financial Forecast ("IFF") scenario filed in the proceeding as Manitoba Hydro Exhibit 93 supported the Board's decision on the level of the overall rate increase. In particular, Exhibit 93 was directionally consistent with many of the Board's decisions, including continued deferral of $20 million in ineligible overhead costs, amortized at a 30-year rate, and Average Service Life depreciation methodology, without amortization of the difference with the Equal Life Group methodology.

The Exhibit 93 scenario resulted in equal annual rate increases of 3.57%, beginning in 2018/19. That scenario included: the Bipole III Transmission Reliability Project ("Bipole III") entering commercial service on July 31, 2018 at a cost of $5.04 billion; no additional export revenues related to uncontracted surplus electric capacity and the assumption of uncontracted surplus dependable energy export sales at opportunity prices; and in 2019/20 $61 million in net income with debt management based on a weighted average term to maturity of 12 years. Adjusting the weighted average debt term to maturity to 20 years, the net income would be forecast at $28 million for the 2019/20 fiscal year.

Exhibit 93 also reflected an $8.7 billion control budget for Keeyask and an in-service date for the first generating unit of August 2021. However, in the last GRA proceeding, the Independent Expert Consultants retained to assist in the Board's review of Manitoba Hydro's major capital projects testified that, without project management improvements by the Utility, the final cost of Keeyask could be in the range of $9.5 billion to $10.5 billion. While the Board accepted the control budget and construction schedule for rate-setting purposes in Order 59/18, the Board also recognized that these targets would only be met if Manitoba Hydro and the general civil contractor achieved a 10% improvement in productivity.

As detailed above, at the time of the November 30, 2018 GRA filing, Manitoba Hydro was projecting that without the proposed 3.5% rate increase, it would experience a net loss of

$28 million in 2019/20. However, the February 14, 2019 Supplement filing shows that Manitoba Hydro's financial position is projected to be improved in the test year, such that positive net income is projected even without a rate increase.

Since the filing of Exhibit 93 in the 2017/18 and 2018/19 GRA proceeding and the Board's issuance of Order 59/18, there have been a number of positive developments in Manitoba Hydro's operations and financial position, as detailed below:

- in the 2019/20 test year, without any rate increase, Manitoba Hydro is projecting a positive net income of $64 million, which is higher than the net income forecast in the financial projection produced in Exhibit 93 (which included annual 3.57% rate increases) at the last GRA, even without adjusting the weighted average term to maturity incorporated into the financial projections;
- Bipole III entered service on July 4, 2018, 27 days earlier than scheduled and at a capital cost of $4.77 billion, which is $270 million lower than projected. The lower capital cost means that Manitoba Hydro has $270 million less in debt borrowing requirements and that annual carrying costs are reduced by $17M;
- due to the lower capital cost of Bipole III as well as other reductions in capital expenditures from what was forecast at the last GRA, without a rate increase in the test year, Manitoba Hydro's net debt for 2019/20 is now projected to be $567 million lower than forecast in Exhibit 93;
- Keeyask's first generating unit may enter service as early as October 2020, approximately 11 months earlier than was anticipated at the last GRA. An earlier in-service date will result in Keeyask generating revenues earlier than projected. Project risks have also been reduced, as the work in 2018 on the South Dam has uncovered the riverbed, resulting in the elimination of geotechnical conditions as a top risk;
- the control budget for the Manitoba-Minnesota Transmission Project ("MMTP") remains unchanged, despite a delay in the commencement of construction to June 2019;

- interest rates have remained below the rates previously forecast and the current interest rate environment is favourable to Manitoba Hydro. Manitoba Hydro has secured long-term debt issuances at favourable interest rates, including 49-year debt at 2.91% and a five-year borrowing of $350 million US (equivalent to $466 million in Canadian dollars) at 2.19%; and
- Manitoba Hydro has completed a term sheet with SaskPower for a 215 MW 40-year power export sale contract, beginning in 2022.

In addition, since Manitoba Hydro's original GRA filing on November 30, 2018, there have been a number of positive developments in Manitoba Hydro's operations and financial position, as detailed below:

- Manitoba Hydro is projecting net income of $95 million in the 2018/19 fiscal year, which ended March 31, 2019, which is a $44 million increase from the net income projected in Manitoba Hydro's November 30 filing;
- following nine consecutive months of below average precipitation in 2018, water conditions have improved significantly. From September 2018 through to February of 2019, Manitoba Hydro's system water flows were above average. Since that time, water flows have tracked to average. These improved water flows resulted in higher than projected extraprovincial revenues and lower fuel and power purchases; and
- the export prices that have been realized to date by Manitoba Hydro were higher than projected in the November 30, 2018 filing, while the export prices forecast for 2019/20 are currently tracking to the same levels as forecast in the November filing.

Manitoba Hydro's Position

Manitoba Hydro maintains that a 3.5% rate increase for all customer classes effective June 1, 2019 is just and reasonable. Although Manitoba Hydro's financial projections for the test year have improved from the November 30, 2018 filing, the Utility argues that the

rate increase remains appropriate as Keeyask entering service ahead of schedule will shorten the period in which to smooth customer rates to a higher level. As well, the rate increase is needed as the likelihood of a financial loss following an earlier in-service date for Keeyask is exacerbated. In this regard, Manitoba Hydro states that interest rate risk remains for the $4 billion of incremental borrowings that will be undertaken in the next few years as well as for the $4.8 billion of debt that requires refinancing over the five-year period following the test year.

Manitoba Hydro further submits that, while there have been positive changes in water flow conditions, there remains significant uncertainty in water supply for 2019/20 and significant risk of losses associated with below average water flows. Under Manitoba Hydro's analysis of net income sensitivities, there is a range of positive net income or negative net loss depending on the actual water flows experienced in the current fiscal year. In assessing the probabilities of water flow conditions in a given year, Manitoba Hydro does not assign weightings to the likelihood of any historical water flow conditions. This means that there is an equal likelihood of any historical water flow condition repeating in the future. In Manitoba Hydro's submission, the change in water flow conditions from the summer of 2018, which led to the November 30, 2018 Application, to the fall of 2018, which led to the February 14, 2019 Supplement, demonstrates the extreme variability in earnings associated with water flows.

Manitoba Hydro also says that it remains exposed to the impacts of colder than normal or warmer than normal winter weather as well as higher or lower export prices than forecast. If such risks materialize in the test year, the proposed rate increase would protect against financial loss.

Manitoba Hydro submits that the proposed 3.5% rate increase can be awarded without the Utility having filed a current IFF. The Utility states that the Board agreed to consider the rate application without an IFF and that the IFF is simply a tool that can be used in rate setting. Manitoba Hydro's position is that forecasts that have been filed in past proceedings as well as Exhibit 93 from the 2017/18 and 2018/19 GRA support a rate

increase for 2019/20 at the level of 3.5% in order to offset potential losses and build a base for the costs that will enter into the Utility's revenue requirement when Keeyask enters service. Further, Manitoba Hydro maintains the trends from prior long-term forecasts provide the Board with directional support for a rate increase in 2019/20. Manitoba Hydro emphasizes the Board's prior approval of rate increases that, in the Utility's view, were intended to smooth the impacts of major projects entering service. Manitoba Hydro states that a 3.5% rate increase in the test year will provide additional revenues on an annualized basis in perpetuity, which will have a profound effect on the Utility's financial reserves, debt levels, and financial metrics.

Intervener Positions

The Consumers Coalition submits that, because Manitoba Hydro has not filed an IFF, the Board should consider only whether the proposed rate increase is necessary for the financial health of the Utility in the 2019/20 test year. It is the position of the Consumers Coalition that Manitoba Hydro does not require a 3.5% rate increase in the test year, based on the improved financial position contained in the Utility's February 14, 2019 Supplement. The Consumers Coalition argues that Manitoba Hydro's financial position has not deteriorated since the last GRA and that some risks – including drought, interest rate volatility, weather, and export prices – have decreased in the 2019/20 test year. Relying on the evidence of its expert witnesses, the Consumers Coalition states that a 3.5% rate increase is not required to reduce the risk of financial losses in 2019/20. A 1% rate increase combined with cost control measures is sufficient to minimize the risk of financial loss in the test year and a 2% rate increase is sufficient to minimize the risk of financial loss in the test year even without any adjustments for cost control.

The Consumers Coalition submits that the appropriate level of rate increase for the test year is 1.5% to all customer classes except for General Service Small Non-Demand. The Consumers Coalition adopts the evidence of its expert witnesses and states that, in combination with Manitoba Hydro exercising cost control of its Operating & Administrative expenses, a 1.5% rate increase will assist the Utility and consumers with the transition to

Keeyask entering service while also helping to manage the Utility's net income and cash flow considerations.

The Manitoba Industrial Power Users Group also submits that Manitoba Hydro has not justified a 3.5% rate increase based on financial need in the 2019/20 test year. In particular, in seeking a 3.5% rate increase, Manitoba Hydro has not accounted for the positive improvements in its financial position and operations since the last GRA, nor has the Utility demonstrated that there have been any material or sustained negative developments compared to what is embedded in Exhibit 93. Further, the Manitoba Industrial Power Users Group adopts the evidence of its expert witness and submits that Keeyask is expected to generate annual revenues of $360 million, which will also benefit the Utility's cash flow position once Keeyask enters service. However, this Intervener states that negative net income is normal when major new capital projects enter service and as part of managing the level of rate increases. The expert witness for Manitoba Industrial Power Users Group testified that reserves would not serve a purpose if there is no need to draw down reserves in periods of negative net income or drought; moreover, rate increases in 2019/20 should not be planned as a means of preventing all net losses from Keeyask and Bipole III entering service.

The Manitoba Industrial Power Users Group recommends a 1.5% rate increase in the 2019/20 test year, consistent with an inflationary increase. This Intervener states that a 1.5% rate increase should be granted solely as a rate-smoothing mechanism for the transition to higher rates when Keeyask enters service and due to the eventual end of the Bipole III deferral account amortization in 2023/24 (which annually contributes $78 million of previously deferred revenue to net income

Two Interveners - Assembly of Manitoba Chiefs and Manitoba Keewatinowi Okimakanak - focused their submissions on the level of rate increase that would be just and reasonable for the First Nations On-Reserve Residential customer class, discussed further below in section 7.0 of this Order.

Board Findings

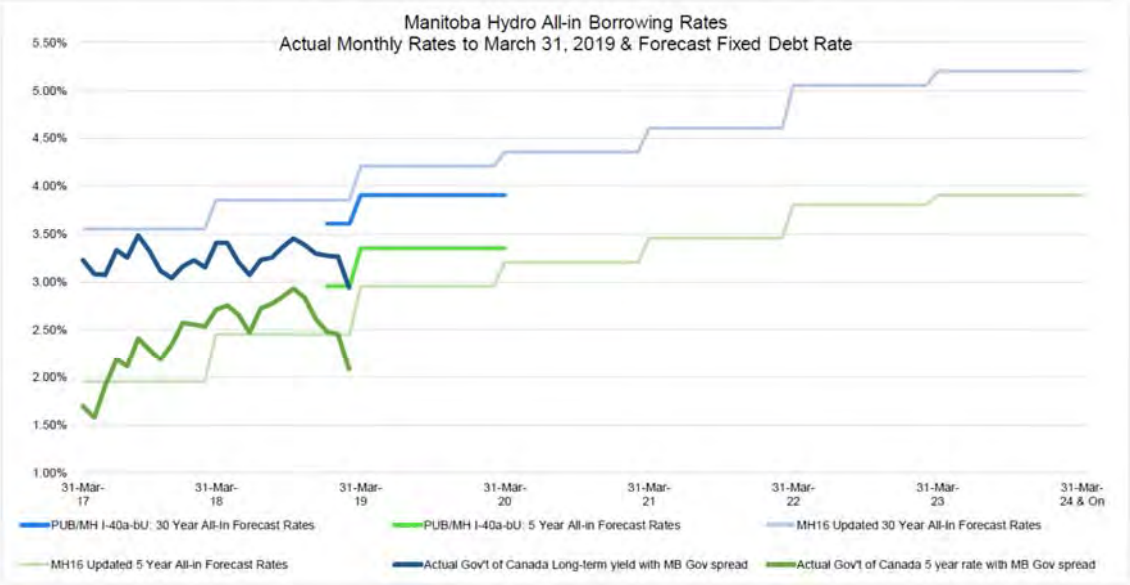
Revenues from a Rate Increase are Not Required for 2019/20

The Board finds that Manitoba Hydro has not satisfied its onus to demonstrate that a 3.5% rate increase in 2019/20 is just and reasonable and in the public interest. The Board further finds that Manitoba Hydro has not established that it requires any additional revenues from a rate increase in 2019/20 to flow into the Utility's general revenues.

When Manitoba Hydro filed its GRA on November 30, 2018, it sought a 3.5% rate increase for all customer classes because, without a rate increase, it projected a net loss of $28 million in the 2019/20 fiscal year. The supplemental information filed on February 14, 2019 showed a $92 million improvement in its financial forecast for 2019/20 with an updated projection of $64 million in positive net income without any rate increase. With its requested 3.5% rate increase, effective June 1, 2019, net income would be projected to be $115 million.

Based on the supplemental financial information, it is not just and reasonable to order any rate increase in 2019/20 that would result in increased revenues flowing into the Utility's general revenues.

The Board finds that there are diminished risks of Manitoba Hydro's financial position deteriorating in the 2019/20 test year. As noted by the Board in Order 59/18, drought risk should be managed through retained earnings in combination with regulatory action by the Board. The Board reiterates:



> *as the Board has demonstrated in past decisions – including in years of drought where the Board awarded rates in excess of those sought by the Utility – it will consider all of the facts and circumstances which confront Manitoba Hydro at that point in time in determining the appropriate rate relief. The Board is prepared to take regulatory action – whether through a rate rider, an interim rate increase, or a general rate*

increase – as required in times when emergent situations face Manitoba Hydro.

Manitoba Hydro experiences net income variability due to changes in water flow conditions. At the time of the November 30, 2018 GRA filing, there was a 50% likelihood that water flow conditions would result in negative net income if there was no rate increase in the test year. The improved water conditions incorporated into the February 14, 2019 Supplement filing, along with the other updates in that filing, now mean that the water flow risk has decreased to a 21% likelihood of negative net income in the 2019/20 test year. Put another way, and based on no rate increases in the test year, Manitoba Hydro is now expected to have positive net income in 79% of the water flow conditions experienced over the last 105 years, assuming Manitoba Hydro's other projections are achieved as forecast.

Similarly, interest rate volatility is no longer considered by Manitoba Hydro to be a top risk to 2019/20 net income due to pre-borrowing already undertaken by the Utility. As a result, interest rate volatility is expected to affect the net income in the test year by no more than a variation of plus or minus $7 million. For remaining borrowings, Manitoba Hydro acknowledged in its evidence that the current interest rate environment is favourable to Manitoba Hydro. Actual and forecast long-term interest rates are lower than compared to the interest rates incorporated into Exhibit 93. As shown in the figure below, actual long-term all-in forecast rates were an average of 0.5% lower for 2018/19 and, while average interest rates as of April 2019 were 0.18% higher in 2019/20, that does not account for recent debt issuances that include long-term borrowings at low interest rates.

Figure 2: Manitoba Hydro All-in Borrowing Rates Actual Monthly Rates to March 31, 2019 & Forecast Fixed Debt Rate[27]

Source: MIPUG-8 pg 16

Further, even without a rate increase, with low export prices or the warmest winter weather in 60 years, with all else remaining constant, net income in the test year will remain positive. It bears repeating that under average conditions Manitoba Hydro's current projections are that, without a rate increase, the Utility will have $64 million in net income in 2019/20.

Given the nature of Manitoba Hydro's operations, there are always risks that could affect the Utility's financial health. The Board finds that the chance that risks could materialize in the test year to the detriment of Manitoba Hydro's financial position is no higher than in any other year, and in the respects identified above, is diminished from the average. In these circumstances, it is not necessary to increase consumer rates to provide additional revenue to protect against the risk of financial loss in 2019/20.

Therefore, the Board finds that Manitoba Hydro does not have a current financial need for increased revenues from domestic ratepayers flowing to the Utility's general revenues in 2019/20.

A Rate Increase Directed to a Major Capital Deferral Account

The Board approves a 2.5% rate increase to all customer classes, except for General Service Small Non-Demand, the First Nations On-Reserve Residential and Diesel Zone Residential customer classes, and the non-grid portion of the Diesel Zone rates, effective June 1, 2019, with all additional revenue generated from this rate increase to flow into a major capital project deferral account ("Major Capital Deferral Account") to be established by Manitoba Hydro.

The rate increase approved by the Board is based on the need to enhance rate stability and predictability due to the upcoming in-service dates for major new capital projects. The evidence in the proceeding is that Keeyask could enter service as early as October 2020. As well, MMTP is scheduled to enter service in June 2020 and the Bipole III Deferral Account will be fully amortized into revenues as of 2023/24.

The Board finds that it should consider years beyond the test year in setting the rates for 2019/20. However, it is acknowledged that without Manitoba Hydro having filed a current IFF, the Board and all parties have been limited in their ability to assess the need for a rate increase in the test year based on Manitoba Hydro's future forecast levels of net debt, net income, and levels of reserves. Despite this limitation, the Board accepts the evidence of the expert witness for the Manitoba Industrial Power Users Group that the known fact of Keeyask entering service in either 2020/21 or 2021/22 at a control budget of $8.7 billion provides directional guidance. While the Board views the potential for an October 2020 in-service date for Keeyask as a positive development, the advancement of the Keeyask schedule also shortens the amount of time available for required higher customer rates to be smoothed in. The Board notes, however, that it is concerned that Manitoba Hydro did not present sufficient evidence to explain the Utility's position that an earlier in-service date would not result in cost savings for the Keeyask project. The Board directs Manitoba Hydro to file with the next GRA an explanation of the cost and revenue implications of the advancement in the Keeyask construction schedule from an in-service date of August 2021.

Keeyask is not the only major capital project with an anticipated 2020 in-service date. MMTP is scheduled to enter service in June 2020, and therefore the carrying costs of that project will also enter into Manitoba Hydro's revenue requirement. Moreover, if the construction of MMTP is delayed due to the timing of the issuance of necessary pre-construction federal permits, the costs of the project could increase and Manitoba Hydro will also incur additional costs for alternate arrangements to service the 250 MW sale to Minnesota Power that commences June 1, 2020.

As well, the known annual carrying costs of Bipole III provide further directional guidance as to the need for rate smoothing in the 2019/20 test year. The Bipole III Deferral Account established by the Board in Order 43/13 resulted in $392 million being collected as deferred customer revenues to be recognized as revenues through amortization over a five-year period beginning with the in-service date of Bipole III. However, the annual recognition of revenues from the Bipole III Deferral Account covers only a portion of the annual Bipole III carrying costs. Moreover, the Bipole III Deferral Account will be fully amortized and depleted in 2023/24, with the full amount of annual costs needing to be recovered by ratepayers beginning in 2024/25.

As the known costs of these major new generation and transmission capital projects will form a significant part of Manitoba Hydro's revenue requirement beyond the test year, it is appropriate to take steps today to assist in mitigating future rate increases. As such, the Board orders a rate increase of 2.5% in 2019/20 targeted to a Major Capital Deferral Account to assist in the transition to higher rates. This is consistent with the Board's long-standing concern that customer rate changes should be on a stable and predictable basis. Without implementing rate smoothing through a rate increase in the test year, combined with the capital costs of Bipole III and MMTP, the costs associated with Keeyask and the potential for those costs to enter into Manitoba Hydro's 2020/21 revenue requirement could lead to rate shock for consumers. The Board will determine how the deferral account will be brought into Manitoba Hydro's operating revenues at a future GRA.

The Board notes Manitoba Hydro has historically provided IFFs that included projections of equal annual rate increases premised on the Utility attaining a financial target over a specific timeframe, roughly 20 years. In prior Orders dating back to the time of the 2014 Needs For and Alternatives To Review, the Board relied on IFFs that included projected equal annual rate increases in the range of 3.57% to 3.95%.

As the MHEB is in the process of developing a new financial plan for Manitoba Hydro, those prior rate trajectories based on now out-dated financial targets are of questionable value in the current proceeding. However, those rate trajectories provide directional guidance to the Board in determining the appropriate level of the rate increase for 2019/20 to assist in smoothing consumer rates when major new capital projects enter service. This further supports the 2.5% rate increase approved by the Board.

The Board notes the evidence of the expert witness for the Manitoba Industrial Power Users Group that the Board's rate regulation of Manitoba Hydro has long used long-term financial forecasts as a tool in rate setting. This so-called "modified cost of service" approach allows for consideration of rate stability, measured rate transitions, and the appropriate level of customer-funded reserves. In the absence of a long-term financial forecast, the Board is challenged in its ability to assess the appropriate level of a rate increase in the 2019/20 test year to reduce the likelihood of future rate shock to consumers. While the evidence in this GRA establishes that it is just and reasonable to approve a 2.5% rate increase in 2019/20 for certain rate classes with the full revenues from the rate increase directed to a Major Capital Deferral Account, the Board expects that it will be necessary to assess future rates in the context of a long-term financial forecast given the expected in-service for Keeyask.

The limitations in this proceeding that arose from the Utility not filing an IFF demonstrate the importance of such long-term financial forecast being available as a tool in rate setting. The Board finds that it is not reasonable to consider another GRA absent a full IFF or other long-term financial forecast. The Board directs Manitoba Hydro to file with its next GRA filing an IFF or other long-term financial forecast in a form consistent with an IFF.

4.0 Operation & Administrative Expenses

Operating and administrative ("O&A") expenses are one of Manitoba Hydro's highest expense categories in its revenue requirement, at over half a billion dollars per year. These expenses primarily consist of wages and benefits, materials, contracted services, and overhead costs associated with operating and maintaining Manitoba Hydro's facilities and providing services to customers. O&A expenses do not include capitalized salaries and benefits for employees who work on capital projects, or materials and services related to those capital projects.

In February 2017, Manitoba Hydro began implementing a plan to reduce its total workforce by 15%, or 900 positions, through a combination of a reduction of the executive leadership and senior management teams and a Voluntary Departure Program. As of March 31, 2018, 821 employees were approved to leave under the Voluntary Departure Program resulting in annual employee-related cost savings of $92.6 million. Due to the timing of the Voluntary Departure Program, Manitoba Hydro was not able to file detailed O&A budgets and related detailed schedules as part of the last GRA. Although there were no detailed budgets, IFF16 incorporated forecast O&A expenses of $518 million in 2017/18, $501 million in 2018/19, and $511 million in 2019/20.

In Order 59/18, the Board accepted Manitoba Hydro's evidence that a detailed O&A forecast could not be filed at that time because of the ongoing Voluntary Departure Program. The Board directed Manitoba Hydro to file with its next GRA the details of its O&A expenditures. While the Board acknowledged Manitoba Hydro's efforts to implement cost containment measures, the Board recommended that Manitoba Hydro continue those efforts both in terms of staff reductions and supply chain management after the conclusion of the Voluntary Departure Program transition. The Board noted that in the 2014/15 & 2015/16 GRA, Manitoba Hydro expressed a commitment to reducing the growth of O&A expenses to 1% annually, excluding the impact of accounting changes.

In the current GRA, Manitoba Hydro relies on a high-level preliminary O&A target of $511 million, reflecting an inflationary increase of 2% over the $501 million of O&A expenses

included in the 2018/19 Financial Outlook. The starting point for Manitoba Hydro's establishment of the $511 million O&A target for 2019/20 is the ending 2017/18 actual O&A result, which was used by the Utility to in calculating the 2018/19 O&A budget of $501 million. Manitoba Hydro then escalated the 2018/19 budget by 2% to arrive at the $511 million target for 2019/20.

Manitoba Hydro did not provide a detailed O&A budget for 2019/20. The targeted levels of total OM&A expense for 2018/19 and 2019/20 remain unchanged from what was forecast at the last GRA.

Manitoba Hydro's Position

Manitoba Hydro submits that the $511 million target is valid for rate-setting purposes. This target reflects an inflationary increase of 2% over the $501 million of O&A expenses included in the 2018/19 Financial Outlook. However, the $511 million target has been re-validated by Manitoba Hydro based on current staffing levels and current business requirements. Manitoba Hydro states that the $511 million target will not change with the development of a detailed O&A budget and that it is not possible to achieve further O&A reductions. Manitoba Hydro also stated that limiting growth in O&A expenses to 1% is not sustainable, given the significant staffing reductions that have already taken place, negotiated wage settlements, and cost escalation for materials and services.

Responding to the evidence of the expert witness for the Consumers Coalition, Manitoba Hydro submits that the $22 million reduction in O&A expense identified by that witness is not achievable. Manitoba Hydro states that, in order to reduce O&A expense by $22 million, a staffing reduction of 300 employees would be required – in addition to the 821 positions that have already been reduced through the Voluntary Departure Program. Further staffing reductions would significantly increase risks to public and employee safety, system reliability, and the ability of the Utility to provide reasonable levels of customer service. Regardless, Manitoba Hydro says that its levels of Equivalent Full-Time positions are comparable to the levels in 2004/05, despite growth in Manitoba Hydro's operations in the last 15 years. Further, Manitoba Hydro argues that reductions in O&A

expense in 2019/20 will not address the fundamental issue facing Manitoba Hydro's financial health: the significant revenue shortfall following the in-service date of Keeyask and associated transmission projects.

Intervener Positions

The Consumers Coalition, the only Intervener to take a position on this issue, argues that Manitoba Hydro has not provided key supporting evidence for its 2019/20 O&A target, particularly due to the fact that the Utility did not file an updated or detailed O&A forecast or budget for this test year. As such, the Consumers Coalition submits that the Board should not adopt Manitoba Hydro's O&A budget for rate-setting purposes.

Adopting the evidence of its expert witness, the Consumers Coalition takes the position that the $511 million O&A target for 2019/20 should first be reduced for rate-setting purposes to $495.6 million, and second, should further be reduced to $489 million through the use of an escalation number of 1%. The first budget reduction is to normalize both for an $8.1 million non-recurring increase in collection costs from 2017/18 (the starting point for the Utility's O&A target) and a $7.3 million provision for unallocated transitional contingency funds for which there are no planned costs. The second reduction, based on the use of a 1% escalation number, is recommended by this Intervener as a means of sending a signal to Manitoba Hydro to further reduce costs in a period of transition while reducing the trajectory of O&A costs going forward. The Consumers Coalition argues that these reductions are equivalent to a 1.9% rate decrease by 2022/23 for customers – or put another way, a 1.9% rate increase that Manitoba Hydro does not need to collect from ratepayers.

Board Findings

The Board finds that Manitoba Hydro's 2019/20 O&A target is not accepted for rate-setting purposes. First, the target is premised on a high-level target calculation from early 2017 for the 2017/18 year, and includes two prior non-recurring costs that should be normalized in establishing a target for rate-setting purposes.

The Board finds that the 2019/20 O&A target should be reduced by $8.1 million. This is the amount of a one-time increase in collection costs in 2017/18 as a result of an assessment of collectability of arrears. The $8.1 million was used in the calculation of the 2018/19 budget, which was in turn used in establishing the 2019/20 target. The Board does not accept that the 2019/20 test year O&A target should include this $8.1 million for rate-setting purposes, as it is a one-time occurrence.

Similarly, the Board finds that the 2019/20 O&A target should be reduced by a further $7.3 million – the amount included in the 2019/19 O&A budget to support transitional business requirements arising from the Voluntary Departure Program. This amount was unallocated to specific Operating/Corporate groups and was held as a contingency. These expenses were not incurred in 2018/19 and Manitoba Hydro is not planning for these costs in 2019/20. There are also no actual expenditures associated with this unallocated funding. For these reasons, the test year O&A target should also not include this $7.3 million expense for rate-setting purposes.

Removing both of these expenses from the 2019/20 O&A target reduces the target from $511 million to $495.6 million.

Second, the Panel finds that, in developing the 2019/20 O&A target for rate-setting purposes, an escalation of 1% above the 2018/19 Financial Outlook is to be used. The Utility's primary basis for the 2% escalation rate was that it is an inflationary increase. Manitoba Hydro's evidence did not establish that a 2% escalation rate should be used. Moreover, the Board is concerned that the use of a rate of escalation of 2% will erode all of the O&A savings achieved by Manitoba Hydro through the Voluntary Departure

Program and supply chain management within the early years of Keeyask entering service. This offsetting of savings would be inconsistent with the intent of the Voluntary Departure Program and contrary to the need for Manitoba Hydro to find savings in controllable costs during a period of major capital expansion and related rate pressures.

In the absence of evidence demonstrating the appropriateness of a 2% escalation number, the Board finds that a 1% rate of escalation is to be used for rate setting purposes. This is consistent with Manitoba Hydro's prior commitment dating back to 2013 to limit operating cost increases to 1% per year. As the Board stated in Order 59/18, the Board expects Manitoba Hydro continue its efforts to reduce O&A costs, both in terms of staff reductions and supply chain management. The Board reiterates that cost control should be ongoing, and that it should continue in the post-Voluntary Departure Program years.

Reducing the escalation rate to 1% further reduces the O&A target to $489 million, or $22 million less than Manitoba Hydro's $511 million target. This is equivalent to a 1.3% rate decrease for ratepayers in 2019/20 and will have enduring benefits for ratepayers over time.

The Board is concerned about the lack of detailed information provided by Manitoba Hydro in evidence to support the O&A expenditures incorporated into the filing. As noted by the expert witness for the Consumers Coalition, the Voluntary Departure Program was complete approximately one year ago. It is difficult to understand why Manitoba Hydro has not yet been able to develop a detailed O&A budget. Given the materiality of this expense in Manitoba Hydro's revenue requirement, the Board directs Manitoba Hydro to develop and file a detailed O&A budget with the next GRA filing and provide the year over year dollar and percentage increases for the past five fiscal years. That detailed O&A budget is to include the 2019/20 year, as well as similar detail in support of any years for which Manitoba Hydro seeks a rate increase.

5.0 Financial Ratios and Cash Flow

The MHEB is currently undertaking a comprehensive review of the Manitoba Hydro operations, forecasts, and financial plans which will allow them to establish a new financial plan and financial targets for the Corporation. As such, neither Manitoba Hydro's November 30, 2018 GRA filing nor its February 14, 2019 GRA Supplement filing focused on Manitoba Hydro's financial ratio targets.

In its filing, Manitoba Hydro did include Cash Flow Statements showing two methodological or presentation changes that the Utility made for financial reporting purposes in its most recent audited financial statements. The first is to use the Indirect Method of reporting cash flows rather than the previously used Direct Method. The second change is to record capitalized interest in Operating Activities rather than as previously presented in Investing Activities. By recording the interest paid on capital projects not yet in service in Operating Activities, approximately $300 million is moved from Investing Activities where the remainder of the costs of those capital projects under construction are recorded.

Manitoba Hydro's Position

Manitoba Hydro acknowledges the additional incremental revenue from the requested rate increases does not make a noticeable impact to the debt ratio and results in only minor improvements to the EBITDA Interest Coverage Ratio and the Capital Coverage Ratio in 2019/20. However, the Utility stresses that the additional rate increase revenue on an annualized basis in perpetuity has a profound impact on the financial reserves, debt levels, and financial metrics. Manitoba Hydro calculates the net present value of a 3.5% rate increase to be approximately $600 million (using a 6.0% nominal weighted average cost of capital discount rate).

Manitoba Hydro states that the two changes in the manner in which it presents its Cash Flow Statement were made based on the direction from its former Audit Committee;

however, Manitoba Hydro advises that the Utility's cash balances remain the same regardless of the changes in presentation.

Manitoba Hydro explains that its new presentation of the capitalized interest better shows the total interest expense paid by the Utility. Manitoba Hydro further explains that this new presentation mirrors what will happen when Keeyask enters service, when the interest expense related to Keeyask moves to the operating statement.

Manitoba Hydro argues that there has been additional scrutiny of Manitoba Hydro by a credit rating agency that has identified weakening of a financial metric used by that agency.

Intervener Positions

The expert witness for the Consumers Coalition accepts the Indirect Method of presenting the Utility's Cash Flow Statement as providing a finer level of detail in terms of understanding the cash flow from operations. This is because the Indirect Method starts with Net Income and then makes adjustments for non-cash expenditures such as Depreciation Expense.

However, the Consumers Coalition witness questions the change in reclassifying interest capitalized on capital projects from Investing Activities to Operating Activities as being potentially concerning from a rate-setting perspective. According to this witness, the change will alter the perception of the amount of cash flow that is available to meet financial obligations and fund sustaining capital expenditures on Manitoba Hydro's audited financial statements.

The Consumers Coalition's expert witness also indicates that the reclassification of capitalized interest from Investing Activities to Operating Activities is inconsistent with how capitalized interest is reflected in both the income statement and balance sheet. In the income statement and balance sheet, capitalized interest is presented as an Investing Activity for financial reporting purposes. As well, this witness notes that Manitoba Hydro

is a regulated utility. The principles of regulation and rate setting are such that interest is normally capitalized as part of a project until the project is in service and then it becomes part of the revenue requirement.

The Consumers Coalition submits that Manitoba Hydro has not demonstrated that it is facing a cash flow challenge. Rather, it is the position of this Intervener that current rates are sufficient from a cash flow perspective.

The Manitoba Industrial Power Users Group submits that cash flow should not be the key consideration in analyzing the sufficiency of rates, given the Utility's hydraulic variability. Like the expert witness for the Consumers Coalition, the expert witness for the Manitoba Industrial Power Users Group states that capitalized interest for assets that are not used and useful should not be a factor for rate setting. In his view, interest for capital projects is no different than other cash expenditures needed for capital projects, such as materials and labour, which are capitalized. The Manitoba Industrial Power Users Group argues that, although interest coverage ratios can be informative in rate setting, the information conveyed by such ratios can be skewed when capitalized interest is treated as an Operating Activity.

The Manitoba Industrial Power Users Group also submits that the Board should not place weight on Manitoba Hydro's arguments about the alleged concerns of credit rating agencies.

Board Findings

The Board finds that the presentation in which capitalized interest is included in Operating Activities is not to be taken into account when considering cash flow sufficiency in a test year for rate setting purposes. The Board agrees with the expert witnesses for the Consumers Coalition and the Manitoba Industrial Power Users Group that the change in the presentation of capitalized interest on the Cash Flow Statement is inconsistent with rate setting principles and is potentially confusing to stakeholders. Should the amount of

capitalized interest need to be presented separately from other aspects of Investing Activities, a new line item under Investing Activities would address that concern.

On the issue of financial metrics, the Board's views remain as expressed in Order 59/18, including:

> *…that debt-to-equity is a questionable metric for a vertically integrated monopoly Crown utility with a debt guarantee from the provincial government. The equity level target does not have the prominence suggested by Manitoba Hydro given the context in which the Utility operates. The concern regarding the value of the equity level target is compounded when Manitoba Hydro is going through an unprecedented major investment period to more than double the value of its assets in the next four years. As noted by Manitoba Hydro's external consultant KPMG, there is a "practical recognition that this target will not be met during a period of large capital expenditures when newly constructed assets are placed in service. Accordingly, the 75/25 could remain the long-term objective." The Board supports this view…. As such, the Board is not prepared to look at the issue of pacing to achieve a particular equity level target at least until the current phase of major capital construction is completed, now projected by Manitoba Hydro to be in 2024.*

As for reserves, the Board remains of the view that:

> *Retained Earnings should be used to manage drought risk in combination with regulatory action by the Board. The Board further agrees that interest rate and export price risks over the long term should be addressed with rate increases as and when those risks materialize. Rates should not be set to increase Retained Earnings to manage those longer-term risks. As discussed elsewhere in this Order,*

the Board is prepared to consider regulatory action when required to address emerging risks facing Manitoba Hydro.

In its written rebuttal evidence and in oral testimony, Manitoba Hydro also referenced a report from a credit rating agency in support of its argument that the Utility faces financial risks in the test year. The Board reiterates its findings from Order 59/18 that, "while important, care must be taken to avoid placing too much weight on reports by credit rating agencies." The Board continues to accept that the assessment of the financial health of a utility by credit rating agencies and by capital markets are related, but are not the same thing.

Manitoba Hydro testified that the new MHEB is currently undertaking a comprehensive review of the Utility's operations, forecasts, and financial plans to enable it to establish, first, a new Corporate Strategic Plan and, second, a new long-term financial plan for Manitoba Hydro. Included in that review and planning process is consideration for meetings with stakeholders. The Board sees an opportunity for Manitoba Hydro to meet with regulatory stakeholders to further understandings of the financial reserves required for the Utility and to be considered in rate setting. As such, prior to the MHEB's development of a new Corporate Strategic Plan and long-term financial plan, there should be engagement by Manitoba Hydro with stakeholders and the Board.

In an effort to assist the MHEB, the Board repeats its views from Order 59/18 that:

there is merit to gaining better understanding of the financial reserves required for Manitoba Hydro under various circumstances. This would include consideration of risk tolerances, what risks should be protected by reserves, and the circumstances which would guide the need for more aggressive rate increases to continue full cost recovery for Manitoba Hydro. The Board is mindful that the financing and depreciation expenses related to these new major capital assets entering service already require additional revenues from rate increases. Consideration of the appropriate level of financial reserves,

for example a minimum retained earnings test, is best done through a collaborative approach with stakeholders.

The Board finds there is merit in a collaborative process as envisioned by the Board in Order 59/18. The Board directs Manitoba Hydro to participate in a technical conference hosted by Board staff or an external consultant appointed by the Board for the consideration of the use of rule-based regulation to provide guidance in the setting of consumer rates and of the question of the role and sufficiency of reserves in Manitoba Hydro's operations and the Board's rate regulation of the Utility. Board staff will invite Manitoba Hydro to a planning meeting to review and revise the draft scope of this technical conference before circulation for Intervener comments.

6.0 Revenue to Cost Coverage Ratios and Differentiated Rates

Manitoba Hydro's Cost of Service Study is used by the Board as a tool in setting rates. One of the outputs of the Cost of Service Study is the calculation of the total costs allocated to each customer class. The total allocated costs by customer class are compared against target class revenues, the ratio of which is called the Revenue to Cost Coverage ratio. If that ratio is less than unity (1.0) for a class, that means the revenue generated by the class is not sufficient to recover all the costs allocated and assigned to that class; conversely, if the ratio is greater than unity (1.0), then Manitoba Hydro is recovering more revenue from the class than its allocated and assigned costs.

Due to the inherent lack of precision in a Cost of Service Study, a zone of reasonableness is used to target the Revenue to Cost Coverage ratios of the customer classes. The Board has approved the use of a zone of reasonableness of 95-105% in assessing the Revenue to Cost Coverage ratios of Manitoba Hydro's customer classes. Revenues that are within this range are deemed to represent full cost recovery.

In Order 59/18, the Board directed the use of the Revenue to Cost Coverage ratio output of the Cost of Service Study to more closely align the revenues collected from each customer class with the costs of the electrical system that are caused by each class. Specifically, the Board approved different rate increases than the average overall rate increase for certain customer classes in order to begin to move the General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV customer classes into the zone of reasonableness. For the June 1, 2018 rate increase, the Board directed Manitoba Hydro to assume a 10-year timeframe to move all classes within the zone of reasonableness, with the rate increase impact of doing so shared across all customer classes either below or within the zone of reasonableness.

The Board also noted in Order 59/18 the expected effect of Bipole III entering service on the class Revenue to Cost Coverage ratios. As Bipole III is considered to be a Generation asset in the Cost of Service Study, the Revenue to Cost Coverage ratio of classes with a greater proportion of allocated Generation costs relative to their total costs automatically

decreases with the in-service of Bipole III, without any rate differentiation. As such, although the Board directed the beginning of implementation of differentiated rates in 2018/19, the Board also held that it would examine the Revenue to Cost Coverage ratios arising from the Prospective Cost of Service Study filed with the next GRA to consider the effect of Bipole III entering service.

Manitoba Hydro did not file a new Prospective Cost of Service Study with the current 2019/20 GRA. The Utility advises that, while it completed modifications to the cost allocation model to reflect most of the Board's directives from Order 59/18, a new Prospective Cost of Service Study will not be developed until after the MHEB approves a new IFF. Manitoba Hydro continues to study the Service Drop allocator and treatment of Common Costs and intends to have the review completed in time for the next Prospective Cost of Service Study.

In the Information Request process in the current GRA, Manitoba Hydro provided a high-level indication of the anticipated shift in functionalized costs and Revenue to Cost Coverage ratios in 2019/20 with Bipole III now in service, as well as the rate differentiation required to bring all classes within the zone of reasonableness if implemented over different time periods. The information filed by Manitoba Hydro reflects the asymmetrical increase in costs by function resulting from the incorporation of the Bipole III revenue requirement into the Cost of Service Study, as explained above. The result is that the Revenue to Cost Coverage ratios of the General Service Large class are significantly decreased, with the 30-100kV and >100kV sub-classes moving into the zone of reasonableness without any further rate differentiation. The Revenue to Cost Coverage ratio of the Area & Roadway Lighting customer class is significantly increased, from 100.3% to 118.7%.

This high-level illustrative Cost of Service Study output includes the modifications to the cost allocation model discussed above and embeds certain assumptions related to the treatment of Bipole III costs. The table below also assumes that the revenue shortfall that would result from the below-average rate changes for the General Service Small Non-

Demand and Area & Roadway Lighting customer classes would be recovered through additional rate increases above the requested 3.5% from customer classes below unity.

At June 1, 2018 Rates

	Initial RCC including BPIII	Annual Differentiation 1 Year	Annual Differentiation 5 Years	Annual Differentiation 9 Years	Final RCC
Residential	96.5%	2.00%	0.40%	0.22%	98.5%
First Nations On Reserve	93.1%	2.12%	0.42%	0.23%	95.1%
GSS ND	116.7%	-10.02%	-2.09%	-1.17%	105.0%

Manitoba Hydro's Position

Manitoba Hydro is seeking an across-the-board rate increase of 3.5%, to be applied to all components of all customer class rates, excepting the non-grid portion of the Diesel class rates. Manitoba Hydro advises that it intends to continue the migration of customer classes into the zone of reasonableness in its next GRA, based on the results of its next Prospective Cost of Service Study.

Manitoba Hydro says that most classes have moved to within the zone of reasonableness with the addition of the Bipole III revenue requirement to the Cost of Service Study, with only General Service Small Non-Demand and Area & Roadway Lighting above 105%. Manitoba Hydro notes that the expert witnesses for the Manitoba Industrial Power Users Group and the Consumers Coalition generally accept that any rate increase should be applied on an across-the-board basis, except for the Consumers Coalition's evidence that the General Service Small Non-Demand class should receive a less-than-average increase. Manitoba Hydro agrees that there is a strong likelihood that, due to the current Revenue to Cost Coverage ratio differential, the General Service Small Non-Demand class cannot be brought into the zone of reasonableness while maintaining the current

consolidated rate structure with the General Service Small Demand and General Service Medium classes. However, Manitoba Hydro argues that rate stability and price signaling support maintaining class consolidation, and therefore foregoing rate differentiation for the General Service Small Non-Demand class, in the near term until possible rate alternatives can be evaluated.

Although Manitoba Hydro does not support rate differentiation for the General Service Small Non-Demand customer class at this time, it acknowledges that it is likely possible to maintain the current rate structure and implement a lower-than-average rate increase for this class, depending on the level of differentiation.

Intervener Positions

The Consumers Coalition submits that any rate increase granted should be across-the-board to all rate classes, with the exception of the General Service Small Non-Demand customer class, which should receive a smaller-than-average rate increase. This Intervener argues that, as Manitoba Hydro did not prepare a new Prospective Cost of Service Study, key evidence is lacking to support any other rate differentiation. This Intervener also adopts the evidence of its expert witnesses and takes the position that the Area & Roadway Lighting customer class should receive any across-the-board rate increase ordered by the Board. This customer class benefits from how Demand Side Management costs are allocated following Cost of Service Study methodology changes directed in Order 164/16 and there is not enough information on the current record to support giving this class a lower–than-average rate increase at this time.

Should the Board direct further rate differentiation, the cost of any lower-than-average rate increase should, in the position of the Consumers Coalition, be borne by all classes within the zone of reasonableness as well as the Area & Roadway Lighting class. The Consumers Coalition also submits that the Board should direct Manitoba Hydro to prepare an updated Prospective Cost of Service Study for the next GRA and all subsequent GRAs.

The Manitoba Industrial Power Users Group submits that the granting of a rate increase should be on an across-the-board basis to all customer classes. The expert witness for this Intervener testified that the evidence filed in this GRA does not meet the evidentiary standard to award differentiated rates.

Board Findings

The Board finds that the approved 2.5% rate increase is to be applied to all customer class rates, except for the First Nations On-Reserve Residential customer class, the Diesel Zone Residential customer class, the General Service Small Non-Demand customer class, and the non-grid portion of the Diesel Zone rates. Other than these exceptions, which are discussed further below, the Panel finds that there is to be no rate differentiation between the classes. The evidentiary basis for further rate differentiation is lacking due to the fact that Manitoba Hydro did not file a new Prospective Cost of Service Study. As well, the Panel acknowledges that the addition of the Bipole III revenue requirement to the Cost of Service Study will likely move the majority of the classes within the zone of reasonableness without any further rate differentiation.

The Board directs Manitoba Hydro to prepare and file a new Prospective Cost of Service Study with the next GRA. The Board will examine the Revenue to Cost Coverage ratios arising from this Prospective Cost of Service Study and will consider adjustment to the differentiation of rates as necessary.

The Board directs Manitoba Hydro to adjust class revenue targets to continue the migration of the General Service Small Non-Demand customer class into the zone of reasonableness. Manitoba Hydro is to continue on the 10-year timeframe for class revenue to cost coverage ratio movement established by the Board in Order 59/18, such that the rate differentiation directed in this Order is on the basis of the General Service Small Non-Demand customer class moving within the zone of reasonableness in nine years from the 2019/20 test year.

The Board notes the evidence of Manitoba Hydro that the rate differentiation for the General Service Small-Non Demand customer class is possible, even with the continued class consolidation with the General Service Small Demand and harmonization of General Service Small rates with General Service Medium rates.

The Board directs Manitoba Hydro to adjust the rates for the General Service Small Demand and General Service Medium classes such that the class revenue targets are increased by 2.5%, consistent with the rate increase to the Residential, General Service Large, and Area & Roadway Lighting classes. The treatment of the General Service Small Demand and General Service Medium rates differs from those of the other classes because the General Service Small Non-Demand and Demand classes are consolidated and share the same tariff, which in turn is harmonized with the General Service Medium tariff.

The Board directs Manitoba Hydro to study and report at the next GRA on the issues associated with rate differentiation of the General Service Small-Non Demand customer class. This study is to include the intra-class impacts of any required rebalancing of customer, energy, and demand charges, whether consolidation of the General Service Small Non-Demand and General Service Small Demand tariffs remains appropriate, and whether harmonization of the General Service Small and General Service Medium rates remains appropriate. As part of this study, Manitoba Hydro is to consider class cost characteristics, load profiles, and bill frequencies of the General Service Small and General Service Medium classes that will provide the necessary information to evaluate rate design options. The Board recommends that Manitoba Hydro consider incorporating into this study the Utility's response to Order 59/18 Directive 28, which requires Manitoba Hydro to report on the rationale for the declining block rate design for General Service classes and an evaluation of the block thresholds and charges.

The Board finds that the rates for the Area & Roadway Lighting customer class are not to be further differentiated at this time. There is insufficient evidence on the record of this proceeding to support rate differentiation for this class at this time. The Board also

notes the evidence of the witness for the Consumers Coalition regarding the effect of the allocation of Demand Side Management costs being to potentially artificially move the class outside the zone of reasonableness.

7.0 Bill Affordability and First Nation On-Reserve Residential Rate

In Order 59/18 the Board set out its long-held concerns and the lengthy history with utility bill affordability issues, which will not be repeated in this Order. Beginning with Order 116/08, the Board has concluded that it has jurisdiction to order the implementation of a bill affordability program.

The majority of the Board in Order 59/18 directed Manitoba Hydro to establish a First Nations On-Reserve Residential customer class for existing First Nations. There was no rate increase for that class, such that the rate for that customer class was maintained at the August 1, 2017 approved Residential Rate. Manitoba Hydro was kept whole as the foregone revenues from the First Nations On-Reserve customer class had been factored into the level of the average general rate increase granted to all other customer classes.

As found by the Board in Order 59/18:

> *The creation of this customer class is justified by the need to address energy poverty on-reserve, supported by evidence that 96% of First Nations people on-reserve live in poverty and that reserves in Manitoba have the highest rates of child poverty in Canada. In addition, the poor housing stock on reserves in Manitoba and the fact that the vast majority of First Nations on-reserve residential customers (61 out of 63 First Nations communities) have no access to the more economical option of natural gas for heating exacerbate the issue of energy poverty. In his testimony, Manitoba Hydro's President and Chief Executive Officer described the housing conditions on First Nations reserves that he has visited as "abysmal". This results in residents on First Nations reserves having to use more energy to heat their homes. On average, First Nations on-reserve customers consume more energy than off-reserve residential customers, despite the efforts of Manitoba Hydro to use demand side management programming to improve energy efficiency for homes on reserves. Taken together, these factors*

lead to higher utility bills and a population of Manitobans that is disproportionately vulnerable to rate increases.

Manitoba Hydro's Position

Manitoba Hydro requests that the June 1, 2019 proposed 3.5% rate increase be applied to the First Nations On-Reserve Residential customer class, while preserving the rate differential that was directed in Order 59/18. Manitoba Hydro notes that it is seeking to overturn the Board's decision to direct the creation of the class at the Manitoba Court of Appeal. According to Manitoba Hydro, increasing the rate to this new class now will mitigate the potential hardship to the customers in the class in the event the Manitoba Court of Appeal accepts the Utility's position in striking down this customer class.

Intervener Positions

The Assembly of Manitoba Chiefs maintains that the evidence is uncontroverted that the customers in this new First Nations On-Reserve Residential class will be disproportionately and negatively affected by the rate increase proposed by Manitoba Hydro. This Intervener submits that the Utility has failed to justify any rate increase for this class and that for 2019/20 no rate increase should be approved for the First Nations On-Reserve Residential class.

The Assembly of Manitoba Chiefs filed expert evidence in this proceeding which reviewed Manitoba Hydro's 2017 Residential Energy Use Survey. While the data are primarily used by the Utility to develop its annual Load Forecast, the information collected also serves as a basis in designing programs and services to assist customers. This Intervener's witness excerpted several data sets to show that energy poverty is higher on First Nations reserves, average consumption is higher, and household income is much lower compared to Manitoba Hydro's residential base. At the last GRA, this witness reported that energy poverty appeared to be substantially higher on First Nations reserves than among the general population. The Assembly of Manitoba Chiefs says that the updated 2017 Residential Energy Use Survey data confirms that conclusion.

The Assembly of Manitoba Chiefs says that Manitoba Hydro was kept whole in Order 59/18 as other 1000 kWh per month customers of the Utility paid an additional $0.12 per month. Should a 0% rate increase be approved for this class in 2019/20, revenue neutrality for Manitoba Hydro would be maintained through 1000kWh per month customers paying an additional $0.09 per month.

This Intervener acknowledges that the appropriate differential or spread between the First Nations On-Reserve Residential rate and the rate for other Residential customers should be addressed at a full GRA with a proper evidentiary record, which is lacking in this proceeding.

Manitoba Keewatinowi Okimakanak submits that the rate freeze for the First Nations On-Reserve Residential class should be maintained pending the Court of Appeal process. This Intervener identifies options for addressing the foregone revenue including the diversion of water rental fees, allowing the revenue shortfall to fall to Manitoba Hydro's Net Income, or for the Board to factor in the cost into the average rate increase granted in the 2019/20 test year to all other customer classes. However, the preference of this Intervener is that other customer classes not make up the revenue shortfall through paying higher rates as this Intervener acknowledges that an additional rate increase on top of any rate increase approved by the Board could represent a hardship for some ratepayers.

Manitoba Keewatinowi Okimakanak also supports a process with a more robust evidentiary base and dialogue for the next GRA. In the position of this Intervener, this includes the need for Manitoba Hydro to engage with First Nations communities prior to the next GRA to provide notice of the Utility's rate plans, and to gain mutual understandings of interests, issues, and concerns. Manitoba Keewatinowi Okimakanak also maintains that the Provincial Government should divert a portion of the water rental fees to implement, support, and maintain a comprehensive government bill affordability program.

The Consumers Coalition submits that there is no cost of service basis to maintain the current First Nations On-Reserve Residential rates, meaning that this class's Revenue to Cost Coverage ratio is already below unity and outside of the zone of reasonableness used in assessing rates. While the monthly differential paid by other customers is small, some of those other customers may also be suffering similar affordability issues as those on-reserve customers. This Intervener maintains that the Provincial Government is best placed to address energy poverty through taxpayer funded programs.

Board Findings

The majority of the Board finds that it is neither just and reasonable nor in the public interest to approve any rate increase for the customers in the First Nations On-Reserve Residential class or for the customers in the Diesel Zone Residential class. The rates for these customers will remain at the rates approved effective August 1, 2017.

This First Nations On-Reserve Residential customer class and the related affordability measure of no rate increase for that customer class in 2019/20 are also consistent with the principle of reconciliation, the ongoing process of establishing and maintaining mutually respectful relationships between Indigenous and non-Indigenous peoples.

The Board agrees with the Interveners that submitted that the appropriate differential or spread between the First Nations On-Reserve Residential and Diesel Zone Residential customer class rates and the rate for other residential customers should be addressed at the next full GRA with a full evidentiary record.

The Board also agrees with the Consumers Coalition that the Provincial Government is best placed to address energy poverty through taxpayer funded programs. The Board reiterates its statements in Order 59/18 that the First Nations On-Reserve Residential customer class with a differentiated rate to address energy poverty on Manitoba reserves is an appropriate starting point for bill affordability in Manitoba. As the Board found in Order 59/18, it is a "modest first step in addressing bill affordability."

The Board continues to be of the view that there should be a broader bill affordability program to address energy poverty experienced by Manitoba ratepayers. However, due to administrative complexities and cost concerns, it is not feasible for Manitoba Hydro to implement a broader bill affordability program at this time. The Board acknowledges that this results in some obvious anomalies where one household on-reserve has a lower electricity rate than a nearby off-reserve household living in comparable circumstances. The Board reiterates its conclusion in Order 59/18 that these complexities and anomalies are best addressed by a more comprehensive government bill affordability program. With the introduction of a comprehensive government bill affordability program, the First Nations On-Reserve Residential customer class and lower rate built into the 2018/19 and 2019/20 years may no longer be required.

Dissenting Decision and Findings of Board Member Ring

As I did in Order 59/18 and Order 90/18, I accept that the Board has the jurisdiction to create a lower-income customer class such as the First Nations On-Reserve Residential class.

However, for my reasons as enunciated in Order 59/18, I also cannot agree with the majority's decision of a continued rate increase exemption in 2019/20 for a new customer class of First Nations On-Reserve Residential ratepayers. In brief, and beyond the issue of this being a matter outside of the role of this Board, the approach taken is still significantly under-inclusive. I agree with the Consumers Coalition that bill assistance targeted only at on-reserve First Nations customers excludes too many vulnerable consumers. First Nations customers on reserve are not the only ratepayers who experience energy poverty, nor are they the only ratepayers who have no choice but to heat with higher-cost options such as electricity as opposed to natural gas. There is a role for the Provincial Government as to the affordability of energy bills rather than the Utility or its regulator.

8.0 Regulatory Schedule and Compliance with Board Directives

From its initial letter of November 12, 2018 to its closing submissions, Manitoba Hydro has advised the Board that the MHEB is presently undertaking a review of the Utility's Strategic Plan, from which they will develop financial targets, rate strategies, and a long-term financial forecast. As part of that process, the MHEB will determine the financial targets for the Corporation, the pace at which those targets will be achieved, and any new strategies or undertakings that come out of the planning process or alter the direction of the company.

Manitoba Hydro has also advised the Board that it intends to file a complete GRA by late 2019. As communicated to the Board in the Utility's November 12, 2018 letter, the next GRA will include an Integrated Financial Forecast. In that GRA filing, Manitoba Hydro says that it will address the Board's directives from Order 59/18 not completed in time for the current GRA and deferred to the next GRA process.

As well as the general agreement among the parties as to the value brought to the rate-setting process from the filing of an IFF, as detailed below, the Board heard from some witnesses and parties that the regulatory process would be enhanced through Intervener involvement in reviewing Manitoba Hydro's compliance with Board directives.

Manitoba Hydro's Position

Manitoba Hydro advises that a more comprehensive and thorough review of the Board's prior directives that remain outstanding will occur at the next full GRA.

Manitoba Hydro does not support an Intervener request for direct involvement in clarifying the scope of a Board directive, suggesting alternative approaches, or assisting in determining the priority and timing of directives. The Utility maintains that only the Board can interpret the intent of its directives and whether the Utility has complied.

Manitoba Hydro does not accept the position of the Consumers Coalition that the Utility should conduct a review of its ratemaking principles. Rather, Manitoba Hydro says that

certain of its existing ratemaking principles may be given more weight or prominence depending on the specific circumstances of future applications.

Intervener Positions

The Consumers Coalition, the only Intervener to address this issue, suggests that there is a role for Intervener participation in reviewing compliance filings by the Utility. In the view of this Intervener, this is warranted as some directives are recommended by Interveners or have a particular effect on those customers represented by Interveners.

The Consumers Coalition also recommends Manitoba Hydro undertake a review, concurrent with its Board's overall review and strategic planning, of the rate design principles that the Utility wants to apply going forward. This Intervener cites the Board's comprehensive review of the Cost of Service Study Methodology in 2016 but says that a corresponding review of ratemaking principles should also occur.

Board Findings

The Board finds that there is to be no role for Interveners in the Board's consideration of the Utility's compliance filing. The Board agrees with Manitoba Hydro that the Board is best positioned to determine whether the Utility complied has complied with directives. Should an Intervener be aggrieved by any aspect of a compliance filing and Order, that party can seek to have the compliance Order reviewed and varied under The Public Utilities Board Act and the Board's Rules of Practice and Procedure.

The Board has initiated a process whereby prior directives and the status of those directives will be posted on the Board's website. Comments from the parties are always welcome.

The Board finds that additional information should be provided in the compliance filing to this and subsequent Orders. In the compliance filing, Manitoba Hydro is to update the test year financial forecast reflecting the directions in this Order. In the case of the current GRA, this means Manitoba Hydro is to file an updated projected 2019/20 budget.

Even without Manitoba Hydro having a current IFF, the Board agreed to consider a one-year rate application to determine whether rate increases in 2019/20 are in the public interest. The Board appreciates that the MHEB is currently involved in a detailed and lengthy review that is to provide direction to the Utility to incorporate into its next IFF. This Order provides directives designed to assist in the MHEB's review and planning process before it finalizes its review.

As well, as set out above, the Board directs that Manitoba Hydro's next GRA, expected to be filed in late 2019, is to be filed with an IFF or other long-term financial forecast. The Board notes the unusual nature of this proceeding and, while due to the ongoing review and planning process by the new MHEB, emphasizes the importance of a regular regulatory schedule and complete regulatory filings. While it will not be a directive of this Board in this Order, regular review and consideration of ratemaking principles should be part of routine utility planning, especially when the majority of a utility's revenues come from consumer rates set by the regulator. This topic may be further explored when the Board reviews prior directives at the next GRA.

9.0 IT IS THEREFORE ORDERED THAT:

1. Manitoba Hydro's Application for a 3.5% across-the-board rate increase effective June 1, 2019 **BE AND HEREBY IS DENIED** as filed.

2. A 2.5% rate increase to the Residential, General Service Small-Demand, General Service Medium, General Service Large, and Area & Roadway Lighting customer classes and to the grid portion of the Diesel Zone General Service rates effective June 1, 2019, with all revenues generated being placed into a Major Capital Deferral Account **BE AND HEREBY IS APPROVED**.

3. A 2.5% rate increase to the revenue target of the General Service Small Non-Demand class **BE AND HEREBY IS APPROVED,** altered as follows: Manitoba Hydro is to implement differentiated rates to continue to move the Revenue to Cost Coverage ratio of the General Service Small Non-Demand customer class into the zone of reasonableness, assuming a 9-year timeframe to move the class within the zone of reasonableness.

4. There shall be no rate increase to the components of the First Nations On-Reserve Residential customer class and Diesel Zone Residential class rates**.**

5. Manitoba Hydro recalculate and file, for Board approval, a schedule of rates reflecting the rate increases and rate differentiation approved in this Order effective June 1, 2019, together with all supporting schedules including proof of revenue, customer impacts, and test year revenue requirement. The compliance filing shall be provided in a timely fashion to allow the Board no less than two business days to review and approve consumer rates effective June 1, 2019.

6. Manitoba Hydro file with the next GRA an explanation of the cost and revenue implications of the advancement in the Keeyask construction schedule from an in-service date of August 2021.

7. Manitoba Hydro file with its next GRA filing an Integrated Financial Forecast or other long-term financial forecast in a form consistent with an Integrated Financial Forecast.

8. Manitoba Hydro develop and file with the next GRA a detailed Operating & Administrative expense budget. That detailed budget is to include the 2019/20 year, as well as any years for which Manitoba Hydro seeks a rate increase together with comparison of year-over-year dollar and percentage increases for the last five years.

9. Manitoba Hydro participate in a technical conference hosted by Board staff or an external consultant appointed by the Board for the consideration of the use of rule-based regulation to provide guidance in the setting of consumer rates and of the question of the role and sufficiency of reserves in Manitoba Hydro's operations and the Board's rate regulation of the Utility.

10. Manitoba Hydro study and report at the next GRA on the issues associated with rate differentiation of the General Service Small Non-Demand customer class, including the intra-class impacts of any required rebalancing of customer, energy, and demand charges, whether class consolidation and harmonization with General Service Small Demand and General Service medium classes should continue, and class cost characteristics, load profiles, and bill frequencies.

11. Manitoba Hydro prepare and file a new Prospective Cost of Service Study with the next GRA.

Board decisions may be appealed in accordance with the provisions of Section 58 of *The Public Utilities Board Act*, or reviewed in accordance with Section 36 of the Board's Rules of Practice and Procedure. The Board's Rules may be viewed on the Board's website at www.pub.gov.mb.ca.

Shocking exclusion

BIPOLE III AND UNNECESSARY $300-MILLION COST SHOULD BE PART OF REVIEW

By: Art Derry
Posted: **05/25/2013 1:00 AM**

OPINION

In April, the Manitoba government announced Manitoba Hydro's controversial plans to build two generating stations for export purposes would be tested in an independent public analysis, called a "need for and alternatives to" review. But one of the most contentious items in the capital plans -- the construction of the Bipole III transmission line -- will not be scrutinized. Manitoba Hydro says that while Bipole III will eventually carry electricity from the new generators, it is first needed for reliability of domestic supply. Therefore, it is not subject to review.

I disagree. I think the timing of construction of the new transmission line shows it is being built for export purposes, and it should be part of the "needs for" review.

i

The Bipole III Coalition, a group of people concerned about Hydro's decision to route the new transmission line on the west side of the province, has provided evidence that Bipole III can be delayed for many years if it is being built only for domestic purposes.

The distinction -- for export or domestic purposes -- is important, because of the costs involved and who will be paying them.

Delaying Bipole III's in-service date will save $300 million a year in servicing costs for each year of delay. That's $300 million a year of ratepayers' money.

Manitoba Hydro's "reliability" claim is this: The Crown utility transmits power from northern dams via two transmission lines, both running in the same corridor through the Interlake. That creates real risk in the event

Bipole I and Bipole II.

both lines go down, as happened in the downburst windstorm of September 1996. Further, both lines connect with the Dorsey converter station and then to lines for distribution to Hydro users. In January 2011, a portion of the Dorsey switchyard was knocked out of service. These are the only two significant outages suffered on the HVDC transmission system over the last 40 years.

The cost of the windstorm in 1996 in lost power was estimated by Hydro at $11.1 million. The cost of the 2011 outage was estimated at $6.6 million.

Building Bipole III as a "reliability initiative" is akin to paying $300 million a year in insurance premiums.

Manitoba Hydro says that to protect the power supply, it needs to build Bipole III by 2017. It plans to run the line down the west side of Manitoba and then connect it to a new converter station at Riel, east of Winnipeg. It is a $3.3-billion project. Compare just its servicing costs to the outage-costs experience and you see why Hydro's plans are being questioned in light of the fact there is an alternative, much cheaper option.

In hearings before the Clean Environment Commission in March, the Bipole III Coalition provided evidence that it was economic to instead relocate a new converter station for Bipole II at Riel and then delay the construction of Bipole III to 2025 and connect it to a converter station near LaVerendrye, southwest of Winnipeg.

This proposal is technically sound, cost-effective and provides a reliable system out to 2050.

This option holds significant savings for ratepayers.

First, it saves ratepayers the $300 million in annual servicing costs. (To put this annual cost into perspective, the $300-million annual servicing cost is greater than the projected revenue of $277 million from export sales to the U.S. in 2013-14.)

Also, connecting Bipole III at LaVerendrye, west of Winnipeg, makes more sense because Manitoba Hydro's plan would require running the western line south of Winnipeg and then northeast to the station.

The coalition believes this is a lot of expense for no good reason.

For domestic purposes alone, a new transmission line will not be needed until 2025.

The coalition's alternative plan would involve relocating the terminus of Bipole II (which requires complete refurbishment if it remains at Dorsey) to the planned Riel station. At a cost of $1.2 billion, this is one-third Bipole III's $3.3-billion tab. This provides reliability, reducing the potential loss at Dorsey to only 1,800 megawatts of converter capability rather than the current 3,800 MW. And it provides reliability out to 2025, when Bipole III should come into service.

The coalition's plan would see a total of three separate converter locations on the periphery of Winnipeg. Much more reliable.

It's a reasonable, cost-effective alternative. So why is Manitoba Hydro pushing for construction of Bipole III by 2017?

One can only assume that what Manitoba Hydro doesn't want to say is that it wants Bipole III built by 2017 so it can finalize contracts with export customers in the U.S., expected to start in 2019, and to avoid the scrutiny of the new line under the "need for and alternatives to" review.

But this means Manitoba ratepayers will subsidize transmission costs that should be borne by export customers.

And what are those costs? A recent Public Utilities Board order in April allowed Manitoba Hydro to raise rates by 3.5 per cent. It required that 1.5 per cent, or $20.6 million this year, of the hike be placed in a deferral account. This deferral account will be used to mitigate the rate increases that will be needed when Bipole III is placed in service. That 1.5 per cent each year will amount to only $112 million by 2017-18. That covers only 37 per cent of the $300 million per year that will have to be added to revenue -- and the rates -- to pay for the Bipole III project.

To make up the remaining $188 million shortfall in 2018, Manitoba Hydro consumers can anticipate another 12 per cent increase above the 3.95 per cent already projected for that year. Even with the deferral account in place, the implication is a rate increase of almost 16 per cent when Bipole III comes into service.

To make certain that Manitoba Hydro's proposed decade of major investment is economic, and technically sound, the Bipole III project should be part of the upcoming

"need for and alternatives to" analysis.

This is especially important given the provincial government's decision that the Bipole III line must be built on the province's west side rather than the east at an additional cost of $1 billion to Manitoba power customers.

Let's get it right -- include Bipole III in the review.

Art Derry is retired vice-president business development Manitoba Hydro.

He participated in the first 500 MW sale to Northern States Power (1992) and the economic justification which then resulted in the restart of construction of the Limestone generating plant in the mid-1980s.

Environmental Assessment Studies (https://keeyask.com/project-timeline/environment-assessment-process/activites/environmental-assessment-studies/)
Keeyask Cree Nations

The Keeyask Infrastructure Project (KIP) was reviewed and approved by the appropriate federal and provincial authorities. Construction commenced in early 2012 and was completed in July 2014.

Directly negotiated construction contracts for KIP were awarded to Amisk Construction, a Joint Venture partnership comprised of the Cree Nation Partners and Sigfusson Northern Ltd. Work on KIP began in early 2012 when regulatory approvals were received. Amisk Construction was responsible for the construction of:

- the North Access Road which provides access from PR280 to Gull Rapids
- Looking Back Creek Bridge which is required to cross the creek at km 18.5
- the temporary 125 person start-up camp located near the junction of PR280 and the North Access Road

- work areas

In addition to the infrastructure required to construct the Keeyask Generating Station, service contracts were negotiated with the four Keeyask Cree Nations and included: catering & janitorial, emergency medical & ambulance services, camp maintenance & operations, security, and employee retention & support.

Keeyask Infrastructure Project Monitoring Overview (http://keeyask.com/wp-content/uploads/2014/04/MB-Hydro_KIP-Monitoring-Overview_WEB.pdf)

MAIN CAMP

The initial phase of the main camp will house approximately 500 workers. The camp will later be expanded to house 2000 workers and will remain operational until the completion of the Keeyask Generating Station.

ADDITIONAL WORK

Clearing of 31 hectares near the future site of the Keeyask Generating Station was completed. This work involved clearing access roads to borrow material, borrow material areas and work areas required to construct cofferdams for the generating station. The work was conducted over the winter to avoid disturbances to the migratory birds that may nest in the area over the summer.

Amisk sourced approximately 26,000 m^3 of rock to be used by the General Civil Contractor for cofferdam construction. This rock was sourced from Work Area A which is inside the KIP footprint.

KIP ENVIRONMENTAL MONITORING

Ongoing monitoring for KIP occurred consistent with licensing and regulatory approvals. Key components of the program

6	Manitoba Hydro to split out how much of the project cost has been spent regarding Metis involvement	263

--- Upon commencing at 9:03 a.m.

THE CHAIRPERSON: Good morning, ladies and gentlemen, bonjour. Welcome to the first day of the oral evidentiary portion of the Public Utilities Board's hearing with respect to a review of the Needs For and Alternatives To Manitoba Hydro's Preferred Development Plan.

Manitoba Hydro's Preferred Development Plan includes the Keeyask and the Conawapa genera -- generating stations, as well as the several -- as well as several export agreements, together with associated transmission, both in Manitoba and the United States.

You will hear repeatedly the acronym 'NFAT' used to describe the -- this public hearing, 'NFAT' being an abb -- an abbreviation for 'Needs For and Alternatives To'. While today is the first day of the oral evidence, today is not the first day of the process implemented by the Public Utilities Board to consider this NFAT. Let me expand on that comment for the benefit of those who have not been actively involved in the NFAT process.

On January 13th, 2011, the Government of Manitoba notified Manitoba Hydro of the government's intention to carry out a public NFAT review of Manitoba

Hydro's proposed Preferred Development Plan. On November 15th, 2012, the Minister of Innovation, Energy, and Mines announced that the Government of Manitoba had asked the PUB to conduct this NFAT.

On April 25th, 2013, the PUB received terms of reference from the Province of Manitoba for the conduct of the NFAT. On April 25th, 2013, the Board also released its public notice inviting Intervenors and the public to participate in the process. A reminder public notice was also issued on January 27, 2014, advising the public of the hearing and seeking further public participation.

On August 16th, 2013, Manitoba Hydro filed its NFAT business case and supporting materials. Those materials are available on the Board's website, as are other NFAT-related documents. Since August 16th, 2013, the PUB has established a procedure for conducting the NFAT. That procedure included approving five (5) Intervenors and eight (8) independent expert consultants to assist the Board in its review.

There have been thousands of written questions posed in respect of the written evidence that has been filed. Manitoba Hydro has responded to many -- to as many of the written questions as its resources permitted. Likewise, the Intervenors and the

independent consultants have also responded to written requests. Most of this information is available to the public through the PUB's NFAT website, as well as an NFAT website maintained by Manitoba Hydro.

There is, however, some information that has been deemed commercially -- commercially sensitive. For example, you will note that several of the reports filed by the independent expert consultants contain redactions of commercially sensitive information.

That leads us to today as we begin the oral evidentiary phase of the NFAT hearing. We're going to hear from Manitoba Hydro's witnesses over the next four (4) weeks, followed by three (3) weeks of testimony by the independent expert consultants in April, and then another three (3) weeks of Intervenors' expert witnesses. The Board hear -- the Board expects to hear closing submissions from the parties in May. The government has requested a report from the Board by June 20th, 2014.

With that brief background, let me turn to introductions, starting with my colleagues on this NFAT hearing panel. I'm pleased to be joined by Marilyn Kapitany, to my extreme right; Larry Soldier, to my extreme left; Rick Bel, on my -- my immediate right; and Dr. Hugh Grant on my immediate left.

I just wanted to notify that sing -- I just wanted to notify that we have a couple of visitors, Board members from the PUB sitting at the back: Ms. Karen Botte, who is the vice Chair, and Ms. Anita Neville, who are attending today. Also assisting the Board are its executive director Hollis Singh; the associate Board secretary Kurt Simonsen; the project manager Josee Lemoine, assisted by Nikita McCray (phonetic); and regulatory assistants Nancy-Anne Cribbs and Diana Villegas.

The Board is also assisted by its technical and ledal -- and legal advisors, who I'll ask the Board counsel, Mr. Peters, to introduce in a few minutes.

Members of the public unable to be at the hearing can following this hearing by reading daily transcripts that will be published on the NFAT website. The Board's mandate set out in the terms of reference were issued by the government by way of its order in council. I have asked that paper pop -- paper copies of the terms of reference be made available at the back of the hearing room. They are also available on the PUB website.

The terms of reference request a report to be provided no later than June 20th, 2014. The

report is to include recommendations to the Government of Manitoba on the needs for Manitoba Hydro's Preferred Development Plan and an overall assessment as to whether or not that plan is in the best long-term interest of the Province of Manitoba when compared to other options and alternatives.

The terms of reference set out further details as to the items that this Board will address. And for those of you who have not reviewed them, please take a copy or review the document online.

The public has been invited to provide input and comment on Manitoba Hydro's plan. Several citizens and organizations have submitted written presentations to the Board, and copies of all of those are available on the Board's website.

Additionally, the Board has heard from presenters on February 27th, 2014, when they appeared in this room to make oral presentations to the Board. We thank all of them for their comments. Should the Board receive additional requests from citizens and organizations to appear and make oral presentations, we plan to schedule those presentations at mutually available times during the hearing days.

Both the written and oral presentations will be transcribed onto the transcript record of this

proceeding and will be available on the Board's website.

At this time I'll ask the Board counsel, M. Peters, to provide his opening comments, as well as introductions and an indication of the proceeding for today. M. Peters...?

MR. BOB PETERS: Thank you, and good morning, Mr. Chairman. Good morning Board member Kapitany, Board member Soldier, Board member Bel, and Board member Dr. Grant. Good morning, ladies and gentlemen.

For the record, my name is Bob Peters. And together with my colleague, Sven Hombach, seated to my far left, we appear today as legal counsel to the Public Utilities Boards NFAT Review Panel. The Board is also assisted by its engineer advisor Larry Buhr, of LAB Consulting, on my right, and by Roger Cathcart, of Cathcart Advisors, who is the accounting advisor to the Board seated on my left; and also assisted by Margaret Smith seated across the room.

As the Chairman has indicated, today the Public Utilities Board begins a hearing that will span the months of March, April, and May of 2014. Today the Board will hear from Manitoba Hydro's president and chief executive officer Mr. Scott Thomson in the

morning. The late afternoon is reserved for introductory comments by Mr. Ed Wojczynski, also of Manitoba Hydro. And over the next four (4) weeks you will hear from four (4) different Manitoba Hydro panels of witnesses.

There is a timetable that, with the input and cooperation of all parties, has been prepared and circulated. Extra copies are at the back of the hearing room, as well as being available on the Board's website. Both the order of witnesses and witness panels, as well as the order of cross-examinations, are set out on the timetable.

Following Manitoba Hydro's witness panels, there will be the eight (8) independent expert consultants that have been engaged pursuant to the terms of reference to assist the Board. Following the independent expert consultants, there will be approximately twenty (20) witnesses on behalf of the five (5) Intervenors in this proceedings. And additionally scheduled by the Intervenors, there is one (1) panel of ratepayers, and also one (1) panel of First Nations Elders.

Mr. Chairman, Board members, ladies and gentleman, there is one (1) new procedural note that the Chairman made mention of that must be raised. And

that relates to commercially sensitive information, or the acronym as we've given it, CSI.

The terms of reference direct the Board panel to conduct the NFAT in a transparent and public process. The terms of reference also require the PUB panel to ensure there is adequate protection of any information the disclosure of which may reasonably be expected to cause undue financial loss to Manitoba Hydro or any of its contractual counterparties, or harm significantly Hydro's, its contractual counterparties', or domestic customers' competitive positions.

So to balance those objectives in terms -- that are in the terms of reference, some information filed by Manitoba Hydro and the independent expert consultants has only been filed in confidence with the Board and those persons who have signed non-disclosure agreements. Those CSI documents are not on the public record.

When it comes time to ask questions of Manitoba Hydro and the independent expert consultants on that commercially sensitive information, the Board will invoke an in-camera session, where only persons -- the only persons permitted to stay in the hearing room and to see the documents and to listen to the questions and answers are those people who have signed the non-

disclosure agreements.

The timetable that was up on the computer screens moments ago has included in-camera sessions for Manitoba Hydro's witness panels as well as the independent expert consultants. You see that the CSI sessions generally follow immediately after the public sessions for any given panel or for any given witness.

Now, this morning, Mr. Chairman, following my comments, I suggest you call on the Intervenors and the IECs for their opening comments through their legal counsel. After hearing from the Intervenors and IEC counsel, I suggest the Board call on counsel for Manitoba Hydro for any opening comments and introductions.

Now, in terms of Intervenors, the Board will hear from the Consumers' Association of Canada (Manitoba) Inc., often referred to as CAC, and they will hear through its counsel, Mr. Williams and Ms. Menzies, seated across the room.

The Green Action Centre, or GAC, is represented by its counsel, Mr. Gange, who I saw here today with Dr. Miller.

I also see that Manitoba Industrial Power Users Group will be represented through its

counsel, Mr. Antoine Hacault, seated at the front row, together with his consultant, Mr. Bowman.

Manitoba Keewatinowi Okimakanak, or abbreviated with permission as MKO, will be represented through its newly minted counsel, Mr. George Orle. And we welcome him to the hearing room. He is seated across the room beside Mr. Michael Anderson.

The Manitoba Metis Federation is present today and represented through its counsel, Ms. Jessica Saunders, who will appear as well as with her colleague, Mr. Marks.

The independent legal counsel for the eight (8) independent expert consultants is Mr. Christian Monnin and Mr. Michael Weinstein. They are across the room also, and they too should be offered an opportunity for any opening remarks this morning.

And for those who are regularly in the Board hearing, I would be remiss if I did not mention the technology that will assist the panel and the parties in this NFAT. With the able assistance of Ms. Cribbs and Ms. Villegas, documents and exhibits are to be converted to searchable PDFs with bookmarks and emailed to the Board, complete with the intended exhibit number that they be given.

Those exhibits will be added to the

electronic exhibit list and be available to be shown on the monitors on request of counsel. Anyone with questions about this procedure should see Ms. Cribbs or Ms. Villegas or, alternatively, Ms. Lemoine, project manager for the NFAT.

The electronic technology in the hearing room is intended to make it easy for all parties to view the written evidence being discussed. Accordingly, we ask that if a party is examining on or providing testimony with respect to a specific document, counsel clearly state which document they are referring to, perhaps by exhibit number, so it can be put up on the screen.

Counsel are also welcome to file paper books of documents, but we would ask all parties that any documents filed with the Board also be provided the day before they are intended to be used as searchable PDFs so they can be uploaded.

Mr. Chairman and Board members, the evidence of the witnesses is to assist the panel. And so if at any time a question is asked or a question is answered such that any of you want clarification, you are invited to please interrupt and seek clarification. All parties recognize the importance of your questions.

And, panel members, should there be

technology issues or glitches, we will request your patience as we work through them. I will indicate that the exhibit list is now electronic, and is on the Board's website to be updated daily.

The Board itself keeps a hyperlinked version, so persons in the hearing room can follow along with those of us seeing the documents on the monitors. If anyone should wish to have access to the hyperlinked version, the Board should be able to provide you with a copy with the proviso that the list will likely be updated in real time and on a daily basis. So as such, it will change.

Mr. Chairman, Board members, lastly, the outline of procedures, as we have gotten to know over the years, is now contained on the timetable document that has been circulated. The planned witness panels and cross-examinations are mapped out on the -- on the timetable by date and by party.

And so, Mr. Chairman, in your opening remarks you asked about the plans for today. And as a reminder, following my comments, each Intervenor and IEC counsel should have a brief opportunity for opening remarks before Manitoba Hydro is called on for its opening comments and introductions. As I indicated, we expect Manitoba Hydro will introduce its president and

CEO, who has his own opening comments and is available to answer questions from the parties today.

Later today, and following Manitoba Hydro's president's testimony, we expect Manitoba Hydro will introduce Mr. Wojczynski, who will map out Manitoba Hydro's plans for presenting its evidence to the Board. Mr. Wojczynski will not be cross-examined immediately following his remarks, but I understand he'll be available on other Manitoba Hydro panel -- witness panels and available to address questions on the subject matter of those other panels that he may speak to in his comments today.

Starting tomorrow, Manitoba Hydro plans to introduce its first witness panel to address issues of load forecasting and demand-side management. And with that, Mr. Chairman, and subject to any questions you may have for me, I suggest you call on the Intervenors, starting with the Consumers' Association of Canada (Manitoba)'s legal counsel, Mr. Williams. Thank you.

THE CHAIRPERSON: Bonjour, M. Williams. How are you today?

OPENING COMMENTS BY CAC (MANITOBA):

MR. BYRON WILLIAMS: Good morning, Mr.

Chair. And we're going to have some technical glitches right off the bat. I'm doing quite well. I'm a little traumatized with the new technology, but my colleague, Ms. Menzies -- we're just -- we have a PowerPoint and we're just seeing how well it's going to work. It worked well in practice.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: It's actually a -- a rhetorical technique to raise the tension as you wait for the PowerPoint to appear. There we go. Good morning, members of the panel. And, for the court reporter, is the sound okay? Okay. Mr. Peters did an outstanding job of introducing persons in the room. He -- he missed my client, Ms. Desorcy, who's hiding around the corner, and I'm not sure if all of the panel members can -- can see her. But I want to assure you, she is here looking very carefully over my shoulders.

And one of the unique terms of my retainer with CAC (Manitoba) is that as a former -- a son of a -- a family farmer who grew up on a farm, I always have to be able to make one (1) farm reference in the course of a hearing. And our client's presentation, not made in jest, is titled:

"Betting the Farm on Keeyask and Conawapa: Risk and Affordability In an Era of Uncertainty."

And it's nice to see Mr. Wojczynski here, because it was almost ten (10) years ago to the day that we sat in a larger room at the Convention Centre and we started the NFAT related to Wuskwatim. And things seemed so easy then. Manitoba Hydro was about to embark upon a bold new adventure with its partner from the Nisichawayasihk Cree. And we were confident that Hydro would manage its costs and, with its partner, would reap the rewards of the lucrative opportunities in the export market.

With the benefit of hindsight, we were all seized with a collective hubris that Hydro could master both its own costs and the intrinsic challenges of a dynamic marketplace. And when you look at this page of the PowerPoint, you can see that confidence reflected in the -- in this transcript from day 1 of the hearing.

We were told it was a relatively low-risk pra -- project, with the economics being very robes -- robust with respect to risk factors. And we were told, Don't worry about what happens when we have the high export prices. Even with the low range of

export prices for -- forecast, we've still got a good project.

So easy it seemed back then. And even four (4) years ago, we were at another general rate application, the 2011/12 General Rate Application, and we were told then we'd have a bit of a bump, that the -- that this decade, the '10s, would be the decade of investment. We'd make some significant investments and there'd be a little price cost, annual rate increases, less than 3 percent but above the rate of inflation.

But in return for that decade of investment, there would be the 2020s, the decade of returns, a magical decrease in our debt/equity ratio, price stability, and rapidly increasing equity. And you can see there the suggestion that this would be acco -- accomplished with domestic rate increases closely aligned with projected rates of inflation.

Oh, for the wist -- wistful year -- days of yesteryear as we take stock in the barrage of bad news from Wuskwatim and the prospect of rate increases double the rate of inflation, not just for this decade but for the next.

And that bitter experience raises the most basic but the most fundamental of questions: We're all sure that Manitoba Hydro, like all of us, has

learned something. But is the analysis of Manitoba Hydro in this proceeding credible?

And if one looks at the record to date and focussing on key issues such as export revenues, load forecast, and the analysis of alternatives, CAC (Manitoba) is not the only voice in this room raising concerns, fundamental concerns, about Manitoba Hydro's analytic credibility.

This is of significant concern because we're not -- we're now talking about the future, and a future that in our client's view is a future with unprecedented risks, and to a large degree risks in the American marketplace driven by three (3) major uncertainties.

One is what going to happen with long-run environmental policies, with carbon tax being the most important perhaps of them, but other related to coal retirement and transmission expansion.

Another significant uncertainty relates to the really quite dramatic changes in low-carbon technologies, the evolution or in some cases the revolution in terms of wind and solar, in terms of their costs, especially in the case of solar.

And another uncertainty, another great uncertainty, relates to the long-run price effects of

unconventional gas development, shale gas. And these factors affect -- certainly they're all in play when we look at the significant amount of revenues that Hydro still has to gain from the spot market, but also certainly the shale gas issues we expect will affect the firm contracts as well.

This uncertainty, unpredictability, is flamboyantly captured in the first bullet on this page by Binz et al. They describe the changes underway in the 21st Century electric power sector as creating a level and complexity of risk that is perhaps unprecedented in the industry's history.

More prosaically, the Brattle Group, Hydro's consultant, says, The future seems even more uncertain than usu -- usual. And so coupled with this period of unprecedented uncertainty is an evolving concern that Manitoba Hydro is still playing a bit of catch-up when it comes to assessing its resource development options. And certainly from my client's perspective, the absence of treating demand-side management energy efficiency as a legitimate resource option in the business case is a very notable example.

And this issue of catch-up is well reflected in the analysis of La Capra Associates who conclude, and this is on -- the third bullet on this

page, that:

"Hydro's review of the alternative development plans has several shortcomings, including an -- including an overly narrow range of potential development plans and the use of un -- outdated or inappropriate generation cost assumptions."

So this leads to two (2) critical questions:

1. Is the Hydro plan a robust approach to integrated resource planning, or is it an artifact from a more simple time?

And second: Is Hydro's analysis skewed against certain alternatives?

These issues might be less critical for consumers if Hydro did not enjoy a monopoly in the retail sale of power in this province, or if it was a shareholder-owned utility with shareholders prepared to bear the brunt of much of the risk. But the reality is is that Manitoba Hydro has entered an era of unprecedented uncertainty and investing a very significant sum of money with ratepayers as a primary financial backup.

And CAC (Manitoba) does not appear to be alone in that concern either. And you look at this very pointed commentary by Morrison Park, they talk about Hydro taking substantial market risks based on expectations or bets about the future. And noting that while probabilities have been placed on different potential futures, fundamental market risks are necessarily embedded in some resource plans to a far greater extent than in others, with the ultimate degree in the preferred plan; certainly in our client's view.

Morrison Park goes on to say that prices will either turn out to be high and ratepayers will benefit, or they will turn out to be low and ratepayers will have to shoulder more of that burden. Either way, ratepayers can have no certainty in advance, and no choice in the matter.

This leads to four (4) additional questions of our client: Is the gamble of this magnitude in the export market too risky? Are the risks imposed on ratepayers by Manitoba Hydro appropriate? Are risks appropriately shared between Hydro -- excuse me, between ratepayers and the province, or is there an inequitable share of risks with too much being shouldered by ratepayers? Finally, are there less risky alternatives?

And again, our client expresses its regret that the business plan of Manitoba Hydro when filed in August did not integrate DSM or energy efficiency as a supply option.

We probably don't talk about the principles of sustainable development enough in these proceedings before the Public Utilities Board. The Principle 4 is a critically important one. And it warns us that we should take caution. We should have particular care, careful regard to decisions whose impacts are not entirely certain, but which on reasonable and well-informed grounds appears to pose -- appear to pose serious threats to the economy, the environment, human health, and social well-being.

And we've already talked about some of that economic and financial uncertainty, but it's also important to realize that there is a -- some environmental betting going on unde -- and underlaying the Hydro plan. We all know the importance of reducing greenhouse gasses, ut the reality is that -- that the Nelson River watershed, an already profoundly disturbed watershed, fashe -- faces significant uncertainties and risks related to the Hydro plan.

And you see here the insight of Meyers Norris Penny, the independent consultants retained by

the Board. Flagging the uncertainty related to caribou, both migratory caribou and the SARA's protected summer-resident caribou. We see the uncertainty flagged by Mias -- Meyer (sic) Norris and Per -- Penny relating to late sturgeon populations, and to -- they're telling us it's difficult to ascertain whether the strategies proposed by Hydro will be sufficient.

And then we see the commentary by Dr. Joe Gunn, one (1) of the foremost experts on environmental assessment in -- in our country, saying -- not suggesting for sure, but just saying, If this region and its people are already at a breaking point, there's a profound risk in terms of future development. Powerful wards -- words of warning.

And it's perhaps for this reason that after issuing the terms of reference for the Public Utilities Board, that the Province of Manitoba initiated a cumulative regional assess process for the Nelson River watershed. But it seems extremely unlikely that this panel will have the benefit of that process, that review process, in making its determinations. So it leaves us with a critical -- critical macro-environmental question: Can the Nelson River sustain further hydro development?

On the next page, I -- I haven't set out the principles, relevant principles of sustainable development, but it certainly is number 2, which talks about managing the economy, the environment, human health, and social well-being for the equal benefit of present and future generations. And if we think back just to four (4) years ago, to the decade of development and the decade of returns, obviously there was going to be some -- some pain for consumers in the decade of development, but quickly repaid. That's very different from the current Hydro plan, because under the Hydro plan it appears that today's ratepayers are being asked to pay a very steep price for very uncertain returns in the far-distant future. And that point was succinctly made by Dr. Roger Higgins, an expert retained by the Consumers' Association and a former Board member of the Ontario Energy Board. He succinctly, simply says, The ratepayer impacts are not acceptable. More eloquently, the witnesses on behalf of the MKO have spoken about how, without mitigation, the Preferred Development Plan will put pressure on fixed and low-income First Nation customers.

Our client is deeply concerned about the implications of this plan for all ratepayers, whether working families struggling to pay the bills week to

week, or the most vulnerable consumers. And that concern about affordability frankly relates to all the alternatives presented by Manitoba Hydro, and our client is asking, Are any of these plans affordable?

Members of the panel, over the last months our client has been engaged in an extensive series of focus groups, advisor group meetings, and also doing a fair bit of interviewing of -- of individuals in this province. And our client has been quite struck by a sense of inevitability around Manitoba Hydro's plans and about the decision-making process. Whether fairly or not, in both the interviews conducted by our researchers and the input from our advisory group, we have detected a strong sense of fatalism with regard to the Hydro plan, a sense that Hydro occupies a preeminent role in public discourse in this province, and that the outcome of the decision-making process is inevitable.

Our client does not subscribe to this view, and it is truly appreciative of the opportunity to engage with the Public Utility Board in the recommendation process. But it does wish to highlight what it considers to be some significant concerns with this process. The first is that there never was an NFAT for Bipole III, and so the costs with Bipole III

are treated equally in terms of all those plans. We see that similarly with the sump costs; a lot of sump costs, already in Keeyask and Conawapa, being treated equally against all plans, which certainly, in our client's view, skews the playing field against the alternatives.

My Friend Mr. Peters talked about CSI -- which someone should maybe make a movie with that name, maybe a TV show -- and our client is extremely frustrated with the amount of black highlighting currently in a number of the reports from the independent experts. We know that there is a -- a welcome decision by the Board, just on Friday, in terms of providing more access to that information. But it -- it's -- it has reaped a profound disadvantage on our clients because it -- it's getting pretty late in the -- in the day to be accessing that information. And our client would be remiss if they did not also note the challenges they have had and their lawyer has had with the undertaking, one (1) that -- that I cannot in good conscience sign.

So while our client is truly grateful for the support of the PUB, for the hard work of many of the independent experts, and frankly by the candid concessions of Manitoba Hydro in its rebuttal evidence,

a challenge our client has, and I think we all have here, is can our advice to the province collectively be credible, given the many hindrances in the process? That's not a reflection on the PUB, it's just a challenge that we -- we all face.

Finally, and noting the time, my client reminds me that at the end of the day this process is not about economists, with all deference to Dr. Grant, it's not about actuaries -- oh, or Mr. Bel -- it's not about accountants, it's not about engineers, it's about people and corporations. And it is so easy to forget the human impact of this proceeding.

The fact that Hydro rates grow -- going and growing at double the rate of inflation, can impose stresses upon working persons struggling to pay the bills, upon seniors faced with escalating prices, upon the single parents who have to use a food bank by the third Thursday of the month, it's perhaps not as hard to forget that assuming the debt related to $16 billion in capital expenditures imposes risks upon all Manitoba Hydro ratepayers.

CAC (Manitoba), through this hearing, has tried to understand the human impact. They've done so through their focus groups, their advisory groups, and daily consumer contact. And it will seek to

represent the broad consumer interest, taking an evidence-based approach to three (3) core principles: ensuring affordable access to basic necessities such as Hydro, ensuring that the process is transparent, and that the decision reached is sustainable.

In bringing this perspective forward, CAC will be -- be bringing forward, first, a truly outstanding group of expert witnesses, as well as two (2) people panels: one (1), a consumer's panel with their colleagues from the MMF; and the other individual traditional land users, individual Elders, who will be bringing their individual perspective of the particular impacts that Hydro will be having upon their communities.

I thank the panel very much for your patience in listening to us and putting up with our modest technical glitches. And I look forward to participating on behalf of our client in this proceeding.

MS. MARILYN KAPITANY: Mr. Williams, you spoke about focus groups that you held during the preparation stage. Could you expand a little on the demographics of those focus groups. And I'm particularly interested in if there were any business people, small business owners, or business people

involved in those focus groups?

MR. BYRON WILLIAMS: The -- in -- in terms of -- they're ongoing and it would be part of an ongoing deliberation that CAC(Manitoba) has had over the past three (3) years. My client could probably speak to their makeup a little better than I. I'll do my best though.

The focus groups themselves would tend to be selected from residential customers, and they would be -- we would have a southern, or Winnipeg-based focus group, and also, through the auspices of a -- a colleague organization, focus groups -- a -- a northern based -- what -- people who have come from the North and remote communities.

Where -- in terms of where we would have a modest impact -- influence, in terms of our advisory groups, which are different, the advisory groups are asked to represent particular interest groups, and there would be a -- a low-income person representation coming from groups that work closely with people who use food banks, we would have an environmental perspective, we would have an indigenous perspective, a -- a faith-based perspective. And certainly, I recall in, not the most recent advisory group, but one (1) from a -- I missed the seniors' perspective, which is

consistent throughout. Our second last one (1), I believe, involved some farmers. Okay.

But I would say, in answer -- in an indirect answer to your question, perhaps -- maybe I'll get to the direct -- those groups would be less represented than the -- the residential consumer. We also have had, from time to time -- or excuse me, I should say at least one (1) occasion -- some input from industry. But that was not our most recent advisory group.

MS. MARILYN KAPITANY: Thank you.

MR. BYRON WILLIAMS: Thank you.

THE CHAIRPERSON: Merci, Mr. Williams. I turn it over to M. Gange.

OPENING COMMENTS BY GAC:

MR. WILLIAM GANGE: Thank you, Mr. Chair. Mr. Simonsen advised us that this little light down here is very dim. He's right. The opening remarks of the Green Action Centre will be given by Dr. Miller.

DR. PETER MILLER: Thank you. Greetings to the Chair, and the panel, and the other participants here. I just want to give a -- a little perspective on our organization's approach to this

matter. Green Action Centre is a non-profit governed by an elected community board and committed to advancing applied sustainability.

(BRIEF PAUSE)

DR. PETER MILLER: We try to id -- identify, educate about, advocate, and facilitate sustainable choices and practices for individuals, organizations, governments, and society.

'Living Green Living Well' is our motto. Our NFAT intervention is part of that mission. Principles of sustainability and justice guide our interventions. In these remarks I wish to highlight aspects of that perspective brought to bear on Manitoba Hydro's development plans and alternatives in this proceeding.

We agree that our society is unthinkable without electricity. Manitobans are indeed fortunate to have a premium source of reliable, storable, renewable, dispatchable, low-carbon hydro electricity.

We know that the supply of electricity comes with a variety of environmental, social, and financial risks and costs along with the benefits. We share with other parties in this proceeding the concern

that these be properly weighed, as well as mitigated and compensated where possible.

We know that -- that it is economically and environmentally costly to waste electricity, hence our focus on DSM. Generally speaking, using electricity for heat when other alternatives are available is a wasteful and environmentally harmful use system-wide. Hence, our attention to fuel switching.

We are -- we're are thus presently surprised to see in the just-filed rebuttal that Manitoba Hydro plans a major reassessment of its achievable DSM potential, including fuel -- fuel switching, conservation rates, and new technologies. Manitoba Hydro hopes to file their new Power Smart Plan and implications for resource planning in the course of this NFAT.

The hydroelectric potential in Manitoba is a renewable but limited resource. Thus, we view with alarm a domestic demand curve that raises winter peak demand by 2,900 megawatts over thirty-five (35) years, the equivalent of two (2) Conawapas or of Conawapas plus two (2) Keeyasks. This looks to be unsustainable.

We believe that not only Manitoba's DSM potential but also the potential for hydro power to

multiply renewable energy supply in combination with intermittent renewables by creating a hybrid product should be explored. Hence, our attention to the wind potential.

We will also want to explore the 750 megawatt intertie as a potentially strategic asset in this regard where hydro capacity can backstop US wind.

An NFAT requires that an appropriate range of alternative portfolios be evaluated. We were thus disappointed that the filing presented a fixed set of alternatives that were so time consuming for Manitoba Hydro to analyze that no new alternatives could be contemplated, despite the PUB's directive that they should be prepared to model some.

Thus, alternatives with load-flattening level of DSM or of wind plus an intertie were omitted. It remains to be seen what level of analysis Manitoba Hydro can provide for the integration of its new DSM projections into the NFAT scenarios, and whether there is opportunity for Intervenors or independent experts to consider, analyze, and respond to the new results.

One (1) option is to extend the hearing process sufficiently to permit this opportunity.

So those are just some brief remarks to indicate our starting point in this proceeding, and

thank you for your attention.

THE CHAIRPERSON: Thank you, Dr. Miller. I'll now call upon the counsel for the Manitoba Industrial Power Users Group, Me. Antoine Hacault.

OPENING COMMENTS BY MIPUG:

MR. ANTOINE HACAULT: Bonjour, M. President Gosselin. Good morning, Board members. Good morning, all.

Manitoba Industrial Power Users Group is an association of ten (10) major industrial customers operating in Manitoba. The purpose of MIPUG, Manitoba Power Industrial Users Group (sic), is to work together on issues of common concern related to electricity supply and rates in Manitoba.

MIPUG's intervened in each of Hydro's general rate applications since 1988, as well as the review of the Centra Gas acquisition in 1999 and Hydro's major capital projects hearing in 1990, which was the first hearing on Conawapa.

The MIPUG membership currently includes the following companies: HudBay Minerals Inc., located in Flin Flon; Tolko Industries, located in The Pas; Canexus Chemicals, located in Brandon; Koch Fertilizer

Canada ULC, located in Brandon; Erco Worldwide located in Virden; Gerdau Long Steel North America, the Manitoba mill, located in Selkirk; Amsted Rail, the Griffin Wheel Company, located in Winnipeg; Enbridge Pipelines has operations in southern Manitoba; TransCanada Keystone Pipeline, again with operations in southern Manitoba; and finally, Vale, located in Thompson.

These ten (10) companies make up about 20 percent of Hydro's domestic load. Members provide jobs to about fifty-six hundred (5,600) full-time equivalents, and about $2.3 billion to the provincial GDP.

Most members are outside Winnipeg, and many are the largest employers in their communities. MIPUG's concerns reflect the size of the members' investments in Manitoba, which requires a long-term perspective. In addition, MIPUG's concerns reflect competitive market pressures from selling Manitoba products to world markets. We'll hear some reference to competitiveness in Canada and North America, but the reality is even Manitoba companies compete internationally.

The simple point is that rates do matter. They help offset disadvantages that arise from

operations in Manitoba such as transportation and distance to markets compared to competitors throughout the world. In this hearing, MIPUG is also endeavouring to provide the Board with a view of the concerns raised during the consultation process with others in the business community in Manitoba.

To that end, there's a been a newsletter, there's been some consultations, and the consultation process will be ongoing as the information continues to be provided and this hearing continues to evolve, and we also expect that some of those members, the chambers, might wish to make some presentations at one point in time.

As we've seen, this hearing is even more intensive than the risk hearing that was quite intensive. There are a few things that it will not cover but are essential to understanding MIPUG's position.

First, industrial rates in Manitoba have risen considerably in recent years since 2004. This has occurred at a time when industrial loads in many other locations have seen prices decline, and be provided with more flexibility to manage power costs. MIPUG's presentation in the recent GRA noted how Manitoba, in its view, was no longer the lowest-priced

jurisdiction. One (1) member in particular noted that the power costs in Manitoba were now the fifth lowest of its eighteen (18) plants.

Second, since Manitoba Hydro became regulated in the late 1980s, industry has faced rates that exceed the costs to provide the service. This has tended to be a premium paid by the industry sector of 10 to 15 percent over costs throughout that time period. That cost was about $20 million per year or more that the industry was bearing.

Third, industry continues to have very limited options to manage their power costs in Manitoba, unlike other jurisdictions. The DSM Program, known as cur -- 'curtailable rates' has been capped by Manitoba Hydro, and no additional customers can now participate.

Hydro has no programs that let customers respond to times of high export prices by dropping load, letting Hydro sell power and thus allowing a sharing of revenue between the utility and the -- the industrial customers that might enable that generation of additional revenue. Customers, that's the industrial customers, have waste streams or potential to develop renewable sources of energy, and they basically have no option to generate those and provide

power back to Manitoba Hydro.

With respect to the NFAT hearing, it has the potential of becoming overwhelming if it hasn't already, and Mani -- MIPUG suggests a primary focus in two (2) areas. This is taken from the PUB terms of reference.

But firstly, focus on ratepayers' rates and risks. The hearing ultimately ends with a report to the Minister who will make final decisions. If I'm not mistaken, the Minister has many other inputs being provided from other departments and consultation processes. For example, I expect that he's dealing with conservation, economic development, Aboriginal affairs.

We say that the unique wisdom which this Board brings is a good understanding of rates and ratepayers. We hope that this perspective is central to the Board's review and report.

Secondly, focus on the decisions that must be made now. Many of the issues that are going to be discussed are matters that cannot be reversed. Primarily, this includes whether to take up export agreements with Minnesota Power and others, which also requires whether to put a shovel in the ground on Keeyask, and whether to build a US line and, if so, at

250 megawatts or 750 megawatts. These are key decisions that we must address.

Many other issues are informative, but do not, in our respectful submission, require major decisions today. They require decisions that can be altered as time goes on, for example, matters such as what level of DSM to target, whether to be more aggressive and aggressively monitor and pursue more wind generation, or whether -- whether to continue to spend to protect the Conawapa option.

These last examples that I've given are no means an ex -- exhaustive illustration, but we say that those are not critical decisions that need to be made today, and we urge the Board to make sure it gets the large and irreversible questions clearly explored and decided correctly. Other topics can always be adjusted as time goes on.

Focus on rates is key. For industrial customers, the preferred plan shows higher rates for twenty (20) to thirty (30) years in exchange for potentially lower rates over the extremely long term.

This extra cost of investment adds up to a substantial amount. For industrial customers, the total additional amounts paid over the next twenty (20) years is estimated to be over $800 million. This extra

cost affects competitiveness, it represents funds that cannot be used to invest in people -- I mentioned the fifty-six hundred (5,600) jobs -- or facilities.

At its core, we submit that the case is relatively simple. MIPUG has framed this as two (2) major questions: Is Manitoba better off with a need-based approach, sticking to its knitting, avoiding debt and commitments as long as possible, letting the current uncertain market climate settle out before committing to future plans; or is Manitoba better off pursuing current opportunities?

If the focus is on pursuing opportunities as opposed to need, the question is asked. Which plan is the best? And as we've known, there have been developments even as recently as Friday, some major announcements on potential contracts, and so I hesitate to say that there's a clear answer to that question, because I don't know what else is going to be coming. But we don't see a really clear answer to that issue or question yet: Needs-based approach, opportunities-based approached.

With respect to the process itself, MIPUG has always expressed the desire to have the least amount of CSI being blacked out and let this process be as public as possible. I, as counsel, have also not

signed the undertaking as it was presently framed because of issues similar to what my colleague, Mr. Byron Williams, expressed more recently in his letter.

On another issue, all parties and -- I congratulate all parties for their extreme efforts, including in particular Manitoba Hydro, for the answering of IRs and dealing with evidence. A lot of them have been burning the midnight oil to provide good and complete information to this Board to assist it in making its report.

Mani -- MIPUG, I believe, has one (1) IR to respond to but is making the best efforts to answer them as -- as and when they had come in. We note that -- I don't believe we've received any responses to the IRs asked of the independent experts, and that some reports, such as the La Capra Report, is noted to be work in progress. Hopefully everything continues to unfold favourably so that this Board has complete information by the time this hearing concludes.

Another example has been brought up by other parties, Hydro has apparently provided some updated cases to some parties with respect to the DSM and imports, but we don't believe that those other cases or alternatives have been shared with us fully.

We do not expect to need major changes

and major updates to the prefiled testimony. But if the incoming information leads to a need to provide a small supplement, we will be providing that for the Board and all the parties. And as previously indicated, there may be some brief presentations forthcoming from the business community, such as the Chamber and some of the MIPUG members.

We thank the Board for listening to our opening remarks, and look forward to a productive exchange of information from all parties to assist the Board in drafting its report. I'd be pleased to answer any questions, if there were some.

MS. MARILYN KAPITANY: Messr. Hacault, you -- I think I heard you say that members have no opportunity to provide power back to Manitoba Hydro.

Could you just explain briefly what you would like to see in that area?

MR. ANTOINE HACAULT: That issue was briefly dealt with at the last GRA. There's some of the facilities in Manitoba that could generate power through their own facilities as a result of excess waste, like nitrogen, things like this. So in other jurisdictions the companies have the opportunity to generate those and offset some of the loads. There's programs related to that.

MS. MARILYN KAPITANY: Merci.

THE CHAIRPERSON: Merci, M. Hacault. I now call on the representatives from MKO. I believe it's Mr. Anderson and Mr. Orle.

OPENING COMMENTS BY MKO:

MR. GEORGE ORLE: Good morning, Mr. Chairman, members of the Board. My name is George Orle. I appear on behalf of Manitoba Keewatinowi Okimakanak. I'll refer to them as MKO henceforth.

MKO represents approximately sixty-five thousand (65,000) treaty First Nation citizens in Northern Manitoba. It's been in existence for over thirty-two (32) years, and is a nonprofit advocacy organization governed by the elected Chiefs of the thirty (30) sovereign First Nations in Northern Manitoba.

MKO was granted Intervenor status to deal with the following issues: the socioeconomic impacts and benefits of the Preferred Development Plan and alternatives in respect to the MKO First Nations; and also, the impact of domestic electricity rates over time with and without the Preferred Development Plan and with alternatives.

I wish to share with the -- the Board

the instructions provided to legal counsel and experts on behalf of MKO. In accordance with the MKO Constitution, and given the fact that it is an organization of sovereign First Nations, MKO has directed its legal counsel and its experts that the position to be taken by MKO at this hearing is not to compromise or contradict the position of the four (4) First Nations, being the York Factory First Nation, War Lake First Nation, Tataskweyak Cree Nation, and Fox Lake Cree Nations, the partners.

MKO will be dealing with the matters of rates and the impact on rates upon the members and the citizens in the MKO First Nations homes.

MKO was not allowed to intervene with respect to macro-environmental impact. MKO still believes that it has a unique perspective in that area and is disappointed that it will not be able to present evidence, or at least to be able to cross-examine on areas that deal with macroeconomics.

And that may be raised at a later time. I don't wish to make it as part of the initial presentation. But there will be a time when evidence will come forward and we will be asking the permission of the Board at that time that if it is appropriate, for MKO to be given an opportunity to cross-examine on

some of the experts' reports.

The citizens of the MKO First Nations are residential ratepayers and the First Nation governments are general service ratepayers. The three (3) diesel First Nations which pay electricity bills for the schools are also First Nation education rate customers.

All of the citizens of the MKO First Nations and the MKO First Nation government facilities receive electrical service solely from Manitoba Hydro. The MKO First Nations have an interest in determining the socioeconomic impacts and benefits of the plan and alternatives in respect to the MKO First Nations, including opportunities for training, employment, contracting, and procurement.

In terms of the potential impacts of the Preferred Development Plan on future Manitoba electricity rates and bills to be paid by ratepayers, MKO recognizes the advice given by the independent expert consultants retained by the Public Utilities Board, which have indicated that the plan is expected to result in annual electricity rate increases of about 4 percent, double the rate of inflation, for the next eighteen (18) years or more.

One (1) of the independent experts,

Morrison Park Advisors, stated:

> "For the Preferred Development Plan, maximum rate increases are applied until 2032, when they reach 100 percent above 2013 rates."

Of primary importance to MKO is the fact that these high rate increases will be disproportionally shared. And that is because most MKO citizens are regarded in the low-income category. This is a category which spends a higher percentage of income on electricity than higher-income citizens.

Experts' reports have indicated that raises in electrical rates to low-income ratepayers results in their not reducing their electricity, because electricity is a fundamental need. It results in them reducing food, education, and other necessities.

Income to pay for utility charge in many cases comes from the federal government. MKO has seen no evidence, nor has it been told, that there is any obligation on the part of the federal government to accept the increased rate changes and that if the budgets remain the same, the difference between the amounts payable by the First Nations at the present time and those that they will pay in the future may not

be able to be absorbed by the economies of these First Nations communities.

MKO will also examine the distribution of the overall financial benefits that are to be received in the future. First Nations historically have been caught in the middle of arguments between the province and the federal government as to who has responsibility to provide services. If the financial benefits in the future from the payment of these rates goes primarily to non-First Nations communities, then MKO feels there should be some adjustment as to what the increased rates should be and how they should be paid by First Nations.

Part of MKO's approach to the NFAT will be to explore measures to mitigate the effect of the expected rate increases on Northern First Nations, including establishing objectives for widespread inclusion of and delivery to all First Nations customers of programs such as the Home Insulation Program, Refrigeration Retirement Program, Water and Energy Saver Programs, First Nations Programs, and ongoing Residential Loan and Affordable Energy Programs.

MKO wishes to establish objectives for the widespread inclusion of and delivery of commercial

programs to all First Nation facility and commercial general service customers. We're intending to ask for the establishment, monitoring, and measurement of the effective capture of these programs of First Nation customers. And we would like to see a design and implement appropriate rate mitigation measures for local communities aversely affected by the plan.

MKO also hopes to explore establishing effective long-term relationships that are intended to maximize an effective sharing of development benefits in order to achieve a legacy of real, measurable improvements and pre-project baseline conditions, and more equitable post-project outcomes which are also a foundational principle of emerging international sustainability criteria, good practice and the best practice regarding Hydro power projects.

Members of the Board, thank you for allowing us the opening statement. Hopefully we'll be able to expand on the position of those statements throughout the course of the hearings. And, again, thank you for allowing us the Intervenor status.

(BRIEF PAUSE)

THE CHAIRPERSON: Thank you, Mr. Orle.

I'll now call on Ms. Saunders to represent the views of the Manitoba Metis Federation. Ms. Saunders...?

OPENING COMMENTS BY MMF:

MS. JESSICA SAUNDERS: Good morning, Chair, Board members on the panel and in attendance, parties, and members of the public. In attendance today I do believe will be the leader of the Manitoba Metis Federation, President David Chartrand. And I do see board member -- board of director and -- to the Manitoba Metis Federation's Minister of Hydro, Mr. Jack Park, as well as Mr. Al Benoit, Ms. Marci Riel, and Ms. Jasmine Langham of the MFF present. Mr. Corey Shefman of our firm is also in attendance today and will be assisting in some of the hearings next week.

The PUB has provided the Manitoba Metis Federation, to which I will at times refer to as MMF, the opportunity to speak to the impact on domestic rates; financial and economic risks; socioeconomic impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternatives to Northern and Aboriginal communities; macro-environmental impacts of the plan compared to alternatives; and whether the plan has the highest level of overall socioeconomic benefit to Manitobans.

We are pleased to appear before you today to give you, the other parties, and the public an idea of the unique perspective from which we will provide our review of Manitoba Hydro's business case and whether or not its Preferred Plan offers the most benefit to Manitobans.

We would like to begin our comments today in explaining who the Manitoba Metis community is, who the MMF is, and what the MMF hopes to accomplish in its role as an Intervenor in assisting the PUB in its task of coming up with recommendations to the Government of Manitoba on Hydro's plan.

As set out in the Manitoba Metis Federation's constitution, the Metis Nation is one of the Aboriginal peoples of Canada referred to in Section 35 of the Constitution Act of 1982. The Manitoba Metis community refers to the collective of those individual citizens that comprise the Metis Nation within Manitoba, and the MMF has been created to be the democratic and self-governing representative body of the Manitoba Metis community.

For greater clarity regarding the composition of the Manitoba Metis community, there are a number of rural and urban brick-and-mortars commun -- brick-and-mortar communities throughout Manitoba, north

and south, within which Metis citizens reside and have settled.

The Manitoba Metis community in this regard transcends the common meaning of a mere location where people reside and refers to a distinct identity based on certain criteria.

The Metis -- the Manitoba Metis community is comprised of, among other things, socioeconomic, cultural, and kinship networks of interconnected parts. For instance, there are Metis settlements in and around Gillam, Thompson, and the Keeyask and Conawapa project areas, and those in around Lorette and Richer in the Manitoba-Minnesota transmission line area, and these sediment -- settlements, together with other settlements of such nature in Manitoba, comprise the Manitoba Metis community.

The MMF represents the Manitoba Metis community at the local, regional, and provincial levels through province-wide ballot box elections. While it is currently going through a reregistration process to identify Metis citizens, it is estimated that the MMF has an adult membership of fifty-two thousand (52,000). The president, a vice president, and two (2) board of directors for each MMF region comprise the MMF's board

of directors.

The Manitoba Metis Federation supports development in this province, so long as it's done in a way that promotes sustainability and economic prosperity for the Manitoba Metis community and for all Manitobans.

The history and early beginnings of trade and industrial development in Manitoba are interwoven with the history of the Manitoba Metis community as the founders of this province. The provisional government of 1869 led by Louis Riel negotiated Manitoba's confederation in 1980 (sic).

These founders of Manitoba and the forefathers and mothers of the Manitoba Metis community had a certain vision for the Metis and for all of Manitoba when this province was first founded.

The Metis of this territory, which started out as the Red River Settlement, governed this province long before there was a government of Manitoba, and utilized these waters of everyday life, business, and trade long before there was a Manitoba Hydro or a Winnipeg or Manitoba Gas Company.

I would like to briefly share a story with you. Not far from where we stand today, Cuthbert Grant, a notable Metis leader, constructed his mill on

Sturgeon Creek in 1829. He also led the Metis in the battle of Seven Oaks in 1816, and that was the first time that the -- the flag of the Metis Nation, the infinity flag, was flown, but that's another story.

Grant's Mill, though, was the first water mill to be built west of the Great Lakes. It was constructed so that he could provide for his people, the Metis, with ground wheat meal. He knew very little about milling, and it's said that he lost most of his personal fortune in this venture.

I would be remiss if, on behalf of my client, I didn't mention the work of St. James-Assiniboia Pioneer Association that ensured that reconstruction of his mill on Portage Avenue at Sturgeon Creek.

On its website, the Grant's Old Mill Museum notes this of the mill:

> "It marks not only the initiative of pi -- of a pioneer leader, but might well be distinguished as the beginning of industrial enterprise in the Red River Settlement."

This history shows the deep roots of the Metis that this province have, not only tied to the land and waters the Metis exercise their rights as

Aboriginal peoples within, but also as the first entrepreneurs and pioneers in the building of industrial enterprise in Manitoba.

To further demonstrate the importance of this review to my client, the Keeyask and Conawapa generation stations are being developed in the Manitoba Metis Federation's Thompson region. The process of assessment of potential impacts to the Metis began in 2013 and is still underway.

The Bipole III transmission line, while not a project component in and of itself under review in the NFAT, it will export power generated from Keeyask and Conawapa to the USA, and it runs right through the Metis breadbasket. It will greatly impact Metis rights, culture, economy, and way of life.

The Manitoba-Minnesota transmission line, the power to be generated through this line no matter what route is chosen, runs right through the Metis territory, or as it was referred to in the MMF land claim, the old postage stamp province.

For my clients, much is at stake in Manitoba Hydro's planning for these new developments in considering the socioeconomic and macro-environmental effects of these developments to the Manitoba Metis community, and to them as ratepayers in considering the

financial and economic risks of the plan.

The MMF has provided evidence with the assistant of -- with the assistance of Management and Solutions in Environmental Science, MSES, and Camerado Energy Consulting in socioeconomic and macro-environmental matters. The report of Camerado Energy Consulting on macro-environmental matters provides a comprehensive evaluation of the macro-environmental impacts of the plan.

The report of Camerado Energy -- Energy -- pardon me, Camerado Energy Consulting, as I said, provides this comprehensive evaluation of the macro-environmental and socioeconomic implications of additional wind resources in Manitoba.

The evidence of Whitfield Russell Associates examines Manitoba Hydro's plan, and completes a thorough analysis of the financial and economic risks of the plan when compared to alternatives. This analysis involves consideration of Keeyask and Conawapa, and to a certain extent, Bipole 3 as it relates to the inextricable link in terms of system engineering, impacts, and ratepayer -- impacts on ratepayers, and financial risk.

Manitoba Hydro has brought a motion to stroke -- strike portions of this evidence as it

relates to matters that are out of scope of the NFAT. The MMF responded in arguing that it does relate to in-scope matters, and should be heard. Hydro has provided its rebuttal evidence on this, and the parties are awaiting a decision as to whether or not the motion from Hydro will be allowed or dismissed.

As my colleague Mr. Williams noted, we're also pleased to be presenting a ratepayer impacts panel with the Consumers' Association of Canada, Manitoba Chapter.

So in closing, I would like to go back briefly to the story that I shared with you. Cuthbert Grant, as a Metis leader and entrepreneur, put all of his fortune into building this mill so that he could provide for his people, and we are reminded of his contributions every time we drive by that mill on Portage Avenue. Today, he is celebrated by the Manitoba Metis community and members of this province for those contributions.

What we have in front of us in this review is a plan and a number of alternatives put forth but (sic) what my client has called the Crown corporation that Manitobans own.

We are talking about billions of dollars, our economy, and the legacy we will be leaving

behind for future generations. The Manitoba Metis Federation would respectfully ask that this panel, the parties, and the public keep in mind this question in the NFAT. When we look to the impacts of these plans being proposed, what will be the legacy of Manitoba Hydro and this government ten (10) years from now, thirty (30) years from now, seventy (70) years from now?

In general terms, to some, seventy (70) years may seem like a long time. But to the Metis, whose history and legacy predates the very first gas or electric lighting in this province, seventy (70) years is not a long time. The Manitoba Metis Federation believes that we all must be accountable to our future generations, starting with our participation in this review of Manitoba Hydro's plan, and examining whether or not it will bring the economic prosperity for Manitobans that Manitoba Hydro says it will now and into the future. Thank you very much.

THE CHAIRPERSON: Thank you, Ms. Saunders. I now call on M. Christian Monnin on behalf of the independent expert consultants.

OPENING COMMENTS BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Merci, M.

President, members of the panel. I'm -- to my immediate right is Mr. Michael Weinstein, and we're pleased to be here this morning on behalf of the independent experts and consultants. On a going-forward basis I'll be using the vernacular of these proceedings and referring to them as IECs.

For the purposes of our opening statements, we will be addressing four (4) points this morning, and I assure you it will not be long. A brief introduction to the IECs: We touch upon the reports and their status. Also touch upon how we intend to proceed with their evidence in -- as Mr. Peters said earlier, in approximately three (3) weeks in April, and some concluding remarks regarding process.

As -- as most here know, the IECs, as per the terms of reference -- reference, have been requested to address certain questions and issues set out in the terms of reference under five (5) general headings. In addition to that, the terms of reference indicate that additional questions and issues are to be addressed at -- which flow from the terms of reference, and those are enshrined in the scope of work.

I'm sure most of you -- I surmise most of you are avail -- are familiar with what's contained in the scope of work, so I won't go through that

deliberately this morning. I expect that will be well-tilled soil by the time we're done these hearings.

Who are the IECs? For those of you who want to bone up on that, they can go see report number -- Order number 127-13 at pages 9 of 19. At a very high level, we have Knight Piesold, who will be dealing with construction, management, and capital cost matters; Power Engineers dealing with transmission matters; Elenchus Research Associates Inc., dealing with load forecasting and demand-side management, and energy efficiency matters.

We also have Potomac Economics, dealing with Midcontinent Independent System Operator market; again, for those familiar with the vernacular, MISO. MMP will deal -- will be dealing with macro-environmental matters. Typlan Consulting LTD., socioeconomic matters; Morrison Park Advisors, dealing with financial analysis and public sector finance matters; La Capra Associates, dealing with power resource planning and economic evaluations, together with business case and risk assessment. A subcomponent of La Capra is EnerNex as a subcontract dealing with wind matters.

With respect to the filing of the reports, we've heard about CSI redactions being done.

In substantial conformity with the NFAT revised pre-hearing schedule dated January 10th, 2014, all the IECs, say for La Capra and Morrison Park, filed these reports. These reports have been reviewed for CSI content, and public reports have been filed with the website, and CSI reports obviously have not been.

Also in substantial accordance with the revised pre-hearing schedule, La Capra and Morrison Park advisors filed their reports in or around January 24th, 2014. As noted by M. Hacault earlier, La Capra's first report on January 24th, 2014, was an initial report, and this is largely due to the timing of receipt of certain data regarding, among other things, alternative development cases. On account of this fact, La Capra finalized its supplemental report on February 28th, 2014, and this report is presently going through the CSI redaction -- or CSI review.

There's also a supplemental report by the IEC Knight Piesold. They were requested to review additional information in relation to its initial report, and that additional information pertains to Manitoba Hydro's intention toward the Keeyask general and civil contact in early 2014. That supplemental report was filed on February 18th, 2014, and is also going through the CSI content process. It's our

understanding that this is still in process, and the same pertains to the IRs, the Information Responses of the IECs with respect to CSI content.

It's my understanding that there is possible adjustments being done to the report, CSI redactions, and also the IRs, and these are to be respectively completed by March 7th and March 14th.

I would like to just briefly touch upon the intended procedure with re -- how we will be providing evidence with the IECs come April. I -- I don't think I would be accused of overreaching when I say that we are dealing with an ambitious and aggressive timeline in these proceedings. Without any further de -- digression on that point, for the purposes of the direct evidence, it is our intention that each IE team -- IEC team will have one (1) individual that will, in the interest of efficiency, will be providing the direct evidence. However, some IECs may rely on a panel of individuals from their respective teams in order to address the cross-examination.

We are presently not in the position to advise of the makeup of these IEC witnesses and panels, but we expect to be able to -- to do so by the end of this week.

I want to briefly touch upon -- include -- concluding remarks, brief -- briefly touch upon a procedural issue, and that pertains to the PUB's decision regarding IECs counsel's right to limited cross-examination. We acknowledge the uniqueness of this right is mirrored by the uniqueness of this hearing. I cannot stress enough our recognition that this is a limited right, and our obligations -- our obligation -- these are obligations that we do not take lightly, and hope that they will be used sparingly.

And subject to any questions or comments, those are my opening statements, and thank you very much.

(BRIEF PAUSE)

THE CHAIRPERSON: Merci, M. Monnin. And I call on Ms. Ramage. Good morning, Ms. Ramage.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Yes, good morning, Mr. Chair. Before Manitoba Hydro begins, and given the hour right now at 10:30, I'm wondering if it might be a -- a time to have a break so I can speak to Mr. Thomson

about what we've heard this morning, and -- and then Manitoba Hydro will provide its opening comments through myself and Mr. Thomson.

THE CHAIRPERSON: Okay. Let's do that. Let's take fifteen (15) minutes. Is that an adequate time to -- yes? Okay. Thank you.

--- Upon recessing at 10:33 a.m.

--- Upon resuming at 10:52 a.m.

THE CHAIRPERSON: I believe everybody is in position. Good morning, Ms. Ramage and Mr. Thomson.

OPENING COMMENTS BY MANITOBA HYDRO:

MS. PATTI RAMAGE: Thank you, and good morning, Mr. Chair, Board members Kapitany, Soldier, Bel, and Grant. For the record, my name is Patti Ramage and I am counsel for Manitoba Hydro in this NFAT. Seated directly behind me is Marla Boyd, who is co-counsel in the NFAT.

As you may have surmised through the exchange of correspondence over the last number of weeks, a number of Manitoba Hydro's legal counsel will be assisting us through the course of the NFAT. So

just as the witness panel changed to provide you with Manitoba Hydro's subject matter experts on various topics, so too will legal counsel taking up this chair.

This hearing is the culmination of more than a decade of work for many of Manitoba Hydro's employees that you're going to be hearing from in the coming weeks. Given the importance of the Preferred Development Plan to both our ratepayers and the Province of Manitoba, it seems only fitting that opening remarks in this hearing be delivered by our leader, our president and chief executive officer, Mr. Scott Thomson, who is seated immediately to my left.

In our back row this morning we have Mr. Ed Wojczynski and Ms. Joanne Flynn, who are the NFAT project leads. Mr. Wojczynski is the division manager of Portfolio Projects, and Ms. Flynn is the division manager of Power Planning. Both will be testifying as the hearing proceeds. Seated next to Ms. Flynn is Mr. Bruce Barrett. He is our new vice president of Major Capital Projects, having recently joined Manitoba Hydro from BC Hydro.

Having heard the opening comments of both Board counsel and My Learned Friends to the left, I can't quite bring myself to turn the microphone over to Mr. Thomson without providing a brief comment

myself.

You have already received massive quantities of information regarding the Need For and Alternatives To the Preferred Development Plan, both from Manitoba Hydro, our perspective, as well as from the Intervenors and the IECs. And I fully expect much more is coming.

One of Manitoba Hydro's primary objectives during this hearing is to assist you in sorting through this material and identifying the relevant and accurate information that is needed in order to make your recommendation on the -- the decisions that must be made by government this coming June.

Over the course of the next eight (8) or nine (9) weeks, as you listen to the evidence, remember there are key decisions that government must make this June. Mr. Wojczynski is going to outline them in his presentation later this afternoon. But in a nutshell they are: Do we continue to capitalize on our water-rich resources and commit to the construction of the Keeyask generating station?

And do we commit to construction of a new interconnection with exp -- with our export customers to the south and the export contracts that

facilitate that interconnection? And if so, will that be a 250 megawatt transmission line or a 750 megawatt transmission line?

When you are listening to the evidence ask yourself: Will this information help me make the recommendation on those key decisions? If so, I'd suggest we classify that information as stage 1 information. It's relevant to the decisions that need to be made immediately.

For example, if the evidence deals with whether we should make the decision to abandon the Keeyask hydro pathway in favour of gas, I'd suggest that be stage 1 information and kept it top of mind.

If, however, the information deals with decisions that must be made at a future date -- for example, supplementing Manitoba Hydro's resource mix with a potentially promising but still emerging technology -- I'd suggest that be classified as stage 2 information. That information will aid in identifying which pathways you want to keep open, but it is not necessary for today's decision making.

There is so much information on the record of this pre -- proceeding, it's very easy to get bogged down in the details. Classifying information as stage 1 or stage 2 is a good decision-making tool. It

will help identify and separate primary considerations from secondary considerations.

The amount of information out there is virtually without end, and we could go in circles forever. But we have critical decisions that need to be made today, and there are risks with all decisions. Please, do not allow yourselves to be drawn into focussing solely on the negative. The system we enjoy today is because of decision makers who took a balanced approach. They weighed downside risk against upside potential. And that is the kind of thinking that Manitobans need today.

Manitoba Hydro sees this as an important step in what has already been a deci -- a decade-long decision-making process. It has no doubt been a long haul, but we are anxious to get underway and satisfied that, at the end of this process, you will agree that -- that the pathway Manitoba Hydro proposes to embark on is in the best interests of Manitobans.

Now, before I turn the microphone over to Mr. Thomson and -- or -- and have him sworn, there was a few housekeeping matters that I thought should be attended to arising out of comments this morning.

The first deals with -- MIPUG made a comment regarding cases shared with some parties and

others. Manitoba Hydro is not entirely sure what is being referenced, but we thought it important to point out that if it is the DSM case that is referenced in the rebuttal, that information is forthcoming, but it has not been provided to any party as of yet. And Mr. Wojczynski's going to expand upon that this afternoon.

If it is the La Capra no-new-generation case that we saw in La Capra's evidence filed on Friday, in that case, La Capra selected the load, had Manitoba Hydro run SPLASH models, but they developed the case. It's not Manitoba Hydro's case. And it's our understanding that case is fully contained in the La Capra materials. So hopefully that clarifies that for parties.

The second matter which I've briefly discussed with Mr. Monnin at the break, he referenced a -- a Knight Piesold report dated February 18th that is waiting on Manitoba Hydro. We've looked at our records. We have not received that report as yet. Mr. Monnin is going to ensure that we get that report, so that should be -- we will then review it, and hopefully that can be distributed to the parties forthwith after that.

So that concludes my introductions. I think it might be appropriate now to have Mr. Thomson

sworn in, and then he can deliver opening comments on behalf of the Corporation.

MANITOBA HYDRO PANEL 1:

SCOTT THOMSON, Sworn

EXAMINATION-IN-CHIEF BY MS. PATTI RAMAGE:

MR. SCOTT THOMSON: Good morning, Mr. Chair, panel members, ladies and gentlemen. My name's Scott Thomson, and I'm very pleased to be here with you today, given the importance of this proceeding for Manitoba Hydro, its customers, and the people of Manitoba.

This hearing's a culmination of an extraordinary effort by many people over many years. Getting to where we are today is a significant accomplishment that we at Manitoba Hydro can be quite proud of.

But in the broader context, this proceeding is only one (1) more step amongst many towards a longer-term objective of ensuring that Manitobans continue to have access to safe, reliable, and cost-effective electricity for generations to come.

Today, Manitobans enjoy electricity rates that are among the lowest in North America. This

is not an accident. The benefits that we enjoy today are a direct result of forward-thinking planning decisions made decades ago.

Investment decisions were made with a view not just with an eye to short-term objectives, but also to how future generations would be affected. My view, and Manitoba Hydro's view, is that we should continue to make our resource planning decisions with careful regard to how they will affect our children and our grandchildren in the decades to come.

One (1) thing that's certain as we sit here today is that under whatever reasonable scenario that can be constructed, Manitoba needs new resources in the not-too-distant future. Our population is growing. The economy is growing. Households are using more electricity than they used to. Our analysis shows that even without any new exports, Manitoba will require new electricity resources to meet domestic load by about 2023.

Different scenarios regarding, for instance, population growth, economic growth, and demand-side management activity only affect the timing of when new resources become critical. Given the long lead times required to develop new supply resources, we're at a decision point on what paths to take in

meeting our growing domestic load.

We've carefully examined a number of options. I'm convinced, and we hope to persuade you of this as well, that the plan that Manitoba Hydro has identified as its Preferred Plan is the right path forward.

And I do want to underscore that the Preferred Development Plan is not without flexibility. While construction on the Keeyask generating station and other aspects of the Preferred Plan must begin shortly, Manitoba Hydro will always maintain the flexibility to respond to future circumstances when it comes to future resources identified as part of the path. Conawapa, for instance, will only get built if the business case remains sound.

Having made those introductory remarks, my intention today is to address a few of the themes that run through Manitoba Hydro's business case and have been emerging as the proceeding has unfolded. My hope is to frame these issues for the panel and explain at a high level Manitoba Hydro's perspective of them.

As you know, Manitoba Hydro is putting forward a number of witness panels that can speak better than I can to the more detailed elements of the analysis. I'll touch on the following matters: the

first are mandate, why the Preferred Development Plan is the appropriate path forward, managing uncertainty when developing a long-term plan, gated decision points, Manitoba Hydro's views on natural gas generation as a supply option, ratepayer impacts, and the role of exports.

The mandate of Manitoba Hydro, a Crown corporation of the Province of Manitoba, is set out in the Manitoba Hydro Act. There are three (3) components of our mandate that should be stressed. First, our mandate includes providing for the continuance of a supply of power adequate for the needs of the province. Second, the Act references engaging in and promoting economy and efficiency in the development, generation, transmission, distribution, and supply of end-use power. Third, it also references marketing power to persons outside the province on terms and conditions acceptable to the Board.

Now, as I've already mentioned, the fundamental driver of the NFAT analysis is the increasing electricity demand in Manitoba. We can, and likely will, debate the pace of this growth and debate different ways to slow it through energy conservation or demand-side management initiatives.

However, what is crystal clear in my

view is that: A) the Manitob -- that Manitoba Hydro has an obligation to meet the province's future demand for electricity, and B) new supply will be required sooner rather than later to meet that obligation.

As I noted a minute ago, our statutory mandate contemplates exports on appropriate terms. As I'll discuss later, exports have been a major reason why Manitoba Hydro's rates remain so low relative to many other jurisdictions. Revenues from exports help to offset costs for domestic customers.

While our need is associated with domestic load, it is appropriate and important, in my view, to look at the potential for export revenues to be enhanced. These opportunities exist right now and they're real. Manitoba Hydro already has in place significant commitments from the US utilities to -- to purchase new power supplies. And of course, all of our resource planning is done with an eye to the pri -- the principles of sustainable development.

In leading up to this proceeding, Manitoba Hydro investigated a wide range of potential options to meet our growing domestic demand, including demand-side management, or DSM, imports, wind, solar, biomass, and natural gas, as well as hydro, and many others. We believe that among the variety of

alternatives considered we've arrived at the best path forward to achieve our mandate.

Our plan is about meeting the electricity needs of Manitobans in a way that maximizes benefits to Manitoba over the long term, effectively manages the risks and supports long-term sustainable development. It's also about taking timely action that respects the lengthy time frames for planning, regulatory approval, and construction that are today's reality for developing reliable electricity supply infrastructure.

Our analysis shows that even without any new exports, Manitoba will require new electricity resources to meet domestic load, as I said, by about 2023. As such, the Preferred Plan includes the construction of the Keeyask generation station to be in service in 2019, the construction of the Conawapa generating station with an earliest in-service date of 2026, the construction of a 500 kilovolt, 750 megawatt transfer capacity interconnection with the United States at an earliest in-service date of 2020, and new export sales commitments with Northern -- Northern States Power, Minnesota Power, and Wisconsin Public Service.

Our Preferred Plan also includes DSM.

As you well know, unlike a generating station, the size of DSM is not fixed. It is continually under review by Manitoba Hydro and will be expanded as it is determined to be economic. We believe our Preferred Development Plan is the best long-term solution for Manitoba customers and Manitobans when compared to other options and alternatives, for a number of reasons.

It provides the lowest electricity rates for Manitobans over the long term. It provides the highest level of system reliability and energy security to Manitobans. It supports Manitoba Hydro's long-term financial health with higher levels of tangible fixed assets and equity. It has the lowest levels of regional greenhouse gas emissions. It provides the most jobs and greatest socioeconomic benefits. It provides training, employment, business, and income opportunities for Aboriginal communities in the vicinity of the new generating stations. It provides the highest level of financial transfers to the provincial government, which benefits all Manitobans, and it has the most flexibility to deal with future uncertainties and take advantage of additional export opportunities.

This last point relating to flexibility to deal with future uncertainty is important. It's my

second theme, and I propose to turn to it now. Dealing with uncertainty. As noted earlier, we're planning for the long term. By definition, a long-term plan is driven by and informed by the assumptions we make about the future. These include energy prices, interest rates, and capital cost estimates and variables, such as load growth, future energy conservation, severe drought, and possible increases or decreases in river flows due to climate change.

No one, not Manitoba Hydro and not one (1) of the many experts who will be participating in this review process, has perfect knowledge about the future. This means we -- we all must use the best information available to us and rely on assumptions and planning for an uncertain future.

It's not a simple undertaking. The world is dynamic place and change is ongoing. The thing is, we do not have the luxury of engaging in perpetual analysis, as Ms. Ramage said. It takes years to plan and build a hydro generating station.

Similarly, it takes years to get permits, obtain and prepare a site, and build a gas-fired generating station. These long lead times require us to initiate these steps long before there's an actual need for the energy. If we wait too long, we

will have failed in our mandated Hydro.

At some point, we must put a stake in the ground and move forward to be in a position to meet our obligation to Manitobans. It's time to put that stake in the ground. While this may seem daunting, the panel should be able to proceed with confidence. It will have the benefit of a very significant amount of very good information on which to base its assessment and recommendations, and it can be confident that Hydro proceeded through a logical step-by-step analysis in reaching its conclusions.

For starters, Manitoba Hydro has presented a wide range of energy options, including natural gas, DSM, wind, and hydro. We've performed extensive multistage resource planning analysis to come up with viable plans. Part of that analysis involved engaging with neighbouring utilities so that opportunities to work together for mutual benefit are included.

Second, we performed extensive modelling of all viable plans using a wide range of inputs and what I understand to be cutting-edge, probabilistic methods and scenario analysis to come up with a Preferred Plan. In addition to our -- to our internal staff expertise, we engaged external expert consultants

to assist in this modelling and analysis.

This work has enabled Hydro to respond to changing conditions and develop plan sensitivities to gain understanding of how shifts in underlying assumptions might impact or alter our Preferred Plan over time.

Third, on Keeyask, which is the first major component of the Preferred Development Plan, Hydro has undertaken the necessary steps to bring us to the point where we can begin construction with confidence. There have been extensive community consultations. We've submitted mutually beneficial partners -- partnerships with our First Nations partners. We've conducted environmental studies. The CEC hearings are now complete, and we look forward to their report in April.

We've conducted significant field investigations, engineering analysis, and construction preparations. We've recently selected a -- a very experienced and capable contractor for the general civil contract. We're intending to award the contract next week with construction being conditional on the -- upon final project approvals.

We're completing the process of incorporating the successful build into our overall

project cost estimate, including assessing the adequacy of project contingencies and management reserves. The estimate will be reviewed for approval this week, and preliminary results shared with you next week.

What I can say to you today is that the general civil contract price is higher than what we had estimated, but based on what we know, we don't see the updated estimate changing our conclusion that Keeyask is beneficial and justified by the variety of significant benefits it brings to the table.

With the award of the general civil contract, over 80 percent of the value of construction contracts will be committed. We'll have the benefit of greater confidence around the Keeyask -- we have the benefit of the greater -- greater confidence around the Keeyask cost estimate, one of the larger var -- variables in the plan analysis.

Finally, Manitoba Hydro has developed a comprehensive Risk Management Plan for the Preferred Plan, including detailed contract provisions and project management requirements. Here I would point to lessons learned from Wuskwatim and revisions to our capital planning processes.

All of these steps were important for improving our confidence in the appropriate path

forward. We can also address the uncertainty by remaining flexible in how we respond to changing circumstances. Hence, the Preferred Plan is not a fixed plan. It's a pathway which sets us in the direction of more hydro and an inner -- and interconnection capacity, but it will be adapted as necessary as we go along.

To allow for this adaptation, we've built in a number of gated decision points into the Preferred Plan. The use of gated decision points is my next topic. We need to make a decision this year, as Ms. Ramage said, about whether we're moving forward with Keeyask or not, and we need to decide about building the 750 megawatt interconnection.

Prospectively, there is what we refer to as a gated decision point for proceeding with Conawapa. The decision of whether or not to proceed with Conawapa will be dependent on a number of factors, some of which are controllable by us, some of which we can influence, and some beyond our control.

We can and, based on our assumptions, should continue to proceed on the path of planning for Conawapa, but we do not need to commit to its construction until early 2018 if we want it in service by 2026. In the interim, we'll continue to monitor and

review key variables, including load growth, DSM plans, new export contracts, which we continue to pursue with -- with partner utilities in the US, capital cost estimates for Conawapa and natural gas plants, natural gas price forecasts, energy price forecasts, and others.

If, for example, load doesn't materialize and alternative sources of supply, including DSM, become more cost effective, our plan has the built-in flexibility to delay Conawapa, or shelve it indefinitely.

I mention DSM because as -- as you'll hear in more detail later today, we're looking at significantly increasing our level of DSM programming as part of our ongoing resource planning process. The preliminary results indicate that an increased level of DSM, even if the initiatives are very successful, does not alter the conclusion that Keeyask and the new 750 megawatt interconnection are justified, but it'll be important to continue to monitor and evaluate how additional DSM could affect other elements of our plan, including Conawapa.

At this point, I want to shift gears and address head-on the subject of natural gas generation. During the course of this process, you'll unnec --

undoubtedly hear the suggestion that we should be developing natural gas generation rather than hydro.

First of all, I can assure the panel that Manitoba Hydro has considered all possible sources of new supply that could meet the province's future needs, including natural gas. We've -- we already have gas generation in our resource mix. It was only twelve (12) years ago that Hydro constructed a 280 megawatt gas generation facility at Brandon.

In our NFAT analysis, an all-gas option was the base case which we compared all of the other plans to. As you may or may not know, half of my professional life prior to joining Manitoba Hydro included working for a large natural gas utility. So I'll be the first person to say that natural gas-fired generation has favourable attributes, and in some circumstances it could be the best option, but I have no hesitation saying to you today that the all-gas solution isn't the best option before us.

Our evaluations comparing new hydro with natural gas generation options, including assessment of natural gas supply and demand, and its competitive environmental dimensions utilizing industry best practices, based on current inter -- industry consensus forecast gas prices, we concluded that gas generation

options would result in the highest net cost and the highest long-term electricity rates for Manitobans.

At the same time, gas-fired generation produces significant greenhouse gas emissions and provides fewer social benefits when compared to hydro-based solutions. But having said that, consistent with the gated decision points built into our Preferred Plan, we will continue to assess natural gas along with other options as the future unfolds.

Turning to rates, I mentioned at the outset of my opening statement that Manitobans are fortunate to enjoy electricity rates that are amongst the lowest in North America. No one wants to see their electricity bills rise, and we would prefer to avoid that, too.

We will continue to do what we can to control costs in our operations, but we're at a point where we need to make significant investments to maintain and review our existing generation, transmission, and distribution systems, maintain our corporate financial health, and of course develop new sources of supply.

All of the options before us today will lead to increased rates. Over the long term, however, the expected rate impact of our preferred development

plan is lower than the alternatives.

I'll turn for a moment to the topic of the role of exports and assessing potential paths forward. One of the reasons that we have low rates in Manitoba is our electricity exports. We have several significant export arrangements in place that allow us to maximize the benefit from existing -- our existing resources. Revenues from export sales offset revenue requirements that would -- would otherwise have to be recovered from our domestic customers.

As I've mentioned, domestic load growth is driving our decision to build new generation, but there currently exists a window of opportunity where we can take advantage of new generation to increase export revenue and mitigate the risk of investing in new supply.

We continue to see a demand for clean, reliable hydroelectricity in the US, and in particularly the Midwest market we serve, where utilities are looking to diversify their supply portfolios by replacing aging coal-fired sources, limiting their exposure to the price volatility of the natural gas markets, and in some instances, securing environmental attributes of renewable hydro power.

Manitoba Hydro now has in place new

long-term export agreements that, along with domestic demand growth, have essentially sold out all of the surplus associated with Keeyask. In all cases, these agreements reflect prices substantially more attractive than those in our existing firm export contracts.

As new hydro generating stations come online, we will sell the surplus energy available to help pay for those stations. Large committed sales contracts include Minnesota Power for 250 megawatts between the years of 2020 and 2035; Northern State Powers (sic) for 125 megawatts between '21 and '25; Wisconsin Public Service, 108 megawatts recently announced on Friday, between 2016 and '21; a previously announced deal of 100 megawatts commencing in 2021 and growing to 308 megawatts in the period 2027 to 2036.

The Minnesota Power NSP sale and the 100 megawatt Wisconsin sale that was announced in -- in 2011 do require the development of Keeyask. A decision to delay or not to proceed with the construction of Keeyask would mean foregoing the revenue that would flow from these contracts for decades. These utilities would build or procure alternative resources, essentially taking Manitoba Hydro out of play in the foreseeable future.

There is significant potential for

export of hydro generation beyond the output of Keeyask. In addition to signed contracts, we've entered into signed memorandums of understanding to enter power sales discussions. On the table for discussion with export customers are up to 600 megawatts with Great River Energy and up to 500 megawatts with SaskPower, and we're pursuing discussions with another of addi -- a number of additional US utilities as well.

Of course, MOUs are not signed contracts, and I fully expect to be challenged on our outlook regarding the rate of electricity demand growth in our targeted US markets. I also expect you'll hear differing views about the opportunities for Manitoba Hydro, given competition from natural-gas-fired generation, the uncertainty about the retirement of coal-fuelled generation, and the market impacts of carbon restrictions or taxes in these markets.

There will always be debate around such outlooks. We are comfortable that our outlooks are reasonable. We also view the MOUs as an indication of strong commercial interest, and an important step on the road to future sales contracts. Virtually every one of our existing firm export contracts was preceded by an MOU. As well, our 500 megawatt contract with

Xcel is up for renewal and repricing in 2025. This would have to be supplied from Conawapa. There won't be capacity to renew that without it.

So where does leave us with our Preferred Development Plan? Keeyask is sold out, as I've said, and the benefits of the new US interconnection can be realized with this project. Prospects for Conawapa are very promising. Assuming Conawapa proceeds, the recently announced 308 megawatt WPS sale would utilize about 30 percent of its dependable energy output. Even partial successes under the 600 megawatt MOU with GRE, and the 500 megawatt MOU with -- with SaskPower, could fully subscribe the balance of the firm energy available from Conawapa until we grow into the demand.

The sale to Minnesota Power has triggered a new transmission line from Winnipeg to Duluth, Minnesota that will be required by around 2020. Minnesota Power is championing the development of this line in the US. Those of you who follow the challenges of developing new transmission lines in North America will understand the significant opportunity that -- that presents itself today. This new line will provide enhanced access to markets for our surplus energy for its -- over its entire life, not just for the term of

the initial sales contracts. It will also strengthen reliability supply in Manitoba by doubling our ability to import electricity in times of drought or other emergencies.

If we were to pursue a gas path as the next step in our supply portfolio, we will lose export sales and a customer who is championing the development of the US interconnection. When and if Hydro power expansion was reinitiated, we would be back to the drawing boards for increased transmission to help enable future surplus power sales and imports for reliability. The new Min -- the new Minnesota tie-line is a time limited opportunity.

Having addressed my list of topics, I'll return to my initial observation about how far we've come. Our plan is the result of many years of Manitoba Hydro experience and studies, and is fully supported by Manitoba Hydro staff, management, and as recently as their meeting last week, by our board of directors. Many of our staff have essentially been working seven (7) days a week for months now, just as I'm sure the same could be said for other participants and independent consultants.

I'm proud of our team and the professional product that we've brought forward. It's

not always easy for people to listen to lengthy public critiques of their work, especially for those individuals who have poured the better part of the last year of their lives into first the preparation of the filing, and subsequently responding to many hundreds of interrogatories, often at great personal sacrifice. However, at every opportunity I've tried to make it very clear that Manitoba Hydro welcomes the public scrutiny, financial, environmental, and otherwise, that this process provides of our plans.

As we move forward with this review I would encourage all of us to do our best to make this process as much as possible about constructive dialogue. Many of the points we may hear during this review have been heard before, during the '60s, '70s, and even the 1980s, we move -- as we moved forward with earlier Hydro power developments. Many of those developments were not without controversy in their day, and certainly not without their issues. I'd be the first to say that our view of how such developments should be undertaken, particularly with regard to the environment and affected communities, has changed for the better since then.

However, one (1) thing hasn't changed from decades past, and that's our need to consider the

long-term interests of Manitobans. The projects of past decades were the produce of good foresight. They've stood the test of time and have provided our province with reliable, inexpensive energy that has made us the envy of our neighbours. They've powered our homes, businesses, and industries for nearly forty (40) years. I'm confident that Manitoba Hydro's Preferred Development Plan offers the best opportunity to build on that legacy by providing reliable, cost effective, and renewable energy for this and future generations of Manitobans.

Recognizing that this panel has a significant time commitment, I'll conclude my ope -- or challenge -- I'll conclude my opening remarks at this time. And I think I'm about five (5) minutes ahead of schedule so hopefully we can keep that going.

(BRIEF PAUSE)

MR. RICHARD BEL: Scott, what proportion of the total cost of Conawapa and Keesak (sic) is covered by those new export contracts depending on their being built?

MR. SCOTT THOMSON: In total, the committed sales contracts that we've got are a little

over $9 billion. And those are over, you know, a time-frame spanning out to -- to 2035.

I think the thing that's important to recognize is that the -- the plants themselves have lives of seventy-five (75) to a hundred (100) years, so we would never anticipate that -- that the sales that we make in the first ten (10) years would pay for the plants in total. And ultimately, we're not building them to supply the US market need; we're building to -- to supply Manitoba demand. But as you bring capacity in, in chunks, you need to have a -- a way to lay off the surplus in the early years.

So the -- the fact that -- that of the two (2) projects of just over $16 billion combined -- the fact that we do have a revenue stream on the order of $9 billion in -- between now and -- and 2035 provides a significant contribution towards that.

MR. RICHARD BEL: Thank you.

THE CHAIRPERSON: Mr. Thomson, you said there's a -- there's a window of opportunity for the tie-line to the US. Could you explain that one?

MR. SCOTT THOMSON: Yes. Minnesota Power has -- has agreed to champion the development of the line. The -- the contract that we've entered into with them for 250 megawatts of capacity could be satisfied with a 230 kV line. And they -- they were committed to -- to building a 230 kV line to -- to be able to take the power under their agreement. They've agreed to pursue a larger line, which would allow us opportunities to make the sales to Wisconsin and -- and other -- other deals that we will firm up over time.

If -- if Keeyask were not to proceed, there would be no reason for them to -- or if we -- if we don't get regulatory approvals to -- to do that, then they wouldn't be building the -- the tie-line 'cause we wouldn't be able to supply them under the contract. So if -- if the -- they have a need early -- in the early '20s and the -- and the transmission line is targeted to go into service in 2020, if -- if that contract falls away, they -- they won't build the line, and then we -- we'll be left short.

THE CHAIRPERSON: I'll turn the microphone over to you, Mr. Peters.

MR. BOB PETERS: Thank you, Mr. Chairman. I recognize the timetable had -- had these comments going to 11:30. And it appeared there might have been a lunch break, and I'm not sure if that has prompted attention from the media who wants access to any of the parties. But I'm prepared to continue at least till noon, if that's satisfactory, and then I can re-calibrate.

I can tell the panel that, based on my informal discussions with colleagues opposite, in addition to my questions, there will probably be another hour and a half worth of questions for Mr. Thomson as long as he's prepared to be with us this afternoon.

And I believe Mr. Wojczynski is looking to keep the last hour of the day for himself in terms of his presentation. So with that in mind, and backing up, we need to hear from Mr. Wojczynski starting at 3:30, and then we should be finished with Mr. Thomson by then.

So I'm prepared to continue if it suits the panel.

THE CHAIRPERSON: Let's continue, please.

MR. BOB PETERS: All right. Thank you.

CROSS-EXAMINATION BY MR. BOB PETERS:

MR. BOB PETERS: Mr. Chairman, I have circulated a book of documents. I'll refer to it in a few minutes, and it's been marked as PUB Exhibit 58-1. I do have some extra copies at my side. I'm not sure if anybody wants the paper. If they do, they're welcome to it.

I understand from Ms. Ramage that, Mr. Thomson, you've got a copy of my thirty (30) tabs in the book of documents?

MR. SCOTT THOMSON: Yes, sir.

MR. BOB PETERS: Does it matter where we start, sir?

MR. SCOTT THOMSON: I'm in your hands.

MR. BOB PETERS: All right. Let's start with your Manitoba Hydro Exhibit 84, which is a document provided last week. And this happens to be your beef -- brief biography that's been filed for the purposes of the NFAT.

Is that correct?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And, Mr. Thomson, I want to thank you for your opening comments and your being available today to answer parties' questions. I would like to make it clear at the outset that my

questions are not seeking answers that contain commercially-sensitive information.

Would that be clear?

MR. SCOTT THOMSON: M-hm.

MR. BOB PETERS: And your answer was yes?

MR. SCOTT THOMSON: Yes, it was.

MR. BOB PETERS: And if any answer of yours, you feel to complete your answer to the Board, needs to contain the CSI, I would make the recommendation that you would undertake to provide that answer through your counsel, Ms. Ramage, and then that written answer could be provided to the Board on blue paper, as is the confidential information in these proceedings.

Would that be satisfactory, sir?

MR. SCOTT THOMSON: Certainly.

MR. BOB PETERS: And, Mr. Thomson, you've been the President and CEO of Manitoba Hydro -- you just had your two (2) year anniversary.

Have I got that right?

MR. SCOTT THOMSON: That's right.

MR. BOB PETERS: And if I am also correct, today is your second appearance before the Public Utilities Board?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And before -- and for the benefit of the newer members of the Board, you alluded to it in your opening comments, prior to Manitoba Hydro you were an executive fic -- Vice President in the Finance and Regulatory Affairs Department in energy supply with FortisBC Holdings?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And you'll have to help me out here, because I'm -- I always get this wrong, but BC Gas became Terasen, and that became FortisBC Holdings?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And your involvement was with Terasen Gas before it merged with Fortis?

MR. SCOTT THOMSON: Yeah. Initially, the -- the company was called BC Gas Utility Limited when -- when I joined. And there was a -- a name change along the way to Terasen.

MR. BOB PETERS: And that was predominantly a natural gas distribution utility, as you mentioned?

MR. SCOTT THOMSON: That's correct. When Fortis acquired the -- the gas assets from -- from Kinder Morgan in 2007, Fortis owned and operated a -- a

electric distribution and generation utility in -- in southeast BC. And that's when I -- I got involved in the electric industry directly.

MR. BOB PETERS: Directly before that you were with the natural gas distribution and had about nine hundred and twenty thousand (920,000) customers?

MR. SCOTT THOMSON: Yeah, it was about nine-fifty (950) by the time I left.

MR. BOB PETERS: And predominantly in communities outside of the mainland?

MR. SCOTT THOMSON: No, we -- we served -- we -- we served 96 percent of the -- the gas customers in the province. It was only the -- the northeast that was served by Pacific Northern Gas.

MR. BOB PETERS: And did Terasen generate electricity using natural gas as a fuel?

MR. SCOTT THOMSON: No, we didn't. We supplied BC Hydro and their thermal operations at Burrard Inlet.

MR. BOB PETERS: So Terasen generated electricity using water as a fuel?

MR. SCOTT THOMSON: No, sorry, FortisBC did in their -- in their electric operations. They -- they operated four (4) facilities.

MR. BOB PETERS: The electric customer base that you had when you were in British Columbia was about a hundred and eleven thousand (111,000)?

MR. SCOTT THOMSON: Direct. And then about fifty thousand (50,000) through municipal -- or that we supplied to municipal utilities.

MR. BOB PETERS: Would it be fair and true, Mr. Thomson, that you didn't have prior experience overseeing the construction of hydro-generating stations?

MR. SCOTT THOMSON: That would be -- that would be true.

MR. BOB PETERS: And I was going to say certainly who would have in terms of the magnitude of Keeyask and Conawapa, but that's -- that's unprecedented in Manitoba's history?

MR. SCOTT THOMSON: Well, we've certainly built stations as big as Keeyask before. Conawapa will be bigger. And we do have a -- a few people that are still around from those days, but they are -- they are thinning out.

MR. BOB PETERS: When you were hired by Manitoba Hydro to succeed Mr. Brennan as president, Manitoba Hydro already had a preferred development plan, did it not?

MR. SCOTT THOMSON: Yes, it did.

MR. BOB PETERS: And that Preferred Development Plan included Keeyask and Conawapa, as well as exports at that time?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Can you tell the Board, under your presidency, what, if any, major changes have been made to Manitoba Hydro's Preferred Development Plan?

MR. SCOTT THOMSON: I -- I suppose the most significant thing would be that we've -- we've firmed up a number of the -- the sales contracts that support the Preferred Development Plan over the past couple of years, culminating them in the most recent announcements. And then of course assumptions that we've made have -- have been born out or been amended as time passed for -- for economic circumstances.

MR. BOB PETERS: And speaking of recent announcements, including the one that was made this past weekend, Mr. Thomson, Manitoba Hydro and Wisconsin Public Service have some to a tentative agreement on a 308 megawatt sale.

Is that right?

MR. SCOTT THOMSON: That's -- that's correct.

MR. BOB PETERS: And I'm not looking again for any commercially sensitive information to be disclosed on the public record, but -- and I understand through counsel that contract has not yet been filed in a redacted form on the public record, or un-redacted with this Board.

Is that your understanding as well?

MR. SCOTT THOMSON: That -- that's correct.

MR. BOB PETERS: Are you able, at this time, Mr. Thomson, to indicate to the Board whether transmission is included in that contract?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Would you mind just clarifying what you mean by 'including transmission'?

MR. BOB PETERS: Has it been disclosed, or can you disclose publicly who's paying for the transmission line to ship energy to Wisconsin Public Service?

MS. PATTI RAMAGE: Mr. Peters, maybe I can help with the clarification. Are you talking the transmission investment, as opposed to who pays under the MISO -- or under the tariffs for transmission?

MR. BOB PETERS: Thank you, Ms. Ramage. I'm -- I'm asking who's paying for the investment in the transmission line, the physical transmission line, that is needed to carry the 308 megawatts to -- help me out, is it Green Bay?

MR. SCOTT THOMSON: Okay. We're -- we're building the line to the border. Minnesota Power is -- is going to be the majority owner of the US side of the transmission line. And the -- we'll be looking to incorporate investments from -- from other players south of the border. We have agreed to back-stop, as necessary, the -- the investment -- the minor -- a mon -- sorry, a minority investment in that line up until the time when it can be sold off to third parties.

MR. BOB PETERS: Thank you. And if I'm dancing on eggshells you're going to tell me in short order. But what you've just indicated is that for the first time ever Manitoba Hydro is planning on investing in an asset located in the United States.

Is that correct?

MR. SCOTT THOMSON: A transmission -- well, we -- we hold transmission rights in the US, but the -- this would be the first time we -- I believe, we've -- we've invested in a -- in a transmission line per se.

MR. BOB PETERS: And the size of the transmission line, and we -- we talk about the 750 megawatt transfer capability as being the -- the large line or the larger of the two (2) lines that were being considered.

Is that correct?

MR. SCOTT THOMSON: That's correct. And -- and it would only be if the 750 megawatt intertie was built that we would have an investment. If -- if a two-fifty (250) line gets built that would be funded by Minnesota Power exclusively.

MR. BOB PETERS: Okay. Well, let's just take this one (1) step at a time then. If the -- if the -- you already told the Board this morning in your comments that you have a 250 megawatt sale lined up with Minnesota Power, correct?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And Minnesota Power is prepared to build their own transmission line to the Manitoba border to come and get that power and bring it back down to the Minneapolis area?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: However, to have the opportunity to sell additional power in the states, Manitoba Hydro is proposing that the transmission line

now be up-sized to 750 megawatts as opposed to the 250 megawatts, correct?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And so the only way that Manitoba Hydro can get the energy to Wisconsin Public Service is on a line that is 750 megawatts of transfer capability?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And that 750 megawatt line that Manitoba Hydro is proposing to build, the first third of it, or the two hundred and fifty (250) out of the seven-fifty (750), would still be paid for by Minnesota Power, who you've indicated was prepared to build their own transmission line on their deal?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: So what's left over is, by up-sizing it by an additional 500 megawatts, there's additional capital costs and operating costs that go along with that?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And would it be correct to say that Manitoba Hydro plans to own 49 percent of the line?

MR. SCOTT THOMSON: No, we don't plan on owning that much and, ultimately, we expect to -- to

be able to sell that off. The -- the -- with -- with the two-fifty (250) that -- that Minnesota Power is taking and the three hundred and eight (308) that Wisconsin's taking, there are only -- there -- there remains about 200 megawatts of -- of capacity that would have to be taken up. And we're -- we're confident that we're going to be in a position to do that. We -- we've -- it is commercially sensitive, but I -- we are in discussions with -- with parties about that investment.

MR. BOB PETERS: So the question that precipitated this line of questioning, Mr. Thomson, is: Can you tell us on the public record whether Wisconsin Public Service is prepared to contribute to the 750 megawatt transmission line as part of the recently announced 308 megawatt sale to WPS?

(BRIEF PAUSE)

MR. SCOTT THOMSON: They -- they'll get a delivered product as part of that.

MR. BOB PETERS: I take from your answer that a delivered product means that there's no express payment by Wisconsin Public Service for the transmission line costs, but whatever it pays in the

price of the product Manitoba Hydro delivers will include, from Manitoba Hydro's perspective, a portion on account of transmission costs?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: But Manitoba Hydro would still then be notionally responsible for the capital costs, at least to two-thirds (2/3s) at this point in time, as well as two-thirds (2/3s) of the operating and maintenance costs?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Yeah, Minne -- Minnesota Power will be holding 51 percent of the line. The -- the maximum holdings that we could -- would have would be forty-nine (49).

MR. BOB PETERS: And I take it that that 51-49 percent demarcation isn't necessarily based on financial contribution; it's based on recognition of -- of sovereignty issues, that Manitoba Hydro does not want to be a majority owner of a transmission line located in the United States?

MR. SCOTT THOMSON: That's true in part, yes.

MR. BOB PETERS: Well, what part of

that isn't true?

MR. SCOTT THOMSON: As far as that goes, that's true. We -- we don't want to hold a majority interest in a US asset.

MR. BOB PETERS: All right. So -- so let's not get caught up on 49:51, because the amount of dollars spent won't -- won't track that ownership interest necessarily?

MR. SCOTT THOMSON: That's -- that's fair.

MR. BOB PETERS: Okay. And we know that because Minnesota Power is only in for 250 megawatts, which is one-third (1/3) of the capacity of the line, and yet they're going to own 51 percent of it?

MR. SCOTT THOMSON: And -- yeah. And I think that there -- there's other -- there's other elements of -- of contra -- contractual elements with Minnesota Power probably -- which probably would be best for you to follow up with Mr. Cormie on his panel, he -- he'll be able to speak to it in some detail, and then through the -- the CSI piece.

MR. BOB PETERS: All right. Thank you for that, Mr. Thomson. If I can turn to the PUB Exhibit 58-1. Maybe we'll start at page 3 and look at

-- it's at -- it's Tab 1. It's the PUB's terms of reference.

I was just putting this up, Mr. Thomson, to -- to try to narrow down with you what specifically Manitoba Hydro is asking for this PUB-NFAT panel to do in respect of this -- this hearing that it's conducting.

MR. SCOTT THOMSON: Well, the government's asked the -- the panel to review our plans and make recommendations as it sees fit on them. I think what -- what both myself and -- and Ms. Ramage were speaking to this morning, there are some -- some key elements that have to be dealt with sooner rather than later in terms of -- of moving forward with -- with the first step of our -- our preferred plan, which is around the -- the Keeyask generating station and the interconnection.

And -- and so as a -- as a first step, we're -- we're hopeful that we'll be persuasive with the panel and -- and that they'll recommend that that -- that we proceed down that avenue and preserve the -- preserve the -- the option of -- of building Conawapa as events unfold into the future.

MR. BOB PETERS: Would it be a correct interpretation of your comments that, if this panel

deals with the Keeyask issue and the size of the transmission line issue, in terms of positive recommendations, those would be the only two (2) matters that Manitoba Hydro says are -- are key at this point in time?

MR. SCOTT THOMSON: Those are most critical. Whether -- whether we -- whether we follow that path to build Keeyask or if -- if the determination of the panel was to -- to pursue an all-gas alternative, that would pre-empt a number of things. But if -- if we proceed down the path of -- of Keeyask, we would -- we -- in the fullness of the hearing and the evidence that's been filed and -- and yet to come out in -- in the process of the hearing, I think that -- that the second piece around Conawapa and -- and preserving the option to move forward is also important.

Part -- as I'd mentioned, I think part of what we will be doing over -- in the ensuing years is continuing to -- to monitor and update our analysis to -- to ensure that moving forward with the second phase of the plan makes sense at -- at the time that we have to make those decisions.

MR. BOB PETERS: Would it be fair and accurate, Mr. Thomson, to suggest that the long-term

nature of the Conawapa generating station is one that is not in clear focus as we sit here today because there are many variables?

MR. SCOTT THOMSON: Yeah. We're not as far progressed in terms of -- of that element of it. You know, if I -- if I -- if we think about where we sit with Keeyask, where we've -- where we've identified about 80 percent of the -- the contractors and contract value of -- of moving forward on that project at this point in time, there's -- there's a great deal of -- of certainty around that.

Conawapa was a very well-defined -- is a very well-defined project. We've -- we've been down this path before. There's -- the engineering's been done and we've -- we've incorporated all the lessons learned from -- from Wuskwatim in -- in the assessment of that and -- and the estimating of that. So, you know, I think that -- I think that there's a lot of evidence that's been placed on the record around that, and it makes sense to -- to deal with that at this point in time. I wouldn't -- I wouldn't want to see us just preempt this and -- and bifurcate the hearing.

MR. BOB PETERS: I understand your point, and I'll ask Ms. Villegas to help me turn to page 13 in Board counsel's book of documents, found in

Tab 2, which just set forward an extract of the Preferred Development Plan from Manitoba Hydro's filing.

You mentioned in your last answer to me, Mr. Thomson, that Manitoba Hydro wants -- wants, in my words, the green light on Keeyask, correct?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Because the green light on Keeyask really means either a red light or a yellow light on an all-gas scenario.

MR. SCOTT THOMSON: That's correct. If we -- if we proceed down the path of moving to Keeyask, we have the optionality of Conawapa or gas in the future beyond Keeyask.

MR. BOB PETERS: Now, in terms of the commitment to Keeyask, is it on the public record -- and I believe it is, so I'll ask the question in a way that I think is appropriate -- that there is no mandatory requirement for Manitoba Hydro to commence Keeyask construction in the summer of 2014 if Manitoba Hydro still wants to preserve the export contracts, some of which are shown on the screen.

MR. SCOTT THOMSON: There's -- there are some provisions in the -- in the contractual arrangement that we have with -- with Minnesota Power

that would allow for -- for regulatory delay. If a proj -- projects that get delayed tend to cost more money. We're -- we're in a position where we're ready to go this summer. We've identified the contractors, and we have made investments to date in -- in the project. So -- so if the -- if it's put on hold, it's almost certainly to cost more in the long run.

MR. BOB PETERS: Okay. Well, we'll -- we'll deal with that part of your answer, if not with you, we'll -- I'm sure we'll talk to -- to others about that -- that portion. But let's just talk about the -- the delay possibilities of constructing Keeyask.

Can you indicate on the public record for how many years Manitoba Hydro can delay the construction of Keeyask for regulatory purposes without losing the export contracts that Manitoba Hydro has -- has signed?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Sorry about that. There's -- there's up to a two (2) year regulatory delay allowed.

MR. BOB PETERS: And so if for any reason the provincial government wanted to or requires

additional time to finalize its decisions, there are additional years for such delay, that's two (2) years you're telling us, and you would still preserve the contractual arrangements that Manitoba Hydro has negotiated?

MR. SCOTT THOMSON: That's correct. I -- the two (2) year window, it is -- is there for regulatory purposes, but we've also got to accommodate the construction schedule as well, so.

(BRIEF PAUSE)

MR. BOB PETERS: Just on the point, your second point. I want to come back to it. You said projects delayed cost -- end up costing more money, and one (1) of the reasons for that delay is the financing costs of whatever money has been spent to date?

MR. SCOTT THOMSON: That's part of it, yes.

MR. BOB PETERS: And --

MR. SCOTT THOMSON: And -- and then general escalation in pricing.

MR. BOB PETERS: The general escalation in pricing would be for the contractual commitments,

and the buying the -- the components?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: Can you indicate -- when you indicate that, in your opening comments, up to 80 percent of the Keeyask costs will be, in my words, committed once the Keeyask civil contract is let, have I got that evidence from you right?

MR. SCOTT THOMSON: You have, subject to approvals to proceed. So I -- we're -- we're not -- we -- we -- there are outs if we don't get regulatory approval.

MR. BOB PETERS: And si -- 80 percent of the construction costs will be let, or in place.

Is that 80 percent of the $6.2 billion?

MR. SCOTT THOMSON: It's the -- it's the -- the hard construction related costs. A -- a significant portion of -- of the six point two (6.2) is associated with -- with financing.

MR. BOB PETERS: Okay. Let me ask it this way. Are you able to put on the record what the dollar amount is that -- what does that 80 percent equate to in dollars?

MR. SCOTT THOMSON: You'd probably be better to wait and ask the panel that -- that's going to deal with capital costs on -- on the var -- I -- I

just don't have the information in front of me, and -- and it would make more sense to have -- have those folks deal with it.

MR. BOB PETERS: When -- okay, when you talked about those contracts having different outs in it in terms of a two (2) year regulatory delay, as an example, are there any financial penalties as a result of the delay?

MR. SCOTT THOMSON: There are -- in -- in the -- the most significant of the contracts, the general civil contract that we've negotiated, there are -- there are clauses that would allow for delay, and there's clauses that would deal with cancellation. They're -- they're relatively nominal in the -- in the scheme of the project, but beyond that, that is commercially sensitive.

MR. BOB PETERS: And can you indicate to the panel how much money of -- and -- and let me start off, maybe, by this question.

Would I be correct in understanding that the Keeyask generating station, for purposes of this NFAT, has been priced out in service at $6.2 billion?

MR. SCOTT THOMSON: Say that -- please say that again?

MR. BOB PETERS: All right. I'll

change it. What is going to be the in-service cost of Keeyask?

MR. SCOTT THOMSON: Yeah, we're -- we're -- as I mentioned in my -- my remarks, we're in the process of finalizing our -- our review of our contingencies and management reserves. That information is going to be shared with Knight Piesold -- Piesold later this week, I believe, and -- and then be available by next week for Panel 2.

MR. BOB PETERS: That answer suggests to me that the $6.2 billion number may not be fixed in stone.

MR. SCOTT THOMSON: Well, we're -- we're finalizing a revision to cost estimates. Once -- with the general civil contract being the -- the most significant piece of the project, the -- the bid that -- that we had received was -- was within our -- our pro -- our point estimate and -- and contingency, but it -- it caused us, as would normally be our custom when we -- when we enter into a significant arrangement, to review the adequacy of the reserves. It's a -- it's a major milestone in the -- in the project then.

So based on that, the -- the preliminary indication is that there is going to be a change in our -- in our reserve estimates, and -- and that

information will be available for next week.

MR. BOB PETERS: On page 70 of the book of documents, found at Tab 20 -- twenty-three (23), there's -- there's a graph that depicts over time the capital cost increases on Conawapa, Keeyask, Bipole 3, and Wuskwatim. You've be familiar with those since you came to Manitoba Hydro, sir?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: I -- I didn't understand from your last question and -- and -- or your last answer to my question that the Keeyask generating station -- you were going to look at the management reserves and the contingencies is what I heard, but I was given to understand that the management reserves and contingencies are already built into the $6.2 billion number?

MR. SCOTT THOMSON: Yes, they are.

MR. BOB PETERS: All right. So what you're telling the panel is, based on Manitoba Hydro's review, the panel next week will be in a better position to indicate whether that $6.2 billion figure is firm, or whether it's different than 6.2 billion?

MR. SCOTT THOMSON: They will be able to confirm that. And -- but I can tell you today, it's going to be adjusted upwards.

MR. BOB PETERS: All right. So that takes out the surprise as to whether it's up or down, but the magnitude of the increase, is that something that's -- you're able to quantify, at least estimate at this time, or is that something you have to wait?

MR. SCOTT THOMSON: I -- I'd prefer if -- if we -- if you could bear with us for a couple more days. We are -- we're finalizing it and going over it at the executive committee tomorrow. I've seen the preliminary results, but --

MR. BOB PETERS: Okay. I'll respect you want to take it through your executive and that'll -- that'll also get reported to your board, I take it?

MR. SCOTT THOMSON: M-hm. Yes.

MR. BOB PETERS: In terms of the Keeyask cost to date, is it correct that Manitoba Hydro has spent approximately $1 billion on the Keeyask project to date?

(BRIEF PAUSE)

MR. SCOTT THOMSON: I'm -- I'm advised by my colleague that it's not to date, but expected to be by June when the decision has to be made.

MR. BOB PETERS: You mean -- you mean

it's not June?

MR. SCOTT THOMSON: Jesus, I hope not with this weather.

MR. BOB PETERS: You're not alone. There is a response, and I am corrected, that June of '14, the expected expenses that will have been already paid for by Manitoba Hydro will be $1 billion for Keeyask.

And -- and likewise, is it -- for Conawapa, there's been approximately $300 million spent -- expected by June of '14?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Mr. Thomson, I don't want you to divulge any discussions you've had with the province, but I take it that Manitoba Hydro is in communication with the province, because it nominally owns the share for all Manitobans?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And in -- in terms of the permissions that Manitoba Hydro requires from the province, on tab -- on page 18 of my book of documents, I have a couple of extracts from the Manitoba Hydro Act, and perhaps on page 19 it's set out even better, that the -- Manitoba Hydro needs the permission of the Lieutenant Governor-in-Council to develop new power

generation stations, correct?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And I also understand from the legislation -- I'm not asking you to put your lawyer's hat on. You -- you have enough of them around you at this time. But Manitoba Hydro also requires the permission of the province before Manitoba Hydro can spend over a certain amount?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Much like me with my wife, but the numbers are quite a bit different here. The -- the budgetary approval that Manitoba Hydro requires is for expenditures in excess of $5 million -- million?

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Peters, I reluctantly admit I don't have the Act memorized, and I'm not a hundred percent sure on the answer to that. So in fairness to Mr. Thomson, it -- it will read as it reads. But rather than myself review the -- the Act on the spot, maybe we could defer that to --

MR. BOB PETERS: All right.

MS. PATTI RAMAGE: -- this afternoon.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: I'll -- I'll move along, and I know -- recognize we're approaching the lunch hour.

Manitoba Hydro, Mr. Thomson, does not yet have final approval from the Lieutenant Governor-in-Council to construct Keeyask, does it?

MR. SCOTT THOMSON: That's correct. We have approvals to do the work that we've done so far --

MR. BOB PETERS: All right. In terms --

MR. SCOTT THOMSON: -- in the infrastructure project.

MR. BOB PETERS: I'm sorry for cutting you off. You have approvals for the infrastructure projects?

MR. SCOTT THOMSON: The Keeyask infrastructure project, building the roads and -- in and -- and the -- the preliminary work, the camps.

MR. BOB PETERS: Is that preliminary work is what's costing $1 billion?

MR. SCOTT THOMSON: That's a portion of it.

MR. BOB PETERS: Has Manitoba Hydro obtained specific approvals along the way, Mr. Thomson, or is it a blanket approval that Manitoba Hydro was

operating under in terms of its expenditures on Keeyask?

MR. SCOTT THOMSON: Not a blanket approval.

(BRIEF PAUSE)

MR. SCOTT THOMSON: We -- we didn't have a blanket approval for the -- the full amounts, but the various components where we needed approvals have been obtained.

MR. BOB PETERS: Mr. Thomson, has the Manitoba Hydro Electric Board retained any independent expert consultants to conduct any due diligence on Manitoba Hydro's Preferred Development Plan?

MR. SCOTT THOMSON: No, I don't believe they have.

MR. BOB PETERS: And to your knowledge and Manitoba Hydro's knowledge, has the Government of Manitoba retained any independent expert consultants to conduct any due diligence on Manitoba Hydro's Preferred Development Plan?

MR. SCOTT THOMSON: I -- I believe that was the purpose of this whole proceeding.

MR. BOB PETERS: All right. So you

understand that the government hasn't retained it -- any of its own independent expert consultants, but the government is relying on the Public Utilities Board to conduct this NFAT and provide a report as part of the government's due diligence?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Mr. Chairman, in light of the hour, I would suggest I stand down for the lunch hour. I am prepared to continue after lunch for a limited period of time, recognizing that by two o'clock I will have to turn the microphone over to other counsel to finish by 3:30, which will allow Mr. Wojczynski to finish by 4:30. So that would be my game plan recommended, sir.

THE CHAIRPERSON: And what is your recommendation for us to resume these proceedings?

MR. BOB PETERS: I'd say 1:15 would be fine, if that suits the panel.

THE CHAIRPERSON: There seems to be a consensus that we can start at 1:00 if that --

MR. BOB PETERS: I'll be here.

THE CHAIRPERSON: Okay.

MR. BOB PETERS: Okay. One o'clock.

THE CHAIRPERSON: One o'clock, then.

MR. BOB PETERS: Thank you.

--- Upon recessing at 12:05 p.m.
--- Upon resuming at 1:01 p.m.

THE CHAIRPERSON: Good afternoon. I think we're ready to resume the proceedings. I just want to remind all attendees that those with microphones to be careful about the management of your microphone, particularly making sure that you turn it off, because the asides that you deliver to your colleagues can be overheard if the microphone is still on. So please be mindful of the sensitivity of these devices. Thank you.

I think we're ready to turn it over back to you, Mr. Peters.

MR. BOB PETERS: Thank you. Good afternoon, Mr. Chairman and the panel, Mr. Thomson, Ms. Ramage.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Mr. Thomson, before lunch you answered a question from Board member Bel. Do you recall that, about the revenues coming from the various contracts?

MR. SCOTT THOMSON: I believe so.

MR. BOB PETERS: And again I'm throwing

out the CSI warning here, that I don't want you to delve in an area that you don't want on the public record for competitive or financial reasons. But when Manitoba Hydro goes to market to sell energy, Manitoba Hydro has, in essence, different products.

Would you agree with that?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And I would suggest that probably Mr. Cormie will be the gentleman who knows what those products are inside and out. And that would be your understanding, as well?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Now, some of those -- when we talk about energy and the products, it may not be intuitive to those who aren't in the -- in the energy industry, but some electricity is worth more than other electricity.

Would that be true?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And I'm not going to talk about any particular contract in my questions at this time, Mr. Thomson. But for example, we -- we talk about firm energy.

And what the panel will learn is that firm energy is exported by Manitoba Hydro out of

Manitoba Hydro's dependable energy?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And that's a -- that's one of the most valuable products that Manitoba Hydro can sell?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Because that's the product that's being sold to everybody in this room, is dependable energy?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And for those residential customers, they're paying approximately seven (7) cents a kilowatt hour for it?

MR. SCOTT THOMSON: That's the delivered cost, yes.

MR. BOB PETERS: All right. And your export partners who buy that similar product will have a price that's negotiated between them and Manitoba Hydro for that product?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And that dependable energy has its highest value during the peak hours of the day for your counterparties generally.

Would you agree with that?

MR. SCOTT THOMSON: Generally, yes.

MR. BOB PETERS: All right. And let's -- let's leave the caveat on the table that if Mr. Cormie is listening or reading and disagrees with this, we'll give him ample opportunity to -- to clarify the record.

So the peak energy that comes out of the dependable energy on a firm contract for Manitoba Hydro is probably one of Manitoba Hydro's most valuable products that it sells?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And that leads to then there are other products that Manitoba Hydro also sells to its counterparties that is not as valuable.

MR. SCOTT THOMSON: It follows.

MR. BOB PETERS: All right. And when I talk 'counterparties', I'm talking about a bilateral agreement between Manitoba Hydro and a named US utility, correct?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And the other option for Manitoba Hydro, in terms of export sales, is not to have a counterparty on the other end of the deal, but Manitoba Hydro could just sell it into the MISO market?

MR. SCOTT THOMSON: Yeah, real time or day ahead.

MR. BOB PETERS: And -- and the MISO market is -- as it says, it's an electricity market where buyers and sellers meet and all electronically done so that sellers can put their product into the market and buyers can buy out of the prod -- out of the market what products they need?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Now, when you and Board member Bel were talking about -- I believe your number was $9 billion in sales to 2035, and that was your number, sir?

MR. SCOTT THOMSON: Yeah.

MR. BOB PETERS: Would it be correct to say that that $9 billion in sales is made up of the sales of different products?

They're not all the same product?

MR. SCOTT THOMSON: That's true.

MR. BOB PETERS: And if they're not all the same products, they probably don't all have the same price?

MR. SCOTT THOMSON: That's true.

MR. BOB PETERS: All right. And the alternative to selling it to a counterparty, from Manitoba Hydro's perspective, is that if it has surplus energy, it can just sell it into the MISO market rather

than go to a counterparty and -- and execute a bilateral contract?

MR. SCOTT THOMSON: That -- that's true.

MR. BOB PETERS: But there may also be reasons that counterparties want to buy certain products from Manitoba Hydro that they might be able to shop around for in the market but they prefer to buy them from Manitoba Hydro?

MR. SCOTT THOMSON: Yeah, they have -- they probably have options to do other bilaterals. I think that certainly when we enter into firm contracts, we're -- with -- with customers, there's a mutual benefit in that they're -- they're looking at it to provide dependable energy to their customers as opposed to buying surplu -- they -- they'll have a portion of their portfolio that they'll -- they'll look at, and balancing requirements and whatnot that they'll go to the market with, but they'll have an -- a -- an element of their supply stack that they -- they have committed.

And they'll buy some of that in the States from coal plants and -- and gas plants and -- and some of them have entered into arrangements with us.

MR. BOB PETERS: And is it -- are you

able to put on the public record your answer to whether or not Manitoba Hydro also sells products that aren't firm energy under its contracts with bilateral arrangements?

MR. SCOTT THOMSON: Yeah, I believe that's -- that's true.

MR. BOB PETERS: And that maybe was a little awkward in my questioning, but what you're telling the Board is that perhaps instead of selling it into the MISO market, Manitoba Hydro could sell it to a counterparty pursuant to some of these long-term contracts?

MR. SCOTT THOMSON: Yes, that's true.

MR. BOB PETERS: All right. And that leads me to the discussion again you had with Board member Bel, and in terms of coming up with a quantity, are you able to put on the public record your answer to this question, as to whether or not any of Manitoba Hydro's sales of $9 billion comes from products that wou -- that would otherwise or could otherwise be sold into the MISO market?

MR. SCOTT THOMSON: Well, it -- it could all be sold into the MISO market, but -- but it would be inopportune to do so. We can maximize the value by entering into long-term arrangements with --

with customers. If we went a hundred percent spot, we wouldn't expect to -- to achieve the same value that -- that we've been able to do with this -- this arran -- the arrangements that we've entered into.

MR. BOB PETERS: All right. And if -- but you wouldn't want to go a hundred percent spot with your dependable product, because that's your -- your highest value product, correct?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: But you may also have a -- a lower valued product that would ordinarily be sold into the -- that could be sold into the MISO market that you could also package up as part of a -- an export contract to a counterparty if you could find one?

MR. SCOTT THOMSON: Well, that's true, and we often do. From year to year, we'll enter into arrangements for short term over the winter that we can shape -- shape shorter term arrangements that are -- are -- and extract a higher value from that. It'll depend on reservoir levels from year to year, whereas when we -- when we go out to the market and we sell long-term firm, we know that that power's going to be available in low-water years because we -- we base that -- that energy availability on the lowest flow

conditions that -- that we've had in the last hundred (100) years.

So we -- there's only a certain amount that we can sell up to in -- in that and we do -- we do pursue those sales, as -- as they are -- can be higher value. But from year to year, and seasonally, we might enter into short-term arrangements as well.

MR. BOB PETERS: Thank you for that answer Mr. Thomson. Good point you made in your answer to the panel is that, dependable energy is what gives rise to the firm contracts that Manitoba Hydro can sell, correct?

MR. SCOTT THOMSON: Correct.

MR. BOB PETERS: And dependable energy is defined as that energy that would be available in Manitoba over the last hundred years of actual precipitation and water regimes?

MR. SCOTT THOMSON: That's correct. And -- and based on the installed capacity of the plants.

MR. BOB PETERS: The dependable energy will increase as your installed capacity goes up and that's the essence of the NFAT in terms of what you're going to see with Keeyask and Conawapa?

MR. SCOTT THOMSON: That's correct,

we're reusing the same water that's already gone through other turbines.

MR. BOB PETERS: But dependable energy then could be considered -- and tell me if this is true -- as the lowest level of water that Manitoba Hydro expects to experience based on it's hundred years of history?

(BRIEF PAUSE)

MR. SCOTT THOMSON: In essence that's true, plus -- plus any contractual imports that we have in -- in thermal capacity.

MR. BOB PETERS: Okay, I should have --

MR. SCOTT THOMSON: Because we --

MR. BOB PETERS: -- dependable hydraulic resource than is the lowest water flows that you've had in the last hundred years?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And you have other dependable energy. And we'll get into the -- into the Power Resource Plan, but alas not with you. At least not today.

MR. SCOTT THOMSON: Not, alas.

MR. BOB PETERS: So, Mr. Thomson, where

we're going then is, your dependable product is -- it's not called guaranteed, but it's the next best thing to guaranteeing it, based on your hundred years of water flows.

MR. SCOTT THOMSON: That's -- that's correct.

MR. BOB PETERS: And if you have water flows that are above that dependable level, that gives you opportunity to sell excess power?

MR. SCOTT THOMSON: That's true --

MR. BOB PETERS: And that excess power, sir, would be not quite as valuable, in any event, as your firm dependable power?

MR. SCOTT THOMSON: That's probably fair to say, although at times power can be worth -- you know spot power can be worth a lot more than -- than firm committed contracts. I mean that's a market dependant --

MR. BOB PETERS: Okay. Good answer then in the sense that what you're telling the panel is the market is what the market is, but, generally speaking, your dependable product has a better value than the -- than the non-firm market product?

MR. SCOTT THOMSON: I think as a general rule that's fair.

MR. BOB PETERS: And so when you gave Board member Bel the $9 billion number, does that include any non-firm energy, or is all of that 100 percent firm dependable energy?

(BRIEF PAUSE)

MR. SCOTT THOMSON: My understanding is that's just firm contracts. But Mr. Cormie could confirm that.

MR. BOB PETERS: All right and -- and to give Mr. Cormie an opportunity to gear up to confirm that, I'm going to ask an undertaking through your counsel to provide it when Mr. Cormie testifies so that we can go through it for the benefit of certainly Board Member Bel and others.

And that undertaking is to -- is to provide the firm price revenue from the contracts that are listed. If we go to Tab 13, page 49 of Board counsel's book of documents -- thank you Ms. Villegas -- you'll see -- you'll see a sheet that breaks down the contracts. And one (1) of the columns that's missing is the -- is the period in which the export is to occur. I'm going to ask that, that also be filled in, if Manitoba Hydro agrees. I'm on page 49, sir -- maybe

I've lost you -- Tab 13 of the book of documents.

MR. SCOTT THOMSON: Well, the term of the contracts is listed there.

MR. BOB PETERS: Yes, but the period -- and when I say, "period," I'm talking about you know we've learned about 5x16 power, 2x16 power, and -- and that type of in -- information.

I believe one of your counsel will have the worksheet that includes that information, and I'm going to ask that this be updated and include on this as well now the 308 megawatt contract with Wisconsin Public Service.

--- UNDERTAKING NO. 1: Manitoba Hydro to provide the firm price revenue from the contracts that are listed and an updated worksheet to include the 308 megawatt contract with Wisconsin Public Service

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: In addition to that request, it's either going to be Undertaking Number 1(b) or number 2, I would like you to break down as by

contract how much of that $9 billion comes from which contract and for which product, and certainly the -- the time frame would be -- would be on that in -- information as well.

MR. SCOTT THOMSON: Okay. That'll have to be done on blue paper. That'll be a confidential filing.

MR. BOB PETERS: I understand that, and thank you, sir. I -- I can also indicate that on blue paper currently, Manitoba Hydro provided a response to PUB Information Request First Round 1 -- no, sorry, Fir -- First Round Question 282(a) and 282(b), which contains a -- a considerable amount of that information, although there might have been a little duplication in -- in those two (2) answers.

But to break it down in terms of dollars by contract, I would like the time frame included, and the product that is being sold to generate that revenue included, and I'd like that to also be clear as to whether it includes a capacity payment, whether it includes transmission payments, and whether it includes energy charges, so that we can explain to the -- to the panel that answer you gave about the $9 billion.

MS. PATTI RAMAGE: Mr. Peters, we can accept that undertaking, subject to the same proviso

that you began with at the beginning of this. If Mr. Cormie sees any issues with any of those requests, we will have to get back to you and -- but at this point we can accept what we've heard.

MR. BOB PETERS: And, Ms. Ramage, while we're conversing, I wonder if Manitoba Hydro could also, when it's responding to that, determine if it can compile a public version of that document which may require some aggregation, but at least then it can be discussed on the -- on the public record.

MS. PATTI RAMAGE: We can certainly undertake to determine if we can do it.

MR. BOB PETERS: That's all I'm asking at this time. Thank you, Ms. Ramage.

(BRIEF PAUSE)

MR. BOB PETERS: It's all part of Undertaking 2, yes. Thank you.

--- UNDERTAKING NO. 2: Manitoba Hydro to break down as by contract how much of the $9 billion comes from which contract and for which product, as

well as time frame, and determine if Manitoba Hydro can compile a public version of that document

MR. BOB PETERS: Thank you, Mr. Thomson --

THE CHAIRPERSON: Mr. Peters, could I just in -- interject a few questions, since you were talking about export contracts.

I just want to clarify one (1) thing that I thought I heard this morning, which is that the -- the firm power that's available for sale as a result of Keeyask has now all been committed.

MR. SCOTT THOMSON: Yes.

THE CHAIRPERSON: So there would be no further contracts that you would be comfortable with signing involving a counterparty for the production of dependable energy out of -- out of the Keeyask generation station?

MR. SCOTT THOMSON: Unless it -- yeah, that's correct, but we -- we anticipate with our internal load growth and the -- and the committed sales that -- that it's -- it's all utilized. There might be a sh -- very short-term piece. I'd like to confirm

that with Mr. Cormie.

THE CHAIRPERSON: Now, I -- again I want to confirm that you -- I thought I understood you to say that the -- the power sale that you just recently announced, the two fifty (250) that relates to the Minnesota Power, leaves a portion of that 750 kV line that would be available for transactions.

MR. SCOTT THOMSON: That's correct, yeah. Fi -- it's a 500 kV line, 750 megawatts of transfer capacity, and -- and so, yes, the -- the -- there's two fifty (250) committed with MP. The three hundred and eight (308) -- and so that leaves the -- the balance is -- is available still to contract.

THE CHAIRPERSON: Now, I know that you would have some available dependable power between now and 2019. In other words, we're not using -- we're not -- we -- we haven't committed the entire dependable energy from the system, as it currently stands, from now till 2019.

You would be in a position to sell some of that power on a -- on a firm basis into the US?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Mr. Chairman, I --

I understand I misspoke in my previous response, that there is some other available capacity in the period beyond 2019, but I -- I think it might be better to have Mr. Cormie explain that.

THE CHAIRPERSON: In relation to my earlier question with respect to the system that currently stands now, you know, now to 2019, when -- assuming the Keeyask comes into play, the -- there is some dependable energy that is available for sale on a long-term basis now?

MR. SCOTT THOMSON: We have other resources that -- other than -- than the hydro resources that are available to us. It's a question of whether there's poten -- you know, a buyer available for that. The -- the attributes of those resources, they -- they have that capability in -- in the US.

THE CHAIRPERSON: The reason I'm asking -- the reason I'm asking, it's not really germane to the -- to the Pre -- Preferred Development Plan, but germane to my understanding, I -- I -- you know, I do know that MISO is undertaking a review of the available resources for -- and during the period of '15/'16 because they're concerned about reserve levels and so on during that period because of coal retirements.

MR. SCOTT THOMSON: M-hm.

THE CHAIRPERSON: I guess the question is -- my -- my reaction to that was it represents an opportunity for Manitoba Hydro to sell power to distributors in the US who are faced with this tight -- tight system.

And I guess the question is: Is that something that you're exploring at -- at the moment, or is that something that --

MR. SCOTT THOMSON: In the interim... Short-term sales to -- to the extent that we have capacity available and -- and from time to time, as -- as I'd mentioned previously, that -- that power -- we're in ongoing discussions with -- with utilities in -- in the US.

THE CHAIRPERSON: Back to you, Mr. Peters.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Thank you. The book of documents has at Tab 5, starting on -- perhaps we could jump to page 24, has some extracts from Manitoba Hydro's Corporate Strategic Plan published November 2013, Mr. Thomson?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: Your fingerprints are

all over that?

MR. SCOTT THOMSON: I'm familiar with the document.

MR. BOB PETERS: All right, sir. This document actually replaces the one that got filed in the NFAT. This is a new document that I don't think was filed in the NFAT, correct?

It replaces the previous Corporate Strategic Plan?

(BRIEF PAUSE)

MR. BOB PETERS: Let's -- let's -- that's just a question anyone can research, but I -- I think this is a new document, or prepared certainly after Manitoba Hydro filed its NFAT?

MR. SCOTT THOMSON: We -- we updated our Strategic Plan, yes. I -- I just wasn't sure whether you had last year's plan in the original filing. I was trying to check that.

MR. BOB PETERS: We do. We -- we have -- we have --

MR. SCOTT THOMSON: Okay. Then yes, this would be a different plan.

MR. BOB PETERS: All right. And that -

- my question was this wasn't part of the NFAT filing? And I just wanted to bring it forward for parties' and the Board's benefit, and you've already claimed some ownership of authorship in this document, Mr. Thomson?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And on page 24, which you'll see in front of you, on page 24 of the book of documents, you will see in front of you an extract from the -- from the Corporate Strategic Plan.

In -- in essence, you're -- you're saying here what I think the Board heard you say this morning, is that Manitoba Hydro wants to commit down a pathway without committing to final decisions that don't, at this point in time, have to be made?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And the plans can be modified as circumstances unfold?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And one (1) of those circumstances would be load growth, correct?

MR. SCOTT THOMSON: That's one (1) of the factors we'll continue to evaluate, yes.

MR. BOB PETERS: And, in essence, if the load growth is higher than what's forecast, you'll need new resources sooner; and if it's slower than

forecast, you won't need new resources as quickly as you're currently planning?

MR. SCOTT THOMSON: Yeah.

MR. BOB PETERS: And while we're on the topic of load growth, you'd mentioned something in your opening comments this morning about Manitoba Hydro load growing. And on page 37 of the book of documents found under Tab 7, there is a less than average depiction of a -- of a chart showing electric heat customers' forecast, and it did not come out on the scanned copy, and I'll try to remedy that with a better colour copy for those who -- who want one.

But, in essence, Mr. Thomson, are you aware that from 2011 through '12 to '13 the -- the number of residential heat customers forecast has declined for the Corporation? You won't see it on that chart, sir.

MR. SCOTT THOMSON: No.

MR. BOB PETERS: I apologize.

MR. SCOTT THOMSON: Could I ask you to -- to -- when you reference the pages, the tabs that you're referring to? It just makes it a lot easier for me to find my notes on it.

MR. BOB PETERS: Reference it by tab, sir?

MR. SCOTT THOMSON: Yeah. You had --

MR. BOB PETERS: For tabs?

MR. SCOTT THOMSON: -- you had tabbed headings on -- on these documents.

MR. BOB PETERS: Yes, I did, and I'm -- I'm currently under Tab 7 --

MR. SCOTT THOMSON: Perfect.

MR. BOB PETERS: -- page 37. I apologize.

MR. SCOTT THOMSON: Yeah. No, that's okay.

MR. BOB PETERS: I've tried to make the page numbers paginate with the PDF, and that was not an easy task for me.

MR. SCOTT THOMSON: Okay. And sorry, I'm -- I'm oriented now.

MR. BOB PETERS: Is it correct to the panel that Manitoba Hydro revised its 2013 load forecast and now projects reduced customer numbers using electric heat by about fifteen thousand (15,000) at the end of the twenty (20) year forecast, like the number of customers is forecast downwards?

MR. SCOTT THOMSON: My understanding is that -- that, yes, there's fewer electric space heating customers in the 2013 forecast.

MR. BOB PETERS: And that's based on Manitoba Hydro's most current information, or is there a 2014 load forecast available?

MR. SCOTT THOMSON: This is the most recent information, as I understand it, and certainly the -- the load forecasting panel that's coming up next will be able to speak to that.

MR. BOB PETERS: Abs -- absolutely. And the -- and the -- also, now found at Tab 8, page 39 of the book of documents is a 2011, '12, and '13 residential load forecast by the standard customers, and standard customers are those who do not use electricity for space heat.

That's your understanding, sir?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And is there a conscious move afoot within Manitoba Hydro to have customers switch from electric space heat to gas space heat?

MR. SCOTT THOMSON: There's currently an -- an education program ongoing to -- to explain the -- the benefits of -- of using gas for space and water heating.

MR. BOB PETERS: Does that education include the results of the fuel switching report that

Manitoba Hydro did where I recall it being approximately seven thousand dollars ($7,000) cheaper for customers to convert to gas rather than stay on electric heat?

MR. SCOTT THOMSON: Yeah, the -- the savings attributable to -- to electric space heating is -- is included in that educational material.

MR. BOB PETERS: So perhaps, unlike your prior employment in British Columbia where you were trying to extol the virtues of gas heat, Manitoba Hydro, because it owns both sides of the energy sector, finds itself in a position it does not want to promote one over the other.

Would that be true?

MR. SCOTT THOMSON: Well, we want to make the -- the -- all of the information available to our customers and allow them to -- to make up their minds about what makes the most sense for them. There's the -- the Provincial Energy Plan has a very long-term objective of -- of getting the province off a carbon economy, so in the very long term that -- that's -- that's a stated goal.

We are -- we are trying to make the information available to our customers so that they can make informed choices.

MR. BOB PETERS: Almost a political answer, Mr. Thomson, but -- but you're -- you're not -- if -- if a customer walks up to you at lunchtime today and said, Should I heat with gas or heat with electricity, Manitoba Hydro wouldn't give him a direct answer? It would say, Here's the material, you decide for yourself?

Have I summarized your answer correctly?

MR. SCOTT THOMSON: Yeah. I -- yeah. I mean, it would depend on the person's perspective, but I -- I use natural gas for space heating in my home, and if I was building a new home, I would build it with natural gas space heating. I'm making that on -- on a whole host of -- of different determinants, but -- but it's -- it's cheaper, and broadly speaking, it -- it provides benefits to the customer, the utility, and the province as a whole.

MR. BOB PETERS: So what benefit to the province as a whole does heating with gas have relative to -- relative to heating with electricity?

MR. SCOTT THOMSON: The -- the -- to the extent that we were -- we create surplus that can be sold, there's -- there's a benefit in terms of -- of revenue. So there's a -- a net benefit to the province, the provincial economy, in terms of what we

can export power for that -- that would be freed up. And that's in the -- in the report that you were referring to.

MR. BOB PETERS: All right. In terms of simple math, I told you earlier that the residential rate was seven (7) cents a kilowatt hour, or seven point zero-two (7.02).

You'd accept that?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And so if you were to export your energy at a price less than seven point zero-two (7.02) cents, Manitoba Hydro would actually be losing money?

MR. SCOTT THOMSON: Over the long haul, we can -- if we can shape that -- that product, it's -- it's beneficial. And -- and we're -- we're utilizing capacity that exists on the natural gas system, so there's revenues that are -- that are achieved from -- on -- on the gas system.

MR. BOB PETERS: All right. Does -- does Manitoba Hydro then not raise a concern with greenhouse gas emission by converting from electric to gas heat?

MR. SCOTT THOMSON: Well, that's another one of the areas where there's -- there's

challenges from a regional perspective. The -- the exported power, it's displacing -- largely displacing thermal generation outside the province, which is about twice as intense in terms of emissions as -- as is the -- the combustion of natural gas in a -- in a high-efficiency furnace. So there's a net reduction in regional greenhouse gas emissions even if there's a -- an increase in provincial gas emi -- or GHGs.

And again, that's another -- that's another challenge for the way the score card works in terms of -- of who gets to account for what, but on a -- on a regional basis, it's -- it's -- it reduces the amount of greenhouse gas emissions.

MR. BOB PETERS: Manitoba Hydro imports electricity at night?

MR. SCOTT THOMSON: At times, yes.

MR. BOB PETERS: Probably every night for the last six (6) months, eight (8) months? Would you know that, or is that a question for Mr. Cormie?

(BRIEF PAUSE)

MR. SCOTT THOMSON: I -- I can't speak to whether it's every night, but -- but that information can be -- be made available on the next

panel.

MR. BOB PETERS: All right, but you understand that Manitoba Hydro will import electricity at night and, maybe the word is pond the water, or keep that energy in reservoir, and try to sell it at a higher price later?

MR. SCOTT THOMSON: Absolutely.

MR. BOB PETERS: And when Manitoba Hydro imports energy, it's importing out of the MISO market?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And im -- importing at night, if that's what Manitoba Hydro does, it's likely importing coal-based energy?

MR. SCOTT THOMSON: It can be coal, it can be base-load gas, and it can be wind. When -- the wind blows when the wind blows, and -- and so there's an opportunity there for us to bring that -- that power across the line.

In fact, that's one of the reasons why some of our US customers that have wind generation, they -- they want to buy our hydro power. It's -- it's an opportunity.

But as you -- as -- as Mr. Peters suggested, there -- there are ar -- arbitrage

opportunities for us, and -- and that helps us to keep our rates low as well. We can -- we can hold back water from -- in the reservoirs and -- and buy it cheaply and sell it for higher value in the day market.

MR. BOB PETERS: Does Manitoba Hydro specify what generation source created the electricity that Manitoba Hydro imports?

MR. SCOTT THOMSON: I -- I don't believe so, no.

MR. BOB PETERS: Manitoba Hydro doesn't say, We don't want coal generated electricity, we only want wind or gas?

MR. SCOTT THOMSON: We -- as far as I'm -- I know, we don't.

MR. BOB PETERS: And you probably couldn't do that from a MISO market perspective, where it's all fungible, in any event?

MR. SCOTT THOMSON: I think that's fair.

MR. BOB PETERS: And in terms of the document that's in front of you on page 39 from Tab 8, what is -- what is your understanding as to why the residential standard customer count is -- is decreasing from in the forecasts?

(BRIEF PAUSE)

MR. SCOTT THOMSON: I don't believe it is. The -- the eleven (11) line is the -- the lowest on the -- on the graph I've got in front of me. I think it's off slightly from last year, but it's up from eleven (11), unless I'm looking at the wrong document.

MR. BOB PETERS: I'm going to have to get a better copy, and I think that'll be a matter for tomorrow. But I think we are -- I think the -- the bottom line is the...

MR. SCOTT THOMSON: The bottom line's the 2011 forecast?

MR. BOB PETERS: Yes, correct. And -- and if you follow where we are, the 2013 I thought was the bottom line on this graph starting near the -- the left axis.

MR. SCOTT THOMSON: And it goes up and eclipses the previous year line.

MR. BOB PETERS: There -- there is a crossover at some point --

MR. SCOTT THOMSON: Yeah.

MR. BOB PETERS: -- in the future, but it's dropped in recent times, and my -- my question was

why does -- why does that appear to be happening?

MR. SCOTT THOMSON: Why don't you ask that for the detailed panel?

MR. BOB PETERS: All right, I'll take that.

MR. PATTI RAMAGE: Mr. Peters, could it -- we also ask perhaps if you gave us the source of the graph so we could check?

MR. BOB PETERS: Oh, sure. We'll provide that. I believe it was the load forecast that's shown in the right-hand column, Ms. Ramage, 2011, 2012, 2013 load forecast numbers.

If we turn the tab to --

MS. PATTI RAMAGE: Is there -- sorry. Is there an IR, or where it's --

MR. BOB PETERS: No, it's taken right out of the load forecasts.

MS. PATTI RAMAGE: So it's been prepared --

MR. BOB PETERS: Yes. Yes.

MS. PATTI RAMAGE: -- by a Board advisor. Okay. Thank you.

MR. BOB PETERS: Check Appendix C and D of those load forecasts and you'll find the -- the data.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Tab 9, Mr. Thomson, page 41 of the book of documents. You had mentioned earlier to the panel in your opening comments that -- that the industry sectors -- or there was growth happening in Manitoba, and would it be correct to say that when it comes to the top consumers, at this point in time, that that growth is not evident?

MR. SCOTT THOMSON: No, I don't think that would be -- be correct. The -- there were -- there were a couple of -- in -- in this graph that you're referring to, there was -- there was a loss of a large customer that -- that had an adjustment to that.

But following that, we -- we expect -- we expect to see that continue to -- to grow, and in re -- in recent times, we've been seeing that.

MR. BOB PETERS: Well, then if we turn to Tab 10 and page 43, we see out of one of the load forecast documents, a -- a graph of general service top consumers.

Do you see that?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And the -- the blue dots, if that's what they are, the dark ones, show the history or the actual results and -- and make reference

and visually depict that Manitoba Hydro has perhaps lost some load from top consumers?

MR. SCOTT THOMSON: Yes. I think that the -- the significant one was the loss of Tembec when it closed its Pine Falls operation.

MR. BOB PETERS: All right. And then Manitoba Hydro provides a forecast in -- in the -- the red -- on the red line as to what that forecast will look like for top consumers?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And then the green line is also Manitoba Hydro's forecast, but it takes out the potential large industrial load factor that's put into the load forecasts. Is that correct?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And you'll see in the chart on the bottom of -- of that page 43 that the PLIL is a number that Manitoba Hydro, after the first few years -- thank you -- puts down to approximately 100 gigawatt hours -- exactly 100 gigawatt hours a year, correct, starting in 2016/17?

MR. SCOTT THOMSON: Yes, I believe that's correct.

MR. BOB PETERS: And, so that -- that potential large industrial load is -- for a lack of

word, it's -- it's speculation as to what may happen for that customer class.

MR. SCOTT THOMSON: Yeah. I think that that forecast, or projection, is -- is based on historic experience. The -- the load growth from that sector was about 91 gigawatt hours a year over the last twenty (20) years, if you remove the effect of -- of the Tembec closure.

MR. BOB PETERS: So at this point in time, there's no committed customer for that hundred gigawatt hours a year, but it's -- Manitoba Hydro has used that as a proxy for what growth could come from existing or new customers?

MR. SCOTT THOMSON: Yeah. We -- I think that the average annual load growth since 2010/11 has been about 2 percent a year, which -- which was comparable to the annual average load growth over the last twenty (20) years. There's -- there's that short interim period where we're -- where we're holding back, and then the -- the forecast resumes picking up in anticipation of that in the future, so.

MR. BOB PETERS: We started this afternoon, once we got past the undertaking discussion, to talk about some of the risk factors that you had mentioned in your Corporate Strategic Plan, and that

was way back in Tab 5, page 24, Mr. Thomson, if you want the reference.

One of the other risks was the Power Smart results, and I heard you say, I think, repeatedly today that Manitoba Hydro is perhaps changing its plans, and is going to be more aggressive on looking for economic DSM?

MR. SCOTT THOMSON: Yes, that's correct.

MR. BOB PETERS: And at this point in time, has Manitoba Hydro been able to quantify where that's going to take the Corporation with -- with their plans?

MR. SCOTT THOMSON: Yeah. I think -- just one sec.

(BRIEF PAUSE)

MR. SCOTT THOMSON: I'm advised that the panel that's going to be on tomorrow is going to speak to the expended DSM program and, next week, the economics of that.

MR. BOB PETERS: Thank you. The -- the long story short on that, Mr. Thomson, in terms of a risk factor if DSM is taken up more aggressively by

Manitobans, that would mean there wouldn't be a need for new supplies for Manitobans as early as you had mentioned in your opening comments.

MR. SCOTT THOMSON: On some plans, yes. There -- there'd be an acceleration of -- if -- if, for instance, we were to proceed with Keeyask and the export sales, then -- then we would be accelerating the need beyond a no-sale scenario.

MR. BOB PETERS: And I suppose the converse is true, that if the -- the -- if the product, or if the energy isn't needed for Manitobans, it would afford an opportunity to try to sell it on the export market for more than what you would make if you sold it to Manitobans.

MR. SCOTT THOMSON: It -- it could provide that opportunity, yes.

MR. BOB PETERS: One of the other identified risks in your Corporate Strategic Plan was the export contracts.

And when you referenced the export contracts, Mr. Thomson, are you referring to just the number of them, or are you determining the duration of them?

MR. SCOTT THOMSON: Yeah. All of the above. As -- as we move into the future and we secure

the contracts, the risks go down. So -- so we're making progress in that regard.

MR. BOB PETERS: But you'd agree that these contracts have an end date on them?

MR. SCOTT THOMSON: They -- they are for specified terms, yes.

MR. BOB PETERS: And as you're testifying before the Board, there is no certainty that after those dates, that those contracts would be renew -- renewed by that counterparty, or even taken up by some other counterparty.

MR. SCOTT THOMSON: That's true, although we're -- we ultimately are building the projects for -- for domestic purposes, and we would anticipate that at a point in time in the future, we'd no longer be able to serve them because our domestic load has increased.

I referenced NSP or -- or the Xcel renewal in -- in 2025. We won't be trying to replace that sale if -- if we don't build Conawapa because we wouldn't be in a position to -- to re-up that -- that agreement.

(BRIEF PAUSE)

MR. BOB PETERS: If you flip ahead to Tab 15 and page 53 of the book of documents, Mr. Thomson, let's just talk about your last answer. On this chart, trying to graph some of the information from Appendix 11-3 seems to suggest that at a certain point in time, looking at the right side of the chart, that the total export sales goes flat in approximately -- is that 2048?

Do you see that?

MR. SCOTT THOMSON: I -- I see where it goes flat, yes.

MR. BOB PETERS: And that suggests then that if the total export sales have gone flat, it also suggests then that the domestic load has also gone flat at that point in time. Would that be correct?

MR. SCOTT THOMSON: I'm not sure that follows.

MR. BOB PETERS: All right. Would you agree, though, that what you're showing, if these numbers are properly depicted, and we'll let the next panel or the second next panel discuss that, that when the export volume -- the sales go flat, the export revenue line, the red line, keeps going up, which seems to suggest that the exports become more valuable, either through price or volume or whatever else

happens.

MR. SCOTT THOMSON: Yes. We've -- we've -- I mean, this extends beyond the term of the existing arrangements, obviously, but there's -- there's an inflation, an expectation that they'll -- they'll inflate, which is pretty standard in -- in the arrangements we've entered into.

MR. BOB PETERS: What you're telling the Board is that, without being specific about what contracts, there's generally a provision of some escalation to go along with the fixed prices.

MR. SCOTT THOMSON: That's generally standard, and I'd ask that we talk about that in any detail that -- in -- in the confidential panel.

MR. BOB PETERS: If you can take it, subject to check as we often say, that the domestic load on Schedule 11-3, page 272 of 432, shows domestic load going flat at that point in time.

Is that a realistic assumption?

MR. SCOTT THOMSON: I'd prefer you ask that to the next panel.

MR. BOB PETERS: All right. We'll do that. Let's turn back then to talk about export revenue and Tab 11, page 45, because export -- export prices is a -- is a major risk faced by the

Corporation, Mr. Thomson?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And on this chart, although again, we -- what -- what we're trying to show in -- in general terms is that the historical export line with the orangey-red line, solid line with the circles on it, for lack of better description, on page 45 of Board counsel's book of documents, which is PUB Exhibit 58-1, that shows the actual average unit export revenue for Manitoba Hydro since approximately 2004?

MR. SCOTT THOMSON: Yes, both firm and -- and opportunity.

MR. BOB PETERS: Right. And you're making the point that blended into this is -- is what the opportunity and the firm price have as an average?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: What also is shown here is that there were forecasts along the way over the years that Manitoba Hydro had where there was an expectation that the export prices were going to increase and increase, in some cases, significantly?

MR. SCOTT THOMSON: Yes, based on -- in -- in part on -- on contracts that we had been negotiating and -- and the forecasts -- the external forecasts.

MR. BOB PETERS: Well, the Wisconsin deal that -- that was signed this last weekend, the term sheet for that goes back to March of 2008. Have I got that right?

MR. SCOTT THOMSON: I believe that's correct.

MR. BOB PETERS: So a lot of these deals were being negotiated way back when, in -- including the NSP and maybe Minnesota Power?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And since then, the circumstances haven't turned out as forecast, at least in terms of Manitoba Hydro's forecast. Would that be true?

MR. SCOTT THOMSON: Well, we've -- we've revised our forecasts each year.

MR. BOB PETERS: Does that mean you never get them wrong?

MR. SCOTT THOMSON: Well, forecasts are never right.

MR. BOB PETERS: It's just a question of how wrong they are. Is that -- is that -- that the reality? The blue solid line on page 45 that's shown on the screen, that's the export line now used for the NFAT purposes. Do you accept that?

MR. SCOTT THOMSON: I believe that's correct, yes.

(BRIEF PAUSE)

MR. SCOTT THOMSON: Sorry, no. I'm -- I'm looking now -- I -- I have a hard time these days seeing certain font sizes, but I believe that was picked up from the forecasted unit revenues for the CEC hearing around Wuskwatim.

MR. BOB PETERS: I was looking at the solid blue line, which was the IFF adjusted Preferred Development Plan unit revenues. The solid blue line, the lowest one on the -- on the chart.

MR. SCOTT THOMSON: Yeah. I see the solid blue line, and I'm --

MR. BOB PETERS: You're just not sure that's the right reference?

MR. SCOTT THOMSON: If you're -- just one (1) moment, please.

(BRIEF PAUSE)

MR. BOB PETERS: Mr. Thomson, I'm going to interject, if you will let me, before you answer

that. I'd like you to disregard that arrow. There was a shaded area on this page that didn't come through on the scanning and the photocopying, and there was a -- a range of export prices that was given at the Clean Environment Commission hearing into Wuskwatim.

I can indicate that I know My Friends at MIPUG have similar documents, and I didn't -- I didn't want to dwell on what was presented at the Wuskwatim hearing, but if you can disregard that arrow and just focus on the blue line, would you be prepared to take, subject to check, that it represents the Preferred Development price unit revenues that are contained in the NFAT filing?

MR. SCOTT THOMSON: I'm not sure I can do that. I believe this was a GRA document not filed in this proceeding.

MR. BOB PETERS: It -- it was a GRA document that was updated for this hearing.

MR. SCOTT THOMSON: Okay. Just one (1) sec.

(BRIEF PAUSE)

MR. SCOTT THOMSON: We're having a hard time identifying the source of the documents, whether

this is built into our analysis here or not so -- because this isn't our document.

MR. BOB PETERS: No, it -- it was taken as an exhibit and then we added a line based on what we were given as the average export unit revenues coming out of the IFF used to support the NFAT. So the blue line, the dark blue line, wasn't yours or it wasn't Manitoba Hydro's, but it was plotted based on our interpretation of the IFF adjusted that was used in the NFAT.

But let's -- let's approach it this way Mr. Thomson; the -- the -- for those who want the definitive source, it's on page 271 of 432 of Appendix 11.3, which is one of the source documents that we were using.

The average export unit revenue since 2008/09 have been about thirty dollars ($30) a megawatt; would that be correct, Mr. Thomson?

MR. SCOTT THOMSON: Since which period?

MR. BOB PETERS: Since 2009.

MR. SCOTT THOMSON: That appears to be correct based on what's on this page.

MR. BOB PETERS: All right and that's about forty dollars ($40) a megawatt lower than what was forecast way back in IFF-09, according to the

materials that's plotted

MR. SCOTT THOMSON: As -- as plotted yes.

MR. BOB PETERS: All - all that tells the --

MR. SCOTT THOMSON: 2011 on --

MR. BOB PETERS: All that tells the panel, Mr. Thomson, is that export prices have changed since Manitoba Hydro was forecasting them back in 2008/09.

MR. SCOTT THOMSON: That's true. We had a pretty significant economic downturn that occurred around that time.

MR. BOB PETERS: And subsequent to that economic downturn, have we recovered from it?

MR. SCOTT THOMSON: Well, the -- the economy has been responding in the US, yes.

MR. BOB PETERS: All right. And the prices are still low?

MR. SCOTT THOMSON: Yes, and they've recovered somewhat in the last year. We've seen a -- a surge in our -- in our export revenues.

MR. BOB PETERS: And we'll talk to the panel about the dollars and cents of that. But -- but it's still -- it's still below what was predicted back

in 2008/09?

MR. SCOTT THOMSON: Yes, and I guess the only point I would like to make is that -- that these forecasts do move and that -- that our current analysis is based on a much different forecast than -- than had been made four (4) years ago.

MR. BOB PETERS: And if you take it subject to check your new forecast is the solid blue line above that arrow that I asked you to cross off?

MR. SCOTT THOMSON: Subject to check.

MR. BOB PETERS: All right, and when we talk about forty dollars ($40) a megawatt lower, we can convert megawatt -- dollars per megawatt into cents per kilowatt, help some of the lawyers in this room.

And the forty dollars ($40) a megawatt is really about four (4) cents a kilowatt hour, correct?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And so when we see the sales, the actual history here, shown as the historical export unit revenues, around the thirty dollars ($30) a megawatt hour, that's telling this Board that on average Manitoba Hydro has been exporting it's energy for three (3) cents a kilowatt hour?

MR. SCOTT THOMSON: Approximately up

until in the period nine (9) through twelve (12), yes. It's a wholesale price of power.

MR. BOB PETERS: I'm sorry?

MR. SCOTT THOMSON: It's a wholesale price of power, you can't -- you can't equate that to what residential customers pay in the province. Doesn't include all the costs of distribution and -- and all the other costs that -- that are related to -- to -- an industrial power customer would be more akin to that. And that's approximately what our industrial customers are paying.

MR. BOB PETERS: Okay, I'm sorry, I've got your point. Your point is, you don't want to compare the three (3) cents a kilowatt hour that you're selling on export on average, to the seven (7) cents you're getting from residential customers?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: It would be more akin to the four (4) cents or whatever you're -- the -- the MIPUG customers are paying. And we could look at their rate sheet to see what that is.

MR. SCOTT THOMSON: They're more akin to, yeah, an industrial customer load. Our firm sales, which are industrial customers, are -- are customers that are buying dependable energy. Our firm export

sales are higher than -- than the domestic rates, but the -- the opportunity or spot market prices, we're -- we're getting what we get in the marketplace.

The alternative would be to -- to spill that water and make no money on it, so it's a -- it -- its cost of production is -- is in the three and a half (3 1/2) dollar a megawatt, point three (.3) cents, that's -- to -- to produce. That's the -- the cost of the water rental.

So when -- when we sell power for twenty dollars ($20) on the spot market overnight, it's only costing us three and a half (3 1/2) dollars to produce. It's still good for our customers. It still creates revenue and benefit for Manitoba.

MR. BOB PETERS: And that assumes, Mr. Thomson, that the cost you receive on the export can carry the costs of things like depreciation, finance expense, and O&M in addition to the one-third (1/3) of a penny that you pay the province for water rentals.

MR. SCOTT THOMSON: Yeah. What I -- what I was referring to was, when we sell surplus power when there's more water available to us, we've are -- we're -- we're paying the costs of -- the fixed costs of our -- our system, and we're better off to sell into the spot market even at these lower prices than to --

to not generate electricity with -- with that water. We -- we get a positive contribution to the benefit of the customers in the province.

MR. BOB PETERS: In the few minutes I have left, Mr. Thomson, let's just please jump ahead to Tab 12, page 47 of the book of documents. I just wanted to come back to this chart because you had mentioned to the Chairman and the panel members that -- you'll see it on the screen in front of you, just to make sure you're looking at the same page.

You had said something to the effect that Manitoba Hydro won't renegotiate one (1) of the NSP deals if certain things happen.

Do you recall saying that earlier this afternoon?

MR. SCOTT THOMSON: Yeah. What I was referring to when -- when I mentioned that was that was that absent -- absent Conawapa, I understand we're not going to be in a position to extend that deal.

MR. BOB PETERS: Can you -- on this chart --

MR. SCOTT THOMSON: That -- that blue line presupposes the -- the Preferred Development Plan where we've got Keeyask in '19 and Conawapa in 2025.

MR. BOB PETERS: And where the spike

occurs sometime after 2026, that's the -- that's the onset or the in-service of Conawapa --

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: -- as it's depicted. And you're -- you're telling the Board that if Conawapa is not built, that blue line, instead of going up will come down.

MR. SCOTT THOMSON: That's right.

MR. BOB PETERS: And depending on how far it comes down will determine how much is available to be sold on any firm contract to any counterparty after 2026?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: Can you tell the Board, where does the WPS 308 megawatt sale fit on this graphical depiction?

MR. SCOTT THOMSON: It -- it -- you'll see -- I believe the -- the original -- it's the dotted line five (5).

MR. BOB PETERS: Yeah. It's the WPS 100 megawatt arrangement, and when it expires, it's -- the 100 megawatts goes up to three hundred and eight (308).

Is that the public announcement?

MR. SCOTT THOMSON: Yeah. When -- once

-- that -- that's right, but I -- I'm not sure that the three hundred and eight (308) is depicted here, just --

MR. BOB PETERS: I'm sorry. It's not on this graph yet.

MR. SCOTT THOMSON: Yeah.

MR. BOB PETERS: But I'm just asking you, where would it fit?

MR. SCOTT THOMSON: The three hundred and eight (308) addition would be in the piece -- the -- the final segment that's in the -- the green hatched. It would be above that, so starting in 2026/7, going out just slightly beyond the -- the graph.

MR. BOB PETERS: So it would carry on past the Minnesota Power deal --

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: -- that's set to expire at that time.

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And from a financial basis, if I turn to -- quickly to Tab 18 and page six -- fifty-nine (59), Mr. Thomson, your --

MS. PATTI RAMAGE: Mr. Peters, can I just interject --

MR. BOB PETERS: Yes.

MS. PATTI RAMAGE: -- for just a

second? I just want it on the -- the chart that was there, because we're having some confusion in terms of -- for Mr. Thomson's benefit, again in terms of a reference. I think the last two (2) -- to clarify, because I don't know the record off by heart, is this a Manitoba Hydro chart?

MR. BOB PETERS: No, it's not.

MS. PATTI RAMAGE: It is not. I -- it may be helpful for all parties as -- as we go forward, a lot of these charts look alike and I think it's beneficial to know who produced a chart, because there's a certain assumption that this is Manitoba Hydro's evidence, and particularly for Mr. Thomson's benefit.

The subject matter experts, I'm not always sure that they would necessarily agree with what's depicted on the chart and, so it's helpful for Mr. Thomson if he knows who created the chart and whether it's his own staff whose information he's looking at, or someone's interpretation of that.

So with that caveat, carry on, but I think Mr. Cormie may have some comments on these charts.

THE CHAIRPERSON: I wonder if you wouldn't be in a position to make an undertaking to us

to deliver us a similar chart which encompasses the new contract, disposed in the same way, but I would add a line that indicates what's available, dependable energy there so that we understand what's available for sale rela -- for -- for long-term fixed contracts relative to what is available overall?

I think that would be very useful for me, and I'm not sure about the other members, but just to make sure that it's --

MS. PATTI RAMAGE: I think I'd be more comfortable with that if I knew Mr. Cormie for -- and his staff agreed with the contents of the chart.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Yes, subject of course to I have to speak to Mr. Cormie if he has any concerns with that, but I would be more comfortable.

--- UNDERTAKING NO. 3: Manitoba Hydro to provide a similar chart to PUB/MH I-012a which encompasses the new contract, and add a line that indicates what dependable energy is

available for long-term fixed contracts relative to what is available overall

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: And, Mr. Thomson, just to jump in here, what's attempted to be depicted in this chart, or -- or the one that Manitoba Hydro prepares or has prepared relative to the same as this, the bottom portion, those rectangular shapes that are coloured blue and red and green, those are depicting the contract announcements that Manitoba Hydro has made, correct?

MR. SCOTT THOMSON: I presume that's what they do. I mean, the --

MR. BOB PETERS: All right.

MR. SCOTT THOMSON: -- they're identified as having been sales contracts.

MR. BOB PETERS: And in terms of --

MR. SCOTT THOMSON: I haven't done the conversion in my head in terms of gigawatt hours to -- to verify that that's correct.

MR. BOB PETERS: And it's the -- it represents the contracts that the Board understands are under a fixed price arrangement that Manitoba Hydro

has. Would you accept that, subject to check?

MR. SCOTT THOMSON: Subject to check.

MR. BOB PETERS: And that blue line at the top that oscillates up and down, you'd understand that to be the -- the energy exports that are not under firm price contracts, but rather under market price scenarios.

(BRIEF PAUSE)

MR. SCOTT THOMSON: Evidently the -- the bees have been buzzing. Our subject matter experts have concerns and -- and don't accept the chart, so I'd prefer not to answer anymore questions on the chart until we've -- we've prepared something.

MR. BOB PETERS: I understand that, and we'll await the answer to the undertaking then. The last area that I want to ask you about, Mr. Thomson, is at Tab 18, page 59 of the book of documents, and from the Ivey School of Business, you should be able to help me on this one.

The -- Manitoba Hydro has gained revenues as a result of the foreign exchange difference between Canada and the United States, sir?

MR. SCOTT THOMSON: No more -- very

recently, yes. We've -- we -- in -- there's been a decline in the exchange rate in the last several years that -- that's been negative to -- to revenues on a -- on a unit cost basis.

MR. BOB PETERS: And I'll try to put this correctly for the economists in the room, as well. The weaker the Canadian dollar relative to the American dollar, the better it is for Manitoba Hydro as an exporter?

MR. SCOTT THOMSON: Generally speaking, that's true. The -- we -- we have a -- a natural hedge in our operations in terms of the -- the amount of debt that we carry in US dollars, and it -- and it's a fairly effective hedge so the -- the -- over -- over the near term, and -- and given our existing configuration, it doesn't have a huge positive or negative impact.

But as we move forward in time, the -- depending on the level of debt we place in US -- US denominated debt and the -- and the related revenue streams, you know, the -- the effectiveness of the hedge will likely decline somewhat. So when -- when the US dollar strengthens, it -- it tends to be favourable to our operations. Sorry, that wasn't an easy answer, but...

MR. BOB PETERS: Well, on this -- on this information which came, and has been before the Board in -- in general rate applications, Manitoba Hydro -- if you -- if you take the revenue Manitoba Hydro gets on its US sales, and then factor -- factor out the exchange rate, you can determine how much money Manitoba Hydro gains simply as a function of the exchange rate.

MR. SCOTT THOMSON: Is that another way to say how much they -- they are in US dollars?

MR. BOB PETERS: Well, we know how much they are on line 'B' in US dollars. Let's go back to 1999 and 2000. Manitoba Hydro made two hundred eighty-six million three hundred and thirty-seven thousand dollars ($286,337,000) on US -- on exports to the US. And in terms of US revenue, in US dollars it was $244 million. And the difference would have been a surplus in favour of Manitoba Hydro?

MR. SCOTT THOMSON: Yeah, it would -- it's just -- it's US dollars translated to Canadian dollars.

MR. BOB PETERS: Right. And in terms of this NFAT, Manitoba Hydro is forecasting the exchange rate closer to the one point zero four (1.04) in the near term?

MR. SCOTT THOMSON: Yeah, I'll accept that, subject to check. I think that's right. In the near term.

MR. BOB PETERS: Mr. Thomson, is there a capital expenditure forecast '13 that's been prepared?

(BRIEF PAUSE)

MR. SCOTT THOMSON: We haven't filed that.

MR. BOB PETERS: I know it hasn't been filed. I think it was referenced in one of the IEC reports.

Is that a document that's available to be filed?

(BRIEF PAUSE)

MR. SCOTT THOMSON: We're having -- we're -- we're just talking about fiscal years and calendar years here.

I understand that the '13/'14 capital expenditure forecasts will be filed with the general rate application, which will be later in March.

MR. BOB PETERS: Okay. Well, let's not close the microphone to Mr. Peters yet, if we can, and let me just go down that road, Mr. Thomson. I remember, perhaps not this last weekend, but maybe it was the weekend before, Manitoba Hydro had another public announcement about issuing its third quarter report?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And Manitoba Hydro has net income on its electric operations over a hundred million dollars better off in the most current nine (9) months than it did a year -- in the previous year's nine (9) months?

MR. SCOTT THOMSON: I believe that's right.

MR. BOB PETERS: And there's also -- I think one (1) of the reasons for that turnaround was attributed to things like the PUB rate increase from last year, correct?

MR. SCOTT THOMSON: There's a portion of it associated with that. The -- the majority of it related to water levels and -- and export sales.

MR. BOB PETERS: And a portion related to the cold weather?

MR. SCOTT THOMSON: That played a

factor, too. It's we -- it's -- it's the only silver lining to this winter cloud.

MR. BOB PETERS: And that cold weather -- your quar -- your third quarter report stopped in December 31 of 2013?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And my recent memory is that January and February have been colder than normal.

MR. SCOTT THOMSON: I hope so.

MR. BOB PETERS: And that all means the silver lining that you talked about, that Manitoba Hydro's revenues will be above what would be based on normal expectations?

MR. SCOTT THOMSON: Yeah, I think we -- we included some outlook information in the -- in the press release.

MR. BOB PETERS: And even in light of -- in -- in light of the improved financial position of Manitoba Hydro, you're indicating that Manitoba Hydro is going to be filing a general rate application for rates effective April 1st, 2014?

MR. SCOTT THOMSON: That's correct.

MR. BOB PETERS: And what's the rate increase that's going to be sought?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Can I say that it's consistent with what we've been filing, but it's not part of an application that's been filed yet, so.

MR. BOB PETERS: All right. I'll tell you my recollection of what's consistent, Mr. Thomson. You tell me if I'm off-side or if I'm in the ballpark. The last IFF I remember seeing included annual rate increases going forward of 3.95 percent for the next eighteen (18) to twenty-two (22) years?

MR. SCOTT THOMSON: Yes.

MR. BOB PETERS: And that's in the ballpark of where you're talking about this rate increase coming up?

MR. SCOTT THOMSON: Yeah, the interim application will be for a year.

MR. BOB PETERS: And did I understand then that the CEF13 is available but it's not available to the NFAT proceeding?

MR. SCOTT THOMSON: We're in the final stages of putting together a general rate application, so I'll have to check.

MR. BOB PETERS: All right. If -- if CEF13 is available, would you undertake to file it in

these proceedings through your counsel?

MR. SCOTT THOMSON: Sure.

MR. BOB PETERS: All right.

--- UNDERTAKING NO. 4: Manitoba Hydro to File CEF13, if available

MR. BOB PETERS: Mr. Chairman, at this point I am going to thank Mr. Thomson very much. I appreciate him answering my questions. And, subject to the Board's plans, turn it over to counsel opposite.

THE CHAIRPERSON: Thank you, Mr. Peters. Over to you, Mr. Williams.

MS. PATTI RAMAGE: Before Mr. Williams begins, can we have a two (2) minute break?

THE CHAIRPERSON: Yes, two (2) minutes, please.

--- Upon recessing at 2:17 p.m.

--- Upon resuming at 2:20 p.m.

THE CHAIRPERSON: I believe we're ready to resume the proceedings, so Mr. Williams, please.

CROSS-EXAMINATION BY MR. BYRON WILLIAMS:

MR. BYRON WILLIAMS: Good afternoon, members of the panel and Mr. Thomson. My client's not able to be here this afternoon. She did want to express her appreciation to you through me for your courtesy in -- in attending. It's -- it's much appreciated.

I hope you'll forgive me if I -- I don't ask you too many questions. That -- that'll be all right with you, sir?

Now, just from your discussion with Mr. Peters, Mr. Thomson, it would be fair to say that you're not the detail guy supporting the Manitoba Hydro Application? Would that be fair?

MR. SCOTT THOMSON: That's fair.

MR. BYRON WILLIAMS: You're the high level vision guy?

MR. SCOTT THOMSON: I guess you could say that.

MR. BYRON WILLIAMS: And the vision for the hydro plan, as you testified this morning, dates back about a decade. Agreed?

MR. SCOTT THOMSON: Yeah. The -- we've been working on it a long time.

MR. BYRON WILLIAMS: Yeah. And you joined Hydro in 2000 -- 2012, almost two (2) years ago,

in February, agreed?

MR. SCOTT THOMSON: Yeah, that's right.

MR. BYRON WILLIAMS: And, so by the time you joined the Corporation, for example the JKDA with the Keeyask Cree Nation partners had been signed in 2009, correct?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And the contract with NSP and with Minnesota Power, those had been signed, agreed, in 2011?

MR. SCOTT THOMSON: Yes, subject to check.

MR. BYRON WILLIAMS: Okay. I think you can trust me on these ones, sir.

MR. SCOTT THOMSON: Okay

MR. BYRON WILLIAMS: And the 100 megawatt sale to WPS commencing in 2021 had also been signed, agreed?

MR. SCOTT THOMSON: That's right.

MR. BYRON WILLIAMS: And the decision to sequence Keeyask ahead of Conawapa had already been reached by the time you joined the Corporation?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: Okay.

THE CHAIRPERSON: Mr. Thomson, could I

ask you to put -- to move the microphone to the other side of your -- your left-hand side. That'll probably be easier.

Yeah. That'll be -- I think we'll get a -- we'll get a better reception if you're speaking to that one.

MR. SCOTT THOMSON: Okay.

THE CHAIRPERSON: Thank you.

MR. SCOTT THOMSON: Is that better?

THE CHAIRPERSON: Yeah

CONTINUED BY MR. BYRON WILLIAMS:

MR. BYRON WILLIAMS: I was trying to take tactical advantage of you having to twist your head, Mr. Thomson, so.

Despite your recent start with the Corporation, I take you -- take it that, at a high level, you're familiar with the NFAT business case?

MR. SCOTT THOMSON: Yes, I am.

MR. BYRON WILLIAMS: And at a high level you're aware of the screening process and the alternatives analysis?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And I know you've been really busy since you got here, but would I be

correct in assuming that prior to pro -- partaking in -- - in this NFAT you would have taken the time to review the report and recommendations of the joint panel into the Wuskwatim NFAT?

Would you have done that, sir?

MR. SCOTT THOMSON: I haven't seen that in detail.

MR. BYRON WILLIAMS: Okay. Coming back to 2013, can we agree that at the time the Hydro business case was filed in August of 2013 that an economic analysis to evaluate the attractiveness of higher levels of DSM was not able to be completed at that time, sir?

MR. SCOTT THOMSON: Yes, that's true.

MR. BYRON WILLIAMS: And we can agree -- - or you will agree with me, that the Hydro business case filed in August of 2013, in the business case, the Corporation was unable to provide an integrated evaluation of DSM and supply options which would have allowed for the assessment at the optimum level of DSM, correct?

MR. SCOTT THOMSON: I think that's true. I think that sensitivity information had been filed at that point, and -- and we were waiting for the -- the DSM potential study results to come out to -- to

have a better understanding of what was -- what was possible.

MR. BYRON WILLIAMS: Okay. And, sir, again recognizing that you haven't memorized the report from Wuskwatim into the NFAT, but going back to that report, would you be aware that in that proceeding it was recommended that in any future Manitoba Hydro -- Hydro NFATs, that portfolios should include consideration of hydro electric sequencing as well as coordinated implementation of other initiatives, such as DSM programs and SSE programs?

Were you aware of that, sir?

MR. SCOTT THOMSON: Not the explicit details, but -- but I'll accept that.

MR. BYRON WILLIAMS: Okay. And you'll be aware -- or you'll accept, subject to check, that the Wuskwatim recommendations were made in September of 2004?

MR. SCOTT THOMSON: Subject to check.

MR. BYRON WILLIAMS: Roughly nine (9) years before this NFAT filing, agreed?

MR. SCOTT THOMSON: Agreed.

MR. BYRON WILLIAMS: And would you agree that nine (9) years would be sufficient time to integrate DSM into hydro resource planning in such a

way as to provide alternatives for examining an optimized DSM por -- portfolio, sir?

MR. SCOTT THOMSON: Well, I think that work had been done. A consultant had been hired. And as I understand it, the -- the Corporation anticipated the -- the DSM potential study about a year before it was delivered. It was -- it was quite late.

And so the -- the work plan had -- had anticipated that -- that we would have had that and we would have been able to integrate that sooner. The analysis is -- has been done subsequent, and -- and the -- the DSM load forecasting panel, which is next, tomor -- I believe, starting tomorrow, will be addressing questions around that.

MR. BYRON WILLIAMS: And, Mr. Thomson -- and if this is an unfair question, your counsel will -- will chip in -- but, to your knowledge, has the detailed analysis supporting this DSM analysis been -- been filed on the public record or is it just the reference to the -- in rebuttal evidence?

(BRIEF PAUSE)

MR. SCOTT THOMSON: It's -- it will be filed. Mr. Kuczek, tomorrow, will be in a position to

give you an idea of when.

MR. BYRON WILLIAMS: So it's -- it's not yet filed, sir?

MR. SCOTT THOMSON: Correct.

MR. BYRON WILLIAMS: Now, you had a really enjoyable conversation with My Learned Friend Mr. Peters this morning, so I won't go too much into the American transmission line, but I do have just a couple of questions of -- of follow-up.

And -- and for clarity's sake, I'm referring to the 750 megawatt American portion of the line that you discussed with Mr. Peters this morning.

Okay, Mr. Thomson?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And just in terms of that line, and just to try and summarize your conversation with Mr. Peters, would it be fair to say, referring specifically to the American portion, that initially Manitoba Hydro may own up to 49 percent of that line, sir?

MR. SCOTT THOMSON: Yes, initially.

MR. BYRON WILLIAMS: Would it be also fair to say that initially it would be responsible -- may be responsible for up to two-thirds (2/3s) of the construction costs?

MR. SCOTT THOMSON: No. Minnesota Power will be responsible for at least 51 -- well, fif -- they will be responsible for 51 percent, and -- and we may be responsible for up to 49. We'll -- we're -- we'll be actively seeking to -- to lay that off and bring other -- other partners in prior to the -- the completion of the line.

MR. BYRON WILLIAMS: So for greater clarity, Minnesota Power is assuming the one-third (1/3) of that cost associated with the 250 megawatt, and then it is kicking in something additional of -- towards the 750 megawatt, sir?

MR. SCOTT THOMSON: Yeah. I'm just hesitating because we're -- we're getting dangerously close to an area that we should be talking about in camera.

MR. BYRON WILLIAMS: The percentage ownership?

MR. SCOTT THOMSON: No, the details around the -- the deal.

MR. BYRON WILLIAMS: Okay. Well...

MR. SCOTT THOMSON: I -- I shared the percentage ownership with you. It's 51 percent.

MR. BYRON WILLIAMS: In terms of the share of the construction costs, is it possible that

Hydro will be responsible for more than 49 percent, sir?

MR. SCOTT THOMSON: No.

MR. BYRON WILLIAMS: Currently, would it be responsible for 49 percent of the construction costs?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: Okay. Thank you. Apart from the NFAT, it would be fair to say that Hydro's been kept fairly busy with other regulatory processes?

MR. SCOTT THOMSON: That's fair.

MR. BYRON WILLIAMS: You spoke this morning of the Keeyask EIS, and you're awaiting recommendations from the Clean Environment Commission?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And once those recommendations are out, it'll be up to pro -- to the province to decide what to do with them, agreed?

MR. SCOTT THOMSON: That's correct.

MR. BYRON WILLIAMS: And you're anticipating those recommendations in April?

MR. SCOTT THOMSON: Yeah. My understanding is they have ninety (90) days from the close of the proceedings, so that would put it late April.

MR. BYRON WILLIAMS: And then there will be subsequent actions which are required to be taken by the province, presumably --

MR. SCOTT THOMSON: That's correct.

MR. BYRON WILLIAMS: -- one (1) way or the other?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And in addition to the Keeyask EIS another process that the Corporation is involved with would relate to the regional cumulative effects assessment of the Nelson River watershed --

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: -- sub-watershed?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: And that process was just initiated in the fall of 2013, sir, agreed?

MR. SCOTT THOMSON: I believe that's -- that's accurate.

MR. BYRON WILLIAMS: And the Clean Environment Commission, I think it's fair to say, in its Bipole III recommendations, suggested that that

analysis be completed before any new projects beyond Bipole III were licensed.

Is that your understanding, sir?

MR. SCOTT THOMSON: Yeah. I believe those were the -- were the -- the recommendation that they'd had. The -- the Keeyask project had been initiated before -- before that had -- those recommendations came out. Nonetheless, we're -- we're proceeding with that, and I understand that there'd be a preliminary report out later this spring or around June time-frame.

MR. BYRON WILLIAMS: So the summer of 2014 you're expecting an interim report, sir?

MR. SCOTT THOMSON: That's my understanding.

MR. BYRON WILLIAMS: And while those are going on, of course we've got the NFAT that we're -- you're juggling as well?

MR. SCOTT THOMSON: Yes.

MR. BYRON WILLIAMS: Given all these moving parts including the EIS, the regional cumulative effects assessment, and the NFAT, would it be fair to say that it is unlikely for Keeyask to begin construction in the summer of 2014?

MR. SCOTT THOMSON: No. I think we're

-- we're very hopeful that we're -- we're going to proceed starting in July, subject to the -- the outcome of this proceeding and -- and the determination by the province.

It -- I'll grant you, it's tight -- the -- but if the panel issues its report on or prior to June 20th, if you look at the -- the time-frames around when the Bipole III recommendations came out and the length of time it took for the province to issue a licence, we can -- we can get it all done in -- in the time-frame to allow a summer construction start. And it's -- it's pretty important that we -- we make that happen, because the -- there's -- there's -- you know, there's construction windows and there's only certain times that we can -- we can be operating in the river. It's -- it's particularly important that we start the cofferdamming of the river this summer in order to -- to protect the overall construction schedule 'cause you can't -- you can't do that work in the winter.

MR. BYRON WILLIAMS: And just in -- in terms of that specific issue, the cofferdamming, what is your summer window of opportunity, sir?

MR. SCOTT THOMSON: Sorry, the...?

MR. BYRON WILLIAMS: The summer window of opportunity? You said it's quite short.

MR. SCOTT THOMSON: Yeah. We're -- we're looking by mid-July to be -- to be wet, as -- as they say, and then through early fall before the ice starts forming up.

MR. BYRON WILLIAMS: Okay. So if there's a slippage of two (2) months, construction would be in jeopardy --

MR. SCOTT THOMSON: I --

MR. BYRON WILLIAMS: -- in the summer of 2014?

MR. SCOTT THOMSON: Yeah, I think that's fair to say. If we were -- if we were pushed out past July we'd lose the summer.

MR. BYRON WILLIAMS: Okay. I thank you, Mr. Thomson, and I turn it over to My Learned Friend Mr. Hacault, I believe. I'm not sure who I turn it over to, sorry.

THE CHAIRPERSON: Before -- before you go there, I want to make sure I understand what Mr. Williams first addressed, which is -- or at least addressed, which is the issue of the cost of that transmission line to the US.

Now, I understand completely that the 51/49 split. What I do not understand, I want to make sure I clarify, is who's picking up the cost of the

construction of that line south of the border. I clearly read that Manitoba Hydro at the present time was assuming two-thirds (2/3s) of the cost of that because of the -- the dropping out of the Wisconsin counterparty in the construction of the line.

So I -- I need to understand what the responsibility is for Manitoba Hydro on that southern portion of the kV line.

(BRIEF PAUSE)

MR. SCOTT THOMSON: Mr. Chair, I think that -- that in the original filing under "Pathway 4" there was an assumption made, but in the -- in the time that's past we've -- we've firmed things up with Minnesota Power and they are going to pay -- build -- they're going to be a 51 percent shareholder. They're going to cover 51 percent of the capital costs of the project.

CROSS-EXAMINATION BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Good afternoon, Mr. Thomson.

MR. SCOTT THOMSON: Good afternoon.

MR. ANTOINE HACAULT: You heard part of

my presentation in the opening statements with respect to whether or not we should proceed with a need-based approach or an opportunity-based approach. And part of my discussion with you this afternoon will be with respect to that subject matter, and taking you to various statements made and various documents either by Manitoba Hydro, yourself, or the province and its documents.

The first document I'd like to draw your attention to is in our book of documents, which I understand has been marked as Exhibit 20, MIPUG-20. It's a Volume I book of documents, and in particular at page 34.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: In that document, there's some highlighting. It should show up on your screens.

MS. PATTI RAMAGE: Mr. Hacault, which tab is that in the...

MR. ANTOINE HACAULT: Sorry, that is the, if you're looking at tabs, Tab 6, and the page numbers are on the bottom. Page 34.

MR. SCOTT THOMSON: Yes.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Yes. My first question is: Is the chair and yourself still meeting with the Minister on a regular basis?

MR. SCOTT THOMSON: Yes, we are.

MR. ANTOINE HACAULT: Okay. And in this document your president indicates that there hasn't been specific direction on any issues with respect to the development plan.

Are there general directives from the Minister with respect to the gen -- the Preferred Development Plan?

MR. SCOTT THOMSON: No, there's -- there's no directives with respect to the Preferred Development Plan. I -- I don't think it's any -- any secret that the -- the province supports the direction that we're taking on this. But we haven't been directed to do one thing or another. I mean, we've been independently preparing the analysis and -- and developing the recommendations that -- that we're bringing forward.

MR. ANTOINE HACAULT: Thank you. Earlier, in answering questions to Mr. Peters, he had asked questions with respect to interim approvals by the government with respect to the generation stations

which were coming up. And I believe your answer was something to the effect that some small portions had been approved.

Did I understand that correctly?

MR. SCOTT THOMSON: The -- we've got licensing and work permits. The -- the Keeyask infrastructure project has -- was separately licensed and approved. And on a -- on an overall basis, our -- our borrowing and capital plans are vetted by a treasury committee. So we -- all -- we've got all the necessary approvals in place to do the work that we've been doing.

MR. ANTOINE HACAULT: Yeah. Are there specific pro -- components though? I -- I think you had talked about the preparation of the site. Did that require specific approval and is -- is that available for public --

MR. SCOTT THOMSON: There's --

MR. ANTOINE HACAULT: -- record?

MR. SCOTT THOMSON: There were work permits issued for that -- that work, yes.

MR. ANTOINE HACAULT: Okay. The reason I was asking the question, counsel for the Public Utilities Board, Mr. Peters, had drawn your attention to approvals required by the Cabinet.

And is there anything available that can be put on the public record with respect to any such approvals?

MR. SCOTT THOMSON: The --

MS. PATTY RAMAGE: Mr. Hacault, if I could interject. The approvals -- having looked at the -- I had a moment to look at the sections that Mr. Peters raised -- those are required when we're dealing with a joint venture, or subsidiary, or partnership, and they don't apply in this case. Manitoba Hydro's borrowing approvals that Mr. Thomson just referred to are -- are all that applies.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Do you agree with that, Mr. Thomson?

MR. SCOTT THOMSON: Yeah. She's the lawyer. But -- but, yeah, my -- my understanding is that we'll ultimately need that -- that order in council when -- when the assets roll into a partnership. We -- we've entered into a partnership arrangement, but the -- the project is -- is not in that. That would happen on the heels of this proceeding, assuming that -- that we're granted the approval to proceed. And then that OGIC -- LGIC

(phonetic) would -- would be forthcoming at that time.

MR. ANTOINE HACAULT: Thank you, sir. Could I ask you to turn to the next page in the book of documents, page 35, at the bottom of the page. There should have been a highlighted portion.

And there was a question asked of you as to whether Keeyask would be built, and whether there was still a debate as to whether that particular structure would be built. And this was, I appreciate, only a couple months into your tenure as the CEO of Manitoba Hydro; your response is recorded, "No, not internally."

So with respect to the Keeyask project and its role in the Preferred Development Plan, am I to take it that, internally, Hydro was convinced, as of April of 2012, that Keeyask was proceeding?

MR. SCOTT THOMSON: That was our intent. And I think, as -- as my statement at the -- at the Standing Committee said -- it went on to say, "No, not internally." I mean, we've -- we've got to go through a review process and get it certificated to build. But based on the information that we had available to us at the time, it was our intent to keep going forward with this process.

MR. ANTOINE HACAULT: Was it the same

conclusion that had been reached internally with respect to Conawapa at that point in time?

MR. SCOTT THOMSON: Yes, although it was much further out on -- on the calendar.

MR. ANTOINE HACAULT: Okay. When you come to the Public Utilities Board and the NFAT, is Manitoba Hydro's approach to present the in -- information in a disinterested way, or is it advocating particular positions?

MR. SCOTT THOMSON: No, I'd -- I'd say it's fair to say we're advocating a position. We've -- we've done the analysis. We -- we believe in what we're promoting and putting forward, and I don't think we're -- we're not bringing this forward and saying, You make -- you know, it's jump ball. We -- we believe that -- that the path that we're on and that we're proposing is the -- the best plan based on the analysis that we've done and -- and our mandate.

MR. ANTOINE HACAULT: And is it fair to say that that view has not changed as a result of any of the filings occurred so far in this hearing?

MR. SCOTT THOMSON: Yes. Certainly for the first phase of the project, I think that -- that the -- the changes to our -- our load forecasts, the changes to -- to our revenue forecasts have -- you

know, they've altered the economic look at this -- at this -- this plan.

It -- it isn't -- and I'm sure we'll hear more about that over the course of the -- the next eight (8) weeks. But it -- it isn't as positive at the corporate level, financial level as it was in -- in our outlook four (4) years ago. But we believe it's realistic. And -- and it hasn't -- it hasn't deteriorated to the point where the next best -- we -- we believe there's another next-best option at this point.

We -- we believe that, certainly as it relates to Keeyask, that there's a compelling case that we should be proceeding with Keeyask and -- and keeping the optionality around Conawapa.

I -- I think it's also fair to say that in our view three (3) or four (4) years ago, there was a compelling case to -- to push forward with Conawapa as long as that -- as long as that -- you know, the planning assumptions built out -- played out.

And we still believe that -- that Conawapa makes sense if -- if the future unfolds as -- as we -- we anticipate today. It's -- again, you know, the forecasts are -- are down somewhat from -- from where they were four (4) years ago.

There's -- there's a crossover point where -- where we might change on our mind on that, and that's why, you know, we'll be thinking about that and the gated decision points that I -- I spoke to in my opening remarks will play a -- a role in that. We're -- we're not -- we're not going all in, to use a card playing terminology, at this point. But -- but the first step down a pathway, we believe -- we believe Keeyask is the right way to go.

MR. ANTOINE HACAULT: Thank you, sir. If the document organizer could -- I had identified MIPUG/MH-1-10A. And there's a figure on the second page, if she can bring that up.

MS. PATTI RAMAGE: Is that in the book of documents, Mr. Hacault?

MR. ANTOINE HACAULT: It -- it isn't in the book of documents. It's something that I'm going to be asking as a result of some of Mr. Thomson's answers this morning. He had, I -- I understood, indicated that for Keeyask, about the longest time we could delay that decision would be for about two (2) years.

And this is a response, as I understand it, provided by Manitoba Hydro in decision dates for new resources.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Do you see that, sir?

MR. SCOTT THOMSON: Yes, I do.

MR. ANTOINE HACAULT: Okay. And in the middle of that table, there is the abbreviation, capital 'K' 22/gas.

Do you see that? There's a heading.

MR. SCOTT THOMSON: Keeyask 20 -- K22/gas, yeah.

MR. ANTOINE HACAULT: Yes. And in that particular table prepared by Manitoba Hydro, there's an indication that there needs to be a decision by 2017.

Do you --

MR. SCOTT THOMSON: Yes, I see that.

MR. ANTOINE HACAULT: Do you have any idea when in 2017 that decision needs to be made, and why, and to what extent it's different than your initial indication that we should have to make a decision by 2016?

MR. SCOTT THOMSON: Yeah, just -- just a sec.

(BRIEF PAUSE)

MR. SCOTT THOMSON: Yeah, the -- the -- this pathway contemplates no -- no export sales. So if we -- if we didn't proceed with the export sales and we'd be looking to put Keeyask into service for 2022, and if we were -- if that was our target date rather than 2019 under the Preferred Development Plan, then we'd have until about 2017 to make that decision --

MR. ANTOINE HACAULT: Okay. So am I correct --

MR. ANTOINE HACAULT: -- in order -- in order to achieve a 2022 date. We wouldn't achieve a 2019 date if -- if we push out the -- by two (2) years, the start date on -- on Keeyask either. But they're -- they're planning for different outcomes.

MR. ANTOINE HACAULT: So am I correct in understanding then that if we're building for Manitoba demand requirements, local consumers, you had indicated that was a 2023 expected date, correct?

MR. SCOTT THOMSON: We need -- yeah, we need -- we -- we now estimate that we need resources by 2023 --

MR. ANTOINE HACAULT: Okay.

MR. SCOTT THOMSON: -- for domestic load.

MR. ANTOINE HACAULT: So that if the

focus was the needs of Manitobans for electricity, am I understanding this table correctly, that if that was the focus, we could delay the decision date until 2017?

MR. SCOTT THOMSON: That would presuppose that we -- we had given up on building an interconnection and -- and any other sales. So there's many -- there's Needs For and Alternatives To. And in exploring the various different options open to us in the alternatives, they have -- they have benefits and costs associated with them.

So we've evaluated the economics of -- of these different pathways, but that's -- and -- and so that will inform where we ultimate land on -- on which one's the best one. This -- this one would -- would have a certain economic outcome, and -- and it's not the preferential outcome. It's -- it's not the highest-value outcome for -- for Manitobans.

So there's benefits from those export sales that -- that make it desirable for us to proceed with -- with building interconnections and -- and having -- having Keeyask in service earlier.

MR. ANTOINE HACAULT: Thank you. My focus was just on when a decision date would need to be made if we were focussing only on Manitoba consumer needs, as far as the load.

Am I right in understanding this table, that if we started out -- and this is new resources, SCGT/C26, would be Conawapa 26.

If we were embarking on a gas route initially, we wouldn't have to make a decision until 2019 with respect to additional hydraulic resources?

MR. SCOTT THOMSON: I believe we... In 20 -- under that scenario, I believe it's 2018 --

MR. ANTOINE HACAULT: 2018.

MR. SCOTT THOMSON: -- for -- for the hydraulic resource. We would have to make a decision on -- on the -- the simple-cycle gas turbine sooner than that.

MR. ANTOINE HACAULT: Okay. Thank you, sir. I'm going to turn back to our book of documents, Exhibit 20, at page 12. That's Tab 3; Tab 3, page 12.

This is an extract from the technical conference that occurred last year. And I'd like to draw your attention, sir, to some of the statements you made on page 12 at line 4, the bottom. It should be page -- in the transcript it's page 7, but the bottom numbering for the document organizers, page 12.

MR. SCOTT THOMSON: Page 12, yeah.

MR. ANTOINE HACAULT: It -- it records you indicating:

"The NFAT business case sets out the best long-term options to meet Manitoba's electricity needs now and into the future."

And then if we continue reading, you talk about what you've found to be most beneficial for the province as a whole.

Do you see that paragraph, sir?

MR. SCOTT THOMSON: What line? I -- I see where -- where you started. And I'm just --

MR. ANTOINE HACAULT: I've finished at lines 10 and 11.

MR. SCOTT THOMSON: Okay, yes, sorry.

MR. ANTOINE HACAULT: So my question to you, sir, is with respect to your vision and the corporate vision, is the focus on Manitoba's electricity needs now and into the future, or is it on what you find most beneficial for the province as a whole?

MR. SCOTT THOMSON: Both. They're not mutually exclusive.

MR. ANTOINE HACAULT: Okay. Would you agree with me, sir, that ratepayers might have a different priority than the province as a whole?

MR. SCOTT THOMSON: Certainly. I -- I

would say that some ratepayers would have a different perspective than -- than the province as a whole.

MR. ANTOINE HACAULT: Okay. And I won't get into that, but some of the scenarios develop substantial revenues and benefits for the province as compared to other scenarios, but not much difference for ratepayers.

MR. SCOTT THOMSON: That's true. I mean, the -- the -- there -- there isn't a great deal of difference in -- in the rate impacts across most of the scenarios, actually. But -- but there are -- there are financial benefits beyond the Corporation, and then there's all of the -- the social benefits associated with -- with the -- the hydro development plan.

MR. ANTOINE HACAULT: Yes. And if I -- if you would flip back, sir, to page -- it's at Tab 6 and it's page 33 in our book of documents, when you were speaking in front of the Crown corporations committee on April 4, 2012. Midway through the page you're quoted as saying, in talking about exports and domestic sales -- and it was at 1,920. You should see some highlighting there.

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT:

"I mean, we're not building them to

export."

You see that statement, sir?

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT: My question to you is: Has there been a change in vision or priority for Manitoba Hydro? Are some aspects of this Preferred Development Plan being done to build for exports in advance of Manitoba consumers' needs?

MR. SCOTT THOMSON: No, I -- I wouldn't say that there's a -- there's a change in -- in corporate philosophy. The -- the plants will ultimately all serve the -- the domestic requirements. But there's an expectation -- and -- and it's -- it's been the case -- I -- as I understand it, every time we built -- or -- and I certainly would expect that it would have been the case, that when you bring a big block of capacity on, that you're not going to be able to utilize it all at once.

So we would -- we would look to utilize the -- or make best -- best use of that capacity and extract the most value out of that capacity as we build. So that -- now, in -- in the case of -- of some of the sales contracts, we may be advancing the timing around when the Manitoba need would -- would arise, the -- the domestic load would arise. But that's to take

advantage of -- of other attributes of the -- of the export sales for a short period of time.

So we get our US customer to build a transmission line that we would never get built without them if we -- if we do it now. And they're willing to take the power, so they're -- they're -- we feel that we can -- we can lay that power off, shape it, and sell it short term to help advance payment on these things.

We also get a transmission line out of the arrangement, which is good for the reliability of our supply and security of the supply in the province. And that is very useful to industrial customers, residential customers, having that in -- in -- to -- to serve through drought and -- and through other emergencies.

MR. ANTOINE HACAULT: With respect to the Preferred Development Plan, I think you'd categorized it in two (2) segments. And we had in our opening statement, too, the must make decisions Keeyask, and the transmissions lines and Conawapa.

Would you agree with me, sir, that Conawapa is being advanced with respect to export sales, and not to meet Manitoba needs?

MR. SCOTT THOMSON: We have an opp -- yeah, we have an opportunity to build that and -- and

sell the power as we -- as we grow into the requirement.

MR. ANTOINE HACAULT: And, sir, if we look at the primary focus when we're trying to answer the question: Does Manitoba need a particular project?

Is it ratepayer focussed, or is it focussed on exports which could be achieved such as through Conawapa?

MR. SCOTT THOMSON: I think broadly it's ratepayer focussed because -- and -- and why the plan that we're -- we're advocating is beneficial is it has the lowest long-term rates, and -- and has all the other attributes associated with it.

So over the long haul if it's going to be cheaper to go down this path and utilize the resource that we have here in the province, that's -- that's a ratepayer benefit.

MR. ANTOINE HACAULT: Okay. Let me narrow that question a bit more. When I say, "ratepayer focussed," is it focussed on the needs for power of Manitoba consumers?

MR. SCOTT THOMSON: Yes, ultimately, but if -- I think where you may be -- may be going with this question is: Should we only look at options that satisfy domestic requirements to the exclusion of

looking at anything else?

And -- and I would say, no, not if -- not if that prejudices customers by -- by not being the best economic choice for them.

MR. ANTOINE HACAULT: If I could take you to Tab 2. I'm mindful of the time here. And that's page 10 of our book of documents.

I believe this was taken from your corporate website. The source is at the bottom. And this was part of your presentation to a particular group.

Do you recall which group, sir?

MR. SCOTT THOMSON: Yeah, I believe that would have been the Chamber speech that I did in 2012.

MR. ANTOINE HACAULT: Yes. And why would you chose revenue sources for a ten (10) year time period and categorize them as you did, sir?

MR. SCOTT THOMSON: I think the point I was trying to make at that point in my presentation was export sales deliver value back to -- to ratepayers in the province. The -- the -- absent that -- that revenue source, we would have had to recover those costs from domestic customers. Rates would have been higher.

MR. ANTOINE HACAULT: Okay. Sir, would it also follow that there's been mention of a decade of investment at $20 billion that encomp -- that encompasses not only the Preferred Development Plan, but other aspects, that the industrial and commercial group would be carrying from a revenue perspective about 40 percent of that cost?

MR. SCOTT THOMSON: Well, they -- they bore about 40 percent of our revenues over the period. The decade of investment is prospective.

MR. ANTOINE HACAULT: And do you have any reason to base a conclusion that it would be materially different going forward, that there would be substantially less contribution by the commercial and industrial group?

MR. SCOTT THOMSON: One moment.

(BRIEF PAUSE)

MR. SCOTT THOMSON: My recollection is that I -- I don't think it's going to change dramatically but -- but we can certainly look at -- dig that out. I just don't have the information in front of me.

MR. ANTOINE HACAULT: Thank you, sir.

And...

(BRIEF PAUSE)

MR. SCOTT THOMSON: Do you want it as an undertaking?

MR. ANTOINE HACAULT: We'll ask it of the particular people if we need to. I don't --

MR. SCOTT THOMSON: Thank you.

MR. ANTOINE HACAULT: -- want to waste time on it. Sorry, sir. I've got to try and ask general policy questions and limit my specific questions to specific panel members that you'll have.

It also follows that of this $20 billion of general investment, Manitoba Hydro is trying to seek a 25 percent equity ratio.

Is that correct?

MR. SCOTT THOMSON: That's our -- our long-term target, yes.

MR. ANTOINE HACAULT: Yeah. So if we take 25 percent -- well, maybe start going backwards. If you got $20 billion of capital investments, and the industrial and commercial group are carrying about 40 percent of that, we're in the order of $8 billion of capital investment, which this group is looking to pay

for through the revenue stream.

Are you with me, sir?

MR. SCOTT THOMSON: I understand where you're going. The one (1) -- the one (1) thing that you're -- you're leaving out of the analysis is the cash we generate from -- from operations, which recovery of -- of depreciation; so orders of magnitude over a ten (10) year period. We'd -- we're currently recovering about 5 billion dollars in the -- in the order of $5 billion, based on the current depreciation rates.

MR. ANTOINE HACAULT: Okay. Well, it's a debt that over time, through depreciation -- depreciation otherwise, that category, if nothing changes, we'll be asked to carry, correct?

MR. SCOTT THOMSON: Yeah, there's the -- although the -- they -- the revenue contributions from exports we'll -- we'll have to factor into that, and to the extent that -- that the overall mix shifts.

MR. ANTOINE HACAULT: Yes, understood. And if we then go from the $8 billion, as a general number, to a 25 percent equity, the 25 percent equity is something that you'd seek to attain fairly quickly, is it not, sir?

MR. SCOTT THOMSON: Well, we're --

we're there today. The -- the outlook is that -- that in the early '20s we'll -- we'll -- that -- that the leverage in the -- in the capital structure will go to about 89 to 11 percent equity, and then so will have to come back up from the eleven (11) to the twenty-five (25). I think our current outlook is by about 20 -- about 2035.

MR. ANTOINE HACAULT: So in the next twenty (20) years this group of customers will have to assist the Corporation in putting approximately, if the proportion stands, about $2 billion of equity, to which --

MR. SCOTT THOMSON: No, because you're -- you're assuming that it's about 25 percent of 8 billion and we -- we'd never get down to zero. So it's using that -- that line of thinking, it would be about 14 percent of the -- of the net capital investments.

So if you'd -- if you want to do it that way, 15 billion net after depreciation would be the borrowing requirements that we'd have to -- to fund that -- the growth, 15 percent of $6 billion. So it'd be on the order of 900 million. Subject to -- to running that through a calculator --

MR. ANTOINE HACAULT: But that's -- that's the general order. And those companies and

businesses would have, for your calculations, not too far off, a billion dollars in Manitoba Hydro's coffers, not available for other purposes?

MR. SCOTT THOMSON: Yeah, the -- the cost of power -- that's right, it'll be a cost of it of doing business.

MR. ANTOINE HACAULT: And if those companies have exhausted a particular mine, for example, that's not money that they can say: Well, now we've spent over the next twenty (20) years, so many millions of dollars to put into Hydro's equity. Could you please give it back to us because our mine is finished?

MR. SCOTT THOMSON: Sorry, is -- is there a question there?

MR. ANTOINE HACAULT: It's not -- it's not money that they can ask back if they leave Manitoba or -- or a particular project, like a mining project is finished?

MR. SCOTT THOMSON: Well, no, their -- their power costs are what -- they will have consumed the -- the resource.

MR. ANTOINE HACAULT: But contrary to other -- say my grandchildren, under your plan, you're hoping that they benefit from it so that at least if I

spend, I can say, Well, hopefully my grandchildren would benefit.

But that reasoning does not necessarily apply to a company developing a specific resource?

MR. SCOTT THOMSON: No -- no, I suppose -- suppose that's true if they're just here for a short period of time, then -- but they're -- they're benefiting from the lowest power costs in -- in North America today. And we fully expect that with, even with the Preferred Development Plan, that we're going to be able to help them retain that -- that cost advantage versus other jurisdictions.

MR. ANTOINE HACAULT: I have a couple more questions and then I'll leave it to the next questioner. At page 17 of our book of documents, this relates to the -- the news release last week.

And in the top paragraph of the news release, it's indicated that there is 308 megawatts of firm power for up to ten (10) years. Do you see that?

That's in the first paragraph?

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT: Are you able to put on the public record why the qualification, "up to ten (10) years"?

Is it ten (10) years, or is it something

less than ten (10) years?

MR. SCOTT THOMSON: It is -- it is ten (10) years, assuming that we have the fourth unit at Conawapa in service by 2026, i.e, if we follow through with the -- the plan as it's currently envisioned. The -- the end date is fixed, so if we're not in a position to deliver power starting in 2026, that -- the way things are -- are structured in the arrangement, that would -- it still terminates in -- in 2036.

MR. ANTOINE HACAULT: Thank you, sir. Further down in this press release, they're indicating or attributing some words to you. There's a quote. It starts in quotation marks:

> "Expert opportunities are fundamental to our Preferred Development Plan [period]. The agreement we are announcing today validates our plan and means all Manitobans will continue to benefit from exports through enhanced reliability and lower rates."

My question to you, sir -- and this is getting back to whether the focus is on the needs of energy for Manitobans or an opportunity-focussed analysis. I can think of a lot of different ways the

first sentence might have been phrased.

Am I understanding correctly that the focus is opportunities based when you're talking about this new deal which would allow for Conawapa to proceed?

MR. SCOTT THOMSON: Well, the sales opportunity is based on proceeding with Conawapa. The -- the Preferred Development Plan doesn't happen without exports, but the Preferred Development is all -- - all -- any development plan scenario is there to meet the needs of -- of Manitobans.

So again, I -- I had said before, they're not mutually exclusive. The -- the -- we're -- we're not -- we didn't pursue a plan so that we would have opportunities. Opportunities exist that we can exploit that -- that make sense to exploit in order to meet the needs of Manitobans.

MR. ANTOINE HACAULT: But I think we've agreed that the plans are being advanced because of these export opportunities?

MR. SCOTT THOMSON: That is -- yeah, that's true.

MR. ANTOINE HACAULT: The last series of questions are a couple with respect to the document found at Tab 5. It's the Manitoba Clean Energy

Strategy. At page 20, sir, the -- there's a message from the Minister, and my question is with respect to one (1) or two (2) sentences, whether this aligns with the vision of Manitoba Hydro or whether Manitoba Hydro has a different vision.

In the first full paragraph under the picture, it starts, "Not only does energy play a critical role," and it continues. And it says:

> "Plans for new hydraulic generation and transmission require a bold capital program of $20 billion over the next decade."

Is Manitoba Hydro ad idem with the message of the Minister thus far?

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT: Okay. And two (2) paragraphs down, the sentence starts, "Our strategy focusses on building new-generation hydro." Is that consistent with Manitoba Hydro's vision as a primary focus?

MR. SCOTT THOMSON: Yes, it is, in -- because we think that that -- that's the best way to make -- meet the needs of our customers.

MR. ANTOINE HACAULT: Okay. And flipping on to the next page, at the top, there's a

highlight of Manitoba's Clean Energy priority actions, including -- and there's a number of different priority actions, but the first one listed is building new hydro.

Does that figure as a priority for Manitoba Hydro and its vision?

MR. SCOTT THOMSON: Yes; yes, it does.

MR. ANTOINE HACAULT: Okay. And flipping to page 23, so the next page, on the right-hand side, there's a bullet the second paragraph down indicating:

> "Maximize the economic benefits from [full colon]: Constructing and operating energy generation facilities."

My --

MR. SCOTT THOMSON: Sorry, which bullet are you referring to?

MR. ANTOINE HACAULT: On the right-hand side.

MR. SCOTT THOMSON: Under, "Keeping rates low"?

MR. ANTOINE HACAULT: We are maybe under --

MR. SCOTT THOMSON: Those two (2)

columns there?

MR. ANTOINE HACAULT: -- a different page. If you look on your screen in front of you, sir, page 23.

MR. SCOTT THOMSON: Sorry. Okay.

MR. ANTOINE HACAULT: And the person has highlighted it for your convenience. Again, keeping in mind the questions that I asked, is it Hydro focussing on a needs -- that means pure needs as far as demand load -- or is it focussing on opportunities?

There's the statement:

> "Maximize economic benefits from constructing and operating energy generation facilities."

Is that a primary focus for Manitoba Hydro to maximize economic benefits from constructing and operating energy generation facilities, sir?

MR. SCOTT THOMSON: It -- it is one (1) of our -- our overall corporate objectives to -- to continue -- contribute to the development of the economy of the province, and that's part of our -- our strategic plan as well, so it is one (1) of our corporate purposes.

MR. ANTOINE HACAULT: If I had to explain to somebody on the street, What are Manitoba

Hydro's three (3) priority criteria, what would they be in, and in what order would they be?

MR. SCOTT THOMSON: Well, I can take you back to my opening remarks. At least I think I --

MR. ANTOINE HACAULT: Were they set out in a priority?

MR. SCOTT THOMSON: Yes. And -- and I -- I referenced them to our corporate mandate, first being to provide for the continuance of the supply of power adequate for the needs of the province, first and foremost.

MR. ANTOINE HACAULT: Okay. So let's stop there. So the first visioning criteria of this Corporation that you run is to determine whether or not the Manitobans need this from a supply and demand perspective domestically, correct?

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT: And that is the first in the order of priority?

MR. SCOTT THOMSON: They're all -- they're all important, but -- but, yes, meeting the -- the needs of the province.

MR. ANTOINE HACAULT: Well, I'd like to pin you down to one (1), two (2), three (3), if I could.

MR. SCOTT THOMSON: Yeah.

MR. ANTOINE HACAULT: If you can't give me the order of three (3) in specific order, can you at least give me which three (3) are the most important?

MR. SCOTT THOMSON: Well, I -- I did. I thought I did. Meeting the supply needs, engaging and promoting an economy and efficiency in the development of our system, and -- and the third is -- is marketing power to outside persons on -- on terms and conditions acceptable to the Board.

The legislation doesn't set a priority around those things, so I believe that the approach that we've taken to developing our Preferred Plan is -- is -- considers all of those things and -- and looks at that.

Will we -- will we restrict our -- our view on what's the absolute bare minimum that we need to do in order to ensure that the lights stay on five (5) years from now, ten (10) years and -- from now, and ignore other things that contribute value for the benefit our -- of our customers? No, we won't, and -- and I think we'd be remiss if we -- if we did that.

MR. ANTOINE HACAULT: So taking you back to the statement I just referred you to, sir:

"Maximize the economic benefits from

constructing and operating energy generation facilities."

That doesn't figure in the top three (3) priorities, sir?

MR. SCOTT THOMSON: Well, not as that's framed. I mean, that's one (1) part of the provincial's energy strategy.

MR. ANTOINE HACAULT: And is it fair to say in the top three (3) priorities that it is not also a top three (3) priority to generate cash for the province through water rentals and other benefits?

MR. SCOTT THOMSON: We don't have a whole lot of choice around that one. That's legislated, so we -- that's -- that's a cost of us doing business that we don't control, and that, you know, it's up to the province to -- to administer that.

MR. ANTOINE HACAULT: So, sir, one (1) of the criteria in the terms of reference was to assess the alignment of the plan with respect to the Green Energy Strategy, I believe. I don't have it in front of me right now. It was part of the terms of reference in the book of documents by counsel at page 4 of his book -- book of documents. It was at the bottom of the page.

MR. SCOTT THOMSON: M-hm.

MR. ANTOINE HACAULT: Item 2(b). Has Hydro...

MR. SCOTT THOMSON: Sorry, we're on the wrong page.

MR. ANTOINE HACAULT: Have you loci -- located it now, sir? It's page 4 of the book of documents. It's --

MR. SCOTT THOMSON: Yes.

MR. ANTOINE HACAULT: -- at Tab 1. And in the term of reference, it's para -- on the -- page number 4 of the book of documents, there's paragraph 2, 'B' as in Bob, and the first line says:

> "The alignment of the plan and alternatives to Manitoba's Clean Energy Strategy."

Do you see that?

MR. SCOTT THOMSON: Yes, I do.

MR. ANTOINE HACAULT: And I was asking various priority questions. Sir, how does Manitoba Hydro decide whether or not its plan has aligned with that strategy?

MR. SCOTT THOMSON: Well, looking at it in -- in the fullness of the plan that we put forward, we look at whether it's consistent or inconsistent, and I believe that -- I -- I believe that it -- it is, but

that'll be a matter for the panel to determine whether -- whether you feel it's -- it's consistent with -- with the Clean Energy Strategy.

MR. ANTOINE HACAULT: See, the reason I was bringing you to certain extracts of this strategy is that the strategy seems to be pretty clear, and maybe -- this is the Catholic part in me, Thou shall built. That's part of my strategy.

So any strategy different than building as set out in this plan wouldn't be consistent with that strategy, so what are we here for?

MR. SCOTT THOMSON: Well, I -- I don't think -- I think that's -- that's probably overstating things. Another thing that the energy strategy says is that -- that the -- the province is pursuing a -- a carbon-free economy, but there's -- there's natural gas used in the province. There's petroleum products used in the province. We're shifting away from coal.

So it's -- it's -- again, I don't think that -- that the -- the strategy overrides what we're doing here today. It's not -- it's -- it's on balance. You know, does what we're doing make sense in the context of the province's energy strategy? But I can tell you here today we haven't been directed by the province to -- to build these -- these projects.

MR. ANTOINE HACAULT: Thank you, sir, for being very helpful, and doing your best to answer my questions.

MR. SCOTT THOMSON: Thank you.

THE CHAIRPERSON: I think that we should take a -- a short break, if you don't mind. I know we're going over schedule but I hope you're still available, Mr. Thomson. I think that we'll take advantage of your presence to ask some more questions. So let's take a ten (10) minute break. We'll resume at 3:30.

--- Upon recessing at 3:20 p.m.

--- Upon resuming at 3:33 p.m.

THE CHAIRPERSON: I believe we're ready to resume the proceedings, so unless we have any instructions from -- from counsel, I'll turn it over to Mr. Gange.

CROSS-EXAMINATION BY MR. WILLIAM GANGE:

MR. WILLIAM GANGE: Thank you, Mr. Chair. Mr. Thomson, I'm back here. Just -- you could look right through Ms. Menzies, and she -- she's probably -- well, I won't go there.

To the -- Keeyask is -- is 695 megawatts, sir?

MR. SCOTT THOMSON: That's correct.

MR. WILLIAM GANGE: And in the Preferred Development Plan, there's a listing -- and -- and I think that Mr. Hacault went through some of them, the -- the -- included in the Preferred Development Plan is the Minnesota Power sale of 250 megawatts, the Wisconsin Public Service of 300 megawatts, and the Northern States Power of 125 megawatts.

Doesn't that take up all of the capacity of Keeyask?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Some of the -- the NSP sale is being served today. But as I had -- had referred to with -- with -- we're -- we're largely there in terms of -- of having committed sales to -- to utilize Keeyask, assuming it's built.

MR. WILLIAM GANGE: So -- so the -- and the -- and -- and the evidence that you've given is that somewhere between 2020 and 2022 you expect the Manitoba growth to -- to outstrip the -- the present capacity of the system.

Is that correct, sir?

MR. SCOTT THOMSON: I believe that -- that what we've indicated is bu -- we expect to need a new resource by 2023.

MR. WILLIAM GANGE: Okay. Then the recent power -- or the -- the mem -- memorandums of understanding with SaskPower and Great River Energy of 1,100 megawatts, they can't -- I mean, this just makes mathematical sense -- they can't be serviced under Keeyask?

MR. SCOTT THOMSON: That's correct.

MR. WILLIAM GANGE: And -- and is there any change in terms of Manitoba Hydro's outlook to the domestic load forecast that would allow all of these sales to take place, or is it -- or -- or are you not counting on a slowdown in the Manitoba capacity?

MR. SCOTT THOMSON: Well, our -- our load forecast is -- is continually updated, and -- and certainly we'll speak to that starting tomorrow. When we -- when we enter into memorandums of understanding it's to pursue discussions around sales.

If -- if we are successful in converting, for instance, the full amount of GRE, the 600 megawatts, that would preclude us completing five hundred (500) for -- for SaskPower. Similarly, when we

-- the recently announced sale with -- with Wisconsin Public Services for -- for the 308 megawatts in the -- in the period beyond 2026, now the original term sheet was for up to five hundred (500). We -- we may not get six hundred (600) with GRE. We -- we may not get five hundred (500) with Saskatchewan, but we may get half of both or some other -- other percentage.

And we are -- as I've mentioned, we're -- we're in discussions with a couple of other US utilities that we could serve from Conawapa. So I want a hopper as -- as broad as I can with sales prospects that will pursue, but once it's sold it's sold.

And -- and it's -- I think, in part, one (1) of the reasons why we're -- we're getting some enthusiastic responses from some of these other utilities that are now -- you know, now that we've announced some MOUs, we're broadening and diversifying our customer base. And some of our traditional customers want to ensure that they can continue to do business with us.

So, you know, I -- I think it's a positive thing that we've got -- that we're entering into discussions with people, with -- with -- I -- I'd rather have more sales opportunities than sales capacity, because then I don't have to convert

everything. And, in fact, it -- it helps us to avoid a scenario like we experienced back when -- when we lost the Ontario Power sale and - and Conawapa was -- was shelved. This isn't the first time around for this project.

So having three (3) or four (4) sizeable sales prospects on the go at one (1) time is a good thing.

MR. WILLIAM GANGE: I -- I believe that -- the evidence that the Green Action Centre intends to introduce, both through Mr. Chernick, dealing with fuel switching, and then in conjunction with the Consumers' Association, through Mr. Dunsky, is going to suggest that with an aggressive DSM program and the fut -- and taking into account fuel switching, that the demand -- the domestic demand curve may well flatten out to such an extent that -- that the -- that the -- the time-line that you've suggested of 2023 may not be necessary in terms of using up or exceeding the -- the Manitoba capacity.

So -- and -- and I don't want to get into a debate about that. I'm just saying that that's the evidence that we expect to bring. And -- and obviously it's then going to be up to the Board to listen to that and accept it or reject it, whatever.

But if it were to be that the -- that the Manitoba domestic demand did not require a Keeyask or a Conawapa, in your calculations, sir, has -- has Manitoba Hydro determined whether or not they could turn a profit if these two (2) dams are built solely to supply export contracts like the ones that have been listed?

MR. SCOTT THOMSON: Well, I -- I -- I'm -- I'm pausing. The -- we -- we don't anticipate -- and you're right. I mean, I guess we'll -- we'll have a -- a lengthy discussion in terms of -- of where we think that the load forecasts are going and -- and the ability that we have to -- to utilize DSM. And I -- we -- we'll have to talk in camera about the details of the export contracts.

But if -- if we -- if we built the -- the -- if we built the projects and never needed them domestically and we were selling power under those contracts at the -- at the prices that we've -- we've done in the early stages, and that lasted over the life of the project, I think they'd be wildly successful and profitable.

(BRIEF PAUSE)

MR. WILLIAM GANGE: Thank you, Mr. Thomson. Those are my questions on behalf of Green Action.

MR. SCOTT THOMSON: Thank you.

THE CHAIRPERSON: Before we move on to the next one, I just wanted to explore a statement you made to Me. Hacault, specifically addressing the issue of competitiveness of Manitoba rates in a context where the Preferred Development Plan goes ahead as -- as submitted: 3.95 percent increases per year for eighteen (18) to twenty (20) years, which -- which would mean a double of -- of rates, essentially, over that time frame.

Now, I guess the question I have is: You're in a competitive energy market. You indicated that, despite those increases, we'd still be competitive. And I -- I -- I'm having trouble reconciling that with the fact that, you know, rates in the US are relatively flat -- rates to consumers in the US are relatively flat in -- in some jurisdictions, not all jurisdictions. And I guess -- are you confident that, in the face of these significant rate increases, that we would still be a competitive option for a -- a business or industrial manufacturer wanting to sell in Manitoba?

MR. SCOTT THOMSON: Yeah. Based on -- if -- if our -- if our rates were to double over twenty (20) years, they -- they'd be approaching what people in southern Ontario pay today. And -- and their rates aren't staying flat for twenty (20) years.

Saskatchewan, they're about 50 percent higher than our rates are today, and they have plans to invest $15 billion over the next ten (10) years in their thermal generating stations. Their rates are going up.

BC, over the next three (3) years are raising their rates 9 -- 9 percent, 6 percent, and 3 percent. Saskatchewan's going up 16 percent over the next three (3) years. Quebec just announced -- I believe it's a 5.6 percent rate increase request.

We don't -- we're -- we're all facing pressures. The markets that we sell into in -- in Minnesota and Wisconsin, their residential domestic rates are on the order of twelve (12) cents a kilowatt hour US.

So I -- I believe that -- that, in the fullness of time, they are. I know that -- that BC's got huge expenditures. They're making over $2 billion a year in investments in -- in their infrastructure. That's hydro.

That's the -- you know, Hydro and Quebec -- or BC and Quebec are the -- the most comparable to -- to Manitoba in terms of -- of infrastructure and -- and rate structure, so it would be my expectations as -- as US utilities retire coal and have to build new -- assuming they build thermal generating stations and wind, which they'll need to do both, they'll -- they'll need to firm the wind. They -- they're going to have to make major investments, too.

So I think our rates -- I think we can keep our rates competitive. Certainly in -- in the -- the near term what we're seeing in -- in our neighbouring jurisdictions, the -- the announced rate increases are higher than -- than we're contemplating doing.

THE CHAIRPERSON: In -- in the most recent rate application, we heard from members of MIPUG who appeared before us to indicate that they were concerned about the direction of rates, specifically citing Louisiana as a jurisdiction where they could get lower rates than are currently available in Manitoba.

I'm raising that issue because I -- I mean, I -- I understand your comparisons to Canadian jurisdictions. You know, I understand that our neighbours, and so on, are -- are a good relative

comparison, but I guess the -- the issue that was raised for us as a panel was the fact that these companies see the -- the North American market as their market, and they can move tomorrow to -- some of them can move tomorrow to go to another jurisdiction to take advantage of lower rates.

And I guess the question is: Are you still confident despite the fact that some of these companies are fairly -- fairly mobile, that they wouldn't, you know, in the face of these increases wouldn't be considering going to another jurisdiction where they can enjoy lower rates?

(BRIEF PAUSE)

MR. SCOTT THOMSON: Mr. Chair, the -- obviously, we'll -- we -- we'd be concerned about losing our customer base in -- in the event that someone chose to relocate outside the province, but the -- there are -- there are -- particularly in the United States, there are some jurisdictions that will induce -- they -- they'll cut special deals to induce a customer for economic development purposes, and -- and we are not in that game, or haven't been up until now. That -- that, I suspect, would have to be something

that would be a government policy thing that -- that might evolve over time.

I'm -- I'm not sure that -- that -- you know, if -- if someone wants to give it away below cost, we're -- I'm not going to advocate that we do -- do that. So that's -- that's picking winners and losers, and that's giving preferential treatment to -- to a certain group to induce them into -- and I -- as I understand it that Louisiana situation was -- was a special rate that wasn't available to everybody.

THE CHAIRPERSON: Thank you. I would turn the microphone over to Ms. Saunders on behalf of the Manitoba Metis Federation.

CROSS-EXAMINATION BY MS. JESSICA SAUNDERS:

MS. JESSICA SAUNDERS: Thank you. I do not intend to get into too many of the details regarding technical matters, and I believe that a lot of my questions will endeavour to stay in line with the more higher-level policy comments that you made in your opening remarks.

So, Mr. Thomson, your counsel Ms. Ramage spoke of Hydro's view of the analysis being broken down into Stage 1, relevant to decisions needing to be made immediately, and Stage 2 on decisions of a later date

supplementing options. And you referred to these stages in your open -- in your opening remarks.

So Hydro's ability to come to this Stage 1 and Stage 2 approach to the analysis is the result of Hydro's strategic or high level planning.

Would you agree?

MR. SCOTT THOMSON: Yes, in the detailed analysis that we've done on -- on the economic evaluations.

MS. JESSICA SAUNDERS: Okay. Mr. Peters went over this with you in your -- in his cross-examination, and I would note from your CV, as it's been provided by your counsel, it's been included...

(BRIEF PAUSE)

MS. JESSICA SAUNDERS: I included, as well, in our Tab 1 of our materials your CV. And as I said, Mr. Peters went over this, that prior to becoming the president and CEO of Hydro in 2012, you were the Executive Vice-President of Finance, Regulatory Affairs & Energy Supply and the Chief Financial Officer, FortisBC Holdings, from 2010 to 2011, and that prior to that you were Vice-President, Regulatory Affairs and Chief Financial Officer of Terasen Gas Inc. from 2007

to 2010, correct?

MR. SCOTT THOMSON: Correct.

MS. JESSICA SAUNDERS: In your previous role as -- in your previous role, any of your previous roles that I've -- I've just mentioned, or any that, for that matter, happen to be in your CV, did you have any experience in working with Aboriginal peoples? And to clarify, what I mean particularly by 'Aboriginal', I mean that being First Nation, Metis, or Inuit peoples.

MR. SCOTT THOMSON: Yes, I did.

MS. JESSICA SAUNDERS: Okay. Would you care to elaborate on some of the work that you've done previously in that regard?

MR. SCOTT THOMSON: Well, the most -- the most recent thing that I was doing prior to -- to joining Hydro, Fortis had developed an LNG storage project on Vancouver Island, and there were two (2) -- two (2) bands in the vicinity of the project that we entered into a limited partnership arrangement with to own the -- the facility. So it was a one and a half (1 1/2) bcf LNG storage tank. And so I was -- I was involved in all the negotiations with the bands, putting the arrangement together and -- and bringing it to -- to a conclusion.

MS. JESSICA SAUNDERS: Okay. So you

referenced these projects as being about a storage tank. And so is it fair to say that you had some experience in your previous role, but in reference to projects like Wuskwatim, Keeyask, and Conawapa, you have certainly gained a lot of experience in your role as President and CEO of Manitoba Hydro with large projects that involve Aboriginal people, such as First Nations?

MR. SCOTT THOMSON: That's -- that's very true.

MS. JESSICA SAUNDERS: The plan under review in this NFAT involves three (3) new major project components with associated facilities: Keeyask, Conawapa, and the Manitoba-Minnesota transmission line. And the terms of reference at Tab 4, page 26, near the bottom, the very bottom there, lead -- indicates:

> "Aboriginal consultation is conducted as a separate Crown-Aboriginal consultation process."

And that appears next to the out-of-scope item that says, "Aboriginal consultation pursuant to section 35 is out of scope." And I just want to confirm that -- that that is your understanding, correct?

I can rephrase that. I apologize. That

in the terms of reference in the out-of-scope matter section, in brackets it indicates:

"Aboriginal consultation is conducted as a separate Crown-Aboriginal consultation process."

And I just want to confirm, is that your understanding as well, sir?

MR. SCOTT THOMSON: Yes, it is.

MS. JESSICA SAUNDERS: Thank you. So in your opening remarks you spoke of demand-side management, wind generation, and natural gas generation as alternatives, and particularly natural gas, as the underlying base case comparing all inter -- alternatives to, correct?

MR. SCOTT THOMSON: Yes.

MS. JESSICA SAUNDERS: It may go without saying, but as a result of Hydro's screening of these alternatives, the preferred plan in this review has, of course, taken the front seat with other aspects being considered as alternatives, correct?

MR. SCOTT THOMSON: Well, the preferred plan emerged as the one (1) having the most benefit of the fifteen (15) that we looked at.

MS. JESSICA SAUNDERS: Okay. And to confirm, that goes to the strategic planning on the

part of Hydro, correct?

MR. SCOTT THOMSON: Well, we -- we've evaluated all the plans that -- that we could come up with that -- that would serve the needs of -- of the province, so it's part of the strategy. It's a chicken and an egg thing. But that helps to -- to dri -- confirm and validate the -- the plan.

MS. JESSICA SAUNDERS: Okay. And going back to your opening statement, you underscore that the plan is not without flexibility, that there are decisions that need to be made shortly, but Manitoba Hydro maintains that there is flexibility and future resources is part of the past.

So is it your view that regardless of the, perhaps, sec -- analysis that -- that Hydro completed as part of my questions to you regarding the -- the planning involved, and so that in part of identifying the plan as the preferred plan, that there is still some flexibility in certain decisions with respect to this plan.

Is that fair to say?

MR. SCOTT THOMSON: Yes, there's -- there -- over the course of time, we'll -- we'll evaluate. And -- and some of the things, as I'd mentioned, are out of our control. If -- if there

isn't approval to build, for instance, a 750 megawatt transfer transmission line in the United States, well, it's going to take us down a -- a different pathway.

Similarly, if -- if some of the -- the economic considerations don't pan out, then, as I'd mentioned, we may -- we may want to delay Conawapa, or it -- it may -- may push it off the table and we'd be looking at -- at some other resources at that time.

MS. JESSICA SAUNDERS: Thank you. And that relates to I believe where I wanted to go next. I would refer to you -- to you Tab 5, starting at page 32. This is your presentation to the Second Session, 40th Legislature, of the Legislative Assembly of Manitoba Standing Committee on Crown Corporations, dated October 2nd, 2013.

And on page 42, you are asked -- and I can tell you -- it starts at:

"How is the low price of natural gas in the US affecting Manitoba?"

It's in the second column --

MR. SCOTT THOMSON: Yeah.

MS. JESSICA SAUNDERS: -- below the screen. You might have to move down the screen. So right -- right there, the second last paragraph, you're asked:

"How is the low price of natural gas in the US affecting Manitoba Hydro's plans for the future?"

And in the next paragraph, you indicated:

"It hasn't changed our basic assessment that harnessing the hydro potential on the Nelson River at this point were the two (2) projects we're planning. The economics still favour that."

Do you confirm your comments there?

MR. SCOTT THOMSON: Yes.

MS. JESSICA SAUNDERS: Okay. And then turning to the next page, 43, the third paragraph, you say:

"If gas prices stay at three dollars ($3) five (5) years from now, and the outlook is a lot lower, that's probably going to impact on the decision whether to proceed with Conawapa at that time, defer the project, or shelve it indefinitely. So -- but today, that's the lens we're looking through. It's still

the two (2) hydro projects appear to be the best ones."

You confirm your comments there?

MR. SCOTT THOMSON: Yes.

MS. JESSICA SAUNDERS: Okay.

MR. SCOTT THOMSON: I can confirm all my comments in the document I was --

MS. JESSICA SAUNDERS: I do apologize.

MR. SCOTT THOMSON: -- I was testifying there to.

MS. JESSICA SAUNDERS: Yeah. So I know while these matters are likely to be discussed in -- in panels later on, I just wanted your views, given these comments.

How long (sic) would you say does the gas pricing and related export power pricing relative to the cost of new generation have to go before Manitoba Hydro would defer or cancel Keeyask and/or Conawapa?

MR. SCOTT THOMSON: I -- I'm sorry. You're going to have to repeat that.

MS. JESSICA SAUNDERS: Okay. So how low would you say --

MR. SCOTT THOMSON: Oh, how low. I thought you said "how long".

(BRIEF PAUSE)

MS. JESSICA SAUNDERS: Well, how low and I believe how long are -- are both tied in the question. And I can repeat.

But how low would you say does the gas pricing related to export power pricing relative to the cost of new generation have to go before Manitoba Hydro would defer or cancel Keeyask and/or Conawapa?

MR. SCOTT THOMSON: As we sit here today, we're -- the pricing that -- that's in place today and the outlook that's there is supportive of Keeyask. I can't give you an exact answer on Conawapa. We -- we anticipate an escalation in the natural gas prices in -- in the -- in the next three (3) or four (4) years and beyond.

So I -- I'd prefer to defer the -- the detail on that one to the next panel.

MS. JESSICA SAUNDERS: Thank you. And so moving on to the next area, we heard Hydro identify in its opening remarks again the Stage 1 and Stage 2 on decisions at a later date and supplementing options. I'm wanting to explore with you more some of your comments and -- on what has needed to occur in coming to the decisions stages, the decisions that led

Manitoba Hydro to this point in time when other decisions are needing to occur in short order.

And in his examination of you, Mr. Peters asked you about the costs that have already been associated with Keeyask. You confirmed to him that the cost of Keeyask would be 1 billion in June 2014.

Are you able to confirm the amount to these projects -- the amount of these project costs spent with respect to First Nations involvement in the project?

MR. SCOTT THOMSON: In aggregate, yes, and we can get that information. I don't have -- have it in front of me.

MS. JESSICA SAUNDERS: Okay. Yeah. Yes, would -- would we be able to confirm the undertaking?

MS. PATTI RAMAGE: That can be done by undertaking, or it can be done by the panel with the detailed information. It's...

THE CHAIRPERSON: Let's do it as an undertaking.

MS. JESSICA SAUNDERS: An undertaking as to in -- in Mr. Peters's earlier testimony he was asking the project cost spent with respect to Keeyask, and that it would be around 1 billion in June 2014.

And my question was wanting to confirm the amount of these project costs spent with respect to First Nations involvement in the project.

--- UNDERTAKING NO. 5: Manitoba Hydro to confirm the amount of project costs spent with respect to First Nations involvement in the project

CONTINUED BY MS. JESSICA SAUNDERS:

MS. JESSICA SAUNDERS: I guess my -- my second question would be then: Are you able to confirm the amount of these project costs in Metis involvement in the project?

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Chairman, that undertaking we'll have to accept subject to check, because I'm not sure if we break it out that way or not.

MS. JESSICA SAUNDERS: Those comments are fair. And so in your undertaking the fir -- the undertaking regarding the First Nations involvement,

would it then be possible when you're preparing that information to indicate clearly what costs go towards First Nation?

I -- I am aware that there may be some references to Aboriginal, but just if you're mindful in your cost projections which costs apply particularly to Metis, if you could indicate that, as well, in your undertaking.

Is that possible?

(BRIEF PAUSE)

MS. PATTI RAMAGE: Ms. Saunders, I'm not entirely clear on what the second part was. But to be clear on what I think we have undertaken to provide is how much the project costs have been -- have been spent regarding First Nation involvement, with a tentative undertaking is: Can we split out how much of the project cost has been spent regarding Metis involvement? And it is tentative because my understanding is that we categorized those costs as 'Aboriginal', and the -- I am not sure that they are -- are -- can be further broken down.

Does that cover what you were looking for? So if we can break it down further, we will, but

that's the tentative part.

MS. JESSICA SAUNDERS: Yes, we would agree to that. Thank you.

--- UNDERTAKING NO. 6: Manitoba Hydro to split out how much of the project cost has been spent regarding Metis involvement

CONTINUED BY MS. JESSICA SAUNDERS:

MS. JESSICA SAUNDERS: And, now, this relates to the narrative we spoke of -- of earlier, both in -- in your comments, sir, regarding the various decisions that have --have been made in order to allow for these plans to be presented here today.

One of the projects being reviewed in the NFAT is Keeyask. And in your opening comments you spoke of how Hydro is a partner along with First Nation partners.

You were referring to the Keeyask Hydro Power Limited Partnership in this project, correct?

MR. SCOTT THOMSON: That's correct.

MS. JESSICA SAUNDERS: And in your opening comments, you explained that Hydro's plans for development are not without controversy or challenges.

I want to refer to your speech to the Winnipeg Chamber of Commerce on September 19th, 2012. It's at Tab 2 starting on page 5.

And on -- if we move forth -- further to page 6 you indicate -- further down. Right there:

> "There is no one-size-fits-all template for our future developments. They are not without challenges or controversy, and without doubt require major commitment of time and resources from Manitoba Hydro and key stakeholder groups, including Aboriginal communities and resource users."

So you discuss a no-size-fits-all template for future developments.

Can you explain more what you mean by that?

MR. SCOTT THOMSON: Yeah. What I was -- what I was referring to, I believe, was we entered into an arrangement with Nisichawayasihk Cree Nation on Wuskwatim. As we -- as we look at the Keeyask partnership agreement, and ultimately Conawapa, I wouldn't expect that the business relationship would be identical across the board on those.

They're -- they're a -- a -- they're -- they're much different size. The capacity of the -- of the potential partners in the -- in the bigger projects, the financial capacity to make investments in a project of that size are -- are limited. And their risk tolerance is -- is limited, as well. And that's something that we learned from the -- from the Wuskwatim partnership arrangement.

So we're not expecting that each deal will mirror all aspects of the -- of the prior deals.

MS. JESSICA SAUNDERS: Thanks. I'll also refer to your comments on page 13, you saying:

> "We have a different set of challenges than those of the '60s and '70s."

Do you see that there in the -- the second-last paragraph that's up on the screen?

MR. SCOTT THOMSON: Yes.

MS. JESSICA SAUNDERS:

> "...including increased responsibility for those affected by our projects and greater scrutiny and accountability for both financial and environmental impacts. And we are up to those challenges."

And so you referred to the challenges of the '60s and '70s, considering impacts to those affected by Hydro projects. In your speech you used the wording, "Aboriginal stakeholders."

Is it fair to say that Hydro's approach to these stakeholders today has changed from the '60s and '70s?

MR. SCOTT THOMSON: Very much so.

MS. JESSICA SAUNDERS: Is it fair to say that Hydro takes a more proactive approach with respect to these stakeholders?

MR. SCOTT THOMSON: Yes, I believe we do. The -- the -- that's borne out in the arrangements that we made with -- with NCN on Wuskwatim and with the -- the partnership arrangements that we've -- we've entered into discussions with for Conawapa and, of course, the -- the Keeyask partnership.

MS. JESSICA SAUNDERS: Thank you. And Manitoba Hydro doesn't have to take this approach, of course, given what I've referred to it, and -- and we've confirmed, as being the proactive approach.

But Hydro has decided to, correct?

MR. SCOTT THOMSON: That's right.

MS. JESSICA SAUNDERS: And how was the name for Keeyask chosen for the project?

MR. SCOTT THOMSON: Well, it's -- my understanding is it's the Cree word for 'Gull Rapids'.

MS. JESSICA SAUNDERS: Do you know who would have chosen the name?

(BRIEF PAUSE)

MR. SCOTT THOMSON: The local Cree Nations asked us to use that name.

MS. JESSICA SAUNDERS: Thank you. And so we've discussed this approach, and I -- I just want to discuss with you further, you've confirmed that this approach has -- has been applied in the -- in Wuskwatim, and as well, in the -- the Keeyask project.

And you can agree then that this approach has been important in development of these projects?

MR. SCOTT THOMSON: Yes.

MS. JESSICA SAUNDERS: In your presentation to the Standing Committee on October 2nd, again, at Tab 5, page 37, you say in the fourth -- the left fourth paragraph down:

> "In preparing for Conawapa, we believe we're taking a responsible and respectful approach to working

with First Nations to reduce environmental impacts and ensure local community benefits from the development. This approach refer to Wuskwatim, and Keeyask, as well] results in better projects to supply the province's growing demand for electricity."

And so you can confirm then that this approach is not only beneficial to Hydro and to the First Nations, but also as part of it being beneficial in the end to all Manitobans in the development of these projects?

Is that fair to say?

MR. SCOTT THOMSON: Yes, it is.

(BRIEF PAUSE)

MS. JESSICA SAUNDERS: I'll just take a moment for a second, please.

(BRIEF PAUSE)

MS. JESSICA SAUNDERS: And in continuing your speech again at Tab 5 on page 37, the

second left -- last paragraph in the second column, you begin to discuss the new transmission line from Winnipeg to the -- to the US triggered by the sale to Minnesota Power, or the Manitoba-Minnesota transmission line. And you indicate:

> "We're about to begin seeking public input to help identify and refine the most suitable route, taking into account impacts on people and the environment."

And I will refer you to the map of the Manitoba-Minnesota transmission line at Tab 9, page 74. Oh, it didn't show up as -- okay.

(BRIEF PAUSE)

MS. JESSICA SAUNDERS: It hasn't showed up as -- quite as clear, but this of course, the -- the map of the Manitoba-Minnesota transmission line from -- from your website.

You can confirm that this proposed project, as is seen on the map here, is the same project you were referring to in your comments?

MR. SCOTT THOMSON: The Canadian portions, some alternative routes that are being looked

at, yes. I -- I -- the colour isn't -- it's -- there are a number of different alternatives that were being -- that we're looking at.

MS. JESSICA SAUNDERS: Yes. And I don't intend to refer you to the particular routes such that I -- I should have had colour in any event, but I don't intend to get into those details.

But in the map, you can see that the converter station -- I presume you can see, but it is there. And as you know, it's been named the Riel converter station.

Are you familiar with the name Riel?

MR. SCOTT THOMSON: Yes, I am.

MS. JESSICA SAUNDERS: And do you know how this name was chosen?

MR. SCOTT THOMSON: I -- I'll double-check.

(BRIEF PAUSE)

MR. SCOTT THOMSON: I'll have to -- we'll have to get you the -- the history around that. I know my understanding is it was -- it was out of respect for -- for the Metis leader, and we were actually hoping that President Chartrand would be

available when we commissioned the station.

MS. JESSICA SAUNDERS: However, though, can you confirm as to whether you consulted with President Chartrand on the name of this converter station?

MR. SCOTT THOMSON: I can't. I can't confirm. I -- I -- it was before I arrived here, so I don't know all the details behind that. I can find out.

MS. JESSICA SAUNDERS: Okay. And so I don't know that we want to -- to do an undertaking on that. I -- I do know that you will provide us with those details, and so thank you very much.

THE CHAIRPERSON: Thank you, Ms. Saunders. I -- I have neglected to ask Mr. Orle if you had any questions. I -- I'm sorry. I apologize that I -- I jumped over you.

MR. GEORGE ORLE: No apology needed, Mr. Chairman. I'm the sixth one to cross-examine. I'm like the last speaker at a roast. There's nothing new that can be added, and I'm quite satisfied from Mr. Thomson's answers that whatever I need will be obtained from the panels on behalf of the questions that my -- my client has.

And in regards further cross-

examinations, the fact that we don't cross-examine doesn't mean that we're in agreement with everything that's been said by the witness. But there's been some very good and adequate cross-examination. I'm prepared to rely on that. Thank you. And thank you, Mr. Thomson.

THE CHAIRPERSON: Before I let you go, I have a few -- a few questions I'd like to ask you, Mr. Thomson. And, by the way, I appreciate your coming in today. I -- I think that it's very important that see the CEO, particularly involving a plan of this import. I think it's important that we -- we see -- see into your eyes and be able to answer (sic) questions directly of you.

I do have a question though in relation to the Strategic Plan, and very specifically, gas versus hydro. I mean, you are -- so you are an energy provider to Manitobans. You're doing over two hundred thousand (200,000) gas customers, serving two hundred (200) -- over two hundred thousand (200,000) gus -- gas customers; also serving two hundred thousand (200,000) electricity customers -- I'm sorry, over five hundred thousand (500,000) electricity customers.

And I -- and I guess the question is: Corporately, are you indifferent as to gas versus

hydro?

MR. SCOTT THOMSON: Not indifferent. I -- I think that my view would be that -- that we should be -- we -- we should encourage and educate customers to make the best choices for energy for specific uses.

You know, in -- in areas served by natural gas, I think it's the preferable way to -- to space and water heat. In -- in areas served by electricity only, there's -- there's potential options to -- to use -- use geothermal heating as an alternative to gas.

We've -- we've got a couple of the projects that are -- that are ongoing right now with -- with the First Nations to -- to convert some of their communities. And -- and because we were in a position to do that en masse, it's allowed the cost to be reduced on those projects, so it's making them more economic.

It's -- it's a -- it's a tough sell in a -- in a gas-served area. Just the numbers don't turn. And even -- it's -- it needs that volume buying today, volume capability in order to -- to make it work, and even in an electric-serviced area at the residential level. But in those instances, we -- we think it is.

So not indifferent, no. I think that

natural gas has its place and -- and we -- we -- you know, we own a gas company. I -- I think that -- that that's an asset owned by the -- the people of the province, too, and we -- we ought to get the most out of that asset that we can.

THE CHAIRPERSON: We heard on Thursday last from an individual who indicated that they were advocating for gas service in Pembina Valley. You know, they -- they -- there's parts of that valley that are -- where gas is available but parts where it isn't available. And -- and I understand from his -- his evidence or his testimony that he has approached Manitoba Hydro to talk about that.

So what say you to a region or part of the province where there isn't gas service, and what's your approach there? I mean, do you see that as an opportunity? Do you see that as something that you need to do to give energy options to those Manitobans?

MR. SCOTT THOMSON: It is an opportunity. I think that extension of gas service is subject to a number of board orders on -- on main extensions. We've done considerable -- I think on the order of over 330 kilometres of new gas mains that we've installed over the last three (3) years.

And -- but -- but there's a -- there's

an economic test that governs that that's -- that I understand it's -- it's been put in place by the Board; your Board, not my board.

So the -- you know, subject to it being economic, that's a -- that's a constraint around -- around extending gas service. But certainly it's -- it's got benefits, and -- and, in particular, in areas where there are some of the -- the colonies that are coal users today and are -- are coming off coal that we can serve with natural gas, rather than having them come onto the -- the electric system. I think that's desirable.

It's -- and economics are important. It's -- it's -- we have -- we still have, unfortunately, four (4) communities in the North that -- that we -- we serve with electricity by -- by burning diesel. And it's -- that's, unfortunately, the most economic choice that we have available today, although we're exploring a lot of options around that.

But the cost of extending transmission service to those communities is on the order of four hundred thousand dollars ($400,000) per customer. Clearly, that's not an economic choice and would require a huge subsidization to bring into place. So there's -- there's a tipping point in there somewhere.

But -- but we are looking at -- at the area there. And -- and if -- if we can make the numbers work, I'm -- I'm certainly interested on behalf of the Company in pursuing it.

THE CHAIRPERSON: Now, there are some commentators that voiced very strong concerns about the risks that are associated with the Preferred Development Plan. In other words, you know, they -- they -- there's clearly opportunities, which you have enumerated today, but significant risk associated with interest rates, and gas prices, and so on. I mean, there are very significant risks.

And there's some commentators that suggest that you could take an alternate plan with considerably lower risks and yet achieve some of the same objectives, which is to have power available for Manitobans when it's ultimately needed by Manitobans. So -- so what do you say to that?

I mean, you -- you've indicated that you have a fairly robust Risk Mitigation Plan in place, but how can you protect yourself against massive increases in interest rates, for example?

MR. SCOTT THOMSON: That -- that's one that we can't insulate ourselves from. I -- I guess -- and -- and much has been made about the -- the movement

in -- in the spot market electricity prices and that -- forecasts not being right if you go back a few years. They haven't all gone against us either. Interest rates we had anticipated would have moved up higher sooner, and they haven't.

So -- so there are some things like that. But -- but again that's -- that is the part of this gated process that we're talking about. If -- if interest rates go to 10 percent and all else stays equal, that's going to have a significant impact on whether or not Conawapa gets built.

I -- I haven't tumbled the numbers, but I -- I believe that that would -- that would cause the financials to -- to go in the wrong direction, and it would make other less-capital-intensive choices likely better.

THE CHAIRPERSON: Okay. We -- you -- go ahead.

MR. SVEN HOMBACH: Mr. Chairman, you'll note that IEC counsel is shown on the hearing schedule as well, but M. Monnin advised me during the break that he does not have any questions for Mr. Thomson.

THE CHAIRPERSON: Now, the schedule also provides that we now turn the microphone over to Mr. Wojczynski, and we have a few more minutes. I know

that it's provided for an hour. So obviously we're not going to do the full hour now, but we can stay longer.

And do you need the full hour?

(BRIEF PAUSE)

MS. PATTI RAMAGE: Yes, we need the hour but it would be my vote to stay on track and -- and do it today.

THE CHAIRPERSON: I'm getting the green light from the fellow panel members, so let's proceed.

(BRIEF PAUSE)

THE CHAIRPERSON: I believe we're in a position to start. Are we?

(BRIEF PAUSE)

THE CHAIRPERSON: Good evening, Mr. Wojczynski.

MR. ED WOJCZYNSKI: Good evening. The honourable counsel for -- earlier made mention about being the -- the last cross-examiner and -- and I -- I think he may -- we -- I realize I'm the last one

between you and the rest of the evening. So I will try and be as efficient as I can, but I'm afraid I do have some significant amount of important material, so I hope you'll bear with me. But I will try and -- and keep it as efficient as I can.

MANITOBA HYDRO PANEL 2:

ED WOJCZYNSKI, Unsworn

EXAMINATION-IN-CHIEF BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: And, Mr. Chair, because Mr. Wojczynski will be appearing as a witness for the first time, we have just a couple of questions for the record to -- to establish his role in the NFAT.

So, Mr. Wojczynski, can you please provide the panel with your role at Manitoba Hydro with respect to this NFAT filing?

MR. ED WOJCZYNSKI: I am the division manager who has the overall lead for the NFAT process itself.

MS. PATTI RAMAGE: And your CV has been filed as part of Manitoba Hydro, what I believe is Exhibit 85. Can you briefly run through your qualifications and past experience relevant to this process?

MR. ED WOJCZYNSKI: I have a bachelor's in electrical engineering, U of M. I did my master's in power systems engineering, University of Saskatchewan. I took numer -- various finance and utility courses. I have been -- I'm a professional engineer, a member of the Institute of Electrical and Electronic Engineers.

I have -- was chair of the Canadian Hydropower Association until this fall when I withdrew, so that I could focus on this significant process that we're engaged in here. I'm still on the board, but not as active right now.

I'm also involved with the International Hydro Association, chair of a working group there. I'm a member of Environment Canada's Species at Risk advisory committee. There are ten (10) industry, ten (10) ENGO members.

I've -- I've held various posts on boards at ArcticNet, Wuskwatim Partnership. I was involved at CA. I was involved with the Mid-Continental (sic) Area Power Pool on the reserve requirements task force earlier. DFO National Science Advisory Counsel. So I have some variety of experience.

When I first graduated, I worked --

interesting given we're talking about gas versus hydro to some degree here -- I started my working career in oil and gas exploration and -- but then took my master's courses and joined Hydro in 1982 where I've been since.

I was also a research associate at University of Saskatchewan.

MS. PATTI RAMAGE: Thank you, Mr. Wojczynski. As a matter of housekeeping, Manitoba Hydro has filed a large volume of written materials to date, including the main filing, which is the business case, the appendices thereto, as well as responses to Information Re -- Requests.

Were these materials prepared under your direction?

MR. ED WOJCZYNSKI: Yes.

MS. PATTI RAMAGE: And can you on behalf of the Corporation adopt these mat -- written materials as Manitoba Hydro's evidence?

MR. ED WOJCZYNSKI: Yes.

MS. PATTI RAMAGE: Thank you. And, Mr. Wojczynski, you have a presentation you would like to give the Board?

MR. ED WOJCZYNSKI: Yes, I -- I do. And I'd like to start off by saying that -- that I'd

like to echo what Mr. Thomson said earlier today, Mr. Chair and four (4) panel members, that we, our team and myself, strongly believe that this type of public review process is very important giv -- for what we're undertaking here.

We're looking at something that's going to influence and affect the electrical supply future of Manitoba for decades to come, our children and grandchildren. And as we all know, there's large dollars at stake, and there's a lot of other issues that are at stake.

So we think it's -- it's -- we're pleased and welcomed that we have this review. We're glad it's starting. And I actually -- in the -- in the sake of us dealing with the issues that are on your mind as the panel and the public's mind, I welcome the comments from the Intervenors earlier today. I -- and I -- I'll try and pick up on a couple of them as I go through my -- my overview of what we're going to be presenting to you the next four (4) weeks.

But there's one (1) particular I'd like to start off with, and -- and it's -- and that is Mr. Williams's comment, although I don't -- he's gone. Oh, that's too bad.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: Well, that's too bad. He -- he raised an issue that is -- been integral to Manitoba Hydro's thinking for the last ten (10) years in -- in working with Wuskwatim itself, what happened with Wuskwatim, and then what -- and our preparations for other activities, including Keeyask and Conawapa. One (1) of the things we have done is learn from what we're doing.

I was involved in the 1990 capital plans hearing plan Conawapa, which is quite a ways back. I was the lead for the Wuskwatim NFAT process. I was the chief planner then. And now I've led this NFAT process.

But in this process, we have -- we have modified what we do as we go along. And the Wuskwatim experience was a major one for us, as it was for other infrastructure developers throughout North America.

So what happened with Wuskwatim? There were two (2) major parameters that struck it and caused the economics to deteriorate, compared to what we were looking at in that NFAT. The first was the capital costs went up significantly. And I think you're quite aware that the cas -- cost of other infrastructure

throughout North America, and particularly in western Canada, went up dramatically. So it wasn't that we were the only ones who misjudged and mis-estimated what was going to happen.

That structural change in capital construction costs, commodity costs, that's something that has been integrated into our planning. And that's one (1) of the reasons, when you saw earlier today one (1) of the presenta -- one (1) of the overheads when -- during the cross of the increase in capital cost -- I think it was perhaps a PUB cross-examination, you saw Keeyask and Conawapa costs increasing significantly. That is because those structural changes are now incorporated into those projects. And -- and we are continuing, of course, to mo -- to update those. But the big shifts we feel have happened on the -- and we have done many things that have caused us to have more confidence in these costs compared to Wuskwatim.

A major element that we did different was we undertook the Keeyask infrastructure project ahead of coming into this process where we are today. We had a lesson learned in Wuskwatim that the First Nation contract -- joint venture contractor didn't have the same cap -- capabilities that a lot of other contractors might have had, and that there were delays

and cost increases due to that. It harmed the ability of the First Nations to benefit. So we've done that early.

Another major difference, if you look at Wuskwatim, when we were in that NFAT process and the -- and there was the completion of it and we had the report, construction didn't start until two (2) years later. We still hadn't yet had a development agreement with the First Nations. We still had to go through that. It took longer than we thought. Plus we had a far dis -- a fair distance to go in the environmental review process.

Where we are different with Keeyask? We have agreements with the four (4) First Nations. We are virtually, we hope, finished the environmental review process. We are on the verge, hopefully, of starting construction, so we're in a much different situation that we were with Wuskwatim.

Mr. Thomson referred to the fact we have 80 percent of the value of the construction contracts already in hand, that we had virtually none with Wuskwatim when were in the NFAT process.

So from -- plus in our contracting approaches we've learnt from Wuskwatim. We do things much differently. We've significantly enhanced our

capital cost estimating process. We're learnt from other projects in Canada, including Pointe du Bois, not just Wuskwatim.

When we did Wuskwatim, there had been not maj -- there had not been very much major hydro construction in Canada since Limestone. We've had a lot of experience in Canada on hydro projects, including in Manitoba, so we -- we've built on all of that.

The other big thing that happened, was the export prices and national gas prices. The shale -- the natural gas prices are going up, export prices are going up. We saw the numbers earlier.

Then the shale revolution hit. It had a big impact, we all know about that. We know that's not going away. But our forecasts and those of all the expert North American consultants we use, already integrate that in. People -- some people claim that we haven't noticed these things, or that we're -- we're playing catch up. If that's true, then that's true for all the -- most of the major consultants and oil and gas companies in North America. We're quite aware of what's going on and that has been integrated in -- already into our analysis.

So -- and I'll just make one (1) or two

(2) other points. Our whole evaluation approach now we are m -- more aware, as others are of the volatility in things like export prices. And so lesson learned from Wuskwatim, we strongly enhanced how we evaluate our projects. And that's why you see us having this probabilistic scenario analysis, which is a significant enhancement than anything we did it with Wuskwatim.

So the last point on the export price side. Wuskwatim, we had no contracts in place for any of the output. As we heard already today, we still have some surplus power to be sold at -- even with the ones we've announced here. But we have a large chunk of our surplus already contracted for and we're engaged with others, which is much different than we were with Wuskwatim.

So I'd better move on to the rest of my presentation. But we thought it was important to -- to highlight that for you as we go along. And we'll go through some of those things in more detail over the next four (4) or five (5) weeks.

I'll just very briefly go through the plan, but you've already seen it. Focus as a -- as a Ms. Ramage did earlier today, and actually our MIPUG colleagues indicated, focus on the major issues and the major decisions. I'll refer to that and then go

through the various perspectives. We were talking earlier today when Mr. Thomson was being crossed, what are the priorities, what -- what are, what is -- what are you focussing on?

Well according to the Manitoba Hydro mandate and the NFAT terms of reference, we have a number of perspectives that we're supposed to utilize. And -- and we utilize them right through the evaluation and through our conclusions. I'll run through that, then try and indicate what the panels will cover, the four (4) different panels, and then just come to the conclusion.

And if I'm talking a bit quickly it's because I know the time-frame. Scott you're suppose to kick me if I go to fast. No, Patti was supposed to.

The preferred plan, I am not going to go through this in detail you've already had it presented to you. I'd like to reinforce what Mr. Thomson said, and that is in our plan DSM will be expanded. And you will hear more about that over the next couple of weeks.

In our plan we -- we didn't seek approval for a particular level of DSM, in our plan, partly because we did not yet have the analysis of the alternative levels. And partly it's 'cause something

that we intend to update and work on as we go along. And as more opportunities arise and the economics become clearer, then we will expand to that level of DSM. It's not something that's going to be staying static.

We've gone through the rest of the plan and that we need to have commitments this summer. We focussed on Conawapa again that we -- that we're not seeking of -- of -- for a -- make a firm construction decision that we'll have to -- early 2018, and we'll consider all the factors that could arise between now and then, including what's going to happen to the DSM capital cost energy prices.

MS. MARILYN KAPITANY: Could I just ask a question before you move off DSM?

MR. ED WOJCZYNSKI: Sure.

MS. MARILYN KAPITANY: We heard this morning that in First Nation communities there are some higher -- Hydro costs. Are the DSM programs available and accessible to First Nation costumers in Manitoba?

MR. ED WOJCZYNSKI: I -- I understand DSM programs are available and accessible to them, but -- but how successful that is and what the details of that, I'm -- I'm not the best person to talk that -- but tomorrow morning and the DSM panel, it's the right

people there.

MS. MARILYN KAPITANY: Thank you, I'll ask them.

MR. ED WOJCZYNSKI: Yes. So what are those decisions that we think we should focus on? And this is a somewhat akin to what you heard earlier today from MIPUG, and -- and although, it's -- I'll, we'll frame it in our own way. And we're looking here at the -- what is -- the long term electrical future of Manitoba. We think this is a major decision point and a major influence in what that will be. And there are many elements to it. DSM, again, will be expanded in all the plans. The -- the fundamental issue we feel is are we going to go ultimately with hydro, or are we going to go with gas, recognizing again wind and solar, other things, will play their part, too.

But -- when you look at the major fundamental options -- if -- in our view, hydro is clearly the better alternative overall compared to gas. If -- if we go with --with hydro, there are associated decisions that perhaps we can view as the opportunities that MIPUG was referring to.

Should we have an internect -- interconnection expansion opportunity should we pursue that? If that's the case, you would have to expand --

accelerate Keeyask development from the late -- the date that would be needed for domestic to meet the Minnesota Power requirements, and move it into 2019, or if there was a delay 2020, and we'd have to have the Minnesota Power sale.

Should that interconnection be 750 megawatts or 250 megawatts. That's another decision that would have to be made.

The 250 megawatt option we have included in our submission. We've evaluated. Increasingly what we've found since the submission in August of last year is that the 250 megawatt option is a -- is a riskier option to get approval than the 750 megawatt option. And you -- you'll hear more about that in -- in the second panel.

We -- the 750 megawatt option per -- has economies of scale that provide more benefits to the entities in the US. There are benefits to having a larger tie-line and more supply for wind integration and for reducing the cost of supply to consumers in the US, which will effect how the regulators there and the utilities and the -- and the MISO itself respond to a 250 megawatt versus a 750 megawatt tie-line.

Min -- Minnesota Power has gone quite far in terms of their process. They'd have to step

back and -- and restart the process. So there -- there are those kind of issues that cause us to think the 250 megawatt option is -- is still a possibility but riskier than the seven fifty (750) in terms of getting approval.

The last one is: Should the 380 megawatt WPS sale, that was recently announced, should it be pursued as part of this approach? And the 750 megawatt interconnection, we -- would be needed for that. The two-fifty (250) megawatt would not work with that.

THE CHAIRPERSON: Can you explain to me -- you just said that the seven fifty (750) is less risky than the two fifty (250), and I -- could you -- could you explain that?

MR. ED WOJCZYNSKI: In -- what I was referring to is that the -- the likelihood of getting approval for the interconnection in the United States, the regulators in the United States will -- would have to approve either one (1) of those transmission line options, and the 750 megawatt transmission line option provides way more benefits to the State of Minnesota and its consumers, to its electricity suppliers, than a 250 megawatt transmission line.

One (1) of the elements I didn't

mention, 'cause I was trying to save some time, but I'll mention it now, is that the transmission planning authorities in Minnesota have strongly indicated that transmission lines should be optimized in terms of use of the right-of-ways. There's a lot of opposition to expanding transmission lines. We've seen it in Manitoba. It's -- certainly see it in Minnesota.

And what they have told all the developers is -- and a goal is to use the available right-of-ways to the max amount out possible. So if Minnesota Power now went back and withdrew the 750 megawatt option and put the 250 megawatt, the smaller option, on the table, which has much less ability and -- and less potential to expand later, the transmission approval people would -- would look probably not very kindly on that.

THE CHAIRPERSON: Now, just since you've raised the issue of DSM -- and I -- I know you're not the expert on DSM -- but there -- there is a strategic element to this because one (1) of the -- one of the experts acting on behalf of GAC and CAC has suggested that DSM should be addressed via integrated resource planning, specifically, that it's not considered an add-on but you -- you use that as one (1) of the potential sources of -- of supply, in essence,

in your decisions around which options should you pursue.

So I guess the question is: Longer term, are you considering integrating DSM into your resource planning given the significance of DSM more generally in North American and in Canada?

MR. ED WOJCZYNSKI: I -- well, thank you for the question. And I was going to touch on that, but I'll -- I'll do that now.

Manitoba Hydro agrees that for us to have a -- a good evaluation and comparison and decision on -- on which pathway we should follow, which -- which of these decisions we should take, we should have a good sense of what would the different DSM options -- how they combine with the different plans, and would your choices change with the -- the different DSM levels or sets of options, and that we should integrate those.

Manitoba Hydro has been looking at DSM on an ongoing basis. There are two (2) ways to do it. You can use what are called the marginal values of how much extra DSM is worth with the current plan you have. And if you're not looking -- and that's what we have been doing for a number of years, and that's because we weren't looking at radically different plans. The

plans were more or less similar, and so the -- the value of additional DSM wouldn't change that much.

But now when we're looking at radically different plans for going forward, then the -- the value of the -- the incremental DSM could be different in those plans and could complement them in different ways. And they should be integrated into that analysis, and that is what we are doing.

And, unfortunately, as was mentioned earlier, we had intended to have that available well before our submission in August last year. The DSM potential study, which is a -- a first step in doing that, took a lot longer, a year and a half longer, than was -- was supposed to happen, and so we weren't able to do that integrated evaluation in our submission. We did a sensitivity to try and see what impacts there may be, but that isn't a -- a full integration.

What you will be getting in the course of the next few weeks will be that integrated evaluation. And we are -- it's still actually a work in progress. We're just doing the final work on that. And -- and it's not even quite ready yet, although we have some preliminary indications, and I was going to talk about that.

Refer to these choices, and in -- in

these -- these fundamental choices, how do we evaluate those in our submission, and how can we present them to you, and how can we -- how do we compare these decisions?

What we prepare -- came up with is five (5) pathways that are the results of those decisions and that implement those decisions. And each one of those pathways has a number of very specific development plans with individual dates for different supply options or -- and sales, or tie-lines, or whatever. And -- and then -- then we evaluate those plans and help decide between the pathways.

There's -- there's the -- the first pathway is you -- you start with gas as your next option. You only do it for domestic load. You can do gas or hydro after that.

Or you could start with Keeyask; no interconnection, no sales. You'd do it with the -- the current information. We have 2023 for Keeyask. That date can move. And later on you'd do gas generation or Conawapa. You can make those choices.

Or you can start with a small interconnection. You'd have to advance Keeyask. You have the Minnesota Power sale, a couple of those other sales. And again, later on, Conawapa or gas. You have

those choices.

The fourth one is you have the 750 megawatt interconnection, and -- but you don't do the 300 megawatt WPS sale. That's the fifth pathway. The fourth pathway probably is not that interesting any more now that we have the 300 megawatt WPS sale confirmed, but it's still there as a possibility.

And as I indicated, the Pathway 3 with the 250 megawatt interconnection is still there as an option, but it's probably not as likely a possibility as the -- the Pathway 5.

MR. RICHARD BEL: Can I ask -- I don't see gas-Keeyask. Was that ever on the table? Because it -- it's one (1) of the gateways on -- it's one (1) of the gateways on the plans, but it doesn't show up.

MR. ED WOJCZYNSKI: We -- we have done work with gas-Keeyask at times, but we -- Keeyask has been an economic option to do first. And we have Keeyask -- we have gas-Conawapa looked at quite significantly, so you -- there -- there -- that kind of information has been available.

The Ma -- Manitoba Hydro mandate starts off with -- with meeting the Manitoba load, but we have to consider a wide range of issues, and the NFAT terms of reference spelled those out in some specificity, and

so our analysis uses those throughout this submission. Our submission was based on -- on that and our conclusions are based on that.

A significant point that we're going to be going through over the next four (4) weeks and the cross-examination, the evidence from others, we'll deal with this to a fair degree as well, is that to deal with the different perspectives, you need to have different tools and methodologies. And it can get confusing when you say -- when we -- why -- why do you do it this way here and this other way over here? And that's because there -- the different perspectives require that, and I'll try and give some indication of that today.

What are these multiple perspectives? And I got two (2) overheads on that. The first is the Market Valuation Economics. This is the standard evaluation methodology used around the world for decades for evaluating projects. It uses a -- a discounted cashflow to get a net present value benefit, in this case, to Manitoba Hydro, of proceeding with the project or projects or that plan compared to other ones.

And -- and this is an absolutely standard technique and it's one we have -- we have used

for all our evaluations going back as far as anybody remembers, and -- and when you provide that analysis to Manitoba Hydro, it in -- the benefits indirectly flow to domestic comer -- customers and the project partners, and -- because it's the benefits from the project.

The -- the second perspective is from the Manitoba Hydro domestic customer specifically, and the -- there's a reliability of supply to them. There's the minimum reliability you need to meet the criteria, but if you have greater reliability than that minimum, that's still a benefit to the customers. And all of our plans meet the minimum criteria, but some of them provide additional benefit by having additional reliability, and we evaluate that.

The same from the point of view of energy security, energy security being -- being able to supply the load if you got a bad drought or an energy shortage of some kind like that. And again, there's a planning criteria that says what the minimum is, but then there -- there's also -- you can have a se -- energy security above that, because we can have things like droughts that are worse than ones on record, and we have to -- and -- and there's a benefit to being able to deal with those, particularly with climate

change coming and happening.

The one, obviously, that's a huge focus here are rate increases, what will happen with the rates to the customers, what will happen to all the financial targets? That is -- that's of interest to customers because at the end, that affects -- can affect rates in one way or another: retained earnings, fixed asset, debt levels, all of those financial ones we deal with in -- quite significantly throughout this submission.

Socioeconomic is more broadly going into now from the provincial societal point of view. There's the economy, employment and income, training and business opportunities, infrastructure, services, personal, family, community life, with a special focus on the Northern and Aboriginal communities. And these fit the definitions of -- from the NFAT terms of reference and what the PUB had defined earlier in this process.

Oh, sorry, I have to -- something happened here. Ah. Okay. They use the macro-environmental impacts and benefits, again, as per the PUB definitions, and I highlight in there the greenhouse gases, which is a -- a major differentiating element. Manitoba government is very much a part of

the -- of the terms of reference and importance in Manitoba. The -- the financial transfers to the province have been discussed earlier today, capital tax, water rental, debt guarantee fee, and those are a -- a cost to Manitoba Hydro.

When we do the market valuation, when we do the financial evaluation, those are costs, and they decrease the benefits to Manitoba Hydro, but they -- those transfers go to the provincial government and either reduce taxes or increase services. They be -- do become a benefit to Manitobans.

So if you're looking at the borders of Manitoba or Manitoba as an entity, either -- those financial transfers will get added to the benefits to Manitoba Hydro because they're a benefit to the province as a whole.

Alignment to the Manitoba Hydro Act and the various other Acts and risk. We have to deal with uncertainty, and -- and we do that quite extensively in our -- our submission.

We talked about different perspectives and different methodologies. One of the confusing elements, it's already come up in the -- in the IR process, it's beginning to come up in the evidence presented by others, is discount rate. In the market

valuation, a standard approach is to use the weighted average cost to capital, which we have calculated for our Company.

It's the -- the cost of our -- our capital with an imputed equity, and in -- right now using 5.4 percent. We update it every year. Last year -- the -- the submission started with 5.05 percent because it was based on 2012. That's a real discount rate. That's with inflation taken out. That's equivalent to a 7.65 percent nominal discount rate, which is what we normally think about as -- as day-to-day consumers.

If you go to the provincial societal perspective and do a social benefit-cost evaluation, which is what's in Chapter 13, then you move to not the cost of capital for Manitoba Hydro, but you go to a -- what's called a social discount rate, and -- and that, in our analysis, is 6 percent real.

Then if you go to the third perspective, and that is we've got customer bills that vary over time, and we've got the intergenerational equity of the customers paying bills today and tomorrow and ten (10) years from now, and I believe it was MKO -- it might have been MMF -- referring to seventy (70) years from now, and how that's important to them and not that far

off.

How do you balance when people paying their bills then and now, one (1) being low -- higher, one (1) being lower? So what we use is something called the social time preference. It is -- it's called a solid body of -- of why that is the appropriate rate. It's based on the interest rate that is from risk-free savings, and that's 1.86 percent real, which is nearly 4 percent nominal, and this will all be discussed in more detail later, but it's giving you a head's up as to what you're going to be hearing.

So we have our four (4) panels. I'll go through each one of them. Tomorrow is the load and DSM panel. We're going to be having the consultants who did the market -- the DSM potential study present their methodology, their market potential, the -- the achievable potential. That was the -- the starting point for dealing -- developing the new DSM levels.

Then we'll explain the DS -- Manitoba Hydro's DSM philosophy and approach, the 2013 DSM plan, which is the current plan, but additional programs have already started being delivered. And that program -- that plan is already been expanded through on-the-ground activity by Manitoba Hydro staff.

We have -- the 2014 DSM options are the

ones that were being referred to earlier. And -- and what I was saying, that we need to have those and to evaluate them. Well, we -- we have a -- have a -- a first cut at those, and we are of finishing the evaluation of those, and we will present those next -- not -- yeah, next week, and I'll explain a little bit more about that right away.

Then the panel will go into the current load forecast, how historic and future load forecast compares, what's -- and compare it to other jurisdictions, as well. The lar -- probably the largest panel in terms of amount of material and the amount of time will be the second panel, which is the heart of the NFAT process, and it's the need, alternatives, and economic evaluation panel.

Their -- the third panel is the financial panel, and it takes the output of this and then does the financials, but it starts with this. And the first thing this panel deals with, when are new -- new resources needed? This is the 'need' question.

Very much a part of what identifies that for us is the generation planning criteria, and that was reviewed by the independent consultants. And there wasn't much debate on them except for the one on energy import limits, and you'll be hearing about why Manitoba

Hydro thinks our -- our energy import limits are reasonable.

We already count on a large amount of imports in a drought. We're -- if you take in 2020, for example, and we're in a -- in a drought of record, that's like the worst drought we had in -- on our record, Manitoba is -- is a -- a net importer, and we import 20 percent of the Manitoba load requirement, either import or run our thermal generation in Manitoba. So it's already a significant amount of imports, which is around over half of that, and then our own thermal.

And we'll explain why we think it's reasonable for the cri -- the criteria we have that limit that. With a larger line, we would expand that, and we will, but there are limits.

Talking about the tie-line, another issue that was raised in the last few months was, well, we -- if the -- the interconnection brings benefits. There's no question of that. It brings export and import benefits.

Why don't we import -- build this tie-line, Manitoba Hydro build it, don't have any export contracts? Build it itself. Don't have a counterparty in the States, and then get all the import benefits so

you don't have to build anything in Manitoba.

We don't believe that that is a viable alternative, that the -- the processes in the States are not ones which would enable that to happen. And we'll have testimony as to why that is the case.

Resource options. We'll se -- we'll go through all the options we looked at and the short list of them, then we'll go into the window of opportunity that has been mentioned earlier, and I -- I'm going to give a bit of a different explanation, perhaps, of what that window of opportunity for the interconnection is.

Building interconnections across the US border, or even across the pro -- provincial borders, is a -- a -- requires a confluence of critical conditions that do not happen very often, and we have that confluence of conditions today.

And we think it's important for Manitoba to seize upon that opportunity, because the likelihood is, if we don't seize it now or in the next year or whatever, that that opportu -- that confluence of circumstances won't arise likely in the near future.

And we can go into more detail later, but that confluence is there's a -- a structural change happening in the US market south of us. They want to get off coal. They want to have low-emitting

resources, ones that aren't exposed to greenhouse gas, clim -- CO2 taxes or anything like that. They -- it's -- they want resources that fit in the renewable portfolio standard.

So they're at a point where they have a massive change in their structure, and we have secondly a counterparty who is good at building transmission, and -- and is willing to champion.

And third, we have resource options, new generation, that are ready to go or nearly ready to go that meet their portfolio standards, say, in -- in Wisconsin for new hydro, and -- and we've got support from our Aboriginal partners. And so this is a confluence event -- events that are just coming together in a nexus that's quite advantageous right now.

Finally, we'll get to our development plans, and then how do we evaluate those? What are the discount rates? We'll have a -- a discussion on those, or begin to have a discussion there.

Then we're going to go into the Keeyask and Conawapa capital cost estimates. We'll have a detailed explanation of how we developed those cost estimates. There was a discussion in the technical conference, the pre-hearing conferences.

We'll have more of that, but in addition, we're going to have what Mr. Thomson referenced earlier today, that we've just finishing the -- the general civil contract process. It's the single biggest contract Manitoba Hydro will ever have awarded. It takes many months to evaluate the alternatives.

And we are just now doing the final landing, and -- and we'll be updating the estimates based on those. And as Mr. Thomson indicated, they are being -- the estimates are being reviewed tomorrow and we'll be presenting next week in our panel that deals with these issues. And we'll also present some preliminary results of evaluations with those.

And we'll also talk about capital costs for the other resources, for the transmission. We'll go into the export prices and the -- and gas prices. We'll go through the various contracts, and specifically not just the one that was signed, but Great River Energy MOU and the SaskPower MOU that Mr. Thomson referred to.

Uncertainty, risk. There was a lot of discussion of that earlier. We have enhanced how we deal with that. We'll give a good explanation of -- of how we do that.

And then finally we get into the

results. The re -- the submission was based on the 2012 information with some update on 2013, and we'll provide some preliminary update with some preliminary cost information from these new cost estimates that are just -- just being finalized now.

We will provide an evaluation of the DSM alternatives, the -- the new options, and then finish off with a discussion of our flexibility and the pathways, and then present the reli -- the comparisons on reliability and energy security.

Coming back to the issue of what are the things to focus on in -- when there's such a huge amount of information and a large number of issues. What -- what are the main things to focus on?

We did -- with external consultants, expert consultants assisting us, we went through the process a couple of years ago and have updated that, and determined that the single most important elements that affect the comparison of results are these first three (3). And -- and intuitively, it's actually not a surprise.

Energy price is our export and natural prices, the capital cost of the projects, and what are the interest and discount rates? Those are the three (3) big drivers, and those are the ones we focus on in

our uncertainty analysis with twenty-seven (27) probabilistic scenarios.

Other issues are important, as well, but not as critical. What will our load growth be? How much DSM will we do? What happens with climate change? What happens with droughts? And those have all -- are being evaluated, as well. And I -- I already mentioned the probabilistic scenarios.

Okay, so our DSM options. We know there's a lot of interest in these, and we've been working feverishly to have as much early -- as much available as early as possible, and the work isn't even finished yet as I speak here.

In this table we just summarize the -- there's four (4) options, essentially, and on the left column we sort of label them and indicate how much energy would these options save, how much load reduction would there be in the year 2027? We just picked that year somewhat arbitrarily as a metric.

The current DSM program is the base DSM, and that -- and that's the 2013 program, would reduce load by 773 gigawatt hours in that time frame. That's what has been in the plan for the whole last year and been in the -- in the submission. We're referring to that simplistically as one (1) times DSM.

Then we have the new 2014 Option 1, and what we did with that is we expand the energy efficiency measures and roughly -- actually, a little bit more than double the amount of DSM for this Option 1.

Option 2, we took all the stuff that was in option 1 and we added in rate programs, fuel switching, fuel switching from electricity to natural gas, and load displacement by customers by using other forms of electricity generation. And we -- and that roughly doubles the -- the DSM again, so we call that four (4) times DSM.

The last option, Option 3, takes all the stuff that was in Option 2, and then goes to those energy efficiency programs and expands those and pushes them harder, increasing their cost, as well, but testing that -- that higher level of DSM.

And we evaluated those levels of DSM. The little 'X's on here are studies that we have done and -- or are in the process of finishing, and you see two (2) of them say March 10th or later. We're trying to have those ones available for next week and we're doing everything we can to have them available, and we think we will, but we're -- we're not sure.

And what we've done is evaluate all of

these with the 2013 load forecast and updated information. And then for Options 2 and 3, when you're evaluating the higher level of DSM, we are expecting our load growth will increase if -- if the pipeline proposals that are being actively pursued right now, the oil pipelines that take oil from Western Canada to Eastern Canada, that there's two (2) major pipelines being pursued right now, that if those happen, we could see load growth increase around 2019, but up to something that's over 1 1/2 thousand gigawatt hours. We used a 13 gigawatt hour pipeline sensitivity, and we repeated those there, and that way, you -- you don't underestimate the value of the DSM, because as the load grows faster, the -- then the DSM becomes more valued, and so those results will be provided next week.

We're also using the same runs to compare the Preferred Plan against the keeyask-gas plan with the seven fifty (750) tie-line versus an all-gas plan. With the -- the two (2) levels of DSM to get a -- a sense of the optimization between those. And we'll be presenting information on that next week, as well.

Then we go to the finance panel, dealing with the targets, how they do their evaluation, all the metrics that you'd expect to see from the financial evaluation. We'll deal again with the

intergenerational equity, and some consideration of provincial credit ratings. And I won't go through any explanation of those, I think, just to save some time here.

Briefly, particularly for people who haven't been as involved in this NFAT process for the last while, we've got the two (2) different evaluations: the economic and the financial. And what's the difference between them? The economic evaluation only thinks about the costs and revenues that are related to that project proceeding or not. It's an incremental analysis.

The financial analysis looks at the -- all the reve -- the rev -- costs and revenues from the Company, whether they're reallocated or overhead or sunk costs, or whatever. There's -- the economic evaluation concerns itself only with the project or things that are affected by the project. The financial evaluation is the whole company, and very similar to the IFF and the CEF, it -- it's really repeating those, but as almost to sensitivities.

The economics measure the end pre -- net present value that I mentioned. It's for the -- for the project, or for the plan. The financial evaluation doesn't come up with a single metric. It has hundreds

of measures, rate increases, and all the financial targets and objectives, and on a year-by-year basis.

Economics is done in the real terms; that is, inflation removed. Financial evaluation, we do it in current dollars we -- we -- and leave inflation in. Depreciation. In -- it came up from -- with one (1) of the independent consultants, My goodness, your economic evaluation doesn't have a depreciation or -- or a revenue requirement. Well, we don't do -- that isn't done in the economic evaluation. That's done in the financial evaluation.

When you do -- in standard approach in economic benefit cost benefit cost evaluation, you do it for the life of the asset you're evaluating. Now, we don't pretend we can do a seventy (70) year study and have excellent forecasts all the way through. We have a thirty-five (35) year detailed study period and forecast for that, and then we have an extension beyond that with some assumptions that we'll explain later in another panel where we calculate the -- what's called the residual value, or the -- the value of the asset at the end of the thirty-five (35) years. And -- and you can do that in different ways, and the -- the way we done it we think is the best way, and we'll certainly discuss that.

In the financial evaluations, you don't have to do a residual value because you do it year by -- - you calculate year-by-year, and that's another big difference between the two (2) evaluations. It's come up in -- with the independent consultants is that in our economic evaluation, we don't look at the economic evaluations every ten (10) years or for different periods of time.

That's because standard approach with economic evaluations, it's for the project over its asset life. What Manitoba Hydro has always done is look at the year-by-year impacts. That's the financial evaluations.

Then we move onto the Societal Panel, and this is where we deal on a screening level with the environmental and socioeconomic, partnership and Aboriginal benefits, and I emphasise macro-environmental and screening. This is not to be a repeat of the environmental assessments being done -- having been done for Keeyask, going to be done for Conawapa, going to be done for the transmission, or any other resource that's going to be built.

The terms of reference are very explicit on that. We're not to repeat the environmental assessment. So we presented the -- these issues on a -

- on a screening or a macro level. We deal with the al -- alignment of the Manitoba legislation or strategies, then we provide what's called an economics im -- impacts analysis, and that can be kind of confusing because we just talked about economic evaluations. What this is about is if you do these projects, or -- how much employment will be increased? What happens to the GDP, income in the province as a whole, tax revenue as a whole? And so that -- that's from a provincial point of view.

Then we go to what's called a multiple accounts societal benefit-cost analysis. That's something that takes all of these various elements and brings them together and evaluates them from a provincial societal point of view. Not from a Manitoba Hydro point of view, and that's very much in keeping with the NFAT terms of reference and looking at the -- the long-term best interest of Manitobans.

I don't think I'll spend much time on the benefit costs; we're running rather late tonight. I think I've indicated it from a provincial-societal point of view. The one (1) point I'll make is that one (1) of the things it does is that, where there are benefits that are Manitoba Hydro benefits evaluation and the rates benefit -- rates evaluations don't take

into account there are benefits that are not accounted for there. This analysis tries to monetize those or put a dollar value on.

And an example of that: You've got high unemployment and you reduce that employment, then that's a benefit, and the -- the -- in that you -- you adjust the -- the cost of the labour and you reduce the cost of the labour for that. So that's -- that's one (1) example of that.

But not all things can be monetized, and those are dealt with in that in a qualitative fashion.

These accounts are the same ones I mentioned earlier. It brings them all together. I won't go through those again.

This is something that we're going to spend the next three (3) hours on. Seriously, this is just up to depict that -- what Mr. Thomson was talking about: the gateways.

This is out of chapter 13. I'm not going to go through this. You have the -- the five (5) pathways, and -- and there are literally hundreds of decision points you could point to. This is a simplified version of, over time, the kind of decisions and gateways we'd be talking about and the different plans and the flexibility we have. And we will be

talking about that at the end of the four (4) panels.

And my last overhead is really just a summary again of why Manitoba Hydro -- we conclude that the preferred plan is in the best long-term interests to Manitobans and is needed. We have our load growth. Even with expanded DSM, we are going to need new supply. The interconnections are always beneficial, and if we develop more hydro, the new exports will further increase their benefits.

The rates we've -- we conclude will be the lowest rates in the long term. We recognize there will be in the medium time -- term some slightly higher rates, but we feel it's a fair tradeoff from an inter-generational point of view. The plan supports our long-term fiscal health with higher levels of fixed assets and retained earnings. We're in better shape to deal with things like droughts or other contingencies.

We get the most improvement and load reliability and energy security of all the plans, certainly for over the first twenty (20) years. It's robust, larger financial transfers, benefits socio-economic, major reduction in greenhouse gasses.

Climate change as been identified as one (1) of the most, if not the most, severe environmental issue in the world today and a threat to bio-diversity,

whether it's caribou in northern Manitoba, whether it's people in the deserts, whether it's the Arctic which is experiencing climate change faster than anywhere on the earth. Polar bears. So that's a major component of our plan is that consideration.

And lastly, the hydro is a renewable energy, gas is not.

Thank you.

THE CHAIRPERSON: Thank you very much for your presentation, and we look forward to drilling down into these topic areas as we proceed over the next few weeks.

Now, I don't know if there's any additional business to conclude tonight. If not, we will adjourn the proceed -- oh, go ahead, Ms. Ramage.

MS. PATTI RAMAGE: One (1) small matter of business is that Mr. Wojczynski's presentation should be assigned an exhibit number and entered into the record. I believe, subject to check, it'll be Manitoba Hydro Exhibit 86. But maybe we can just confirm that in the morning.

--- EXHIBIT NO. MH-86: Copy of presentation by Ed Wojczynski

THE CHAIRPERSON: Okay. There being no other business to conclude, I will adjourn the proceedings, and we'll see each other again tomorrow morning at nine o'clock. Thank you very much.

--- Upon adjourning at 5:19 p.m.

Certified Correct,

_____

Cheryl Lavigne, Ms.

News Release - Manitoba

May 25, 2011

$4 BILLION IN POWER SALES TO U.S. FOR MANITOBA HYDRO: SELINGER

Premier Greg Selinger announced today that Manitoba Hydro has signed agreements for a 250-megawatt (MW) sale of electricity to Minnesota Power and a 100-MW sale to Wisconsin Public Service. Combined with a previously completed 125 MW sale to Northern States Power, these sales total 475 MW with an estimated value of $4 billion, Selinger said.

The premier said these sales will require the construction of new hydroelectric generating capacity in Manitoba. They will trigger the development of the 695-MW Keeyask (Cree for gull) Generating Station located on the lower Nelson River 175 km northeast of Thompson in the Split Lake Resource Management Area. Keeyask is to be developed by a partnership consisting of Manitoba Hydro and the Keeyask Cree Nations-Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation, and York Factory First Nation. The $5.6-billion project will provide some 4,500 person-years of construction employment, said Selinger.

"I am very pleased that Manitoba Hydro is moving forward with these power sales which will significantly increase our exports and lead to further development of Manitoba's renewable hydro power resources," stated Selinger. "These sales will add to Manitoba's reputation as a sustainable energy leader and help reduce global greenhouse-gas emissions by reducing the need for thermal generation in the United States. At the same time, the development of Keeyask will deliver jobs, training and business opportunities to the Keeyask Cree Nations, the north and all of Manitoba."

"Today's announcement demonstrates there is strong interest in Manitoba hydro power in U.S. markets, resulting in the need to advance construction of new generation and a new interconnection with the U.S. that will broaden and diversify our customer base, increase our revenues and contribute to reliable, cost-effective future electricity supply for Manitobans," said Bob Brennan, president and CEO, Manitoba Hydro.

The 250-MW power sale to Minnesota Power over a 15-year period from 2020 to 2035 requires an additional interconnection between Manitoba and the United States which will provide increased export capability and reliability benefits for Manitoba, said Selinger.

The 100-MW power sale agreement to Wisconsin Public Service covers the 2021-2027 period. Negotiations are continuing to expand the Wisconsin sale to 500 MW which would require construction of the Conawapa Generating Station, the premier said, adding with these sales, Manitoba Hydro and its partners are reviewing scheduling and other requirements for moving forward with Keeyask.

Manitoba Hydro's construction program also includes the Bipole III transmission line, being developed for a 2017 in-service date to provide reliability for Manitoba customers. Bipole III will also be utilized to transmit power from Keeyask and the 1,485-MW Conawapa Generating Station, supporting expanded electricity export sales outside of Manitoba's borders. The Conawapa site is located in the Fox Lake Cree Nation Resource Management Area.

ABOUT WUSKWATIM

- Powerhouse, Main Dam and Spillway
- Transmission
- Maps

About The Wuskwatim Generating Station

Wuskwatim is a 200-megawatt, run-of-river hydroelectric generating station on the Burntwood River at Taskinigup Falls. It is located in the Nelson House Resource Management Area about 45 kilometres southwest of Thompson and 35 kilometres southeast of Nelson House. **(Enlarge Map)**.

Primary Wuskwatim components include the generating station and dam, a transmission line to the provincial power grid and an access road. Construction of the generating station was completed in late 2012 at a cost of $1.3 billion. The transmission line was a separate Manitoba Hydro project constructed at a cost of $300 million.

The generating station is the result of nearly a decade of planning and studies, negotiations between Manitoba Hydro and Nisichawayasihk Cree Nation and an intensive environmental assessment which incorporated NCN traditional knowledge to minimize project impacts. The dam was designed to cause less than one-half of one square kilometre of flooding, the least amount of flooding of any Manitoba Hydro project in the province.

Power produced by the dam is designated for export until Manitoba needs the energy for domestic use.

Benefits

Clean, Renewable Energy

The Wuskwatim Generating Station produces clean, renewable energy that earns revenues from the export market and assists in supplying domestic load in Manitoba.

Jobs

The Wuskwatim Generating Station was one of the province's largest construction projects and provided hundreds of jobs over six years. Qualified workers from Aboriginal communities close to the site and people from Northern Manitoba communities were given first consideration for employment during construction and during operation of the station.

Training

REPORTS & UPDATES

- A New Way Forward (Video)
- See the Station (Photos)
- Monthly Water Level Reports
- Access Road Restrictions
- Year in Review Reports
- Monitoring Overview Reports

Targeted training opportunities were in place beginning in 2003 to ensure NCN Citizens and other Aboriginal people had the skills they needed to take advantage of project opportunities.

Contracts

Manitoba Hydro provided management and construction services to Wuskwatim Power Limited Partnership (WPLP) that jointly owns the generating station. It provided Manitoba businesses with opportunities to bid on contracts consistent with its commitment to work with suppliers through the Buy Manitoba and Northern Purchasing programs.

7 Screening of Manitoba Resource Options

7.0 Chapter Overview

Previously***, Chapter 4 – The Need for New Resources*** described how Manitoba Hydro establishes the need for new supply resources in order to meet the electricity demands of Manitoba Hydro's domestic and firm export customers. As part of the resource planning process, Manitoba Hydro monitors a wide range of resource supply options and maintains an inventory of options which are potentially available to meet future Manitoba needs. ***Chapter 7 – Screening of Manitoba Resource Options*** describes the process of screening resource technologies and options and establishes the portfolio of resource options that is used by Manitoba Hydro in determining development plans.

This chapter considers those technologies that are available for utility-scale generation. Detailed information on resource technologies is available in ***Appendix 7.1 Emerging Energy Technology Review*** and ***Appendix 7.2 – Range of Resource Options.***

7.1 Resource Technology Screening

Screening of different resource technologies begins with a high-level review that identifies the resource technologies most suitable for further evaluation. Sixteen resource technologies potentially suitable for utility-scale generation are considered and discussed in this section.

7.1.1 Resource Technology Characteristics

This section provides a general description of 15 characteristics associated with each resource technology.

These characteristics form the basis for the criteria used in screening the full range of resource technologies to a select number for further consideration. A comparative summary of

descriptive characteristics for the resource technologies is provided in Table 7.1: Screening Characteristics of Resource Technologies. The characteristics are grouped into the following conventional categories:

- technical
- environmental
- social and policy
- economic.

Table 7.1 SCREENING CHARACTERISTICS OF RESOURCE TECHNOLOGIES

SCREENING CHARACTERISTICS OF RESOURCE TECHNOLOGIES

Screened Out | **Some Concern** | **Minimal Concern or Positive**

Utility Scale Resource Technologies		Characteristics															Screening Summary
		Technical					Environmental					Social & Policy			Economic		
		Maturity of Technology	Technical Challenges in Manitoba	Ease of Integration into System	Intermittency	Seasonality	Water Quality Impacts	Hazardous Air Pollutants	Greenhouse Gas Emissions	Land Use Impacts	Wildlife Species of Interest	Proximity to Load Center	Regulatory Constraints	Social Acceptability	Manitoba Delivered Fuel Costs	Forecast USA Unit Costs ($/MW.h)	
DSM	Additional DSM	increasingly customer dependant	uncertainty in market potential	unknown	unknown	unknown	program specific	program specific	none	none	none	reduction at load centre	none	not polled	no fuel cost	not included in AEO 2013	✓
Hydro	Hydro with Storage	>100 years of experience	long construction schedule	no issues	none	reservoir storage management	shoreline erosion	none	minimal reservoir GHG	flooded area	sturgeon caribou	northern generation southern load	lengthy approval process	strongly support	stable water rentals	use AEO 2013 Hydro plant type	✓
Hydro	Run-of-River Hydro	>100 years of experience	long construction schedule	no issues	lack of reservoir	flow dependent	shoreline erosion	none	virtually no GHG	limited flooding	sturgeon caribou	northern generation southern load	lengthy approval process	strongly support	stable water rentals	use AEO 2013 Hydro plant type	✓
Wind	On-Shore Wind	newly mature	blade icing & cold weather operation	forecast challenges & costs	highly variable wind speeds	moderate seasonality	none	none	virtually no GHG	set backs & land use limitations	birds & bats	southern generation potential	land use setbacks	strongly support	no fuel cost	use AEO 2013 Wind plant type	✓
Wind	In-Lake Wind	lack of experience	no experience with lake ice	forecast challenges & costs	highly variable wind speeds	moderate seasonality	construction phase impacts	none	virtually no GHG	resource user impacts	birds & fish	large lakes preferred	migratory birds & fisheries	not polled	no fuel cost	use AEO 2013 Wind - Offshore plant type	✗ - Very High Unit Costs
Solar	Photovoltaic (Utility Plant Scale)	potential efficiency improvements	unproven in Manitoba	forecast challenges & costs	cloud cover creates rapid power drop off	winter energy is 1/2 of summer	none	none	virtually no GHG	large footprint	habitat loss	best resource in SW corner of Manitoba	none	strongly support	no fuel cost	use AEO 2013 Solar PV plant type	✗ - High Unit Cost & Intermittency
Solar	Solar Thermal	potential efficiency improvements	unproven in Manitoba	forecast challenges & costs	weather dependant	winter energy is 1/2 of summer	potential thermal oil leaks	none	virtually no GHG	large footprint	habitat loss	best resource in SW corner of Manitoba	none	strongly support	no fuel cost	use AEO 2013 Solar THermal plant type	✗ - Very High Unit Costs
Geo.	Enhanced Geothermal System	lack of experience in Manitoba	low grade resource requiring deep drilling	no issues	none	winter peaking	potential fracking impacts	none	virtually no GHG	small surface footprint	not significant	best resource in SW corner of Manitoba	groundwater quality concerns	not polled	no fuel cost	use AEO 2013 Geothermal plant type	✗ - Deep Low Grade Resource
Natural Gas	Simple Cycle Gas Turbine	>70 years of experience	not significant	no issues	none	lower summer capacity	none	easily mitigated with NOx controls	hydrocarbon combustion	small footprint	not significant	near southern pipelines	air emissions	somewhat support	2001 to 2009 price volatility	use AEO 2013 Advanced CT plant type	✓
Natural Gas	Combined Cycle Gas Turbine	>60 years of experience	not significant	no issues	none	lower summer capacity	boiler treatment chemicals	easily mitigated with NOx controls	efficient hydrocarbon combustion	small footprint	not significant	near southern pipelines	air emissions	somewhat support	2001 to 2009 price volatility	use AEO 2013 Advanced CC plant type	✓
Coal	Conventional Pulverized Coal Generation	>100 years of experience	emissions & waste management	cold start ramp times	none	not significant	mercury arsenic selenium	mercury & air toxics	restricted by legislation	fuel storage & ash disposal	deleterious substances to fish or fish habitat	likely located in southern Manitoba	restricted operations	strongly oppose	transportation costs	use AEO 2013 Conventional Coal plant type	✗ - Regulatory Constraints
Coal	Integrated Gasification Combined Cycle	only 2 plants in North America	complex chemical systems	cold start ramp times	none	lower summer capacity	mercury arsenic selenium	easily mitigated with NOx controls	syngas combustion	fuel storage & waste disposal	deleterious substances to fish or fish habitat	likely located in southern Manitoba	restricted operations	not polled	transportation costs	use AEO 2013 Advanced Coal with CCS	✗ - Regulatory Constraints
Nu.	Nuclear Power Plant	>60 years of experience	fuel & waste management	huge individual units	none	not significant	radioactive wastes	none	virtually no GHG	1 kilometer exclusion zone	not significant	southern generation potential	complex & lengthy approval process	strongly oppose	limited supply market	use AEO 2013 Advanced Nuclear plant type	✗ - Difficult Integration into System
Biomass	Agricultural Crop Residue	mature Rankine technology	long-term biomass fuel storage	cold start ramp times	none	limited by annual crop harvest	combustion ash & boiler chemicals	NOx & air toxics	fuel collection & transport	fuel storage & ash disposal	deleterious substances to fish or fish habitat	southern generation potential	air emissions	not polled	collection & transportation costs	use AEO 2013 Biomass plant type	✗ - High Collection & Transportation Costs
Biomass	Wood Based Fuel	mature Rankine technology	long-term biomass fuel storage	cold start ramp times	none	limited by annual forest harvest	combustion ash & boiler chemicals	NOx & air toxics	fuel collection & transport	fuel storage & ash disposal	deleterious substances to fish or fish habitat	located adjacent to boreal forest	air emissions & allowable cut limits	not polled	collection & transportation costs	use AEO 2013 Biomass plant type	✗ - High Collection & Transportation Costs
Imp.	Imports	large well established market	tie line limits	no issues	not significant	not significant	regional impacts outside of Manitoba	regional impacts outside of Manitoba	regional impacts outside of Manitoba	new transmission right-of-ways	not significant	non-Manitoba generation	transmission right-of-way approvals	not polled	no fuel cost	projected market prices	✓

7.1.1.1 Technical Characteristics

Maturity of Technology

For this analysis, maturity of technology is represented as the extent of industry experience with the implementation and operation of a particular technology. The higher the level of industry experience the lower the level of risk and concern with implementing the technology.

Technical Challenges in Manitoba

For this analysis, technical challenges are defined in the context of project development in Manitoba. Technical challenges include the availability of the resource, physical environment conditions including Manitoba's northern climate, level of technical experience in Manitoba, length of implementation time and waste stream management.

Ease of Integration into System

This characteristic measures the complexity of integrating a specific resource technology into Manitoba Hydro's existing system. The factors considered include intermittency, size and dispatchability. Most available technologies pose no significant integration issues.

For example, the intermittency of wind only becomes an issue when the amount of wind variability exceeds the amount of load variability that occurs moment by moment. When wind variability significantly exceeds that amount, additional reserves are required, increasing the cost of integrating those additional wind resources.

Technologies that employ large individual units that are designed for base load operation over long periods of time pose an economic challenge. Such units are difficult to integrate into the current hydraulic system since they lack the dispatchability needed to complement the variability in water flows and loads. Integration of large units is possible as long as additional interconnection capability is provided to manage the increased amounts of surplus energy generated. In addition, a large unit may require Manitoba Hydro to increase the amount of

contingency reserves available to it. Adding six 100 megawatt (MW) hydro units would require one-sixth the reserves as one 600 MW unit.

Intermittency

An intermittent resource technology is one that is not continuously available and cannot be dispatched to meet the demand of a power system.

Seasonality

"Seasonality" refers to those factors that affect the production capability on a season-by-season basis. Seasonality may impact production efficiencies as well as have an effect on a technology's fuel availability.

7.1.1.2 Environmental Characteristics

Water Quality Impacts

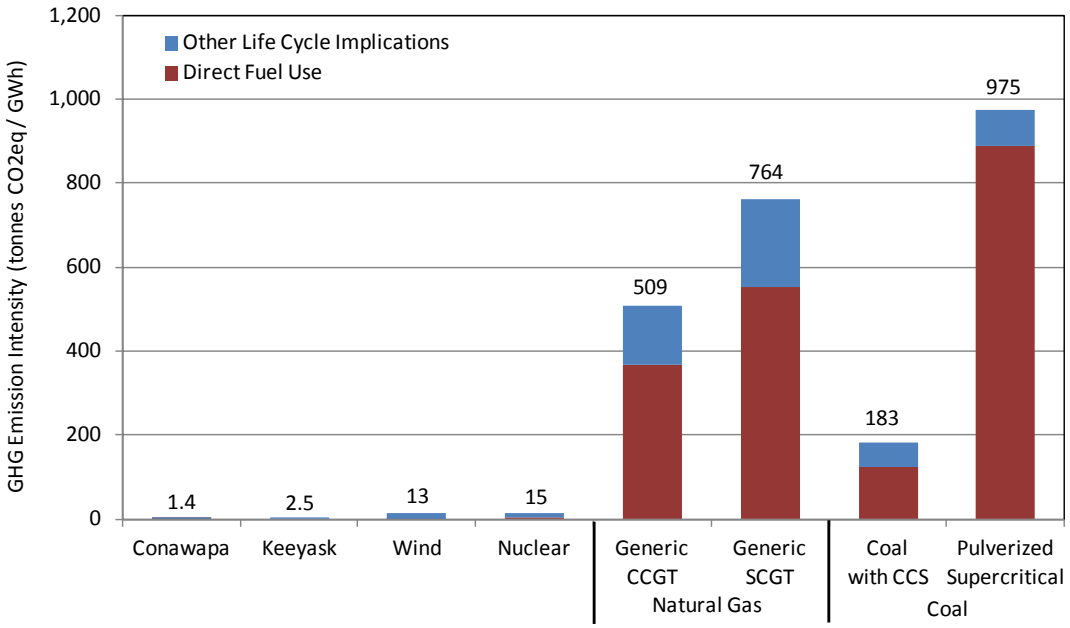
This characteristic captures a range of potential environmental effects impacting either surface or groundwater. Adverse surface water impacts may include increased turbidity due to erosion, thermal plumes or the discharge of combustion by-products such as mercury, arsenic or selenium. Adverse impacts to groundwater are typically associated with uncontrolled spills or leaks of process chemicals or by-products.

Hazardous Air Pollutants

Hazardous air pollutants are the by-products of combustion. Contaminants of concern for an individual resource technology may include nitrogen oxides, sulfur oxides, carbon monoxide, particulate matter (including respirable particles), mercury, arsenic and lead.

Greenhouse Gas Emissions

This characteristic represents the greenhouse gases (GHG) emissions associated with the life cycle of a particular electric generation technology from construction, operation and



decommissioning. Renewable resource options produce minimal GHG emissions, typically during construction phase, while all forms of conventional thermal generation, with the exception of nuclear, produce GHGs.

Error! Reference source not found. Figure 7.1 provides a comparison of the life-cycle GHG emissions for several generation technologies and uses the Keeyask Generating Station (G.S.) and Conawapa G.S. as examples for the hydro technology. The source document for this figure is appended as ***Appendix 7.3 – Life Cycle Greenhouse Gas Assessment Overview.***

One of the key results of a life-cycle GHG assessment is to show a levelized GHG comparison including all life-cycle components between different technologies. The life-cycle assessment encompasses cradle-to-grave calculations of activities for a project inclusive of:

- construction components – raw material extraction, production and transportation
- construction activities – primarily vehicle fuel
- site-specific land-use changes including reservoir emissions
- operation and maintenance activities
- decommissioning GHG emission implications.

Figure 7.1 COMPARISON OF LIFE CYCLE GHG EMISSIONS FOR ELECTRICITY GENERATION

The life-cycle GHG emission intensity for thermal generation options is dominated by the use of direct fuel (coal and natural gas), while the life-cycle GHG footprint for renewable options is dominated by construction and land-use change GHG emissions. As shown in **Error! Reference source not found.**Figure 7.1, the GHG emission intensity from the 100-year life of the Keeyask G.S. is 2.5 CO_{2e} (carbon dioxide equivalent) tonnes/GWh (gigawatt-hour); while a conventional pulverized coal generating station has a GHG emission intensity approaching 1,000 CO_{2e} tonnes/GWh and a Combined Cycle Gas Turbine (CCGT) generating station has a GHG emission intensity of 509 CO_{2e} tonnes/GWh. This means that a conventional pulverized coal generating station operating for less than 100 days would have the equivalent GHG emissions from the entire 100-year life of the Keeyask G.S. Similarly, a highly efficient CCGT generating station would emit an equivalent amount of GHG emissions in less than one year compared to the 100-year values from the Keeyask G.S.

Land-Use Impacts

Land-use impacts represent the physical footprint of a resource option as well as other associated land-use limitations such as flooded areas, buffer or set-back limits, adjacent land use restrictions and lands impacted by disposal of waste such as ash from coal plants. A small physical footprint having no post-decommissioning land-use restrictions would have the least land-use impacts. For example, a small, natural gas-fired combustion turbine with a small physical footprint will have no perpetual land use restrictions following its decommissioning.

Wildlife Species of Interest

This characteristic represents specific at-risk species—or other regionally important wildlife species noted in either Canada's *Species at Risk Act* or Manitoba's *The Endangered Species Act*—that could potentially be affected by the development of a resource technology at a specific location. Broader groupings of species that may be adversely impacted by significant habitat loss or alteration are also considered.

7.1.1.3 Social and Policy Characteristics

Proximity to Load Centre

This characteristic is a proxy for a combination of different issues such as associated right-of-way issues, construction challenges encountered in isolated areas as well as post-construction line losses. Distances to potential new facilities are estimated from the Dorsey Converter Station and are grouped into five categories: 0 to 100 kilometers (km); 100 to 250 km; 250 to 500 km; 500 to 900 km; and greater than 900 km. Shorter distances are of less concern.

Regulatory Constraints

Regulatory constraints can severely restrict or prohibit the development of a technology based on federal or provincial governments' policy perspectives or enacted laws and regulations. In some cases, the regulatory approval process itself can become an impediment to development. Policy areas such as land use, environmental emissions and impacts on wildlife may become a

regulatory constraint requiring mitigation or compensation for any individual resource technology within the planning horizon.

Social Acceptability

Two public opinion polls conducted by Ipsos and the Innovative Research Group in April 2011 were used to gauge Canadian public opinion regarding six methods of producing electricity (solar, wind, hydro-electric, natural gas, nuclear and coal). Polling results plus inferences drawn from the data are used to populate this characteristic. The degree of respondent support corresponds to the level of acceptance of individual resource technologies.

7.1.1.4 Economic Characteristics

Manitoba Delivered Fuel Costs

Delivered fuel costs refers to the current and future cost of fuel and associated transportation for each technology. This characteristic includes the effect of the recent fuel-price volatility experienced by natural gas as well as rising transportation costs for fuel that have been impacted by petroleum prices. Natural gas and coal fuels require additional management of the fuel delivery system. Transportation services—either by rail for coal or pipeline service for natural gas—need to be addressed in a manner that both maximizes flexibility but also guarantees service.

Forecast U.S. Unit Cost

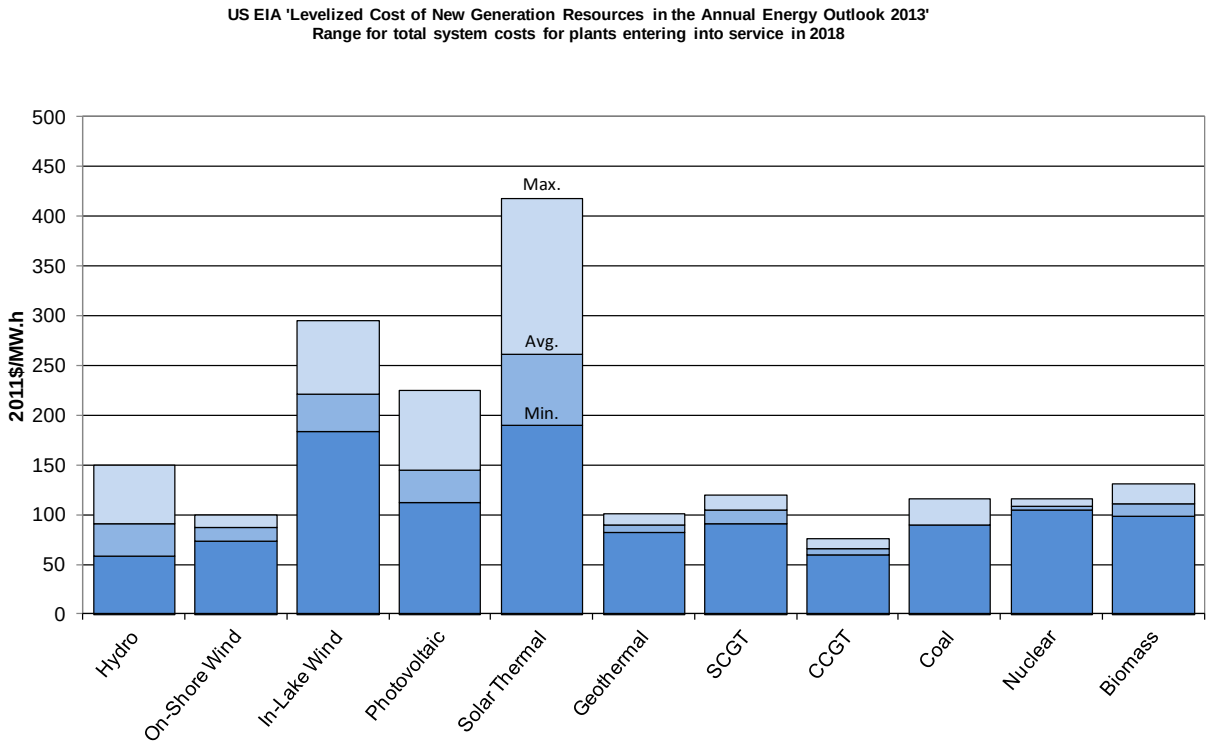
With the exception of demand side management (DSM) and imports, unit cost is represented by levelized cost. The unit cost of DSM varies by program; information on the cost of additional DSM is not available at this time. The unit cost of imports varies by market and by product and is based on Manitoba Hydro's consensus electricity export price forecast.

Levelized cost is a standard measure of the cost of constructing and operating a generating resource over its life. While it is a useful measure for screening of technologies, it should be

noted that levelized cost does not indicate the value of the generation but is a relative measure of the cost associated with a unit of energy. For the purpose of high-level screening, levelized costs for new generation obtained from the U.S. Energy Information Administration (EIA) 2013 Annual Energy Outlook Early Release (AEO) were sorted into three categories as follows:

- less than $100/megawatt-hour (MWh),
- $100 - $130/MWh, and
- greater than $130/MWh.

Figure 7.2 TYPICAL LEVELIZED COST OF NEW GENERATION BY RESOURCE



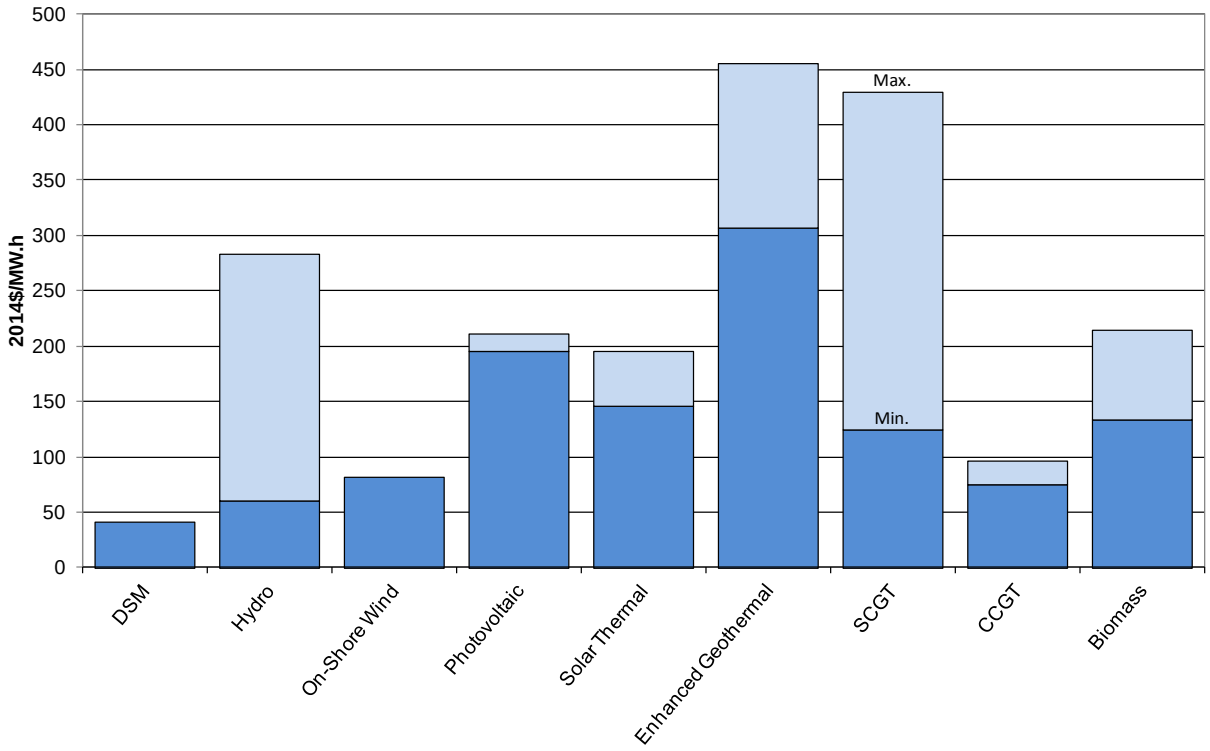


Figure 7.2 above shows the levelized cost ranges for resource technologies as provided in the EIA Annual Energy Outlook 2013. Additional information on resource technologies that have the potential to be developed in Manitoba is provided in ***Appendix 7.2 Range of Resource Options*** and further information on emerging technologies is provided in ***Appendix 7.1 Emerging Energy Technology Review***.

Figure 7.3 shows the levelized cost ranges based on potential development of resource technologies in Manitoba.

Figure 7.3 LEVELIZED COST OF RESOURCE TECHNOLOGIES DEVELOPED IN MANITOBA

Note: Values reflect losses to bring energy to market.

7.1.2 Screening Process

The high-level screening of technologies uses a general characterization to determine whether a technology will proceed to the next stage of evaluation. As shown in Table 7.1, there are three possible outcomes from screening: screened out (red), some concern (yellow), minimal concern or positive (green). If a characteristic for a particular technology receives a "screened out" outcome, that technology does not advance to the next stage and is depicted by an "X" in the Screening Summary column of Table 7.1. A technology will otherwise advance to the next stage of evaluation.

7.1.2.1 Selected Resource Technologies

The screening process resulted in the following resource technologies advancing to the next stage of evaluation:

- additional DSM
- hydro – with Storage and Run-of-River
- wind – On-Shore
- natural Gas-Fired – Simple Cycle and Combined Cycle Gas Turbines
- imports.

The following is a summary of the key characteristics of the selected resource technologies.

Additional Demand Side Management

Manitoba Hydro's DSM initiative, Power Smart, consists of energy conservation and load management activities designed to capture energy efficiency and economic opportunities in an effort to meet the energy needs of Manitoba in a more sustainable manner while assisting customers in using energy more efficiently and reducing their energy bills. DSM encompasses a range of market-based conservation programs and activities.

As indicated in ***Chapter 4 –The Need for New Resources***, the 2012 Load Forecast reflects the expected load reductions as a result of past DSM programs. By the end of 2012/13, Power Smart is estimated to have achieved an annual load reduction of 1,990 GWh and 586 MW (at generation)[1]. Manitoba's net load is determined by subtracting the DSM energy savings from the corporation's electric load forecast.

Compared to other generation technologies in Table 7.1, DSM results in no flooding, no air emissions and has a positive global environmental impact. In the latter regard, energy

[1] Interim estimate as of March 31, 2013.

conserved in Manitoba as a result of DSM efforts can be sold to export market customers, thus displacing the use of fossil-fuel based generation in those regions. DSM may also have a net positive impact on the environment by deferring the need for new electricity infrastructure in Manitoba. However, this deferral may increase overall GHG if the deferred generation is hydro.

One of the main considerations with DSM is that, without regulation or legislation, achieving energy reduction targets is strongly dependent upon market acceptance and voluntary action. Also, in addition to market availability and adoption forecasts, the savings potential is estimated based on a variety of assumptions that include natural technological development, anticipated customer energy usage/savings and market cost projections. As a result, expected energy savings from DSM do not have the same future certainty of supply as would the development of a physical resource.

In the screening process, additional DSM did not receive a "screened out" outcome for any of the 15 characteristics as shown in Table 7.1.

Hydro – with Storage and Run-of-River

From a technical perspective, hydro-electric generation is a mature, dependable technology that easily integrates into Manitoba Hydro's existing system. Approximately 4,700 MW of developable hydro-electric potential remains within the province including the proposed Keeyask and Conawapa projects.

From an environmental perspective, hydro-electric generation is a renewable resource that has virtually no hazardous air pollutants or GHG emissions. Specific hydro developments do have the potential to impact aquatic and terrestrial species. Hydro with storage can typically result in a significant amount of flooding, while run-of-river hydro results in comparatively less flooding. From a social and policy perspective, hydro-electric generation is a long lead-time resource that has a lengthy approval process. Major hydro-electric resources are located in northern

Manitoba which is distant from the load centre. According to Canadian public opinion, hydro-electric generation is generally viewed favourably.

From an economic perspective, hydro-electric generation is a long-lived resource with high upfront investment but very low and stable operating costs over the long-term, resulting in a levelized cost that falls within the range of other technologies selected for the next stage of evaluation.

In the screening process, hydro with storage and run-of-river hydro did not receive a "screened out" outcome for any of the 15 characteristics as shown in Table 7.1.

Wind – On-Shore

From a technical perspective, traditional on-shore wind is an established technology and a good-quality wind resource exists within Manitoba. Wind is an intermittent resource that is highly variable, is challenging to accurately forecast and can result in system integration issues. The integration issues become more significant with higher proportions of wind in a system, resulting in the requirement for additional dispatchable capacity resources.

From an environmental perspective, wind generation is a renewable resource that has virtually no hazardous air pollution and no GHG emissions. However, there are potential negative impacts on various avian species.

From a social and policy perspective, wind generation is a short lead-time resource that has typically experienced short regulatory approval processes. According to Canadian public opinion, wind is generally viewed favourably.

From an economic perspective, wind generation has significant upfront investment costs but low operating costs over its approximate 20-year operating life. The unit cost of wind

generation falls within the range of other technologies selected for the next stage of evaluation. The unit cost for wind generation does not include costs required to compensate for the intermittency.

In the screening process, On-shore wind did not receive a "screened out" outcome for any of the 15 characteristics as shown in Table 7.1.

Natural Gas-Fired – Simple Cycle and Combined Cycle Gas Turbines

From a technical perspective, natural gas-fired generation (simple cycle and combined cycle gas turbines) uses modular, low capital cost technologies that are mature and well established. Natural gas-fired generation is a short lead-time resource that is relatively easy to install and integrate into the existing Manitoba Hydro system, provided that natural gas supply is readily available.

From an environmental perspective, simple cycle gas turbine (SCGT) units emit minor amounts of hazardous air emissions and produce approximately half as much carbon dioxide (CO_2) as coal-based generation. The dual-stage combined cycle gas turbine (CCGT) units require a higher capital investment compared to simple cycle gas turbines but are larger and more efficient, resulting in a lower unit cost of energy. CCGT emit no meaningful amount of hazardous air emissions and produce approximately one-third of the CO_2 of coal-based generation.

From a social and policy perspective, natural gas-fired generation is a shorter lead-time resource that has typically experienced modest regulatory approval processes. According to Canadian public opinion, natural gas-fired generation is generally viewed favourably. There is ongoing concern with respect to GHG emissions, affecting the social acceptance and potential cost of this technology.

From an economic perspective, the majority of the cost of natural gas-fired generation is a result of the cost of fuel, which in recent years has been highly volatile as discussed in ***Chapter 3 – Trends and Factors Influencing North American Electricity Supply***. Recently, as a result of the adoption of innovative technological advancements in natural gas exploration and extraction, the current and forecast price of natural gas is very low, resulting in a highly competitive operating cost for natural gas-fired generation. However, there is general expectation that the price of natural gas will increase.

In the screening process, SCGT and CCGT did not receive a "screened out" outcome for any of the 15 characteristics as shown in Table 7.1.

Imports

Given Manitoba's predominantly hydro system, resource diversity can be achieved by building resources in Manitoba or through the purchase of imports from a non-hydro based region or a combination of both. For planning purposes, under low flow or dependable flow conditions, imports in the 2020 timeframe represent in the order of 10% of Manitoba Hydro's total supply. The primary source of imports to Manitoba is the Midcontinent Independent System Operator, Inc.(MISO) market.

From a technical perspective, imports, utilizing existing or new transmission lines, are a flexible resource option that can be called upon whenever required and on short notice. Imports provide Manitoba Hydro with supply diversity by drawing from the MISO market, consisting primarily of coal-fired, natural gas-fired, nuclear and wind generation.

From an environmental, social and policy perspective, generation from the MISO market—on average across all generation types—results in significant amounts of CO_2 and other hazardous air emissions on a per-unit (MWh) basis. Imports are also dependent on transmission

interconnections; new interconnections require both a willing counterparty as well as approvals from U.S. and Canadian regulatory bodies.

From an economic perspective, the cost of market-based energy can vary by time of day and by season. Manitoba Hydro is not committed to purchase any quantity of imports at any specific time of day or year, and therefore has the flexibility to import when most effective for Manitoba Hydro's overall system operations.

In the screening process, imports did not receive a "screened out" outcome for any of the 15 characteristics as shown in Table 7.1.

7.1.2.2 Resource Technologies Not Selected

The screening process resulted in eliminating the remaining resource technologies that were considered in Table 7.1. The technologies not selected were:

- Wind - In-Lake Wind
- Solar – Solar Photovoltaic and Solar Thermal
- Enhanced Geothermal Systems
- Coal – Conventional Pulverized Coal and Integrated Gasification Combined Cycle
- Nuclear Power Plants
- Biomass – Agricultural Crop Residue and Wood Based Fuel Biomass.

The following is a brief summary of the key characteristics of the resource technologies that were not selected.

In-Lake Wind

In-lake wind shares common attributes with on-shore wind. This resource technology was screened out primarily due to energy costs. In-lake wind costs are significantly higher than land-based alternatives.

Development of in-lake wind resources in Manitoba is significantly more technically challenging than on-shore wind due to issues such as winter ice floes. Additional issues include potential adverse impacts affecting existing commercial and recreational lake users. As well, there is a lack of experience within North America in developing in-lake wind resources.

Solar Photovoltaic

Solar photovoltaic is an established technology with significant opportunity for potential technological improvement. A good-quality potential solar resource exists within southern Manitoba. This resource technology was screened out because:

- energy costs for solar photovoltaic were significantly higher than other resource options costs (although costs have recently been trending downwards)
- solar photovoltaic is an intermittent resource that is highly variable and, as a result of its reliance on direct sunlight, there is potential for significant instantaneous drops in power output due to the unpredictable nature of localized cloud cover.

Solar Thermal

Solar thermal is in advanced stages of development and still has a high cost of energy production relative to other resource options. Solar thermal is considered an intermittent resource as it is dependent upon daily weather. It is less intermittent than solar photovoltaic since it is not impacted instantaneously by cloud cover.

From a technical perspective, Manitoba peak load occurs in the winter when solar intensity is weak. In addition, peak load can occur after sunset.

This resource technology was screened out due to the energy costs for solar thermal being significantly higher than other resource options.

Enhanced Geothermal Systems

An enhanced geothermal system is a proven technology but suitable geothermal heat gradients required for these systems remain unproven in Manitoba. As a result, this technology did not advance to the next stage of evaluation. The production of geothermal-based energy utilizes conventional steam-based generation technology but there remain significant technological and economic challenges in drilling to the 2-10 km depth required.

Conventional Pulverized Coal

Environment Canada's *Reduction of Carbon Dioxide Emissions from Coal-Fired Generation of Electricity Regulations* (2012) established a performance standard for new coal-fired generating units after 2015 of an annual average intensity of 375 tonnes of CO_{2e} per GWh. The Province of Manitoba, under *The Climate Change and Emissions Reductions Act,* is phasing out the use of coal for generation except to support emergency operations. As a result, coal-fired generation as a technology has been eliminated from consideration for the next stage of evaluation.

Coal - Integrated Gasification Combined Cycle

Integrated gasification combined cycle is an evolving technology that is technically complex with only a few utility-scale examples constructed in North America. While combustion of coal-derived synthetic gas produces a significantly cleaner air emissions profile, the Province of Manitoba, under the *Climate Change and Emissions Reductions Act,* is phasing out the use of coal for generation except to support emergency operations. As a result, this technology has been eliminated from consideration for the next stage of evaluation.

Nuclear Power Plants

Nuclear power plants require high up-front capital investment. The limited operational flexibility and large individual unit-size of nuclear power plants together with their baseload mode of operation, would not integrate well with the relatively small size of Manitoba Hydro's existing system. Nuclear power plant development, based on proven technology, has large

individual units typically sized between 600 and 1,200 MW. Nuclear power plants have little operational flexibility resulting in high capacity factors, meaning that there is little opportunity to vary the level of production to suit the needs of the Manitoba system. Although the nuclear industry is addressing this through the development of advanced small sized reactors (less than 300 MW unit capacities in size) they have not yet been commercially deployed in North America and will not be for a number of years.

In addition, *The Manitoba High-Level Radioactive Waste Act* prohibits the long-term storage of high level radioactive waste in Manitoba. As a result, nuclear power plants have been eliminated from further evaluation on the basis of system integration issues and on the basis of the provincial legislation related to the storage of radioactive waste in Manitoba.

Agricultural Crop Residue Biomass & Wood-Based Fuel Biomass

Agricultural crop residue biomass and wood-based fuel biomass are adaptations of conventional steam-based generation. Currently, the cost of energy produced from these forms of technology are not yet competitive with other forms of generation and are highly dependent upon the uncertain price of transportation fuels. On this basis, these technologies have been eliminated from consideration for the next stage of evaluation.

7.2 Resource Options Screening

The next step in the screening process is the selection of specific resource options from each of the resource technologies identified in Section 7.1.2.1. The process for selecting resource options involves comparing the characteristics of the resource technologies—the results of this comparison identifies the resource options for the next stage of analysis.

7.2.1 Additional DSM Screening

Manitoba Hydro's strategy for DSM involves a continued long-term commitment to pursuing all cost-effective energy efficiency opportunities and to continually monitoring the market for

emerging trends and opportunities which may become economically viable. As new opportunities are identified as being economic, these opportunities are included into Manitoba Hydro's DSM plan (e.g. the recently announced Power Smart Community Geothermal program, which will be added to the next update of Manitoba Hydro's DSM plan).

To assist in identifying the available DSM potential in Manitoba, the corporation recently engaged a consultant to undertake a DSM potential study. As the results of this study were not available in time to be incorporated into the 2012 main NFAT analysis, a DSM sensitivity and a DSM stress test are included, based on 2013 planning assumptions and preliminary projections from the DSM Potential Study, in ***Chapter 12 – Economic Evaluations - 2013 Update on Selected Development Plans***

As noted in ***Chapter 4 – The Need for New Resources***, Section 4.2.2 and provided in ***Appendix 4.3 – Demand Side Management Potential Study***, the DSM Potential Study examines the "market potential" and "achievable potential" of existing energy-efficient technologies which are economic in Manitoba and for those technologies that may be on the horizon. The preliminary high-level projections from the study were used to frame threshold levels of additional DSM over and above the 2012 base DSM forecast. These preliminary thresholds are incorporated into the analysis in ***Chapter 12 – Economic Evaluations - 2013 Update on Selected Development Plans*** as a sensitivity of 1.5 times the base DSM plan, and as a stress test of 4 times the DSM base forecast. Table 7.2 shows a comparison of the current approved Power Smart Plan and the final findings of the DSM Potential Study. As shown by Table 7.2 the thresholds incorporated into the analysis presented in ***Chapter 12 – Economic Evaluations - 2013 Update on Selected Development Plans*** remain reasonable.

Table 7.2 THRESHOLDS FOR POTENTIAL ADDITIONAL DSM

	Comparison at Forecast Year 2027/28 (at Meter)			
	GWh	% of Power Smart Plan	MW	% of Power Smart Plan
2013-16 Power Smart Plan (2012/13 – 2027/28)	713	100%	154	100%
DSM Potential Study				
Achievable	1135	159%	255	166%
Market	2915	409%	671	436%

Caution must be exercised in interpreting the results of a DSM potential study. The projections represent a high-level assessment of the achievable and market potential with market potential representing absolute level of energy and demand savings that are technically feasible, economically attractive assuming the ideal market conditions. These conditions could be characterized by the presence of a focused and coordinated effort across organizations/governments (federal, provincial and utilities) eliminating all material market barriers to adoption, such as product availability and market capacity, product awareness and knowledge, price differentials, etc.—i.e., the probability of these ideal market conditions being present in combination is doubtful and therefore represents a theoretical limit.

The setting of specific Power Smart targets involves more detailed and market-specific analysis which was beyond the scope of this study. The study does not involve a detailed assessment of each potential energy efficiency opportunity and does not account for the investment or specific strategies required to support the market intervention.

Insights gathered through the study will need to be further investigated to more specifically define the market and potential associated opportunities, determine the feasibility of the opportunities and the most effective and cost-efficient market intervention strategies to create an effective market change over time. As such, caution must be exercised in using the results of the market potential study for planning purposes: the results of the study should only be used for developing a refined DSM plan.

It is recognized that DSM savings are contingent on program participation and do not carry the same degree of certainty that a generation resource provides. While Manitoba Hydro has relied upon DSM to date at the same level of certainty as new generation, this is reasonable provided realistic DSM programming is underlying the targets associated with DSM. It is reasonable to consider this factor in determining the degree to which Manitoba Hydro will rely on DSM targets which may be arbitrary and not based on sound DSM programming.

7.2.2 Hydro Resource Options Screening

Manitoba Hydro has identified a total of 8,200 MW of undeveloped renewable hydro-electric potential of varying sizes and technical difficulties remaining within the province. Many of the smaller sites are uneconomic in comparison to other sites as a result of their relative small size and remoteness from the existing transmission system. Manitoba Hydro's cooperation with two major government initiatives has eliminated many other potential hydro-electric sites from further consideration.

Under the Treaty Land Entitlement Framework Agreement, Manitoba Hydro agreed to restrict its interest to a total of 16 sites along the Nelson, Burntwood and Churchill rivers including three sites on the Hayes River and Wuskwatim, thereby releasing lands around other sites for selection by First Nations toward fulfillment of their treaty entitlements.

Under the Canadian Heritage Rivers System, which recognizes and conserves rivers of outstanding natural, cultural and recreational heritage, Manitoba Hydro agreed not to pursue development of the three sites on the Hayes River. The 12 remaining sites on the Nelson, Burntwood and Churchill rivers have a hydroelectric potential of 4,700 MW—these sites have been identified as having the highest potential for future development and are listed in Table 7.3.

Hydro-electric generating resources are highly site specific in terms of design, capacity, energy, construction and cost. These factors, as well as a number of other regulatory, technical and environmental considerations, limit the number and location of practical hydro-electric developments within Manitoba. Hydro-electric plants are considered to have high up-front capital costs, low operating costs, require long lead times for development, and can achieve economies of scale if large in size. Hydro-electric plants also tend to provide more significant economic stimulus to Manitoba than many other technologies.

While all sites included in Table 7.3 contain favourable characteristics for development, not all have been investigated to the same degree. The stage of preparation shown in the table represents the level of investigation and study for individual sites from inventory, feasibility, and conceptual design to pre-investment. Inherent in the individual design concepts and overall range of stages—as defined in ***Appendix 7.2 – Range of Resource Options***—are a number of other issues such as environmental concerns, social concerns, economics and system integration.

The stage of development for a particular resource option is driven by the attractiveness of its characteristics, which includes unit cost. Levelized cost is a significant factor at this stage of the screening process.

As demonstrated in ***Chapter 4 – The Need for New Resources***, new resources are required in 2022/23 according to the 2012 planning assumptions. In order to fully approve and develop a resource in time to meet needs and opportunities, only sites suitable in terms of characteristics and stage of preparation are considered for potential use in development plans. Keeyask G.S and Conawapa G.S. are the only two potential hydro-electric sites with suitable characteristics and at a sufficiently advanced stage of preparation.

Table 7.3 HYDRO RESOURCE OPTION CHARACTERISTICS

		Resource Timing	Stage of Preparation	Resource Lead Time (Years)	Technical Characteristics	Nominal Capacity (MW)	Dependable Energy (GW.h)	Environmental Characteristics	Flooded Area (km^2)	Wildlife Species of Interest	Economic Characteristics	Base Cost (2014$ Billion)	Levelized Cost (2014$/MW.h)	Considered for Further Evaluation
Hydro Resource Options	Keeyask GS		V	7		695	3000		45	Yes		3.5	60	✓

Stage I - Inventory Stage II - Feasibility Stage III - Concept Stage IV - Pre-Investment
Stage V - Final Design, Construction & Commissioning

Notes:
Levelized costs are calculated using a real discount rate of 5.05%.
Levelized costs are based on remaining estimated capital costs going forward from June 2014. All costs (incurred or estimated) prior to June 2014 are considered as sunk.
Descriptions of the stages of preparation are included in ***Appendix 7.2- Range of Resource Options***
*Although Notigi is identified at a Stage IV— Preparation level, studies were suspended in 2002.
Energy values do not require transmission loss adjustment for supply & demand tables.

The following is a summary of the main positive and negative characteristics for the two selected hydro-electric options along with a brief summary of why other sites were not selected for further evaluation at this time.

Keeyask Generating Station

At 695 MW, Keeyask G.S. is the only medium-sized hydro-electric plant available for consideration, and is significantly larger than most other plants but is smaller than Conawapa and Gillam Island. This medium size makes it attractive for balancing the economies of scale with the large increments of new capacity added by very large hydro developments. Developing the site requires a moderate amount of flooding at 45 km^2 and is located in known sturgeon habitat.

The Keeyask Project is at an advanced Stage V— Final Design, Construction and Commissioning level of development. For a more detailed project description for Keeyask, see ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***.

Conawapa Generating Station

At 1,485 MW, Conawapa is considered a large generating station and would be the largest generating station within the province if developed. Its large size provides a large amount of excess capacity and would require a more significant upfront investment than other hydro generation alternatives. From a levelized-cost perspective, economies of scale result in Conawapa having the second lowest levelized cost of the hydro options.

The development of this station results in the flooding of 5.1 km^2 within the flood plain of its riverbank, but the location is a known sturgeon habitat. At the time of this analysis and based on a 13 year lead time, Conawapa could be in service as early as 2025.

The Conawapa Project is at an advanced Stage IV—Pre-Investment level of development. For a more detailed project description for Conawapa, see ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***.

Hydro Resource Options Not Selected

After considering the characteristics of resource timing, environmental impact, capacity and energy and economic information, nine of the 12 hydro-electric resource options have been screened out on the basis of their higher levelized cost and on the basis of their state of development being at the Stage II– Feasibility level or less.

The small size of Notigi, combined with a higher levelized cost than that for Keeyask G.S. and Conawapa G.S., results in Notigi receiving no further consideration in this submission.

At 120 MW, Notigi is considered a small generating station located at the site of the existing Notigi control structure. The primary function of this control structure is to regulate water flows into the Burntwood River. As a result, in the winter the capacity of the plant would be significantly reduced due to declining forebay water levels. The capacity of the plant would also be reduced as tailrace water levels rise due to river ice staging. The combined effect is a reduction of approximately 20 MW or 16% of the plant generating capacity. The resulting capacity provided by Notigi would represent less than two years of load growth.

The development of the Notigi site, as a project, would have minimal environmental effects as the forebay, transmission access, the road, and all of the civil structures, with the exception of the powerhouse, are already established. As Notigi would retain its primary function as a control structure, there is no expected change to existing operation and therefore no expected environmental effects.

Stage IV engineering studies for Notigi were initiated as far back as 1999 but were suspended in 2002 in order to concentrate efforts on the Wuskwatim, Keeyask, and Pointe du Bois projects. As a result of the engineering and related planning studies being at an early Stage IV level, there is greater uncertainty in the levelized cost estimate for Notigi. The minimum time identified to the earliest in-service date for Notigi is ten years. Given the vintage of the available project

information and engineering studies, it is likely that longer than ten years would be required for Notigi's earliest in-service date.

In future studies, Notigi G.S.— along with other plants on the Burntwood River such as First Rapids and Manasan G.S. — will be evaluated in a development plan which would allow for economies of scale in construction.

7.2.3 Natural Gas-Fired Resource Option Screening

In Section 7.1.2 Manitoba Hydro determined that the natural gas-fired generation options suitable for further consideration are SCGT and CCGT.

Natural gas-fired turbines are flexible, modular units that come in a variety of configurations from a number of manufacturers and there is a large fleet of natural gas turbines world-wide. Their prevalence ensures predictable operating and environmental performance characteristics. Units range in size from very small (less than 1 MW) to very large (more than 400 MW). As fossil fuel-based resources, natural gas-fired turbines emit carbon dioxide and minor amounts of nitrous oxide. Considerations for siting include accessibility to gas supply, water supply and transmission interconnections. Natural gas-fired generation is considered to be a shorter lead time-resource option with lower capital costs, with the majority of the cost related to high fuel-based operating costs.

Noteworthy decreases in future costs for combustion turbines are not anticipated; however, innovation in the field of combustion turbine generation will lead to more efficient machines that operate at lower heat rates. These efficiency improvements will be achieved through higher cycle pressure ratios, improved turbo-machinery component efficiencies and higher turbine inlet temperatures.

For planning purposes Manitoba Hydro considered the following gas turbine configurations, representative of the different types of units that are available, for integration into the existing system:

- heavy duty SCGT
- heavy duty CCGT
- aeroderivative SCGT.

The following is a summary of the characteristics for each natural gas-fired resource option and how each option would be utilized.

Heavy Duty Simple-Cycle Gas Turbine

A heavy duty SCGT would be best suited as an addition to Manitoba Hydro's system when there is a requirement for a capacity increment larger than 200 MW and when the resource is intended to operate infrequently. Typically, heavy duty SCGTs are large units with short lead times (3-5 years), low capital costs and high operational costs. Consequently, an SCGT is best used as a capacity resource when operation is intended to be infrequent, typically less than 20% of the total time.

The heavy duty SCGT specified for planning purposes is the General Electric (GE) 7FA. The GE 7FA has a capacity of 209 MW and a mid-efficiency heat rate of 9,906 Btu/kWh (British thermal units/kilowatt-hour). The GE 7FA has been in operation since 1994 and has 740 individual units in operation in both simple and combined cycle configurations, lending confidence to its operation, reliability and maintenance. In the event that development is pursued, actual turbine selection would be based upon its intended operation, design requirements, cost, and availability at the time of purchase.

Heavy Duty Combined Cycle Gas Turbine

A heavy duty CCGT is best suited as an addition to Manitoba Hydro's system when there is a requirement for a large increment of energy and capacity and when the resource is intended to operate more frequently than a SCGT (typically more than 40% of total time). Typically, CCGTs are large units with short lead times (3-5 years) and have higher capital costs and lower operational costs than SCGTs.

The heavy duty CCGT specified for planning purposes is the GE 7FA CCGT. The GE 7FA CCGT has a capacity of 308 MW and a high-efficiency heat rate of 6,652 Btu/kWh. In the event that development is pursued, actual turbine selection would be based upon its intended operation, design requirements, cost and availability at the time of purchase.

Aeroderivative Simple Cycle Gas Turbine

An aeroderivative gas turbine is best suited as an addition to Manitoba Hydro's system when there is a requirement for a small increment of capacity and is intended to operate infrequently. Typically, aeroderivative gas turbines are available as small units with short lead times (approximately three years), higher capital costs and higher operational costs than both the simple cycle and combined cycle GE 7FA units. Thus, an aeroderivative SCGT is best used as a capacity resource when the operation is intended to be infrequent or for quick-start and black-start capabilities.

The aeroderivative SCGT specified for planning purposes is the GE LM6000PH. The GE LM6000PH is based on the CF6 aircraft engine which powers the Boeing 747 aircraft among others. The LM6000PH has a capacity of 47 MW and a mid-efficiency heat rate of 9,475 Btu/kWh. The engine has been in industrial operation since 1992 with a current fleet size of 1,025 units, lending confidence to its operation, reliability and maintenance. In the event that development is pursued, actual turbine selection would be based upon its intended operation, design requirements, cost, and availability at the time of purchase.

Table 7.4 summarizes the characteristics of the natural gas-fired resource options used for planning purposes.

Table 7.4 NATURAL GAS-FIRED RESOURCE OPTION CHARACTERISTICS

		Resource Timing	Resource Lead Time (Years)	Technical Characteristics	Nominal Capacity (MW)	Dependable Energy (GW.h)	Heat Rate (mmBTU/MW.h)	Fleet History	Quick Start	Environmental Characteristics	GHG Emissions (CO2e/MW.h)	Economic Characteristics	Base Costs (million 2014$)	Levelized Costs (2014$/MW.h)	Considered for Further Evaluation
Natural Gas	GE 7FA Heavy Duty CCGT		3-5		308	2460	6652	Yes	No		342		399	75 - 97 [1]	✓
	GE 7FA Heavy Duty SCGT		3-5		209	1688	9906	Yes	No		506		161	125 - 266 [2]	✓
	GE LM6000PH Aeroderivative SCGT		3		47	387	9475	Yes	Yes		506		71	163 - 430 [2]	✓

1 Based on 70% to 35% capacity factor range.
2 Based on 20% to 5% capacity factor range.

Energy values require 10% transmission loss adjustment for supply & demand tables.

7.2.4 Wind Resource Option Screening

In Section 7.1.2 Manitoba Hydro determined through resource technologies screening, that on-shore wind generation is a short lead-time resource option suitable for further consideration. Large areas in southern Manitoba are both environmentally and technologically suitable for several thousand MWs of wind farm development.

Wind resource options are modular and are made up of multiple units that can be installed to closely match energy resource requirements. In the Manitoba Hydro system, a wind resource option is suitable when there is a requirement for energy only, and not capacity, as Manitoba experiences peak demand in winter. Wind generation is assumed to have a zero winter peak capacity due to the intermittent nature of the resource and the fact that the wind generators cannot be expected to operate reliably at temperatures below -30°C, the kind of temperatures which produce Manitoba peak winter load. This subject is further discussed in ***Appendix 7.4 - Capacity Value of Wind Resources.*** Wind turbine manufacturers have considered operations in extreme temperatures and have defined a cold climate as less than -20°C for more than one hour in nine days per year. Manufacturers' cold weather packages have been developed and

can extend the operational range of a turbine typically down to normal ambient temperatures of -30°C.

Wind power cannot be reliably controlled due to fluctuations in wind speed; because of its intermittency wind power alone cannot be relied upon to produce electricity when needed. Other issues typically associated with a wind resource include extremes of wind speed (too low or too high), extreme wind gusts, extreme wind shear, and extreme wind turbulence, as well as lack of wind for periods of time. To accommodate a wind resource, other dispatchable resources that have fast energy ramp-up times such as hydro-electric and natural gas-fired generation are required to back-up wind generation when wind energy production is reduced or not available.

In North America, recent on-shore wind development projects under construction have predominantly utilized wind turbines ranging from 1.5 to 3.0 MW in size with hub heights ranging from 80 to 120 metres. The trend over the past decade has seen the increased use of taller wind towers and turbine units with larger capacity ratings, resulting in improved performance as measured by increases in capacity factor. Evolving trends and factors make it difficult to accurately predict which individual wind turbine unit sizes and types may be utilized in the future. In addition, industry forecasts to 2030 anticipate a 45% increase in energy output from wind turbines, assuming that material costs decrease by 10% in real terms from current levels.

Wind speed is the most important factor affecting the production of wind energy. Therefore, it is desirable to locate a wind project where the average annual wind speed is as high as possible. It is assumed that the best wind resource locations would be developed first, proceeding to progressively less windy locations as the number of developments increase over time. For planning purposes, annual energy projections are estimated through statistical wind resource assessments and operating history. An average annual capacity factor of 40% is assumed for all

future wind farm developments in southern Manitoba and 85% of the 40% is assumed to be dependable wind energy.

Manitoba Hydro adopted the 85% factor for determining dependable wind generation based on statistical analysis of wind records for extended periods of time in other jurisdictions. The standard that was adopted required that the dependable energy could be achieved in 19 years out of 20. It is estimated that each year there is a 5% chance that actual annual generation will be less than the 85% level. The five percentile probability is the industry standard for determining the dependable energy of wind generation.

Southern Manitoba's wind resource characteristics are well understood and, for the purposes of modeling and evaluating wind farm developments, can be applied to a generic wind farm. Thus, a generic 65 MW wind farm was created for use in future assessments and evaluations without the need for defining the location, the make, the number or the size of individual towers required. A 65 MW capacity development is a reasonably sized wind farm that can benefit from economies of scale and is also approximately equal to the estimated provincial annual load growth for energy. In order to simplify modeling and evaluations at this stage of planning, it was assumed that all additional wind developments would be owned and operated by Manitoba Hydro.

Table 7.5 summarizes the characteristics of the wind resource option used for planning purposes.

Table 7.5 ON-SHORE WIND RESOURCE OPTION CHARACTERISTICS

		Resource Timing	Technical Characteristics					Environmental Characteristic	Economic Characteristics			Considered for Further Evaluation
		Resource Lead Time (Years)	Nominal Capacity (MW)	Winter Capacity (MW)	Dependable Energy (GW.h)	Capacity Factor		Wildlife Species of Interest	Base Costs (million 2014$)	Levelized Costs (2014$/MW.h)		
Wind	Generic Wind Farm	3-5	65	0	194	40%		Yes	163	82		✓

Note: Energy values require 10% transmission loss adjustment for supply & demand tables.

7.2.5 Imports

For planning purposes, imports are an option to meet either capacity or energy needs. Given Manitoba Hydro's strong connection to the large U.S. market, imports for both capacity and energy needs are available with short lead times and are available for various durations to meet short-term and long-term requirements.

When considering imports for capacity purposes, a critical consideration is that Manitoba experiences a winter peak demand while most U.S. utilities have their peak demand during the summer season. This means that there is likely to be a large pool of surplus U.S. capacity available to Manitoba Hydro in the winter season if suitable transmission arrangements can be made on a firm basis for the delivery of energy associated with the capacity.

Generally Manitoba Hydro has entered into capacity exchange arrangements with U.S. suppliers to acquire winter capacity at no cost. In exchange for the rights to winter capacity, Manitoba Hydro agrees to supply an equivalent amount of capacity to the supplying utility during the summer season: i.e., a seasonal diversity arrangement. If existing firm import and export transmission exists between Manitoba Hydro and the U.S. utility, both companies can meet their capacity needs with no capital expenditures. If there is insufficient firm transmission,

then it would be cost-effective to build or buy the necessary transmission service when the cost of the transmission service is less than the cost of acquiring a capacity resource.

When considering imports for dependable energy requirements, a critical consideration is whether the supplying region has surplus energy available during the period when Manitoba Hydro is experiencing dependable flow conditions. For example, because Saskatchewan and northwestern Ontario share the same watersheds and have significant hydro resources on the same river systems as Manitoba Hydro it is extremely likely that these regions will be short of energy during dependable flow conditions. Conversely, because hydro is a very small component of the generation fleet in the region of the U.S. from which Manitoba Hydro purchases energy (1% of total annual generation), shared drought conditions in Manitoba Hydro's watersheds and those of the U.S. Midwest will not noticeably reduce the supply of energy available for purchase by Manitoba Hydro. Even severe drought conditions extending beyond Manitoba and into the U.S. Midwest that potentially impact the supply of energy by affecting cooling or boiler makeup water requirements of U.S. Midwest thermal generating stations would not be expected to have a material impact in the overall availability of energy for purchase.

Manitoba Hydro can access the supply of surplus energy through market purchases and energy and/or capacity contracts. Firm transmission service is required to ensure the energy can be delivered to Manitoba on a firm basis.

Under seasonal diversity agreements, the supplier not only agrees to provide winter capacity but also agrees to provide winter energy and may provide summer energy if it is available during off-peak periods. If an energy agreement is not associated with capacity, energy is not guaranteed for any particular hour because it may be required to serve the supplier's firm load obligations. To the extent that the supplier has surplus energy, the agreement makes the energy available to the other party. Manitoba Hydro has a 500 MW import agreement with

Northern States Power which provides access to energy from the MISO market throughout the year on firm transmission service.

Although Manitoba Hydro has access to large quantities of energy under contract, there are limitations to the amount of imports that can be relied upon for planning purposes. As described in more detail in ***Appendix 4.1 – Manitoba Hydro Generation Planning Criteria***, Manitoba Hydro's long-term firm import limit on the existing transmission lines from the U.S. is 700 MW. This import limit will not change until new transmission interconnections are built or existing transmission interconnections are upgraded. Manitoba Hydro's Preferred Development Plan includes a new interconnection with additional import capability of 750 MW.

Generation from the MISO market, on average across all generation types, results in significant amounts of CO_2 and other hazardous air emissions on a per unit (MWh) basis. As explained in ***Chapter 3 – Trends and Factors Influencing North American Electricity Supply***, the MISO region is coal-dominated, generating 75% of its electrical energy from coal in 2011, while natural gas-fired and oil generation represents 5%, wind generation 5%, and nuclear generation 13%. The share of energy generated using coal in the U.S. is on the decline. Coal-fired generation last provided a 50% share across the U.S. in 2005 and is expected to be 40% in 2013 according to the U.S. Department of Energy's Energy Information Administration (DOE EIA). In the absence of additional stringent coal regulations or very high carbon prices, the EIA is still projecting coal to generate a significant proportion of electricity within U.S. and particularly in the Midwest through 2030.

As discussed in ***Chapter 5 – The Manitoba Hydro System, Interconnections and Export Markets***, Manitoba Hydro's imports (and exports) have implications on the dispatch of resources in the MISO region. Based on MISO Independent Market Monitor's 2011 annual report, coal was on the margin 93% of all hours in the year. Natural gas was the only other

significant marginal fuel, on the margin 23% of the time. (Due to transmission constraints it is possible for more than one fuel to be on the margin in any particular hour).

Coal generation GHG emissions are typically on the order of 0.9 to 1.1 tonnes CO_2 /MWh while natural gas can range from about 0.3 to 0.8 tonnes CO_2/MWh depending on the specific technology and its efficiency. Manitoba Hydro currently assumes that its exports displace and its imports result in 0.75 tonnes CO_2/MWh.

This reflects a marginal generation mix of various fossil-fuels and technologies. Given that the current marginal generation remains primarily coal (at an emission rate of about 1 tonne CO_2/MWh) the 0.75 tonnes CO_2/MWh factor used by Manitoba Hydro is considered to underestimate both the emissions displaced by exports and the emissions caused by imports. Since Manitoba Hydro is typically a large net exporter, this assumption is considered conservative in that it underestimates the emission displacement benefit. While Manitoba Hydro does not forecast the annual marginal export displacements, it expects that as coal units retire and more natural gas generation is built, the marginal emission factor should decrease over time.

Manitoba Hydro does not have firm import transmission with either Ontario or Saskatchewan and, as such, does not plan on firm imports from these markets to address the resource diversity issue discussed above.

As mentioned previously, for planning purposes, imports have to date represented in the order of 10% of Manitoba Hydro's total supply under low flow or dependable flow conditions. The approximate proportion of imports associated with Manitoba Hydro's Preferred Development Plan is expected to remain generally the same.

Since Manitoba Hydro generally has surplus energy available and cannot predict when it may need to purchase energy, Manitoba Hydro does not contract for fixed blocks of fixed-price electricity imports. Rather, the arrangements made with suppliers provide Manitoba Hydro with the assurance that the energy will be there when needed but also with the flexibility to buy it when most economical, utilizing the storage capability of the hydraulic system to reshape the supply to serve load requirements. When Manitoba Hydro enters a drought period, in which purchased power and a fixed price and delivery schedule are desired, those arrangements can be made at that time.

7.3 Summary of Selected Resource Options

Table 7.6 presents an overview of the key technical, environmental, socio-economic/provincial and economic characteristics of the resource options selected in Section 7.2. These resource options are incorporated into the development plans which are presented in ***Chapter 8 – Determination and Description of Development Plans***.

Table 7.6 SELECTED RESOURCE OPTIONS CHARACTERISTICS

Resource			DSM	Keeyask	Conawapa	Wind	GE 7FA Heavy Duty CCGT	GE 7FA Heavy Duty SCGT	GE LM 6000PH Aeroderivative SCGT	Imports
Technical		Fuel Type	-	Water	Water	Air	Natural Gas	Natural Gas	Natural Gas	Predominantly Thermal

8 Determination and Description of Development Plans

8.0 Chapter Overview

This chapter explains the strategies and components of the various development plans that Manitoba Hydro has chosen to evaluate in this submission.

Development plans are formulated using the resource options selected in ***Chapter 7 – Screening of Manitoba Resource Options*** and consider economic, financial, environmental, and socio-economic/provincial characteristics. All development plans must be able to meet Manitoba Hydro's expected domestic load and existing firm export commitments which are described in ***Chapter 4 – The Need for New Resources***. Further to this requirement, plans are determined in consideration of various strategic business opportunities and, in subsequent chapters, are comparatively evaluated to identify the optimal plan for Manitobans. For example, the development plans with a new transmission interconnection incorporate opportunities to serve export market customers and increase U.S. transmission interconnection capability. Alternatively, a development plan that provides the opportunity to minimize capital investment uses natural gas-based generation resources sufficient to meet only Manitoba Hydro's expected domestic load and existing firm export commitments.

The Preferred Development Plan together with the alternative development plans defined in this chapter provide the basis for all further evaluation in this submission.

8.1 Introduction

The Manitoba Hydro Act and *The Sustainable Development Act* provide the context for the formulation of Manitoba Hydro's development plans. *The Manitoba Hydro Act* Section 2 mandates that Manitoba Hydro "provide for the continuance of a supply of power adequate for

the needs of the province, and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power". *The Sustainable Development Act* Schedule A section 1(1) sets out the framework for sustainable development which includes the principle that "economic decisions should adequately reflect environmental, human health and social effects".

The direction provided in these Acts is reflected in the determination of development plans and their analysis through the consideration of economic, financial, environmental, and socio-economic impacts as well as through multiple-account benefit-cost analysis.

As described in ***Chapter 4 – The Need for New Resources***, the 2012 Load Forecast indicates that new resources are required in the year 2022/23 to ensure Manitoba electricity users continue to have adequate power for their future needs. The formulation of each development plan is based on this need for new resources and the requirement to achieve a reliable and dependable supply for the bulk power system in Manitoba through the application of Manitoba Hydro's Generation Planning Criteria. All development plans meet or exceed these criteria.

The plans must also provide sufficient dependable energy and winter peak capacity to meet the projected requirements for the entire 35-year study period. Further to this requirement, Manitoba Hydro formulates development plans that will incorporate opportunities such as building new transmission interconnections, pursuing other renewable resources or pursuing export sales for the overall benefit of Manitoba.

8.2 Formulation of Development Plans

Chapter 7 – Screening of Manitoba Resource Options identified the following resource options to be used in the determination of development plans:

- demand-side management programs
- Keeyask Generating Station (G.S.)
- Conawapa Generating Station (G.S.)
- on-shore wind generation
- natural gas-fired generation
- imports.

For a description of the characteristics of the selected resource options see ***Chapter 7 – Screening of Manitoba Resource Options***.

Development plans are comprised of a sufficient number and size of resources to meet requirements or address opportunities over a 35-year planning horizon. A long-term perspective is required due to the long lead time and the long life of the resource options under consideration.

8.2.1 Resource Option Descriptions

The differing characteristics of resource options are taken into consideration when formulating development plans. Based on 2012 planning assumptions, the following resource options have been considered.

Keeyask Generating Station

The earliest in-service date (ISD) by which Keeyask G.S. can be developed is 2019/20. Keeyask is therefore an option to meet the persistent deficits in energy supply which begin in 2022/23

based on the 2012 Load Forecast. Plans that include Keeyask G.S. as the first resource in 2022/23 will satisfy Manitoba's energy and capacity needs until 2029/30, at which time another resource is required.

Also under consideration is the opportunity to advance Keeyask G.S. to 2019/20 to serve a 250 MW (megawatt) sale to Minnesota Power (MP) starting in 2020, which would facilitate the construction of a new transmission interconnection to the U.S., as described in ***Chapter 6 – The Window of Opportunity***.

Conawapa Generating Station

The earliest ISD by which Conawapa G.S. can be developed—if it is developed together with Keeyask G.S. is assumed to be 2025/26 in these analyses. If Keeyask G.S. does *not* precede Conawapa G.S. then an additional year will be required to finalize the Conawapa aboriginal community arrangement, resulting in 2026/27 as the earliest ISD for Conawapa G.S. In the latter case, in order to meet Manitoba domestic load and firm export commitments starting in 2022/23, other supply options would be needed in advance of Conawapa G.S. Wind and natural gas-fired turbines are the other resource options being considered for this purpose.

Also under consideration is the opportunity to advance Keeyask G.S. to 2019/20 and Conawapa G.S. to 2025/26 to serve sales to both MP and Wisconsin Public Service (WPS) totaling 550 MW. A new transmission interconnection with a transfer capability of 750 MW to the U.S. would be facilitated by such sales, as described in ***Chapter 6 – The Window of Opportunity***.

Keeyask and Conawapa Generating Stations – Manitoba Transmission

For those plans in which Keeyask G.S. and Conawapa G.S. are both constructed, it is expected that transmission improvements will be required in the Manitoba Hydro system, once the final few units of the second plant comes into service, to be able to transmit all the firm power to

southern Manitoba (see North-South Transmission System Upgrade project description in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***). As the additional north-south transmission would not be required for over 10 years, the final determination of the design will be made nearer to that time.

Wind Resources

Wind generation is available as a long-term resource option and is considered for inclusion in development plans on that basis. Wind generation is also considered as a short lead time resource option (approximate three year lead time) in the event that, from an energy perspective, the load grows at a higher rate than forecasted.

In its long-term resource planning evaluations, Manitoba Hydro considers a development plan that combines wind generation with natural gas-fired generation; such a combination provides the firm winter peak capacity component that wind generation alone does not provide. Manitoba Hydro also includes wind generation as a resource option in the circumstance where there would be significant delays or deferral of large hydro or if large hydro cannot be built due to environmental or regulatory restrictions and when the supply requirement is for dependable energy and not for capacity. For purposes of the Needs For and Alternatives To (NFAT) evaluations, additional new wind generation is assumed to be owned by Manitoba Hydro.

Natural Gas-Fired Resources

Natural gas-fired generation can serve a variety of functions in development plans, including as:

- a low-capital cost resource option
- a bridging resource option to meet load requirements prior to construction of new large hydro-electric generation

- a capacity support resource option for wind generation
- a short lead-time resource option.

8.2.2 New U.S. Interconnection

In addition to resource options, a major consideration in the formulation of development plans is the opportunity to develop a new transmission interconnection to the U.S.[1]

As identified in ***Chapter 5 – The Manitoba Hydro System, Interconnections and Export Markets***, a new U.S. interconnection would support Manitoba Hydro's mandate to provide a reliable and dependable supply of electricity and would increase import capability during times of drought, peak demand and emergency situations. As well, additional export capability expands Manitoba Hydro's market access and provides an outlet for surplus power from the Manitoba Hydro system.

Pursuant to the executed power agreement with MP for 250 MW of system power, a new transmission interconnection with a minimum export capability of 250 MW is required as well as an import capability of up to 250 MW (50 MW import capability has been assumed for NFAT analysis purposes). In addition, Manitoba Hydro and WPS have a signed term sheet that provides for a sale by Manitoba Hydro of up to 500 MW of system power of which 400 MW would require the construction of a new transmission interconnection. An interconnection with a transfer capability of more than 250 MW would be required to accommodate both a 250 MW sale to MP and a sale greater than 100 MW to WPS.

[1] It should be noted that the transmission lines can be described by voltage size (kV) or by transfer capability (MW). As the focus of this chapter is the usage of interconnections, transfer capability in MWs will be used as the reference, i.e. 250 MW and 50 MW, associated with a 230 kV line, and 750 MW, associated with a 500 kV line.

For the purposes of NFAT analysis, it is assumed that a new interconnection to the U.S. can be in-service for 2020/21. Two interconnection projects are considered in the analysis: a larger interconnection with 750 MW of import and export capability, and a smaller interconnection with 50 MW of import and 250 MW of export capability. Irrespective of its size, a new interconnection will consist of two parts: a portion constructed in Manitoba and a portion constructed in the U.S.

Manitoba Hydro is responsible for the cost and all phases of development of the interconnection facilities in Manitoba; U.S. counterparties are responsible for all phases of development of the U.S. portion of the interconnection projects. For development plans that include a new 750 MW interconnection, the cost of the interconnection facilities in the U.S. is assumed to be shared to varying degrees by U.S. counterparties and Manitoba Hydro. In order to avoid becoming a majority owner in a U.S. transmission line, Manitoba Hydro will only enter into an arrangement where it will not own more than 49% of the interconnection facilities in the U.S. In return for investing in the U.S. portion of the transmission interconnection, Manitoba Hydro will benefit by having the right to use and/or sell its proportionate share of the U.S. transmission service associated with the new interconnection.

8.2.3 Description of Development Plans

Fifteen development plans have been identified and described in this section and are based on three main groupings:

- plans with a U.S. interconnection with 750 MW of import and export capability – five plans
- plans with a U.S. interconnection with 250 MW of export capability and 50 MW of import capability – three plans
- plans that meet Manitoba Hydro's domestic load and existing firm export commitments starting in 2022/23 with no new U.S. interconnection – seven plans.

The specifics of the development plans identified in the next section have been incorporated into the supply-demand tables which can be found in ***Appendix 4.2 – Manitoba Hydro Supply and Demand Tables***. The cost assumptions used in NFAT analysis can be found in ***Appendix 9.3 – Economic Evaluation Documentation, Appendix 11.1 – Net Capital Expenditures*** and in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities.*** Table 8.1, found at the end of this chapter, provides a listing of new resources by development plan and ISD. Table 8.2, also found at the end of this chapter, identifies the sales agreements associated with each of the development plans. Table 9.3, found in ***Chapter 9 – Economic Evaluation – Reference Scenario***, provides a summary of the 15 development plans, described in this section, listed in order of lowest incremental capital investment.

8.2.3.1 Plans with a U.S. Interconnection with 750MW of Import and Export Capability – Five Plans

There are five development plans identified which include a U.S. interconnection with 750 MW of import and export capability. They are described as follows:

Preferred Development Plan

K19/C25/750MW (WPS Sale & Inv[2]) – Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation Starting in 2041/42, 750 MW Import/Export Interconnection 2020/21

This development plan consists of the Keeyask G.S. with an ISD of 2019/20, the Conawapa G.S. with an ISD of 2025/26, and a transmission interconnection to the U.S. with import and export capability of 750 MW with an ISD of 2020/21. Both the 250 MW MP sale and the 300 MW WPS sale described in ***Appendix 6.1 - Summary of Terms and Conditions of Export Contracts*** are evaluated as part of this plan. The 250 MW MP sale will require 250 MW of new transmission service and the 300 MW WPS sale will require 200 MW of new transmission service. To meet these commitments, Manitoba Hydro must build new hydro-electric generation which, in this plan, consists of the Keeyask G.S. and Conawapa G.S. developed by their earliest ISDs. Other firm export sale commitments that would be served by this plan include the 108 MW and subsequent 100 MW WPS sales and the 125 MW Northern States Power (NSP) sale; this development plan is also one of two plans that could serve the 300 MW WPS sale.

According to this plan, it is assumed that Manitoba Hydro will be responsible for 40% of the capital cost and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities. In addition, Manitoba Hydro will be responsible for the entire cost of the Manitoba portion of the new interconnection. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are summarized in Table 8.2.

[2] Inv refers to WPS investment in the U.S. portion of the 750 MW interconnection facilities.

K19/C25/750MW – Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation Starting in 2041/42, 750 MW Import/Export Interconnection 2020/21

This development plan consists of the same resources as those evaluated in the Preferred Development Plan described above, includes the 250 MW MP sale, but does *not* include the potential WPS sale agreements of up to 300 MW as described in ***Chapter 6 – The Window of Opportunity*** Section 6.5.2. The signed 100 MW WPS sale is included as it is contingent on the Keeyask G.S. and would be served using existing transmission service.

Since the potential agreements with WPS continue to be under discussion, this development plan allows for comparison to the Preferred Development Plan should the potential sale to WPS not materialize and should WPS not invest in the U.S. portion of the 750 MW interconnection facilities.

For the purposes of NFAT evaluation, while Manitoba Hydro will not enter into an arrangement in which it owns more than 49% of the proposed U.S. interconnection, a conservative assumption has been used whereby Manitoba Hydro will be responsible for approximately two-thirds of the capital and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities. In addition, Manitoba Hydro will be responsible for the entire cost of the Manitoba portion of the new interconnection. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are summarized in Table 8.2.

K19/Gas25/750MW (WPS Sale & Inv[3]) – Keeyask 2019/20, Natural Gas-Fired Generation starting in 2025/26, 750 MW Import/Export Interconnection 2020/21

Manitoba Hydro has identified an alternative plan which allows for the comparison of the option of building natural gas-fired generation as an alternative to building Conawapa G.S. in 2025/26. This plan consists of the construction of Keeyask with an ISD of 2019/20, the addition of natural gas-fired generation starting in 2025/26, and a 750 MW U.S. interconnection with an ISD of 2020/21. For the export sales requiring new hydro generation, power from the Keeyask G.S. has been determined to be sufficient to meet the MP and WPS contract requirements. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are summarized in Table 8.2.

K19/C31/750MW – Keeyask 2019/20, Imports, Conawapa 2031/32, Natural Gas-Fired Generation Starting in 2041/42, 750 MW Import/Export Interconnection 2020/21

This development plan enables the construction of a new U.S. interconnection with 750 MW of import and export capability and is facilitated by the 250 MW MP sale; to meet the commitments of this sale, Manitoba Hydro must build the Keeyask G.S. This plan specifically does not include the commitments associated with the 300 MW WPS sale. The plan accommodates, in this case, a six-year deferral of the Conawapa G.S. The additional import capability provided by the new interconnection can be used to meet Manitoba domestic load and firm export commitments until 2031/32. Under the plan, Conawapa G.S. is assumed to be placed in-service in 2031/32 to meet load and firm export commitments; and the new interconnection would provide an outlet for surplus power. Other firm export sale commitments that would be served by this plan include the 100 MW WPS sale and the 125 MW NSP sale.

[3] Inv refers to WPS investment in the U.S. portion of the 750 MW interconnection facilities.

For the purposes of NFAT analysis, while Manitoba Hydro will not enter into an arrangement in which it owns more than 49% of the proposed U.S. interconnection, a conservative assumption has been used where Manitoba Hydro will be responsible for approximately two-thirds of the capital and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities. In addition, Manitoba Hydro will be responsible for the entire cost of the Manitoba portion of the new interconnection. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements summarized in Table 8.2.

K19/Gas31/750MW – Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2031/32, 750 MW Import/Export Interconnection 2020/21

This development plan is the same as K19/C31/750 MW, described directly above, with the exception of natural gas-fired generation starting in 2031/32 as an alternative to building Conawapa G.S. for that date. This plan specifically does not include the commitments associated with the 300 MW WPS sale. This plan allows for the comparison of the option of building natural gas-fired generation as an alternative to building Conawapa G.S. starting in 2031/32. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are summarized in Table 8.2.

8.2.3.2 Plans with a U.S Interconnection with 250MW of Export Capability and 50 MW of Import Capability – Three Plans

There are three development plans identified which include a U.S. interconnection with 50 MW of import and 250 MW of export capability. Manitoba Hydro will be responsible for the capital and on-going operating costs associated with the Canadian portion of the 250 MW interconnection facilities. U.S. counterparties are responsible for all capital and operating costs for the U.S. portion of the interconnection. The development plans are described as follows:

K19/C25/250MW – Keeyask 2019/20, Conawapa in 2025/26, Natural Gas-Fired Generation Starting in 2040/41, 250 MW Export/50 MW Import Interconnection 2020/21

This plan enables the construction of a new U.S. interconnection with 250 MW of export and 50 MW of import capability and is facilitated by the 250 MW MP sale. To meet the commitments of this sale, Manitoba Hydro must build the Keeyask G.S. As the earliest ISD for the Conawapa G.S. is assumed to be 2025/26, a one-year on-peak import contract is included for planning purposes in 2024/25 to meet domestic load and firm export commitments and Manitoba Hydro Generation Planning Criteria. This import contract would not be required in plans where a 750 MW interconnection is assumed as the import capability of the larger line provides significantly more off-peak import capability. Other firm export sale commitments that would be served by this plan include the 100 MW WPS sale and the 125 MW NSP sale. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are outlined in Table 8.2.

K19/Gas24/250MW – Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, 250 MW Export/50 MW Import Interconnection 2020/21

This plan enables the construction of a new U.S. interconnection with 250 MW of export and 50 MW of import capability and is facilitated by the 250 MW MP sale. To meet the commitments of this sale, Manitoba Hydro must build the Keeyask G.S. This plan allows for the comparison of the option of building natural gas-fired generation starting as an alternative to building Conawapa G.S. Natural gas-fired generation is required starting in 2024/25 to meet Manitoba domestic load and firm export commitments which include the 100 MW WPS sale and the 125 MW NSP sale. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are outlined in Table 8.2.

K19/C31/250MW – Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2024/25, Conawapa 2031/32, 250 MW Export/50 MW Import Interconnection 2020/21

This plan allows for the comparison of a transmission interconnection with 750 MW of export and import capability compared to a transmission interconnection with 250 MW of export and 50 MW of import capability. This development plan is facilitated by the 250 MW MP sale; to meet the commitments of this sale, Manitoba Hydro must build the Keeyask G.S. The plan accommodates a six-year deferral of the Conawapa G.S. which is placed in-service in 2031/32 to meet load and firm export commitments. Without the significant additional import capability provided by the 750 MW interconnection, 490 MW of natural gas-fired generation is used to meet domestic load and firm export commitments to accommodate the six-year deferral of the Conawapa G.S. Other firm export sale commitments that would be served by this plan include the 100 MW WPS sale and the 125 MW NSP sale.

8.2.3.3 Plans that Meet Manitoba Hydro's Domestic Load and Firm Export Commitments Starting in 2022/23 with No New U.S. Interconnection – Seven Plans

This section describes development plans with new resource additions starting in 2022/23 in order to meet Manitoba domestic load and firm export commitments. No opportunities for new U.S. transmission interconnections or for new long-term export sales are contemplated in these alternative development plans. The development plans in this section that include Keeyask G.S. in 2022/23 will provide sufficient surplus energy to serve the 100 MW WPS sale. The generation resources for this plan are illustrated in Figure 8.1 and the sale agreements are summarized in Table 8.2.

All Gas – Natural Gas-Fired Generation Starting in 2022/23

This development plan represents the lowest-capital cost alternative available to Manitoba Hydro. In this plan simple-cycle gas turbines (SCGTs) are installed as peaking resources until

demand for energy and capacity is sufficient to justify a more efficient but higher-capital cost combined-cycle gas turbine (CCGT).

Wind/Gas - Wind Generation Starting in 2022/23 Supported by Natural Gas-Fired Generation Starting in 2025/26

This development plan represents an alternative in which wind is the primary resource supported by natural gas-fired generation. Wind generation is not assigned a winter peak capacity value due to its intermittent nature and physical limitations; as such, it can only be relied upon as an energy resource. Therefore, in this development plan wind generation is developed to provide energy and SCGTs are used mainly as a capacity resource. For purposes of the NFAT analysis, additional new wind generation is assumed to be owned by Manitoba Hydro.

K22/Gas – Keeyask 2022/23, Natural Gas-Fired Generation Starting in 2029/30

In order to meet Manitoba domestic load and firm export commitments, this development plan assumes Keeyask G.S. is constructed in 2022/23 followed by a combination of combined-cycle and simple-cycle natural gas-fired units starting in 2029/30. SCGTs would be installed as peaking resources until demand for energy and capacity is sufficient to justify a more efficient but higher-capital cost CCGT.

K22/C29 – Keeyask 2022/23, Conawapa 2029/30, Natural Gas-Fired Generation Starting in 2040/41

This development plan considers building both Keeyask G.S. and Conawapa G.S. to meet Manitoba load and firm export commitments without a new U.S. interconnection. Natural gas-fired generation is included as a low-capital cost resource to meet energy and capacity needs starting in 2040/41. This development plan provides a basis to assess the value of a U.S. interconnection when both Keeyask G.S. and Conawapa G.S. are constructed; the plan also

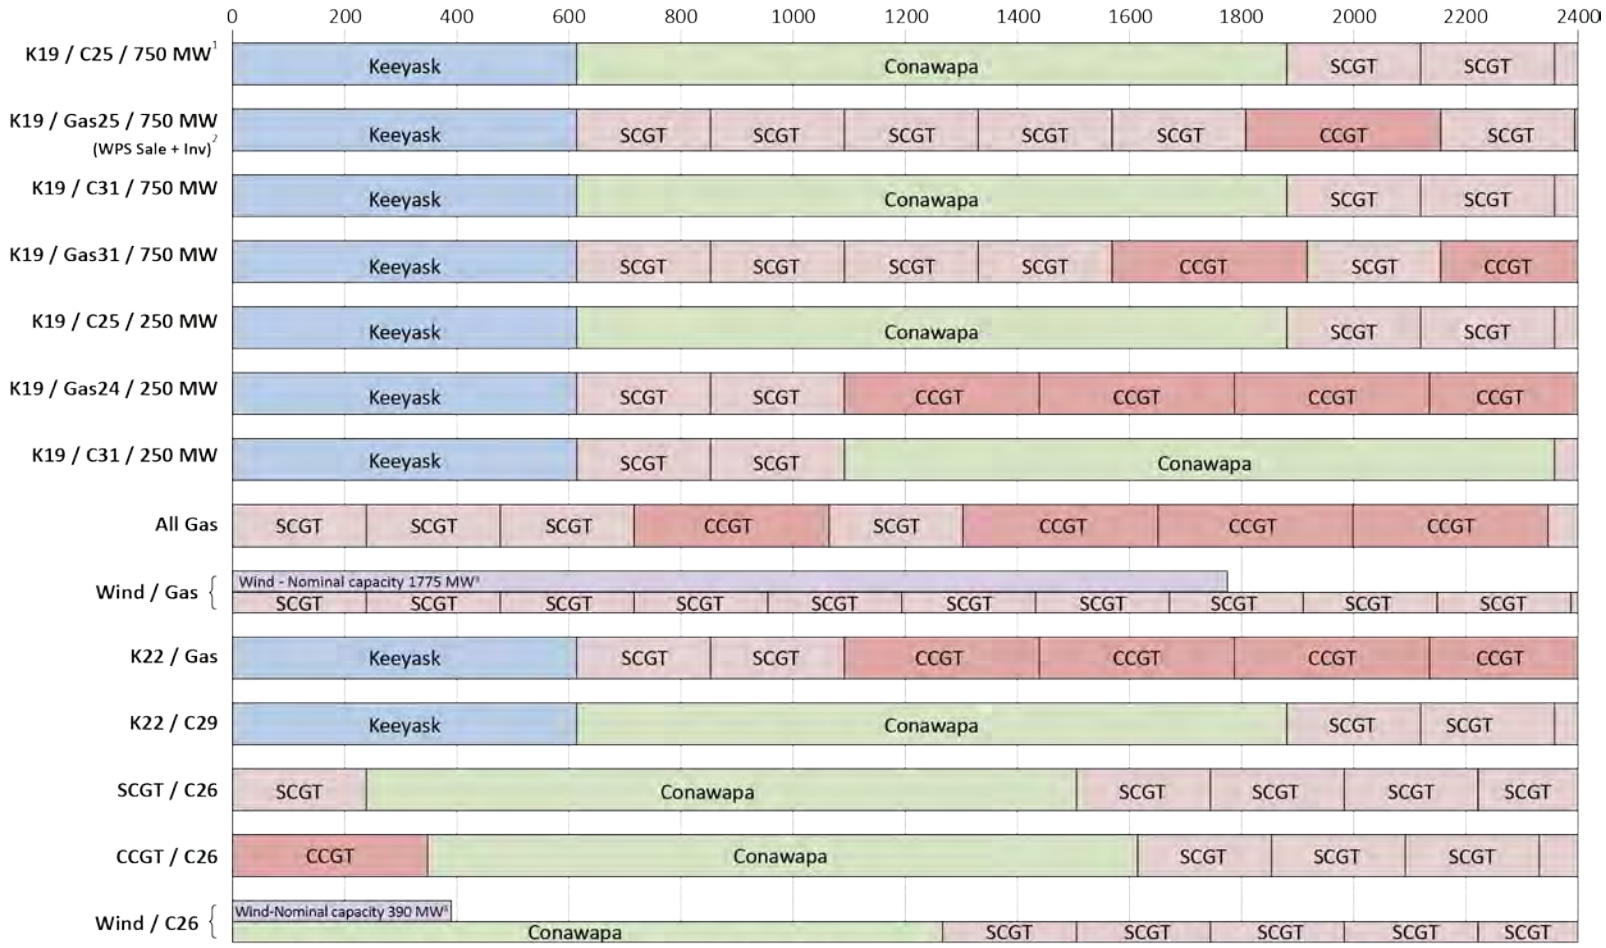
allows for the comparison of the option of building Conawapa G.S. in 2029/30 as an alternative to building natural gas-fired generation at that time.

SCGT/C26 – Simple Cycle Gas Turbines in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation Starting in 2038/39

This development plan assumes SCGTs are developed starting in 2022/23 followed by Conawapa G.S. in 2026/27, the earliest ISD for Conawapa G.S. when it is not preceded by Keeyask G.S. In this development plan, an SCGT represents the lowest-capital cost resource option prior to the 2026/27 ISD of Conawapa G.S. Subsequent to Conawapa G.S., SCGTs are included as a low-capital cost resource to meet energy and capacity needs with a starting date of 2038/39.

CCGT/C26 – Combined Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation Starting in 2039/40

This development plan is similar to SCGT/C26, as described directly above, except that it assumes a CCGT is developed starting in 2022/23 followed by Conawapa G.S. in 2026/27. This plan allows for the comparison of the option of building a CCGT as an alternative to building a SCGT in 2022/23 prior to the 2026/27 ISD of Conawapa G.S. Subsequent to Conawapa G.S., SCGTs are included as a low-capital cost resource to meet energy and capacity needs with a starting date of 2039/40.



Wind/C26 – Wind in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation Starting in 2036/37

This development plan is similar to SCGT/C26 and CCGT/C26, as described directly above, except it assumes wind generation is developed starting in 2022/23 followed by Conawapa G.S. in 2026/27. This plan allows for the comparison of the option of building wind generation as an

alternative to building a natural gas-fired generation in 2022/23 prior to the 2026/27 ISD of Conawapa G.S. Subsequent to Conawapa G.S., SCGTs are included as a low-capital cost resource to meet energy and capacity needs with a starting date of 2036/37. For purposes of the NFAT evaluation additional new wind generation is assumed to be owned by Manitoba Hydro.

Figure 8.1 provides an illustration of the quantity of winter peak capacity for each development plan.

Figure 8.1 WINTER PEAK CAPACITY BY RESOURCE TYPE FOR EACH DEVELOPMENT PLAN FOR THE 35 YEAR PLANNING CYCLE

[1] K19 / C25 / 750 MW represents capacity resources for two plans; one with the proposed 300 MW WPS sale and investment and one without.
[2] Inv refers to WPS investment in the U.S. portion of the 750 MW interconnection facilities.
[3] Wind shown as nominal capacity since wind generation does not provide winter peak capacity.

Table 8.1 LISTING OF NEW RESOURCES BY DEVELOPMENT PLAN AND IN-SERVICE DATE

Development Plan	New Resources and Dates				New US Interconnection Capability
	Hydro	SCGT	CCGT	Wind	
K19/C25/750MW **WPS Sale & Inv**[4]	2019 - Keeyask 2025 - Conawapa	2041 - 1 x 7FA 2044 - 1 x 7FA 2046 - 1 x 7FA	None	None	750 MW import/ 750 MW export

9 Economic Evaluations – Reference Scenario

9.0 Overview

This chapter presents an evaluation of the economics of the 15 development plans described in ***Chapter 8 – Determination and Description of Development Plans*** based on inputs and assumptions associated with the reference scenario. The 15 plans are reduced to 12 plans which will be further tested through probabilistic analysis as described in ***Chapter 10 – Economic Uncertainty Analysis - Probabilistic Analysis and Sensitivities***.

The reference scenario represents the "most likely" outcomes for the factors affecting Manitoba Hydro's future. For the purpose of the main analysis in the NFAT submission, assumptions and forecasts for the reference scenario were based on 2012 resource planning assumptions with the exception of adjustments, primarily downwards, to the electricity export prices, as described in ***Appendix 9.3 – Economic Evaluation Documentation***. Economic comparisons are presented using the measure of incremental net present value (NPV). Section 9.3.2 provides the incremental NPVs to Manitoba Hydro for the reference scenario. Section 9.3.3 provides the incremental NPVs for the reference scenario including the incremental NPVs of the potential cash transfers to the Province for water rentals, capital taxes and provincial guarantee fee.

Appendix 9.1 – High Level Development Plan Comparison Table provides a summary of the key technical, socio-economic/provincial, environmental and economic characteristics and provides an indicative measure of the impact of each on the 15 development plans.

9.1 Methodology for Economic Evaluation

Economic evaluation is integral to resource decisions. Economic comparisons of alternatives are used to assist in making decisions regarding which resources to pursue and when. When evaluating and choosing among alternative development plans, the

appropriate measure is the incremental costs and benefits associated with one plan relative to another. This means that costs and benefits that are common to all development plans are not included in the analysis as these values are the same in each development plan. Likewise, sunk costs are not included in the economic evaluations as these represent money already spent or commitments that cannot be changed relative to the decision point when choosing among plans. While these costs could be included in the evaluations for all the development plans, the comparison of plans would yield the same result as not including the sunk costs in the evaluations. For the purpose of this submission, as appropriate for each development plan, all costs (incurred or estimated) prior to June 2014 will be considered as sunk and having been made to protect in-service dates for Keeyask and Conawapa generating stations as well as the option of a new U.S. interconnection and new export sale agreements. June 2014 was chosen because, according to the Needs For and Alternative To (NFAT) schedule, the NFAT panel report will have been made public and the Government of Manitoba will have made decisions on the development plans.

The economic evaluations present the incremental economic impact for a specific development plan relative to another development plan from the overall project perspective, without accounting for any aboriginal income-sharing. In effect, these evaluations are from the perspective of Manitoba Hydro with the income-sharing considered to be a relatively small proportion of the benefits Manitoba Hydro provides directly to Manitobans. Aboriginal income-sharing for Keeyask and Conawapa generating stations is accounted for in the financial analysis.

From an economic analysis perspective, a “do nothing” option is typically the basis for comparing alternatives. As shown in ***Chapter 4 – The Need for New Resources***, the need for new resources is being driven by persistent dependable energy deficits which begin in the year 2022/23. These persistent deficits mean that Manitoba Hydro is required to

make an investment in order to continue to provide a dependable and reliable supply of power for the needs of the province, and therefore Manitoba Hydro does not have a "do nothing" option. In the case of Manitoba Hydro's analysis, the closest representation of a "do nothing" option is the least-capital cost investment alternative.

9.1.1 Net Present Value

Manitoba Hydro uses standard economic analysis for project evaluation, known as NPV. NPV is calculated by discounting the annual costs and annual revenues to a common point in time and allows for alternatives with different streams of costs and revenues occurring at different times to be compared on an equivalent basis at a single point in time.

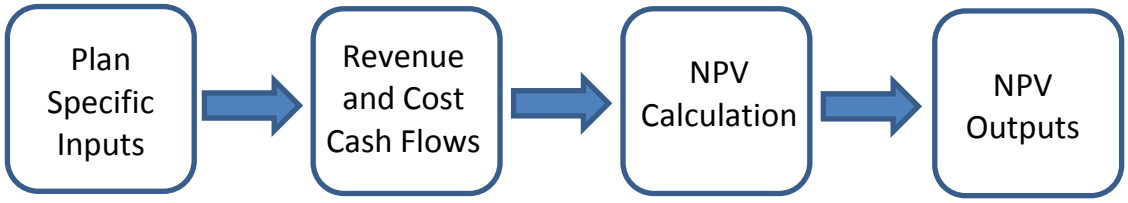
The present value of the costs is the amount of money that would need to be invested today, at a stated discount rate, to pay for all of the costs of the project over its life. The present value of the revenues is the amount of money that would need to be invested today, at a stated discount rate, to provide the annual revenue of the project over its life. The NPV is the difference between the present value of the revenue and the present value of the cost. It is the amount of money, if invested today at a stated discount rate, that would grow to an amount sufficient to finance and to provide a return on the investment over the life of the project. When comparing alternatives, the incremental NPV represents the incremental net benefits (or net costs) associated with the increment of investment made for a higher cost investment option, e.g. the additional investment for the higher-cost option becomes the investment in the NPV calculation, the additional benefits (revenue) from the higher-cost option becomes the revenue in the NPV calculation. The higher-cost option is in fact economically preferable if it provides a positive incremental NPV.

The standard economic analysis approach is based on real dollars (constant dollars). For consistency, the discount rate applied to a real dollar cash flow excludes inflationary effects and is referred to as a real discount rate.

Another metric used in investment analysis is the internal rate of return (IRR)[1] which is the expected rate of return on a capital investment. IRR is more common when analyzing venture capital and private equity investment opportunities—IRR is not typically used to compare alternatives in a particular investment context such as selecting between technology options, but rather to compare/rank investments in a financial portfolio.

Traditionally, the incremental IRR associated with the difference in investment costs between alternatives has been determined based on the difference in the expected revenue and cost streams. Although the costs of alternatives may be similar, the composition and associated risks can be quite different. With a small difference in capital cost between alternatives, the resulting incremental IRR can be large or small, but does not reflect the relative risk associated with each of the alternatives. Conversely, with a large difference in capital cost, the incremental IRR can be small yet the total value may be significant. The use of NPV is a more informative measure in that it shows the net value of the incremental investment and allows the associated risk or opportunity to be evaluated separately using extensive sensitivities or probabilistic analysis.

9.2 Manitoba Hydro's Economic Evaluation Process



Manitoba Hydro's approach to economic evaluation is consistent with standard economic analysis methodology. Manitoba Hydro's use of development plan (portfolio) comparisons and the use of discounted cash-flow analysis to compare cash flows of two development plans (or sequences) has been reviewed and concurred with in previous

[1] Principles of Corporate Finance by Stewart Myers and Richard Brealey. McGraw Hill, pp 98-108

capital plan reviews (e.g. Report of the Public Utilities Board in respect of Major Capital Projects of Manitoba Hydro, November 1990; Report on Public Hearings Wuskwatim Generation and Transmission Projects, September 2004, Manitoba Clean Environment Commission.) The approach has been used by other major Canadian utilities to evaluate projects and development plans (e.g. Site C Clean Energy Project Environmental Impact Statement Volume 1: Introduction, Project Planning, and Description Section 5: Need for, Purpose of, and Alternatives to the Project , 5.5.3 Portfolio Modeling Framework, page 5-61, BC Hydro, January 2013).

Figure 9.1 shows Manitoba Hydro's process for the calculation of NPVs for all the development plans being evaluated, which is described in the following sections.

Figure 9.1 MANITOBA HYDRO'S PROCESS FOR CALCULATING NPVS

9.2.1 Plan-Specific Inputs

Table 9.1 provides a general summary of plan-specific revenue and cost inputs used for economic evaluation. The specific revenue and cost components will be dependent on the formulation of each development plan.

Table 9.1 ECONOMIC EVALUATION – SUMMARY OF REVENUE AND COST INPUTS

Plan-Specific Inputs	Sources of Input for all Development Plans
Revenue:	
• Contract revenue from proposed electricity export sales	Export sale contracts
• Electricity export revenue from surplus power	Manitoba Hydro's consensus electricity export price forecast as used in the generation system model (SPLASH)
Cost:	
• Capital investment	Manitoba Hydro capital cost estimates for each resource option including associated transmission for each development plan and transmission interconnection as applicable
• Fuel	• Water rental rate from *The Water Power Act* • Consensus natural gas price forecasts from Manitoba Hydro's Energy Price Outlook as used in the generation system model (SPLASH)
• Operating & Maintenance (O&M) including capital maintenance	Manitoba Hydro's O&M estimates for each facility in each development plan including capital maintenance items required over the life of the asset.
• Imports	Manitoba Hydro's consensus electricity export price forecast as used in the generation system model (SPLASH)
• Taxes	• Capital taxes based on *The Corporation Capital Tax Act* • Carbon tax on coal from the *Climate Change and Emissions Reductions Act* • Forecast of future carbon adder for Manitoba-based generation (federal/provincial)

While there are a number of direct sources of input into the economic evaluation, a significant source of input is the information provided from the generation system production-costing model, Simulation Program for Long-term Analysis of System

Hydraulics (SPLASH). The forecast information associated with Manitoba domestic load, demand side management, electricity export prices, natural gas prices, current and future carbon adders, and proposed export power sales is incorporated into the SPLASH model. The SPLASH model outputs include flow-related electricity export revenues and production costs such as fuel and variable O&M. The requirements of the corporation's Generation Planning Criteria are incorporated into the SPLASH model. The SPLASH model is described in more detail in ***Appendix 9.2 – Description of the SPLASH Model***.

9.2.2 Revenue and Cost Cash Flows

The next step in the process is to prepare a single revenue cash-flow stream and a single cost cash-flow stream for each development plan over the life of the study in order to calculate respective NPVs. The revenue and cost cash flows are the sum of all individual revenue and cost cash flows from the detailed inputs.

The total study life used in this analysis is 78-years. For the total study life, Manitoba Hydro combines two approaches – a 35-year detailed evaluation and a long-life asset evaluation which extends from the end of the 35-year study period to the end of the service life of hydro-electric generation assets, as representing the longest-lived assets.

Economic evaluations recognize that the economic lives of assets developed in the different development plans may extend well beyond the 35-year planning period. While natural gas-fired generation resources are estimated to have economic lives of 30-years, hydro-electric resources are estimated to have economic lives of 100-years or longer, with the "weighted average" life of the plants being around 67-years when accounting for the periodic replacement of major equipment. For the 35-year study period, detailed forecast information related to the Manitoba Hydro system, including a representation of electricity export markets for a 35-year period, is used.

Beyond the 35-year study period, replacement capital costs are assumed for assets that reach the end of their economic lives before the end of the long-study period (78-years). In addition, a net production cost approximation is used beyond the 35-year study period (see ***Appendix 9.3 - Economic Evaluation Documentation***) which includes:

- extending fixed operating and maintenance costs throughout the economic life of all assets (including major capital O&M investments for large hydro-electric resources); and
- extending the average net revenues of the last three years in a development plan to capture the expected ongoing incremental revenues between development plans to the end of the study period.

9.2.3 Net Present Value Calculation

After determining the cash-flow streams, the discount rate that will be applied is determined. The starting point for development of a discount rate is a company's overall cost of financing. As a discount rate is used to guide investment decisions based on uncertainty, a risk premium may be identified to arrive at a discount rate which makes the investor indifferent between cash amounts received at different points in time. In the case of Manitoba Hydro, the discount rate consists of the cost of financing, which includes a guarantee fee to the Province, and a return on equity as described in ***Appendix 9.3 - Economic Evaluation Documentation.***

As described in Section 9.1.1, the NPV is then calculated by discounting the annual costs and annual revenues to a common point in time and allows for alternatives with different streams of costs and revenues occurring at different times to be compared on an equivalent basis at a single point in time.

9.2.4 Outputs – Net Present Value

The outputs are the NPV for each development plan. In order to compare one development plan to another, the development plans are arranged in order of lowest to highest capital investment, based on the present value of the capital costs. The difference in NPV of one development plan to another represents the net benefit of the incremental investment between the development plans.

9.3 Economic Results – Reference Scenario

Section 9.3 provides the results of the economic analysis completed on the 15 development plans described in ***Chapter 8 – Determination and Description of Development Plans*** using reference scenario assumptions. The reference scenario represents a future based on the "most likely" outcomes.

9.3.1 Reference Scenario Inputs

Assumptions and forecasts for the reference scenario were based on 2012 resource planning assumptions with the exception of adjustments, primarily downwards, to the electricity export price forecast as described in ***Appendix 9.3 – Economic Evaluation Documentation***. Key assumptions for the reference scenario are provided in Table 9.2.

Table 9.2 KEY ASSUMPTIONS – REFERENCE SCENARIO

Economic Evaluation Inputs	Reference Scenario Assumption (See *Appendix 9.3 - Economic Evaluation Documentation*)	Appendix Reference
Electricity Export Revenue	• Adjusted 2012 electricity export price forecast • Proposed and existing export sale contracts	• Section 1.5.1.3, Appendix 9.3 • Section 1.6, Appendix 9.3
Power Purchases (Import Cost)	• Adjusted 2012 electricity export price forecast • Generation Planning Criteria	• Section 1.5.1.3, Appendix 9.3 • Appendix 4.1
Capital Costs – generation and transmission	• Base estimate in 2014$ • Real escalation applied to hydro and natural gas-fired generation	• Section 3, Appendix 9.3 • Section 2.1.3, Appendix 9.3
Fuel Costs	• Water rental costs • Natural gas fuel costs associated with Manitoba generation	• Section 3, Appendix 9.3 • Section 3, Appendix 9.3

In Table 9.3, the 15 development plans, as described in ***Chapter 8 – Determination and Description of Development Plans***, are listed in order of lowest incremental capital investment (Plan 1 - All Gas) to highest incremental capital investment (Plan 15 - K19/C25/750MW).

Table 9.3 LIST OF FIFTEEN DEVELOPMENT PLANS

Order of Capital Investment (Plan Number)	Development Plan Short Name	Description of Development Plan
1	All Gas	Natural Gas-Fired Generation starting in 2022/23
2	K22/Gas	Keeyask 2022/23, Natural Gas-Fired Generation starting in 2029/30
3	Wind/Gas	Wind Generation starting in 2022/23 supported by Natural Gas-Fired Generation starting in 2025/26
4	K19/Gas24/250MW	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
5	K19/Gas25/750MW (WPS Sale & Inv)[2]	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2025/26, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale, Proposed 300 MW WPS Sale
6	K19/Gas31/750MW	Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2031/32, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale
7	SCGT/C26	Simple Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2038/39
8	CCGT/C26	Combined Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2039/40
9	Wind/C26	Wind in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2036/37
10	K22/C29	Keeyask 2022/23, Conawapa 2029/30, Natural Gas-Fired Generation starting in 2040/41
11	K19/C31/250MW	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, Conawapa 2031/32, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
12	K19/C31/750MW	Keeyask 2019/20, Imports, Conawapa 2031/32, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale
13	K19/C25/250MW	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2040/41, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
14	K19/C25/750MW (WPS Sale & Inv)[2] Preferred Development Plan	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale, Proposed 300 MW WPS Sale
15	K19/C25/750MW	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale

[2] Inv refers to WPS investment in the U.S. portion of the 750 MW interconnection facilities.

9.3.2 Reference Scenario Results – Net Present Value

The results provide the NPV of the incremental investment associated with each development plan. The incremental investment associated with a more costly development plan is economically preferable if it provides a positive incremental NPV.

For the purposes of this evaluation, as appropriate for each development plan, costs will continue to be incurred until at least June, 2014 in order to protect earliest in-service dates for Keeyask and Conawapa generating stations as well as the option of a new U.S. interconnection and new export sale agreements. All incurred or estimated costs to June, 2014 are excluded from the analysis as they are assumed to be sunk.

In order to compare development plans in terms of economics, typically, a "do nothing" option is used as the basis for comparing alternatives. For Manitoba Hydro, the closest representation of a "do nothing" option is the least-capital investment development plan, which is the All Gas development plan.

The order of the development plans is based on the principle that Manitoba Hydro would undertake the lowest-capital cost option available, unless the incremental investment associated with a more costly option provides greater incremental benefits when evaluated at the reference scenario discount rate of 5.05% (see ***Appendix 9.3 – Economic Evaluation Documentation***). Thus, the All Gas development plan, as the plan requiring the lowest capital investment, is compared to development plans of increasingly higher investment. Table 9.4 provides a comparison of two development plans: the All Gas development plan to the development plan with the next lowest capital investment, K22/Gas.

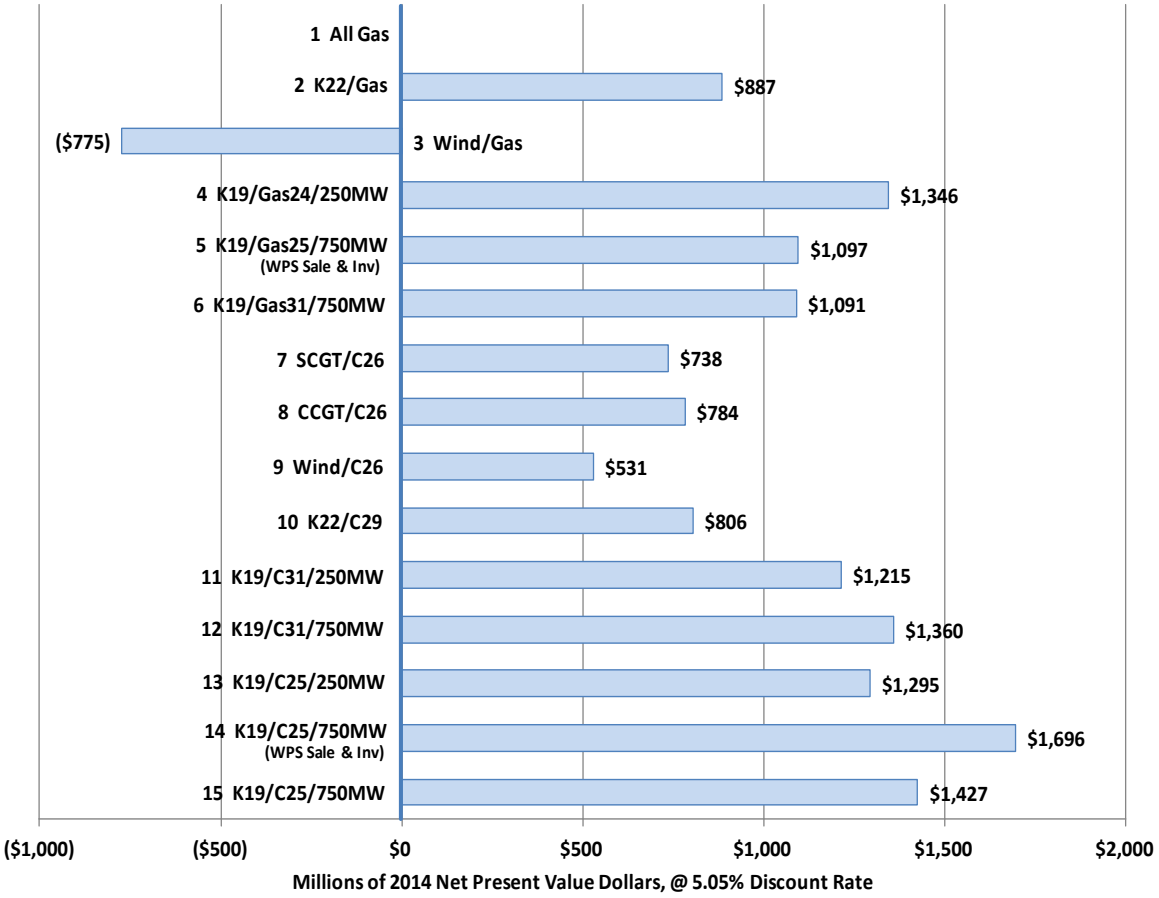

Table 9.4 INCREMENTAL ECONOMICS – ALL GAS COMPARED TO K22/GAS

Development Plan	Incremental NPV millions of 2014 Dollars @ 5.05% Discount Rate
	1 All Gas
1 All Gas	
Lowest Capital Investment Development Plan	-
2 K22/Gas	2 minus 1
	$887

The incremental NPV benefit of $887 million, shown in Table 9.4 as "2 minus 1", represents the net benefit of investing the additional capital required for the K22/Gas development plan when discounted at 5.05%.

Figure 9.2 provides a summary which compares the incremental NPV for each of the 15 development plans based on the incremental investment relative to the investment for the All Gas development plan, from the perspective of Manitoba Hydro (defined here as the economic benefits that Manitoba Hydro can pass on directly to its ratepayers – not including any transfers to the Province of Manitoba). The development plans are shown in order of lowest incremental investment (All Gas) to highest incremental investment (K19/C25/750MW).

Figure 9.2 DEVELOPMENT PLAN NPVS – BENEFITS TO MANITOBA HYDRO (RELATIVE TO ALL GAS PLAN)

The following sections discuss the reference scenario results, in terms of NPV, for:

- Development plans with no new interconnection – seven plans
- Development plans with a 250 MW U.S. interconnection – three plans
- Development plans with a 750 MW U.S. interconnection – five plans
- All development plans with either a U.S. 250 MW or a U.S. 750 MW interconnection.

9.3.2.1 Development Plans with No New U.S. Interconnection – Seven Plans

Table 9.5 provides a comparison of seven development plans that meet Manitoba Hydro's domestic load and firm export commitments starting in 2022/23 with no new U.S. interconnection and no new export contract commitments.

As previously shown in Table 9.4, there is a net benefit of $887 million associated with the incremental investment for the K22/Gas development plan as compared to the All Gas development plan. As shown in Figure 9.2, there is a net benefit between the K22/C29 plan and the All Gas development plan of $806 million. In comparing the K22/Gas development plan to the K22/C29 development plan, the net benefit between the two plans is not large enough to be decisive between the plans on the basis of the NPV.

The purpose of the Wind/Gas development plan is to provide a wind-based development plan which incorporates wind generation to meet energy requirements, combined with the most cost-effective natural gas-fired generation to provide capacity and to support the intermittent nature of the wind resource. When the Wind/Gas development plan is compared to either the All Gas or the K22/Gas development plans in Table 9.5, the NPV is significantly negative. Similarly, when all remaining development plans in Table 9.5 are compared to the Wind/Gas development plan, the incremental NPV is in the order of $1,300 to $1,600 million greater than that of the Wind/Gas development plan. These comparisons show that it would be significantly more beneficial to invest in any one of the other six development plans than in the Wind/Gas development plan.

The three development plans SCGT/C26, CCGT/C26 and Wind/C26 allow for the comparison to determine which of the non-hydro resources, when combined with the Conawapa generating station (G.S.), will be selected for further evaluation. In this comparison, the requirement of the non-hydro resources, including wind in the Wind/C26 development plan, is to fulfill the energy requirement prior to the development of the

Conawapa G.S. The Wind/C26 development plan requires an additional increment of investment, making it the development plan with the second-highest capital investment requirement in Table 9.5. Based on the measure of NPV, the CCGT/C26 development plan yields a marginally higher net benefit than the SCGT/C26 development plan and a substantially higher net benefit than the Wind/C26 development plan. In comparing development plans, the net benefit between SCGT/C26 and CCGT/C26 is small enough to result in indifference between the plans.

Of this group of seven development plans listed in Table 9.5, the K22/Gas plan has one of the highest incremental NPVs when compared to the All Gas plan. As stated earlier in this section, the net benefit of the K22/Gas development plan as compared to the K22/C29 development plan is small enough to result in indifference between the plans. However, the significantly greater investment required for the Conawapa G.S. in the K22/C29 development plan results in it being excluded from further evaluation.

Table 9.5 INCREMENTAL ECONOMICS – NO NEW INTERCONNECTION

Development Plan	Incremental NPV, millions of 2014 Dollars @ 5.05% Discount Rate					
	1 All Gas	2 K22/Gas	3 Wind/Gas	7 SCGT/C26	8 CCGT/C26	9 Wind/C26
1 All Gas						
Lowest Capital Investment Development Plan	-					
2 K22/Gas	2 -1					
	$887					
3 Wind/Gas	3 -1	3 -2				
	($775)	($1,662)				
7 SCGT/C26	7 -1	7 -2	7 -3			
	$738	($149)	$1,513			
8 CCGT/C26	8 -1	8 -2	8 -3	8 -7		
	$784	($103)	$1,559	$46		
9 Wind/C26	9 -1	9 -2	9 -3	9 -7	9 -8	
	$531	($356)	$1,306	($207)	($253)	
10 K22/C29	10 -1	10 -2	10 -3	10 -7	10 -8	10 -9
	$806	($81)	$1,581	$68	$22	$275

Of the seven development plans shown in Table 9.5, three development plans with no new interconnection have been selected for further analysis: All Gas, K22/Gas and

SCGT/C26. For consistency in ongoing corporate analysis, the SCGT/C26 development plan has been selected over the CCGT/C26 development plan. Due to the high level of interest in analyzing a development plan with substantial amounts of wind generation, the Wind/Gas development plan is also being included in the economic probabilistic analysis in ***Chapter 10 – Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities***.

9.3.2.2 Development Plans with a 250 MW U.S. Interconnection – Three Plans

As described in ***Chapter 8 — Determination and Description of Development Plans***, the executed agreement with MP for 250 MW (megawatt) of system power is contingent upon a new transmission interconnection with a minimum export capability of 250 MW as well as an import capability of up to 250 MW (50 MW minimum import capability has been assumed for evaluation purposes). In addition, Manitoba Hydro and Wisconsin Public Service (WPS) have a signed term sheet for a proposed sale by Manitoba Hydro of up to 500 MW of system power of which 400 MW would require the construction of a new transmission interconnection. For evaluation purposes a 300 MW sale to WPS has been assumed, which would require 200 MW of new transmission service. An interconnection with a transfer capability of larger than 250 MW would be required to accommodate new sales to both MP and WPS. In the event that the sale to WPS does not materialize, a smaller transmission interconnection would be sufficient to meet the 250 MW Minnesota Power (MP) sale. This section deals with such a situation.

Table 9.6 provides a comparison of the three development plans—Plan 4 (K19/Gas24/250MW), Plan 11 (K19/C31/250MW), and Plan 13 (K19/C25/250MW)—that enable the construction of a new U.S. interconnection, which is assumed to provide 250 MW of export and 50 MW of import capability. These development plans are facilitated by the MP 250 MW sale. When these three development plans are compared to the All Gas development plan in Table 9.6, the incremental NPV is greater than $1,200 million,

showing that it would be significantly more beneficial for Manitoba Hydro to invest in one of these three development plans. When directly comparing these development plans, the net benefit is small enough to result in indifference between the K19/Gas24/250MW and K19/C25/250MW plans. The K19/C31/250MW plan is considered to be marginally less beneficial when compared to the other two plans. A significant difference between these plans is the substantial incremental investment required with the addition of Conawapa in the K19/C25/250MW and K19/C31/250MW development plans.

Table 9.6 INCREMENTAL ECONOMICS – 250 MW U.S. INTERCONNECTION

Development Plan	Incremental NPV, millions of 2014 Dollars @ 5.05% Discount Rate		
	1 All Gas	4 K19/Gas24/250MW	11 K19/C31/250MW
1 All Gas			
Lowest Capital Investment Development Plan	-		
4 K19/Gas24/250MW	4 -1		
MP Sale	$1,346		
11 K19/C31/250MW	11 -1	11 -4	
MP Sale	$1,215	($131)	
13 K19/C25/250MW	13 -1	13 -4	13 -11
MP Sale	$1,295	($51)	$80

All three of the development plans that include the 250 MW U.S. interconnection have been selected for further analysis.

9.3.2.3 Preferred Development Plan and Other Development Plans with a 750 MW U.S. Interconnection – Five Plans

There are five development plans with a 750 MW U.S. interconnection in this group of plans. This group of plans recognizes the uncertainty associated with the finalization of and approvals for the proposed 300 MW WPS sale and the complexities associated with development of a 750 MW international power line, including agreements and regulatory approvals.

As shown in Table 9.7, the Preferred Development Plan (Plan 14) provides the highest net benefits relative to the other four development plans evaluated but requires the second highest incremental capital investment relative to the All Gas development plan.

All five of the development plans enable the construction of a new U.S. interconnection with 750 MW of import and export capability. Two of the development plans, the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)) and Plan 5 (K19/Gas25/750 (WPS Sale & Inv)) are facilitated by both the 250 MW MP sale and the proposed 300 MW WPS sale. In these development plans, it is assumed that Manitoba Hydro will be responsible for 40% of the capital and ongoing operating costs, associated with the U.S. portion of the 750 MW interconnection facilities. In addition, Manitoba Hydro will be responsible for the full cost of the Manitoba portion of the new interconnection.

Plan 5 (K19/Gas25/750MW (WPS Sale & Inv)) and the Preferred Development Plan (Plan 14) are similar plans, with the major difference being the development of natural gas-fired generation instead of the Conawapa G.S. This plan allows for the comparison of the option of building natural gas-fired generation as an alternative to building Conawapa G.S. in 2025/26. For the sales requiring new hydro generation, power from the Keeyask G.S. is assumed to be sufficient to meet the contract requirements.

The other three development plans provided in Table 9.7 represent potential futures which continue to enable the development of a 750 MW U.S. interconnection in the event that the proposed 300 MW WPS sale does not proceed. For the purposes of the NFAT evaluation, while Manitoba Hydro will not enter into an arrangement where it owns more than 49% of the proposed U.S. interconnection, a conservative assumption has been used where Manitoba Hydro will be responsible for approximately two-thirds of the

capital and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities. In addition, Manitoba Hydro will be responsible for the entire cost of the Manitoba portion of the new interconnection.

Plan 15 (K19/C25/750MW) contemplates development of the same resources as the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)) but without the proposed 300 MW WPS sale. Without the proposed 300 MW sale to WPS and WPS investment in the 750 MW U.S. interconnection, the net benefits of this development plan decrease by $269 million as shown in Table 9.7.

Plan 12 (K19/C31/750MW) incorporates a deferral of Conawapa G.S. while still facilitating the sale of surplus power over the interconnections, including the new 750 MW U.S. interconnection. The K19/Gas31/750MW (Plan 6) development plan allows for the comparison of the option of building natural gas-fired generation as an alternative to building Conawapa G.S. in 2031/32, while still facilitating the sale of surplus power over the interconnections including the new 750 MW U.S. interconnection. The Preferred Development Plan (Plan 14) provides $336 million in net benefits when compared to Plan 12 (K19/C31/750MW) and $605 million in net benefits when compared to Plan 6 (K19/Gas31/750MW).

As shown in Table 9.7, when compared to the All Gas development plan, the Preferred Development Plan (K19/C25/750MW (WPs Sale & Inv)) yields net benefits of $1,696 million, while the other four development plans with a 750 MW interconnection show net benefits greater than $1,000 million: $1,097 million, $1,091 million, $1,360 million and $1,427 million, respectively.

Table 9.7 INCREMENTAL ECONOMICS – 750 MW U.S. INTERCONNECTION

Development Plan	Incremental NPV, millions of 2014 Dollars @ 5.05% Discount Rate				
	1 All Gas	5 K19/Gas25/750MW WPS Sale & Inv	6 K19/Gas31/750MW	12 K19/C31/750MW	14 K19/C25/750MW WPS Sale & Inv
1 All Gas					
Lowest Capital Investment Development Plan	-				
5 K19/Gas25/750MW	5 -1				
MP Sale, WPS Sale & Inv	$1,097				
6 K19/Gas31/750MW	6 -1	6 -5			
MP Sale	$1,091	($6)			
12 K19/C31/750MW	12 -1	12 -5	12 -6		
MP Sale	$1,360	$263	$269		
14 K19/C25/750MW	14 -1	14 -5	14 -6	14 -12	
MP Sale, WPS Sale & Inv Preferred Development Plan	$1,696	$599	$605	$336	
15 K19/C25/750MW	15 -1	15 -5	15 -6	15 -12	15 -14
MP Sale	$1,427	$330	$336	$67	($269)

The five development plans that include the 750 MW U.S. interconnection have been selected for further analysis.

9.3.2.4 Comparison of Development Plans with a New Interconnection

Table 9.8 provides a comparison of a number of development plans that include either the 250 MW or the 750 MW U.S. interconnection. All five of the plans with a 750 MW U.S. interconnection are shown in Table 9.7. The two development plans with a 750 MW U.S. interconnection and with Keeyask G.S. followed by natural gas-fired generation have incremental NPVs of $1,091 million (K19/Gas31/750MW) and $1,097 million (K19/Gas25/750MW) when compared to the All Gas plan. When Plan 4 (K19/Gas24/250MW) is compared to these two plans, its incremental NPV exceeds that of each plan by $255 million ($1,346 million minus $1,091 million) and $249 million ($1,346 million minus $1,097 million), respectively.

The Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)), which includes a 750 MW U.S. interconnection, yields the highest net benefits ($481 million, $350 million

and $401 million), when compared to the development plans that have a 250 MW U.S. interconnection. In addition, Plan 12 (K19/C31/750MW) yields incremental NPVs that are $14 million, $65 million and $145 million higher than the development plans that have a 250 MW U.S. interconnection. In the event that the process for development of an international power line results in a 250 MW U.S. interconnection, Tables 9.7 and 9.8 show that the net benefits associated with a smaller line are greater than $1,200 million compared to the All Gas development plan and exceed the incremental NPVs of development plans that have a 750 MW U.S. interconnection with Keeyask G.S. followed by natural gas-fired generation.

Table 9.8 DEVELOPMENT PLANS WITH A NEW U.S. INTERCONNECTION

Development Plan	Incremental NPV, millions of 2014 Dollars @ 5.05% Discount Rate					
	1 All Gas	4 K19/Gas24/250MW	11 K19/C31/250MW	12 K19/C31/750MW	13 K19/C25/250MW	14 K19/C25/750MW WPS Sale & Inv

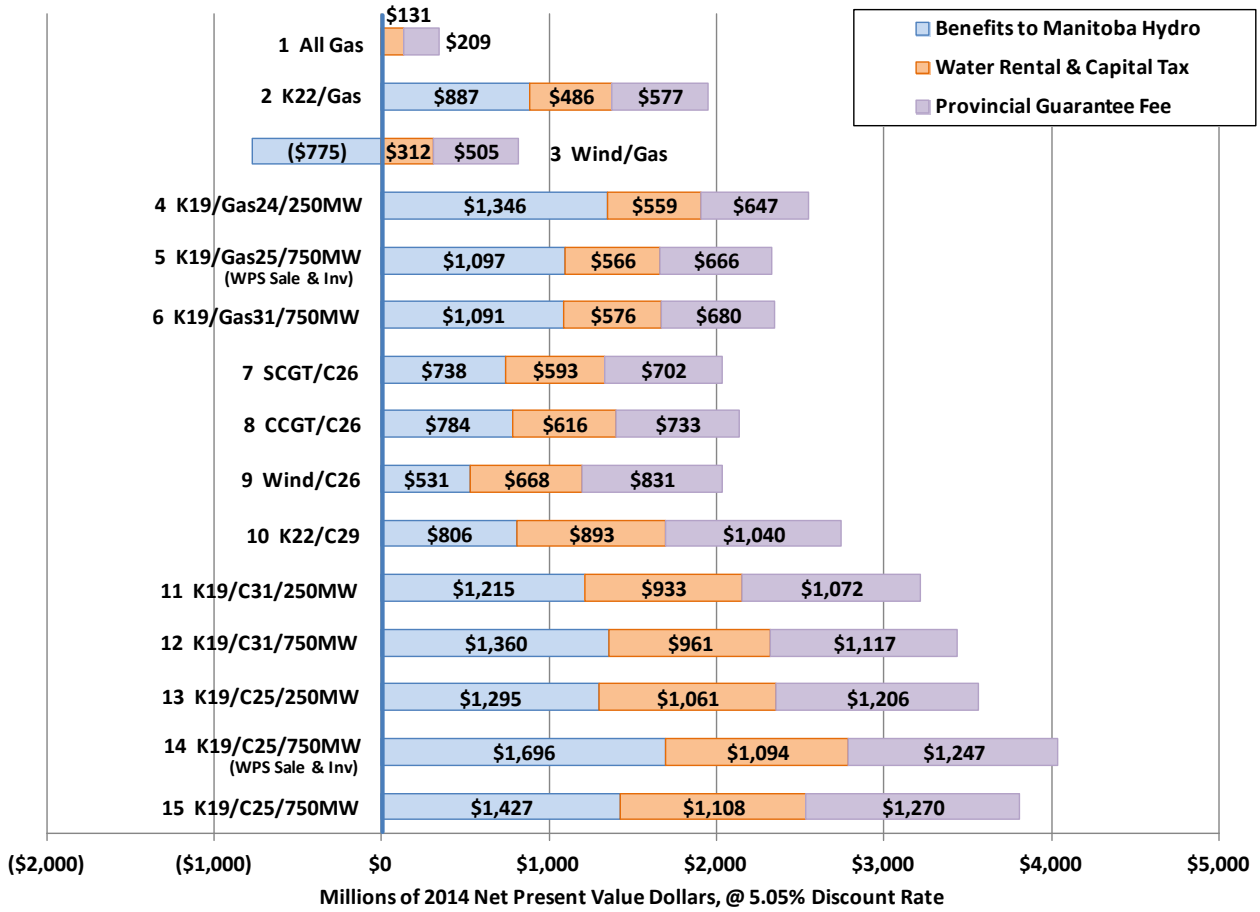
MP Sale	$1,427	$81	$212	$67	$132	($269)

9.3.3 Reference Scenario Results – NPVs Including Cash Transfers to the Province of Manitoba

Section 9.3.3 provides the NPVs for the reference scenario showing the additional assumed cash transfers to the Province of Manitoba for water rentals, capital taxes and provincial guarantee fee over the 78-year study period for the 15 development plans. ***Appendix 9.3 - Economic Evaluation Documentation*** includes the assumptions used in the analysis that relate to cash transfers to the Province.

Water rentals are based on the operation of Manitoba Hydro's hydro-electric generation and are calculated and paid to the Province of Manitoba in accordance with *The Water Power Act*.

Capital taxes are a provincial tax assessed under *The Corporation Capital Tax Act* of Manitoba. In general terms, this tax is applied at a rate of 0.5% to the capital invested by Manitoba Hydro in the province, where "capital" can be generally defined as "the total debt and retained earnings of the corporation".



The provincial guarantee fee is an annual fee payable to the Province of Manitoba in return for the guarantee of the corporation's debt (with the exception of some MHEB bonds) and is calculated using a rate of 1% multiplied by the gross outstanding debt at March 31 of the previous fiscal year.

These cash transfers are provided here as an addition to the economic benefits noted earlier because they benefit the provincial government and indirectly Manitobans. (It must be recognized that the debt guarantee fee provides Manitoba Hydro a benefit and has the potential to incur costs to the Province. See ***Chapter 11 – Financial Evaluation of Development Plans*** for discussion of provincial borrowing and credit rating implications). As shown in Figure 9.3, cash transfers to the Province of Manitoba for water rentals and capital taxes are included as costs when performing economic evaluations. The provincial guarantee fee shown in Figure 9.3 represents the 1% fee applied to the total capital investment for each of the 15 development plans evaluated. The water rental rate, the capital tax rate and the provincial guarantee fee percentages are assumed to remain the same.

For the development plans evaluated, the majority of the cash transfers to the Province are from the provincial guarantee fee; while the capital taxes make up approximately 30%

of the cash transfers; and the water rentals make up approximately 10% (with the exception of the All Gas and Wind/Gas development plans in which incremental water rentals are zero). The greatest cash transfers to the Province result from those development plans that include both Keeyask and Conawapa generating stations; these cash transfers are significantly greater than for those development plans that include only one or no hydro-electric generating station.

Figure 9.3 DEVELOPMENT PLAN NPVS COMPARED TO ALL GAS DEVELOPMENT PLAN - INCLUDING POTENTIAL CASH TRANSFERS TO THE PROVINCE

9.3.4 Development Plans Selected for Economic Uncertainty Analysis

As demonstrated by the economic evaluations for the reference scenario shown throughout this chapter, development plans with a U.S. interconnection provide higher net benefits than those development plans without a U.S. interconnection. The Preferred

Development Plan (K19/C25/750MW (WPS Sale & Inv)) yields the highest net benefits across all of the development plans evaluated.

Table 9.9 lists the 12 development plans that will be further considered in the economic uncertainty analysis provided in ***Chapter 10 – Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities***.

Table 9.9 DEVELOPMENT PLANS SELECTED FOR ECONOMIC UNCERTAINTY ANALYSIS

NEEDS FOR AND ALTERNATIVES TO (NFAT)

Manitoba Hydro Undertaking #27

Manitoba Hydro to file the additional calculations performed on all of the plans upon which Manitoba Hydro conducted a probabilistic analysis, using base level DSM, with respect to the new information provided as of March 10, 2014.

Response:

Please see the attached Updated Economic Uncertainty Analysis Results.

Updated Economic Uncertainty Analysis Results

The economic uncertainty analysis as provided in Manitoba Hydro's Exhibit 104-2 has been further updated to reflect the following:

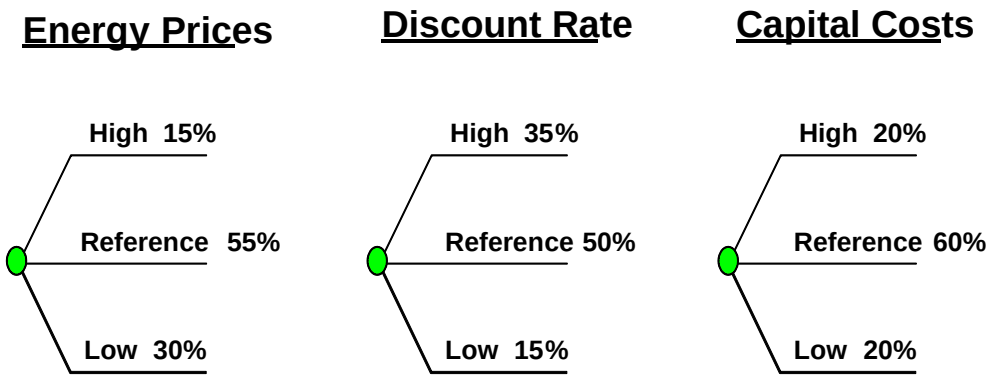
- addition of Plan 6 (K-19/Gas31/750MW) and Plan 12 (K-19/C31/750MW),
- Plans 5 and 14 are now shown with no WPS investment in the new 750 MW US interconnection (Manitoba Hydro is assumed to pay the WPS portion of investment costs); Plan 5 and Plan 14 are now labeled as K-19/Gas25/750MW (WPS Sale & no WPS Inv) and K-19/C25/750MW (WPS Sale & no WPS Inv), respectively.

The following updates reflected in Manitoba Hydro's Exhibit 104-2 are also applied:

- updated capital costs for Keeyask and Conawapa,
- updated probability weightings associated with the Capital Costs factor,
- updated treatment of common factors (costs and revenues common to all alternatives).

Updated Capital Costs

As a result of recently receiving General Civil Contract bids for Keeyask, Manitoba Hydro has updated its capital cost estimates for Keeyask and Conawapa. The updated capital cost estimates used in the updated economic uncertainty analysis, in billions of 2014 base dollars, are provided in the table below. Consistent with the assumptions documented in the NFAT submission, all costs prior to June 2014 are not included in the totals as they are considered sunk and having been made to protect the in-service dates shown in the table.



Updated Capital Cost Estimates for Keeyask and Conawapa
Used in Economic Uncertainty Analysis

(Billions of 2014 Base $)

	Keeyask - 2019			**Keeyask – 2022**			**Conawapa – 2025**			**Conawapa - 2026**			**Conawapa - 2031**		
	Low	Ref	High	Low	Ref	High	Low	Ref	High	Low	Ref	High	Low	Ref	High
2012 NFAT Analysis	3.0	3.3	3.7	3.1	3.4	3.9	5.1	5.7	6.4	5.2	5.8	6.5	5.3	6.0	6.7
2014 Update	3.1	3.6	4.2	3.1	3.7	4.4	5.0	6.1	7.5	5.0	6.1	7.5	5.2	6.4	7.9

Updated Probability Weightings

As described in Appendix 9.3 of the NFAT submission, the Capital Costs factor and associated probability weightings apply to capital costs for hydro-electric generation, natural gas-fired generation, wind generation and transmission line and station. To reflect the greater certainty in the new estimate for Keeyask and the enhanced labour productivity reserve methodology, the low, reference and high probabilities have been updated. The updated probabilities are presented below. The reference capital cost scenario probability weighting has been updated to 60% from the 50% used in the NFAT submission and the high capital cost scenario probability weighting has been updated to 20% from the 30% used in the NFAT submission. The probability weighting for the low capital cost scenario has not changed from that assumed in the NFAT submission.

Results

The latest NPV results with the three updates are presented in the quilt and table below. The results for Plan 1, Plan 2, Plan 4 and Plan 8 are unchanged from those provided in MH Exhibit 104-2. The results for Plan 6 and Plan 12 have been added to the quilt and table below. The results for Plan 5 and Plan 14 have been adjusted for the assumption that WPS does not invest in the new 750 MW US interconnection and Manitoba Hydro pays that portion of investment costs. The assumption that the WPS Sale is included in Plan 5 and Plan 14 remains unchanged.

Relative to All Gas – Ref – Ref – Ref, expected values range from essentially zero to more than $600M. While Plan 4 has the highest expected value, this plan is no longer realistically viable and the economic benefits can only be considered as hypothetical. Excluding Plan 4, Plan 6 has the highest expected value. Plan 1 has the lowest expected value. Again, relative to All Gas – Ref – Ref – Ref, 10^{th} percentile values range from -$700M to -$2.9B. All plans have some

downside risk. Excluding Plan 4 because it is no longer viable, Plan 2 has the least downside risk. Plan 14 has the most downside risk followed by Plan 12.

10 Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities

10.0 Chapter Overview

Despite efforts to understand and predict the future, it inherently remains uncertain. For decision making, including resource planning decisions, potential outcomes can directly and indirectly affect the impact of the alternatives considered and the choices made. The outcome of a wide range of economic, financial, social, technological and political events in both the near-term and the long-term is unpredictable. It is important to recognize uncertainty and identify the way forward that has the best balance of value and risk given that uncertainty.

Chapter 10 - Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities Section 1.0 introduces the concept of scenarios and presents extensive probabilistic analysis on 12 of the development plans with and without probabilities on the factors that have a high impact on the economics of the development plans.

While probabilistic analysis considers several key factors at once, sensitivity analysis focuses on a single variable that tests the impact of that variable on selected development plans. Section 2.0 provides sensitivity analysis on drought, climate change, load growth, and in-service delay. Through ***Chapter 10 - Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities*** it is recognized that there are many factors that are considered in formulating and analyzing development plans and uncertainty and risk associated with these factors.

As it would be a virtually endless task to study the effect of the uncertainty in each of the factors in depth, Section 3.0 provides a matrix which presents a framework in which uncertainties and risks associated with the development of resource options in Manitoba are summarized and are assessed either qualitatively or quantitatively.

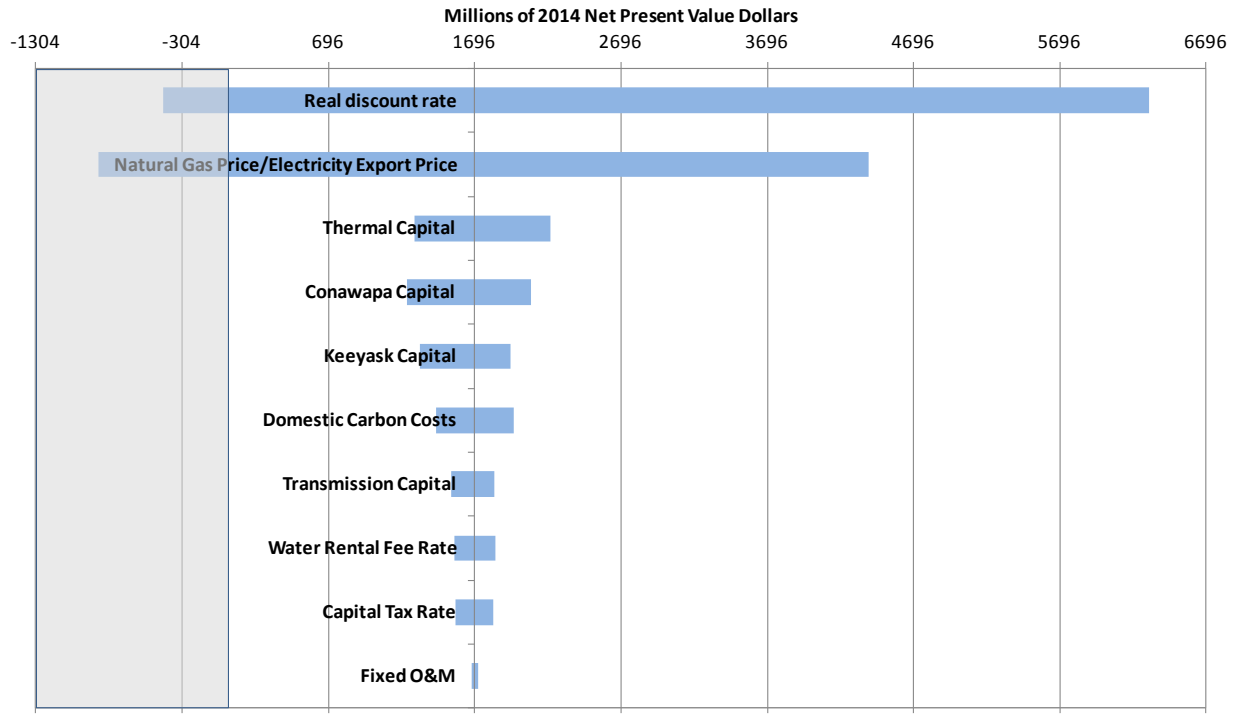
Supporting information and additional detail for the analyses presented in this chapter is available in ***Appendix 9.3– Economic Evaluation Documentation.***

10.1 Probabilistic Analysis with Scenarios

10.1.1 Methodology

Probabilistic analysis considers the range of uncertainty defined by reference, high and low values on key factors which are formulated into scenarios. An assessment is done to determine which factors have the highest impact on the economic and financial outcomes. Probabilistic analysis will grow exponentially with each added factor and, therefore, in this submission it is based on three sets of factors. These sets of factors represent 1) the electricity market 2) investment costs and 3) the economy and, when combined, result in 27 individual scenarios for each development plan analyzed. As each combination of these factors does not have the same likelihood of occurring, probabilities for reference, high and low are applied to the factors and subsequently the weighted factors are applied to the development plans. The application of these probabilities results in a probabilistic comparison of development plans.

10.1.1.1 Determination of Highest Impact Factors



There are numerous inputs and assumptions that are required to formulate and analyze development plans. It would be an endless task to study the effect of uncertainty in each of the inputs and assumptions in depth and uncertainty in some factors is relatively unimportant. In order to focus attention on matters of significance, analysis was conducted to determine which of these factors have the greatest impact and require the most attention and, in turn, which factors have the least impact and do not require in-depth analysis.

In probabilistic analysis, each individual factor is varied from a plausible low value to a plausible high value. For the Needs For and Alternatives To (NFAT) economic evaluation, the impact of

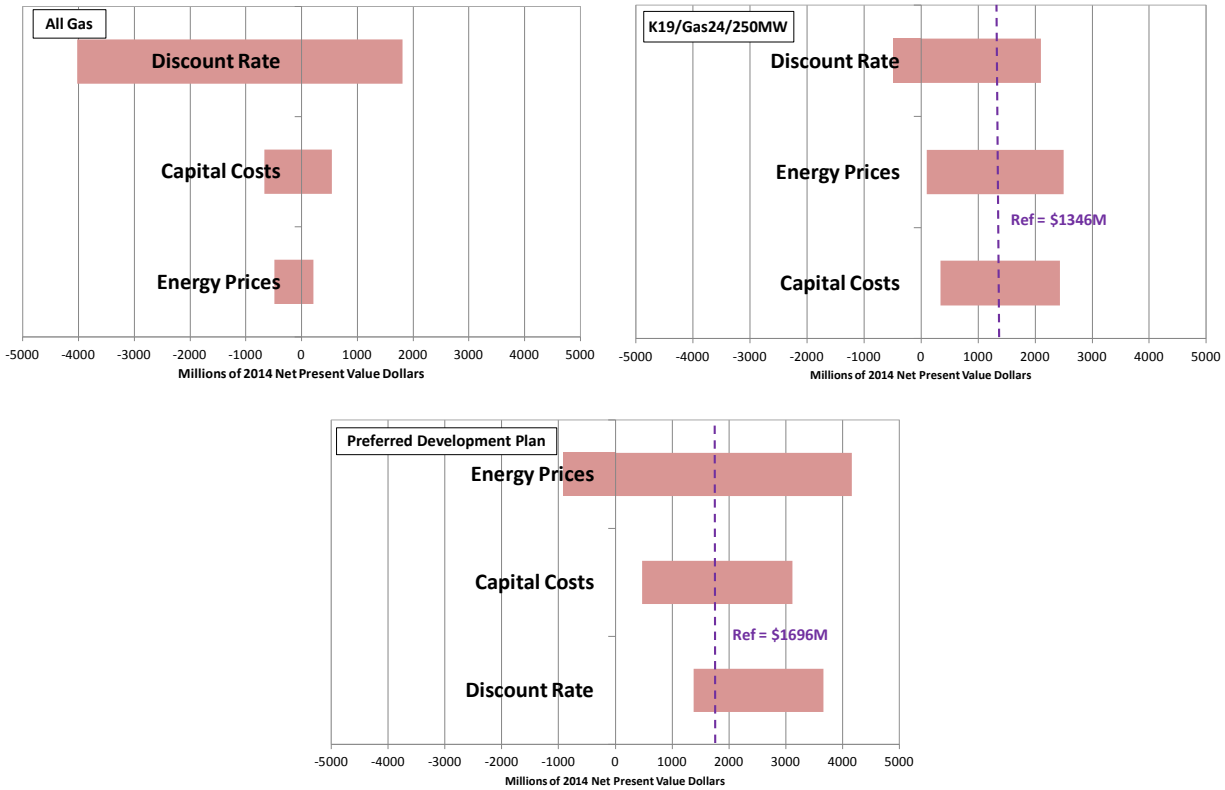
this variation has been measured between the two development plans with the most significant difference in characteristics – the All Gas development plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)). One useful way of displaying this sensitivity information is a "tornado diagram."

Figure 10.1 is a tornado diagram which shows the impact of uncertainty in 10 individual factors; the length of each bar shows the impact of varying each factor from low to high. The "high impact" factors are electricity and natural gas prices, discount rate (representative of the cost of capital), and capital costs. "Low impact" factors include operating and maintenance (O&M) costs, and changes in water rental and capital tax rates. It is important to note that impact refers to the uncertainty in each factor not the factor itself. For example, this diagram does not indicate that O&M is itself relatively unimportant, simply that uncertainty within O&M is relatively unimportant. All else being equal, uncertainty analysis should be focused on the "high impact" factors. The grey area in Figure 10.1 indicates factors that can have a significant impact on the net present value (NPV), resulting in a net loss as opposed to a net benefit.

Figure 10.1 Tornado Diagram of Highest Impact Factors

10.1.1.2 Combinations of Highest Impact Factors

The high impact factors are grouped into three sets: Energy Prices, Capital Costs and Economic Indicators.



Energy Price factors consist of natural gas, electricity and carbon prices. Electricity export prices are a key factor in evaluating Manitoba Hydro's development plans. As described in ***Chapter 3 – Trends and Factors Influencing North American Electricity Supply***, natural gas is a significant factor in the determination of electricity prices in the North American market. The effect of natural gas prices on electricity export prices is embedded in Energy Prices as is the effect of carbon. Carbon prices are reflected in Energy Prices from two perspectives. One is the impact of carbon policy on electricity export prices in the Midcontinent Independent System Operator, Inc. (MISO) market and the other is the impact of a potential carbon adder on Manitoba based fossil fuel-fired generation.

Capital Cost factors include generation costs for all resource types, transmission costs and applicable real escalation. As more analysis on capital cost estimates is undertaken, the uncertainty range narrows.

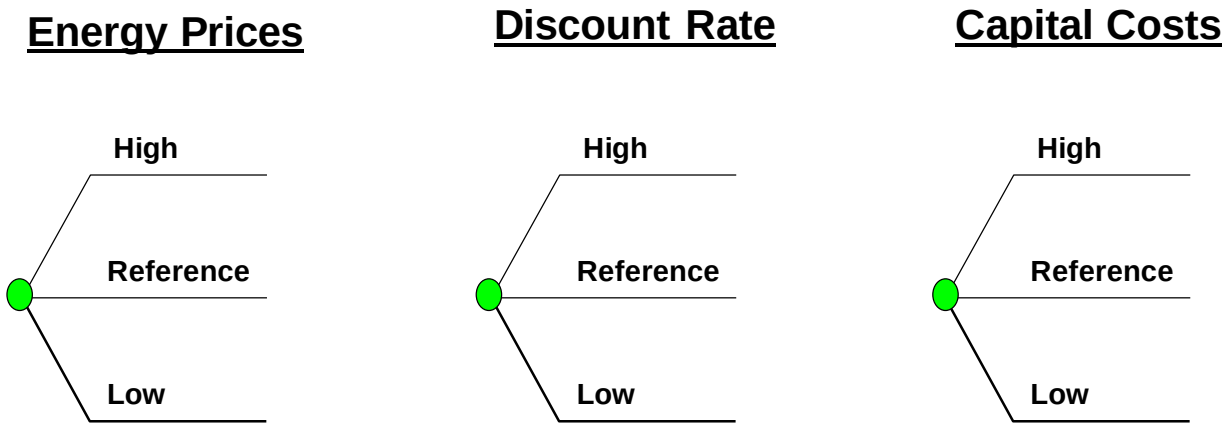
Economic Indicators include U.S. and Canadian, short- and long-term interest rates, inflation rates including U.S. gross domestic product implicit price deflator, CAD/USD exchange rate, and Manitoba Hydro's real weighted average cost of capital. For economic uncertainty analysis the relevant Economic Indicator is the real weighted average cost of capital (discount rate).

Figure 10.2 provides a tornado diagram of the highest impact factors for a selection of development plans which are representative of a plan with no new large hydro resources, a plan with one new large hydro resource and a plan with two new large hydro resources. For each set of factors, the length of the bar in Figure 10.2 is indicative of the impact of the range of that factor on NPV.

Figure 10.2 Probabilistic Analysis – Tornado Diagram
Highest Impact Factors – All Gas, K19/Gas24/250MW
Preferred Development Plans

For the All Gas development plan, Figure 10.2 illustrates that the Discount Rate is the dominant factor and can result in a significant negative impact on incremental NPV. Over the long-term, the amount of natural gas-fired generation required to meet domestic load requirements increases significantly. These operating costs when combined with a low discount rate result in a significant downside risk and a negative impact on the incremental NPV. For the Preferred Development Plan, on a relative basis, the Discount Rate factor does not result in as significant an impact on incremental NPV. Unlike the All Gas development plan, it is the high discount rate that results in a negative impact on incremental NPV. This is primarily due to the impact of the capital intensive nature of large hydro-electric projects which have high upfront costs and which rely on revenue that occurs over the long-term.

For the Preferred Development Plan, the Energy Prices factor has the most significant impact on the incremental NPV due to the sale of large volumes of surplus power associated with the development of two large hydro-electric generating stations, exposing the Preferred Development Plan to the effect of changes in energy price.



From an overall perspective, the Preferred Development Plan is most affected by the Energy Prices set of factors but still has significant exposure to the Discount Rate and Capital Cost sets of factors. The All Gas plan has exposure to the Discount Rate with narrow ranges of exposure to the Capital Cost and Energy Prices factors. For Plan 4 (K19/Gas24/250MW), because it has a mix of new gas and hydro resources, the impact of the three factors is moderated. The diversity provided by the mix of hydro-electric and natural gas-fired resources in the K19/Gas24/250MW development plan balances the effect of the factors and limits the significance of their effect on incremental NPV.

10.1.1.3 Development of Scenarios

In ***Chapter 9 – Economic Evaluations – Reference Scenario***, the reference scenario was presented as the "most likely" set of assumptions for evaluating development plans. Assumptions higher and lower than the reference assumptions are incorporated into the development of scenarios. The resulting scenarios represent all possible combinations of the high impact factors with the range of high, reference and low assumptions.

When combined, three sets of factors with the high, reference and low assumptions result in 27 discrete scenarios.

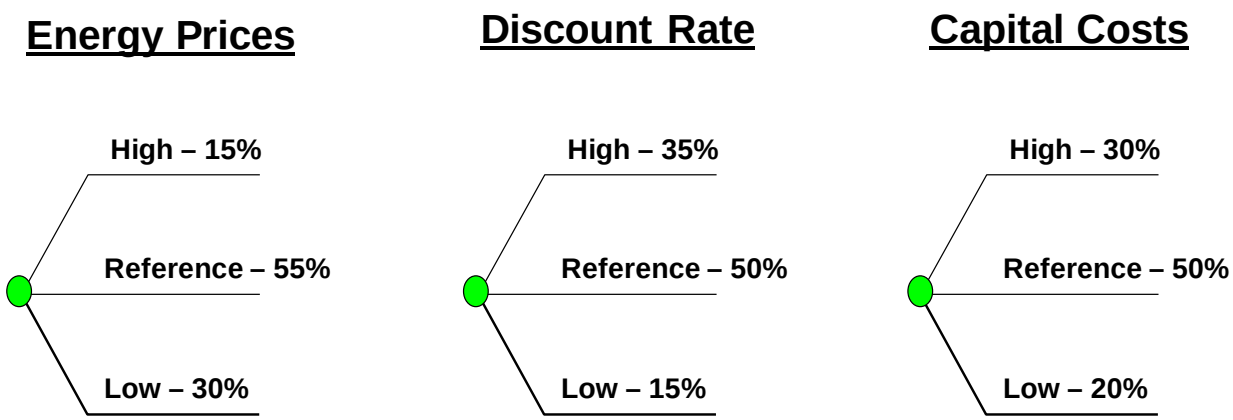


Figure 10.3 Combination of Highest Impact Factors

10.1.1.4 Probabilities for Scenarios

As each of the combinations of the highest impact factors do not have the same likelihood of occurring, probabilities were developed for each set of these factors as explained in ***Appendix 9.3 – Economic Evaluation Documentation***. Figure 10.4 provides the probabilities for each of the highest impact factors.

Figure 10.4 Probabilities for Highest Impact Factors

10.1.2 Inputs for Probabilistic Analysis with Scenarios

Chapter 9 – Economic Evaluations – Reference Scenario provided the economic analysis from the reference scenario perspective and determined which development plans that will be considered in the economic uncertainty analysis documented in this chapter. The reference scenario represents one view of the future. This section builds on the reference scenario economic analysis and considers the impact of uncertainty, using probabilistic analysis to compare the net benefits for the 12 development plans identified in ***Chapter 9 – Economic Evaluations – Reference Scenario***, Section 9.3.4.

The 12 development plans analyzed in this chapter are provided in Table 10.1.

Table 10.1 List of Twelve Development Plans for Probabilistic Analysis

Order of Capital Investment	Development Plan Short- Name	Description of Development Plan	
		U.S. Interconnection	Resources/Sales
1	All Gas	None	Natural Gas-Fired Generation starting in 2022/23
3	Wind/Gas		Wind Generation starting in 2022/23 supported by Natural Gas-Fired Generation starting in 2025/26
7	SCGT/C26		Simple Cycle Gas Turbines in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2038/39
2	K22/Gas		Keeyask 2022/23, Natural Gas-Fired Generation starting in 2029/30
4	K19/Gas24/250MW	250 MW export/50 MW import in 2020/21	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, 250 MW MP Sale
13	K19/C25/250MW		Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2040/41, 250 MW MP Sale
11	K19/C31/250MW		Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, Conawapa 2031/32, 250 MW MP Sale
6	K19/Gas31/750MW	750 MW import and export in 2020/21	Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2031/32, 250 MW MP Sale
15	K19/C25/750MW		Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 250 MW MP Sale
12	K19/C31/750MW		Keeyask 2019/20, Imports, Conawapa 2031/32, Natural Gas-Fired Generation starting in 2041/42, 250 MW MP Sale
5	K19/Gas25/750MW (WPS Sale & Inv[1])		Keeyask 2019/20, Natural Gas-Fired Generation starting in 2025/26, 250 MW MP Sale, proposed 300 MW WPS Sale
14 (Preferred Development Plan)	K19/C25/750MW (WPS Sale & Inv[1])		Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 250 MW MP Sale, proposed 300 MW WPS Sale

[1] Inv refers to WPS investment in the U.S. portion of the 750 MW interconnection facilities

Assumptions and forecasts for all of the scenarios were based on adjusted 2012 planning assumptions and are provided in ***Appendix 9.3 – Economic Evaluation Documentation***.

10.1.3 Analysis of Development Plans Using Scenarios

Table 10.2 provides the framework for comparing the 12 development plans under the 27 scenarios. The 12 development plans are listed across the top of the table. The 27 scenarios are shown in the three left-most columns and represent all possible combinations of the three sets of highest impact factors (3 Energy Prices x 3 Discount Rates x 3 Capital Costs = 27 scenarios). The 12 development plans combined with 27 scenarios result in 324 cases (12 development plans x 27 scenarios = 324 cases). The colour red indicates a negative NPV and the colour green indicates a positive NPV when assuming the All Gas Ref-Ref-Ref case is used as a single point base for comparison. The darkest colours of green represent an NPV that is equal to or greater than +$3,000 million and the darkest colours of red represent an NPV that is equal to or less than -$3,000 million. The colours become lighter as the NPV approaches zero. When all 324 cases are populated in the table and assigned a colour, the table resembles a patchwork quilt.

Colour Legend: < -3000 | 0 | > 3000

The NPVs shown in Table 10.2 and identified as reference assumptions (Ref-Ref-Ref) for all three sets of factors — Energy Prices, Discount Rates, and Capital Costs — are incremental to the All Gas plan under reference assumptions. These reference assumptions are indicated by the "0" NPV for the All Gas Ref-Ref-Ref case. The NPVs shown in Table 10.2 are the same for each development plan as those shown in Table 9.9 in ***Chapter 9 – Economic Evaluations - Reference Scenario.***

The reference scenario (Ref-Ref-Ref) only represents one view of the future, which we know is uncertain. The Ref-Ref-Ref scenario represents the "most likely" future. Table 10.3 introduces two additional scenarios where the range of Energy Prices is shown in the scenarios Low-Ref-Ref (low Energy Prices, reference Discount Rates, and reference Capital Costs) and High-Ref-Ref (high Energy Prices, reference Discount Rates, and reference Capital Costs).

Table 10.3 demonstrates how the incremental NPVs for development plans are affected by changes in the Energy Prices set of factors. The All Gas Ref-Ref-Ref case is used as a fixed base for comparing each development plan in the context of each of the 27 scenarios and is indicated by the "0" NPV. An improvement in NPV is reflected by the shade of red becoming lighter or the shade of green becoming darker with a reduction in NPV having the opposite effect. The comparison of the Low-Ref-Ref scenario of all development plans to the All Gas Ref-Ref-Ref case shows the impact on the incremental NPV due to the decrease in the Energy Prices factor. Similarly, the comparison of the High-Ref-Ref scenario for all development plans to the All Gas Ref-Ref-Ref case shows the impact on the incremental NPV due to the increase in the Energy Prices factor. In this way, Table 10.3 provides a measure of relative performance between each of the 12 development plans and the All Gas Ref-Ref-Ref case for the three scenarios identified: Low-Ref-Ref, Ref-Ref-Ref, and High-Ref-Ref.

Table 10.4 populates the table with all 324 cases. The purpose of the table is to provide a visual representation of the development plans over the 27 future scenarios. As stated previously, the All Gas Ref-Ref-Ref case is used as a single point base for comparing each development plan in the context of each of the 27 scenarios and is indicated by the "0" NPV for the All Gas Ref-Ref-Ref case. In this type of analysis, NPVs for a development plan provide a measure of the relative performance between that development plan and the All Gas Ref-Ref-Ref case.

The development plan evaluations are categorized as follows:

- development plans with no new U.S. interconnection designed to serve only Manitoba load and existing export commitments
- development plans with a 250 MW U.S. interconnection
- development plans with a 750 MW U.S. interconnection
- comparison of development plans across categories.

Figure 10.5 is a scatter plot that provides the same incremental NPVs as in Table 10.4 but graphically displays the range of incremental NPVs by development plans. It demonstrates that the rank of a particular scenario will not be the same in all development plans. Figure 10.5 confirms the insights drawn from the Table 10.4 quilt. The All Gas plan and the Wind/Gas plan have more downside risk and less upside potential than the other development plans, by hundreds of millions of dollars. The other development plans without an interconnection have modest downside risk and upside potential. The development plans with an interconnection have modest downside risk and varying degrees of upside potential, again, differences of hundreds of millions of dollars.

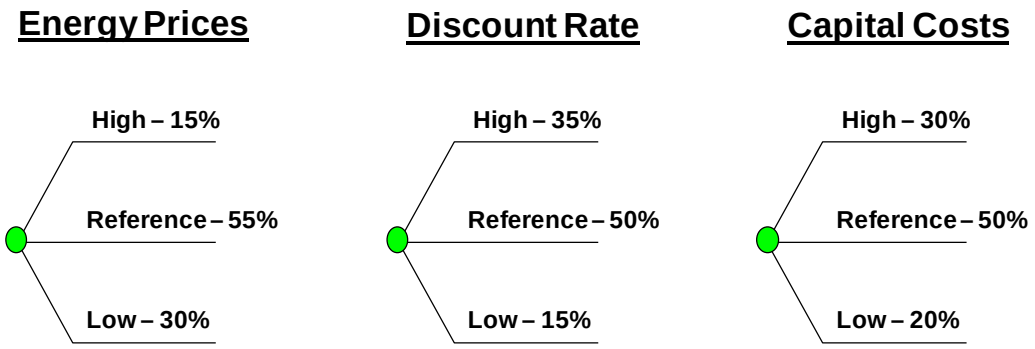

Figure 10.5 Probabilistic Analysis – Scatter Plot
Incremental Economics – All Scenarios

10.1.4 Probabilistic Analysis

As indicated in Section 10.1.1.4, each of the scenarios does not have the same likelihood of occurring and therefore probabilities were developed for each of the sets of these factors. Figure 10.6 repeats the illustration previously introduced in Section 10.1.1.4 and provides the probabilities for each of the highest impact factors.

Figure 10.6 Probabilities for Highest Impact Factors

As Table 10.5 shows, all plans have a substantial range of outcomes which vary from substantially worse than the baseline outcome (All Gas Ref-Ref-Ref case) to substantially better than the baseline outcome. The degree and direction of this variation differs from plan to plan. Both the All Gas and Wind/Gas development plans appear to have the most downside risk as there are more scenarios showing red. Plans with a 250 MW or 750 MW interconnection appear to have the most upside potential as there are more scenarios showing green.

The expected values, provided in Table 10.6, are weighted-average NPVs for each development plan. The information in Table 10.5 is the basis for the determination of the expected value for each development plan when combined with the probabilities provided in Figure 10.6.

Expected value is calculated for each development plan by taking the sum of the NPVs multiplied by their appropriate scenario probabilities listed on the right-most column of the table (see ***Appendix 9.3 - Economic Evaluation Documentation*** for more information on calculating expected value).

Ref-Ref-Ref NPV	0	-775	738	887	1346	1295	1215	1091	1427	1360	1097	1696

The expected values, or weighted-average NPVs, incorporate the uncertainty associated with the highest impact factors represented in the scenarios. For example, the reference scenario economics provided in ***Chapter 9 – Economic Evaluations – Reference Scenario*** used a single un-weighted scenario (Ref-Ref-Ref) with a resulting incremental NPV of $1,696 million for the Preferred Development Plan (Plan 14) as compared to the All Gas development plan. For this same comparison using expected value economics, the incremental NPV is $1,155 million ($1,085 minus -$70, as shown in Table 10.6). Table 10.6 shows that the incremental expected

value for the Preferred Development Plan (Plan 14) is higher than the expected value for all other development plans.

Figure 10.7 provides a box plot which is another method to visualize the range of NPVs for the different development plans being considered. While a scatter plot does not give an indication of the relative likelihood of the NPVs, the box plot is based on the same NPV information used to develop the NPVs presented in Table 10.5, and uses the probabilities provided in Figure 10.6 to produce a probability distribution. The probability distribution is then used to develop the percentiles shown in Table 10.6 and create the "box and whiskers" chart shown in Figure 10.7. The box is defined by the 25th and 75th percentiles and the whiskers are defined by the 10th and 90th percentiles. The expected value is demarked by the dash inside the box. For greater clarity, at the 90th percentile (P90) there is a 10% chance of being greater than the P90 NPV or a 90% chance of being lower than the P90 NPV.

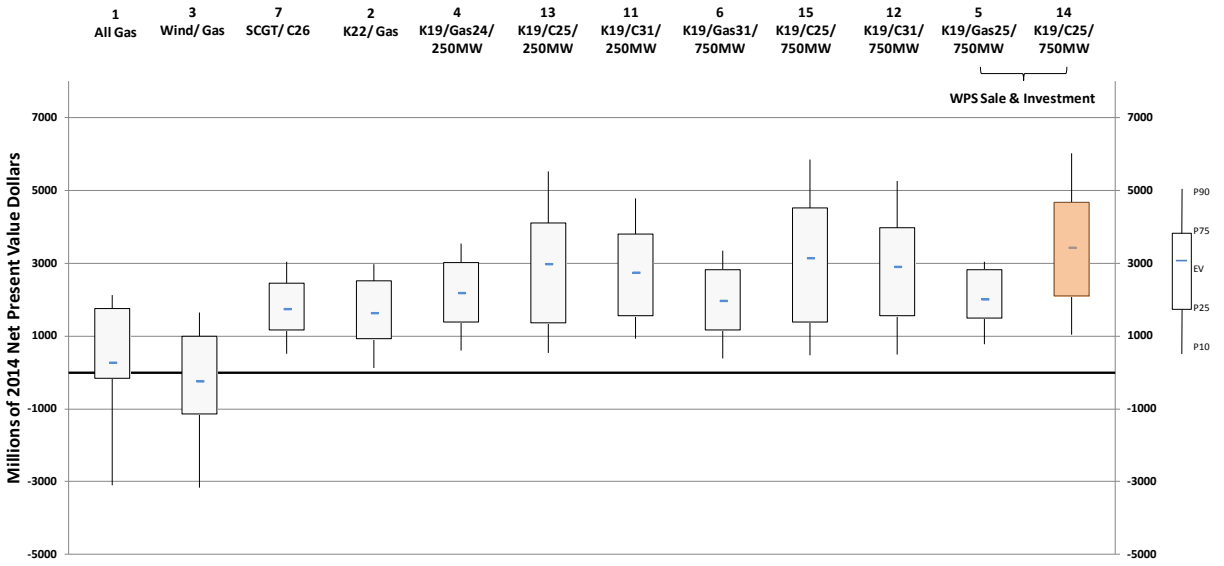

Figure 10.7 Probabilistic Analysis – Box Plot
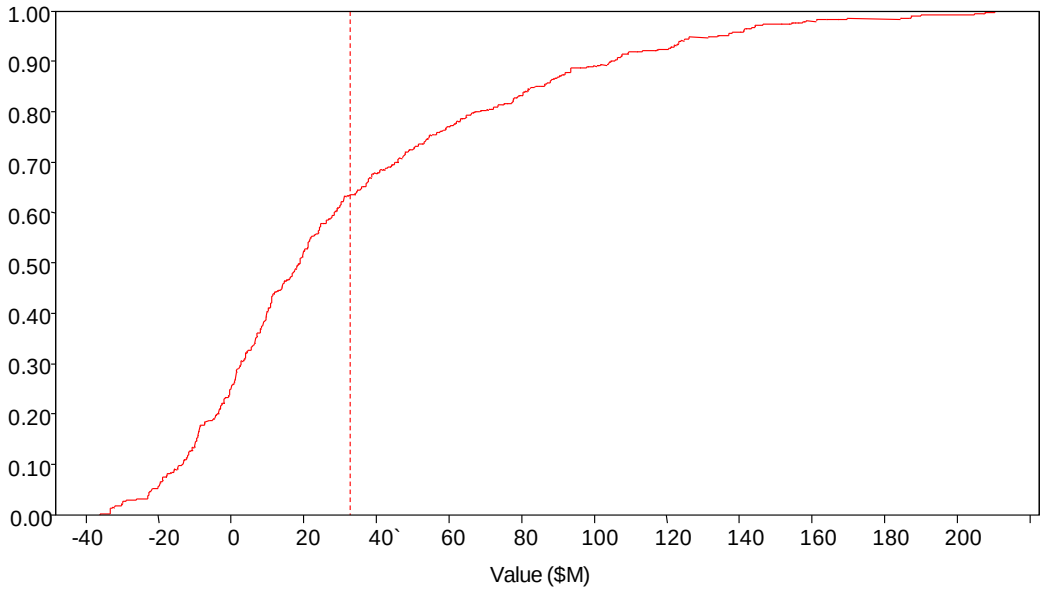
Incremental Economics – All Scenarios

The "0" on the y-axis is the basis for comparison and represents the All Gas Ref-Ref-Ref case. The smaller the size of the box (between the 25th and 75th percentiles) the less variability a

development plan has, and the shorter the "whiskers" the lower the risk and the lower the upside potential. For example, Plan 5 has a smaller box and shorter whiskers than the Preferred Development Plan (Plan 14): this indicates that the Preferred Development Plan has greater variability but has more upside potential. The long whiskers between the 10th and 25th percentiles on the All Gas and Wind/Gas plans indicate a significant downside risk for these plans. Figure 10.7 adds further confirmation to the earlier observations. The All Gas and Wind/Gas plans are relatively low value and high risk. The other plans without an interconnection are low value and low risk. The plans with an interconnection are generally higher value with low to moderate risk, while the ranking among the various interconnection plans represents a value/risk trade-off.

Figure 10.8 Probabilistic Analysis – Box Plot with Transfers to the Province Incremental Economics –All Scenarios



As discussed in ***Chapter 9 – Economic Evaluations – Reference Scenario***, Section 9.3.3, cash transfers to the Province were calculated for each development plan as additional economic benefits. The cash transfers are water rentals, capital taxes and the debt guarantee fee and they benefit the provincial government and indirectly Manitoba taxpayers. The cash transfers to the Province increase the net benefits of all development plans as shown by the higher

expected values in Figure 10.8 as compared to similar values without the cash transfers in Figure 10.7. It has been determined that the higher the capital cost of the development plan the greater the cash transfers to the Province. Development plans with one hydro-electric resource will have a greater increase in net benefits than development plans with no hydro-electric resources. As well, the development plans with two hydro-electric resources will have a greater increase in net benefits than development plans with one hydro-electric resource. This reflects the capital intensive nature of hydro project development.

10.1.4.1 Probabilistic Analysis: Understanding S-Curves

Probabilistic information is often displayed in the form of a cumulative distribution function, called an s-curve or risk profile. The risk profile displays the full range of values associated with an individual alternative in a compact, understandable, graphic format that is suitable for answering a variety of questions about value, risk and opportunity.

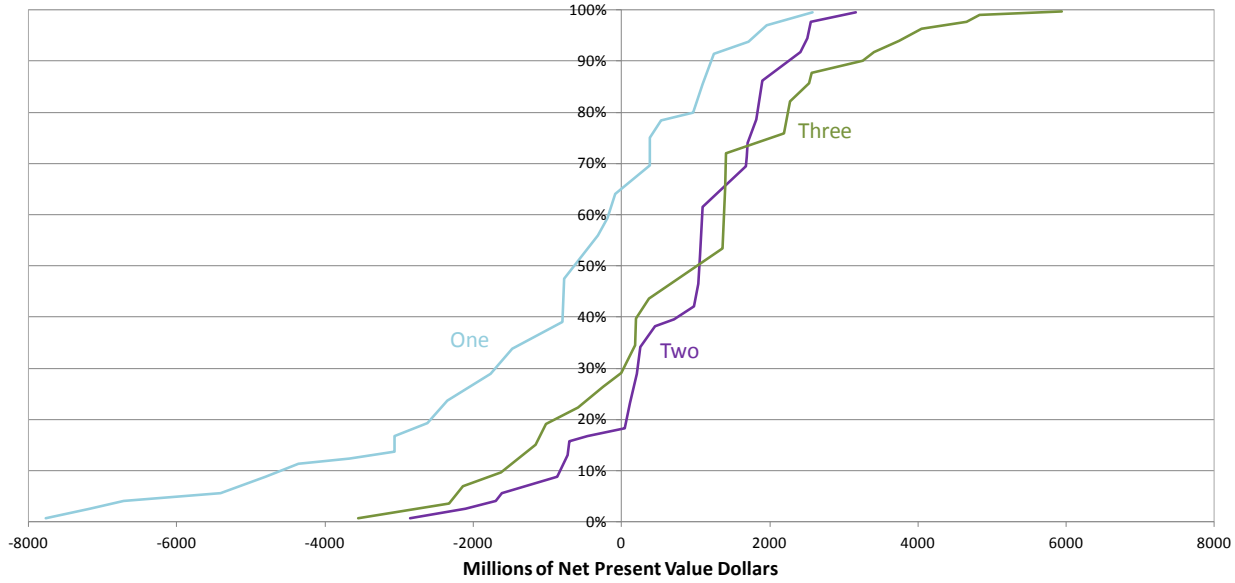


Figure 10.9 Sample S-Curve

The risk profile contains a wealth of useful information. Figure 10.9 provides a sample s-curve. The risk profile clearly shows the range of possible outcomes, from a loss of more than $30 million to a gain of more than $200 million. It also shows that there is roughly a 25% chance

that the value is less than 0; that is, that the investment results in a loss or failure. There is roughly a 90% chance that the value is less than $100 million, meaning that there is a 10% chance that the value is more than $100 million; indicating that the investment has a 10% probability of being highly successful. Consequently, it can be determined that there is a 65% (90% less 25%) chance that the value lies between $0 million and $100 million, a modest success. At the 50th percentile or median point, there is a 50% chance that the value is less than (or greater than) $20 million. The expected value or mean can also be determined from the risk profile, although it requires additional processing. In Figure 10.9, the expected value is indicated by the dotted line at roughly $35 million—it is the value represented by the line where the roughly triangular areas to the lower left and upper right are equal.

Figure 10.10 Sample S-curve Comparison

Risk profiles are generally most useful for comparing alternatives. Figure 10.10 shows three risk profiles on the same scale. Based on the risk profiles, alternative One is "dominated" by alternatives Two and Three; that is, alternative One is strictly to the left of (or worse than) alternatives Two and Three. Therefore, no matter what target dollar value is selected, it is less likely that alternative One will achieve that target than alternatives Two or Three. Alternative One is also much more likely to result in a loss (roughly an 80% chance) than alternatives Two

or Three (roughly a 30% chance). Given these observations, it is difficult to support alternative One.

The choice between alternatives Two and Three is more difficult. Alternative Two has a slightly steeper risk profile than alternative Three; this means that the range of values with alternative Two is smaller than alternative Three. One consequence is that alternative Two has less "downside risk" than alternative Three. Similarly, alternative Two has less "upside opportunity" than alternative Three. Alternative Three has a slightly higher expected value than alternative Two, so the choice is effectively a risk-return trade-off issue. Alternative Two has less risk than alternative Three, but a lower expected value. Alternative Three has higher expected value than alternative Two, but more risk.

10.1.4.2 Probabilistic Analysis: S-Curves

In this section, development plans are compared within each category as described in Section 10.1.3 and across all categories based on economic benefits to Manitoba Hydro using expected value, risk profiles (downside risk and upside opportunity) and the reference (most likely) scenario. In subsequent chapters, further comparisons are made incorporating financial and "multiple-account" impacts.

The comparisons in this section draw out the differences between the plans, as some of the plans have expected values that are within the same order of magnitude but may have different risk profiles. A table which provides the incremental NPV for the Ref-Ref-Ref scenario, the expected value and the 10^{th} and 90^{th} percentile values for each development plan, is included on each s-curve figure.

The development plans being evaluated are categorized as follows:

- development plans with no new U.S. interconnection designed to serve only Manitoba load and existing export commitments
- development plans with a 250 MW U.S. interconnection
- development plans with a 750 MW U.S. interconnection
- comparison of development plans across categories.

Within the comparison of plans across the categories, comparisons were made to demonstrate the difference between pursuing:

- plans with a 250 MW interconnection or a 750 MW interconnection
- plans with and without the proposed 300 MW WPS sale and related investment in the 750 MW interconnection
- plans with and without Conawapa generating station (G.S.).

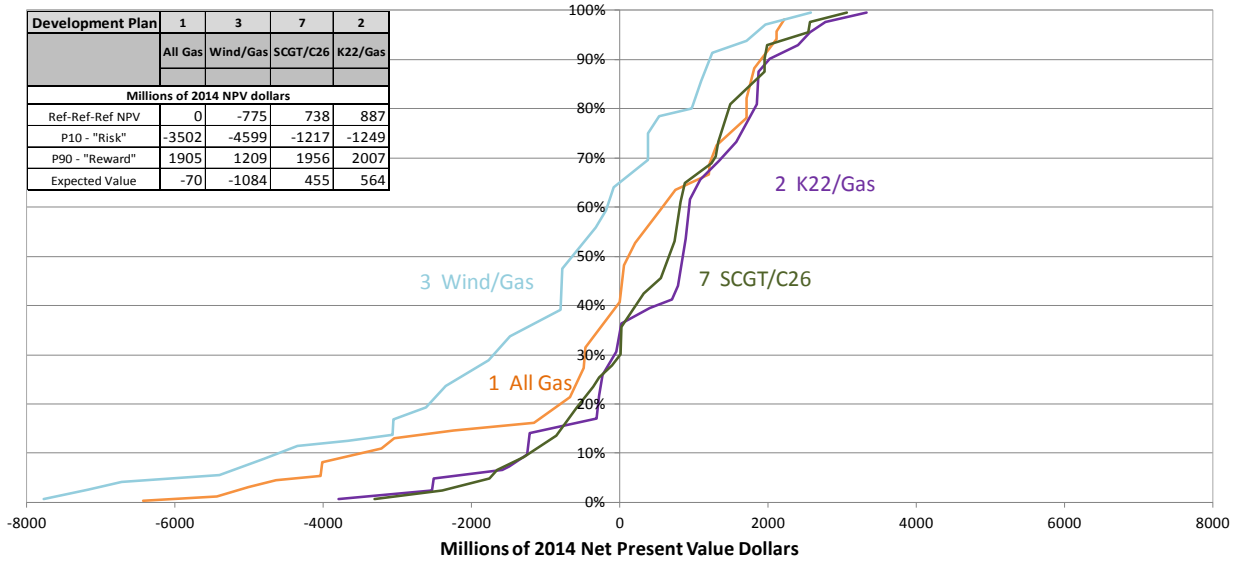
Development Plans with No New U.S. Interconnection - Four Plans

Figure 10.11 displays the four plans in the "Manitoba Load" category that were evaluated: All Gas, Wind/Gas, K22/Gas and SCGT/C26. The expected values for the four plans are: $70 million, $1,084 million, $564 million and $455 million, respectively. With the exception of the Wind/Gas Plan, the plans all have similar upside potential above the 60th percentile. The Wind/Gas plan has the greatest downside risk and the least upside potential when compared to the other three plans and results in an expected value that is significantly lower than the other three plans at $1,084 million. The Wind/Gas plan is less economic than that of the All Gas plan due to the greater capital cost of the Wind/Gas plan. Both plans require the same level of natural gas-fired generation to meet increases in system peak loads. The Wind/Gas plan has the additional cost of the wind turbines and the fuel savings associated with the wind generation is not sufficient to offset these increased costs. With the increased capital cost, the Wind/Gas plan is more sensitive to lower discount rates. As shown in Figure 10.11, the All Gas plan lies to the right of the Wind/Gas plan, clearly dominating the Wind/Gas plan.

While the All Gas plan dominates the Wind/Gas plan, it has a significantly greater downside potential than the K22/Gas and SCGT/C26 plans due to the greater proportion of thermal generation, particularly under low discount rate scenarios. Therefore, on the basis of the expected values and the risk profile, it can be concluded that the All Gas and Wind/Gas plans are effectively dominated, making both inferior to K22/Gas and SCGT/C26.

Figure 10.11 Probabilistic Analysis: S-Curves
Plans With No New Interconnection

Development Plan	1	3	7	2
	All Gas	Wind/Gas	SCGT/C26	K22/Gas
Millions of 2014 NPV dollars				
Ref-Ref-Ref NPV	0	-775	738	887
P10 - "Risk"	-3502	-4599	-1217	-1249
P90 - "Reward"	1905	1209	1956	2007
Expected Value	-70	-1084	455	564



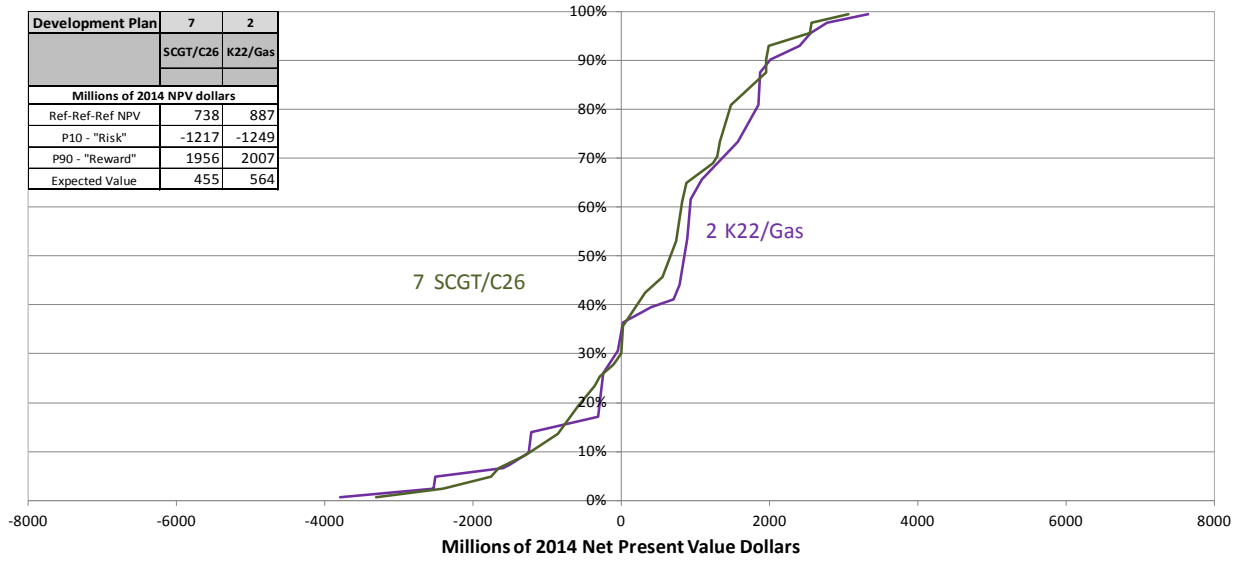


Figure 10.12 Probabilistic Analysis: S-Curves
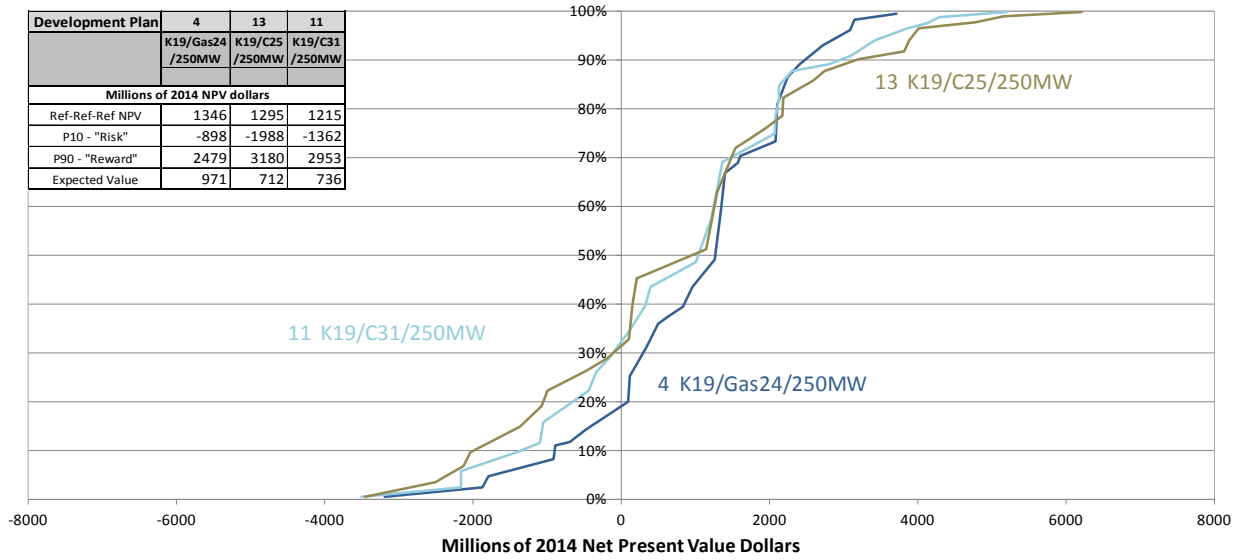
K22/Gas and SCGT/C26 Plans

Development Plan	7	2
	SCGT/C26	K22/Gas
Millions of 2014 NPV dollars		
Ref-Ref-Ref NPV	738	887
P10 - "Risk"	-1217	-1249
P90 - "Reward"	1956	2007
Expected Value	455	564



As shown in Figure 10.12, K22/Gas and SCGT/C26 have comparable risk profiles, with the expected value of K22/Gas approximately $100 million greater than the SCGT/C26 plan. On this basis, K22/Gas is preferable to the other three "Manitoba load only" plans. SCGT/C26 is a reasonable second choice.

Development Plans with a 250 MW U.S. Interconnection - Three Plans

Figure 10.13 displays the three plans in the "250 MW interconnection" category.

Figure 10.13 Probabilistic Analysis: S-Curves
Plans With 250 MW U.S. Interconnection

Development Plan	4	13	11
	K19/Gas24 /250MW	K19/C25 /250MW	K19/C31 /250MW
Millions of 2014 NPV dollars			
Ref-Ref-Ref NPV	1346	1295	1215
P10 - "Risk"	-898	-1988	-1362
P90 - "Reward"	2479	3180	2953
Expected Value	971	712	736

The expected value of Plan 4 (K19/Gas24/250MW) exceeds that of Plan 13 (K19/C25/250MW) and Plan 11 (K19/C31/250MW) by over $230 million. As shown in Figure 10.13, below the 50th percentile, Plan 4 lies to the right of both of the other 250 MW interconnection plans, indicating that Plan 4 has less downside risk. Above the 80th percentile, Plan 4 lies to the left of the other 250 MW interconnection plans, showing less upside potential due to limited surplus power as it does not have the Conawapa G.S. As the two plans with the Conawapa G.S. have greater surplus energy, without fixed-priced surplus power sales they would have more exposure to export price risk when prices are low and greater upside potential when prices are high. The relative risk-reward trade-off between the three plans is reflected in their expected values of $971 million, $712 million and $736 million. From an economic evaluation perspective Plan 4,

with an expected value of over $200 million higher than the other two plans, is the most economic of the three plans. Careful consideration must be given to the trade-offs between the plans due to difference in their risk profiles as shown in this economic evaluation. Further analysis of other perspectives (financial, multiple accounts and optionality), which are provided in following chapters, will be an important consideration.

Development Plans with a 750 MW U.S. Interconnection - Five Plans

There are five plans in the "750 MW interconnection" category. Two of the plans, Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)) and Plan 5 (K19/Gas25/750MW (WPS Sale & Inv)), include the proposed 300 MW WPS sale and related investment in the 750 MW transmission interconnection. The other three plans, Plan 12 (K19/C31/750MW), Plan 6 (K19/Gas31/750MW) and Plan 15 (K19/C25/750MW), reflect the uncertainty in the outcome of the ongoing negotiations with Wisconsin Public Service (WPS) and, therefore, do not include the proposed 300 MW WPS sale and, in addition, in one of the plans the in-service date of Conawapa is deferred to 2031/32.

Figure 10.14 shows the two development plans with the proposed 300 MW WPS sale. As shown in Figure 10.14, when compared with Plan 5 (K19/Gas25/750MW (WPS Sale & Inv)), the Preferred Development Plan (Plan 14) is $300 million higher in expected value. Below the 50th percentile, the risk profile is similar for the two plans but is driven by different factors. The downside risk of Plan 5 is due to a greater proportion of operating costs being related to thermal generation, particularly under low discount rate scenarios. As the Preferred Development Plan, which has Conawapa in 2025/26, has a large volume of surplus power, it is more sensitive to lower energy prices particularly when combined with higher discount rates and higher capital costs. Above the 50th percentile, the Preferred Development Plan lies to the right of Plan 5, reflecting significantly greater value primarily due to the availability of surplus power from the Conawapa G.S. at reference or higher energy prices.

Figure 10.14 Probabilistic Analysis: S-Curves
Plans With 750 MW Interconnection and Proposed WPS Sale

Development Plan	5	14
	K19/Gas25 /750MW	K19/C25 /750MW
	WPS Sale & Inv	WPS Sale & Inv
Millions of 2014 NPV dollars		
Ref-Ref-Ref NPV	1097	1696
P10 - "Risk"	-828	-1429
P90 - "Reward"	2256	3377
Expected Value	772	1085

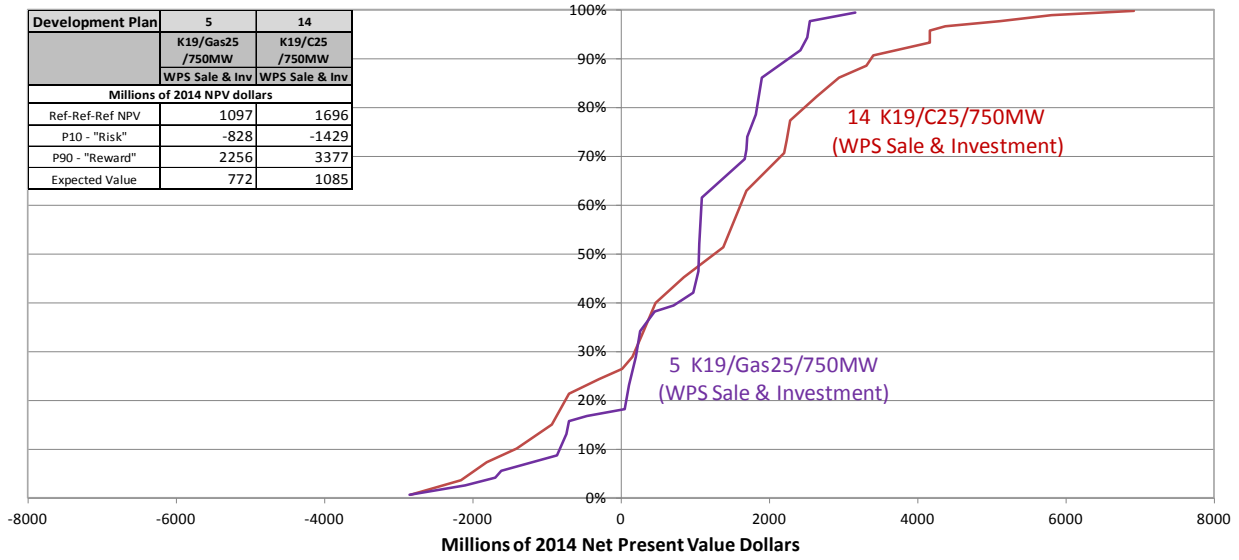


Figure 10.15 shows the three development plans without the proposed 300 MW WPS sale. As shown in Figure 10.15, when comparing the plans that do not include the proposed 300 MW WPS sale, the range of expected values is in the order of $100 million. Under scenarios where energy prices are low, Plan 12 (K19/C31/750MW) and Plan 15 (K19/C25/750MW) yield lower incremental NPVs than Plan 6 (K19/Gas31/750MW). Plan 12 and Plan 15 have greater upside potential when the energy prices are at reference or high (regardless of whether capital cost is at low, reference or high values and when discount rate is at low or reference values) because in Plans 12 and 15 there is surplus power from the Conawapa G.S. to take advantage of the energy prices. As the two plans with the Conawapa G.S. (Plan 12 and Plan 15) have greater surplus energy without fixed-priced export sales, they have more exposure to export price risk when prices are low and greater upside potential when prices are high. With such a narrow range in the expected values of the three development plans (i.e. within approximately $100 million), careful consideration must be given to the risk/reward trade-offs between the plans.

Figure 10.15 Probabilistic Analysis: S-Curves Plans With 750 MW Interconnection and Without Proposed WPS Sale

Development Plan	6	15	12
	K19/Gas31 /750MW	K19/C25 /750MW	K19/C31 /750MW
Millions of 2014 NPV dollars			
Ref-Ref-Ref NPV	1091	1427	1360
P10 - "Risk"	-1181	-2186	-1594
P90 - "Reward"	2215	3360	3220
Expected Value	706	760	821

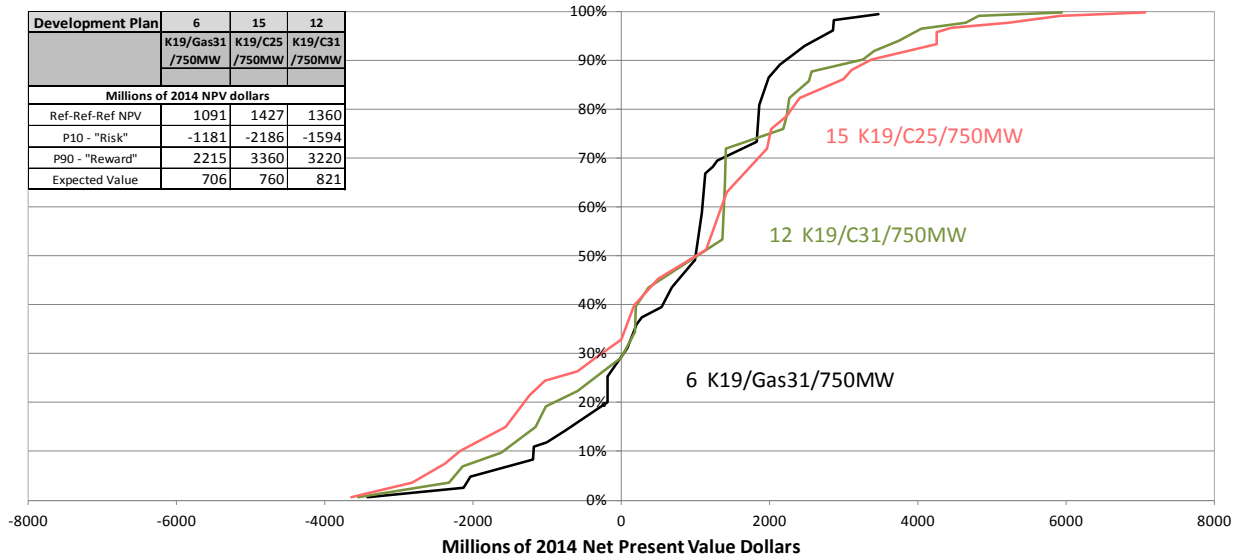

Figure 10.16 displays the three development plans with the 750 MW interconnection and Conawapa G.S.: the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)), Plan 12 (K19/C31/750MW), and Plan 15 (K19/C25/750MW). The Preferred Development Plan and Plan 15 both have the Conawapa G.S. in 2025/26, while Plan 15 reflects the uncertainty in the outcome of the ongoing negotiations with WPS by not including this sale and, therefore, provides a direct comparison to the Preferred Development Plan (Plan 14). The two plans without the proposed 300 MW WPS sale include increased costs to Manitoba Hydro associated with the U.S. interconnection as no investment from WPS is assumed.

The expected value of $1,085 million for the Preferred Development Plan is the highest expected value of the development plans evaluated. The other two development plans in Figure 10.16 have expected values that place them in the top three development plans after the Preferred Development Plan.

Figure 10.16 Probabilistic Analysis: S-Curves
Plans with 750 MW Interconnection and Conawapa G.S.

Development Plan	15	12	14
	K19/C25 /750MW	K19/C31 /750MW	K19/C25 /750MW WPS Sale & Inv
Millions of 2014 NPV dollars			
Ref-Ref-Ref NPV	1427	1360	1696
P10 - "Risk"	-2186	-1594	-1429
P90 - "Reward"	3360	3220	3377
Expected Value	760	821	1085

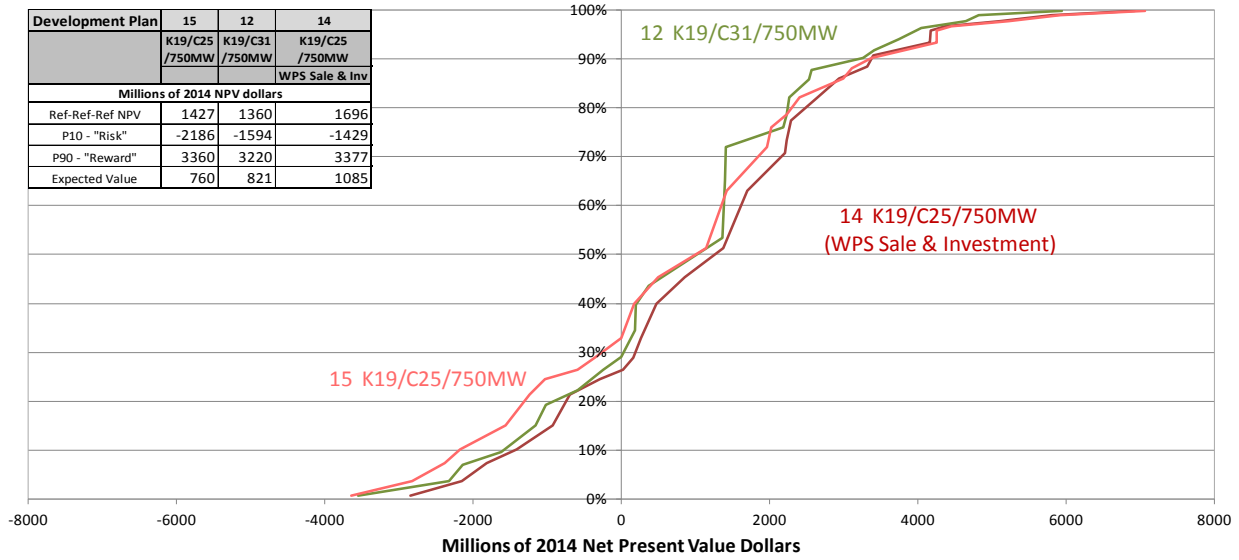

Figure 10.16 highlights the difference between plans which have more surplus power at fixed export prices as opposed to plans with surplus capacity and energy evaluated at forecasted long-term electricity export prices. The Preferred Development Plan, which includes the proposed 300 MW WPS Sale, when compared to Plan 15 (without the proposed 300 MW WPS sale) has an expected value that is higher by over $300 million. Plan 15 has slightly more upside potential than the Preferred Development Plan above the 90th percentile—more of the surplus power in the Preferred Development Plan is at fixed prices, which are lower than those in the high end of the range of energy prices being evaluated. The benefit of this upside potential for Plan 15, however, is more than offset by the significant downside risk related to the exposure to low energy prices on surplus power unprotected by fixed prices. Plan 12 benefits from comparatively lower capital costs and less exposure to low energy prices partially offset by lower upside potential all due to the deferral of Conawapa G.S. This is reflected in an expected value of $821 million which falls between that of the Preferred Development Plan at $1,085 million and Plan 15 at $760 million.

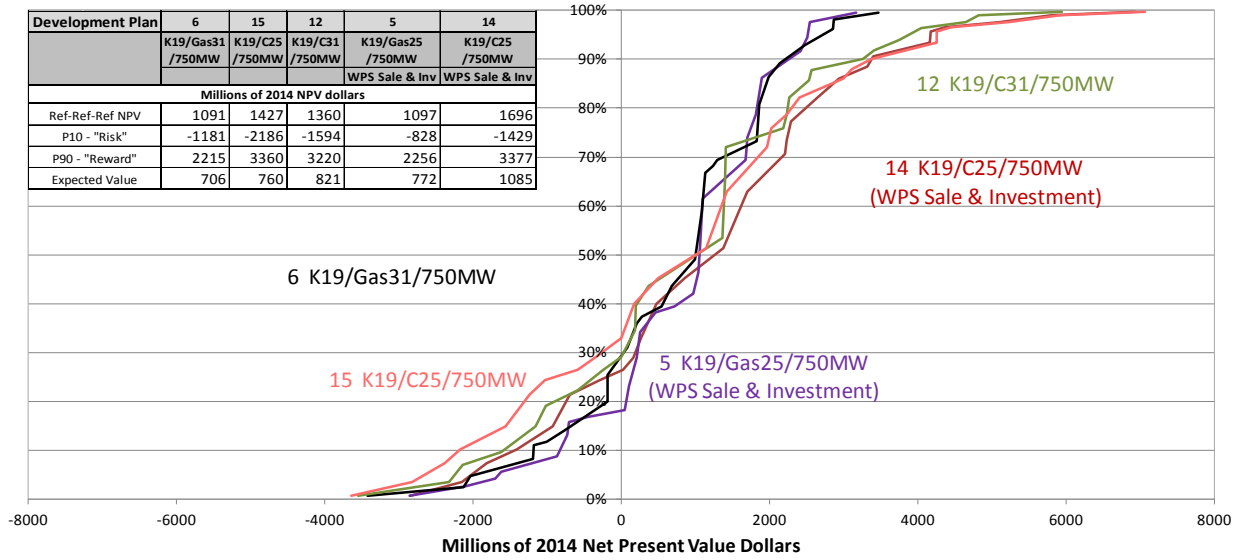

Figure 10.17 displays the five plans in the “750 MW interconnection” category. Two of the plans with a 750 MW interconnection reflect the proposed 300 MW sale to WPS, while the other

three plans reflect the sale of all surplus capacity and energy at forecasted long-term electricity export prices. When all five plans are considered together, there is a noticeable distinction in the upside potential (beyond the 70th percentile) for the plans with the Conawapa G.S. There is a smaller range across the five plans below the 40th percentile, with the plans with natural gas generation lying to the right of the other three plans, indicating less downside risk.

Plan 12 (K19/C31/750MW) and the Preferred Development Plan are higher in expected value when compared to the other plans. On the basis of both the expected value and upside potential, the Preferred Development Plan is the most attractive plan with a "750 MW interconnection" plan. Plan 12 is a reasonably close second choice.

Comparison of Development Plans Across Categories

Comparisons were made across categories to demonstrate the differences between development plans. Figures 10.18 to 10.21 compare a number of the major elements of the development plans, including:

- plans with a 250 MW interconnection or a 750 MW interconnection
    - a 250 MW interconnection compared to no interconnection (Figure 10.18)

- a 250 MW interconnection compared to a 750 MW interconnection with natural gas-fired generation (Figure 10.19)
- a 250 MW interconnection compared to a 750 MW interconnection with Conawapa G.S. (Figure 10.20)
- a 250 MW interconnection with natural gas-fired generation compared to a 750 MW interconnection with Conawapa G.S. (Figure 10.21)

- plans with and without the proposed 300 MW WPS sale and related investment in the750 MW interconnection (Figure 10.20 and Figure 10.21)
- plans with and without Conawapa G.S.
  - Plans *without* Conawapa G.S. (Figure 10.18 and Figure 10.19)
  - Plans *with* Conawapa G.S. (Figure 10.20 and Figure 10.21).

As shown in Figure 10.18, when compared to the K22/Gas development plan, Plan 4 (K19/Gas24/250MW) is dominant and has an expected value that is higher by over $400 million. This means that it is more beneficial to advance the Keeyask G.S. and invest in a small interconnection than to consider any of the development plans without a new U.S. interconnection.

Figure 10.18 Probabilistic Analysis: S-Curves
K22/Gas and K19/Gas24/250MW Plans

Development Plan	2	4
	K22/Gas	K19/Gas24 /250MW
Millions of 2014 NPV dollars		
Ref-Ref-Ref NPV	887	1346
P10 - "Risk"	-1249	-898
P90 - "Reward"	2007	2479
Expected Value	564	971

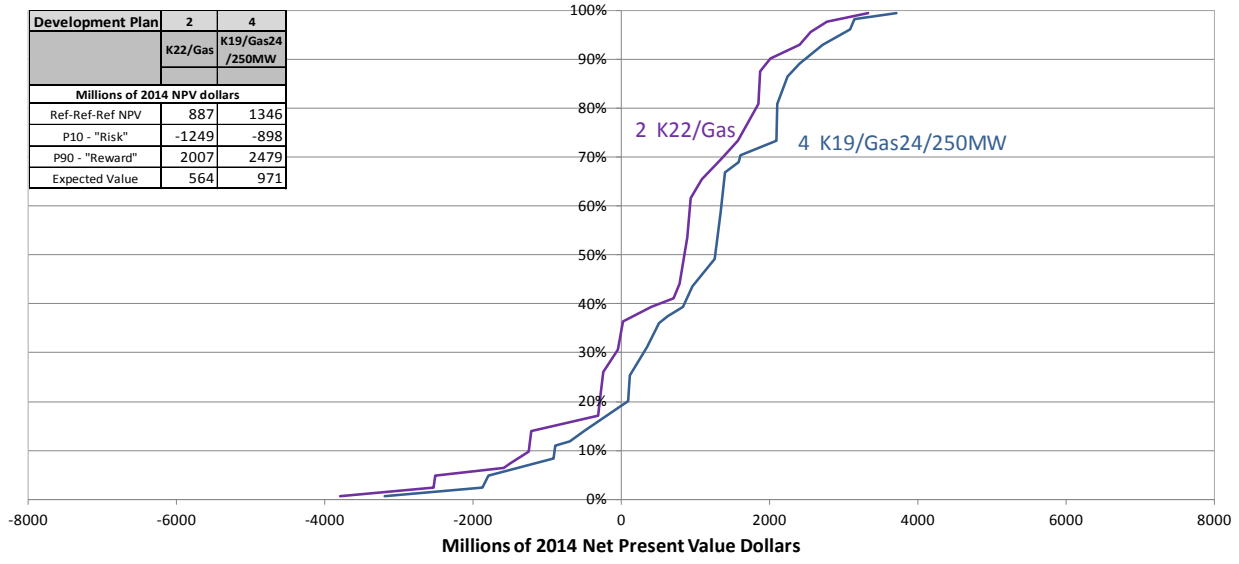

Figure 10.19 compares Plan 4 (K19/Gas24/250MW) to the 750 MW interconnection plans with natural gas-fired generation: Plan 5 (K19/Gas25/750MW) and Plan 6 (K19/Gas31/750MW). The chart on the left shows that Plan 4 dominates Plan 6.

The chart on the right shows that below the 40th percentile, risk profiles for Plan 4 and Plan 5 are similar because the additional value associated with the import capability of the large interconnection offsets the higher capital cost of the large interconnection. Above the 70th percentile, Plan 5 (with the 750 MW interconnection) has lower incremental NPVs as there is limited surplus energy to export on the large line to compensate for its higher capital cost. This illustrates that it is more beneficial to invest in a small interconnection when the Keeyask G.S. is followed by natural gas-fired generation.

Figure 10.19 Probabilistic Analysis: S-Curves
250 MW to 750 MW Interconnections
Development Plans with Natural Gas Generation

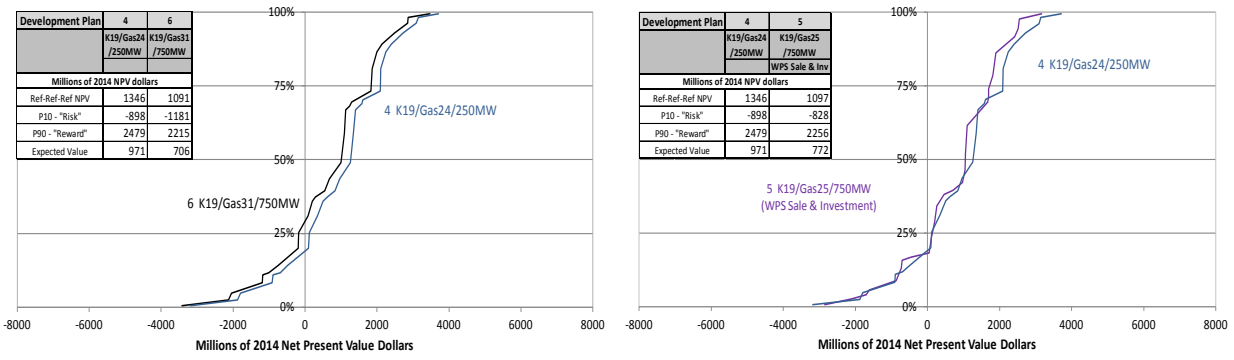

Figure 10.20 shows various comparisons of plans with Conawapa G.S. and either a 250 MW or a 750 MW interconnection.

Figure 10.20 Probabilistic Analysis: S-Curves
250 MW to 750 MW Interconnections
Development Plans with Conawapa G.S.

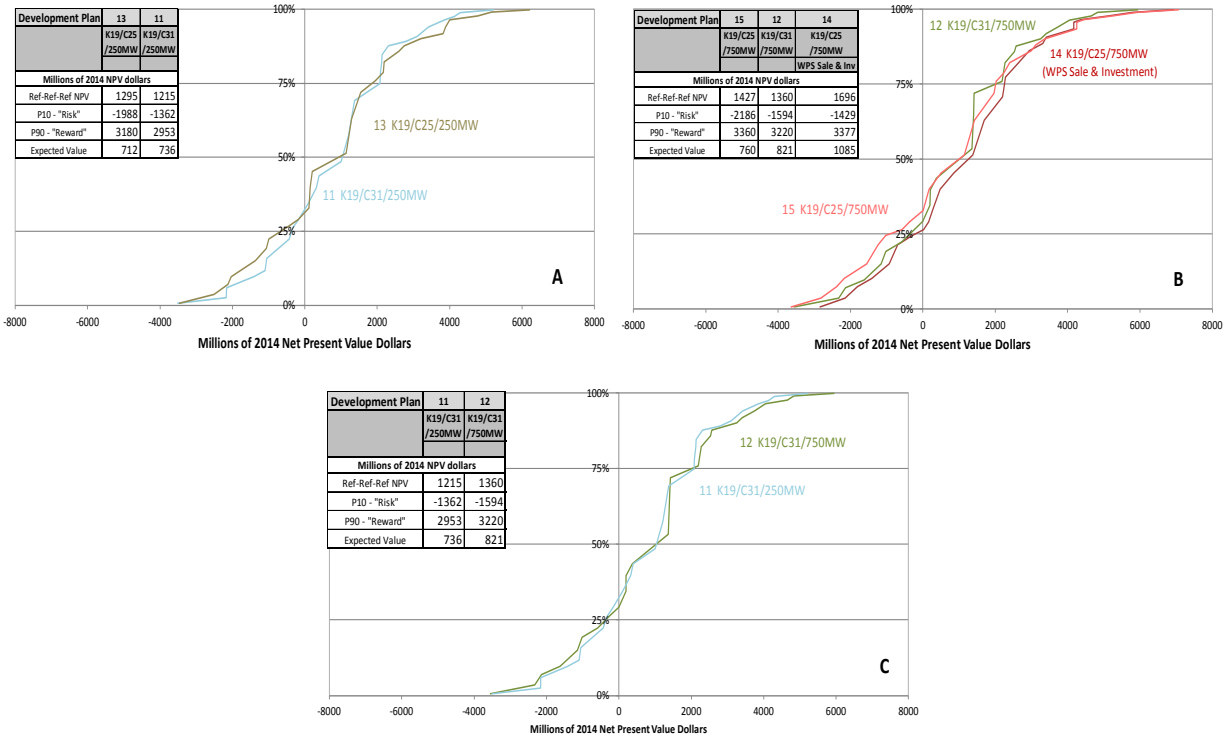

Chart A, on the left side of Figure 10.20, compares Plan 13 (K19/C25/250MW) to Plan 11 (K19/C31/250MW). From an expected value perspective, each plan yields similar values of $712 million and $736 million, respectively, and the NPV at Ref-Ref-Ref scenario for Plan 11 is only $80 million higher. In both plans surplus power from Conawapa G.S. is priced at forecasted long-term electricity export prices. With Plan 13 (Conawapa G.S. in 2025/26), the early years of Conawapa G.S. will have a greater surplus as Manitoba load is lower than it would be in 2031/32. This surplus is likely to exceed available export transmission capability more frequently with only a 250 MW interconnection. The incremental revenue from Plan 13 is unlikely to provide sufficient revenue to offset the additional capital cost of advancing it from 2031/32 to 2025/26 without a larger interconnection. The economic analysis slightly favours the development plan with Conawapa G.S. in 2031/32.

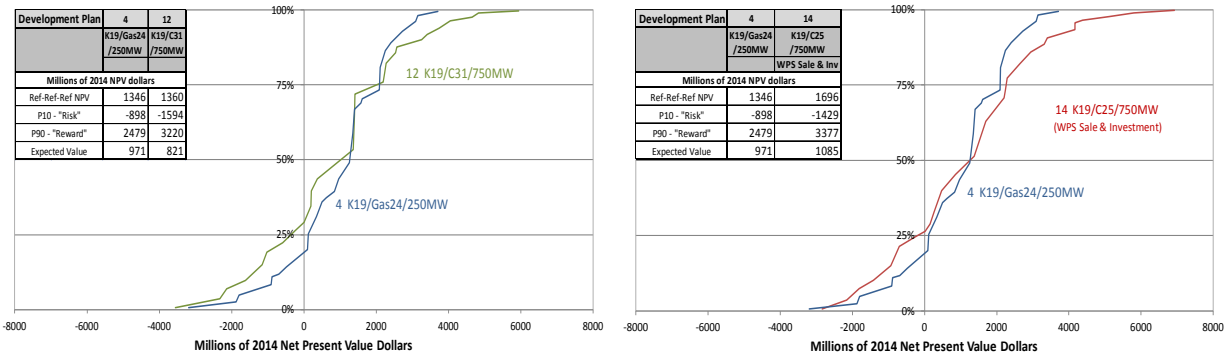

Chart B, on the right side of Figure 10.20, compares Plan 15 (K19/C25/750MW), Plan 12 (K19/C31/750MW) and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)). As explained in the comparison of "Development Plans with a 750 MW U.S. Interconnection - Five Plans", when the Preferred Development Plan is compared to Plan 15, the Preferred Development Plan (with the WPS Sale & Inv) has an expected value that is higher by over $300 million. Plan 15 has slightly more upside potential above the 90th percentile than the Preferred Development Plan, while Plan 12 (Conawapa 2031) benefits from the deferral of Conawapa G.S. This is reflected in an expected value of $821 million which falls between that of the Preferred Development Plan at $1,085 million and Plan 15 (Conawapa 2025) at $760 million. Chart B shows the Preferred Development Plan has the highest expected value and shows that a deferral of Conawapa to 2031 (Plan 12) yields similar results to Plan 15 (Conawapa 2025).

Chart C of Figure 10.20 compares Plan 11 (K19/C31/250MW) and Plan 12 (K19/C31/750MW) to illustrate the effect of developing a 750 MW interconnection as compared to a 250 MW interconnection. When comparing these two plans on an expected value basis, Plan 12 (with a 750 MW interconnection) exceeds Plan 11 by only $85 million while under the reference scenario Plan 12 exceeds the incremental NPV of Plan 11 by $145 million. The risk profiles are similar between the two plans with slightly more upside potential for Plan 12 above the 75th percentile where there is more opportunity to derive benefit from a larger interconnection. The two plans have very similar downside risk with slightly less risk for Plan 11 below the 25th percentile. From an expected value perspective, the analysis yields similar results and slightly favours Plan 12 (750 MW interconnection). Further analysis of other perspectives (financial, multiple accounts and optionality), which are provided in following chapters, will be important when considering whether to pursue a 250 MW or 750 MW interconnection.

Figure 10.21 provides additional comparisons that demonstrate the difference between pursuing a 250 MW interconnection compared to a 750 MW interconnection. Plan 4

(K19/Gas24/250MW) is compared to Plan 12 (K19/C31/750MW) and to the Preferred Development Plan.

Figure 10.21 Probabilistic Analysis: S-Curves
250 MW to 750 MW Interconnections
Selected Development Plans with Conawapa G.S. or Gas

In order to reflect the uncertainty in the outcome of the ongoing negotiations with WPS, Plan 12 is compared to Plan 4 as shown in the chart on the left side of Figure 10.21. These plans have different risk profiles, with Plan 4 being less sensitive to low energy prices and high discount rates. Plan 12 has greater upside potential when energy prices are high (regardless of whether capital cost or discount rate factors are at low, reference or high values) because in this plan there is surplus power from the Conawapa G.S. to take advantage of the higher energy prices. As Plan 12 (K19/C31/750MW) requires a higher capital investment in generation and in the U.S. interconnection when compared to Plan 4 (K19/Gas24/250MW), there is more exposure to higher discount rates. Plan 12 (without the WPS sale) has a higher volume of surplus energy priced at forecasted long-term electricity export prices rather than at fixed prices and is more exposed to lower energy prices than is Plan 4. While Plan 4 has an expected value of $150 million higher than Plan 12, careful consideration must be given to the trade-offs between the plans given the difference in their characteristics and in their risk profiles.

The chart on the right side of Figure 10.21 compares the Preferred Development Plan to Plan 4. When comparing these two plans on an expected value basis, the Preferred Development Plan exceeds Plan 4 by only $114 million, while under the reference scenario the Preferred Development Plan exceeds the incremental NPV of Plan 4 by $350 million. The Preferred

Development Plan has the highest incremental NPV of all of the development plans for the Ref-Ref-Ref scenario as shown in ***Chapter 9 – Economic Evaluations – Reference Scenario***.

The Preferred Development Plan has higher upside potential while Plan 4 (K19/Gas24/250MW) has less downside risk. Under scenarios where energy prices are low, the Preferred Development Plan as compared to Plan 4 yields lower incremental NPVs, with the exception of those scenarios where both energy prices and discount rates are low. At low energy prices, the surplus energy from the Preferred Development Plan does not result in sufficient revenues—when compared to Plan 4—to offset the higher capital cost of the Conawapa G.S. and a larger interconnection. The revenues are insufficient when energy prices are low primarily due to the assumption that surplus capacity and energy (beyond that which is under proposed or existing long-term contracts) are not at fixed prices but are exposed to a range of energy prices.

Generally, at reference or high energy prices, the Preferred Development Plan has greater incremental NPVs because there is surplus power from the Conawapa G.S. and a large interconnection to move the energy to the export market. Under the reference scenario, the Preferred Development Plan exceeds the incremental NPV of Plan 4 by $350 million while the difference in the expected value between the two plans is just over $100 million. Plans with the Conawapa G.S. protect the potential benefits associated with the development of a large interconnection. Given the different characteristics of these plans (Conawapa G.S. versus Gas, and 750 MW interconnection versus 250 MW interconnection), careful consideration must be given to the trade-offs between the plans. Further analysis of other perspectives (financial, multiple accounts and optionality), which are provided in following chapters, are important to the overall conclusions provided in ***Chapter 14 - Conclusions***.

10.1.5 Probabilistic Analysis Conclusions

In section 10.1, probabilistic analysis was used to compare 12 plans within and across three categories:

- development plans with no new U.S. interconnection designed to serve only Manitoba load and existing export commitments
- development plans with a 250 MW U.S. interconnection
- development plans with a 750 MW U.S. interconnection.

Table 10.7 Probabilistic Analysis – Expected Values and Reference NPV Incremental Economics – All Scenarios

Development Plan	1	3	7	2	4	13	11	6	15	12	5	14
	All Gas	Wind/Gas	SCGT/C26	K22/Gas	K19/Gas24 /250Mw	K19/C25 /250MW	K19/C31 /250MW	K19/Gas31 /750MW	K19/C25 /750MW	K19/C31 /750MW	K19/Gas25 /750MW	K19/C25 /750MW
											WPS Sale & Investment	
	Millions of 2014 NPV dollars											
Expected Value	-70	-1084	455	564	971	712	736	706	760	821	772	1085
Ref-Ref-Ref NPV	0	-775	738	887	1346	1295	1215	1091	1427	1360	1097	1696

The following conclusions are provided for the probabilistic analysis of development plans.

Conclusion from the evaluation of the four plans in the "Manitoba load" category (All Gas, Wind/Gas, K22/Gas and SCGT/C26):

- Based on the expected values, reference scenario NPVs and on risk profiles, the All Gas and Wind/Gas plans are effectively dominated, making both inferior to K22/Gas and SCGT/C26. The K22/Gas plan is preferable to the SCGT/C26 plan with the SCGT/C26 plan being a reasonable second choice. (Figures 10.11 and 10.12)

Conclusions from the evaluation of the three plans with a 250 MW interconnection (Plan 4 (K19/Gas24/250MW), Plan 11 (K19/C31/250MW) and Plan 13 (K19/C25/250MW)):

- It is more beneficial to advance Keeyask G.S. and invest in a small interconnection than it is to pursue development plans designed to serve only Manitoba load and existing export commitments. (Figure 10.18)
- Of the plans that contemplate a 250 MW interconnection, Plan 4 (K19/Gas24/250MW) is the most economic plan; however, careful consideration must be given to the trade-offs between the plans as there are notable differences in their risk profiles. (Figure 10.13)

Conclusion from the evaluation of the five development plans with a 750 MW interconnection (Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)), Plan 5 (K19/Gas25/750MW (WPS Sale & Inv)), Plan 12 (K19/C31/750MW), Plan 6 (K19/Gas31/750MW) and Plan 15 (K19/C25/750MW)):

- There is a noticeable distinction in the upside potential for the plans with the Conawapa G.S. As well, the Preferred Development Plan has a higher expected value than the other plans. On the basis of expected value, reference scenario NPV and upside potential, the Preferred Development Plan is the most attractive "750 MW interconnection" plan. Plan 12 is a reasonably close second choice. (Figures 10.14, 10.15, 10.16 and 10.17)

Comparisons were made across categories to demonstrate the differences between development plans. Figures 10.18 to 10.21 compare a number of the major elements of the development plans, including:

- plans with a 250 MW interconnection or a 750 MW interconnection
- plans with and without the proposed 300 MW WPS sale and related investment in the 750 MW interconnection (Figure 10.20 and Figure 10.21)
- plans with and without Conawapa G.S.
    - plans *without* Conawapa G.S. (Figure 10.18 and Figure 10.19)
    - plans *with* Conawapa G.S. (Figure 10.20 and Figure 10.21)

Conclusions from comparisons made across categories:

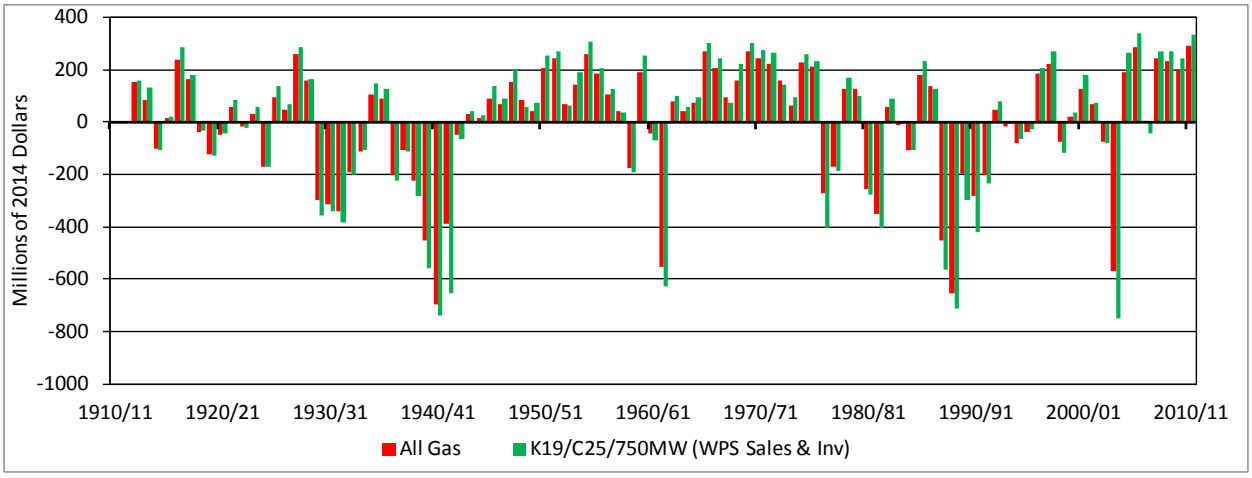
- Energy prices have the most significant impact on development plans with both Keeyask G.S. and Conawapa G.S. (including the Preferred Development Plan) and a 750 MW interconnection while discount rate has the most significant impact on plans with higher levels of natural gas-fired generation.
- The comparison of Plan 4 (K19/Gas24/250MW) to Plan 5 (K19/Gas25/750MW) shows it is more beneficial to invest in a small interconnection when the Keeyask G.S. is followed by natural gas-fired generation.

- While Plan 4 (K19/Gas24/250MW) has an expected value of $150 million higher than Plan 12 (K19/C31/750MW), careful consideration must be given to the differences in their characteristics and their risk profiles.
- While the Preferred Development Plan has a significantly higher incremental NPV under the reference scenario than that of Plan 4 (K19/Gas24/250MW) (over $350 million), the difference in their expected values is only $114 million. As a result, careful consideration must be given to the trade-offs between the plans given the different characteristics of these plans (Conawapa G.S. versus Gas and 750 MW interconnection versus 250 MW interconnection). Further analysis of other perspectives (financial, multiple accounts and optionality), which are provided in the following chapters, are important to the overall conclusions provided in **Chapter 14 - Conclusions**.

10.2 Sensitivity Analysis

Sensitivity analysis focuses on a single variable that tests the impact of that variable on selected development plans. This section will provide sensitivity analyses on drought, climate change, Manitoba load, and in-service delay.

10.2.1 Drought



This section provides a comparison of the impact of a prolonged period of below-average streamflows (5-year drought) on incremental net revenues for the All Gas plan, K22/Gas plan, K19/Gas24/250MW plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv). To assess the impact of energy prices and the timing of drought on the present value of revenues, analysis is provided for low, reference and high energy price scenarios for a 5-year drought starting in four future fiscal years as follows:

- 2014/15 — during construction of Keeyask
- 2021/22 — affecting early revenues from Keeyask and during construction of Conawapa
- 2027/28 — affecting early revenues from Conawapa

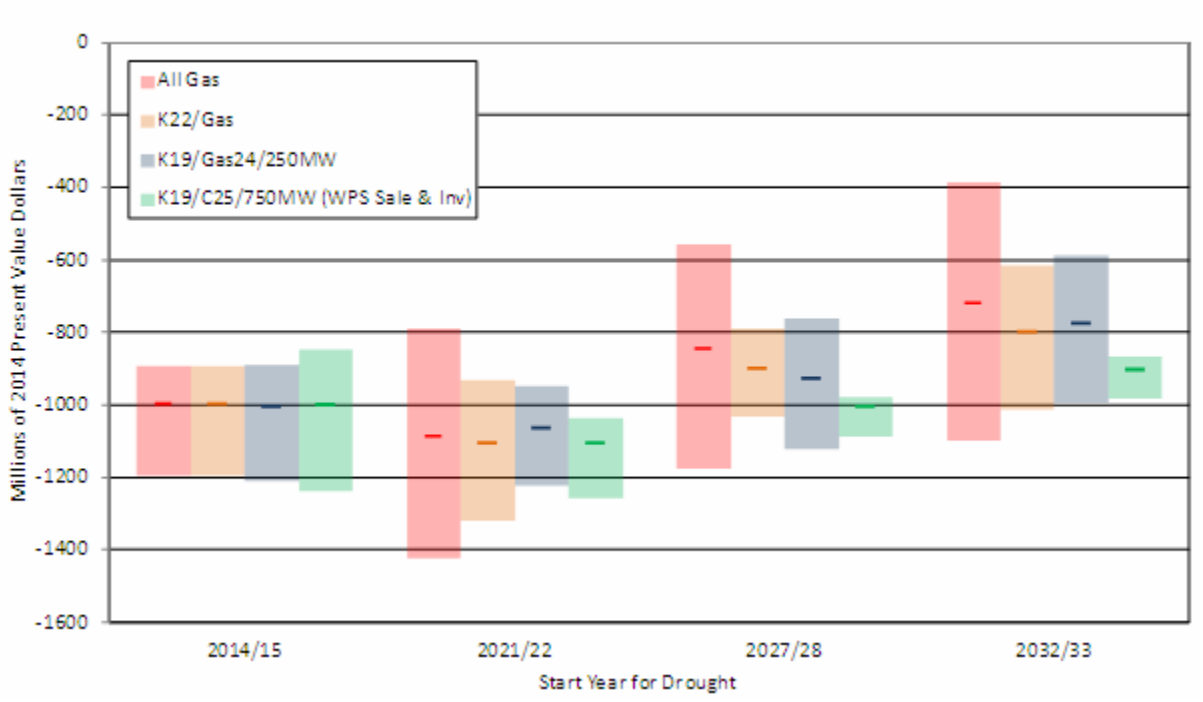
- 2032/33 — beyond early revenues from Conawapa.

The impact of specific annual flow cases on flow-related revenues will differ between development plans. Figure 10.22 shows the variation of flow-related revenues from average for the All Gas plan and the Preferred Development Plan for the 2032/33 fiscal year under each of the historic flow years from 1912-2010.

Figure 10.22 Sensitivity Analysis
Comparison of Flow Related Revenue Variability from Average
All Gas Plan and Preferred Development Plan (Reference Scenario)

Generally, Figure 10.22 shows that development plans with new hydro resources will yield incrementally higher revenues under higher flow periods and incrementally lower revenues under lower flow periods. There are several occurrences of severe drought in the historical record of flows as reflected in the years that have significantly lower than average revenue[2]. Of particular note, in the historic record, are the 5-year-periods centered on 1940 and 1990, both of which have a significant impact on flow-related revenues and provide a basis to compare this impact across development plans. While the 5-year period that spans fiscal years 1937/38 to 1941/42 has been shown to have a modestly greater financial impact, the analysis in this section is based on the 5-year period that spans fiscal year 1987/88 to fiscal year 1991/92 since

[2] A qualitative discussion on drought risk sensitivity related to a drought worse than the drought of record is presented in Chapter 10 Section 3.



there is more confidence in the flow record and this period better reflects the current regulation patterns and water use practices in watersheds upstream of Manitoba.

Table 10.8 shows the incremental change in NPV to the reference scenario for four of the development plans presented in ***Chapter 9 – Economic Evaluations – Reference Scenario***, at low, reference and high energy prices for a 5-year drought starting in 2014/15, 2021/22, 2027/28 and 2032/33. This information is also displayed in Figure 10.23.

Table 10.8 Sensitivity Analysis – 5-year Drought
Impact on Reference Scenario NPV
Low, Reference and High Energy Prices

		Impact on Reference Scenario NPV Millions of 2014$ @ 5.05 discount rate			
Start year	Prices	All Gas	K22/Gas	K19/Gas24/250MW	K19/C25/750MW (WPS Sale & Inv)
2014/15	Low	-893	-892	-891	-849
	Ref	-997	-997	-1003	-999

Figure 10.23 Sensitivity Analysis – 5-year Drought
Incremental Impact on Reference Scenario NPV
Low, Reference and High Energy Prices

For each of the four 5-year drought year periods identified in Figure 10.23, there is a coloured bar for the All Gas, K22/Gas, K19/Gas24/250MW, and K19/C25/750MW (WPS Sale & Inv) development plans. The horizontal dash in each bar is the change in NPV at reference energy prices and indicates the relative sensitivity to drought. Comparing the change in NPV at reference energy prices across the development plans, and into the future, shows that the incremental negative impact of drought is greater for plans with increasing amounts of new hydro-electric generation and a larger interconnection. This is due to a proportionally greater loss in flow-related export revenue in these plans during droughts.

The lower and upper ends of the bars represent the change in NPV due to energy prices, with the size range indicating the overall sensitivity to energy prices coincident with a drought. Overall, the All Gas plan has the greatest relative sensitivity to changes in energy prices over the course of a 5-year drought as shown in Figure 10.23. This is due to the ability of the plans with more new hydro and larger interconnection capability to generate revenue in those years in the

5-year drought that are above the critical low-flow year—such revenue offsets the additional cost of thermal generation and/or imports in the critical low-flow years. In plans with proportionally more natural gas-fired generation there is less ability to generate export revenues and, consequently, changes in energy prices translate directly into changes in the cost of generation and increasing sensitivity to energy prices into the future.

This section presented the impact of a 5-year drought on the incremental NPVs across development plans. ***Chapter 11 - Financial Evaluation of Development Plans*** includes an evaluation of drought on financial indicators, such as retained earnings, debt levels and consumer rates. In general, plans with more hydro-electric generation result in higher retained earnings which place Manitoba Hydro in a better financial position to withstand a drought.

10.2.2 Climate Change

As discussed in ***Appendix K - Manitoba Hydro Climate Change Report Fiscal Year 2012-2013***, Manitoba Hydro has long been investigating the potential impact of climate change on the operation and long-term planning of the generation system. These studies apply the results of global climate models (GCM) which simulate the changes to the global climate based on projected future emission scenarios focused on watersheds that contribute to the Manitoba Hydro system. A goal of these studies is to understand potential changes in temperature and precipitation as well as their impact on runoff and resulting streamflow. The results from GCM were used to establish a range of projected changes to average temperature, precipitation and runoff for different future time frames[3].

[3]Manitoba Hydro climate change studies to date have focused on potential changes in averages due to the strength of GCMs in being able to simulate change in climatic normals. While there is general scientific consensus that climate change may result in increased volatility of weather events, GCMs have a weaker signal of climate impacts to variability and to extreme events due to the coarseness of model resolution. Manitoba Hydro is working with Ouranos, several universities, and other utilities to investigate downscaling and post-treatment methods to quantify local impacts to extreme events and climatic variability. These studies are currently ongoing.

Changes to temperature and precipitation can have an overall effect on the planning and operation of Manitoba Hydro's system. More specifically, temperature and precipitation changes can have a direct impact on load and supply of hydro-electricity, respectively. While the effect of climate change on temperature and forecasted load has not been studied in detail, a general discussion on climate change effects related to a rise in temperature on forecasted load is provided in ***Appendix C – 2012 Electric Load Forecast***. Appendix C indicates that a uniform one degree Celsius of warming in Winnipeg throughout the year would result in a reduction in winter peak but an overall increase in energy demand as reduced winter heating requirements are more than offset by increased summer cooling requirements.

This section presents an analysis of the potential impact of climate-changed streamflow on projections of average revenue under the All Gas development plan, the K22/Gas development plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)). Comparison of these plans demonstrates the incremental effects of climate change on plans with no new hydro resources, one new hydro resource and two new hydro resources, respectively.

Runoff projections from an ensemble of GCM were used to adjust Manitoba Hydro's existing 99 year record of long-term streamflows to reflect potential changes in average runoff. The modified streamflow records were then used in Manitoba Hydro's Simulation Program for Long-term Analysis of System Hydraulics (SPLASH) model to provide average annual revenues. The main assumptions for this analysis were:

- Climate projections were based on the 2050 time frame as the 2050 projections are readily available among global climate model outputs and this time frame corresponds to the end of the 35-year planning horizon.
- A set of 109 global climate model outputs was sorted and ranked based on projected changes to average annual Manitoba Hydro system inflow. For the purpose of this evaluation, projected changes to runoff were chosen corresponding to the 5^{th}, 25^{th}, 50^{th}, 75^{th}, and 95^{th} percentiles.

- The general results from the GCM reflect changes in overall averages and do not reflect changes to specific flows, in particular, extreme low flows. The long-term streamflows were adjusted based on the projected changes to runoff, while maintaining the historic drought levels for critical low flow years. Maintaining the historic droughts in the streamflow records preserves in-service dates for development plans and enables a direct comparison of revenue changes. A qualitative discussion on risk sensitivity related to a drought worse than the drought of record is presented in Section 10.3.
- There is general scientific consensus that the effects of climate change occur over the long-term.
- To model the long-term effects of climate change, calculations were done to derive incremental average revenues for each year from 2012-2047 using the 2050s climate adjustment for flows. This results in applying the full 2050 climate change impact in every year from 2012/13 to 2047/48. To introduce incremental change in climate to the average annual revenues from 2012-2047, the revenues were proportionally adjusted, starting with no adjustment to 2012/13 average annual revenues and 100% in 2050/51.

Table 10.9 provides a summary of the change in net revenue across the various climate change projections incremental to a base, which is the unadjusted flow case for each development plan for reference scenario assumptions as provided in ***Chapter 9 – Economic Evaluations – Reference Scenario***. In general, the results indicate that approximately 70% of the GCM projections show an increase in total runoff, which results in a related increase in revenue above that of the reference scenario. Conversely 30% of the projections show a decrease in average annual revenues below that of the reference scenario. As shown in Table 10.9, for all three development plans, revenues increase or decrease with corresponding increases and decreases in streamflows.

Table 10.9 Sensitivity Analysis - Climate Change
Incremental Impact on Reference Scenario NPV

Incremental Impact on reference scenario NPVs millions of 2014$ @ 5.05% discount rate					
Development Plan	Flow Ranked Percentiles from GCMs				
	5th	25th	50th	75th	95th
All Gas	(1,431)	(240)	560	922	1,697
K22/Gas	(1,519)	(244)	602	993	1,806
Preferred Plan	(1,847)	(276)	714	1,186	2,145

Table 10.9 shows that the All Gas plan has the least amount of variability, followed by the K22/Gas plan when compared to the Preferred Development Plan. This is shown by the difference in incremental NPV impacts between the 5th and 95th percentile flows which are $3,128 million ($1,697 million minus $-1,431 million), $3,325 million and $3,992 million for the All Gas plan, the K22/Gas plan and Preferred Development Plan, respectively.

Table 10.9 also shows that plans with more new hydro-electric generation have greater upside potential (higher incremental average revenues) and greater downside risk (lower incremental average revenues) as a result of changing streamflows. For a 95th percentile runoff change, the incremental NPV relative to the All Gas plan is increased by $109 million ($1,806 million minus $1,697 million) for the K22/Gas plan and by $498 million ($2,145 million minus $1,697 million) for the Preferred Development Plan. For a 5th percentile change in runoff, the incremental NPV relative to the All Gas plan is reduced by $88 million ($-1,519 minus $-1,431 million) for the K22/Gas plan and by $416 million ($-1,847 million minus -$1,431 million) for the Preferred Development Plan. The incremental NPV changes for the K22/Gas plan are less than those for the Preferred Development Plan but exhibit similar characteristics in that there is comparatively higher upside and greater downside effects on revenues relative to the All Gas plan.

Table 10.10 combines the results of the climate change analysis on the three selected development plans with the reference scenario economics presented in ***Chapter 9 – Economic Evaluations – Reference Scenario***. In Table 10.10 the incremental NPVs resulting from the climate changed stream flow analysis are added to the incremental NPVs from the reference scenario economics from ***Chapter 9 – Economic Evaluations – Reference Scenario*** with the All Gas reference scenario as the basis for comparison. As shown in Table 10.10 both the K22/Gas plan and the Preferred Development Plan have higher net benefits than the All Gas plan across the full range of climate change results and the Preferred Development Plan has the greatest net benefits of all three plans. Development plans with new hydro have a larger base of revenue than the All Gas and therefore can withstand the downside variability in streamflows and benefit more from the upside variability in streamflows.

Table 10.10 Sensitivity Analysis- Climate Change Incremental Impact on NPV Relative to All Gas Reference Scenario

	Incremental NPV benefit, millions of 2014$ @ 5.05% discount rate			
Development Plan	Reference Scenario	Reference Scenario at 5th percentile streamflow	Reference Scenario at 50th percentile streamflow	Reference Scenario 95th percentile streamflow
All Gas	0	($1431)	$560	$1,697
K22/Gas	$887	($632)	$1,489	$2,693
Preferred Plan	$1696	($151)	$2,410	$3,841

As the Manitoba Hydro system currently consists of predominantly hydro-based generation, all plans will be affected by changes in streamflow driven by climate change. In general, the projections from GCM indicate that it is more likely that there will be an increase in average annual streamflow as approximately 70% of projections show an increase in runoff. As a result it is more likely that there will be an increase in average revenues than there will be a decrease. This analysis shows that the All Gas plan has the least amount of variability when compared to

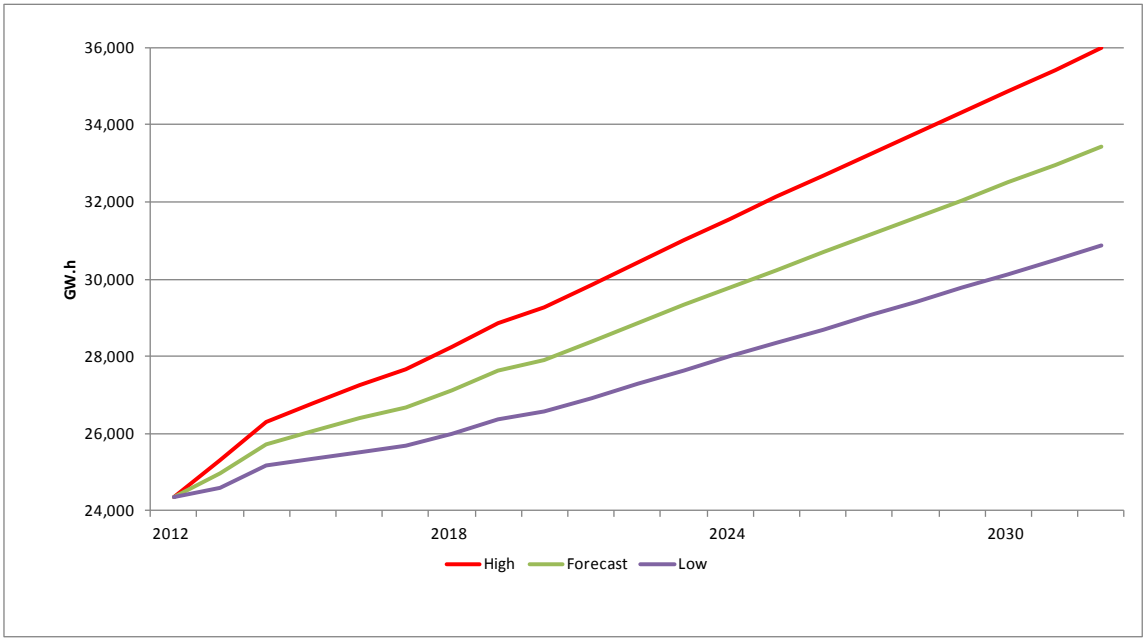
the K22/Gas plan and the Preferred Development Plan. Plans with more new hydro-electric generation have greater upside potential (higher average revenues) and greater downside risk (lower average revenues) as a result of changing streamflows. Even when the 5th percentile annual average system inflow is assumed, plans with new hydro generation have higher incremental NPVs when compared to the All Gas plan (K22/Gas plan: $799 million ($-632 million minus $-1,431 million) and Preferred Development Plan: $1,280 million ($-151 million minus $-1,431 million)).

10.2.3 Manitoba Load

This section presents an analysis of the potential impact of changes in Manitoba load to the incremental NPVs of three development plans: the All Gas development plan, the K22/Gas development plan and the Preferred Development Plan (K19/C25/750 MW (WPS Sale & Inv)). Comparison of these plans demonstrates the incremental effects of changes in load on plans with no new hydro resources, one new hydro resource and two new hydro resources, respectively.

This sensitivity analysis is based on the low and high load forecast described in ***Appendix C – 2012 Electric Load Forecast***. Figure 10.24 and Figure 10.25 show the 90th percentile and 10th percentile probability bands for the energy and peak capacity Manitoba load forecasts, respectively. This means that there is an 80% chance that Manitoba load will fall between the high and low bands for a given forecast year. The energy forecast bands correspond to an annual growth rate of 1.2% for the low band and 2.0% for the high band, compared to 1.6% per year for the base energy forecast. The capacity forecast bands correspond to an annual growth rate of 1.1% for the low band and 2.1% for the high band, compared to 1.6% per year for the base peak capacity forecast.

Figure 10.24 Sensitivity Analysis – Manitoba Load Forecast Energy Forecast Probability Bands



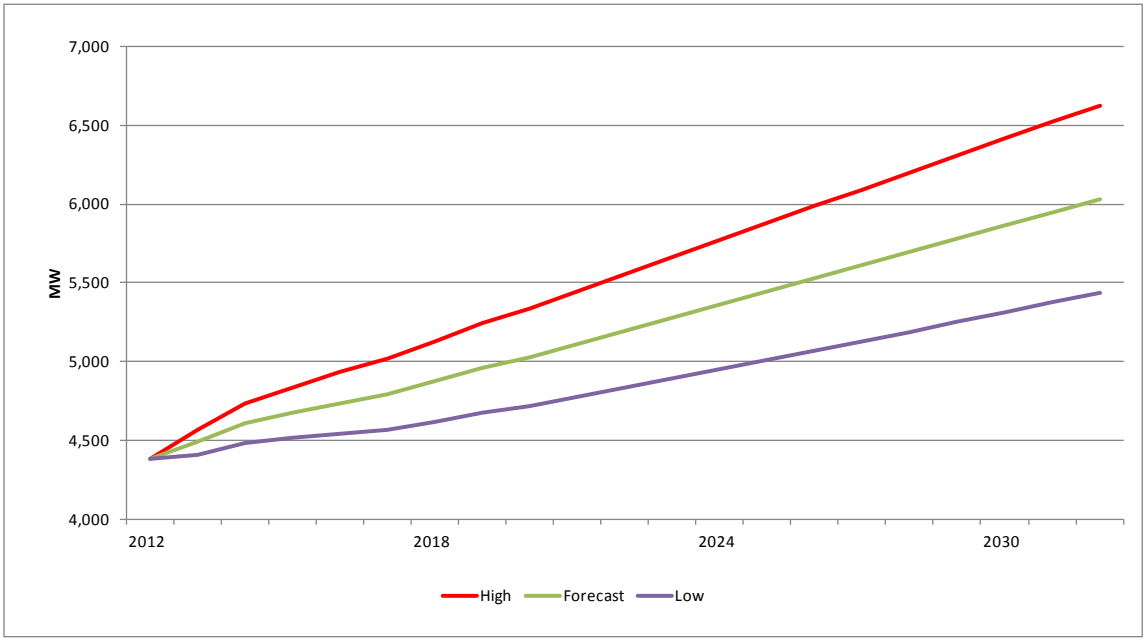


Figure 10.25 Sensitivity Analysis – Manitoba Load Forecast Peak Capacity Forecast Probability Bands

In order to evaluate the development plans, the in-service dates for new resources were adjusted in the All Gas plan, K22/Gas plan and the Preferred Plan, as required, to accommodate

the change in the load forecast (consistent with the methodology described in ***Chapter 8 – Determination and Description of Development Plans***. For the Preferred Development Plan, the in-service dates for Keeyask G.S., Conawapa G.S. and the new U.S. interconnection were held constant and the effect of changes in Manitoba load are mainly reflected in increased or decreased surplus hydro-electric energy. As shown in Table 10.11[4], under the low load forecast, new resources are required for dependable energy in 2028/29 and persistent winter peak capacity deficits start in 2029/30. Assuming the high load forecast, new resources are required for dependable energy in 2020/21 and persistent winter peak capacity deficits start in 2021/22.

System Surplus (Deficit) Dependable GW.h	2,964	2,042	1,728	1,402	1,072	718	1,053	613	272	(79)	(428)
System Surplus (Deficit) Winter Peak MW	805	753	701	646	586	522	212	152	85	14	(58)

The description of the development plans under base, low and high load forecasts is provided in Table 10.12. The All Gas, K22/Gas and Preferred Development Plan described as "Base Load" in Table 10.12, are the same as those described in ***Chapter 8 – Determination and Description of Development Plans***. Under low and high load forecasts the resources are adjusted, as applicable, to accommodate the change in the load forecast.

[4] Based on Appendix 4.2 Manitoba Hydro Supply and Demand Tables, Section 3 NFAT 2012 Reference and Section 4 NFAT 2012 Sensitivities

Table 10.12 Sensitivity Analysis - Manitoba Load
Description of Development Plans

Order of Reference Scenario Capital Investment	Development Plan	Description of Development Plan
	All Gas Low Load	Natural Gas-Fired Generation starting in 2028/29
1	All Gas Base Load	Natural Gas-Fired Generation starting in 2022/23
	All Gas High Load	Natural Gas-Fired Generation starting in 2020/21
	K28/Gas Low Load	Keeyask 2028/29, Natural Gas-Fired Generation starting in 2037/38
2	K22/Gas Base Load	Keeyask 2022/23, Natural Gas-Fired Generation starting in 2029/30
	K19/Gas High Load	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25
	K19/C25/750MW Preferred Development Plan Low Load	Keeyask 2019/20, Conawapa 2025/26, 750 MW Import/Export Interconnection 2020/21
14	K19/C25/750MW (WPS Sale & Inv) Preferred Development Plan Base Load	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export Interconnection 2020/21
	K19/C25/750MW Preferred Development Plan High Load	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2023/24, Conawapa 2025/26, 750 MW Import/Export Interconnection 2020/21

Table 10.13 presents the incremental NPVs for the low load and high load sensitivities for each development plan studied as compared to each respective base load development plan under the reference scenario. The table demonstrates that load changes have a larger impact on the All Gas development plan. Low load growth increases the NPV and high load growth decreases the NPV of the All Gas plan and the change is greater for this plan than for either the K22/Gas plan or the Preferred Development Plan. The variability in the impact on NPV decreases with the addition of new hydro resources and a new interconnection.

Table 10.13 Sensitivity Analysis- Changes in Manitoba Load
Incremental Impact on NPV Relative to Reference Scenario

	Incremental NPV benefit, millions of 2014$ @ 5.05% discount rate		
Development Plan	**Reference Scenario**	**10th percentile Manitoba Load (Low Load)**	**90th percentile Manitoba Load (High Load)**
All Gas	-	$3,470	($3,605)
K22/Gas	-	$3,319	($3,538)
K19/C25/750MW (WPS Sale & Inv) Preferred Plan	-	$3,164	($3,442)

Table 10.14 presents the incremental NPVs for the low load and high load sensitivities for each development plan studied as compared to the All Gas development plan. The reference scenario is also provided for comparison purposes.

Table 10.14 Sensitivity Analysis - Changes in Manitoba Load
Incremental Impact on NPV Relative to All Gas

	Incremental NPV benefit, millions of 2014$ @ 5.05% discount rate		
Development Plan	**Reference Scenario**	**10th percentile Manitoba Load (Low Load)**	**90th percentile Manitoba Load (High Load)**
All Gas	-	-	-
K22/Gas	$887	$736	$954
K19/C25/750MW (WPS Sale & Inv) Preferred Plan	$1,696	$1,390	$1,858

Table 10.14 shows that under the low load sensitivity the incremental NPV for development plans with new hydro resources and a new interconnection decreases relative to the All Gas development plan. Conversely under the high load sensitivity the incremental NPV for development plans with new hydro resources and a new interconnection increases relative to the All Gas development plan, but to a lesser degree than under the low load sensitivity.

Table 10.14 also shows that under the low and high load sensitivities the economic ranking of the development plans studied does not change. The K22/Gas development plan continues to be more economic than the All Gas development plan, and the Preferred Development Plan continues to be the most economic of the three plans studied.

10.2.4 In-service Date Delay

In order to demonstrate the sensitivity of the Preferred Development Plan to delays in the in-service date of Keeyask G.S. and Conawapa G.S., a development plan was studied in which the in-service date of both generating stations is delayed by one-year. Delaying the in-service dates of both plants decreases the NPV of the Preferred Development Plan by $97 million (2014$ @ 5.05% discount rate). A deferral in in-service dates will result in less surplus energy available for export thereby reducing export revenues. These lower revenues will be partially offset by the capital cost savings from the deferral. The decrease in NPV is attributable to lower export revenues being more than offset by the savings of delaying the capital expenditures by one year.

10.3 Other Factors which Contribute to Uncertainty

There are several other factors, in addition to those discussed in the probabilistic and sensitivity analyses, which may contribute to uncertainty in the economic analysis. The purpose of this section is to identify these other uncertainty factors, and to explain how they were considered in the NFAT submission analysis.

10.3.1 Export Market Uncertainty

As a predominantly hydro-electric system, Manitoba Hydro typically has surplus energy available to sell into the export market. It is the revenue from the sale of power surplus to the needs of Manitobans that contributes to the economic and financial benefits of all development plans, especially those with Keeyask and Conawapa G.S.

The uncertainty and risk related to the export market in terms of market access and export contract portfolio are discussed in the following sections.

10.3.1.1 Market Access

Market access risk is the potential for legal or regulatory restrictions which would limit Manitoba Hydro's surplus power from reaching the competitive marketplace free from unreasonable legal, regulatory, structural or tariff barriers.

Manitoba Hydro currently has excellent market access and sees no impending market access barriers on the horizon. Future development plans that include additional hydro development will result in increasing volumes of export energy, but a significant portion of the export energy is dependable energy which provides the basis for long-term relationships with major export customers. Such long-term relationships with major export customers reduce market access risk both as a result of the stability that long-term sales bring and as a result of stronger relationships between the major export customers, the regional power market and Manitoba Hydro.

Manitoba Hydro considers a complete loss of export markets to be a highly unlikely event, as Manitoba Hydro's products are competitively priced, energy is a significant expense for business and consumers, and there is significant political pressure in the U.S. to keep energy prices down. The North American Free Trade Agreement contains provisions designed to

prevent restrictions on trade in energy. Although a U.S. policy objective is energy independence, this policy is in the context of North America and not just the continental U.S. proper[5]. There are however, a number of technical, legal and regulatory issues that need to be monitored on an ongoing basis to minimize the potential for a negative impact on export power sales.

Due to the subjective nature of market access risk, and its low probability, quantitative sensitivity analysis was not undertaken. However, the magnitude of the impact on Manitoba Hydro were restrictions to occur is judged to be similar to that encountered in the low export price cases, which were studied as part of the probabilistic analysis. Manitoba Hydro engages in a comprehensive set of activities to monitor and address market access issues, as detailed in ***Chapter 15 – Implementation and Risk Management Plan for Preferred Development Plan***, which include maintaining industry awareness, monitoring and assessing industry developments and maintaining positive relationships with key groups in the industry.

10.3.1.2 Export Contract Portfolio

Manitoba Hydro currently has a portfolio of export customers and a number of existing long-term power sales as indicated in ***Appendix 9.3 - Economic Evaluation Documentation***. Existing export contracts will expire over time and Manitoba Hydro expects, subject to resource availability, to negotiate replacement contracts with updated commercial terms and conditions. There is uncertainty as to how these negotiations will progress, and in turn how the export contract portfolio will evolve. To assist in managing the uncertainty associated with renewing or extending contracts, Manitoba Hydro contracts have a range of expiry dates. Manitoba Hydro works to maintain positive relationships with its portfolio of export customers to understand their needs, and to help ensure Manitoba Hydro's continued presence as an attractive supply option. Uncertainty with respect to price on future contracts has been addressed in the full

[5] See "*Obama says Canada a partner in US plans to make itself less dependent on oil,* The Globe and Mail, March 30, 2011."

range of energy prices used in the probabilistic analysis discussed in Section 10.1 of this chapter.

As of August 2013, negotiations have not been finalized for the proposed contract with WPS for up to 300 MW of long-term power. Discussions with WPS for varying amounts of capacity and energy have been ongoing since a term sheet was first signed with WPS in March 2008. These discussions continue and, in the event that no agreement with WPS is reached, Manitoba Hydro will consider alternative arrangements.

Manitoba Hydro has addressed the uncertainty of the potential 300 MW WPS sale by considering a range of development plans, including plans without a sale to WPS. For example, Plan 15 (K19/C25/750MW) uses the same resources as the Preferred Development Plan but does not include the potential 300 MW WPS sale. Of the 15 development plans listed in ***Chapter 9 – Economic Evaluations – Reference Scenario*** Table 9.3, only two include the potential sale to WPS for up to 300 MW.

10.3.2 New U.S. Transmission Interconnection

In order to maximize the potential benefits of Keeyask or Conawapa, a new U.S. transmission interconnection is desirable: the Preferred Development Plan includes a new interconnection with 750 MW import and export capability. As of August 2013, Manitoba Hydro and Minnesota Power are proceeding with planning and development activities for a new interconnection as outlined in ***Chapter 6 – The Window of Opportunity***, Section 6.5.3. However there are a number of business, technical and regulatory issues that need to be resolved before a commitment to the transmission project can be made. These include the capacity of the interconnection, project financing, business model and cost allocation.

Manitoba Hydro has addressed the uncertainty associated with the new interconnection by considering a range of possibilities, including development plans that do not include an

interconnection. Of the 15 development plans considered in ***Chapter 9 – Economic Evaluations – Reference Scenario*** Table 9.3, five of the plans include a 750 MW import and export interconnection, three of the plans include a 250 MW export and 50 MW import interconnection, and seven of the plans include no new interconnection.

10.3.3 Drought Worse than the Drought of Record

As detailed in ***Appendix 4.1 - Manitoba Hydro Generation Planning Criteria***, Manitoba Hydro plans its system to ensure sufficient dependable energy is available to meet projected demand in the event of a repeat of the worst drought on the hydraulic record of approximately 100 years. There is the possibility that a drought worse than the one experienced in the last 100 years will occur.

All of the development plans Manitoba Hydro has considered satisfy the Generation Planning Criteria. However, development plans with more resources within Manitoba, and development plans with a larger interconnection, such as the Preferred Development Plan, give Manitoba access to a larger portfolio of supply resources. Should a system emergency occur as a result of a drought worse than the drought of record, Manitoba Hydro would be able to access greater amounts of emergency energy with the additional 750 MW of import capability provided by the Preferred Development Plan or any other development plans that include a new 750 MW interconnection.

10.3.4 Species at Risk Act

In November 2006, as part of the *Species At Risk Act* (SARA) process, the scientific Committee on the Status of Endangered Wildlife in Canada (COSEWIC) assessed Lake Sturgeon as "endangered" in most rivers in Manitoba, triggering a Fisheries and Oceans Canada (DFO) review process to consider Lake Sturgeon for listing under the SARA. In 2010 DFO conducted more thorough assessments of population status and trends, gathering the most up-to-date information from regional fisheries managers, Aboriginal traditional knowledge, academic

researchers, and consultants. These assessments indicated that more recent population trends were notably different from those in the COSEWIC assessment and, importantly, point to initial signs of population recovery. DFO is now developing a recommendation package on whether or not to list Lake Sturgeon as endangered based on current scientific data, along with the results of consultations, socio-economic assessment, and a regulatory impact analysis statement. The DFO recommendation package is to be provided to the Governor in Council, which will have up to nine months to review to accept or reject the recommendation or to send it back to COSEWIC for review and/or updating. Based on recent experience, the internal DFO review could take more than a year before it is sent to the Minister. If the Governor in Council were to return the recommendation to the COSEWIC, it is estimated that this would add at least two more years before a listing decision would be made.

Manitoba Hydro has judged the likelihood of Lake Sturgeon being listed under SARA to be low. If it were to occur, the consequence would be the delay and if permits cannot be secured under the SARA, possible cancellation of the Keeyask and Conawapa projects.

Manitoba Hydro has dealt with the risk associated with the SARA process by evaluating the impacts of the timing of the decision as well as analyzing development plans that do not include hydro-electric development. The potential timing of a SARA listing decision has been evaluated against the terms of the export power contracts, both confirmed and under negotiation. Manitoba Hydro has also evaluated development plans that do not include new hydro-electric generation should the species be listed, and permits to construct and operate new generating stations cannot be secured. As well, Manitoba Hydro is proactively continuing and expanding its commitment to Lake Sturgeon stewardship on waterways affected by hydro-electric development to demonstrate that the species does not need to be listed as endangered under the SARA for it to be protected and for populations to recover. Further information on Manitoba Hydro's Lake Sturgeon stewardship can be found in ***Appendix 2.1 - Lake Sturgeon - Mitigation and Enhancement.***

10.3.5 Aboriginal and Community Relationships

Manitoba Hydro has benefit-sharing and adverse effects agreements with the local Cree Nations for the Keeyask Project and is committed to similar agreements for the Conawapa Project, although the exact nature of the agreements will vary. There are uncertainties associated with each project. For example, in the case of the Keeyask Project, actual financial results could be inconsistent with the projections when the Keeyask Joint Development Agreement was being negotiated. With the Conawapa Project, agreements may not be achieved between the negotiating parties.

The economic circumstances of Manitoba Hydro's major projects have changed during the past several years, due in part to lower energy prices. Manitoba Hydro and Nisichawayasihk Cree Nation, its partner in Wuskwatim G.S., are currently negotiating amendments to the Wuskwatim Development Agreement to deal with this issue. Manitoba Hydro made adjustments to the Keeyask Project development approach post-Wuskwatim. The Keeyask Cree Nations (KCNs) were always aware the Keeyask financial results modeled during negotiations were done so using the forecasting information available at that time. The availability of two investment options, common and preferred, provides the KCNs with an investment choice depending upon their risk tolerance.

Manitoba Hydro is obligated to have adverse effects arrangements in place with Tataskweyak Cree Nation (TCN), York Factory First Nation (YFFN) and Fox Lake Cree Nation (FLCN) (but not including War Lake First Nation (WLFN) and Shamattawa First Nation), under the terms of existing agreements that resolved Northern Flood Agreement (NFA) implementation and the adverse effects of the Churchill River Diversion and Lake Winnipeg Regulation projects and then existing works and power developments on the Nelson and Churchill Rivers. If negotiations are not successful, then the arrangements can be arbitrated.

There is no similar legal requirement to achieve benefit sharing agreements. Rather, benefit sharing is a corporate policy decision. Manitoba Hydro was at the forefront of such agreements in Canada when it began negotiations for the Wuskwatim and Keeyask Projects, and it views benefit-sharing as a foundational element to the successful development of its potential next major hydro-electric generation project on the Nelson River, i.e. Conawapa. Manitoba Hydro is following existing Conawapa protocols and process agreements to discuss benefit agreements with the local Cree Nations.

If negotiations on adverse effects agreements were unsuccessful, the process could be sent to arbitration in the case of TCN, YFFN and FLCN. If negotiations on benefit sharing were unsuccessful, Manitoba Hydro would have to evaluate its best course of action at that time, however it would not be subject to arbitration. In the absence of successful negotiations, there could be challenges to achieving the required licenses and approvals for Conawapa in a timely manner.

Further discussion on business risks related to the Aboriginal participation is contained in ***Chapter 15 - Implementation and Risk Management Plan for Preferred Development Plan.***

10.4 Uncertainty Analysis Summary

A summary of the drivers of uncertainty, the input affected, and how Manitoba Hydro assessed the uncertainty is provided in Table 10.15. For a summary of risk mitigation actions in support of the Preferred Development Plan, please see ***Chapter 15 – Implementation and Risk Management Plan for Preferred Development Plan,*** Section 15.7, Table 15.9.

1 **Table 10.15 Economic Evaluation - Uncertainty Matrix**

Economic Evaluation - Uncertainty Matrix			
Source of Uncertainty	**Description**	**Variable Affected**	**Method of Assessment**
Key Risk Factor - Energy Prices			
Electricity Prices	Future market price of electricity (capacity and energy)	• Electricity export price forecast • Natural gas price forecast • Manitoba thermal fuel burn cost including transportation costs • Import costs	Manitoba Hydro utilizes a consensus based forecast of independent consultants that produce high, reference and low cases. Independent price forecast consultants consider a wide number of pricing factors, including natural gas prices; carbon policy, U.S. environmental policy, new resource capital costs, and MISO load growth. The full range of energy prices from low to high is considered in the probabilistic analysis of various development sequences. Also see Section 4 of Appendix 9.3 for the Electricity Export Price, Natural Gas Price and Carbon Price Forecasting Methodology. Manitoba Hydro engages in a comprehensive set of activities to address environmental policies including monitoring policy development and working with regulators, legislators, customers and the electric industry as a whole to help maintain a presence and help maintain positive relationships with key groups.
Natural Gas Prices	Future market price of natural gas		
MISO Load	MISO market region load growth		
Carbon Policy	Uncertainty towards implementation, timing and level of carbon pricing		
Other U.S. Environmental Policies	Uncertainty towards implementing a series of proposed U.S. environmental policies, their stringency and overall impact. (MATS, ash lagoon, CO_2 for new coal, CASPR, US RPS)		
Key Risk Factor - Capital Cost			
Keeyask & Conawapa Generating Stations	Labour escalation, low productivity rates and associated indirect costs.	• Capital cost of generation	Capital cost estimating contingency derived using integrated probabilistic risk model. Management reserve provides budget provisions for labour and escalation risks. A full range of capital costs is considered in the probabilistic analysis in Section 10.1. Also see Appendix 2.4 for information on developing capital cost estimates.
	Equipment and material costs (direct costs)	• Capital cost of generation	Contingency derived using integrated probabilistic risk model with support from independent consultant. A full range of capital costs is considered in the probabilistic analysis in Section 10.1. Also see Appendix 2.4.
Thermal Generation	Commodity escalation, schedule overruns and environmental legislation.	• Capital cost of generation	In capital cost estimating process engaged independent consultants to identify appropriate manufacturer/turbine models, develop cost estimates and assess systemic risks. A full range of capital costs is considered in the probabilistic analysis in Section 10.1. Also see Appendix 9.3 Section 1.1.2 Thermal G.S. - Natural Gas Fired Generation. Manitoba Hydro engages in a comprehensive set of activities to address environmental policies including monitoring policy development and working with regulators, legislators, customers and the electric industry as a whole to help maintain a presence and help maintain positive relationships with key groups.
Wind Generation	Technology advancements, commodity escalation, and policy.	• Capital cost of generation	Capital estimate developed using industry benchmarking, with independent consultant to assess systemic risks. A full range of capital costs is considered in the probabilistic analysis in Section 10.1. Also see Appendix 9.3 Section 1.1.3. Manitoba Hydro engages in a comprehensive set of activities including monitoring policy and technical development related to wind generation.
Transmission in Manitoba	Final routing, commodity escalation, schedule overruns and environmental legislation.	• Capital cost of transmission	Detailed estimates produced by Manitoba Hydro or generic per unit estimates used stage of development. A full range of capital costs is considered in the probabilistic analysis in Section 10.1. Also see Appendix 9.3 Section 1.1.4 Transmission. Manitoba Hydro engages in a comprehensive set of activities including monitoring transmission policy development, environmental policy, and working with regulators, legislators, customers and the electric industry as a whole to help maintain a presence and help maintain positive relationships with key groups.
Key Risk Factor- Economic Indicators			
Exchange Rate (CAD/USD)	Future exchange rates	• Electricity export revenues	Utilize a consensus based forecast of major banks and independent consultants for a forecast of future rates. As part of Manitoba Hydro's foreign currency exchange risk on U.S. dollar export revenues, Manitoba Hydro maintains a natural hedge with U.S. dollar cash flows, including outflows from U.S. denominated debt. A range of domestic inflation rates is incorporated into the real discount rate. A range of discount rates from low to high is considered in the probabilistic analysis in Section 10.1. The rate for the Provincial Guarantee Fee is set by the Government of Manitoba who will balance overall social interests.
Inflation Rates (U.S. & Cdn)	Future inflation rates	• Electricity export revenues	
Long-term Canadian Interest Rate	Future interest rates	• Real discount rate	
Provincial Debt Guarantee Fee	Future provincial debt guarantee fee	• Real discount rate	
Specific Risk Factor- Drought			
Multi year drought	Extended periods of low flows in the hydraulic system	• Export volumes • Export revenues • Import costs • Adequate dependable supply of energy	Economic impact of drought is considered through use of 99 year flow record. Specific impact of a five year drought is considered in the sensitivity analysis in Section 10.2.1. Financial impact of drought considered in Chapter 11. Generation Planning Criteria provide direction in ensuring an adequate dependable supply of energy.
Specific Risk Factor- Climate Change			
Long-Term Climate Change	Impact on precipitation and temperature	• Water inflow impact on energy production • Load forecast	Sensitivity analysis of revenue impact from lower or higher flow scenarios resulting from climate change is considered in Section 10.2.2. Electric load forecast includes change to temperature as a result of climate change as a possible event.
Specific Risk Factor- Manitoba Load/ DSM			
Manitoba Load Growth	Potential for higher/lower than expected load forecast. Also potential for large load addition or subtraction	• Amount of surplus energy and capacity in the system • Need for new resources	Sensitivities to 10% and 90% Manitoba load forecast and impact on the need for new resources is considered in Section 10.2.3.
Manitoba DSM	Future Power Smart programs and customer response	• Amount of surplus energy and capacity in the system	Sensitivities to 1.5 times and 4 times 2013 PowerSmart Plan DSM levels considered in Section 10.2.3. Engaged EnerNOC to work with Manitoba Hydro to assess the 20-year potentials of energy efficiency for electricity (See Appendix 4.3)

Source of Uncertainty	Description	Variable Affected	Method of Assessment
Specific Risk Factor- In-Service Date Delays			
Delay of Plant ISDs	Delay of Plant ISDs	• Export revenues • Capital cost of generation	Sensitivity Analysis to In-service delay considered in Section 10.2.4.
Other Risk Factors			
Export Contract Portfolio	Uncertainty in the renewal of export contracts which will be the subject of future negotiations, final terms of WPS contract not determined	• Export contract prices and volumes • Export revenues	Diversity of export customers and contract terms is maintained as are positive customer relationships. A full range of energy prices is considered in the probabilistic analysis in Section 10.1. Development plans without the WPS Sale are considered.
New US Transmission Interconnection Capacity & Ownership	Final design and capital allocation among proponents	• Capital costs • Export volumes	Studies include development plans with no new interconnection, 250 MW interconnection, and 750 MW interconnection with alternative ownership models.
Drought worse than drought on record	A drought worse than the drought of record used for system energy planning occurs	• Ability to serve Manitoba load • Export revenues	Development plans with a new 750 MW interconnection can provide additional amounts of dependable energy through curtailment of exports under certain circumstances and through energy imports which together approximate 5,000 to 6,000 GWhs per year when compared to other plans. See Appendix 9.3.
Market Access	Potential for legal or regulatory restrictions which would prevent Manitoba Hydro's surplus power from reaching the competitive marketplace free from unreasonable legal, regulatory, structural or tariff barriers	• Export revenues	Impact is similar to low export prices, which are considered in the probabilistic analysis. See Chapter 10 Section 10.3.4. Additional surplus energy from development plans with hydro options can be used for long-term sales, which reduces market access concerns.
Species at Risk Act	Potential for the listing of Lake Sturgeon under the Species at Risk Act	• Delay or cancelation of Keeyask or Conawapa	The economic evaluations include consideration of development plans that are not contingent on Keeyask or Conawapa. See Chapter 10 Section 10.3.5.
Aboriginal and Community Relationships/Agreements	Uncertainty of the final form of agreements with Aboriginal communities and the ongoing relationships as impacted by the agreements	• Long-term relationships and future development potential	Benefit sharing and adverse effects agreements completed for Keeyask and in progress for Conawapa. Without such agreements, there could be barriers to Conawapa licensing and approvals. See Chapter 10 Section 10.3.6. Continued regulatory and negotiation progress will assist with Aboriginal and community support.
System reliability	Risk of loss of system capability to deliver power from the bulk power system to the load.	• System load carrying capability and cost of expected unserved load	All development plans meet reliability requirement. Plans with a new interconnection increase system reliability. See Chapter 13 Section 13.3.2 Manitoba Hydro Customer Account - Reliability.

Tab 93

MANITOBA
ORDER IN COUNCIL

DATE:	**April 17, 2013**
ORDER IN COUNCIL NO.:	**00128 / 2013**
RECOMMENDED BY:	**Healthy Living, Seniors and Consumer Affairs**

ORDER

1. The Public Utilities Board (the "PUB") is assigned the conduct of a Needs For and Alternatives To review (an "NFAT review") of Manitoba Hydro's proposed preferred development plan, which includes the Keeyask and Conawapa Generating Stations, their associated domestic alternative current ("AC") transmission facilities, and a new Canada-United States of America ("USA") transmission interconnection.

2. Arthur Mauro and Mel Lazareck are appointed as members of the PUB, for the purpose of participating in the NFAT review, with terms to expire on such date as the PUB has fully completed its assigned duties in respect of the NFAT review, unless their appointments are revoked before that date by the Lieutenant Governor in Council.

3. The NFAT review will be conducted in accordance with the attached Terms of Reference.

4. This Order is effective on the date it is made.

AUTHORITY

The Public Utilities Board Act, C.C.S.M. c. P280, states:

> **Membership of board**
> **4** The board shall be composed of such number of members, not less than three, as the Lieutenant Governor in Council may determine.
>
> **Appointment of members**
> **7** The members shall be appointed by the Lieutenant Governor in Council, and shall be paid such remunerations as determined by the Lieutenant Governor in Council.
>
> **Term of office**
> **9** Each member shall hold office during pleasure of the Lieutenant Governor in Council.
>
> **Power of board to perform assigned duties**
> **107** The board may perform duties assigned to it
> …
> (b) by order of the Lieutenant Governor in Council; or
> …
> and Part I, in so far as it is applicable, applies to the carrying out of duties so assigned.

BACKGROUND

1. The Government of Manitoba wishes to have the PUB conduct an NFAT review of Manitoba Hydro's proposed preferred development plan for meeting a growing provincial demand for electricity and for taking advantage of export opportunities, which includes the Keeyask and Conawapa Generating Stations, their associated AC transmission facilities, and a new Canada-USA transmission interconnection, in accordance with the attached Terms of Reference.

2. Arthur Mauro and Mel Lazareck are being appointed to provide the PUB with the necessary capacity and expertise for the NFAT review. Manitoba has requested the chair of PUB to designate these new members, under subsection 15(6) of *The Public Utilities Board Act*, as the members who will conduct the NFAT review, together with any other members of PUB as he deems necessary for purposes of the review.

APPENDIX 2.3

Economic Impact Assessment

This page is intentionally left blank.

Economic Impact Assessment

Economic Impact Assessment - Overview

Economic impact analysis (EIA) provides an estimate of the total employment impacts as well as estimates of the total Gross Domestic Product, tax revenue impacts, and labour income of a project on the economies of Manitoba and the rest of Canada. It indicates not only the potential impacts generated directly by the project, but also the potential spin-off effects generated as a result of purchases on domestic goods and services and the local recirculation of increased income.

Methodology

The economic modeling framework used for estimating the economic impacts is the Manitoba Bureau of Statistics' Input-Output model. The model is based on statistical information about the flow of goods and services among various sectors of Manitoba's economy. In effect, it allows one to trace the demands placed on one industry resulting from increased activity in another. Thus the model provides estimates of direct, indirect, and induced impacts of the proposed projects on the economy of Manitoba and Canada. In summary, economic impact analysis refers to three different types of impacts:

- **Direct impacts.** These refer to the income and employment generated by the project itself.
- **Indirect impacts**. These refer to the income and employment that develop in other industries as the effects of the initial expenditures for the project work through the provincial and national economies. For example, direct expenditures on vehicles will create an indirect increase in spending on fuel and vehicle repair services.
- **Induced impacts**. As a result of the spending and subsequent re-spending of the direct and indirect income generated by the project, there will be induced impacts /effects upon the consumer goods industries as well as the industries which supply them. This leads to more spending on food, housing, entertainment, transportation, and all of the other expenses that make up a typical household budget.

Economic Impact Analysis are reported with the following data:

- **Employment** is a straightforward measure of the number of person-years of employment (full-time job equivalents) that are generated by the project, including direct employment, indirect employment with suppliers to the main project, and induced employment that is associated with the extra spending by households. **A**

Person-year is defined as one person being fully employed for one year. **Direct employment** is on-site direct employment of Manitoba Hydro (including incremental Manitoba Hydro off-site employees) and contractor employees, which are directly generated by the project; **other direct employment** is employment of **direct** suppliers to support the main project; **indirect employment** is employment of people who supply raw materials, equipment, or services to the initial direct suppliers of the project; and **induced employment** is the employment of people as a result of the spending and subsequent re-spending of the direct and indirect income generated by the project.

- **Labour Income** is the additional income earned by workers as a result of the project. Labour income is an important contributor to economic growth and is a large component of GDP. Availability of labour income enables consumers to buy products and services to support and expand local industry. Total Labour Income represents the sum of wages, supplementary labour income, and net income of unincorporated business.

- **Gross Domestic Product (GDP)**. Also referred to as "value-added," GDP represents the additional value of production that is generated by the project after removing the cost of intermediate inputs. For the purpose of this analysis, GDP at market price is reported. GDP at market price is the total value of goods and services produced in Manitoba's economy.

- **Tax Revenue**. Tax revenue is calculated for all three levels of government – federal, provincial, and local. These government revenues do not include capital tax, water rentals and any greenhouse gas taxes associated with the projects (which are considered in the MA-BCA). Tax revenues are based upon the 2012/13 Manitoba Budget and 2009 income tax data, adjusted to current rates.

The analysis is based on cost estimates as of 2012. Any changes to the cost estimates may lead to changes in the economic impacts presented in this report. The economic impact analysis does not include interest and escalation during construction, costs associated with pre-project planning, design, and training, costs associated with environmental studies, any potential local development payments, and contingency costs.

While economic impact analysis can be a useful component in decision making, it does have some limitations. Economic impact analysis differs from socio-economic benefit-cost analysis in that it is a gross, rather than net, measure of benefits and it only considers the impact of project expenditures. It does not consider the opportunity cost of labour and capital in the

project nor does it consider the revenue generated by the project. By itself, it cannot measure the profitability of the project. Thus, the results of this study should be treated as general estimates and never as absolutes.

Potential Economic Impacts for NFAT

The estimated economic impacts for the preferred development plan are summarized in Table 1. A summary of the economic impacts for the Keeyask and Conawapa are also provided in Tables 2 and 3, respectively. Descriptions of the preferred development plan, and the Keeyask and Conawapa projects, can be found in chapter 2 of the NFAT filing. Economic impacts have been calculated separately for construction and operational phases of each project. Impacts during the construction phase include cumulative employment, labour income, GDP, and tax revenue impacts generated over the entire construction period. Impacts during the operating and maintenance phase include the annual impacts (employment, labour income, GDP, and tax revenues) generated for a typical year of operation when the project is at full operation. The total person years of employment during operation and maintenance can be calculated by taking the estimate for a typical year and multiplying it by the operating life of the project.

NEEDS FOR AND ALTERNATIVES TO (NFAT)

Manitoba Hydro Undertaking #70

Manitoba Hydro to describe the socio-economic benefits to non-Aboriganl northern communities and to Aboriginal communities who are non-partners of Manitoba Hydro in a matrix format, in a similar style as to what was provided for environmental effects in responses to CAC/MH 231 a).

RESPONSE:

The response to CAC/MH 231a provides a high level overview of the socio-economic effects to all Aboriginal and northern residents, including those who are members of the Partner communities. The information provided in CAC/MH-I 231a is further expanded upon in MMF/MH-II 40a, which provides further analysis on the socio-economic effects of the alternative development options in matrix and written format, including a consideration of employment and business opportunities, housing, health and resource use. The response to MMF/MH-II 40a also provides commentary, where feasible, on the differences in socio-economic effects between communities in the vicinity of the Keeyask and Conawapa Generation Projects and other Aboriginal and non-Aboriginal residents in Northern Manitoba. MMF/MH-II 40a has been reattached here for reference purposes.

The Keeyask Project is the only project within the PDP or among its alternatives for which detailed socio-economic assessments have been undertaken; as such, it is the only project for which it is possible to separate out in detail the benefits for partner communities and others in northern Manitoba.

Details on the socio-economic benefits of the Keeyask Infrastructure Project, the Keeyask Generation Project and the Keeyask Transmission Project are available in the EIS documents submitted for each of these projects and can be found primarily in the sections on Economy. The attached Table 1 summarizes these differences at a high level based on predictions made in the EIS – it is important to remember that these are predictions only and that actual benefits realized may be different.

Table 1: Keeyask Generation Project: Summary of Socio-economic Benefits for Northern Manitobans

	Keeyask Cree Nations	Northern Aboriginal Residents	Other Northern Residents
Direct Employment[1] • **Construction**	- *Infrastructure:* Up to 110 person years - *Generation:* 235 to 600 person years - *Transmission:* Not separately estimated by component; the JKDA designates the construction power station and the clearing and construction of the Construction Power Line Right of Way as Direct Negotiated Contracts. - *Other:* 35-40 person years through other project-related opportunities (e.g., participation in project monitoring)	- *Infrastructure:* up to 138 person years, including KCNs employment - *Generation:* 550-1700 person years of employment, including KCNs employment; roughly 315-1100 person of employment, excluding KCNs employment - *Transmission:* Not separately estimated by component; all components not covered by the JKDA may be directly negotiated or publicly tendered. The Transmission Line Agreement will be applicable for wages and benefits on the projects and the contract documents will set out the first preference hiring for Northern Aboriginals.	- *Infrastructure:* No separate analysis undertaken - *Generation:* No separate analysis undertaken - *Transmission:* No separate analysis undertaken
• **Operation**	All positions estimated to be located in the North. Approximately 45% of 50 positions estimated to be Aboriginal. A minimum of 182 positions have been targeted to KCNs members across Manitoba Hydro operations (not Keeyask-specific) as a commitment in the JKDA.	All positions estimated to be located in the North. Approximately 45% of 50 positions estimated to be Aboriginal.	All positions estimated to be located in the North. Approximately 45% of 50 positions estimated to be Aboriginal.
Business • **Direct Negotiated Contracts**	To date, roughly $390M negotiated with the KCNs (at time of EIS writing, this value was estimated at $203M (in 2007 $) based on the JKDA negotiations).	N/A	N/A

	Keeyask Cree Nations	Northern Aboriginal Residents	Other Northern Residents
• **Open-Tendered Contracts**	Generally prohibited from bidding on open-tendered contracts due to "insider information". See JKDA Article 13 for more information.	Manitoba Hydro's Northern Purchasing Policy would apply for tendered work. . No estimate available on the dollar value of work that could accrue.	Manitoba Hydro's Northern Purchasing Policy would apply for tendered work. . No estimate available on the dollar value of work that could accrue.
• **Sub-Contracts**	Bid-depository mechanism to facilitate sub-contracting opportunities for the KCN on the Keeyask Project. Possible opportunities to bid on sub-contract work for the Keeyask Generation and Keeyask Transmission Projects. No estimate available on the dollar value of work that could accrue.	Possible opportunities to bid on sub-contract work for the Keeyask Generation and Keeyask Transmission Projects. No estimate available on the dollar value of work that could accrue.	Possible opportunities to bid on sub-contract work for the Keeyask Generation and Keeyask Transmission Projects. No estimate available on the dollar value of work that could accrue.
Training	Funded to participated in the Hydro Northern Training & Employment Initiative (HNTEI): - KCNs: $32.7M; 1108 participants	MMF and MKO funded to participated in the Hydro Northern Training & Employment Initiative (HNTEI): - MMF: $4.8M; 149 participants - MKO: $9.7M; 1015 participants - NCN: $10.9M; 398 participants - WKTC Ops: $2.2M	N/A
Income & Governance	Through the JKDA, partners in the Keeyask Infrastructure and Keeyask Generation projects: - Can purchase up to 25% equity ownership shares (15% for Cree Nations Partners; 5% each for York Factory and Fox Lake) and will receive revenue stream based on investment - Participation in Project governance, including seats on General Partner Board of Directors and all Project-related committees. - As proponent, participation in monitoring activities, including community-specific ATK monitoring contracts and participation in technical science monitoring.	N/A	N/A

Table Notes:

1. Estimates of indirect employment have not been undertaken for each of the identified categories; overall estimates of indirect employment for Manitoba and Canada are included in CAC/MH-I 230a.

Manitoba Hydro

Needs For and Alternatives To
MMF/MH II-040a

SUBJECT: Socio-economic impacts

REFERENCE: MMF/MH I-038a

PREAMBLE: The information presented in the "Socio-economic Comparison of Resource Options" table (CAC/MH 1-231a) is not complete, or detailed enough, to allow for an understanding of the socio-economic effects of the resource options. Further, it presents very general information for all of the components of the PDP, but the same type and level of information is not provided in the NFAT submission, or to subsequent Round 1 IRs, including MMF/MH 1-004a, MMF/MH 1-004c, MMF/MH 1-038a, MMF/MH 1-039a, MMF/MH 1-046a, for the alternatives and other options.

It is still not clear whether, or how, the PDP is superior to the alternatives in even the most general socio-economic terms, and with respect to the Metis in particular.

QUESTION:

Please provide a matrix, consistent with the "Socio-economic Comparison of Resource Options" (CAC/MH 1-231a) that describes the same socio-economic parameters for each of the 15 development plans described in Chapter 8.

RESPONSE:

The response to CAC/MH I-231(a) compared the macro environmental and socio-economic effects of Keeyask, Conawapa, gas turbines, wind generation, demand-side management (DSM), the Manitoba-Minnesota Transmission Interconnection Project and the North-South Transmission Upgrade Project. Five critical environmental characteristics and five socio-economic characteristics were identified that, at a macro level, may differentiate potential effects of the various resource options from each other.

Each of the 15 development plans has various combinations of the resource options. All plans must be able to meet Manitoba Hydro's expected domestic load and existing firm export

commitments. Several development plans share similar resource options, although the timing as to when each option would be developed differs. For the purposes of this macro-level analysis, 12 of the 15 plans can be placed into three groups:

- Group A (Keeyask, Conawapa, 3 SCGTs, and North-South Upgrade): Plans 1, 2, 4, 6, 8 and 12. All but Plan 12 also include a new U.S. Interconnection.
- Group B (Keeyask, gas turbines and U.S. Interconnection): Plans 3, 5, 7.
- Group C (Keeyask or Conawapa and gas [no U.S. Interconnection]): Plans 11, 13 and 14.

The following are the plans that do not fit into a group:

- Plan 9 ('all gas' with no interconnection).
- Plan 10 (gas turbines and wind farms with no interconnection).
- Plan 15 (wind farms, Conawapa and gas turbines with no interconnection).

This response first examines employment and business opportunities. It then examines Infrastructure and Services; Personal, Family and Community Life; and Resource Use.

MH Exhibit 159-Attachment
Page 6 of 20

Manitoba and Canada Employment (also see Table 1)

Employment in CAC/MH I-231a was presented into two categories, construction and operations. Construction was reported in person years of employment, and operations in the number of positions per year.

In preparing the response to MMF/MH II-040a, Manitoba Hydro estimated the operational jobs in person years, in order to provide a fuller comparison between the various development plans. This was accomplished by multiplying the number of operational jobs associated with a particular resource option by the number of years the respective resource options would operate during the NFAT review's 35-year time horizon (to 2047). With construction and operational positions both estimated in person years, it was possible to estimate and compare the total employment opportunities associated with each development plan. These data are presented in Table 1 and are illustrated below in Figure 1 (MMF/MH II-040a).

Figure 1 (MMF/MH II-040a): Total Employment by Development Plan

Plans with both Keeyask and Conawapa (Group A) would result in the most employment opportunities, with employment ranging from 22,700 to 24,600 person years in Manitoba and 63,800 to 65,500 in Canada. Plans with just Keeyask but more gas turbines than plans in Group A would result in employment ranging from 18,000 to 18,500 person years in Manitoba and 46,600 to 48,900 in Canada. Employment estimates for plans in Group C (with Keeyask or Conawapa plus gas, but no U.S. Interconnection) ranged from 14,300 to 17,100 for Manitoba and 41,400 to 46,900 for Canada. For the all-gas plan (Plan 9), the estimates were 10,300 for Manitoba and 28,200 for Canada. Data were not available to break down provincial and national employment for wind-related development plans. However, total employment for Plan 15 (Conawapa, wind and gas) is estimated at 40,400 person years, and for Plan 10 (wind and gas), 28,200.

Aboriginal and Northern Employment (also see Table 2)

Group A development plans (i.e. plans with both Keeyask and Conawapa) would result in substantial Aboriginal and northern employment. Plans in Groups B and C (with either Keeyask or Conawapa, but not both) would have a corresponding decrease in Aboriginal and northern employment. Plans relying more on gas and wind would likely result in no specific benefits for northern residents and Aboriginal people.

CAC/MH I-231(a) noted that Aboriginal and Northern employment estimates have been calculated for construction of the Keeyask Project (with a range of 500 – 1700 persons), but not for any other projects. The response to CAC/MH I-231(a) also suggested Aboriginal and northern employment to construct Conawapa would be greater than with Keeyask. Upon review, Manitoba Hydro has revised that statement. Because of the current preliminary nature of the Conawapa planning process, it is more appropriate to expect that Aboriginal and northern employment on Conawapa would be substantial, rather than suggesting it would be greater than Keeyask. Aboriginal and northern people can also expect to gain employment among the 50 and 60 operating positions associated with Keeyask and Conawapa, respectively (Aboriginal workers are estimated to constitute 45% of Manitoba Hydro's northern workforce). As well, under the Joint Keeyask Development Agreement, 182 positions in Manitoba Hydro's existing operations (not necessarily only Keeyask) have also been targeted for Keeyask Cree Nation members.

Gas generating stations and wind farms, which would be located in southern Manitoba, would provide little, if any, benefit to northern residents. Whereas Aboriginal employment opportunities are greatly enhanced through preference provisions for the Keeyask and Conawapa projects, it is unknown at this time if preferences (as well as the nature of any preferences) would be provided for gas and wind projects in southern Manitoba. There would be opportunities for southern Aboriginal construction employment, but this has not been

estimated to date. The chart provided in this response has been revised accordingly from that contained in CAC/MH I-231(a).

There would be potential Aboriginal employment opportunities, similar to those in other Manitoba Hydro facilities, during the operational phase of a gas plant, but this has not been estimated to date. Employment opportunities have not yet been estimated for the two transmission projects. Some short-term jobs may be associated with the clearing contract and possibly the general contractor. Short-term opportunities would exist for northern and Aboriginal workers on the North-South Transmission Project. The response to PUB/MH II-499(a) sets out preferences for the Manitoba – Minnesota and North – South Upgrade transmission projects.

For further discussion regarding the plans' impacts on the demand for labour, including Northern and Aboriginal labour, please see Sections 13.3.4 and 13.3.6 of the NFAT submission.

Business Opportunities (also see Table 2)

Similar to the Aboriginal and northern employment opportunities, estimates have only been developed for the Keeyask Project. The Keeyask Cree Nations are expected to negotiate construction-related contracts worth over $200 million for Keeyask. The response to MMF/MH II-037(b) also notes all contracts not designated as Direct Negotiated Contracts with the KCNs will be procured through an open tender process and, as such, it is not possible to estimate the dollar amount of contracts that may be filled by northern and Aboriginal businesses other than the KCNs. All northern and Aboriginal businesses, other than the KCNs, will have the opportunity to submit tenders on this work as well as subcontracting opportunities on a number of contracts. The KCNs will have an opportunity to bid on subcontracting opportunities via the bid depository process as outlined in the Joint Keeyask Development Agreement.

The Conawapa ownership arrangement is not yet finalized, but Manitoba Hydro is committed to achieving long-term, sustainable benefits for Aboriginal communities in the vicinity of the project with a focus on income, training, employment and business opportunities.

With transmission projects, local contractors such as northern Aboriginal communities may be awarded clearing contracts.

Local southern businesses could earn modest opportunities with gas and wind projects. Local landowners could also expect to benefit from wind turbines on their land. No specific benefits associated with wind and gas projects have been identified for northern residents. In the past, wind projects have been developed through an Independent Power Producer arrangement; the wind developer would be responsible for procuring all materials and services directly. There may be business opportunities for southern Aboriginal businesses, but this has not been estimated to-date. With respect to gas projects managed by Manitoba Hydro directly, tendering documents could include local or Aboriginal preference clauses. This has not been determined to-date and would depend on the specific context of the project.

Table 3 (MMF/MH II-040a): Housing, Health and Resource Use

		Infrastructure and Services (Housing)	Personal, Family and Community Life (Health)	Resource Use
1. (PDP)	K19/C25/750MW WPS Sale & Investment in 750 MW Interconnection Gas: SCGT in '41, '44, '46	Housing	Worker interaction with local northern residents Mercury Water quality	E.g. hunting, trapping, fishing and gathering Agricultural equipment and practices
2.	K19/C25/750MW No WPS / resources same as above. Gas: SCGT in '41, '44, '46	Housing	Worker interaction with local northern residents Mercury Water quality	E.g. hunting, trapping, fishing and gathering Agricultural equipment and practices

1

Housing (also see Table 3)

Housing was identified in the response to CAC/MH I-231(a) as the parameter for review under the category of Infrastructure and Services.

Workers hired to construct Keeyask and Conawapa (i.e. development plans in Groups A, B and C) would be housed in well-equipped construction camps, and infrastructure and services will be expanded to meet the growing workforce of Gillam, the operational centre for Manitoba Hydro's northern hydroelectric generating system. The use of a job referral service for the construction of these projects, rather than hiring workers directly at site, is expect to reduce in-migration of off-reserve First Nations workers into their home communities, as these potential workers do not need to relocate to be hired for work on the projects. In addition, there are limited local accommodations available and these communities are generally located some distance from the project site (note, though, that the Fox Lake community of Bird is closer than Gillam to Conawapa).

Crews constructing transmission lines, gas turbines or wind farms would likely be housed in local communities. Transmission crews may also be housed in temporary remote camps.

For further discussion about housing, please see Manitoba Hydro's response to CAC/MH I-231(a).

Personal, Family and Community Life (also see Table 3)

Health was the parameter identified for discussion under Personal, Family and Community Life in the response to CAC/MH I-231(a). Different plans (or groups of plans) will affect health differently.

Negative interactions between non-local construction workers and local residents is an important concern related to plans with Keeyask and/or Conawapa (plans in Group A, B and C). Several measures are being planned to limit such adverse effects (see the response to CAC/MH

I-231(a)). It is also possible that this may be a concern for southern developments, such as gas and wind, depending on the size of the workforce and the nature of their accommodations.

A second important health-related concern associated with Keeyask and Conawapa is increasing levels of mercury in fish, as a result of project flooding. The response to CAC/MH I-231(a) erroneously indicated that mercury is not a concern for the Conawapa project. Rather, as noted in the response to PUB/MH II-499(i), it is anticipated that, given the limited amount of upstream flooding associated with Conawapa, mercury will be of considerably less concern than it was for Keeyask. This aspect of the Conawapa project will be thoroughly assessed and reviewed with in-vicinity Cree nations and regulators, and appropriate mitigation measures will be determined based on the assessment findings. In the case of Keeyask, several mitigation measures are being planned to manage this effect (see CAC/MH I-231(a)) through long-term monitoring and the provision of relevant, accurate information so that consumers can make informed consumption decisions. Keeyask and/or Conawapa are included in all plans except 9 and 10.

The health concern associated with wind farms (i.e. Plans 10 and 15) is wind turbine sound. Health Canada is currently collaborating with Statistics Canada on an epidemiological study related to this topic.

The health concern identified in the response to CAC/MH I-231(a) related to gas turbines is not at the generating station itself, but rather “upstream” where natural gas is extracted. The United States Environmental Protection Agency is currently undertaking a study of the potential impacts of hydraulic fracturing (or ‘fracking’) on potable water. All development plans include some gas turbines. They are most prevalent in Plans 9 and 10, and least prevalent in Group A plans.

For discussion about health effects, please see the response to CAC/MH I-231(a).

Resource Use (also see Table 3)

Resource use includes domestic and commercial use of lands and resources, including hunting, trapping, fishing, gathering, mining, forestry and other activities. Typically, of primary concern are domestic hunting, trapping, fishing and gathering by Aboriginal people as these activities provide access to healthy foods and are important to many people's cultural identity. In southern Manitoba, where gas and wind are likely to be located, agriculture is a primary resource use.

Development plans that include hydropower plants have a greater potential to affect traditional resource use activities. Group A plans (Plans 1, 2, 4, 6, 8 and 12) have the most potential to affect resource use, followed by groups B, C and Plan 15. Agreements have been reached with the Keeyask Cree Nations to address Keeyask effects (for example, by providing alternative harvesting opportunities) and similar approaches are anticipated with Conawapa. The Manitoba Metis Federation is concerned programs and agreements have not been developed specifically for the Metis, although to date no evidence has been provided to indicate that this is required or that planned project-related mitigation measures available to all resource users will not be appropriate for Metis harvesters. Manitoba Hydro, on behalf of the Keeyask Hydropower Limited Partnership, has provided funding to the MMF to undertake a Metis-specific Traditional Land Use and Knowledge Study, Socio-economic Impact Assessment and historical narrative for the Keeyask region. These studies, originally to be completed by October 2013, were planned for completion in late February 2014. The Partnership has committed to review the results of these studies, once available, to determine whether additional or enhanced mitigation measures are required.

The Group A and B plans also include a new U.S. Interconnection, which has the potential to interfere with agricultural practices and other local resource users. Manitoba Hydro employs a

comprehensive site selection process to avoid or minimize potential impacts of transmission projects on people and the environment.

Wind farms (i.e. Plans 10 and 15) have the potential to affect aerial spraying of agricultural crops.

Gas turbines are unlikely to affect local resource users. However, the “upstream” exploration and production of natural gas, and transmission facilities (e.g. pipelines) may affect resource harvesting in other jurisdictions.

For more information about the effects on resource use, please see the response to CAC/MH I-231(a).

Table 4, which follows, provides the data upon which the calculations for Table 1 are based.

Table 4 (MMF/MH II-040a): Employment Estimates by Resource Option

	CONSTRUCTION PHASE			OPERATIONAL PHASE		
	Manitoba	Rest of Canada (Does not include Manitoba)	Total – All of Canada	Manitoba	Rest of Canada (Does not include Manitoba)	Total – All of Canada

- Indirect and Induce Employment	251	386	637			
- Total: Direct, Indirect and Induced Employment	586	605	1,191			

Notes:

- Keeyask includes the Keeyask Infrastructure Project, Generation Project and Transmission Project; Conawapa include the Generation Project, Generation Outlet Transmission Project, and Generation Outlet Station Upgrades; North-South Upgrade includes transmission lines and switching station; 750 MW and 250 MW Interconnection includes the transmission line and switching station; SCGT and CCGT Project Direct Employment totals do not include estimated, on-site foreign staff of 6 and 17 workers, respectively.
- Project Direct Employment data for all but the wind farms are internal MH estimates; Other Direct Employment, Indirect and Induce Employment data for all but the wind farms are outputs from the Manitoba Bureau of Statistics.
- SCGT & CCGT Operation and Maintenance estimates are based on two plants per site.
- Direct employment estimate for wind farms was based on Manitoba Hydro Range of Resource Options report (Appendix 7.2 of the NFAT submission) and Indirect and Induced employment estimates were based on the report, Economic Impact of the Greenwich Wind Farm (March 2012 by the Crupi Consulting Group), available at http://www.crupi.biz/assets/files/economic-impact-of-the-greenwich-wind-farm.pdf. Accessed January 17, 2014.
- Totals may not add due to rounding.

Information Accepted Subject to Check, April 28, 2014

The following information is provided in response to the information Dr. Melanie O'Gorman accepted subject to check on April 28, 2014. The original transcript pages are included in the electronic version but will not be included in the paper version.

Response:

All figures mentioned by Jack London below have been updated in a revised appendix to our report, which is attached. The only exception is the rates of return estimates for total economic benefits stemming from the project. This is provided below:

Returns to Cash Investment in the Keeyask Project for the KCN communities for each phase of the project

	Low estimate	High estimate
Construction period	$95,175 income/$2.25 million investment = 4.23%	$95,175 income/$2.25 million investment = 4.23%
First 5 years post-construction period - 1.9% equity holding	$1.06 million income/$25 million investment = 4.23%	$3.63 million income/$25 million investment = 14.52%
After 5 years, post-construction - 1.9% equity holding	$1.06 million income/$25 million investment = 4.23%	$3.8 million income/$25 million investment = 15.2%
First 5 years post-construction period - 2.5% equity holding	$1.06 million income/$25 million investment = 4.23%	$4.83 million income/$25 million investment = 19.32%
After 5 years, post-construction - 2.5% equity holding	$1.06 million income/$25 million investment = 4.23%	$5 million income/$25 million investment = 20%

We do not believe that estimates of investment returns should include benefits such as construction or operational jobs, as these benefits would occur regardless of investment by the KCN communities, as they are not only financial partners in the project. To capture total economic benefits accruing to the KCNs from their partnership in the Keeyask project, we reproduce our updated Table 6 from our report below:

Table 6: Illustrative Total Annual Economic Benefits (Direct and Indirect Benefits) for KCNs from the Keeyask Project, Assuming Preferred Unit Equity Option		
	Estimated Range of Benefit	
Period	Low estimate	High estimate
During construction phase – estimated total annual benefits	**$10.26 million/year**	**$20.67 million/year**
Construction phase total benefits per capita	**$1,616/year**	**$3,255/year**
After construction phase – 1.9% equity ownership, which includes:		
Investment income (first 5 years post-construction)	$1.06 million/year	$3.63 million/year
Investment income (6 years onward)	$1.06 million/year	$3.8 million/year
Manitoba Hydro funding for operational jobs	$1.23 million/year	$1.23 million/year
Labour income from operational jobs	$5.9 million/year	$11.8 million/year
Multiplier effect	$1.39 million/year	$3.09 million/year
Estimated Total Benefits (6 years post-construction)	**$9.58 million/year**	**$19.92 million/year**
Estimated Benefits per capita (6 years post-construction)	**$1,509/year**	**$3,137/year**
After construction phase – 2.5% equity ownership, which includes:		
Investment income (first 5 years post-construction)	$1.06 million/year	$4.83 million/year
Investment income (6 years onward)	$1.06 million/year	$5 million/year
Manitoba Hydro funding for operational jobs	$1.23 million/year	$1.23 million/year
Labour income from operational jobs	$5.9 million/year	$11.8 million/year
Multiplier effect	$1.39 million/year	$3.33 million/year
Estimated Total Benefits (6 years post-construction)	**$9.58 million/year**	**$21.36 million/year**
Estimated Benefits per capita (6 years post-construction)	**$1,509/year**	**$3,364/year**

If we did take total economic benefits for each phase of the project to be the 'return' to KCN investment, Jack London's assertion that the rates of return would be very high is correct. This is show below:

Rates of Return to Cash Investment, Assuming Investment Returns Include Total Economic Benefits		
	Low estimate	High estimate
During construction phase – estimated total annual benefits	456%	919%
Post construction phase - 1.9% equity holding (6 years post-construction)	38%	80%
Post construction phase - 2.5% equity holding (6 years post-construction)	38%	85%

Again, we do not believe it is appropriate to consider total economic benefits as investment income.

Regarding Sven Hombach's questions, I confirm that voter turnout in the last Winnipeg Mayoral election was 47.1%

(http://www.winnipeg.ca/clerks/docs/elections/2010Election/pdfs/2010ElectionOfficialResults.pdf) and voter turnout in the last Federal election was 61.1% (http://www.elections.ca/content.aspx?dir=turn&document=index&lang=e&section=ele).

Appendix 1: An Illustration of Economic Benefitsof the Keeyask Model[1]

In this section, potential economic benefits for the KCNs from the Keeyask project are estimated. The Keeyask project is expected to bring a wide range of economic benefits for the KCNs. In this section we present scenarios for the construction and operational periods of the Keeyask project, to illustrate the potential magnitude of benefits arising from the Keeyask project for KCN Members. We begin by first discussing increased employment and business opportunities during the construction period.[2]

Economic Benefits During the Construction Period

Employment Benefits – Construction Jobs

This section summarizes labour income to Keeyask communities flowing from the project. The job target for KCN Members for the construction phase of the Keeyask project is 630 person years of employment. Given an estimated total person years of employment of 4,225, KCN members would hold 15% of total projected construction jobs on the Keeyask project if the target is met.[3]

KHLP (2012) provides an estimate of the total economic benefit to job creation resulting from the construction phase of the Keeyask project (page 3-105 to 3-106), shown in Table 2 below. The low estimate corresponds to the total wage bill if the lowest wage within a job category (construction support, non-designated and designated trades) applied, while the high estimate corresponds to the total wage bill if the highest wage within a job category applied. The Partnership notes that most of the labour income stemming from the construction phase of the project will come from employment on the DNCs (KHLP (2012), page 3-105).

Employment Benefits – Operational Jobs

In the JKDA Benefits Summary (Manitoba Hydro (2013a)), it is noted that "Manitoba Hydro and the KCNs have agreed to a 20 year target for the employment of 182 Members of the KCNs in Manitoba Hydro's ongoing operations. The funding quantam agreed to in the JKDA for this initiative is $20 million and the 20-year period is 2009-2029" (page 3). This funding is included as an economic benefit in Table 2 below, referred to as Manitoba Hydro funding for Operational employment[4].

---

1 Please note that calculations in this Appendix do not include the increase in capital costs for the Keeyask project reported by Manitoba Hydro at the NFAT hearings on March 10, 2014.

2 While recognizing the economic flows resulting from the Keeyask project will be reflective of the ebbs and flows of the construction schedule, for the purposes of the illustrative scenarios below we take averages of economic benefits flowing from each phase of the project.

3 There is risk that the KHLP will not meet that target. The BNA notes that "regardless of the hiring preferences in place, all employment will be conditional on each applicant having the required qualifications for the job." (http://keeyask.com/wp/the-project/employment) As noted above, 1,876 individuals were trained through the HNTEI, however this statistic includes those that have only taken one course (WKTC (2010)). After taking one course through the HNTEI, a person could still be deemed 'unqualified'.

4 Please note that the multiplier is not applied to funding for the operational employment in Table 1.

Income will also accrue to KCN members who obtain operational jobs with Manitoba Hydro. For sake of clarity I provide the detailed assumptions made by Michael Cobb (Hobbs and Associates, correspondence on May 9, 2014) regarding the magnitude of operational employment income in the table below:

*Table 1: Income from Operational Jobs**

	High estimate		Low estimate	
	Jobs filled	Total earnings	Jobs filled	Total earnings
2016-17	18	$1,123,632	9	$561,816
2017-18	36	$2,292,209	18	$1,146,105
2018-19	54	$3,507,080	27	$1,753,540
2019-20	72	$4,769,629	36	$2,384,815
2020-21	90	$6,081,277	45	$3,040,639
2021-22	108	$7,443,483	54	$3,721,742
2022-23	126	$8,857,745	63	$4,428,872
2023-24	144	$10,325,600	72	$5,162,800
2024-25	162	$11,848,626	81	$5,924,313
2025-26	182	$13,577,647	91	$6,788,824
2026-27	182	$13,849,200	91	$6,924,600
2027-28	182	$14,126,184	91	$7,063,092
2028-29	182	$14,408,708	91	$7,204,354
	Total income:	**$112,211,022**		**$56,105,511**
* Salaries are increased by the rate of inflation since 2014, assumed to be 2% per year.				

For a low estimate of income stemming from operational employment, it is assumed that KCN members will secure 9 operational jobs per year, and for the high estimate, 18 members per year are assumed to secure operational jobs. Each job has been assumed to have an annual salary of $60,000 (information from Jane Kidd-Hantscher). Included in Table 2 below is the average income for the period 2016/7-2020/1.

Business Opportunities

Construction of the Keeyask project will bring opportunities for businesses owned by KCN individuals through Direct Negotiated Contracts (DNCs). A value of $203.1 million in DNCs has been reserved for KCN contractors however total business contracts for KCN contractors are now estimated to total $450 million. This amounts to 20% of the overall value of construction (estimated at $2.2 billion (KHLP (2012), page 3-123)).[5]

[5] Assuming that profits account for 10% of business income --the rate of profit is used by InterGroup Consultants Inc. on page 3-106 of KHLP (2012)-- business profits would be $33.75 million if KCN Members owned 75% of businesses undertaking DNCs. We take this as our high estimate of business profits from DNCs. However if KCN Members owned only 50% of DNCs, then half of the $45 million profit from DNCs would accrue to KCN members ($22.5 million). We take this as our low estimate of business profits from DNCs.

Investment Income

Given the initial $2.25 million investment made by the KCNs at the beginning of the construction period, they will start to receive investment income upon Initial Closing which is assumed to be in early July 2014[6]. They will receive the Preferred Minimum Distribution over this period, which is an annual payment equal to a KCN's own cash invested multiplied by the Thirty Year Rate minus 1.5%. Hence as long as the Thirty Year Rate is greater than 1.5%, the KCNs will see a stable stream of investment income with this option.

To illustrate the magnitude of investment income, in Table 2 below we assume the Thirty Year Rate is equal to 5.73%, the average of the Thirty Year rate using the average long-term Government of Canada bond rate as a proxy for the 30 year Government of Canada bond rate, and the average long-term Provincial bond rate as a proxy for the Manitoba 30 year bond rate, both for the period 1983-2012. Subtracting 1.5% from the Thirty Year Rate of 5.73% gives a Preferred Minimum Distribution Rate of 4.23%.[7]

Multiplier effects

As more KCN Members who have been hired to work on the Keeyask project have incomes to spend, demand for goods and services in other (non-Hydro) sectors will increase in the KCNs. That is, if workers spend their incomes in the KCN communities, they will create increased demand for all goods and services in the KCNs which will lead to further employment in the KCNs, further spending, and so on. We refer to this as the multiplier effect for the Keeyask project.

The within-province total multiplier for Manitoba for 2009 was 1.4 (Statistics Canada (2009)). We decrease this multiplier to 1.2 to account for the fact that a large portion of income stemming from the Keeyask project will be spent in Gillam, Thompson and even Winnipeg . Using this multiplier, if aggregate wages and business income stemming from the Keeyask project were $55 million, an additional $11 million of economic activity would be generated through the multiplier effect. The extent to which this happens will depend on how broadly the benefits are spread. If many KCN Members obtain employment, this multiplier effect would be greater.

Investment income may be used to build housing, local roads or water infrastructure in the KCNs. It is appropriate then to calculate a multiplier effect for infrastructure spending as well. Infrastructure multipliers are used to calculate the increase in output that results from a given increase in infrastructure spending in a given geographic region. Estache (2010) notes that infrastructure multipliers may range from 1.2 – 2.0. We assume that the infrastructure multiplier equals the lower bound of this range (1.2) in the calculations below.

An illustration of total economic benefits during the construction period

In Table 2 below we sum the annual economic benefits during the construction period of the Keeyask project. It is evident that there is a great deal of variance in the expected economic benefits resulting from the Keeyask project. However even if the high estimate of Keeyask benefits were realized, total economic benefits per KCN member would depend on how such benefits were distributed between all KCN Members.

---

6 The annual payment of invesmtment income during construction will be $2,250,000*0.0423=$95,175.

7 All figures for investment income reported in Tables below may be taken as final income, given that such income is tax-free according to an advance tax ruling secured by the KCNs (communication with Jack London, May 9, 2014).

A uniform distribution of the economic benefits from Keeyask is not assured by the JKDA in its present form.[8]

Table 2: An Illustration of the Economic Benefits for the KCNs from the Construction period (2014-2021) of the Keeyask Project

	Estimated Range of Benefit	
Item	Low estimate	High estimate
Total and annual labour income from Keeyask construction employment	$21.6 million (KHLP (2012), page 3-105, Table 3-25) or $3.09 million/year	$62.2 million (KHLP (2012), page 3-105, Table 3-25) or $8.89 million/year
Total and annual business profits during construction period of the project	$22.5 million or $3.21 million/year	$33.75 million or $4.82 million/year
Investment income	$95,175/year	$95,175/year
Annual labour income from Operational employment	$1.27 million/year	$2.53 million/year
Manitoba Hydro funding for Operational employment	$1.06 million/year	$1.06 million/year
Multiplier effect	$1.53 million/year	$3.25 million/year
Potential annual income for construction period of the project	**$10.26 million**	**$20.67 million**

Economic Benefits Post-Construction

Income from Operational Jobs

As above, for a low estimate of operational employment income, 9 KCN members are assumed to obtain new operational jobs with Manitoba Hydro each year in the post-construction phase, while 18 KCN members are assumed to obtain new jobs in the high estimate case. With each job assumed to have an annual salary of $60,000, average earnings stemming from operational employment during the post-construction phase is provided in Table 3 (taking 2021-29 as the post-construction phase in Table 1).[9]

Table 3: An Illustration of Income for KCN Members from Operational Jobs

	Estimated Range of Benefit	
Item	Low estimate	High estimate
Total income for 182 individuals securing operational jobs for the 20 year post-construction period	$5.9 million/year	$11.8 million/year

[8] Funds will flow to the KCNs to support the Adverse Effect Agreements (AEAs), however such funding has not been included in the calculation in this Appendix. This is because the AEAs are meant to compensate for and mitigate adverse effects of the Keeyask project.

[9] Please note that no multiplier effect has been added to estimates of investment income in Tables 3, 4 and 5 below. The multiplier effect is taken into account in Table 6.

Investment Income

The KCNs have two options for investment in the Keeyask project. The first option is for KCNs to hold their investment in the form of Common Units. As the KCNs would receive investment income proportionate to the Partnership's financial performance with this option, investment income stemming from this option would be highly uncertain. In times of low financial performance, the KCNs could receive no distributions from the project but will still be repaying loans from Manitoba Hydro, which means there is the potential for significant losses with this option. A hypothetical return for this option is very difficult to calculate given that it would depend on many factors whose expected value we are not aware of.[10]

The second option for investment in the Keeyask project is the Preferred Unit option. A KCN Investment Entity that decides to hold its investment in the form of Preferred Units will not have to repay its loans provided by Manitoba Hydro Credit Facilities. This option guarantees a return on KCN investment. In particular, this return will be the higher of the Preferred Minimum Distribution and the Preferred Participating Distribution[11].

As noted above, the Preferred Minimum Distribution is an annual payment equal to a KCN's own cash invested multiplied by the Thirty Year Rate minus 1.5%. Assuming that aggregate KCN own cash invested is $25 million , the Preferred Minimum Distribution would be $1.06 million per year.

If however revenue of the Keeyask project were high, the Preferred Participating Distribution would be the higher distribution for the Preferred Unit Option. This distribution provides an annual payment equal to the following proportions of Adjusted Gross Revenue (AGR) for each 1% share of KCN equity:
- 0.8% of AGR for AGR < $250 million
- 1.2% of AGR for $250 million <AGR < $1 billion
- 1.6% of AGR for AGR > $1 billion

Assuming that aggregate KCN own cash invested of $25 million plus revenue sharing (during commissioning of the 7 turbines) bring total KCN investment to $29,450,000 (in the case of 1.9% equity ownership), the Preferred Participating Distribution would be $3.63 million per year. This is $250 million x 0.008 x 1.9 minus $168,618.83[12]. If KCN own cash invested plus revenue sharing instead totaled $38.75 million (in the case of 2.5% equity ownership), the Preferred Participating Distribution would be $4.83 million per year ($250 million x 0.008 x 2.5 minus minus $168,618.83).

Below we illustrate investment income for the KCNs if their combined investment in the project were 1.9% (Table 4) and 2.5% (Table 5)[13]. For the low estimate of investment income in each table, we

---

10 The assumption that the KCNs opt for Preferred Shares is also made in Information Request response CAC/MH 1-022 a) (Manitoba Hydro (2013b)).

11 In its NFAT submission Manitoba Hydro assumed the Preferred Unit Option – this is explained in Information Request response CAC/MH II-006 a).

12 The latter deduction occurs in the first 5 years of the post construction phase provided the KCN's preferred distribution is, after the deduction, greater than the minimum distribution. If that is not the case then the deduction is deferred until the years that preferred distributions are large enough. The amount deducted is the balance on the Common Unit Distribution Credit at Final Closing which is the sum of all distributions, plus interest charges, made during the construction period (communication with Michael Cobb, May 10, 2014).

13 This is the range of KCN equity investment assumed by Manitoba Hydro in the response to Information Request MIPUG/MH 1-017a) (Manitoba Hydro (2013b), page 59).

assume the Partnership experiences zero AGR, and the KCNs receive the Preferred Minimum Distribution for their cash invested ($25 million). For the high estimate in each table, we assume AGR of $250 million and the KCNs receive the Preferred Participating Distribution[14]. This information provided is for illustrative purposes and any distribution will naturally be a function of the magnitude of KCN investment and of the AGR in any particular year.

Table 4: An Illustration of the Investment Income for the KCNs during the Operational period of the Keeyask Project - 1.9% Preferred Equity Holding

	Estimated Range of Benefit	
Item	Low estimate	High estimate
Estimate of annual investment income (during operational period of the project)	Assuming AGR of $0: $1.06 million/year	Assuming AGR of $250 million: $3.63 million/year

Table 5: An Illustration of the Investment Income for the KCNs during the Operational period of the Keeyask Project - 2.5% Preferred Equity Holding

	Estimated Range of Benefit	
Item	Low estimate	High estimate
Estimate of annual investment income (during operational period of the project)	Assuming AGR of $0: $1.06 million/year	Assuming AGR of $250 million: $4.83 million/year

An illustration of total economic benefits during the post-construction period

We tally the illustrative direct and indirect benefits (annually) for the Keeyask project below. We include the construction benefits along with total benefits during the post-construction period for ease of comparison (Table 6). We acknowledge that if the Common Unit option were chosen, results would be significantly different.

As noted above, economic benefits from the Keeyask project for KCN members will depend on how such benefits are distributed within the KCN communities. We have no information on how benefits will be distributed within the KCN communities. However given a populaton of 6,350 KCN members (http://fnpim-cippn.aandc-aadnc.gc.ca/index-eng.asp), we can calculate estimates of annual economic benefits per capita which assumes that the distribution of benefits is uniform. This is also included in Table 6 below.

While a multiplier effect has been applied to the estimate of total salaries for KCN members who obtain operational jobs, this multiplier effect would be relatively weak if operational jobs were not in the KCN communities.

[14] We note that in the response to CAC/MH II-18, Manitoba Hydro indicates an AGR for 2022/23 of almost $250 million. Further, we note that in the response to PUB/MH I-78 b), Manitoba Hydro estimated preferred distributions declared based upon its 'most likely' economic assumptions, capital costs and export/energy prices. Distributions from 2022 through 2039 ranged from $5 million to $8 million annually. While the question asked Manitoba Hydro to assume a full equity interest subscribed by the partners, Manitoba Hydro's response does not identify the assumptions in terms of subscription.

Table 6: Illustrative Total Annual Economic Benefits (Direct and Indirect Benefits) for KCNs from the Keeyask Project, Assuming Preferred Unit Equity Option

	Estimated Range of Benefit	
Period	Low estimate	High estimate
During construction phase - estimated total annual benefits	**$10.26 million/year**	**$20.67 million/year**
Construction phase total benefits per capita	**$1,616/year**	**$3,255/year**
After construction phase - 1.9% equity ownership, which includes:		
Investment income (first 5 years post-construction)	$1.06 million/year	$3.63 million/year
Investment income (6 years onward)	$1.06 million/year	$3.8 million/year
Manitoba Hydro funding for operational jobs	$1.23 million/year	$1.23 million/year
Labour income from operational jobs	$5.9 million/year	$11.8 million/year
Multiplier effect	$1.39 million/year	$3.09 million/year
Estimated Total Benefits (6 years post-construction)	**$9.58 million/year**	**$19.92 million/year**
Estimated Benefits per capita (6 years post-construction)	**$1,509/year**	**$3,137/year**
After construction phase - 2.5% equity ownership, which includes:		
Investment income (first 5 years post-construction)	$1.06 million/year	$4.83 million/year
Investment income (6 years onward)	$1.06 million/year	$5 million/year
Manitoba Hydro funding for operational jobs	$1.23 million/year	$1.23 million/year
Labour income from operational jobs	$5.9 million/year	$11.8 million/year
Multiplier effect	$1.39 million/year	$3.33 million/year
Estimated Total Benefits (6 years post-construction)	**$9.58 million/year**	**$21.36 million/year**
Estimated Benefits per capita (6 years post-construction)	**$1,509/year**	**$3,364/year**

different results, not that they were inconsistent, and I think we've tried to present the basis -- the -- the basic results from each.

MR. JACK LONDON: I -- I'll come back to a more chronologically appropriate set of -- set of questions. But I wanted to deal with a couple of matters that are recent in the minds of the -- of the Board. And to do that, I just want to do something that -- a couple of things on the -- on the numbers.

The -- I want to clarify them. In -- in your paper of March 17, 2014...

(BRIEF PAUSE)

MR. JACK LONDON: Sorry, I lost my...

(BRIEF PAUSE)

MR. JACK LONDON: ...at page 73, Table 3. But when I first looked at this table, it struck me that it looked a bit odd because when you look down the first column and you see that at -- after the construction phase at 1.9 percent, there is a low estimate of $1.49 million a year. And at 2.5 -- 2.5 percent, which is only point-o-six (.06) more, it goes

to 6.44 million a year.

So we -- I asked those people who can do this to run those -- re-run those numbers for me and I just want to correct them so that we're dealing with appropriate numbers. And for the most part, in this particular part of the exercise, they -- what they do is to show a bit of a -- a reduced return to the -- to the Cree -- the KCNs. But the Board should have the appropriate and -- and correct information.

So let -- let me just correct those. In the -- during the -- during the construction where you've got $4.76 million a year, I don't have any quarrel with that. In the high estimate as well, the 11.64 million a year, it looks fine. After the construction phase in 1.9 percent -- 9 -- in the 1.9 percent interest you've got 1.49 million a year, which is okay. But in the high estimate the number ought not to be 1.97 million a year, but 4.56 million a year.

Would you accept that, Dr. O'Gorman?

DR. MELANIE O'GORMAN: I will definitely have to check that once I have a calculator or an Excel sheet.

MR. JACK LONDON: Subject to check?

DR. MELANIE O'GORMAN: Yeah. Yeah.

MR. JACK LONDON: And in the after

construction phase at 2.5 percent, the opposite happens. You've got 6.44 million a year, and I would suggest that it ought to be 1.97 million a year, considerably lower than what you have there and much more consistent with a 1.9 percent re -- return of 1 -- of 1.49 million.

And on the high estimate after the construction phase we have -- you've got 9 million a year. We work it out to -- to 6 million a year. And so if you'll accept that, subject to check, we can move forward.

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: Now, if we can go to...in that same document to Table 3 on page 73. Sorry, that's where we are. Okay.

I want to pull up your presentation to the CEC of a similar table. And that's at Tab 6 of the book of -- large book of documents. I have hard copies here by the way if you'd like. It'll come up on the screen, but it might be easier for you with hard copies.

DR. MELANIE O'GORMAN: That's okay.

(BRIEF PAUSE)

MS. AIMEE CRAFT: Mr. Chair, if I may, just for our information and assistance, are the numbers that are being put forward by Mr. London on -- available on the record anywhere? Is there something we can refer to for the ra -- the veracity of these numbers, or to assist us?

MR. JACK LONDON: We just took the actual evidence of what the percentages were and what the returns were and multiplied them. All the numbers are there. It -- it was -- I think they were just miscalculation errors.

(BRIEF PAUSE)

MS. AIMEE CRAFT: And have those miscalculations been clarified on the record, or is that the intent?

MR. JACK LONDON: That's my intent. My intent is to say that, for the purposes of today, Dr. Buckland's go -- going to go away. I don't want to have to de -- delay the proceedings. And if there is a -- if Dr. O'Gorman comes back and says the numbers are wrong, I -- we -- we'd be happy to accept that. So that's why I say it's subject to check.

MS. AIMEE CRAFT: Thank you.

MR. JACK LONDON: The -- when we left off -- or -- or this morning we were talking about the returns that the KCN will receive under the JKDA and from the project. And Board member Grant talked about it being a -- maybe the equivalent of a GIC investment. So if we can just spend a couple of minutes talking about that for -- for a moment and see if you'll confirm these -- these figures for me.

I don't have them in -- in any of the documents, because I didn't know that we were going to have to enter into this. But if on the assumption of a 1.9 percent preferred unit holding, which requires $25 million in cash from the KCNs, right?

You're okay with that number, the $25 million cash investment?

MS. MARLA ORENSTEIN: Yes.

MR. JACK LONDON: After construction, just looking at investment income at 1.9 percent, the low estimate is 1.25 million over a $25 million cash investment, correct?

DR. MELANIE O'GORMAN: I have 1.49 million for the post-construction, 1.9 percent equity holding.

MR. JACK LONDON: That -- that would -- that would be with the multiplier effect included?

DR. MELANIE O'GORMAN: Sorry, you're right.

MR. JACK LONDON: So without the multiplier effect, it's 1.25 million over a $25 million investment -- cash investment, which presents a 5 percent return on investment, correct, subject to check?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: And at 2.5 percent, it would be 1.64 million if my -- the number I gave you earlier is correct, over a $25 million cash investment, which would be a return of -- a cash on cash of 6.5 percent, correct?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: And in a high, the 1.9 percent return of 3.8 million over a cash investment of 25 million would indicate a return on cash investment of 15.2 percent?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: And on the 2.5 percent holding, the return would be $5 million which is the number that the Board has seen repeatedly in documents that have come before the Board on several occasions, over $25 million, which is a 20 percent return.

DR. MELANIE O'GORMAN: Yes, subject to check.

MR. JACK LONDON: So the -- the -- just to stop -- to pause there for a second, the -- the -- in a response to the IR, which I don't have in front of me, the -- there was a table -- the -- the Board was given a table of the investment -- the returns on the investment likely to be obtained by the -- by the Cree Nations, and it shows in the -- about a $5 million a year return.

With a $25 million investment, the return is 20 percent, correct?

DR. MELANIE O'GORMAN: I remember that IR, yes.

MR. JACK LONDON: And how much money do you have that you'd like to invest at 20 percent these days?

DR. MELANIE O'GORMAN: It's a pretty high return.

MR. JACK LONDON: Yeah, okay. Now, if we take it the way -- and we don't -- we don't just look at investment income, but we look at all benefits, excluding ongoing jobs and excluding the Adverse Effects Agreements. So the numbers actually would be higher, but I'm prepared to do this without even taking

into account the ongoing jobs and the Adverse Effects Agreements.

So after you include the multiplier effect of 1.20 percent, the -- subject to check, would you accept that the returns in the low case on a 1.9 percent holding would be 5.8 percent?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: On the 2.5 percent holding, it would be 7.9 percent?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: And the high case, 4.56 million over the 25 million cash would be 18.24 percent?

DR. MELANIE O'GORMAN: Subject to check, yes.

MR. JACK LONDON: Subject to check. And at 2.5 percent, the return is actually 24 percent.

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: And if you add in the hundred and eight-three (183) operational jobs, which includes $10 million of income per ann -- per annum for those jobs?

DR. MELANIE O'GORMAN: We've never heard that value before. This is the first time we're hearing a value attached to those jobs.

jobs for KCN members. That's the annual income.

--- UNDERTAKING NO. 125: MKO to Calculate the value of one hundred and eight-two (182) ongoing post-construction jobs for KCN members

CONTINUED BY MR. JACK LONDON:

MR. JACK LONDON: Now, if -- if I'm approximately correct, again subject to check and perhaps you can just include this as part of the undertaking, in the low case with a 1.9 percent holding, that would produce a return of 48.8 percent?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: Sorry, 45.8 percent. I -- I misread it, 40 -- 45.8 percent.

On a 2.5 percent holding in the low case, it would be 47.8 percent?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: In the high case it -- at 1.9 percent it would be 58.2 percent return?

DR. MELANIE O'GORMAN: Yes

MR. JACK LONDON: And at the 2.5 percent, it would be 84 percent?

DR. MELANIE O'GORMAN: Subject to check, yes.

MR. JACK LONDON: Subject to check return.

THE CHAIRPERSON: Could you enlighten me about the way you're treating those numbers as being the fruit of an investment?

MR. JACK LONDON: I'm sorry, I didn't hear.

THE CHAIRPERSON: I'm wondering how -- why you're linking the 10 million flowing from jobs as being part of the investment return. My --

MR. JACK LONDON: The question was: What is the net benefit?

THE CHAIRPERSON: And I'm trying to understand why you're taking the 10 million and -- and plugging it into the investment return on the --

MR. JACK LONDON: I'm not plugging it into an investment return, Mr. Chairman. I -- I said that the -- the second category was the total benefits --

THE CHAIRPERSON: I see.

MR. JACK LONDON: -- analysis, including the investment return and the operational jobs --

percentages, and --

DR. MELANIE O'GORMAN: Yes.

MR. SVEN HOMBACH: -- will you accept subject to check that in the last Winnipeg mayoral election the turnout was approximately 47 percent?

DR. MELANIE O'GORMAN: Yes.

MR. SVEN HOMBACH: Whereas in the last federal election it was approximately 61 percent?

DR. MELANIE O'GORMAN: Yes.

MR. SVEN HOMBACH: Assuming that those percentages are true, does that change your answer or does that put you in a better position to assess whether this was an expected level of turnout?

DR. MELANIE O'GORMAN: It puts me in a better position to understand how common that type of voter turnout is, but my overall view is that I would like to have seen a majority of individuals in the KCNs vote to be sure that that vote represented their -- their choice, because as we speculated, there are a number of reasons for why an individual might not vote. So we just lack that -- we lack quantitative knowledge on -- on the motivations behind those people.

It's interesting but I would say it wouldn't -- it wouldn't change my overall concern that we don't know how the majority of KCN members feel.

only have one (1) question.

CONTINUED CROSS-EXAMINATION BY MR. JACK LONDON:

MR. JACK LONDON: You raised the -- My -- My Learned Friend raised the -- the federal statistics, the voting statistics. So I suggest to you -- well, in a article entitled, "First Nations Candidacy and On-reserve Voting in Manitoba," and on June 2011, written by C. Adams (phonetic) from the University of Winnipeg. I'm not sure what the -- the initial stands for, but you probably know that is. So don't tell me that you're going to doubt the credibility of the article.

DR. MELANIE O'GORMAN: No.

MR. JACK LONDON: G. Poezer, P-O-E-Z-E-R, University of Saskatchewan, and L. Birdall (phonetic), University of Saskatchewan. And you can do this subject to check.

Would you agree that -- were you aware that that article found large differences between on-reserve and non-reserve pools across the province having a turnout rate of only on reserve 27.8 percent, and 58 percent at non-reserve pools?

DR. MELANIE O'GORMAN: I was not aware of that.

MR. JACK LONDON: And you are aware that the 33 percent minimum vote and the -- and the statistics that you gave was a blended vote between on and off reserve?

DR. MELANIE O'GORMAN: Yes.

MR. JACK LONDON: So that the number actually is greater -- the lowest number is greater than the 28 -- 27.8 percent on reserve?

DR. MELANIE O'GORMAN: Right.

MR. JACK LONDON: I have no other questions.

THE CHAIRPERSON: Mr. London --

MS. AIMEE CRAFT: Can Mr. London clarify, just for the record, and that's an article in relation to First Nations governance elections or band elections and not referenda.

Is that correct?

MR. JACK LONDON: I -- I don't have that -- I -- I can't answer that question, Ms. Craft. But I -- if you'd -- if you'd like I'm happy to investigate.

MS. AIMEE CRAFT: If we could have the article, that would be helpful and then we can undertake to provide a further response if -- if required.

MR. JACK LONDON: We have it -- we have it online don't we? We have it online and I'll have it sent to you.

THE CHAIRPERSON: Thank you.

MR. JACK LONDON: I didn't -- I didn't know about it in advance, actually. I hadn't done my homework.

THE CHAIRPERSON: Could you frame that as an undertaking, Mr. London? Could you frame it as an undertaking, please?

MR. JACK LONDON: We undertake to forward to you a electronic copy of the article just referenced, "First Nations Candidacy and On-reserve Voting in Manitoba."

--- UNDERTAKING NO. 127: Mr. London to forward electronic copy of the article "First Nations Candidacy and On-reserve Voting in Manitoba"

THE CHAIRPERSON: Thank you for that, Mr. London. Board member Grant has a question, or a comment.

DR. HUGH GRANT: I keep finding bees in

13 Integrated Comparisons of Development Plans – Multiple Account Analysis

13.0 Chapter Overview

The Terms of Reference (TOR) of the Needs For and Alternatives To (NFAT) review of the Preferred Development Plan call for an assessment of its justification and its alignment with Manitoba Hydro's mandate, Manitoba's Clean Energy Strategy and the principles for sustainable development. The TOR also includes a call for an assessment of whether "the Plan has been justified to provide the highest level of overall socio-economic benefit to Manitobans and is justified to be the preferable long-term electricity development option for Manitoba when compared to the alternatives".[1]

The purpose of this chapter is to present the results of a multiple account benefit-cost analysis (MA-BCA) of Manitoba Hydro's Preferred Development Plan as compared to alternative plans with and without new U.S. interconnection capacity and new export sale commitments; and with and without new hydro generating capacity to meet domestic load growth. These alternatives, which are set out in detail in Section 13.2 below, were chosen to enable an assessment of the full range of consequences and benefits and costs to Manitobans of the key components of the Preferred Development Plan:

(i). relying on hydro to meet growing domestic load and

(ii). taking advantage of the current opportunity for new export sales agreements and the development of additional interconnection capacity with the U.S. power market.

[1] Manitoba Order in Council 00128/2013, Scope of the NFAT Review 2(f), p.3.

As explained in the next section, MA-BCA extends Manitoba Hydro's economic evaluation of the preferred and alternative development plans to take into consideration consequences for Manitobans that are not reflected in the revenues and expenditures facing Manitoba Hydro. It uses a set of evaluation accounts to move from a Manitoba Hydro perspective to a broader Manitoba social perspective. The objective is to provide a systematic, comprehensive assessment of all of the benefits and costs to Manitobans in a manner that can assist the NFAT panel address the question of overall socio-economic benefit.

13.1 Multiple Account Benefit-Cost Analysis

13.1.1 Basic Objective and Approach

Traditional cost-benefit analysis is a standard method economists use to assess the net benefits of alternative plans, projects or policies from a broad social perspective.[2] It is intended to take into account the positive and negative consequences of the alternatives being analyzed to everyone (with standing in the analysis)[3] that is affected. These would include not only commercially-valued consequences – those with well-defined market prices – but also the social and environmental consequences that people value.

[2] For a summary of the purpose and rationale of cost-benefit analysis, see Marvin Shaffer, *Multiple Account Benefit-Cost Analysis: A Practical Guide for the Systematic Evaluation of Project and Policy Alternatives*, University of Toronto Press, 2010, pp.3-15. A standard text with details on principles and methods is: A. Boardman et. al., *Cost-Benefit Analysis: Concepts and Practice*, 3rd ed., 2006. For guidelines on the application of cost-benefit analysis in relation to regulatory proposals, see Treasury Board of Canada Secretariat, *Canadian Cost-Benefit Analysis Guide: Regulatory Proposals*, 2007.

[3] 'Standing' is defined by the jurisdiction or parties for which the analysis is being done. For an assessment of the public interest in Manitoba, all people within the province would be considered to have standing.

With its broad scope, cost-benefit analysis attempts to calculate an overall bottom line to determine which of the alternatives is socially preferred, based on the value that people place on what is produced (what people in principle would be willing to pay for all of the positive consequences) relative to the cost people assign, or compensation they in principle would require, to pay for the inputs and offset the negative consequences.

MA-BCA is a variation of traditional cost-benefit analysis. It adopts the same broad scope and the same basic valuation principles. However, MA-BCA recognizes that not all consequences can meaningfully or reliably be monetized in order to calculate an overall bottom line. Furthermore it recognizes that an overall bottom line can mask important distributional considerations. It is not just overall net benefits but also the nature and distribution of those benefits and costs that can govern what is "preferred" from a broad social or public interest perspective.[4]

Accordingly, the objective of MA-BCA, like traditional cost-benefit analysis, is to identify the full range of positive and negative consequences of the alternatives and to assess their significance. However, the assessment does not have to be entirely in dollar terms and the consequences all aggregated to a bottom line. The results are presented in a matrix form for a disaggregated set of evaluation criteria or accounts. The purpose is to identify the advantages or disadvantages of

[4] One of the first government agencies to adopt a multiple account approach to project assessments in North America was the U.S. Water Resources Council, *Economic and Environmental Principles and Guidelines for Water and Related Land Resources Implementation Studies*, 1983. For a recent review and explanation of the multiple account approach see Marvin Shaffer, *Multiple Account Benefit-Cost Analysis* (2010).

the alternatives and the key trade-offs for the different parties and interests that are affected, information with which judgments about the preferred alternatives can be made.[5]

13.1.2 The Evaluation Accounts

A standard way to conduct cost-benefit analysis is to start with the valuation of the project's inputs and outputs based on market prices – the net revenues or return on investment from the perspective of the proponent. Then the analysis proceeds by identifying and assessing positive and negative consequences – social benefits and costs – that the market valuation does not reflect. The MA-BCA of Manitoba Hydro's preferred and alternative resource plans follows that basic approach.

Similar to the cost-benefit assessment of the Wuskwatim project[6], the MA-BCA of Manitoba Hydro's preferred and alternative resource development plans starts with the incremental revenues and expenditures for Manitoba Hydro and its project partners. Then the MA-BCA addresses consequences for Manitoba Hydro customers, Manitoba taxpayers, the economy, the environment and affected communities that this market valuation does not capture or adequately reflect.

[5] MA-BCA is similar to multi-criteria or multi-attribute analyses that are commonly used in project and policy evaluations. In such analyses, a broad set of criteria and indicators of relative advantage or impact are established for the assessment of the alternatives. However, in multi-criteria analysis, criteria and indicators are established by the analyst or stakeholder group governing the evaluation process. In MA-BCA, the accounts and indicators are based on the principles of traditional cost-benefit analysis. They are designed to take into account impacts on everyone with standing that is affected, and to reflect the values of those affected. Unlike multi-criteria or multi-attribute analysis, MA-BCA is not an alternative to traditional cost-benefit analysis, but rather a variation of it. See Marvin Shaffer, *Multiple Account Benefit-Cost Analysis* (2010), pp 43-47.

[6] Marvin Shaffer & Associates Ltd., *Social Net Benefits of Advancing the Wuskwatim Project*, prepared for Manitoba Hydro, August, 2003, and *Social Net Benefits of Wuskwatim vs. Wind Development*, prepared for Manitoba Hydro, February 27, 2004.

Specifically, the MA-BCA assesses the preferred and alternative plans in terms of the following criteria or evaluation accounts:

Market Valuation

This account assesses the net benefit or cost of the preferred and alternative plans to Manitoba Hydro and its project partners. It analyzes the incremental revenues generated by the surplus electricity supply in the different plans, relative to the incremental capital and operating expenditures incurred. The present value difference between the incremental revenues and expenditures measures the net market value or cost of the investment in new electricity supply in each plan.

This market valuation account relies on the assessment of the economics of the different plans from a Manitoba Hydro perspective as presented in previous chapters. The same annual revenue and expenditure cash flows and residual asset values as estimated for the resource plan analysis are used here.

In this MA-BCA, however, the present values of the incremental revenues and expenditures are different. Present values are calculated here by applying a real discount rate that reflects the social opportunity cost of capital. A real rate of 6% is used, based on recent research on discounting in cost-benefit analysis.[7] In the previous resource planning economic analysis, a

[7] In their recent study, Burgess and Zerbe calculated a discount rate range of 6.6% to 7.3% real based on their estimates of the social opportunity cost of capital in the U.S. M. Moore *et al.* argue that rate is too high, and estimate the social opportunity cost of capital to be 5% real. The 6% rate used in this study is roughly mid-point between these estimates. Also, the 6% rate is more consistent with a provincial Manitoba perspective than the somewhat higher rate that Burgess and Zerbe might suggest. The social opportunity cost of capital is calculated by weighting and then summing the cost of the different potential sources of capital: savings, borrowing from outside

somewhat lower discount rate was used to reflect the estimated weighted average cost of capital from a corporate perspective.[8]

Manitoba Hydro Customer

This account assesses the consequences of the different plans for Manitoba Hydro customers. It relies on the financial analysis in Chapter 11 that provides estimates of the rate increases in the short to medium and long term that would be required to recover net system costs and meet corporate financial targets. It also addresses the extent and significance of differences in the reliability of supply under abnormal weather, water condition and other contingencies because of the different mix of assets and interconnection capacity in the different plans.

To provide consistency in the assessment of rates in the preferred and alternative plans, revenue requirements were calculated to achieve common financial targets. The even annual rate increases required to achieve a 75:25 debt/equity ratio by the 20th year of the planning period were calculated for each plan. After year 20 the rates were adjusted each year to maintain an interest coverage ratio of 1.2.

the jurisdiction, and displacement of other investment. The weights reflect the relative importance of each source. From a provincial perspective there will tend to be more outside borrowing than displacement of other investment within the provincial economy. The greater the weight of outside borrowing relative to displacement of other investment, the lower will be the discount rate. See D. Burgess and O. Zerbe, "Appropriate discounting for benefit-cost analysis", *Journal of Benefit-Cost Analysis*, 2(2), 2011 and M. Moore et al, "More appropriate discounting: the rate of social time preference and the value of the discount rate, *Journal of Benefit Cost Analysis*, 4(1), 2013.

[8] In Manitoba Hydro's financial analysis of rate impacts, a discount rate based on time preference is used. This time preference rate is lower than the social opportunity cost of capital used in this MA-BCA and Manitoba Hydro's weighted average cost of capital used for resource planning. The time preference rate is used in the rate analysis because the purpose of the discount rate in that analysis is simply to assign weights (discount factors) to present versus future rate impacts based on the trade-offs people would willingly make (e.g., as they do when they save, deferring present consumption for future consumption opportunities). It is important to note that in the financial analysis, the cost of capital is already reflected in the calculation of revenue requirements and rates; therefore it would in effect be double counting to apply a cost of capital-based discount rate.

While based on the same surplus sale revenues and capital and operating expenditures as in the market valuation account, this Manitoba Hydro customer account is different in that it indicates the impacts over time, not just an overall net present value; it takes into account the effect of partnership arrangements which affect the net revenues to Manitoba Hydro separate from its project partners; and it calculates rate impacts based on Manitoba Hydro's forecast actual cost of capital, as opposed to the discount rate used to calculate the present value net benefit or cost in the first account.

The rate impact assessment in this Manitoba Hydro customer account does not attempt to measure a social benefit or cost in addition to what is estimated by the market valuation. Rather, it serves to indicate a key distributional effect – how the net benefit or cost estimated in the market evaluation account is shared or borne by Manitoba Hydro's domestic customers through impacts on rates over time.

The assessment of system reliability, on the other hand, does address additional benefits or costs not captured in the market valuation. While all of the plans are designed to meet Manitoba Hydro and industry-standard reliability criteria, they differ in terms of their ability to meet load under all possible weather, water conditions, forced outage and other contingencies.

Differences in the estimated loss of load probability and consequently load carrying capability are used to indicate differences in the system reliability in the different plans. To illustrate the value of the different reliability in the different plans, estimates of the expected unserved energy are multiplied by an estimated cost of supply interruptions to calculate differences in the expected costs of the very infrequent, but nonetheless potentially very disruptive bulk system failures to meet demand.

Manitoba Government

This account assesses the net benefit or cost of the different plans to the Manitoba government and therefore Manitoba taxpayers. It analyzes the incremental net revenues accruing to the government. The present value of the incremental net revenues measures the net benefit from the point of view of taxpayers.

The construction and operation of the different projects in Manitoba Hydro's plans have a wide range of direct and indirect impacts on government tax revenues. There are the taxes and fees paid by Manitoba Hydro directly; there are income and sales taxes paid by those directly and indirectly employed by the projects, or by firms directly and indirectly supplying goods and services for the projects.

Many of these tax impacts, however, do not constitute incremental net revenues for government. The income and sales taxes paid by Manitobans who would otherwise be employed elsewhere would not be incremental to the extent those taxes would be paid in any event. The income and sales taxes paid by in-migrants (attracted to the province as a result of the increased economic activity due to the projects) may be incremental revenues but would not be incremental *net* revenues to the extent they are offset by the increased costs government must incur to supply the infrastructure and service they and their families need.

In order to ensure this account captures net benefits as opposed to gross impacts, and to avoid double counting benefits addressed in the Manitoba economy account,[9] only direct incremental taxes and fees paid by Manitoba Hydro net of incremental government costs or risks are included. In this analysis this is conservatively limited to the water rentals and capital taxes paid in each plan. They are clearly incremental revenues that government would not otherwise receive; and they are not offset by incremental expense. These incremental net governmental revenues are not captured as net benefits in the market valuation account. They simply appear as costs to Manitoba Hydro.

There are other taxes and fees that Manitoba Hydro pays to government. For example, there are debt guarantee fees. However, given that the provincial debt guarantee fee is provided in exchange for this guarantee, the multiple account analysis has excluded the debt guarantee fees from the analysis of net benefits to the Manitoba government. It is assumed that these fees serve to offset the risk of higher borrowing costs and consequently may not constitute net benefits for government. There are also sinking fund administration fees, but it is assumed they are intended to pay for incremental administration costs, again not constituting a net benefit for government.

Coal taxes and the carbon charges assumed to be paid by Manitoba Hydro are also reported, but not included as net benefits in the government account. First, the carbon charges may not be manifested in a tax; they could arise, for example, from the purchase of permits in a cap and trade system. Second, even if carbon tax payments were made (like the existing coal tax), these

[9] The Manitoba economy account assesses the incremental income due to the increased employment and economic activity generated by the different plans. The estimated benefits are measured pre-tax and therefore capture both the benefit to the affected individuals and government.

are clearly intended to reflect part of the cost to society of carbon emissions. They are not a net benefit per se.[10]

Manitoba Economy

This account assesses the consequences of the different plans for the Manitoba economy. It analyzes the amount of employment and wages generated by the projects in each plan and estimates the potential incremental income that employment offers for Manitobans. The present value of the incremental income is an indicator of the employment net benefit generated in the different plans.

It is important to note that this account is different from economic impact analyses that serve to estimate the direct, indirect and induced demand for labour generated by a project's expenditures. Economic impacts do not indicate incremental employment or wages – they indicate gross effects. They are useful for understanding how a project may affect total economic activity and employment in different industries and regions, but not what net benefits that entails. The purpose of this analysis is to assess net benefits in accordance with the principles of cost-benefit analysis.[11]

[10] In the environmental account discussed below, the social cost of GHGs is measured by the externality they entail – the estimated social cost of GHGs less the carbon charges assumed in the market valuation. If the carbon charges were included as a benefit to government, the GHG cost in the environmental account would have to be correspondingly larger to include the total social cost of the GHG emissions. The net overall effect would be the same.

[11] For a discussion of the limitations of economic impact analysis and its difference from cost-benefit analysis see, P. Grady and R. Muller, "On the Use and Misuse of Input-Output Based Impact Analysis in Evaluation", *Canadian Journal of Program Evaluation*, 3(2), 1988, pp.49-61.

This account focuses on employment as opposed to purchases of goods and services because of the assumption that it is in the labour market where there is greatest potential for net benefits or "economic rents" to be earned – i.e., where there may be a significant difference between what is paid and the minimum compensation required to offset the incremental or opportunity costs of what is provided.[12] As in the Manitoba government account, the intent here is to capture the net benefit, not the total impact.

Employment net benefits are measured by the wages that are paid less the minimum amount the workers would have to receive to take the jobs: what those workers would otherwise have earned or the value of the activity they otherwise would have engaged in. In well-functioning economies, the incremental income (or in economic terms, the "economic rent") will be relatively small. People are paid more or less what is required to attract them from what they would otherwise be doing.

However, there are circumstances and regions where the net benefits can be significant – in particular, in regions where there is involuntary unemployment, limited alternative opportunities and limited willingness or ability to move to regions with better employment prospects. Here the net benefits from new job opportunities can be significant and, like the net benefit to taxpayers, they are not reflected in the market valuation account. The wages paid to construction and operating workers are simply costs from Manitoba Hydro's perspective.

[12] In competitive markets, the incremental income (or in economic terms, the 'economic rent') from sales will generally be small. Offsetting the gross revenues firms receive are the costs they must incur to provide the goods and services they sell. There would be some net return, but over the long run and under normal market conditions, one could expect that the net return is what is needed to attract capital – in other words it would reflect the cost of capital in the affected industries.

The assessment of the employment net benefits in the different plans is based on the amount and regional location of the jobs, and the estimated origin of the persons filling the available positions. No Manitoba net benefit is assigned to the jobs estimated to be filled by in-migrants because of the provincial perspective taken in this MA-BCA.

Environment

This account addresses the consequences of the different plans for the environment. It considers impacts on GHG emissions in Manitoba and elsewhere, criteria air contaminant (CAC) emissions in Manitoba, and bio-physical effects associated with the construction and operation of the projects in the different plans. The focus of this account is not the impacts in themselves, but rather the externality they represent – the external net benefit or cost to Manitobans not reflected in the market valuation or other accounts.

With respect to GHG emissions, what is measured is the estimated social cost of emissions in excess of the carbon taxes or charges assumed to be paid by Manitoba Hydro and therefore already taken into account. The social cost of GHG emissions in theory should reflect the maximum amount Manitobans would be willing to pay to reduce carbon emissions as part of the global effort to avoid serious, potentially catastrophic effects of climate change. The precise value of that willingness to pay is difficult to determine. However, there is considerable evidence that it is much greater than the carbon taxes or charges assumed in the market valuation account.[13] Estimates of the social cost of GHG emissions based on Environment

[13] Rough calculations indicate that the cost of the measure to phase out coal-fired generation in Manitoba was well in excess of $100/tonne of CO_{2e} when first introduced and remains well over $50/tonne of CO_{2e} at current coal and natural gas prices.

Canada and U.S. government reports[14] are used in this analysis to indicate the potential external costs associated with GHG emissions in the different plans.

With respect to CAC emissions, estimates of damage costs associated with nitrogen oxide (NO_x) and particulate matter (PM) emissions that have been developed in other jurisdictions are used to illustrate the potential magnitude of the external cost they entail for Manitobans.

With respect to biophysical effects, the issue is whether there are residual impacts despite the mitigation and compensation built into the projects' plans and costs. Summaries of the major impacts identified in the Keeyask EIS and preliminary descriptions and assessments for other projects in the plans are presented and the nature and extent of any residual effects – i.e., remaining externality – are discussed.

Social

This account addresses consequences of the different plans for aboriginal and non-aboriginal communities as well as other social effects not addressed in the other accounts.

One of the social consequences analyzed in this account is the net return and other benefits for Manitoba Hydro's project partners. This is not an additional net benefit to what is already

[14] See Environment Canada, *Heavy Duty Vehicle and Engine Greenhouse Gas Emissions Regulation,* section 7.3.3, Feb.22, 2013 (http://gazette.gc.ca/rp-pr/p2/2013/2013-03-13/html/sor-dors24-eng.html#footnoteRef.82118), and U.S. Interagency Working Group on Social Cost of Carbon, *Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis – Under Executive Order 12866*, May 13, 2013.

estimated in the market valuation, but rather an important distributional consequence. It indicates the share of the economic return that will accrue to the project partners.

This account also considers other impacts on communities affected by the projects in the different plans. As with the environmental account the focus here is not the impacts in themselves, but rather the externality they represent: the external net benefit or cost to affected communities as a result of impacts on services, infrastructure or well-being not avoided or offset by mitigation and compensation plans – i.e., not reflected in the market valuation.

Finally, this account addresses other consequences not considered elsewhere such as the long-term sustainability attributes of the different plans – in particular the heritage value of assets remaining at the end of the planning period. The issue analyzed here is whether the "bequest value" Manitobans place on the assets they leave for future generations is fully captured by the discounted present value of the residual asset values taken into account in the market valuation.[15]

[15] The economic concept of bequest value was first raised in a seminal article by John Krutilla ("Conservation Reconsidered", *American Economic Review*, Vol. 57, no. 4, September 1967) who argued that the main reason people are willing to allocate considerable resources (or forego immediate development benefits) for conservation is because of their desire to preserve important environmental attributes for the benefit of future generations. While developed with regard to the value of preserving natural resources, the concept of bequest value more generally recognizes a willingness to pay or allocate resources today for the benefit of future generations. It is a fundamental factor underlying the argument for greater investment in measures that will reduce the risk of climate change many years into the future.

Risk

The estimated consequences of the preferred and alternative plans depend on a number of factors including capital costs, energy prices and economic variables. The assessments under each account are done initially for a reference scenario set of assumptions in order to determine the advantages and disadvantages of the different plans under these mid-range assumptions. However, given the underlying uncertainties, the range of possible outcomes the different plans entail are important considerations in the overall assessment.

In this account, the probability of different net cost and rate implications are used to depict the extent of uncertainty in the relative advantages for the different plans. The potential effect of modifying the plans at key decision points is then considered to indicate how the different downside risks in the different plans can be mitigated.

Summary

Table 13.1 summarizes the multiple account framework. It shows the criteria, nature of analysis and indicators that are used to evaluate and compare the preferred versus alternative development plans.

Table 13.1 SUMMARY OF MULTIPLE ACCOUNT FRAMEWORK

Account	Purpose	Analysis	Indicators
Market Valuation	Net benefit to Manitoba Hydro and project partners.	Incremental revenues from surplus sales less incremental capital and O&M expenditures.	Present value of net revenues or cost (market valuation of investment).
Manitoba Hydro Customer	Consequences for customers in short to medium and long term.	Rate increases required to recover costs and meet MH financial targets. System reliability.	Average annual and cumulative rate increases over the planning period. Load carrying capability and cost of expected unserved load.
Manitoba Government	Net benefit to taxpayers.	Incremental government net revenues. Amount of additional Manitoba Hydro debt guarantee.	Present value of incremental revenues to government, net of incremental costs (including consideration of risk of debt guarantee).
Manitoba Economy	Consequences for the economy.	Employment generated and incremental income earned.	Present value of incremental income.
Environment	Consequences for emissions and natural and bio-physical effects.	Impact on GHGs in Manitoba and elsewhere. Manitoba CAC emissions Biophysical impacts.	Present value of social cost of Manitoba GHGs in excess of carbon charge. Present value of CAC damage costs. Nature and extent of residual biophysical impacts.
Social	Consequences for aboriginal and non-aboriginal communities. Other social impacts not addressed elsewhere.	Benefits to project partners. Impacts on affected communities. Value people place on assets remaining at end of planning period.	Nature and significance of partner benefits. Nature and extent of residual community impacts. Potential bequest value of remaining assets.
Risk	Nature and significance of key assumptions.	Range of possible consequences. Risk mitigation potential.	Probability distribution of system net revenues and rates.

13.2 The Resource Development Plans

The MA-BCA assesses the preferred and three alternative resource development plans. Two of the alternative plans assume no new U.S. interconnection or firm export sales: one based on the development of new gas-fired thermal generation as required to meet growing domestic

loads; and one based on hydro – specifically the development of Keeyask G.S. The other alternative resource development plan assumes a new interconnection and firm export sales, but on a smaller scale than in the Development Plan with a 250 MW (230kV) as opposed to a 750MW (500kV) interconnection.

13.2.1 Manitoba Hydro's Preferred Development Plan

Manitoba Hydro's Preferred Development Plan combines the development of new hydro generation to meet growing domestic load with new access to the U.S. market and new firm export sales in order to enhance the value of the new hydro development and existing hydro system, and thereby reduce the long-term cost for customers. This plan would see the development of the Keeyask generating station (G.S.) and related transmission for 2019/20; Conawapa generating station (G.S.), related transmission, and north-south network upgrades for 2025/26; a new 750 MW interconnection with the U.S. for 2020/21; and new export sales with Minnesota Power (250 MW from 2020-2035) and Wisconsin Power Service (108 MW from 2014-2021, 100 MW from 2021 to 2027 and 300 MW from 2026-2036) as well as an expansion of the Northern States Power export sale (125 MW from 2021-2025). It is assumed that toward the end of the planning period (starting in 2041), Manitoba Hydro would add simple cycle gas thermal units as required to meet currently forecast domestic load growth.

In terms of the pathway[16] this plan represents, it is a commitment to the development of Keeyask G.S., the 750 MW interconnection and new export sales. While the pathway anticipates the development of Conawapa G.S. for 2025/26, the decision on that is not required

[16] The concept of pathways is developed in the next chapter where it is recognized that long term development plans may be modified in the future as new information becomes available. In this sense the pathway defines what is set and what adjustments to the plan may be considered after initial decisions and commitments are made following the NFAT process.

at this time, and the precise in-service date could be deferred if warranted by load growth, market or other conditions. What is done toward the end of the planning period will be determined in the future, depending on precise needs and opportunities available at that time. The assumption of gas plants starting in 2041 is simply a method used in all of the plans to ensure the forecast load can be met in a manner consistent with Manitoba Hydro's planning criteria through the end of the planning period.

13.2.2 The Smaller Interconnection Alternative (K19/Gas24/250MW)

Like the Preferred Development Plan, this smaller interconnection alternative combines the development of hydro generation to meet growing domestic requirements with new interconnection and export sales in the U.S. However, the interconnection in this case would only be 250 MW and the firm export sales commitments would be less. This plan also does not include the development of the Conawapa G.S. and related transmission and network upgrades. Gas-fired thermal generation is added as required to meet growing load after the development of Keeyask G.S.

The specific planning assumptions for this alternative are as follows:

- The construction of the Keeyask generating station and related transmission with an in-service date of 2019/20.
- The construction of a new 250 MW transmission interconnection with the U.S. with an in-service date of 2020/21.
- New export sale commitments of 250 MW with Minnesota Power from 2020-2035, 100 MW with Wisconsin Power Service from 2021-2027, and 125 MW with Northern States Power from 2021-2025.
- New SCGTs starting in 2024/25 and CCGTs starting in 2032/33.

This smaller interconnection alternative serves to indicate the advantages or disadvantages of following a similar strategy as in the preferred case, but with smaller capital cost and export commitments. It also represents a fallback option if the 750 MW (500 kV) line does not receive regulatory approval or the firm export sales are not all satisfactorily concluded.

In terms of the pathway this plan represents, it commits to the development of Keeyask G.S. and a small interconnection. What transpires after the development of Keeyask G.S., however, could change. One variant for example, would be to develop Conawapa G.S. instead of gas plants when required to meet domestic load.

13.2.3 Keeyask with No New Interconnection (K22/Gas)

This plan assumes that Manitoba Hydro would develop Keeyask G.S., without a new interconnection, solely as required to meet domestic load growth. The plan assumes that there would be a relatively small new firm export commitment to absorb some of the surplus that Keeyask G.S. would generate when first developed. It further assumes the development of gas-fired thermal generation after Keeyask G.S. as required to meet growing domestic demand.

The specific planning assumptions for this alternative are as follows:

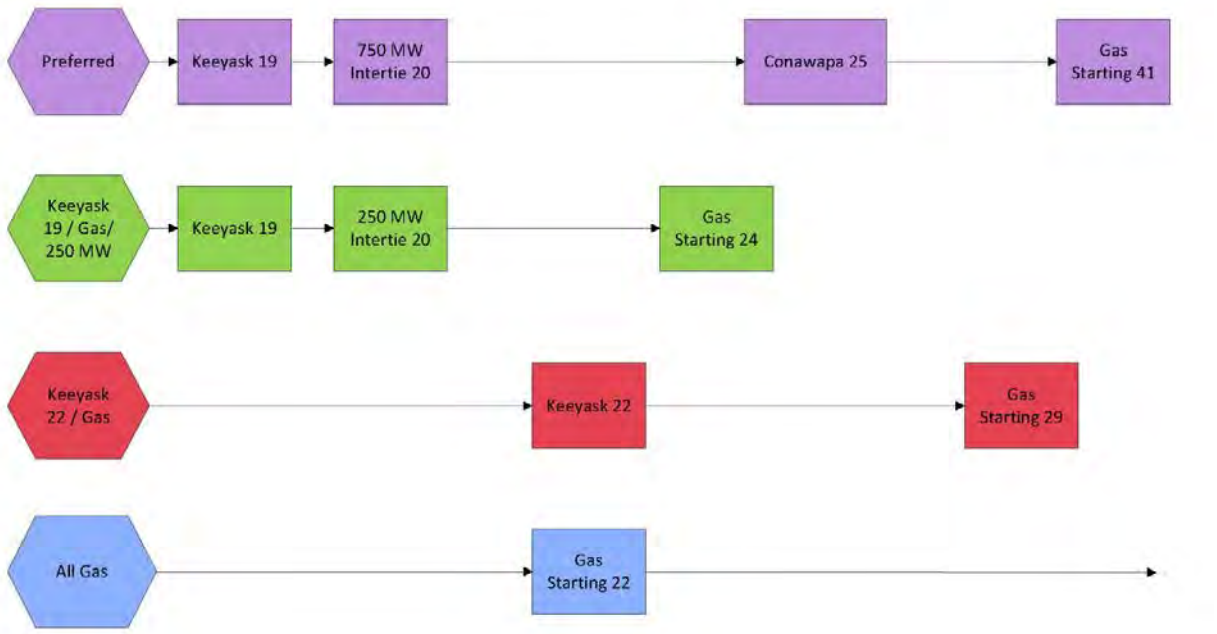
- The construction of the Keeyask generating station and related transmission with an in-service date of 2022/23.
- New export sale commitments of 100 MW with Wisconsin Power Service from 2023-2027.
- New SCGTs starting in 2029/30 and CCGTs starting in 2034/35.

This plan serves to indicate the advantages or disadvantages of retaining a preference for hydro to meet growing load, but without the new interconnection and export sales opportunity currently available to Manitoba Hydro.

In terms of the pathway this plan represents, it commits to the development of Keeyask G.S. and abandons the opportunity for and benefits of the current new interconnection opportunity. As with the previous plan, what transpires after the development of Keeyask G.S. could change. Again one variant would be to develop Conawapa G.S. instead of gas plants when required to meet growing domestic load.

13.2.4 Gas Thermal with No New Interconnection (All Gas)

This plan assumes that Manitoba Hydro would not develop a new interconnection or any new firm export sales with the U.S. and would rely on gas-fired thermal generation to meet growing load. Based on the current load growth forecast, Manitoba Hydro would develop SCGTs starting in 2022/23 and CCGTs starting in 2031/32.



This plan serves to indicate the advantages or disadvantages of relying on gas thermal instead of hydro for the foreseeable future. It is the lowest capital cost alternative and the one with the least facility and export commitments.

In terms of the pathway this plan represents, it abandons the development of Keeyask G.S. for the foreseeable future, and the current opportunity for and benefits of a new interconnection. It could, however, see the development of new hydro in the future if warranted by unfolding conditions.

13.2.5 Summary

The specific components in the preferred and alternative plans assessed in this MA-BCA are shown in Figure 13.1 below.

Figure 13.1 PREFERRED AND ALTERNATIVE DEVELOPMENT PLANS

13.3 Evaluation by Account

13.3.1 Market Valuation Account

The total present value expenditures and revenues for the preferred and the alternative plans under the reference scenario set of assumptions are shown in Table 13.2. The present values are based on the estimated annual incremental capital and system operating expenditures and revenues over the 2014-2047 planning period presented in previous chapters. The residual asset values reflect the present value of the estimated net benefit that the assets remaining at the end of the planning period would provide in subsequent years relative to the costs Manitoba Hydro would be facing in the all gas development plan.[17] The present values are calculated at a 6% real discount rate, a rate intended to reflect the weighted average social opportunity cost of capital from a provincial perspective.

[17] The zero value shown for the all gas plan does not mean there would be no assets remaining at the end of the planning period. It is simply that the residual values were calculated relative to that case.

Table 13.2 MARKET VALUATION OF PREFERRED AND ALTERNATIVE PLANS

	Preferred Development Plan	K19/G24/ 250MW	K22/Gas	All Gas
Incremental capital exp.	7,373.9	3,812.1	3,338.0	1,158.9

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS OF 2014$)

As shown in the table, the preferred and the smaller interconnection plans exhibit the lowest net costs, followed by the plan with Keeyask G.S. but no new interconnection. The all gas plan with no new interconnection exhibits the highest net costs.

The Preferred Development Plan entails much higher capital expenditures than the others, but these are offset by the much higher firm export sale revenues and a much higher residual value of the assets, with Conawapa G.S. as well as Keeyask G.S. remaining at the end of the planning period. The Preferred Development Plan also incurs much lower fuel costs, most notably as compared to the all gas plan.

13.3.2 Manitoba Hydro Customer Account

Rate Impact

The present value net costs of the different plans indicates their relative advantage to Manitoba Hydro and its customers over the long term, but the impacts on rates in the short to medium versus longer term depend as much on the mix of expenditures as their total amount.

Capital-intensive plans give rise to more marked rate impacts in the short to medium term, as revenue and cash flow requirements have to increase to achieve debt-equity and other financial targets. Fuel-intensive plans give rise to more marked rate impacts in the longer term with their relatively large ongoing and escalating annual costs.

Under the reference scenario assumptions the short to medium term rate increases required for the Preferred Development Plan would be greater than with the three alternative plans. With the Preferred Development Plan, a projected even annual rate increase of 3.95% would be required to achieve a target 75:25 debt/equity ratio by year 20 of the planning period.[18] The projected cumulative rate increase by 2031/32 would be 108%. For the three alternative plans projected even annual rate increases in the 3.4 to 3.5% range would be required to achieve the target 75:25 debt/equity ratio by year 20. The projected cumulative rate increase to year 2031/32 is estimated at 90% for the all gas and small interconnection plans and 92% for the plan with Keeyask G.S. but no interconnection – approximately 16 to 18 percentage points less than the Preferred Development Plan.

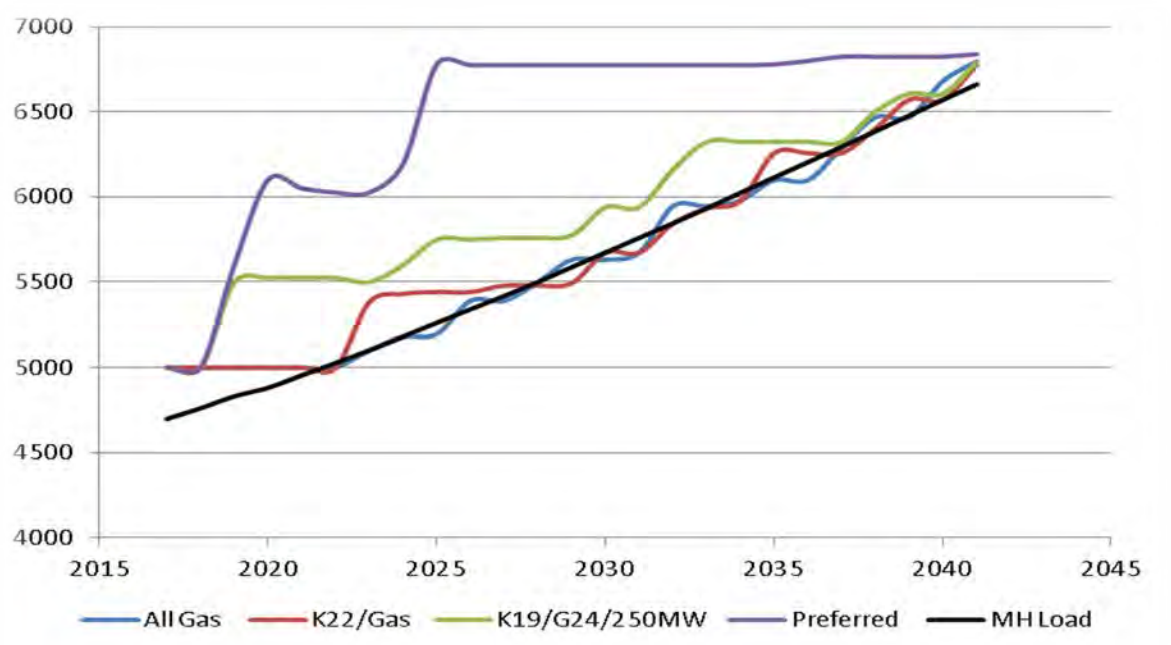
[18] This and all other rate increases discussed in this section are expressed in nominal dollars, that is, including the effect of the general rate of inflation. The real increases, after adjusting for inflation, would be approximately 1.9% per year less.

The higher rates with the Preferred Development Plan would be needed in the short to medium term to raise revenues and cash flow to achieve the target debt-equity ratio. However, the higher rates would be an investment for the long term. Upon completion of the intensive capital investment period and the achievement of the target debt/equity ratio in year 20, there would be reduced inflationary pressure on costs with the predominately hydro system in place. At that point the cumulative rate increases with the Preferred Development Plan would fall below those in the other plans within a relatively short time frame.

Under the NFAT reference scenario assumptions, the projected cumulative rate increase with the Preferred Development Plan would be 106% by year 50 (2061/62) virtually the same as the cumulative increase to year 20 (2031/32). The projected cumulative long term rate increase for the two plans with Keeyask G.S. would be between 140% (Keeyask G.S. with no interconnection) and 143% (Keeyask G.S. with the small interconnection), approximately 34 to 37 percentage points more than with the Preferred Development Plan. The projected cumulative long term rate increase for the all gas plan would be 176%, approximately 70 percentage points more than the Preferred Development Plan.

Reliability

The different development plans are all designed to ensure Manitoba Hydro has sufficient resources to be able to meet its peak and annual load, even under a wide range of forced outage, extreme weather and other circumstances. Manitoba Hydro's planning criteria provide for a very high degree of system reliability – there is a very high probability of being able to meet system requirements under all contingencies. Nevertheless, system reliability is never 100%. There generally will be some combinations of adverse circumstances under which



Manitoba Hydro's generating and bulk transmission capacity would not be sufficient to meet the system load.

The degree of system reliability can be measured by what planners call the "loss of load expectation" – the average number of days per year that the load could not be fully met. A common industry standard is .1 days per year, or an inability to meet system load one day every 10 years. The lower the loss of load expectation, the greater is the system reliability. This can equivalently be expressed in terms of the system's load-carrying capability. With greater reliability the system can reliably carry or meet a greater amount of peak load.

Figure 13.2 shows the estimated load-carrying capability of the Manitoba Hydro system (at the industry standard loss of load expectation of .1 day per year) with the preferred and alternative plans.[19] As shown in the figure, the load-carrying capability of the Preferred Development Plan is significantly greater than the others. The interconnection combined with the additional hydro resources contributes to much higher reliability. For the same reason, though to a lesser extent, the alternative with the smaller interconnection and Keeyask G.S. has a greater load-carrying capability than the two alternatives without a new interconnection.

[19] See Appendix 13.1, Reliability Evaluation, August 1, 2013.

Figure 13.2 PEAK LOAD CARRYING CAPABILITY (MW)

With greater reliability, customers could expect less failure of bulk supply and consequently less unserved load. While failures in bulk supply would be very infrequent, they can have major consequences. To indicate the potential significance of the differences in unserved load, the expected unserved energy costs were estimated based on an outage value of $10,000/MWh. The expected unserved energy cost for the all gas and Keeyask/gas alternatives would be greater than for the Preferred Development Plan by $101 million and $105 million in present value, respectively, over the planning period. The expected unserved energy cost for the small interconnection alternative would be less, but still some $56 million greater than with the Preferred Development Plan.

While the precise outage value is uncertain and would depend on the timing and nature of the outages, the estimates serve to indicate the relative advantage of the large interconnection

over the smaller one and the advantage of both of those compared to the two alternatives without a new interconnection.

In addition to this reliability benefit, the Preferred Development Plan offers customers more security against the risks of extreme drought. The import capability with the large new interconnection plus the advancement of hydro generating capacity for export would provide Manitoba Hydro greater access to back-up supply and flexibility to manage extreme droughts than with the other alternatives, particularly those without any new interconnection.

Summary of Customer Account

In sum, the Preferred Development Plan would result in greater rate increases than the other plans in the short to medium term, with the projected cumulative rate increase approximately 16 to 18 percentage points more than the alternatives by 2031/32. However, the Preferred Development Plan would result in the lowest rates over the longer term. By 2061/62 the projected cumulative rate change in the Preferred Development Plan would be approximately 34 to 70 percentage points less than the other plans.

The Preferred Development Plan would benefit customers with its greater system reliability and significantly lower expected cost of unserved load, as well as its greater ability to manage extreme drought.

13.3.3 Manitoba Government Account

Included in the annual expenditures and financing costs that Manitoba Hydro incurs, and that are reflected in its rates, are taxes and other fees and charges paid to the provincial

government. These include the capital taxes and water rental fees that constitute a significant component of the annual expenditures captured in the market valuation account; the debt guarantee and sinking fund administration fees that add roughly 1% to Manitoba Hydro's cost of capital, and thereby directly affect rates; and the coal taxes and assumed carbon charges[20] that add to the cost of thermal power operations.

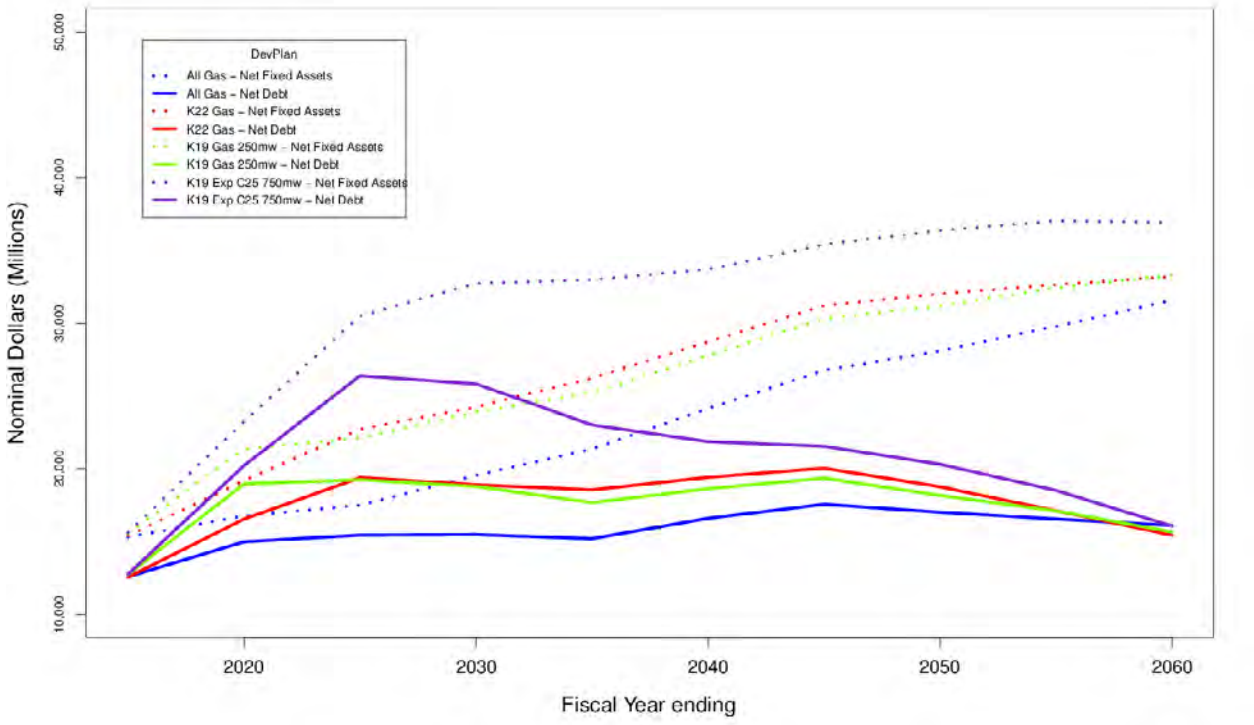
In Table 13.3 below the amount of these payments that would be made in the preferred and alternative development plans are shown. As shown in the table, the total payments are substantial, ranging from $4.3 to $5.6 billion in present value over the planning period. The largest amount of payments arises with the Preferred Development Plan – some $660 to $770 million greater than the two plans with Keeyask G.S., and $1.27 billion greater than the all gas plan.

Table 13.3 DIRECT MH PAYMENTS TO MANITOBA GOVERNMENT

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Capital Tax	1,457.1	1,202.7	1,188.0	991.9
Water Rentals	1,512.4	1,413.3	1,385.6	1,303.4
Debt Guarantee Fee	2,597.5	2,218.3	2,162.1	1,894.9
Sinking Fund Admin Fee	7.1	6.3	5.9	4.4
Coal Tax	10.3	10.3	10.3	10.3
Potential Carbon Charges	28.3	103.4	92.8	139.6
Total Payments	**5,612.7**	**4,954.3**	**4,844.7**	**4,344.5**
Difference from Preferred Development Plan	**0**	**[658.4]**	**[768.0]**	**[1,268.2]**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS OF 2014$)

[20] The carbon charges are included to indicate their potential contribution to the total payments to government, but they may or may not be manifested as a tax, depending on the policy government were to adopt to implement such charges.



In terms of the economic significance of these payments to government, and therefore Manitoba taxpayers, the question is what net benefit do they provide. To what extent do they constitute incremental revenues for government not offset by incremental costs or risks?

The coal taxes and carbon charges do not offer net benefits. As explained in section 2, the carbon charges may not result in direct payments to government, for example in a cap and trade system, and in any event would be intended to internalize at least part of the social cost of GHG emissions. The sinking fund administration fee also would not constitute a significant net benefit for government, on the assumption that the fee serves to compensate government for the administration costs it incurs.

The debt guarantee fees are substantial, but so too is the amount of debt that government would be guaranteeing. Figure 13.3 shows the projected balances of net fixed assets and net debt with the preferred and the alternative plans. As shown in the figure, there would be an increase in the total amount of Manitoba Hydro's debt with all of the plans, but particularly in the Preferred Development Plan with its development of both Keeyask G.S. and Conawapa G.S.

Figure 13.3 MANITOBA HYDRO'S PROJECTED BALANCES OF NET DEBT AND NET FIXED ASSETS – NFAT REFERENCE SCENARIO ASSUMPTIONS

(MILLIONS OF NOMINAL$)

The level of net debt must be considered in the context of the entire balance sheet, including the associated net assets that are under construction or in service. In the medium term, while net debt levels are the highest with the Preferred Development Plan, that plan also has the overall highest capital investment, fixed assets and retained earnings.

The Province of Manitoba provides a flow through credit to Manitoba Hydro and guarantees the vast majority of its debt. Given that the provincial debt guarantee fee is provided in exchange for this guarantee, the multiple account analysis has not included the debt guarantee

fees as part of the net benefits to the Manitoba government. It is assumed that the fee does not provide a net benefit. Under this assumption, the net benefits for government (and taxpayers) would arise only from the capital taxes and water rentals that Manitoba Hydro pays.

Accordingly, the estimated net benefit to government is shown in Table 13.4 for the preferred and alternative plans.[21]

Table 13.4 NET BENEFITS TO MANITOBA GOVERNMENT

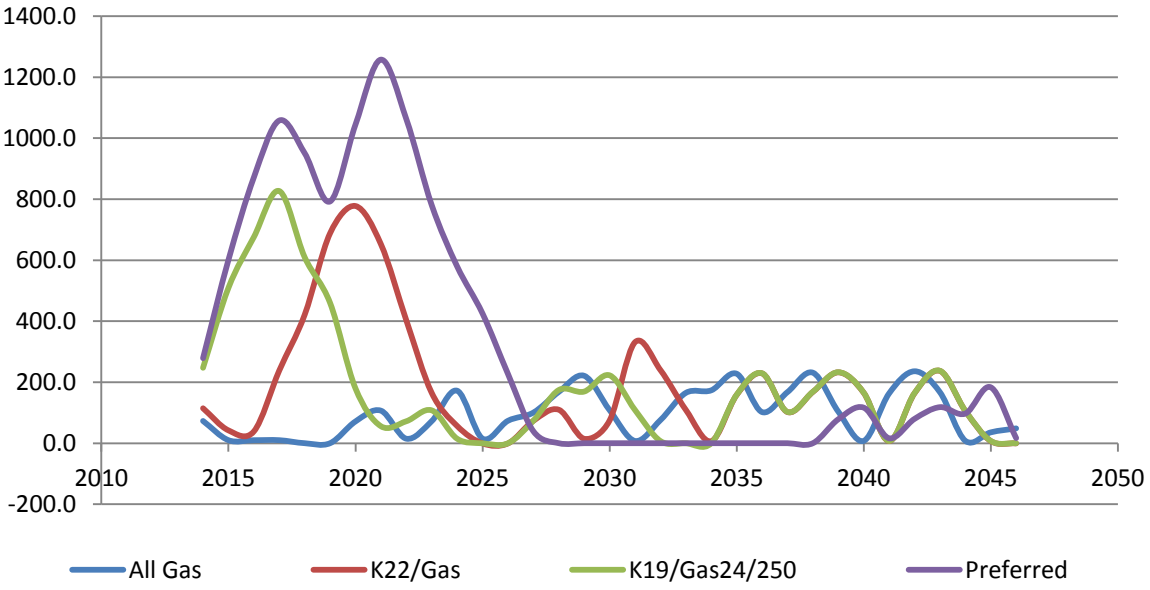
	Preferred Development Plan	K19/G24/ 250MW	K22/Gas	All Gas
Capital tax	1,457.1	1,202.7	1,188.0	991.9
Water rentals	1,512.4	1,413.3	1,385.6	1,303.4
Total net benefit	**2,969.5**	**2,616.0**	**2,573.6**	**2,295.3**
Difference from Preferred Development Plan	**0**	**[353.5]**	**[395.9]**	**[674.2]**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

As shown in the table, while smaller than the total payments Manitoba Hydro would make to government, the total net benefit from capital taxes and water rentals is substantial, ranging from $2.3 to almost $3.0 billion in present value over the planning period. The net benefits are greatest for Manitoba Hydro's Preferred Development Plan – some $350 to $400 million

[21] No expenditures are shown in the calculation of net benefits as there are no significant incremental expenditures that government would incur as a result of the different plans. The provincial government has contributed to training programs for Keeyask and as well road improvements in the area. However, these expenditures have already been incurred and no significant further expenditures are expected.

greater than the two alternative plans with Keeyask G.S., and $670 million greater than the all gas plan.



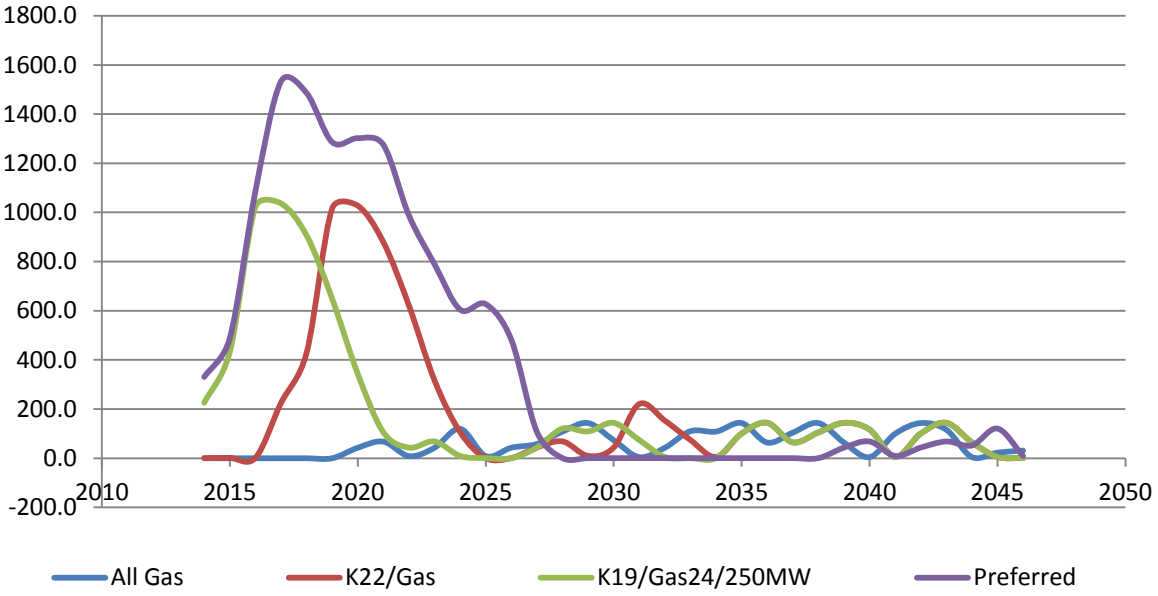
13.3.4 Manitoba Economy Account

Manitoba Hydro's Preferred Development Plan will significantly affect the Manitoba economy as a result of the demand for goods, services and labour generated by the construction and operation of the different projects in the different plans. As explained in section 2, of particular interest in this MA-BCA are the impacts on the demand for labour. That is where there is greatest potential for "economic rents" or net benefits to be generated.

As shown in Figure 13.4, there is a marked difference in the level and pattern of capital investment in the preferred and the alternative plans. The difference is most pronounced in the first part of the planning period, through to the completion of Conawapa G.S. in the Preferred Development Plan. During that initial period the Preferred Development Plan exhibits the greatest level of spending, followed by the two alternatives that include the development of Keeyask G.S. (which differ in the timing but not significantly in the amount of capital spending). The all gas alternative has the least amount of capital spending in the first part of the planning period, with only small amounts invested for thermal power plants starting in the 2020s. Later in the planning period, capital spending is relatively low in all of the plans, but least with Manitoba Hydro's Preferred Development Plan because of the limited need for additional generating capacity once Conawapa G.S. is built.

Figure 13.4 ANNUAL CAPITAL EXPENDITURES - NFAT REFERENCE SCENARIO ASSUMPTIONS

(MILLIONS OF 2014$)



These differences in capital spending carry over into the demand for labour. Figure 13.5 shows the total annual employment directly required for the construction of the generating and transmission projects in the different plans.[22] The largest amount of construction employment is generated by the Preferred Development Plan, again followed by the two plans that include Keeyask G.S. The all gas alternative generates the least amount of construction employment, far less than the other plans.

[22] Employment and wage estimates in this section are based on project data in Manitoba Hydro, Range of Resource Options, Appendix 7.2.

Figure 13.5 ANNUAL EMPLOYMENT FOR PROJECT CONSTRUCTION

(PERSON YEARS)

The demand for labour in operations and maintenance (O&M) is different. Figure 13.6 shows the total annual O&M employment directly required for the projects developed in the preferred and the alternative plans. All of the plans generate an increasing amount of annual O&M employment. Toward the end of the planning period, however, the three alternatives without Conawapa G.S. generate more annual employment than the Preferred Development Plan because of the need to add more thermal plants to meet growing load.

Figure 13.6 ANNUAL EMPLOYMENT FOR PROJECT OPERATIONS AND MAINTENANCE

(PERSON YEARS)

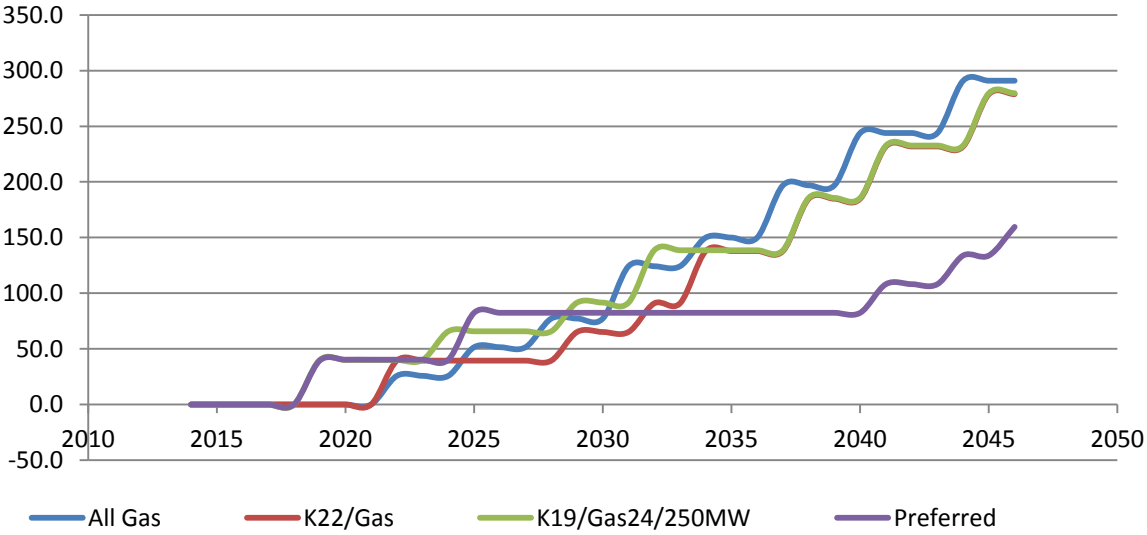


Table 13.5 shows the present value of the gross wages generated by the direct employment in project construction and O&M in the preferred and alternative plans. The wages are shown separately for the employment that takes place in northern versus southern Manitoba.

Table 13.5 GROSS WAGES FOR CONSTRUCTION AND O&M

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Construction – N. Man.	1,317.4	599.9	503.9	--
Construction – S. Man.	142.0	95.0	72.0	62.6
Total Construction	1,459.4	694.9	575.9	62.6
O&M – N. Man.	85.0	49.6	40.5	--
O&M – S. Man.	4.2	47.4	37.3	71.5
Total O&M	89.2	97.0	77.8	71.5
Total Gross Wages	1,548.6	791.9	653.7	134.1
Difference from Preferred Development Plan	0.0	(756.7)	(894.9)	(1,414.5)

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

As shown in the table the total gross wages directly generated by the Preferred Development Plan would be much greater than with the other plans and more heavily concentrated in northern Manitoba.

The net benefits derived from the employment on Manitoba Hydro's projects, however, are measured not by the gross wage impact, but rather by the incremental income or other benefits Manitobans would realize. That would depend on the *increase* in income or other benefit that Manitobans would earn in relation to what they would otherwise be doing. And that in turn would depend on where the workers originate from and what alternative opportunities they would have.

Significant net benefits would only be realized to the extent that the jobs provide opportunities for Manitobans which are better than what would otherwise be available. That is most likely in regions where there are high levels of unemployment, or when there are complementary programs and other measures enabling workers to upgrade their skills and earning potential, or where the jobs simply offer better wages or benefits than available elsewhere.

There will not likely be widespread unemployment over the long term in Manitoba as a whole without these projects. Labour force data indicate that the unemployment rate in Manitoba is relatively low and growing demand for labour combined with the impact of "baby boomer" retirements are expected to maintain low rates of unemployment, with shortages in some occupations.[23] The net benefit from new jobs will generally be limited to the advantage they offer relative to alternative sources of employment – the amount required to attract the workers away from what they would otherwise do.

At the same time, however, it is important to recognize that there has been chronic unemployment in northern Manitoba, particularly in Aboriginal communities, with limited alternative prospects and with social and cultural barriers to migration to areas where employment prospects are better.[24] Jobs opportunities created in northern Manitoba,

[23] See Manitoba Government, *Manitoba Government Labour Force Trends* and Manitoba Construction Sector Council, *Construction Looking Forward 2012-2020 Key Highlights*.

[24] Statistics Canada data indicated that the 2001 unemployment rate for Keeyask Cree Nations was 40% and for the northern Manitoba Aboriginal population [Census divisions 19,21,22 and 23] it was 28% compared to 6.1% for Manitoba as a whole. While the rates have no doubt changed since 2001 (in part because of the Wuskwatim project), the relative pattern and vulnerability to unemployment is likely the same. See Keeyask Hydropower Limited Partnership, *Environmental Impact Statement-Response to EIS Guidelines*, Chapter 6, Environmental Effects Assessment, June 2012, p.6-143.

combined with training and other measures to enable northern Manitobans to fill those positions, can provide significant net benefit.

For this assessment it is assumed that the net benefits of the jobs filled by Manitobans would generally be in the order of 15% of the gross wages. That is consistent with a study of the relationship between wages and the social opportunity cost of labour (what the workers would otherwise have earned) for a major project developed when labour markets were generally tight, as one could expect in this case.[25] However, the net benefit for northern Aboriginal employment, supported by training, recruitment and retention policies and programs, is assumed to be in the order of 50% of the gross wages paid. Again this is consistent with estimates of the relationship between wages and the social opportunity cost of labour where alternative opportunities are more limited.[26] With respect to in-migrants it is assumed the net benefits would be zero from a Manitoba perspective. The in-migrants would pay income and other taxes, but it is conservatively assumed these would be offset by the cost of services that government would have to provide for them.

With respect to the origin of the workers filling the jobs generated in the different plans, it is assumed that for the northern projects 40 to 45% of the construction positions would be filled by Manitobans, and of the Manitobans, 50% would be northern Aboriginal. The Manitoba share of the construction employment is less than what has been observed for the Wuskwatim Project and may be conservative, but reflects the larger size of the projects. The northern aboriginal share (50% of the Manitoba workers or 20 to 22.5% of the total number of jobs) is

[25] See Chun-Yan Kuo, "Evaluating the Social Cost of Job Creation", *Canadian Journal of Program Evaluation"*, Special Issue, 1997, pp. 67-82.

[26] Ibid.

within the range for northern aboriginal construction employment estimated in the Keeyask EIS.[27]

With respect to the southern construction jobs, it is assumed that Manitobans would fill just over 50% of the gas plant related employment and almost all of the tie-line and head office related employment. The share of gas plant jobs going to Manitobans is based on consulting reports indicating that they require a large amount of specialized work combined with the fact that Manitoba has not undertaken such projects in recent years.

With respect to the O&M jobs in the north and the south, it is assumed all would be filled by Manitobans. For the northern O&M jobs it is assumed that at least 45% would be filled by northern Aboriginal people based on current shares of northern operations employment and targeted measures expected with Keeyask G.S.[28]

Based on these employment assumptions—plus an estimate that the average wages for the mix of construction jobs filled by northern Aboriginal people would be approximately 75% of the total project average wages—the net benefits of construction employment in the north would equal 12.2 to 12.4% of the total gross wages paid; for construction employment in the south

[27] For a breakdown of the person-years of employment on the Wuskwatim project through to November 2012 see Manitoba Hydro, *Wuskwatim GS Employment, November 2012 Monthly Report*, p.11. In the Keeyask EIS it was estimated that northern aboriginal would fill between 13 and 40% of the direct construction employment for Keeyask. See Keeyask Hydropower Limited Partnership, *Environmental Impact Statement,* Chapter 6 p.6-434.

[28] Northern Aboriginal people currently account for 42% of northern operations employment. The Joint Keeyask Development Agreement calls for the placement of 182 Keeyask Cree Nation members in operating jobs throughout the hydro system. That would be equivalent to more than 100% of the O&M jobs that would be created by Keeyask and Conawapa combined. The 45% assumption is conservative, recognizing it may take some time until the target can be reached.

net benefits per dollar of gross wages paid would range from 7.8% (for the all gas case where a large number of the workers would be from out-of province) to 14.6% (for the preferred case for which most of the southern employment would be filled by Manitobans). The net benefits of O&M employment in the north would be 30.8% of the total gross wages paid; for O&M employment in the south net benefits would be 15% of the total gross wages paid. In Table 13.6 the resulting employment net benefits generated by the preferred and alternative plans are shown.

Table 13.6 EMPLOYMENT NET BENEFITS FOR PROJECT CONSTRUCTION AND O&M

	Preferred Development Plan	K19/G24/ 250MW	K22/Gas	All Gas
Construction – N. Man.	160.7	74.4	62.5	--
Construction – S. Man.	20.7	10.8	7.6	4.9
Total Construction	**181.5**	**85.2**	**70.1**	**4.9**
O&M – N. Man.	26.2	15.3	12.5	--
O&M – S. Man.	0.6	7.1	5.6	10.7
Total O&M	**26.8**	**22.4**	**18.1**	**10.7**
Total Net Benefits	**208.3**	**107.6**	**88.2**	**15.6**
Difference from Preferred Development Plan	**0.0**	**(100.7)**	**(120.1)**	**(192.7)**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

As shown in the table, the employment net benefits, though much smaller than gross wages, would still be significant in the plans that include northern hydro development. Those plans generate a significant number of jobs, a large proportion of which would be in a region where they would be particularly beneficial. The employment net benefits would be greatest with the

Preferred Development Plan - $100 to $120 million greater than the two plans with Keeyask G.S. and over $190 million greater than the all gas plan.

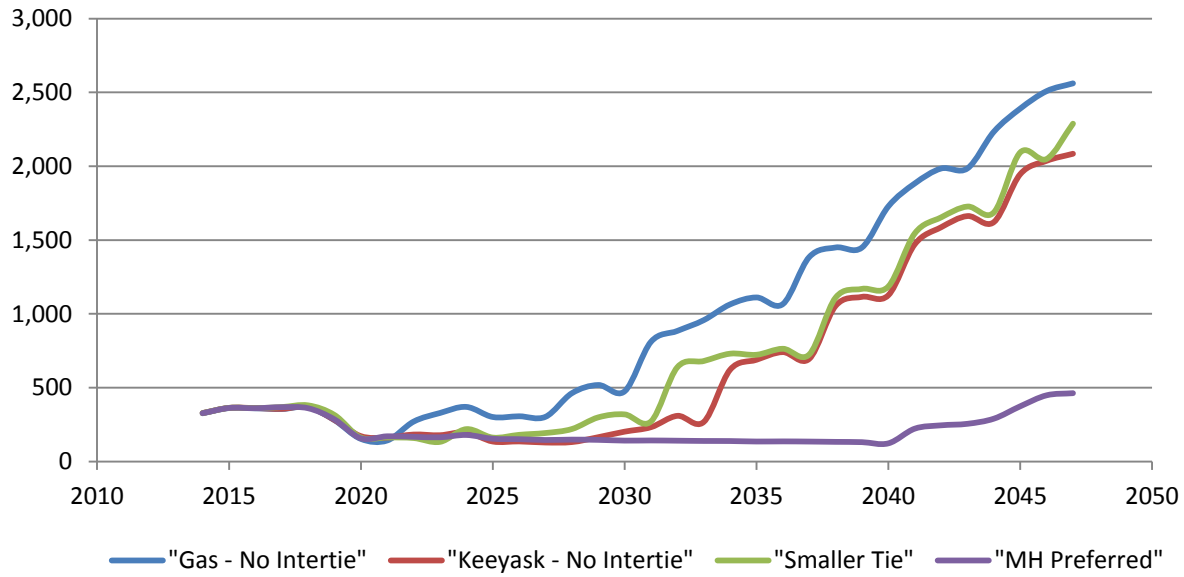
Clearly the assumptions used to develop these estimates are rough, and arguably conservative for purposes of estimating the net benefits from the employment and other economic activity generated by the projects in the different plans. Nevertheless, they do serve to indicate the relative magnitude of the employment net benefits and the advantage of the Preferred Development Plan.

13.3.5 Environment Account

The preferred and alternative development plans differ in terms of the impacts they would have on GHG emissions; NO_x and other local CAC emissions; and terrestrial and aquatic habitat and natural resource impacts.

GHG Emissions

The development plan that Manitoba Hydro undertakes will affect GHG emissions both within and outside Manitoba. Within Manitoba, the plan will determine the amount of thermal generation that would be used to meet growing load and backup low-water conditions, and consequently affect thermal power-related GHG emissions. It will also govern the development of new hydro reservoirs, generating stations and transmission lines, and therefore the production of associated lifecycle GHG emissions. With respect to GHG impacts outside Manitoba, the plan will determine Manitoba Hydro's exports and imports of power, and consequently affect the amount of thermal power generation and related GHG emissions in the



interconnected jurisdictions. There are also lifecycle GHG impacts outside Manitoba associated with the project development plans.

Figure 13.7 shows the estimated amount of Manitoba Hydro thermal generation-related GHG emissions associated with the preferred and alternative plans. As shown in the table, emissions are lowest with the Preferred Development Plan.[29] Unlike the alternatives, the Preferred Development Plan incorporates the development of both Keeyask G.S. and Conawapa G.S., and consequently entails far less thermal generation than the others. The highest level of emissions is with the all gas plan. By the end of the planning period the annual emissions in that plan would be some 2 million tonnes (CO_{2e}) per year greater than with the Preferred Development Plan.

[29] The Preferred Plan is the only plan which emissions are lower than Manitoba Hydro's annual greenhouse gas emissions target of 520 kilotonnes of CO_2e throughout the planning horizon.

Figure 13.7 MANITOBA HYDRO THERMAL GENERATION-RELATED GHG EMISSIONS

('000 TONNES CO_{2E})

In the market valuation of the different plans, it was assumed that Manitoba Hydro would pay a charge for its carbon emissions from natural gas-fired thermal generation as well as a tax on the coal used in the single remaining coal-fired unit. The timing and level of charges depend on future policies in Manitoba and Canada with respect to new emission taxes or membership in a cap and trade system. In the absence of defined policies at this time, the carbon pricing from other regions was considered and judgment applied to create a plausible range of future GHG-emission charges. For the reference scenario analysis, the GHG emissions charge for natural gas-fired thermal generation was assumed to be approximately \$5/tonne CO_2 in 2015 rising to approximately \$25/tonne CO_2 by 2048 (in constant 2012\$).

These assumed charges, however, do not reflect the full social cost of GHG emissions – i.e., the maximum amount people would be willing to pay to reduce emissions in order to reduce the expected costs and risks of global warming and climate change.

Recent estimates of the social cost of GHG emissions are much higher than the assumed carbon charge. Environment Canada has estimated that the social cost of GHG emissions, based on the present value of expected climate change costs is currently over $28/tonne CO_2, rising to almost $60/tonne CO_2 by 2050 (in constant 2011$).[30] Including consideration of the willingness to pay to avoid uncertain, but potentially catastrophic, climate change impacts raises the estimated cost to over $112/tonne CO_2. Similarly, a U.S. government inter-agency team recently estimated the social cost of GHG emissions at $38/tonne CO_2 in 2015 rising to $71/tonne CO_2 in 2050 (in constant 2007$ US),[31] and recognized that the cost would be much greater the more that people are willing to pay to avoid damages in the future (the lower the discount rate), and the more that people are willing to pay to avoid uncertain, catastrophic risks.[32]

For purposes of estimating the external cost of the Manitoba GHG emissions in the different plans – the difference between the estimated social cost of GHG emissions and the carbon charges plus coal taxes included in Manitoba Hydro's estimated expenditures – it is assumed that the social cost of GHG emissions would be $40/tonne CO_2 in 2014, rising to $80/tonne CO_2 by 2048 (in constant 2012$). This is somewhat higher than Environment Canada's estimate of GHG damage costs, but less than its estimate of the willingness to pay to avoid the risks of uncertain but catastrophic effects. It is broadly consistent with the most recent U.S. estimates, again without any provision for the willingness to pay to avoid uncertain, catastrophic risks.

[30] In constant 2012$ that would be over $28.50 rising to almost $61/tonne.

[31] In constant 2012$ Cdn that would be $42 rising to $78/tonne.

[32] See Environment Canada, *Heavy Duty Vehicle and Engine Greenhouse Gas Emissions Regulation,* section 7.3.3, Feb.22, 2013 (http://gazette.gc.ca/rp-pr/p2/2013/2013-03-13/html/sor-dors24-eng.html#footnoteRef.82118), and U.S. Interagency Working Group on Social Cost of Carbon, *Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis – Under Executive Order 12866*, May 13, 2013.

Table 13.7 shows the estimated present value of the external GHG costs from the Manitoba thermal generation in the different plans based on these assumptions.

Table 13.7 EXTERNAL COST OF MANITOBA THERMAL GENERATION-RELATED GHG EMISSIONS

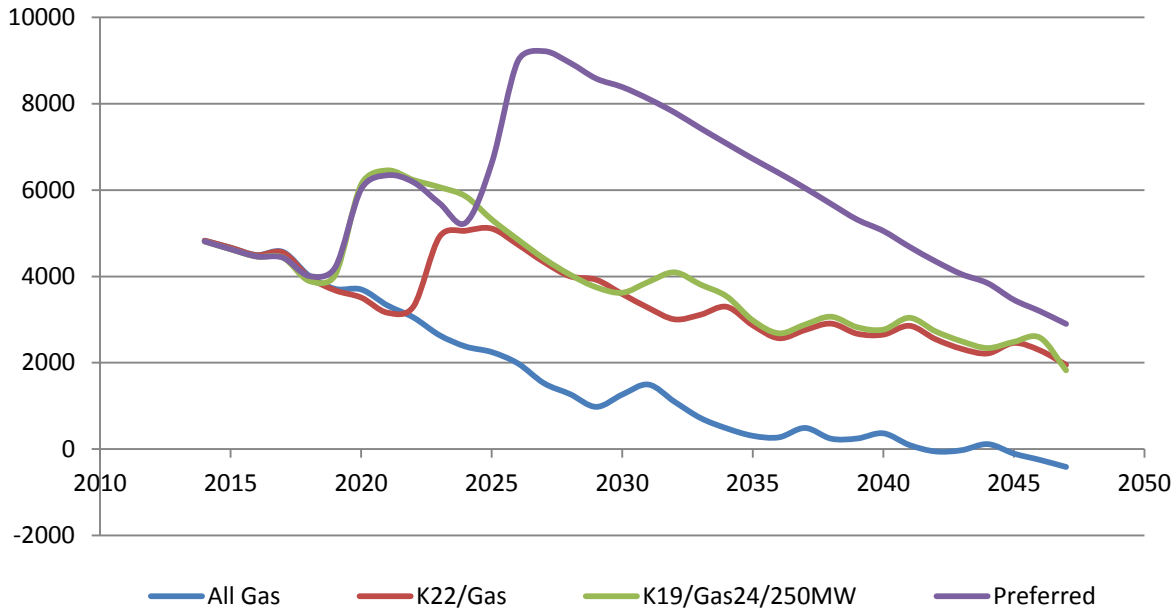
	Preferred Development Plan	K19/G24/ 250MW	K22/Gas	All Gas
Estimated social cost of GHG emissions	188.8	472.6	427.6	620.4
Estimated coal tax and carbon charge payments	38.6	113.8	103.1	149.9
External Cost of GHG Emissions	**150.2**	**358.8**	**324.5**	**470.5**
Difference from Preferred Development Plan	**-------**	**208.6**	**174.3**	**320.3**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

As shown in the table, the estimated external costs of the Manitoba thermal generation-related GHG emissions in the Preferred Development Plan are significantly less than the alternatives. As compared to the all gas case, the present value external cost in the Preferred Development Plan is an estimated $320 million less.

In addition to thermal generation-related GHG emissions there would be the emissions associated with the development of reservoirs, generating stations and transmission lines. Estimates are not available for all of the project development impacts in all of the plans. However, the largest GHG emission impacts within Manitoba would likely result from the Keeyask and Conawapa Projects, with the clearing, flooding and construction-related impacts they would have.

A lifecycle GHG assessment for the Keeyask Project[33] indicates that land-use changes including reservoir clearing and flooding would result in an estimated 496,000 tonnes CO_{2e} of emissions. Construction activities, including building materials and manufacture, transportation and on-site construction activities, would result in approximately 454,000 tonnes CO_{2e} (an estimated 40% of which would occur within Manitoba). In total the lifecycle development impacts for Keeyask G.S., including provision for future maintenance and refurbishment activities and decommissioning, would amount to some 979,000 tonnes CO_{2e} of emissions. Approximately 700,000 tonnes CO_{2e} would occur within Manitoba. The development of the Conawapa Project would also generate some GHG emissions, though less than Keeyask Project because of the much more limited flooding it entails.



Taking into account the social cost of the emissions resulting from the development of Keeyask G.S. would reduce the GHG advantage of the plans with Keeyask G.S. relative to the all gas plan. However, the impact would be relatively small. The Keeyask G.S. emissions would be some two orders of magnitude less than the emissions from the thermal operations they displace. Similarly, taking into account the emissions from the development of Conawapa G.S. would reduce the GHG advantage of the Preferred Development Plan relative to the others. But the impact here would also be relatively small, especially with Conawapa G.S. emissions even less than Keeyask G.S.

Moreover, whatever GHG emissions impacts would result from the development of Keeyask G.S. and Conawapa G.S., they would be more than offset by the very significant positive impact those projects have on global displacement of GHG emissions. Figure 13.8 shows the estimated

[33] Appendix 7.3: Life Cycle Greenhouse Gas Assessment Overview.

impact of the different development plans on GHG emissions outside Manitoba due to Manitoba Hydro's exports and imports, and consequently on thermal power generation outside the province.

Figure 13.8 REDUCTION OF THERMAL GENERATION-RELATED GHG EMISSIONS OUTSIDE MANITOBA
('000 TONNES OF CO_{2E})

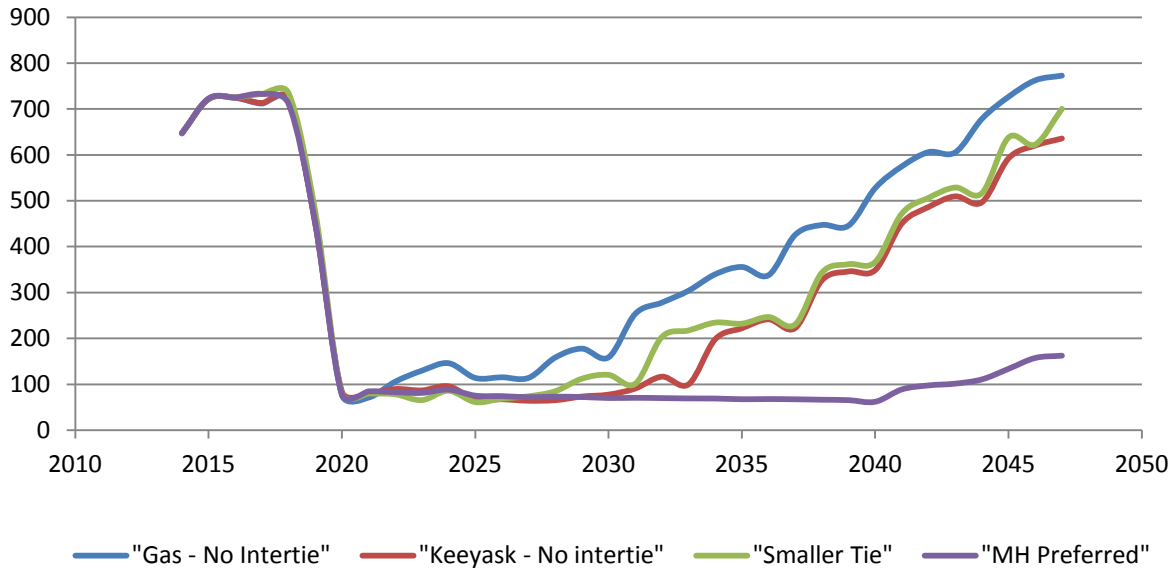
As shown in the figure, the plans with Keeyask G.S. would all significantly reduce GHG emissions in the U.S. The Preferred Development Plan with Keeyask G.S. and Conawapa G.S. would have an even greater impact. In some years the annual displacement of GHG emissions outside Manitoba with the Preferred Development Plan would exceed 8 million tonnes. This single-year impact is many times larger than the total 100-year lifecycle GHG impacts of these projects. Overall, the Preferred Development Plan, and to a lesser extent the Keeyask-gas and smaller interconnection alternatives, would make very significant contributions to the reduction of global GHG emissions.

Local CAC Emissions

In addition to GHG emissions, thermal generation in Manitoba produces emissions of nitrogen oxide (NO_x), fine particulates (PM_{10}) and other criteria air contaminants (CACs). Figures 13.9 and 13.10 show the estimated tonnes of NO_x and PM_{10} emissions in Manitoba in the different plans. As shown in the figures, the all gas alternative has the greatest amount of emissions, followed by the two alternatives that include the development of Keeyask G.S. The Preferred Development Plan, with the development of both Keeyask G.S. and Conawapa G.S. has significantly less CAC emissions than the others.

Figure 13.9 NO_x Emissions in Manitoba in Preferred and Alternative Plans

(Tonnes)



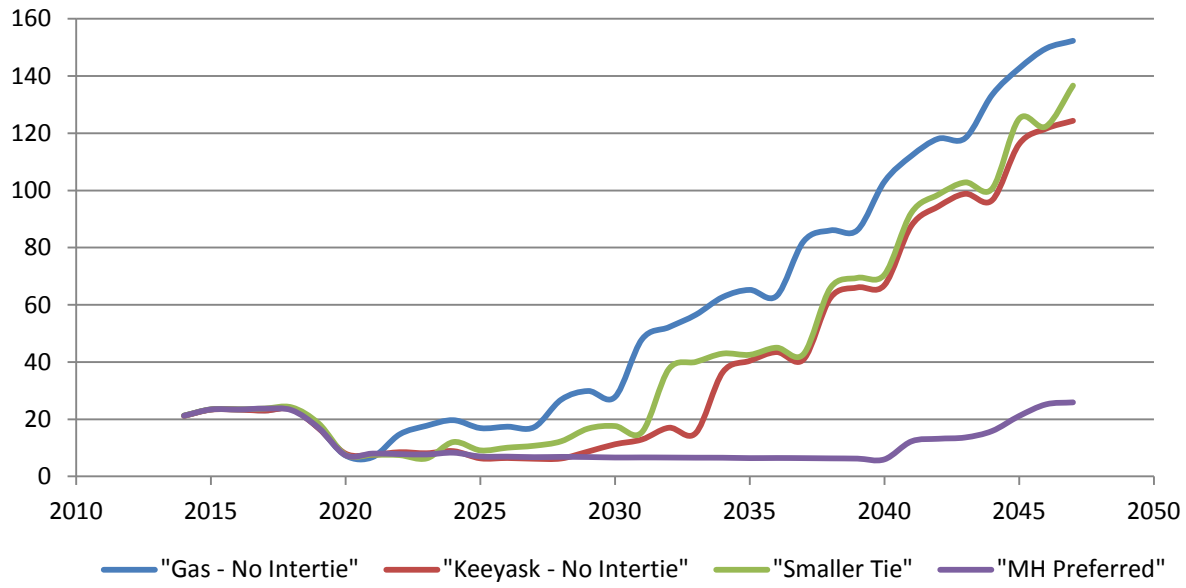


Figure 13.10 PM_{10} EMISSIONS IN MANITOBA IN PREFERRED AND ALTERNATIVE PLANS

(TONNES)

These emissions are of concern because of the health and other adverse impacts they can have. A measure of the cost they entail is their total damage costs – the estimated costs of the illness and premature death, as well as any agricultural or other adverse resource impacts they may have.

The exact damage costs associated with these emissions depend on many factors, including meteorological conditions, topography, and the size, proximity and demographics of exposed populations. External cost studies undertaken for the European Commission (2005) show estimates of the damage costs of NO_x emissions ranging from 1,000 euros/tonne to over 9,000 euros, and damage costs of PM ranging from just over 4,000 euros/tonne to over 60,000 euros

per tonne.[34] Higher ranges are reported with higher assumed values for the willingness to pay to reduce the risk of loss of life years. A key factor governing the costs is nearby population, as human exposure to the pollutants is critical in determining the incidence of illness and death due to the emissions.

For purposes of illustrating the potential damage costs of the CAC emissions in the preferred and alternative plans, damage cost values of $3,000/tonne for NO_x and $20,000/tonne for PM_{10} are assumed (2012$ Cdn). These are in the lower end of the range of the EU study, which is appropriate for relatively small southern population centres like Brandon and Selkirk where much of the thermal generation would likely take place.

Table 13.8 shows the total present value costs of the CAC emissions in each plan based on these damage cost estimates. As shown in the table, the total costs and differences from the referred plan are relatively small. While arguably the costs estimates are conservative[35], the fact remains that with appropriate siting and modern pollution control technology, the pollution-related external costs of thermal generation can be minimized. There are advantages in avoiding CAC emissions, but they are relatively small compared to GHG impacts and other consequences of the different plans.

[34] See European Commission publication, *Damages per tonne of emissions of $PM_{2.5}$, NH_3, NO_x and VOCs from each EU25 Member State (excluding Cyprus) and Surrounding Seas*, March 2005.

(http://ec.europa.eu/environment/archives/cafe/activities/pdf/cafe_cba_externalities.pdf)

[35] The European PM damage cost estimates are for $PM_{2.5}$. One could expect higher costs for finer particulates (PM_{10}) because of the greater health hazard they present. Also the damage cost estimates could increase over time. See U.K. Department of the Environment, Air Quality: economic analysis, May 10, 2013 (www.gov.uk/air-quality-economic-analysis) where it is recommended to assume an increase in the real value of damage costs over time due to an expected increased willingness to pay to reduce the risk of loss of life as incomes rise. It is also recommended to use a lower discount rate (3.5% real) as compared to the 6% real rate used to calculate present values in this study.

Table 13.8 CAC DAMAGE COSTS FROM MANITOBA THERMAL GENERATION IN PREFERRED AND ALTERNATIVE PLANS

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Estimated damage cost of NO_x emissions	13.4	16.9	16.3	18.9
Estimated damage cost of PM emissions	4.1	9.2	8.3	11.9
Total CAC Damage Costs	**17.5**	**26.1**	**24.6**	**30.8**
Difference from Preferred Development Plan	**-------**	**8.6**	**7.1**	**13.3**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS OF 2014$)

Bio-physical Impacts

The development of new generation and transmission facilities in the different plans would have a wide range of physical, aquatic and terrestrial environmental impacts.

In the Preferred Development Plan, there would be the impacts associated with the development of the Keeyask and Conawapa hydro stations, related transmission and network upgrades; a new 750 MW interconnection with the U.S.; and some 600 MW of simple cycle gas turbine capacity should that capacity be needed toward the end of the planning period (2041-46) to meet requirements.

In the smaller-interconnection alternative there would be the impacts of the development of Keeyask G.S. and related transmission; a 250 MW interconnection to the U.S.; and over 1,600 MW of simple and combined cycle gas turbine capacity. The Keeyask-gas alternative would give rise to the same development impacts, except for the interconnection to the U.S. which would

not be built in that case. With the all gas alternative there would be the impacts associated with the development of gas turbine capacity – some 900 MW of simple cycle capacity and 1,540 MW of combined cycle capacity.

As discussed in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities,*** Manitoba Hydro and its Cree Nation partners have undertaken a detailed environmental assessment of the Keeyask generation project. The assessment sets out the scope of the project, its potential effects, plans to avoid and mitigate adverse effects and an evaluation of residual effects (i.e. those that remain after mitigation).[36]

The project would entail the flooding of 45 km^2 of land initially, increasing another 7 or 8 km^2 over time. There would be increases in water levels upstream and flow impacts up to 3 km downstream. There would as well be clearing of land for construction, access and transmission line right of ways.

Among the aquatic impacts, there would be some loss of spawning and foraging habitat as well as some blockage of fish passage. Extensive mitigation measures have been planned to minimize and offset these effects. These include plans in construction and for turbine design to minimize impacts; development of new habitat and fish passage; and implementation of a fish stocking program. While some short term declines in fish populations are expected, no declines are expected over the long term, and lake sturgeon populations in the region are expected to

[36] Keeyask Hydropower Limited Partnership, *Environmental Impact Statement-Response to EIS Guidelines*, Chapter 6, Environmental Effects Assessment, June 2012.

increase with the stocking and stewardship programs despite the loss of habitat due to the project.[37]

The federal government is considering whether to list lake sturgeon in the Nelson River as endangered under the *Species at Risk Act (SARA)*. Manitoba Hydro's planning is based on the assumption that this will not occur, particularly given the stocking and stewardship programs that are being developed and implemented. Were listing under *SARA* to occur the Keeyask and Conawapa Projects could be delayed or cancelled. If Manitoba Hydro (and in the case of Keeyask the partnership) decided to proceed with the projects, federal permits would be required.

The development of Keeyask G.S. would result in an increase in methylmercury concentrations in fish peaking 3 to 7 years after impoundment. It is expected the methylmercury concentrations would revert back to original levels after 30 years. Monitoring and communication programs, as well as funding of offsetting programs to support harvesting in alternative locations are planned to mitigate these effects.

Among the terrestrial impacts is the loss of habitat, including wetland areas, affecting mammals, birds and waterfowl. There would also be impacts due to sensory disturbance, increased traffic and human presence, and greater access to and pressure from hunting. For birds there could as well be impacts from wire strikes. Mitigation measures include careful

[37] Manitoba Hydro has been working on stewardship activities with provincial and federal regulators, academic institutions, First Nations and stakeholder organizations such as the Nelson River Sturgeon Board and the Saskatchewan River Sturgeon Management Board. The objective is to develop a comprehensive set of programs designed to protect and enhance lake sturgeon populations. See NFAT, Appendix 2.1 for details.

siting of infrastructure facilities away from sensitive sites, such as caribou calving habitat and regionally rare habitat types. New wetland habitat and nesting areas would be developed. Cumulative effects for all priority habitat types would be maintained below 10%, a key indicator of ecosystem sustainability. An access management and hunting control plan would also be implemented.

Manitoba Hydro is of the view that these mitigation measures combined with offsetting programs and the compensation provided for in the adverse effects agreements, plus the fact that from the very outset a low-level development option was selected to minimize flooding and the increase in water levels upstream, would serve to ensure that the residual impacts would be relatively small.

The economic measure of the cost of any residual impact on environmental resources and attributes is the compensation required by those people who would be adversely affected to willingly accept the impacts and risks. The acceptance and participation of the KCNs in the Joint Keeyask Development Agreement suggests that the cost (for social as well as natural resource and environmental effects as they affect local residents) would be largely internalized in the design, plans and agreements governing the project development. There would be no major *external* cost to take into account.

Detailed environmental assessments have not been undertaken for the other projects in the preferred and alternative plans. Preliminary assessments indicate, however, that the impacts of the Conawapa Project would be similar in nature to the Keeyask Project, except the flooding and related aquatic impacts would be much less. It would entail only 5 km^2 of flooding as compared to 45 km^2 for Keeyask G.S. There would be less linear development to connect

Conawapa generation to the system than for Keeyask G.S. – five 7-km lines would be required to connect the generating station to the converter station. However, the combined development of Keeyask G.S. and Conawapa G.S. would require upgrades to the HVDC collector system as well as upgrades to some 470 km of the north-south 230 kV AC transmission system.

At this point, and subject to the findings in project-specific environmental assessment reviews, Manitoba Hydro is of the view that preliminary project designs and cost estimates for Conawapa G.S. and the related upgrades provide for sufficient mitigation to minimize residual adverse effects to acceptable levels. It is also expected that some form of local agreements would be entered into to ensure whatever residual biophysical impacts or risks remain, they would be addressed. Thus, as with the Keeyask Project, it is not anticipated there would be significant external environmental costs from the projects' impacts on aquatic or terrestrial habitat and resources as they affect local residents.

The same general conclusion applies to other projects in the different plans. Careful siting, construction methods, and right-of-way maintenance provisions would be used to minimize the environmental impacts of the U.S. interconnection. With respect to gas thermal plants, the land requirements are small (some 2.8 hectares for a 320 MW CCGT plant and 1.7 hectares for a 216 MW SCGT, and linear development of 2 to 55 km depending on the exact site). New terrestrial impacts could be minimized further with brownfield development at existing power station sites. There would be some steam and cooling water requirements, but these would be minimized with efficient water recycling design.

Some residual impacts could occur with these projects, but they would be the subject of detailed environmental reviews and arrangements with directly affected individuals or

communities. It is anticipated that most, if not all of the costs, would be internalized in the measures that would be undertaken in securing easements and land, and in the project construction and operations.

In summary, while the bio-physical impacts would differ across the different plans, there would not appear to be a major difference in the external costs they give rise to. For the most part the impact-related costs have been internalized with the project designs and plans, and consequently are already reflected in the revenues and expenditures in the market valuation account.

13.3.6 Social Account

The project developments in the preferred and alternative plans would have a wide range of social and economic effects for project partners, local and regional communities, and Manitobans as a whole.

For partners there would be the expected returns and other benefits from their investment and participation in the projects. For affected communities there would be employment and business impacts, as well as potential impacts on traditional and commercial resource activity. There would also be potential impacts on population, housing, infrastructure and services; transportation; family and community well-being; health and safety; and culture and heritage resources. For Manitobans generally, there would be potential impacts on widely held values, including the long-term sustainability or bequest value people in principle may be willing to pay for.

Project Partners

In the preferred and alternative plans that include the development of the Keeyask Project, the investment, employment, direct contract award and other provisions of the JKDA would take effect. These would generate significant benefits for the four Cree Nations (KCNs) that would partner with Manitoba Hydro in the development of the project.

In the Keeyask Environment Impact Statement (EIS) it was estimated that the project would generate between 235 and 600 person-years of construction employment for the KCN partners. There would as well be direct negotiated contracts generating employment and profits from the provisions of camp services, clearing and site preparation, road construction, and other work. For the longer term, there would be a target placement of 182 KCN members in operating positions in Manitoba Hydro.[38]

The investment provisions would enable KCN to acquire an equity interest up to 25% in the project, with the potential of generating significant net returns from their investment. Agreements have not yet been reached for Conawapa, but it is expected for that project, too, there would be benefit-sharing arrangements with local First Nations in the vicinity of the project, as well as a range of local and regional employment, training and business opportunities.

As for the other projects in the preferred and alternative plans, in particular the thermal projects that would be developed, there are no plans to enhance local employment

[38] Keeyask Hydropower Limited Partnership, *Environmental Impact Statement* Chapter 6, pp. 6-434 to 6-439.

opportunities as in the JKDA and no investment participation or direct income benefit arrangements are envisaged at this time.

The net returns to Manitoba Hydro project partners and other direct income beneficiaries would be significant in all of the plans with Keeyask G.S., but particularly if it is built in conjunction with new sales and a new interconnection. That enhances the average export price and participant returns. The largest benefits would be realized with the Preferred Development Plan because of the larger interconnection and sales it includes and because of the benefit-sharing agreement that Conawapa G.S. is assumed to entail.

Local and Regional Community Impacts

A detailed socio-economic impact assessment has been undertaken for the Keeyask Project, but not for the other projects in the preferred and alternative plans.

The Keeyask G.S. assessment has indicated that there would be significant employment benefits throughout the region, and spin-off business benefits in Gillam and Thompson. Gillam would realize longer-term benefits because of the permanent jobs that would be located there to support Keeyask operations. While there are concerns about wage pressure and cost-of-living impacts that could result, these are not expected to be significant because of an anticipated business closure and consequent weakness elsewhere in the regional economy.

There are expected to be some adverse impacts on domestic resource use and commercial trapping due to disturbance to fish and wildlife resources and habitat. However, they would be

limited and offset by the provision of alternative harvesting opportunities and compensation arrangements. Licensed trapline holders would be eligible for compensation.

There could be some in-migration to local and regional communities during construction, with consequent pressures on housing, recreational and other facilities, and community services. The impacts are expected to be limited, in part because the existing housing shortage in nearby local communities would discourage project workers from returning to those communities. However, the impacts would be monitored and mitigation measures taken as required. Additionally, plans are being developed to address infrastructure and service requirements in Gillam, with an expected increase in its permanent population.

Concerns about transportation have been expressed, including impacts due to increased traffic on provincial roads. Impacts on provincial roads would be mitigated by improvements to PR 280, and impacts on winter road access and ferry landings would be monitored.

As with other major projects in remote areas, there would be both positive and negative potential impacts on families and community well-being. The increased income and employment opportunities can significantly benefit families, but at the same time they can give rise to undesirable activities such as drug and alcohol abuse. Undesirable interaction between construction workers and local residents would be expected to be much reduced compared to previous experiences, but this issue would remain a priority of Manitoba Hydro, the communities, RCMP and other local service providers to monitor and address. Similarly, monitoring and mitigation measures would be implemented to address other community and health concerns, in particular with regard to increased methylmercury levels in fish after impoundment.

Overall, while there would be some adverse effects, for the most part they would be mitigated and limited in duration. Some concerns would no doubt remain, but again, the KCNs support and participation in the project suggest that local adverse effects would be offset by the positive impacts and expected benefits.

Detailed assessments for the other projects in the preferred and alternative plans have not been undertaken. The impacts and mitigation plans for Conawapa G.S. would be similar to Keeyask G.S., with similar net effects. The impacts for thermal power plant developments would be different, but again it could be expected that siting and mitigation plans would minimize residual adverse effects. Transmission line development through private lands raise different social issues, including disputes about the compensation paid for easements. For the transmission lines associated with generation-related, network upgrade and interconnection projects, siting would be carefully done to minimize impacts, and fair market value paid for access to or purchase of private land. In most instances the number of parties and amount of money involved would be relatively small. Nevertheless, while not necessarily significant from a broad provincial perspective, any residual impacts could be quite important from the perspective of those directly affected.

In sum, there would be the full range of positive and negative impacts major projects can have on nearby communities and affected property owners. For the most part, adverse impacts would be minimized or offset with careful project planning, siting, monitoring, mitigation and compensation arrangements. However, some negative residual effects could still occur for some individuals and families.

Manitobans as a Whole

For Manitoba as a whole, the cost-benefit question is whether there are social benefits or costs – consequences that people in principle value positively or negatively – not reflected in the other accounts. There could be some broad community support for the engagement with Aboriginal Communities in the plans with northern hydro development. There could as well be strong preference for development plans that rely on renewable as opposed to non-renewable fossil-fuel resources. For some Manitobans there may be a willingness to pay for such consequences or attributes that go beyond what is already reflected in Manitoba Hydro's aboriginal partnership agreements and in the costing of GHG emissions already taken into account, though it is not clear how significant that would be from a broad provincial perspective.

One aspect of the plans, however, that may be more broadly significant and that may not have been fully recognized in the other accounts, is what one could describe as a bequest value – the value of the assets that will benefit future generations of Manitobans over the very long term.

The residual value of the assets at the end of Manitoba Hydro's planning period was included in the present value calculations in the market valuation account. This was done by projecting and comparing for the different plans the capital and O&M costs net of export revenues required to maintain the system from 2047 through to 2090. The residual value of the hydro generating and related assets in the preferred and two alternative plans with Keeyask G.S. was then calculated by calculating the long-term net cost saving relative to the all gas plan, with its greater need for replacement investment, greater O&M and lower export revenues.

The calculated residual values for the hydro assets remaining at the end of the planning period were significant, as one would expect given their long life and minimal operating cost. However, their 2047 residual value was calculated at a real discount rate of 5.05% reflecting Manitoba Hydro's weighted average cost of capital; and its 2014 present value in this MA-BCA was calculated with a 6% real discount rate reflecting the weighted average social opportunity cost. The question is whether those discount rates give adequate weight to the future benefits – whether they truly reflect what people would be willing to pay today for benefits passed onto future generations.

Discount rates of 5.05% and 6% (real) are lower than the rates that private industry would use to calculate the present value significance of residual assets remaining at the end of the planning period. However, that is because private industry typically assigns much greater weight to the more immediate consequences of its decisions. It is precisely because of that, it has been Crown Corporations that have undertaken the major hydro developments in Canada in the past. As a matter of public policy and with government support Crown Corporations were able to give much greater weight to the long-term value of their investments. In effect, they applied much lower discount rates in the assessment of their investment decisions; and as can be seen with the very low electricity prices in Manitoba, Quebec and British Columbia as compared to other jurisdictions, that has served this present generation very well.

In recent years, a number of economists specializing in cost-benefit or related analyses argue that traditional cost of capital-based discount rates do not give adequate weight to the intergenerational consequences of investment and policy decisions. Some economists advocate and some government cost-benefit guidelines have in fact adopted declining real discount rates

over time to give greater weight to intergenerational impacts in the distant future.[39] This has been particularly important in the assessment of climate change concerns; it is also relevant to any long-lived assets providing benefits into the very distant future.

The application of lower, intergenerationally sensitive discount rates would increase the weight or present value significance of the assets remaining at the end of the planning period and increase the advantage of the plans with Keeyask G.S. and especially the Preferred Development Plan with Keeyask G.S. and Conawapa G.S. as compared to the all gas plan. In economic terms it would add an important bequest value to these plans, over and above what has already been taken into account. No attempt is made in this assessment to quantify the magnitude of that potential value; it is simply recognized as a potentially important qualitative consideration to take into account in the overall assessment of the relative merits of the different plans.

13.3.7 Summary of Reference Scenario Assessment

In Table 13.9, the assessment of the preferred and alternative development plans under the market valuation, customer, Manitoba government, Manitoba economy, environment and social accounts are summarized. The dollar values show the estimated present value difference from the Preferred Development Plan under Manitoba Hydro's NFAT reference scenario set of assumptions, with positive values indicating a net advantage (higher net revenue/benefit or lower net cost) relative to the Preferred Development Plan; negative values indicate a net disadvantage (higher net cost).

[39] See e.g. M. Weitzman, "Why the Far-Distant Future Should be Discounted at Its Lowest Possible Rate", *Journal of Environmental Economics and Management*, Vol.36, 1998, pp.201-8; P. Portnoy and J. Weyeant, *Discounting and Intergenerational Equity*, Resources for the Future, 1999; and U.K. HM Treasury, *The Green Book: Appraisal and Evaluation in Central Government*, p.26.

As shown in the table, the market valuation – the incremental revenues and expenditures for Manitoba Hydro and its project partners – shows that the plan with Keeyask G.S. and no new interconnection is preferable to the all gas plan and that the plans with a new interconnection (large or small) are preferable to the two alternatives without one. As between the Preferred Development Plan and the one with the smaller interconnection, there is little difference. The smaller interconnection is slightly better with its estimated present value net revenues (at a 6% real discount rate) $17 million greater than with the Preferred Development Plan.

In summary, from a long-term Manitoba Hydro perspective it is advantageous to develop Keeyask G.S. (as opposed to gas thermal) and even more advantageous when developed in conjunction with a new interconnection and firm export sales to the U.S.

As one moves from a strictly Manitoba Hydro to broader social or public interest perspective, the long-term advantage of the plan with Keeyask G.S. and particularly Keeyask G.S. with a new interconnection relative to all gas, become even more pronounced. There are significant advantages for customer reliability, government, the economy, and in relation to GHG emissions for the plans with Keeyask G.S. as compared to all gas. And with these broader net benefits taken into account there is a significant advantage of the Preferred Development Plan relative to the plan with the smaller interconnection. The estimated present value of the monetized net benefits of the Preferred Development Plan is $654 million greater than the plan with the smaller interconnection; $967 million greater than the plan with Keeyask G.S. and no interconnection; and $1.855 billion greater than the all gas plan.

Table 13.9 SUMMARY OF REFERENCE SCENARIO ASSESSMENT

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Market Valuation Net revenues (cost) to MH and partners	--	17.0	(270.5)	(654.1)
Customer Account Cumulative rate increase	Preferred Development Plan has highest rate increases in first 20 years (cumulatively 16 to 18 percentage points more than the alternative plans) but has lowest rate increases over long term (cumulatively by year 50 approximately 34 to 37 percentage points less than the two alternatives with Keeyask G.S. and 70 percentage points less than the all gas plan).			
Reliability	Preferred Development Plan and to lesser extent the alternative with the smaller interconnection provides greater load carrying capability, lower expected loss of unserved energy and greater ability to manage extreme drought			
Government Incremental revenues net of costs/risk	--	(353.5)	(395.9)	(674.2)
Manitoba Economy Employment net benefits	--	(100.7)	(120.1)	(192.7)
Environment Manitoba GHG external cost	--	(208.6)	(174.3)	(320.3)
Global GHG impact	Preferred Development Plan and to lesser extent the two plans with Keeyask G.S. would contribute to a reduction in global emissions by displacing thermal generation in US.			
Manitoba CAC damage cost	--	(8.6)	(7.1)	(13.3)
Residual biophysical	Aquatic and terrestrial impacts with hydro projects in Preferred Development Plan and plans with Keeyask G.S.; subject to detailed environmental hearings, residual effects and local external cost expected to be relatively small with initial design, extensive mitigation, monitoring, compensation and benefit-sharing arrangements.			
Social Partner net return	Significant net returns from up to 25% interest in Keeyask G.S. and income benefits from Conawapa G.S. in Preferred Development Plan; significant benefits from up to 25% interest in two alternatives with Keeyask G.S., greater with new sales and interconnection.			
Community impacts	Wide range of potential impacts on local employment and business; population, infrastructure and service; social and community well-being; owners of land needed for rights of way and easements; major commitments and plans to minimize adverse residual effects with extensive mitigation, monitoring, compensation and partnership arrangements.			
Other Manitoba	Potentially significant bequest value from the hydro assets remaining at end of planning period; greatest with Preferred Development Plan and to a lesser extent in the alternatives with Keeyask G.S.			
Overall Monetized Net Benefit (Cost)	**--**	**(654.4)**	**(967.5)**	**(1,854.6)**

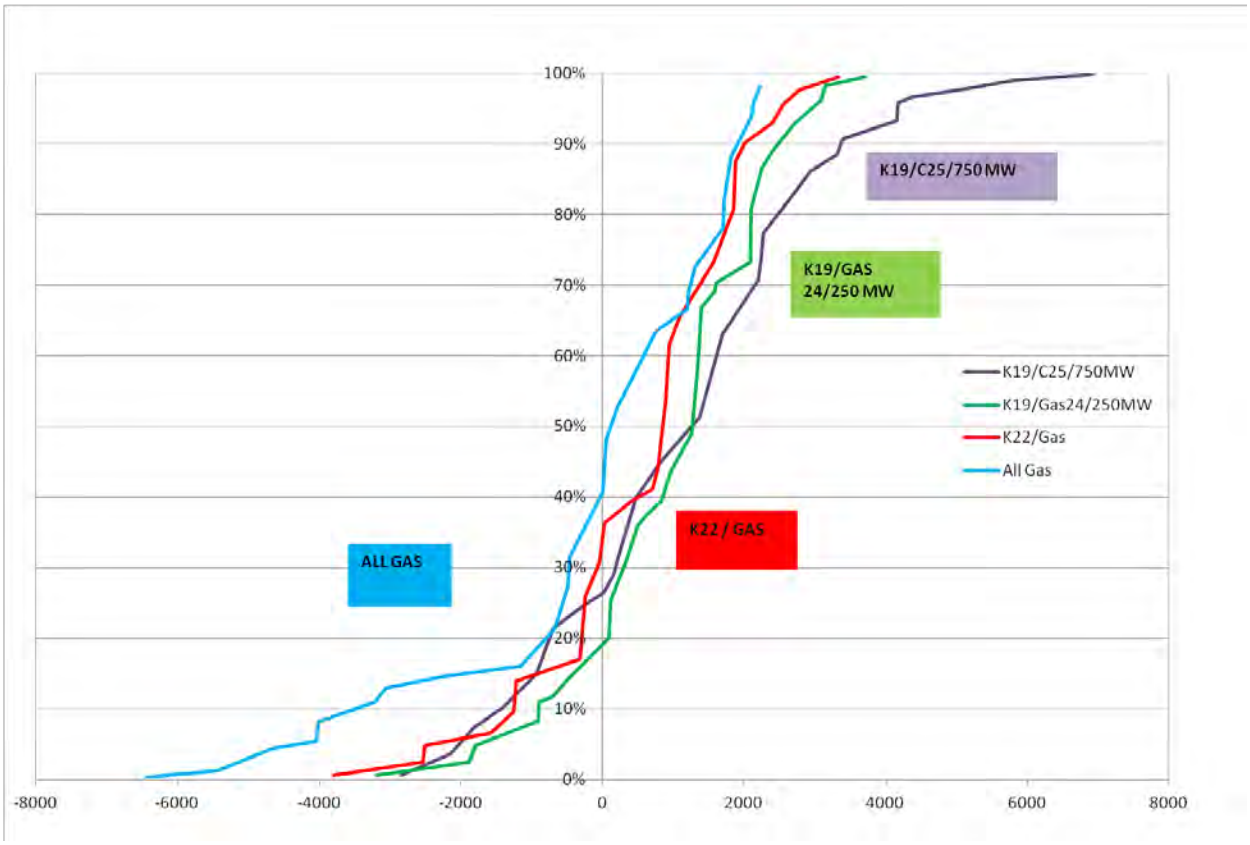
NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS OF 2014$)

There are important distributional and non-monetized impacts that the monetized net benefit numbers do not show. A key distributional issue is the pattern of rate impacts over time. The Preferred Development Plan exhibits the lowest rate increases over the long run, but the largest increases in the short to medium term. On the other hand the Preferred Development Plan offers the greatest bequest value for future generations – a value that may not be fully captured by the residual value in Manitoba Hydro's assessment of net system costs.

This distributional trade-off calls for careful consideration of short to medium versus long-term interests. A long-term perspective strongly supports the Preferred Development Plan with its development of Conawapa G.S. as well as Keeyask G.S. A shorter-term perspective will favour less capital expenditure, though the results would still indicate an advantage for the plans with Keeyask G.S., and especially Keeyask G.S. and a new interconnection over the all gas plan. There is not the same short to medium versus long term trade-off when comparing the Keeyask/gas or Keeyask/small tie alternatives versus the all gas plan as there is with the Preferred Development Plan.

The main non-monetized issues concern the environmental and social impacts of the projects in the different plans. The assessment does not indicate that there would be major residual effects or trade-offs to consider given the extensive monitoring, mitigation and other measures that are planned, but this will be addressed in detail in the environmental hearings the projects require.

13.3.8 Uncertainty and Risk



The benefits and costs estimated with Manitoba Hydro's reference scenario set of assumptions indicate that the development of Keeyask G.S. offers significant advantages over gas; that the

development of Keeyask G.S. is more advantageous with a new interconnection and firm sales than without; and that the Preferred Development Plan, which includes the development of Conawapa G.S. and a large new interconnection, is the best overall from a broad provincial perspective over the long term.

However, there is uncertainty in the reference scenario assumptions and therefore in the consequences of the different plans for Manitoba Hydro revenues and expenditures and customer rates. It is not just the consequences of the Preferred Development Plan, but rather of all the plans that are subject to considerable uncertainty. The question thus arises, does the uncertainty favour some plans over others – is there a risk trade-off that could change the relative advantage of the different plans based on the reference scenario analysis.

To address this question, the revenue and expenditure and consequent rate implications of the different plans were analyzed under a wide range of assumptions. With probabilities attached to the different underlying assumptions, probability distributions of the range of outcomes were calculated. In Figure 13.11 the probability distribution of the net present values of the preferred and alternative plans are shown. They are presented as “S-curves” which show the cumulative probability values. A given point on the curve indicates there is a percentage value (from the y-axis) chance that the net present value (calculated relative to the all gas reference scenario result) will be less than or equal to the corresponding amount of the x-axis.

Figure 13.11 MANITOBA HYDRO NET REVENUE S-CURVES

2014 PRESENT VALUE IN MILLIONS OF 2014$

The curves show that there is a wide range of outcomes for all of the plans. However there are differences. Manitoba Hydro's Preferred Development Plan would appear to offer the greatest upside potential. The all gas plan, on the other hand, exhibits the greatest downside risk. With respect to the Preferred Development Plan versus the alternative with the smaller interconnection there is a trade-off. There is a 50% chance the small-interconnection alternative would be better than the Preferred Development Plan and it generally has less downside risk. The Preferred Development Plan however has an equal chance of being better with greater upside potential.

The S-curves shown in Figure 13.11 are based on set development plans. In the all gas case, for example, the plan assumes a continuation of gas plant development even in scenarios where gas and energy prices rise above what is currently expected. In the Preferred Development Plan Conawapa G.S. is developed for 2025 even if low market prices or high interest rates would favour delaying the in-service date. As discussed in the next chapter, each development plan represents a pathway which preserves some flexibility to make changes depending on unfolding events. And that flexibility can serve to mitigate certain downside risks.

For example, some of the downside risk of the all gas plan can be mitigated by shifting back to hydro or other sources if fuel and carbon prices rise to the point where gas-fired thermal is clearly uneconomic. Similarly, up until the commitment date for Conawapa G.S., some of the downside risk of the Preferred Development Plan can be mitigated by deferring development expenditures should it become apparent that project development would not be economic with the currently planned early in-service date.

With these mitigation opportunities, the differences in the extent of the downside risk greatly diminish. The all gas plan could become gas followed by Keeyask G.S. or Conawapa G.S. as opposed to Keeyask G.S. followed by gas. The Preferred Development Plan could be Keeyask G.S. without Conawapa G.S. or Keeyask G.S. with Conawapa G.S. at a later date.

What differentiates the plans is not so much the extent of the downside risk due to unfolding future events, but what is retained or foregone by the initial decisions. The all gas alternative retains the opportunity to have a no hydro future, but it foregoes the benefit and upside potential with the early development of Keeyask G.S., and in particular the development of Keeyask G.S. with the current export and interconnection opportunity. As for Keeyask G.S.

without a new interconnection, it foregoes the expected benefit and potential upside from the current export and interconnection opportunity. And as for the Keeyask G.S. with a small tie, it foregoes the benefit and potential upside of the larger sales and early development of Conawapa G.S.

Overall, there is little reason to reconsider the broad conclusions concerning the relative long term (net present value) advantage of the different plans suggested by the reference scenario analysis. The plan with Keeyask G.S. is better from an expected and risk point of view to the all gas plan, and the plans with a new interconnection are better than the ones without.

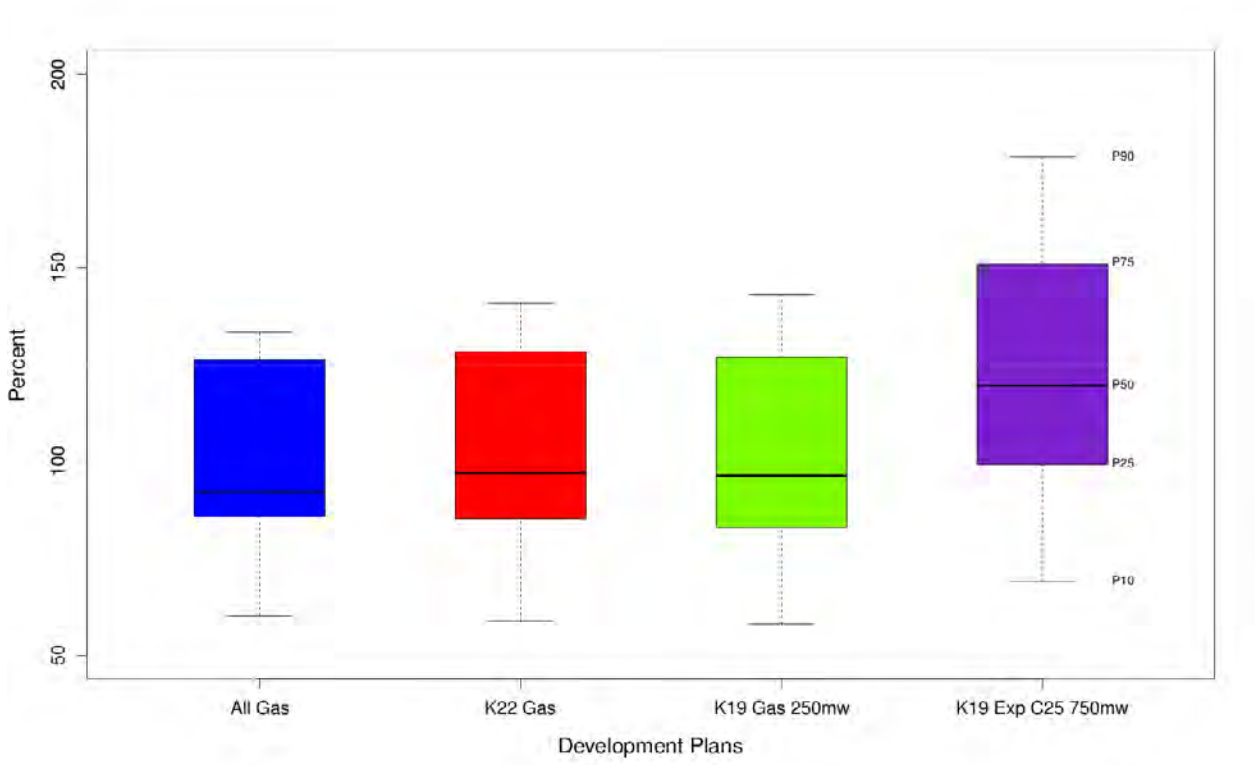
As with the reference scenario findings, the rate implications in the short to medium term versus long term are a different matter. Figure 13.12 shows the probable range of the projected cumulative rate impacts of the different plans after 20 years; Figure 13.13 the probable range of the projected cumulative rate increases over 50 years.

The rate impact ranges in these figures reinforce the short to medium term rate versus long term trade-off identified in the reference scenario analysis. Over the long term (by year 50) the rate impact with the Preferred Development Plan is lower with a narrower band of uncertainty than the others, but the opposite is true in the short to medium term. The rate impact with the Preferred Development Plan is cumulatively greater and more uncertain than the others.

These projected rate impact figures are based on the set development plans as opposed to the pathways they represent. Cumulative rates with the pathways would show narrower ranges for

all of the plans. However, the general pattern and short to medium term versus long-term trade-off would remain much the same.

Figure 13.12 PROJECTED MANITOBA HYDRO CUMULATIVE NOMINAL RATE INCREASES TO 2031/32



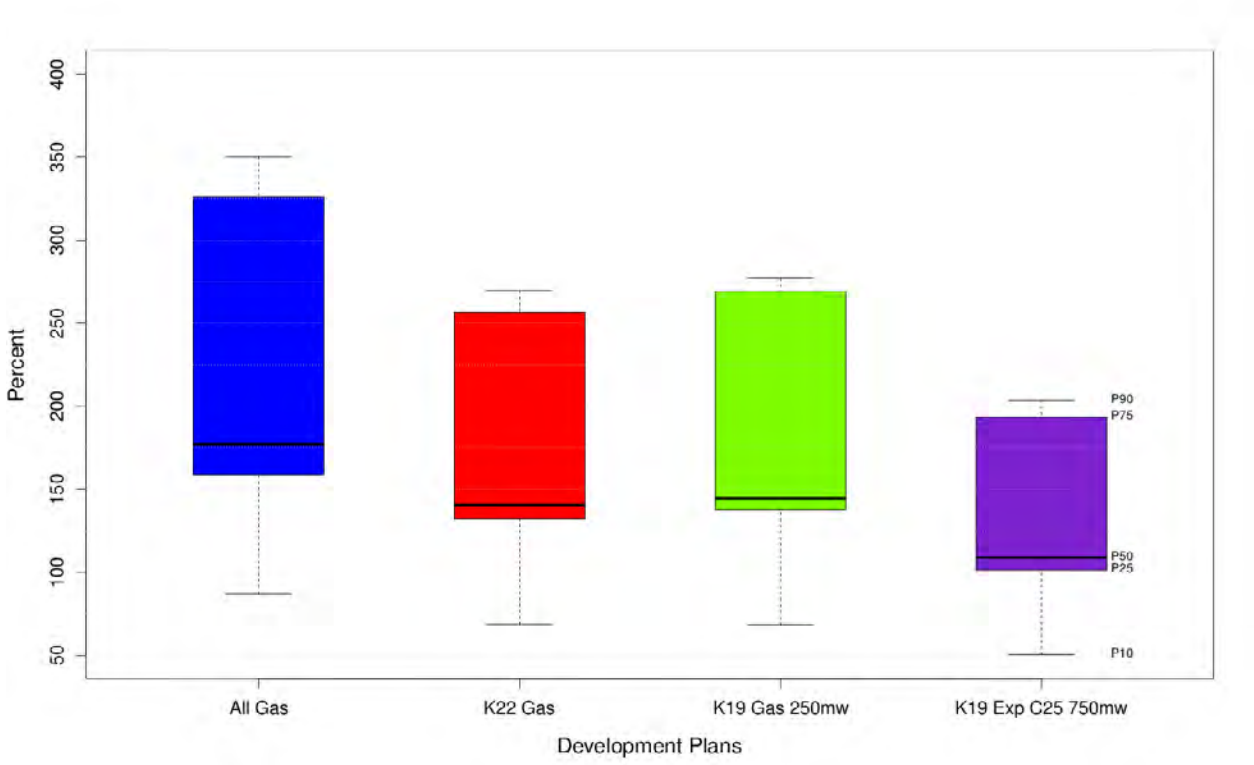


Figure 13.13 PROJECTED MANITOBA CONSUMERS CUMULATIVE NOMINAL RATE INCREASES TO 2061/62

13.4 Conclusions

The purpose of a multiple account benefit-cost assessment is not so much to determine which of a set of alternatives is best, but rather to identify their advantages or disadvantages and the key trade-offs from a broad social or public interest perspective.

This multiple account benefit-cost assessment of Manitoba Hydro's Preferred Development Plan and alternative plans with and without Keeyask G.S. and with and without a new interconnection and firm sales with the U.S. indicate that there are key trade-offs that require

careful consideration, most notably between a strictly Manitoba Hydro and broader social perspective and between customers in the short to medium versus long term.

The main findings are as follows:

- Developing Keeyask G.S. to meet domestic load offers significant net benefits relative to the all gas plan not only for Manitoba Hydro but also more broadly to society as a whole; developing Keeyask G.S. offers significant tax, employment, GHG and social benefits that go beyond the benefits to Manitoba Hydro and its partners.
- Plans that include a new interconnection offer significant net benefits compared to those that do not include a new interconnection. These plans significantly enhance the net benefits for Manitoba Hydro and its partners.
- The alternative with the 250 MW interconnection and the development of Keeyask G.S. but not Conawapa G.S. offers similar expected net benefit to Manitoba Hydro and its partners as the Preferred Development Plan, without the short to medium term rate trade-off that the Preferred Development Plan gives rise to. At the same time this alternative with a smaller interconnection and Keeyask G.S. only does not offer the same long-term legacy value or upside potential as the Preferred Development Plan. Nor does it offer the same long term rate, customer reliability, tax, employment, GHG and social benefits as the Preferred Development Plan.
- The Preferred Development Plan offers the lowest projected rate impacts for the long term and significantly greater benefits to society as a whole than the smaller interconnection alternative. It does, however, require higher projected rate increases in the short to medium term than the other plans. The more weight one places on the broader public interest consequences and the longer-term effects, the more one would favour this plan.

Tab 98

Whitfield Russell Associates Report on the NFAT for the MMF

Whitfield Russell Associates

May 13, 2014

WRA Presentation Focuses on:

- Lack of transparent data
- Study Period of 78 years is too long
- Export revenues forecasts unavailable, risky
- Exports will not recover the full costs of Keeyask/Conawapa
- Hydro's analysis and conduct indicates a predisposition to build hydro
  - Bipole III's $3.3 billion costs is deemed sunk and ignored in economic comparison analysis
  - Other sunk costs for Keeyask and Conawapa similarly prejudice analysis
  - 78-year study period favors hydro
- Reliability analysis that Hydro relied on to expand the HVDC system
- An additional transmission line to the U.S. will lower costs and risks and improve reliability for Manitoba

The Lack of Transparent Data

- Much of the data on financial and economic risks of the PDP, transmission planning and export contracts has been restricted as commercially sensitive information.
- Many questions asked by the IECs were similar to those that MMF would have asked. And many of the answers came as follows:
  - "This Information Request has been withdrawn by the IEC as no longer required, having been satisfied through discussion with Manitoba Hydro."

TOR Lacks Bipole III Review

As noted in the TOR at page 4, the scope of the NFAT does not include the Bipole III high voltage direct current (HVDC) transmission line and converter station project. This portion of the TOR caused the parties to treat future investments in Bipole III as sunk costs (even though much of that investment has not yet been made and some of that investment may be avoidable). This element of the TOR distorted the analyses to favor hydro-centric alternatives.

The 78-Year Study Period Is Too Long

1. Is longer than typical even for Manitoba Hydro which uses a 20-year projection for its Financial Forecast and a 35-year period for its Power Resource Plan.
2. Favors high-risk, hydro-centric plans that have near-zero energy costs but add generating capacity in large capacity blocks, require export sales of surpluses until needed by domestic loads (thus exposing MH to a risk of suppressed export prices), require large capital investments, take a long time to build and are projected to generate savings only after much of their initial cost is paid down through depreciation.

The 78-Year Study Period Is Too Long

3. Makes plans susceptible to difficult-to-predict structural changes such as those that could alter relative costs of assets and lower domestic demands (e.g., from DG and new technology) and export prices.
4. Masks the need for near-term rate increases (and the associated burdens) to support hydro projects before they begin to generate savings and achieve lower costs decades from now. MH showed that 26 years must elapse before the PDP lowers cumulative rates to Manitoba consumers. This creates inter-generational inequity.

Risk Associated with Export Revenue

The net benefits claimed for plans involving Keeyask and Conawapa are highly dependent upon the magnitude of future exports and the future level of export prices. Publicly available data on the historical magnitude of exports and the average price per kWh sold revealed a disturbing trend of considerable volatility (particularly in opportunity sales volumes and prices) and a decline in export prices since 2006/7.

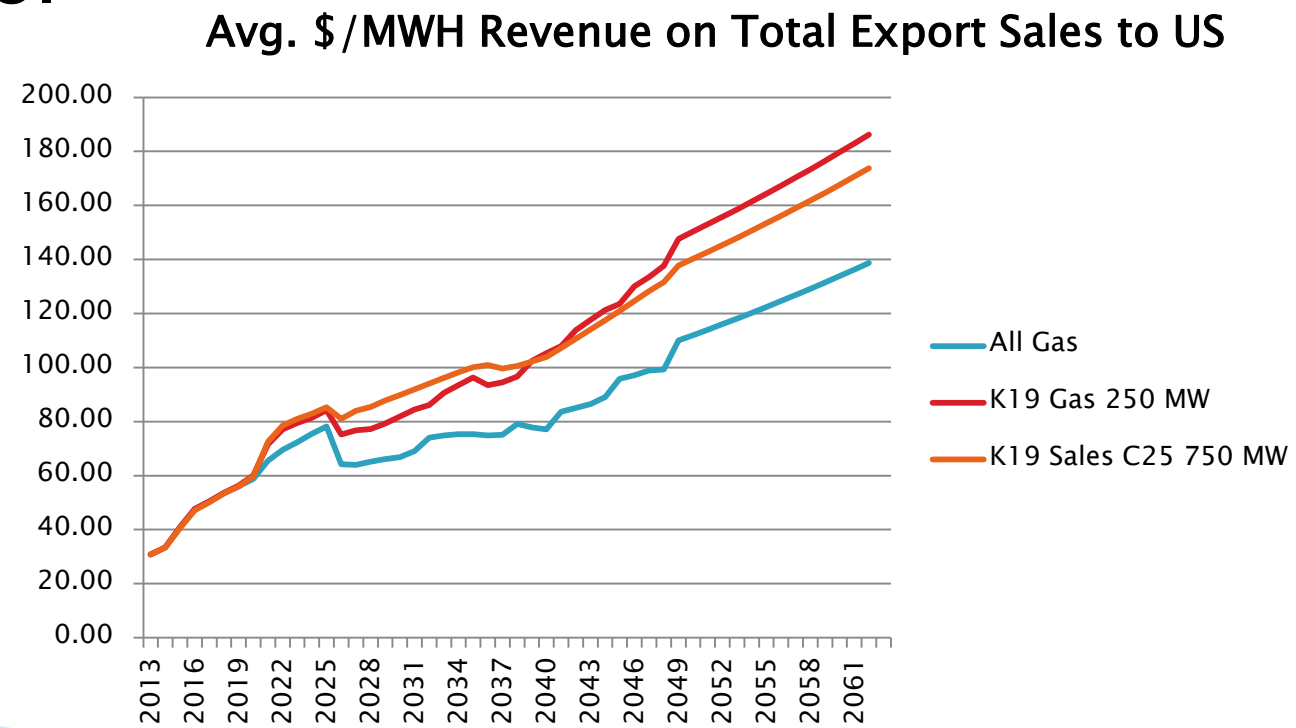
Source: PUB/MH I-058														

MH's Intent to Build Hydro

- Manitoba Hydro's selection of the PDP seems to reflect a predisposition to build high-cost hydro resources largely for export in the initial period of the life of those resources.
- The market for firm exported power is primarily determined by the marginal cost of alternative thermal resources which presently tend to have capital costs ($750/kW for SCGTs and $1350/kW for CCGTs) far below those of hydro ($9000/kW for Keeyask before the recent escalation).

Export Revenues Will Not Fully Recover Costs of New Hydro



There is a substantial gap between:

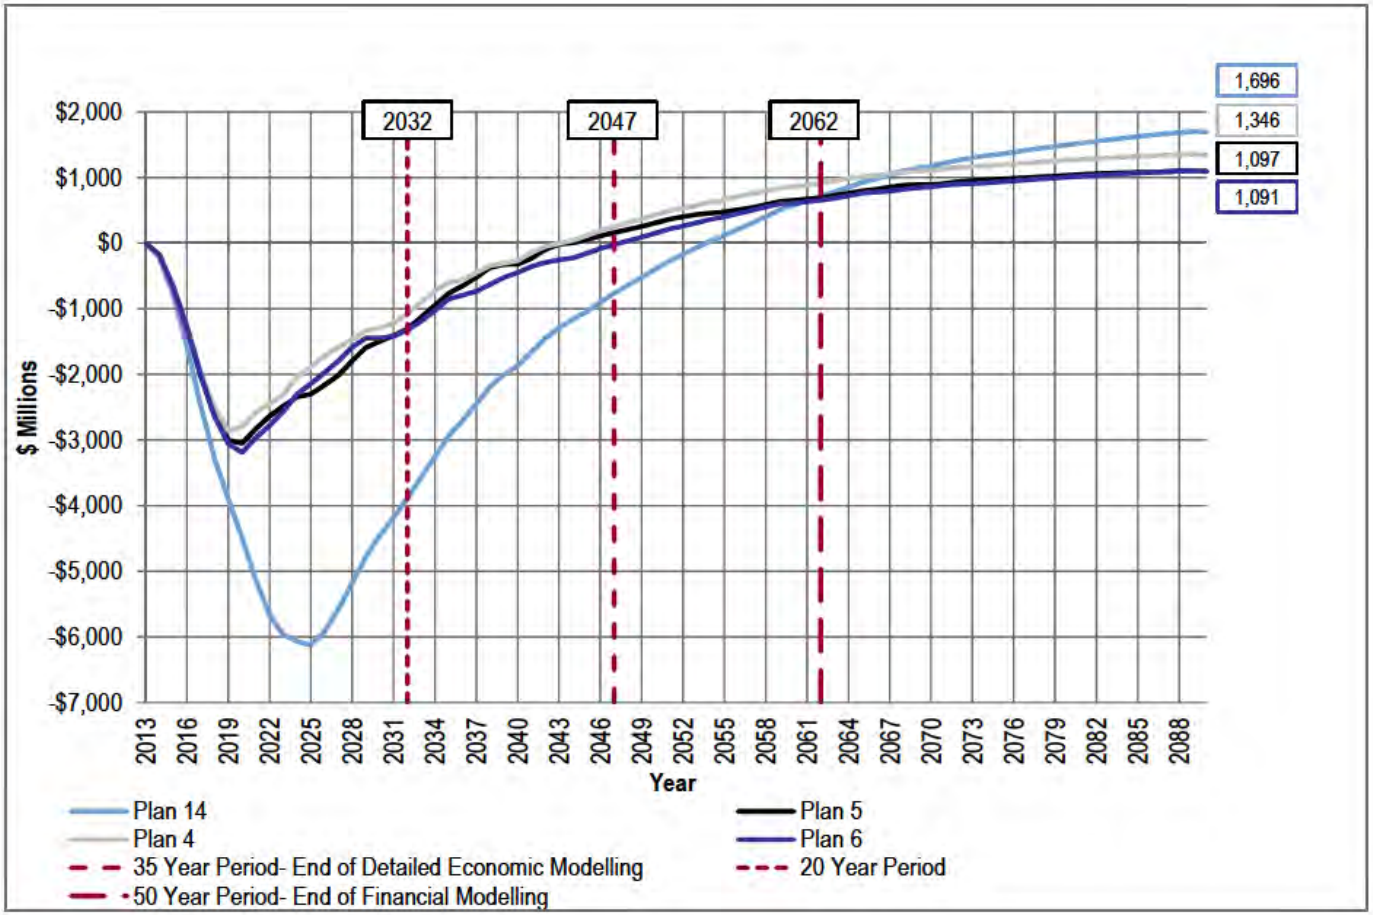
- The high initial in-service annual revenue requirement to recover the cost of power for Wuskwatim, Keeyask and Conawapa (approximately $100/MWH or 10¢/kWh – See BO 5/12 at 8, 54) and

- The much lower prices at which MH can expect to sell its firm and surplus hydro power in export markets (resulting in unit sales prices of no more than 6-7¢/kWh on average for firm sales and opportunity sales combined – See BO 5/12 at 55).

PDP and Other Plans Revenue/MWH

The weighted average forecast of firm exports and opportunity sales is below 10¢/kWh until 2038.

Impact of Prices and Study Length



MH has an incentive to maximize firm exports and lock in pricing for firm exports, but is constrained by buyer resistance and the cost of alternatives. As costs escalate and forecasts of export prices fall, the point in time at which export revenues recover increased costs is pushed farther into the future. This set of constraints has provided a powerful incentive to lengthen the study period.

PDP Benefit is Long in Coming

As Keeyask and Conawapa are depreciated over their 67-year useful lives, their costs will decline to a level that is projected to fall below the market price of exports, but that crossover will not happen for a long time. In the meantime, losses on exports will accumulate before eventually being reduced. In comparison to the All-Gas benchmark case, LaCapra's analysis showed negative cumulative NPVs for the first 30 years for Plans 4, 5 and 6, and for the first 41 years for the PDP.

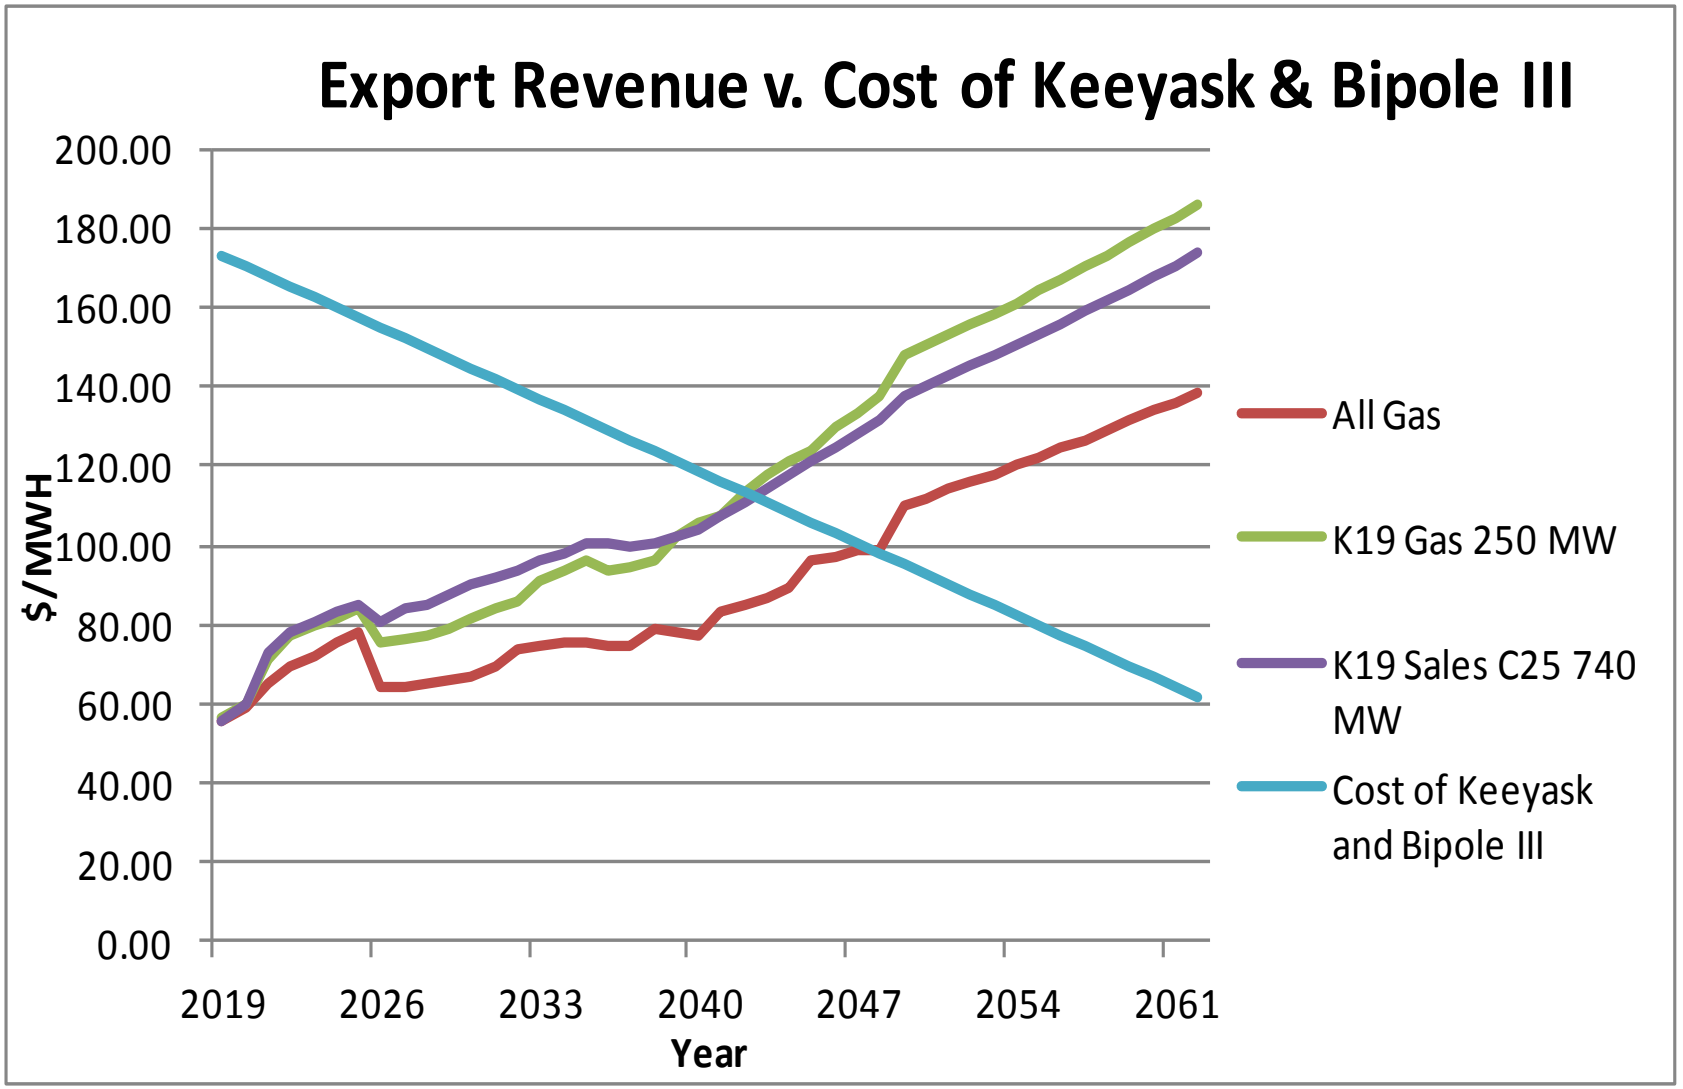
LCA Figure 9-17 Corrected

. Figure 9-17 *Incremental CPV Plan 4, 5, 6 and Plan 14 Relative to All Gas Case*
Changed 20 year period to end at 2032 rather than 2033 and the 35 year period to end at 2047 rather than 2048.

Increased Costs Will Reduce Benefits of Exports

- MH's failure to incorporate up-to-date cost estimates in its analyses and negotiation of export contracts harms ratepayers (BO at 65).
- The recent increase in the estimated capital costs of Keeyask and Conawapa were apparently not known at the time MH negotiated the Term Sheets and export contracts.

Erosion of Benefits Impacts Plan Choice



- Favorable economics of hydro erode as capital costs increase, as has been demonstrated in the updated work of MH. The initial $1.696 Billion advantage enjoyed by the Preferred Development Plan (PDP) over the All-Gas Plan diminished to $374 million as a result of an $800 million increase in estimates of capital costs associated with Keeyask and Conawapa and the removal of the WPS investment decision (See MH Exhibit 95 at slide 123).
- With the addition of DSM at level 2, the PDP's NPV advantage over the All Gas Plan falls to only $45 million (MH Exh. 95 at slide 130).

Hydro's Levelized Cost Comparison Obscures Impact of Upfront Cost of Hydro Plans

- MH reports a 67-year life-cycle levelized cost of 6-7¢/kWh for Keeyask and Conawapa. See Chapter 7 Table 7.3 and LCA/MH I-308. These costs do not include the sunk costs of Keeyask and Conawapa up through June 2014.
- These numbers are far different from those found in BO 5/12 at 54, which showed starting (non-levelized) costs of 9-10¢/kWh for Keeyask and Conawapa before MH made its new cost estimates known in this proceeding.
- Neither of these starting cost estimates includes approximately 3¢/kWh cost of Bipole III (per BO 5/12 at 54).

Adding Bipole III Costs to Hydro Plans Drives Up Their Costs

- The 10¢/kWh cost of power from Keeyask and Conawapa (from BO 5/12) is forecast to be above the overall weighted average forecast price of exports for many years into the future (See Slide 13).
- When fully loaded, the cost of Bipole III is estimated to add 3¢/kWh to the cost of power delivered (BO 5/12).
- When the cost of Bipole III is added to the cost of Keeyask alone, the deficit is even larger because the incremental costs of the 2000 MW of Bipole III must be recovered on the incremental energy produced from only 630 MW of Keeyask output.
- This drives the incremental cost of Keeyask to about 17.3¢/kWh before potential cost escalations are considered.

PUB Board Order States:

"To the extent MH's real costs with respect to these projects are not recovered from export customers, it will fall to Manitobans to bear financial responsibility through reduced annual net income of MH (and reduced overall retained earnings) and increased electricity rates for Manitobans." BO 5/12 at 63.

Sunk Costs Disadvantage Non-Hydro Alternatives

By adopting the analytical approach for the NFAT that Bipole III is a sunk cost, Manitoba Hydro has biased its analysis in favor of the PDP. Under the PDP, Bipole III will be built first (for commercial service by 2017/2018 to accept the output of Keeyask in 2019 and of Conawapa in 2026.

Bipole III's Sunk Costs

The $3.3 billion cost of Bipole III exceeds the incremental benefits which the PDP is said to produce under many scenarios as compared to the benefits of the "All Gas Plan." Accordingly, adding the $3.3 billion cost of Bipole III to the NPV of the PDP and to the other hydro plans, while removing it from non-hydro plans, would make a vast difference in the probability analysis.

The next slide shows MH's Quilt Table for Several Plans with Updated Capital Costs from MH Exhibit 95 at 125.

Process for Approval on Capital Projects Has Prejudiced the Result

- It is apparent that the process by which MH obtains approval for moving forward on capital projects warrants examination with a view to being reformed.
- Although the PUB has regulatory authority over the rates that MH imposes on ratepayers, it does not appear to have authority to approve or disapprove of MH's capital spending – unless requested by the Government (Minister of Energy) to review – and feels constrained to act within any Terms of Reference.
- BO 5/12 at 68: "While this Board's jurisdiction does not extend to the approval of MH's capital expenditures, this Board does have jurisdiction over the approval of MH's rates in which MH seeks to recover the financing, operating and amortization expenses directly attributable to MH's capital expenditures"
- BO 5/12 at 200: "PUB's role as regulator of MH is to make sure rates are justified, and that MH is not seeking increased rates for recovery of losses for mistakes, errors and inefficiencies. MH must ensure efficiencies are maximized, and that it exercises a discipline of maintaining lowest costs."

Process for Approval on Capital Projects Has Prejudiced the Result

- In this case, substantial amounts have been spent by MH prior to the Government asking for this NFAT.
- Although the PUB could deny rate increases to cover these costs, such an action would undermine indicators of financial health.
- New evidence provided in this proceeding appears to demonstrate that much less costly scenarios are possible, but may be coming to light too late to help the ratepayers.
- The remedy is to subject all major capital expenditures to NFAT review before substantial sunk costs are incurred.

LCA's Plan 17 Looks Promising

Plan 17, the LCA No New Generation scenario is a new scenario developed in the reports and testimony of La Capra. Because of Plan 17's low cost, low risk and substantial economic benefits, La Capra makes a strong case for refining this option into a full-fledged plan or an early stage of a long-term plan in order to reduce risk and cost. LaCapra recognizes that Plan 17 is not a fully fleshed out plan, but asserts that its benefits are so significant that its elements warrant serious consideration by the PUB. Transcript at 6071-78.

The LCA No New Generation Scenario Involves:

- DSM at levels 1.5 times the DSM assumed in MH's studies
- Substitution of natural gas heating for electric heating
- Development of a new 750 MW interconnection in 2029/30 with the US that increases import and export capacity.
- Reliance on relaxed import limitations (20% rather than 10% of domestic load plus export obligations) in lieu of developing generation within Manitoba, and
- Continuation of existing diversity exchange agreements with the United States.

Including Sunk Costs, Plan 17 Appears Advantageous

- Plan 17 demonstrates favorable economics despite being burdened by $4.3 billion in sunk costs that Manitoba Hydro incurred in connection with development of new hydro and transmission features that add little or nothing to Plan 17's value.
  - Sunk costs of $1.0 billion are associated with preserving the option to build Keeyask and/or Conawapa.
  - An additional sunk cost of $3.3 billion is associated with Bipole III.

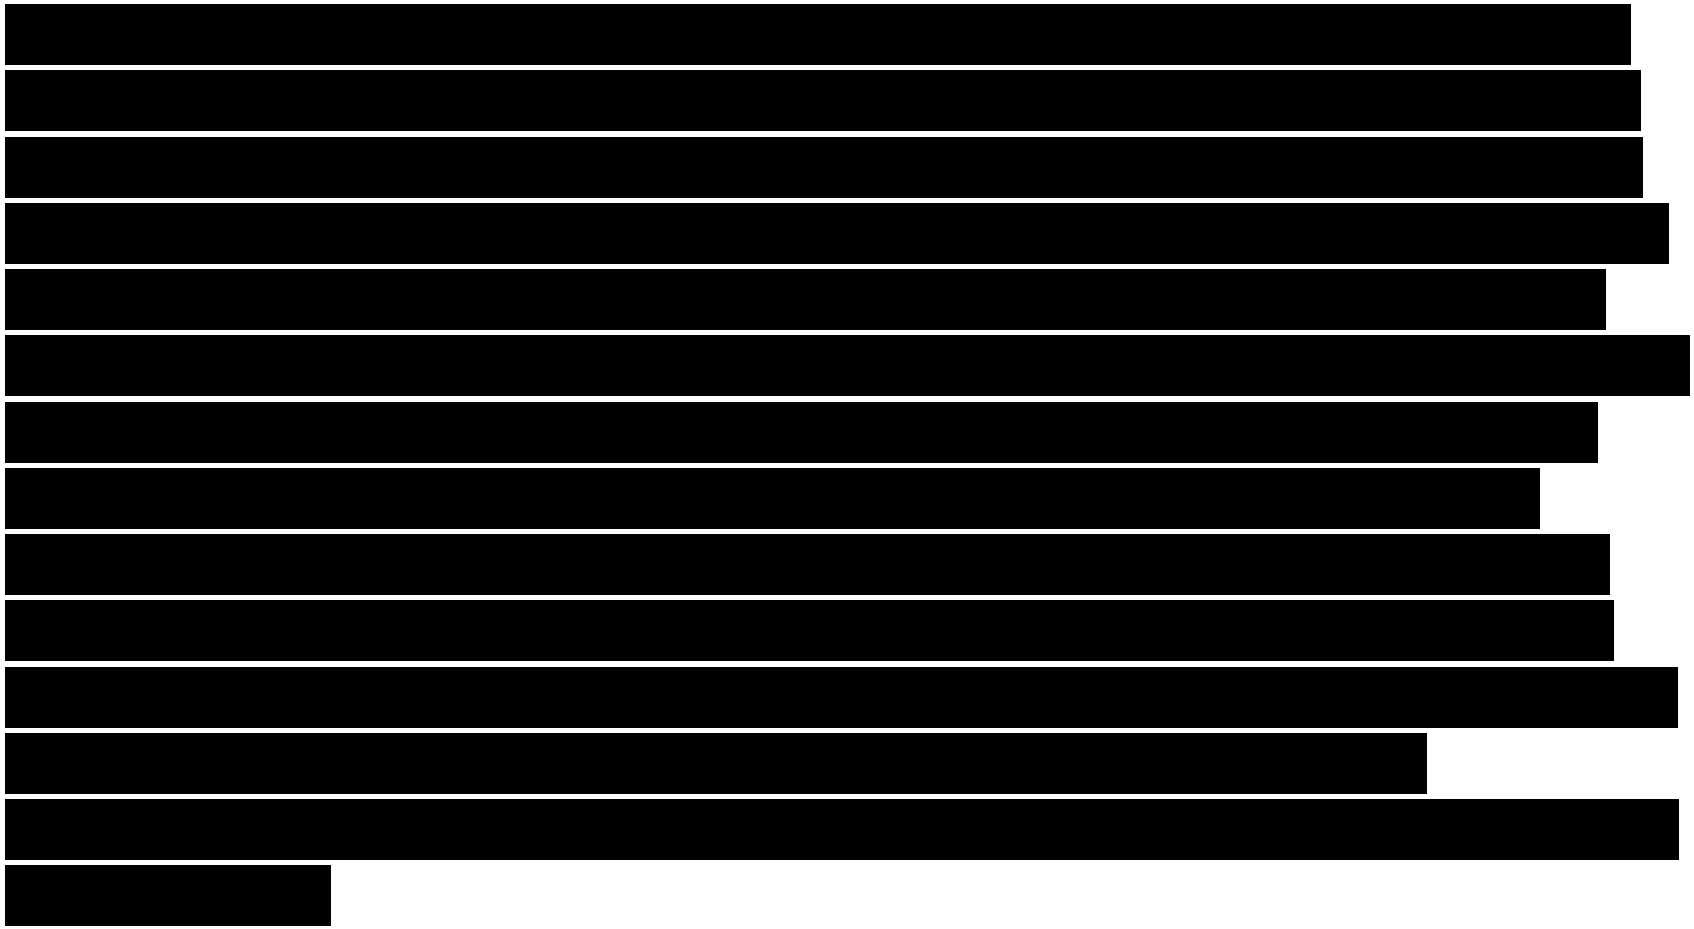
Transmission Planning Standards

- According to Manitoba Hydro, the existing transmission system is vulnerable to a common mode failure such as catastrophic outages of either or both of Bipoles I and II for a period of months or years.
- An extreme event, such as a catastrophic failure of both Bipoles I and II would involve the simultaneous outage of all four single poles of Bipoles I and II (called an N-4 event); utilities must evaluate such scenarios for risks and consequences but need not mitigate them.
- Loss of a single pole of a Bipole is considered an N-1 event which has a less-than-1% probability of occurring (i.e., less than 1×10^{-2}). See the response to CAC/MH II-013b.
- Although industry reliability criteria require that Manitoba Hydro continue to serve all firm load obligations after the occurrence of any single contingency (an N-1 event), those criteria do not require that it continue serving all firm load after an N-2 event, let alone, after an N-4 event.

MH Reliability Standards Have Changed

- In justifying Bipole III for reliability reasons, Manitoba Hydro adopted a deterministic standard requiring that it be able to meet its peak demand after a loss of both Bipoles I and II for a period of months or years.
- The deterministic reliability standard used to justify Bipole III may not have been carried over in developing plans for comparison in the NFAT.
- That deterministic standard could be met either (1) by strengthening interconnections to the United States or (2) by adding Bipole III.
- Manitoba Hydro chose the more expensive option, adding Bipole III.

Planned Hydro Generation Additions Diminish Claimed Reliability Benefit of Bipole III



- The 2000 MW spare transmission capacity initially created by adding Bipole III will drop when Keeyask is added and virtually disappear once Conawapa is added.
- Under the PDP, Manitoba Hydro plans to upgrade its ability to import capacity from the USA to replace the diminishing spare transmission capacity in Bipole III.
- [redacted]

Too Many Eggs in One Basket

- Each of the hydro plans causes greater concentrations of the Province's hydro resources along the lower Nelson River, even higher than the present high (70%) concentration.

- MH's failure to evaluate these impacts seems to be an oversight in that the same type of catastrophic events that could take out Bipoles I & II could also take out Bipole III as well, trapping immense portions of Manitoba Hydro's resources without an outlet and cutting off revenues from export sales for extended periods of time. Without sufficient import capacity from the United States, Manitoba could be plunged into darkness under that scenario.

—LCA No New Generation Plan Supports Additional Interconnection

LCA's Plan 17 Promotes Exports and Imports

Addition of another 500 kV US interconnection alone without additional hydro capacity will increase Manitoba Hydro's exports as well as its ability to import power, according to LCA's analysis.

LCA's No New Generation Plan Annual Resource Generation Mix

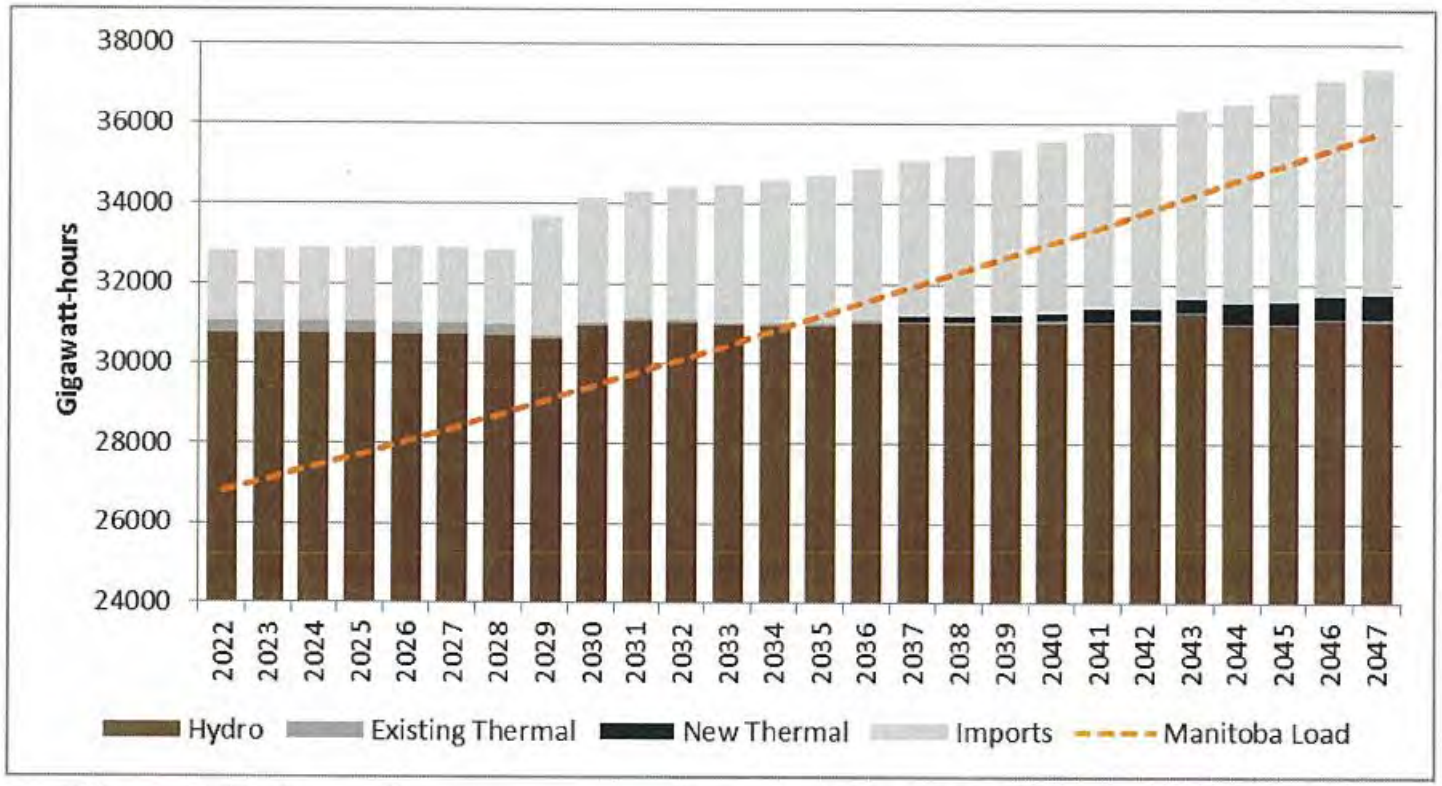


Figure 3-26: Annual resource generation mix in LCA No New Generation Plan

LCA's No New Generation Plan Annual Resource Generation Mix

- This figure indicates that adding a 750 MW line between MH and MISO along with MH's purchasing firm power from generators in the U.S. (but not constructing additional generation in Manitoba) would enable MH to export substantially more power in the annual amounts shown above the dotted line. See the sentence at bottom of first paragraph: "There is also an increase in exports, which is the difference between the load line and the top of the resource mix bar."
- The final paragraph on the page states in part: "More [transmission] import capacity could allow higher imports in off-peak periods allowing exports of hydro during peak price periods. The value of these exports and of the additional capacity in this scenario is likely to be significant, but at this point is unknown, as that analysis has not been conducted by MH."
- This indicates that much of the increase in exportable energy in Plan 17 is the result of energy imported in off-peak hours and stored as elevated water in Manitoba reservoirs until needed as a source of firm capacity and energy for on-peak exports.

MH Objects to LCA's "Import" Line

MH contends that Minnesota regulators would not approve a new transmission line designed for exports to Manitoba and, further, that there is insufficient firm generating capacity in MISO that could be imported cost-effectively by Manitoba. (See MH Rebuttal of Mr. Eric Swanson of Winthrop & Weinstine, P.A.).

I disagree because:

I Disagree Because:

- MISO, PJM and SPP are summer peaking regions that should have substantial surplus capacity and energy available in the winter when Manitoba experiences its peak demand.
- Entities owning generation in the U.S. would have an incentive to increase their sales of firm and non-firm power during the off-peak winter season and engage in diversity exchanges.
- Transmission providers are required to provide transmission service under OATTs at cost-based rates and to build needed upgrades.

I Disagree Because:

- FERC has established incentives to build and own transmission facilities that make such activities quite lucrative.
- FERC Order No. 1000 requires transmission projects for "public purposes" such as renewable energy be considered in developing transmission plans.
- Minnesota utilities have petitioned the Minnesota PUB to consider a competing alternative to the Great Northern Transmission Project. See Megawatt Daily for April 17, 2014.
- Firm power sold during an off-peak season commands only about half the demand charge associated with on-peak firm power during on-peak seasons.

If Plan 17 Had Been Evaluated Earlier:

- [redacted]
- If Bipole III did not already exist, its cost would have had to be added to the cost of any plan for developing Keeyask and Conawapa.
- [redacted]

Response to MH Rebuttal

- The MH Rebuttal to WRA addresses the reliability justification for Bipole III as described in MH/MMF/WRA-004a and b.
- MH proceeded with development of Bipole III to address the risk of an extended loss of both Bipoles I and II, an event expected to occur no more than 1 day in 17 years, a 1-day-in-17-year event. We accepted the proposition that the spare transmission capacity created by Bipole III without Keeyask and Conawapa would lessen risks and costs associated with loss of both Bipoles I and II, [redacted] We also questioned how Bipole III could fulfill its role as backup to Bipoles I and II once it is loaded with Keeyask and Conawapa power. We favored an additional tie line to the US.

Response to MH Rebuttal, cont.

- MH recognized that an additional link to the U.S. was a valid alternative to Bipole III, but, in analyzing alternatives to Bipole III, MH created a different and deterministic reliability standard for judging the adequacy of that alternative in providing reliability. That alternative involved a new 1500 MW AC U.S. interconnection which MH insisted must be backed up with 1500 MW of new gas generation. The additional cost of the new generation made an additional link to the US more expensive than Bipole III (without new generation), and that alternative was rejected.
- At page 5 of its new rebuttal, MH states that the alternative to Bipole III considered in the CEC proceeding was a new US interconnection that MH characterizes as a hypothetical "import only" transmission scenario. I am unfamiliar with the notion of an interconnection that would function as an "import only" line. Any new US transmission tie to the US would be no different in this respect from the proposed 750 MW tie to Minnesota and could be expected to provide opportunities for both imports and increased exports. This was supported by LaCapra's presentation on its No New Generation Plan.

Response to MH Rebuttal, cont.

- MH further insisted that it added on the cost of 1500 MW of new gas turbines because an "import only" line must be connected to some form of firm generating capacity. We believe that a new tie to the US would NOT need to be backed up by additional firm gas generation, especially generation needed only once in every 17 years. MH could rely upon its contingency reserves while it shops for longer-term supplies during an extended outage of both Bipoles I & II.
- MH's CEC analysis showed that it would need backup for loss of both Bipoles I & II primarily during the winter peak. With a new tie to the US, MH could expect to call upon winter surpluses of generating capacity in the primarily summer-peaking systems in the US and obtain that power at relatively low cost.

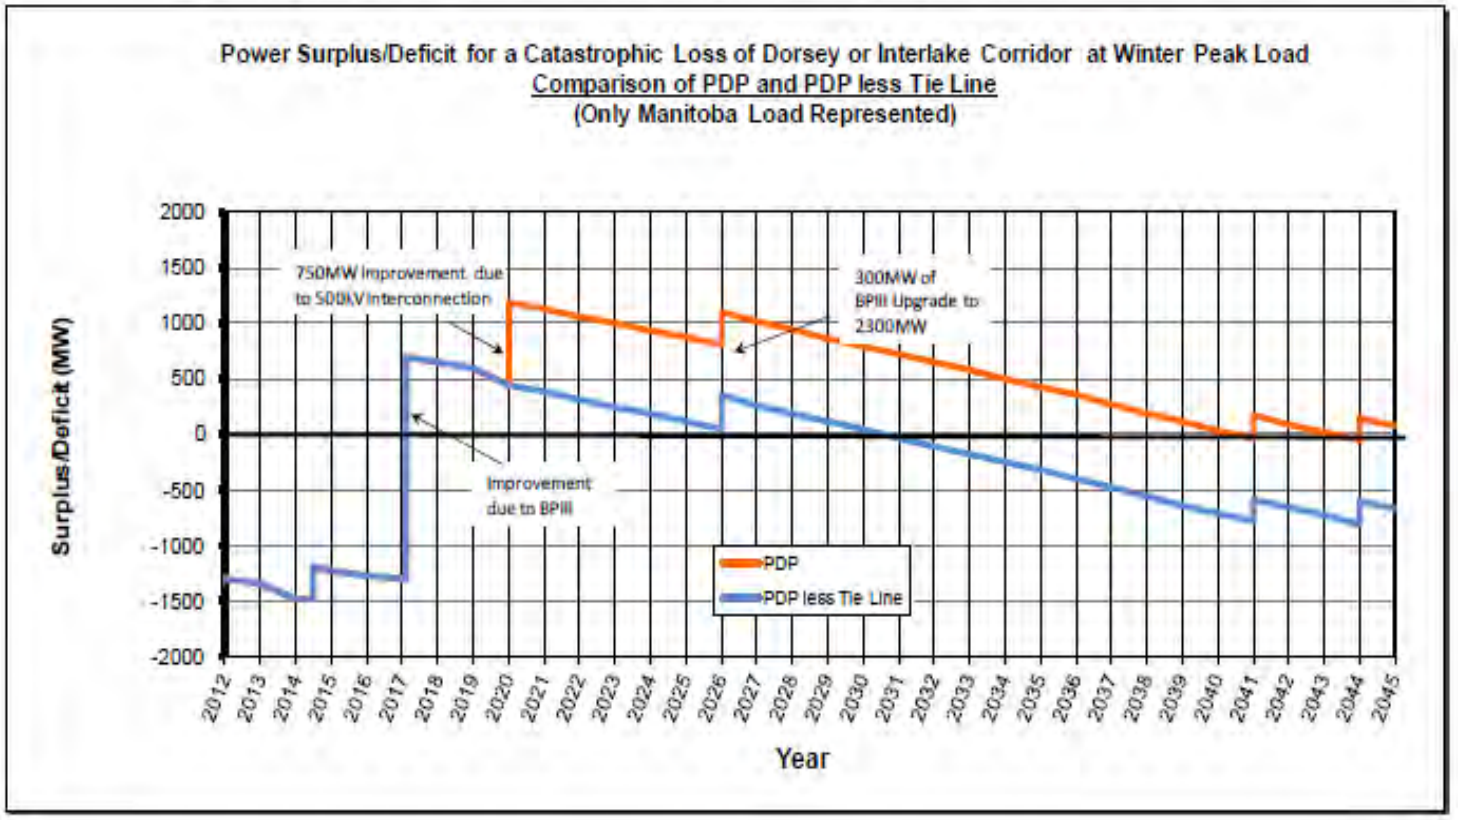
Response to MH Rebuttal, cont.

- MH seems to agree at page 6:2-6 of its latest rebuttal testimony. In speaking of its new US tie, MH states:

  > The proposed transmission line will have the added benefit of providing firm import transmission to Manitoba. As a result, Manitoba Hydro will be able to gain access to surplus energy from the MISO market at essentially no incremental capital or operating costs. There will only be variable costs associated with the cost of energy needed to supply Manitoba load in the times of unexpected outage.

- Moreover, by insisting that a new US tie be accompanied by an additional 1500 MW of gas generation, MH creates an apples-to-oranges comparison because all that Bipole III provides (if Keeyask and Conawapa are not built) is an alternative path for MH to reach its existing Northern Hydro. It does not create an additional 1500 MW of generation. Under MH's logic, Bipole III should also be backed up by 1500 MW of generation. In reality, a 1500 MW tie to the US has access to an array of generation sources while Bipole III can access only existing Northern generation.

Response to MH Rebuttal, cont.



- At pages 1-3, MH challenges our position that it has implemented a less restrictive standard than it did in the CEC proceeding. MH seems to have missed my point because its rebuttal focuses on the adequacy of spare transmission capacity and not upon the adequacy of imported generating capacity to meet the strict new deterministic standard it espoused before the CEC. My calculations indicate that, with Bipole III, MH has not arranged for sufficient firm imports to meet the strict standard it set out in the CEC for covering a loss of both Bipoles I & II.
- The PUB should care about this sequence of events because MH created a stiff reliability standard to support the need for Bipole III and then seemed to back away from it in the NFAT. That stiffer standard occasioned little or no mention until MH filed its most recent rebuttal. As a consequence, Bipole III has been treated as a sunk cost in the NFAT and then repurposed. The result is a distorted economic analysis of alternatives in the NFAT. Moreover, by backing away from the CEC standard in the NFAT proceeding, MH has reduced the needed amount of firm purchases but has not updated the evaluation of a US tie on that same basis.

Response to MH Rebuttal, cont.

- In the NFAT, the hydro-based plans call for filling the spare capacity of Bipole III with the output of Keeyask and/or Conawapa. This would diminish the ability of Bipole III to provide spare capacity to cover the loss of both Bipoles I & II. In those hydro-based plans, MH would rely upon a new tie to the US to replenish the spare Bipole III capacity with capacity on a new US Tie. Thus, MH is planning to obtain backup from the US to replenish the diminishing ability of Bipole III to cover the loss of both Bipoles I & II. One wonders why it did not build a new lower-cost interconnection to the US in the first place [redacted]

MH Rebuttal Figure 1 at 4:

FIGURE 1: POWER SURPLUS/DEFICIT FOLLOWING LOSS OF BP I/II AT WINTER PEAK.

What Does This Show?

- This chart shows that an interconnection to the U.S. provides reliability benefits that are like those provided by Bipole III.

- The amount provided by the 750 MW 500 kV MMTP could have been increased, and built to a higher level [redacted]

MH Rebuttal–TPL–002 Note b

- At 6–7 of its new rebuttal, MH claims that footnote b of NERC Standard TPL–002 allows it to drop firm exports after an N–1 contingency. However, footnote b addresses an exception to the general rule of TPL–002 that Firm Transfers cannot be curtailed for single contingency (N–1) events. Instead, MH employs a number of special protection systems (SPS) to deal with its unique transmission system that cannot meet usual operating reliability levels.
- Note b states "Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non–recallable reserved) electric power transfers."

MH Rebuttal–TPL–002 Note b

- MH's SPS, in dropping firm transfers to the US goes well beyond the "radial customers or some local network customers" requirement. The US is not simply a remote load served by a radial transmission line and it is not "local network" on the MH system. Note b is applicable to minor firm load interruptions that are costly to avoid.
- Note b does not preclude the normal practice of system adjustments to prepare for the next contingency. Such adjustments can include dropping firm customers or reducing firm transfer in a controlled manner. However, automatically dropping firm customers or transfers with an SPS does not qualify as an adjustment.

In Conclusion

Manitoba Hydro's Preferred Development Plan has not been supported by Manitoba Hydro's NFAT submission and, if approved and built, will impose unnecessary and excessive risks on ratepayers. Manitoba Hydro's pursuit of DSM, imported power (supported by enhanced import capacity on its interconnections with the United States) and future gas generation would be far lower in cost in the years through 2031, and lower in risk, than would pursuit of its PDP. The PDP would exacerbate the concentration of its generating resources along the Nelson River hundreds of kilometers north of its Manitoba Winnipeg load center and put more eggs in that basket.

--- Upon commencing at 9:04 a.m.

THE CHAIRPERSON: Good morning. I believe that everybody's in position to commence today's proceedings. Now, before we start, I'll turn the microphone over to Mr. Peters, please.

MR. BOB PETERS: Thank you. Good morning, Mr. Chairman, panel members, ladies and gentlemen. On March the 3rd, 2014, many of us had today circled on our calendars. And I want Ms. Saunders and Mr. Marques to think it was because of them, but today is also the last scheduled day of evidence before the panel, if I need to remind anybody. But on this day we're pleased to have the Manitoba Metis Federation's witnesses from Whitfield Russell Associates. And I'll leave that My Friend, Mr. Marques and Ms. Saunders, to introduce in a few minutes.

But before they do, there's a couple of matters of housekeeping that I would like to attend to. Yesterday, the Clean Environment Commission's -- that's the Manitoba Clean Environment Commission's report on Keeyask was made as an exhibit, number PUB-69. And the parties should also be aware that on April the 23rd, after the Easter weekend, the federal Canadian Environmental Assessment Agency also released its

comprehensive study report on Keeyask. And that document is essentially the federal -- the federal counterpart to the CEC report on Keeyask.

So anticipating that the parties will want to make reference to that document in their submissions, I propose that we have that document filed on the record, as well. And it could be made PUB Exhibit 7-0, 70, if the -- if the secretary concurs.

MR. KURT SIMONSEN: I concur. Thank you.

--- EXHIBIT NO. PUB-70: Canadian Environmental Assessment Agency's comprehensive study report on Keeyask

MR. BOB PETERS: And there's one (1) other matter of business. And I'll perhaps look to My Friend opposite, Ms. Ramage. We received by email a few days ago the rebuttal evidence -- written rebuttal evidence from Manitoba Hydro in respect of Whitfield Russell Associates's evidence. And that should be marked as an exhibit. And subject to concurrence, it could be marked as Exhibit 85-2 because 85-1 -- I'm sorry, it's -- I'll suggest it be marked as Exhibit 85-

1.

MR. KURT SIMONSEN: Sure.

--- EXHIBIT NO. MH-85-1: Evidence of Whitfield Russell Associates

MR. BOB PETERS: And that'll just be a reminder to parties that Exhibit MH-85 was the rebuttal evidence filed by Manitoba Hydro earlier.

So with those matters, Mr. Chairman, I'm not aware of any other matters. I would suggest that it could be turned over to Ms. Saunders and Mr. Marques to introduce their witnesses, and we can proceed. Thank you.

THE CHAIRPERSON: Thank you, Mr. Peters.

Mr. Marques, Ms. Saunders, good morning.

MR. TONY MARQUES: Oh, I'm sorry. I'm not used to having to turn on a microphone. Good morning. Yes, we would like to proceed this morning. We have a PowerPoint presentation which has been given to the secretary. We made copies available to the parties. I believe that will be Exhibit 31.

MR. KURT SIMONSEN: That's correct, MMF-31.

--- EXHIBIT NO. MMF-31: PowerPoint presentation

MR. TONY MARQUES: Thank you. And we've already taken care of the Hydro rebuttal.

MOTION:

MS. PATTI RAMAGE: Mr. Chairman, I'm -- I'm dealing in unchartered waters at this point, so you're -- I'm going to beg your indulgence. In my time at the Board, I've -- I've never -- I have never done this before or made a motion with respect to a party's PowerPoint presentation.

And I'm not sure, and I look to Mr. Peters for -- to tell me where this comes in. Manitoba Hydro has concerns with this presentation. We're of the view that sections of it are in breach of the Board's Order 22/'14 and are dealing directly with the Bipole III issue.

And at some point in the proceeding, and I'm not sure whether it occurs at this point when the exhibit is filed, whether it occurs after the qualifications of the witness, or -- or where is the best point, we would like to speak to those portions which we believe should be struck, consistent with the Board's Order in 22'/14, to ensure consistency with

that direction of the Board.

THE CHAIRPERSON: Thank you, Ms. Ramage.

Mr. Peters, can you provide me with some guidance here?

MR. BOB PETERS: I will attempt to assist, Mr. Chairman. Just by way of background, the terms of reference from the provincial government to this Board indicated that there were certain matters that were not in scope. One (1) of those matters that was not in scope was the Bipole III project, as it was -- as it was called in the terms of reference.

Now, that in itself doesn't suggest that Bipole III hasn't been the subject of some discussion at the hearing. But, in short, the decision on whether or not Bipole III proceeds is not a matter that is within the jurisdiction of this Board.

That decision is made elsewhere. So to that extent, I think the -- the panel issued an order, as Ms. Ramage identified, as Order 20/'14 (sic). And since then, I believe MMF has been responsive and have, for lack of a better word, revised -- I won't say redacted, in the sense that there's any CSI, but they have deleted aspects from their testimony. And that's found as MMF Exhibit 14.

The suggestion that the PowerPoint that was circulated impinges on that order, I guess, is a -- a matter that Ms. Ramage will have to bring to the attention of the Board and then to hear from counsel for MMF as to whether any of those pages should be deleted or removed.

We can proceed on the record, or we can proceed by taking a short recess and seeing if Ms. Ramage and Ms. Saunders and Mr. Marques can -- can review those aspects to come to some understanding.

MS. PATTI RAMAGE: And, Mr. Chair, if I could jump in and just apologize to Mr. Peters. I was able to speak to Ms. Saunders, but because we got this late last night, we've been reviewing it upstairs, and I didn't get an opportunity to alert Mr. Peters to that.

So I congratulate him on his excellent recollection of the record, except for it was Order 22/'14, not 20.

THE CHAIRPERSON: My sense, Mr. Peters and Ms. Ramage, probably -- I would prefer if there was an attempt made to see if we can seek common ground before we consider the evidence presented. So I -- I think we should stand down and see if there's some way in which we can arrive at a consensus, how to address

the issues that are of -- of concern to Manitoba Hydro. And -- and then we're prepared to come back in. And -- and, you know, if -- if we can't arrive at a consensus, we'll make a ruling and proceed from there.

MR. BOB PETERS: Thank you. Perhaps I'll meet with Ms. Ramage and counsel in the Board's library and we'll just have quick run through this order and -- or the PowerPoints and see the concerns of Manitoba Hydro and if they can be addressed.

THE CHAIRPERSON: Thank you.

MR. BOB PETERS: Thank you.

--- Upon recessing at 9:11 a.m.

--- Upon resuming at 10:02 a.m.

THE CHAIRPERSON: I believe that we're ready to resume the proceedings. Mr. Peters, please.

MR. BOB PETERS: Thank you, Mr. Chairman. And thank the panel for the opportunity to caucus with Manitoba Hydro and the MMF parties. And as a result of caucusing, there was discussion in respect of the slide deck that Whitfield Russell Associates wants to present today.

And there were ten (10) or twelve (12) slides on which there were concerns that were raised.

The concerns were -- were focussed, and I believe the parties will want to bring those to the attention to the Board for a Board ruling on it. And that being the case, I would suggest that Ms. Ramage could come forward with the slides and the portions of the slides that Manitoba Hydro finds in violation of Board Order 22/'14 and then allow MMF the opportunity to respond to those concerns.

THE CHAIRPERSON: Thank you, Mr. Peters. Ms. Ramage, please.

SUBMISSIONS BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Okay. Thank you. And with the Board's indulgence, I may have Ms. Moroz or Mr. Bedford jump in at some points. I am not the transmission legal expert that Ms. Moroz is, nor was I at the CEC hearing for the Bipole III, which Mr. Bedford was. So -- so I will do my best based on my reading of this in the last twelve (12) hours or so.

I should probably begin, before walking through, just go back to the -- the two (2) points in Order 22/'14, or two (2) statements in it that I used as my guide when I walked through these. And -- and just to put those on the record, the Board, at page 9 of Order 22/'14, said:

"The Board is not in a position to reach a determination as to which plan should or should not include Bipole III -- include the Bipole III project without delving into an analysis of the needs for Bipole III on a plan-specific basis."

It goes on in that page to say:

"The Board accordingly accepts that those portions of the WRA report that deal with the need, alternatives, or delay potential of Bipole III are outside the scope of the NFAT. The Board further accepts that it would be unfair to allow one (1) Intervenor to adduce evidence on such issues without other parties having an opportunity to the same and will order such portions to be struck from the record."

And those are the two (2) guiding principles that I went through -- or I -- I used when going through the slide deck. And so if we turn on the slide deck to page 33, and if we look at the last bullet on page 33, we see the bullet that says:

"LCA's No New Generation Plan has little or no need for Bipole III, making all sunk costs wasteful."

Manitoba Hydro's view is that it is appropriate to talk about sunk costs. It is appropriate to talk about a plan -- any plan assuming Bipole III, because it's a given in all plans. But the need for Bipole III is -- is not before this panel, and evidence to that effect is not appropriate today. So that's page 33.

The next is at page 35. And -- and the statement here is -- this discusses, by strengthening interconnections to the US -- United States before building Bipole III, what Manitoba Hydro can do. It goes on to say:

"Without distorting the analytical process of the NFAT or taking on the risks and costs associated with building Bipole III."

So it's clearly directed at whether Bipole III is in or out, the -- the words 'without distorting'. Anyways, and then later on that it says:

"Moreover, by strengthening int -- interconnections to the United States before building Bipole III, the PUB

would restore logic to the process."

And again, the shovel's in the ground for Bipole III. The terms of reference ind -- indicate Bipole III is not part of this proceeding. And this panel has specifically said it's not looking at the delay potential of Bipole III.

Page 42. We're looking really at the second bullet. And, for example, in that bullet, the -- the witness says -- it's about the fifth line from the bottom. Just want -- seeing where the sentence begins. But I'll begin by way of a question, whether Bipole III was the most cost-effective way to address the risk. Right there we see that's a -- that's questionable.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: That's 43.

MS. PATTI RAMAGE: I'm sorry. I skipped a page, 42 is -- is dealing with -- that overhead is aimed at justifying, or deferring Bipole III. The -- in the first bullet it talks about a proposal, whether it would have enabled Manitoba Hydro to cancel Bipole III. You'll see that is the second-last line in that bullet. And again, the last bullet

on that page, for example, says:

"This situation raises the question of how many dollars could be saved by deferring or delaying the project."

And again, now over to 43, and I just went through that, it -- it has the -- the purpose of it is to question how Bipole III could fulfill its role as backups to Bipole I and II. And I'm trying to go through these fairly quickly.

Page 44, the first bullet, and it talks about the additional cost of new generation being more expensive than Bipole III without new generation.

Page 45 is -- it's both bullets on page 45 again deal with justifying Bipole III and the timing of Bipole III. And just for the Board, it's -- we're now going through 45, 46, 47, and 48.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Wojczynski is reminding me on 46 we could leave the first bullet in.

47, the intent appears to be, again, to justify Bipole III:

"My calculations indicate with Bipole III, Manitoba Hydro had not arranged

for sufficient firm imports to meet the strict standard it set out in the CEC for covering the loss of Bipoles I and II."

And these come from the inference that Bipole III is not needed.

Page 48, we look at the bottom of that page:

"One wonders why it did not build a new lower-cost interconnection to the US in the first place instead of building the more expensive and risky Bipole III."

Clearly, the intent of this slide is to question Bipole III.

And finally, at page 50, the second bullet. And there we have -- if you look at the last two (2) lines, it -- well:

"The amount provided by the 750 megawatt 500 kV Manitoba-Minnesota transmission project could have been increased and built to a higher level instead of or prior to the proposed installation of Bipole III."

And it's putting into issue the timing

and justification of Bipole III, which Manitoba Hydro is of the view is not the purpose of this hearing. And I certainly didn't come prepared with witnesses, or otherwise, to address the timing of Bipole III. And quite frankly, I'm at a bit of a disadvantage other than having My two (2) Friends on either side of me who can tell me what happened at other hearings. But that isn't what our evidence was intended to address.

And before turning over the mic to Ms. Saunders to address this, there is the question of our rebuttal evidence. And -- and just in terms of context, that rebuttal evidence was intended to address one (1) point and one (1) point only, and that was an assertion that the reliability standard used by Manitoba Hydro had changed since the Bipole III hearing to this hearing, and that we were using a different reliability criteria than in that previous hearing.

And if you look at that rebuttal evidence, that was the intent, what it was intended to address. If that evidence of -- of the MMF stands, we think that's appropriate. If the MMF wishes to withdraw that assertion that reliability criteria has changed, we -- we can resolve this by withdrawing that evidence.

But we think that was fair -- we -- we

can discuss reliability, and so Manitoba Hydro thought it important to bring to the Board's attention that that criteria has not changed. The MMF will differ on that point. And we can have that debate. But the debate doesn't allow us to extend to then discuss whether Bipole III should or should not be built.

So I think maybe Ms. Saunders can now walk through each of those points.

THE CHAIRPERSON: Thank you, Ms. Ramage.

Mr. Marques, please?

MR. TONY MARQUES: Thank you.

THE CHAIRPERSON: I'm sorry.

SUBMISSIONS BY MR. TONY MARQUES:

MR. TONY MARQUES: Thank you, Mr. Chairman. Like Ms. Ramage, I'm at a bit of a disadvantage. And the Board would know this. I have not been here prior to yesterday, so I don't have some of the background. With your indulgence, Ms. Saunders will step in. And perhaps -- usually it's the other complaint -- and perhaps if the Board feels necessary, any subjects from Mr. Russell or Ms. Looker.

But I -- I just wanted to put the whole thing into context first. What -- what Manitoba Hydro

is now asking you to do is to go through the PowerPoint presentation without hearing any context and, on a piecemeal basis, to take out certain portions of it. And their justification for doing that is they say that it's beyond the jurisdiction of this -- of this Board to make a determination as to the need for Bipole III.

We agree with that. You don't have the jurisdiction to come out with a finding that Bipole III is not needed. And we will not be arguing that at the end of the day. However, in the presentation and this part of the narrative that Mr. Russell hopefully will be able to -- to present, it's very difficult to separate individual items from the big picture.

And sometimes it is of assistance to imagine a scenario, or even a hypothetical scenario, that this does or does include Bipole III. That's for the purposes of analysis, because the -- at the -- at the end of the day, the Board's going to have to compare a number of different scenarios. And -- and what role Bipole III plays in them, I guess, will be for the Board to determine, whether it's a reliability role or whether it's a role of actually delivering power that doesn't really deal with the reliability issue.

All that aside, it's -- it's

acknowledged that Bipole III, and in terms of the need for Bipole III, that issue's been determined. We're not to look at it. There is a distinction, in -- in our submission, between us asking the Board to make an order that it can't make and talking about something to put it into proper context. And I think what Hydro's suggesting, in my submission, is that we can't even talk about it.

And in my submission, we should be able to talk about it to the extent that it's relevant to put everything into context. There's not a great harm at this point. The -- the slides have already been produced and -- and photocopied. There's not a great harm at this point in allowing Mr. Russell to go through his presentation and allowing Hydro to cross-examine on that presentation as much as it wishes and we have time for, in terms of any errors that -- that are contained in that presentation, and -- and allowing Hydro at the end of the day to say, The Board should disregard slides 33 and the second line in 44 and 45 and all of those other things because they're not relevant.

But to ask you to predetermine that now without the context of his testimony, I would submit, is probably not the best course to pursue because you

may find that, in fact, it is necessary to explain the narrative. And you may find that having him spend a few extra moments at this stage of the proceedings is really not that injurious to the role that you have to fulfill, which is to consider all of the facts.

That's my general submission. Ms. Saunders, I think, has some specific comments to make, as well. But my general submission is that we have to keep the big picture in mind.

SUBMISSIONS BY MS. JESSICA SAUNDERS:

MS. JESSICA SAUNDERS: I would thank you for hearing our comments at this late hour. And I know it -- it perhaps wasn't ideal. I think that my preference would have been to have received rebuttal evidence, because most of our substantive arguments in our report were available very soon after Order 22 and a Schedule A attached to that order that the Board did fill out.

And the subject of our further application to review and vary on Order 35 dealt with removing offending portions at that time such that the substantive arguments were available to Manitoba Hydro to make submissions on any point after Order 22.

So I think what we -- what we would have

done -- and I think I've enjoyed the PUB's process of allowing us to consider the points, the terms of reference, what we're hearing, what we discuss in these hearings to consider them thoughtfully and come back with a submission. I've utilized your rules, your applications to review and vary to do that

And my preference would have been, of course, to have received the rebuttal evidence and consider it and come back with a submission that perhaps would have thought more about those aspects of the report that we would have suggest be returned back to the -- to the record based on the rebuttal evidence.

We're faced with having the rebuttal evidence as of Thursday, and -- and for circumstances I explained in -- in an email to counsel for the PUB, I didn't get it until Friday. We were advised that appropriate protocol would be to address the new matters brought up in rebuttal evidence in slides in our presentation.

And so today we have some of those. And I can only, as you went through those slides, add to Mr. Marques's comments that what we did do is consider those matters that I did point out in the submission to review and vary Order 22. That would be Order 35, the submission that resulted in Order 35. We highlighted

that from Order 22 the general risk of reliance on the HVDC corridor, the sunk cost issues as Manitoba Hydro has recognized, as well as general issues of reliability were within scope.

And so what we did do was we received the rebuttal. We considered it in the time that we had, and we considered the fact that we were able to speak to those matters in our PowerPoint presentation. And we've done so on the understanding that in considering the reliability standards and -- and the -- the various other in scope matters some context would be required.

And now I do know that we go an added step of providing some conclusions on those contexts, but I leave that to your consideration in light of what Mr. Marques has said today here. And I thank you for considering this at this late hour, and I do believe that it's just a matter of process.

I would have liked to have dealt with it, I think, much earlier than -- than this morning. But unfortunately, having received it on the -- the 9th of May, this was the position that I think we were put in. So my apologies that this has happened, but I thank you for allowing us to deliberate this morning.

THE CHAIRPERSON: Thank you for that.

And now, Ms. Ramage, please.

REPLY BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Yes, if I could comment on a -- a few of the comments being made by the MMF. I think we have agreement with everyone in the room that the Board was not given jurisdiction over this matter. And when a panel is not given jurisdiction, it doesn't hear evidence on the matter. It -- it's not a question of we get -- we listen to evidence and you can come to this panel and talk about whatever you like, be it Manit -- Bipole III, be it MPI rates.

Because the Board has a general topic, rates, we don't get to come to hearings and just talk about to the Board what we'd like to. We have a -- a scoping document, and we comply with the scoping document. I don't accept, quite frankly, that it's difficult to accept -- to separate individual items. This is the only -- only Intervenor who has raised Bipole III issues in this hearing.

All Intervenors were able to accept it, and it was quite easy to accept because Bipole III is consistently dealt with across every single plan. There is no need to take it out of any plan because it

-- it's been treated the same. It's a given. The shovels are in the ground. We're not talking about what happens when -- if it was delayed, deferred, it didn't occur, it was done differently. That was dealt with in a different process, and the MMF participated in that process.

I'm advised by Mr. Bedford in that process, they considered different alternatives. That's not something I can speak to and it's not something Manitoba Hydro has the appropriate people here to speak to, nor should they. It's not something that the Board has been prepared for in this hearing. It's not something we've been dealing with up till now. It's not something the other Intervenors have been dealing with up till now.

And to, on the very last day of this hearing, to come up with this type of evidence after the Board has already issued an order on this topic, -- and the Board was very clear in its order. And it asked that -- it -- it directed that this evidence be struck. And as I said earlier, it -- it's -- the evidence that was struck was those that -- which deals with the need, alternatives, or delay potential of Bipole III, the Board couldn't have been clearer.

And to suggest now that it's -- it's

difficult to -- to deal with this without Bipole III is, quite frankly, preposterous. You -- it's what we've been dealing with for the last how many ever months. No one has raised this until the last day of this hearing. To suggest that the Board needs to understand what role Bipole III plays, it's -- it plays the same role in every single plan. And -- and that's what the terms of reference have directed us to do, and -- and that's what we have done up till this date.

Mr. Marques talked about cross-examining. I can tell you, I can't cross-examine on Bipole III. It's not something I can -- came prepared to do. It's -- it's -- we didn't prepare for this issue. And we certainly didn't prepare after the Board's order directing that it would not be part of this hearing.

In terms of comments regarding the late date of the rebuttal, I would simply remind parties in the room of the timing of this. The WRA evidence, I believe, was filed originally February 18th -- no, February 12th. Manitoba Hydro responded with a motion on February 18th. The Board issued its order on March 4th.

In the Board's order, the Board invited MMF to refile its evidence. MMF filed that -- refiled

that evidence on April 29th. Manitoba Hydro did not know what was coming back, so Manitoba Hydro was not going to file rebuttal evidence on materials that it did not know what was going to be in them.

We've had plenty of different evidence introduced throughout this process, and the Board has generously advised parties that they can -- they -- they were invited to refile on that evidence. So certainly, Manitoba Hydro wasn't going to file rebuttal to something that hadn't been filed yet.

So I'd ask the Board to remember that that came in on April 29th. It's not new. It was raised in -- in the panels -- or it was -- it -- it was their evidence that we're dealing with now. They were -- it was struck. And now, in the materials we've put -- seen put back in what was taken out -- out of that struck evidence.

And I think it -- it's imperative that the Board deal with that right away, because if parties are allowed to come to hearings and ignore Board orders as to what's in scope and suggest that they can talk about whatever they like when they're here, regardless of a scoping order and regardless of the terms of reference, I think our processes will fall apart completely.

THE CHAIRPERSON: Thank you, Ms. Ramage.

MR. TONY MARQUES: Mr. Chair, I'm sorry, just one (1) --

THE CHAIRPERSON: Mr. Marques...?

MR. TONY MARQUES: -- minor issue that I think needs clarification. At the beginning, Ms. Ramage stated that the rebuttal was directly solely at the IR, an issue which was actually completed and -- and filed on the 28th of February. So I don't see how the redaction in the report or any other of those issues have anything to do with the late hour of Manitoba Hydro's rebuttal.

It was strictly based on a report of February -- or an IR of February 28th.

MS. PATTI RAMAGE: And if we want to talk about the rebuttal, the rebuttal only addresses the issue of criteria. It doesn't address the addit -- the issue of Bipole III. I -- I can advise the Board, we were very careful and it was the question I asked as it was being produced. We do not want to invite Bipole III into this, and we were very careful to word that rebuttal so it addresses the criteria and that there had been no change in the criteria. We did not address Bipole III in the criteria. We didn't invite this to

come back in.

Having said that, as we have suggested as a resolution, if these matters are withdrawn and that IR that has been allowed -- that is remaining is withdrawn, we have no issue with withdrawing the rebuttal also.

THE CHAIRPERSON: Mr. Marques, anything else?

MR. TONY MARQUES: I'm not sure what else to say. I think that even the rebuttal itself -- and I'm not certain to what extent the Board has had an opportunity to review it. I can tell you that the MMF does not agree with Ms. Ramage's statement that it's addressed to -- or confined to the issue of reliability.

Our position is that it's -- that -- that it's a bigger issue than that that's raised in the rebuttal. We'd like Mr. Russell to be able to explain that further. And as I say, at the end of the day, I think we're spending more time talking about it than just hearing it and excluding whatever's not relevant. But we don't accept that we can't -- that we can somehow artificially create a barrier where as soon at the words 'Bipole III' come up we can't talk about it.

THE CHAIRPERSON: Thank you. With that

we'll step down. We are going to caucus and be back as soon as we have a decision, which we will render to the parties as quickly as possible. Thank you.

--- Upon recessing at 10:28 a.m.
--- Upon resuming at 11:27 a.m.

THE CHAIRPERSON: I believe that we're ready to resume the proceedings. So, Mr. Peters, please.

MR. BOB PETERS: Yes, thank you, Mr. Chairman. In terms of proceeding at this time, I know we've perhaps taken time that we thought we might be in other evidence. But if the panel has finished their deliberations, perhaps the panel could indicate how it wants Whitfield Russell to proceed at this point, in terms of the slide deck.

BOARD RULING:

THE CHAIRPERSON: Now, the panel has -- has met to consider the motion made by Manitoba Hydro to delete certain portions of the slide deck prepared by Whitfield Russell and Associates. Dr. Grant recused himself from the deliberations on this matter.

In addressing this matter, the Board

relied on its decision set out in Orders 22/'14 and Orders 35/'14. I want to -- I want to read certain portions of those orders into the record.

(BRIEF PAUSE)

THE CHAIRPERSON: In respect of Order 22/'14, on page 8 of that order, the following paragraph is set out:

> "The extended scope of the Board's inquiry into the Preferred Development Plan is therefore set out and constrained by the NFAT terms of reference, which state that the Bipole III transmission line and converter station project are not in the scope of the NFAT. The Board interprets this carve out to mean that it is not the Board's mandate to inquire into the need for the Bipole III project, nor into the alternatives to the Bipole III project."

Now, from page 9, the following paragraph is set out:

"The Board accordingly accepts that those portions of the Whitfield Russell and Associates report that deal with the need, alternatives, or delay potential of Bipole III outside the scope of the NFAT. The Board further accepts that it would be unfair to allow one (1) Intervenor to adduce evidence on such issues without other parties having an opportunity to do the same."

Now, having considered those -- those orders, the Board has made the following determinations. And what we have done is we have edited the slide deck that was submitted by Whitfield Russell -- Whitfield Russell and Associates.

So starting on page 33, the Board has decided that the last bullet of that slide should be deleted.

Now turning to slide 35, the Board has determined that all the text on that slide should be removed with the exception of the title.

Moving to slide 42. The Board has determined that the first and third bullet of that slide should be removed.

Moving to slide 43. Starting with the second sentence of the second bullet, the sentence starts:

> "We accepted the proposition that the spare transmission capacity created by Bipole III without Keeyask and Conawapa would lessen risks and cost associated with loss of both Bipoles I and II."

The balance of that sentence is deleted.

Moving to slide 44. All of the text from that slide will remain in the record.

Moving now to slide 45. All of that text should remain on the record.

Slide 46. All of the slide should remain on the record.

47. All of the text should remain on the record.

Slide 48. In that case, the words at the end of the sentence, the last sentence of that slide:

> "One wonders why it did not build a new lower-cost interconnection to US in the first place."

So the rest of that is deleted.

And finally, turning to page -- to slide 50, rather. The -- turning now to the second bullet, the text should read as follows:

> "The amount provided by the 750 megawatt/500 kV MMTP could have been increased and built to a higher level."

The rest of that sentence is deleted.

With that, I think that is the -- completes my portion, Mr. Peters.

MR. BOB PETERS: Thank you. We might want to give MMF just a few minutes to wrap their head around all of that. And I believe they now have black and white paper copies.

I should suggest, Mr. Chairman, that in light of the ruling of the Board, that MMF -- what had been marked as Exhibit 31 would now be removed and we would provide a new exhibit number for the -- the new slide deck that the Board has -- has approved.

And I'll leave it to Mr. Secretary to provide us with the appropriate exhibit number.

MR. KURT SIMONSEN: We could call it 31 revised or give it a whole new number.

MR. BOB PETERS: I'd be okay with 35 revi -- 31 revised, unless there's any comments from --

MR. KURT SIMONSEN: Ms. Saunders, are you okay, 31 revised? Thank you.

--- EXHIBIT NO. MMF-31: Revised PowerPoint presentation

MR. BOB PETERS: And my last point, Mr. Chairman, is that the electronic version of this is available to Mr. Russell and Ms. Looker. I believe it's available so that when they go through their presentation, they can control the screen, although I'm -- I'm not sure if -- if they presently have the electronic version of it at this point in time.

MR. KURT SIMONSEN: I don't believe they have it yet. If we're going to have the presentation, we'd probably have to operate the system, if that's acceptable. You'll just have to indicate the next slide, please. Thank you.

THE CHAIRPERSON: So -- thank you, Mr. Peters.

So with that, Mr. Marques, please.

MR. TONY MARQUES: Thank you. In view of the fact that a number of the changes made are later on in the presentation, I propose that we commence. Certainly we have some work to do before we get into

the actual material. And I'm ready to go in the best interests of time if -- if you are, Mr. Chairman. Thank you. Perhaps we should have Mr. Russell sworn. We've already taken care of the exhibits.

MMF PANEL 2 - ECONOMICS:

WHITFIELD RUSSELL, Sworn (Qual.)

QUALIFICATION OF WITNESS:

MR. TONY MARQUES: Mr. Russell, you have been called as an expert witness on behalf of the Manitoba Metis Federation?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And you had produced a report which is filed with this Board as Exhibit 14?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And is that your report?

MR. WHITFIELD RUSSELL: It is.

MR. TONY MARQUES: You had received certain IRs and answered certain IRs and submitted certain IRs?

MR. WHITFIELD RUSSELL: I did.

MR. TONY MARQUES: And were those prepared for -- or prepared by you or at your

direction?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: All right. And all of the -- and you have prepared a PowerPoint, what's left of the PowerPoint this morning.

Was that prepared mostly at your direction?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: Yes. And all of the material that I have referred to, did you have anyone assisting you in the preparation of that?

MR. WHITFIELD RUSSELL: I did. I had Mrs. Looker, who is to my right. And then we had two (2) subcontractors, Mr. Thomas Besich and Mr. Harrison Clark.

MR. TONY MARQUES: All right. And I understand that Mr. Besich's CV is filed as Exhibit 16 before the Board, and that Mr. Clark's CV is filed as Exhibit 17. And Ms. Looker's CV, which we'll get to in a minute, is filed as Exhibit 18.

In the preparation of the material that you -- that we have referred to, first of all, with respect to your involvement, were you using your best professional experience and expertise?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And can you just briefly tell the Board what the involvement of the others was, in terms of the final product?

MR. WHITFIELD RUSSELL: Well, I and others, mostly Mrs. Looker, we drafted sections of the report. Then I would rewrite and react to comments on the drafts. I would initially draft parts myself. As comments came in, I took some and I rejected some, and that was the final report.

MR. TONY MARQUES: All right. And specifically referring now to Ms. Looker, she is seated beside you.

And I understand that you would like her to be able to assist you in your testimony?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And I understand that the assistance would be in the nature of clarification and finding material for you, and perhaps enhancing your evidence in some cases, depending on the circumstances?

MR. WHITFIELD RUSSELL: Indeed, yes.

MR. TONY MARQUES: And we will talk to her in a minute, but from your knowledge, what are her professional qualifications?

MR. WHITFIELD RUSSELL: She has a -- an

undergraduate degree from Hope College. She has a graduate degree in business administration from George Washington University. She became known to us when she worked for the American Public Power Association in Washington, DC, and began working with us, I think, in the late 1980s or early 1990 -- late 1980s. There was one (1) sabbatical for children and -- and other reasons, and she has returned and worked with us for many years.

MR. TONY MARQUES: And in a general way, can you tell the Board what her contribution to the report would have been?

MR. WHITFIELD RUSSELL: Well, she knows a great deal about our business. And so she administers -- when I have multiple cases going on, she -- she moves along the cases for me, does much of the substantive work, and kind of cracks the whip on me.

MR. TONY MARQUES: All right. Very well. And I'd like to talk about your qualifications for a moment. As I said, we have Exhibit 15 filed, which is your CV. And I don't propose to go through it in any great detail, but I did want to highlight some -- some points.

And I understand that you're an electrical engineer?

MR. WHITFIELD RUSSELL: I am.

MR. TONY MARQUES: Just tell us where you obtained your credentials.

MR. WHITFIELD RUSSELL: The University of Maine as a bachelor degree, and then a master's in electrical engineering from the University of Maryland.

MR. TONY MARQUES: What year did you obtain your master's?

MR. WHITFIELD RUSSELL: 1971.

MR. TONY MARQUES: Now, I don't quite understand why, but you also decided that you wanted to be a lawyer.

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And you have a juris doctor?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: Just tell us what the background is.

MR. WHITFIELD RUSSELL: Well, I went to night school at the Georgetown University Law Centre and graduated with that degree in 1976. And I was admitted to the bar in the District of Columbia and Virginia.

MR. TONY MARQUES: And I understand from our personal discussions that you don't actually

practice law except by giving free advice to your friends.

MR. WHITFIELD RUSSELL: That's right.

MR. TONY MARQUES: All right.

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: Just in terms of your professional involvement, I understand that sometime in 1969 you started as an associate engineer with the System Planning Division of the Potomac Electric Power Company?

MR. WHITFIELD RUSSELL: Yes. That's the utility for Washington, DC, and Maryland suburbs.

MR. TONY MARQUES: And just briefly explain what -- what your involvement was.

MR. WHITFIELD RUSSELL: It was transmission planning, generation planning. A good deal of our work was as part of the then-called PGM interconnection, which is a power pool of, I think, thirteen (13) companies organized into six (6) holding companies. And it is really the classic beginning of what is now the PJM ISO, which spreads as far west as Chicago and incorporates parts of Virginia and -- and other states.

MR. TONY MARQUES: Okay. And for people who don't -- like me who don't know what the PJM

--

MR. WHITFIELD RUSSELL: 'PJM' stands for Pennsylvania-New Jersey-Maryland. And the -- those classic PJM companies were -- resided there --

MR. TONY MARQUES: All right.

MR. WHITFIELD RUSSELL: -- served.

MR. TONY MARQUES: And from -- for a couple of years, you were with -- you were with the Federal Power Commission?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And then you moved on to chief engineer for Securities and Exchange, administering the Public Utility Holding Company Act?

MR. WHITFIELD RUSSELL: Yes. The -- the SEC has jurisdiction over about 20 percent -- at that time, about 20 percent of the electric industry. And that was with respect to mergers, acquisitions, and other matters under the 1935 Act, the Public Utility Holding Company Act.

MR. TONY MARQUES: All right. And I understand that you started your company, Whitfield and Associates, in 1976?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: So about thirty-eight (38) years ago.

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And what have you been doing for the last thirty-eight (38) years?

MR. WHITFIELD RUSSELL: Mostly our client base initially was public power companies and their dealings with investor-owned utilities. In 1978, the Public Utility Regulatory Policies Act was passed, and co-generation became a matter of great concern. And I worked for a number of large co-generators and small entities as well with -- who obtained rights under that statute.

And over the years, I've worked both against and for investor-owned utilities, publicly owned utilities, First Nations in -- in about forty (40) states in -- with respect to rate cases, contract disputes, arbitrations, and so forth.

MR. TONY MARQUES: Have you ever testified in proceedings similar to this?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And can you tell us generally approximately how many times you have?

MR. WHITFIELD RUSSELL: I've been accepted as witness somewhere between a hundred and fifty (150) and two hundred (200) times, an expert witness on these matters.

MR. TONY MARQUES: Expert in what?

MR. WHITFIELD RUSSELL: Bulk power planning, bulk power supply contracts, transmission access, and so forth.

MR. TONY MARQUES: In your CV, you indicate that you're -- that you have experience in electric utility system planning, transmission and generation, rate making, and bulk power contracts.

MR. WHITFIELD RUSSELL: I do, yes.

MR. TONY MARQUES: And is that a fair -- well, you prepared it, but is -- is that a fair summary of your area of expertise?

MR. WHITFIELD RUSSELL: It is.

MR. TONY MARQUES: Now, you said that you've been qualified as an expert witness in approximately twenty-seven (27) states?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And I understand that you've also been qualified as an expert witness in Canada in some provinces?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: I'm not going to -- I -- I see that in your CV there are a hundred and eighty-two (182) entries for matters in which you have testified or provided evidence. And I'd just like --

I'm not going to go through it any great detail, but just highlight a couple of the more notable ones.

I guess I should start with your involvement in Manitoba in 1990. Can you --

MR. WHITFIELD RUSSELL: Yes. That was the --

MR. TONY MARQUES: -- outline that for the Board, please?

MR. WHITFIELD RUSSELL: Yes. That involved the proposed sale of the output of Conawapa to the Ontario Hydro at the time. And I was retained by the Board to offer my comments on that and related matters.

MR. TONY MARQUES: Okay. I see that you have provided evidence in Alberta?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And what was the nature of that?

MR. WHITFIELD RUSSELL: I think the dis -- the -- the matter was the definition and pricing of ancillary services under their recently restructured market.

MR. TONY MARQUES: And you provided evidence in Ontario?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: And what was the nature of that?

MR. WHITFIELD RUSSELL: That related to the Sagkeeng Ojibwe First Nations. And a large 500 kV line was being planned to pass through their lands and -- for purposes of -- of transmitting the output of large additions of wind generation and the Bruce Nuclear Plant.

MR. TONY MARQUES: All right. And in the cases that I've just asked you about, were you giving the type of testimony that you have described that's within your area of expertise?

MR. WHITFIELD RUSSELL: I was.

MR. TONY MARQUES: I see that, from looking at your CV, that you have substantial involvement with the Wisconsin utility companies?

MR. WHITFIELD RUSSELL: Yes.

MR. TONY MARQUES: Just, again, very generally, can you tell us what that is?

MR. WHITFIELD RUSSELL: Yes, for a number of years I worked for the Wisconsin Public Power Inc., which is WPPI. It's a consortium of about thirty (30) publicly owned, municipally owned systems and in their dealings with investor-owned utilities, such as Wisconsin Public Service and Wisconsin Electric Power

Company, and so forth. And on other occasions -- this was with regard to rate dispute, transmission access, and so forth.

In other occasions they were a part of a coalition to promote and develop transmission lines, such as the Arrowhead Line, which terminates near where the Great Northern Minnesota line will -- will terminate, near Blackberry.

MR. TONY MARQUES: All right. And would you lastly describe for the Board what you consider to be your level of expertise or knowledge with respect to NERC, FERC, and MISO, in terms of their --

MR. WHITFIELD RUSSELL: That has frequently -- the reliability standards applicable to transmission and generation have frequently been a subject of my testimony over the years. And I should say that Mr. Harrison Clark was one (1) of the original -- after the 1965 blackouts in New York, when NERC was formed, he was -- had a very early role in helping draft the initial reliability standards of NERC.

MR. TONY MARQUES: And Mr. Clark being one (1) of your co-workers?

MR. WHITFIELD RUSSELL: One (1) of our sub -- subcontractors, yes.

MR. TONY MARQUES: Mr. Chairman, I'm going to be asking that Mr. Russell be accepted as an expert in electric utility system planning, both transmission and generation, rate making, and bulk power contracts, recognizing that that is a pretty substantial area. But -- and I don't know if any of the other parties have any questions for him, but that's what we're looking for.

And then I propose after we deal with Mr. Russell to then briefly ask Ms. Looker a few questions, just so that we can put her in context, in terms of anything she might contribute.

THE CHAIRPERSON: Mr. Marques, I've got electricity, utility planning and generation, transmission, rate making. And what was the other one?

MR. TONY MARQUES: Oh, and bulk power contracts.

THE CHAIRPERSON: Bulk power contracts. Okay.

MR. TONY MARQUES: Okay.

(BRIEF PAUSE)

THE CHAIRPERSON: I'll call on Ms. Menzies, please.

MS. MEGHAN MENZIES: Thank you, and good morning. CAC (Manitoba) has no objections to these qualifications as set out.

THE CHAIRPERSON: Thank you. Mr. Gange, please?

MR. WILLIAM GANGE: GAC is prepared to accept the witness as well.

THE CHAIRPERSON: Thank you, Mr. Gange.

Me. Monnin, s'il vous plait.

MR. CHRISTIAN MONNIN: Merci, M. President. The IECs have no objections.

THE CHAIRPERSON: Merci, Me. Monnin.

Ms. Ramage...?

MS. PATTI RAMAGE: Manitoba Hydro has no questions.

THE CHAIRPERSON: Thank you for that, Ms. Ramage.

Mr. Peters...?

MR. BOB PETERS: No questions. Thank you.

THE CHAIRPERSON: Thank you. I -- I -- looking at the clock. I think what we're -- what I propose to do is that we -- we work for about a half an hour and then break a half hour for lunch and then resume the proceedings. Because of the delays we've --

we've encountered today, I'd like to proceed as quickly as possible, because we are time constrained at the panel level beyond six o'clock, I believe. So I really would like to get it done today if possible. Otherwise, we -- we'll have to look at alternatives.

MR. TONY MARQUES: Very well. And perhaps I -- I can save some time by saying that I've already indicated what our intentions are with respect to Ms. Looker's involvement. I will ask Mr. Russell if Ms. Looker contributes any information that is not in accordance with your expertise, will you undertake to advise the panel?

MR. WHITFIELD RUSSELL: I will, yes.

MR. TONY MARQUES: And perhaps we can do it that way. Her CV speaks for itself, and we'll get moving right along. Very well.

MR. KURT SIMONSEN: Mr. Marques, is Ms. Looker to be sworn in?

MR. TONY MARQUES: Yes, I think that would be a good idea. Thank you.

GENEVA LOOKER, Sworn

THE CHAIRPERSON: Now, I want to make sure that we understand. Ms. Looker, you're going to

be serving as a fact witness in this case, right, and -- but the expert is Mr. Russell?

MR. TONY MARQUES: Yes. There are obviously certain business aspects to the presentation which I think will be quite clear. But clearly what we're here for is the technical aspect of the presentation, and the expert is Mr. Russell.

THE CHAIRPERSON: Okay. I just want to make sure that the Intervenors and Manitoba Hydro is prepared to accept what's being proposed here.

MS. PATTI RAMAGE: No, Manitoba Hydro has no objection.

THE CHAIRPERSON: No concerns from the Intervenors? Looking around the room, there doesn't appear to be any concern. So what I neglected to say is the panel's prepared to accept Mr. Russell as an expert witness for the areas outlined by Mr. Marques. And we're also prepared to accept Ms. Looker as a fact witness in support of Mr. Rusfield -- Mr. Russell's testimony. Okay, with that?

MR. TONY MARQUES: Thank you very much, Mr. Chairman.

THE CHAIRPERSON: Thank you.

MR. TONY MARQUES: And with your permission, we will get right into the presentation.

EXAMINATION-IN-CHIEF BY MR. TONY MARQUES:

MR. TONY MARQUES: So, Mr. Russell, I ask you to start your presentation based on the revised PowerPoint that was prepared.

MR. WHITFIELD RUSSELL: Thank you. May we go to slide 2, please. We're going to focus on a quick summary here of what my presentation focusses on, is the lack of transparent data available to us, largely because we were unable to see CSI materials.

The study period underlying the NFAT is too long; seventy-eight (78) years. The export revenue forecasts have been unavailable, and the -- the detail underlying the NFAT. But we resorted to second-best information and did the best we could to put together a substantive presentation for your -- for your use.

Export revenue forecasts are unavailable, and they indicate a lot of risk. Exports will not recover the full costs of Keewa -- Keeyask and Conawapa. Hydro's analysis and conduct indicates a very strong predisposition to develop hydro. That -- I'm going to discuss Bipole III's 3 billion -- $3.3 billion cost, which is deemed sunk and is ignored, frankly, as a neutral factor in the economic comparisons analysis. Other sunk costs with respect to Keeyask and Conawapa are similarly omitted and

prejudice the analysis. And the seventy-eight (78) year study favours hydro.

Next to the last is reliability analysis that Hydro relied on to expand the HVD sys -- HVDC system. I'm going to contrast that with what has changed since then.

And finally, an additional transmission line to the US, I believe along the lines outlined by La Capra, will lower costs and risks and improve reliability for Manitoba.

Slide 3, please. Much of the data that we tried to obtain and would rely on in the absence of our CSI barrier was on financial and economic risks of the PDP, but it's been restricted. And many questions that were asked by the IECs were of interest to us -- the responses, that is -- and similar to those that we would have asked. And many of the answers came back as follows, quote:

> "This Information Request has been withdrawn by the IEC as no longer required, having been satisfied through discussion with Manitoba Hydro."

Close quote. That left us in a situation where we had to rely upon the findings and

analysis of the IECs. And when we tried to do so, much of what we were interested in was redacted. So we have sort of an indication in many instances of the precision, but in other cases we weren't able to get the full benefit of their analysis.

Next slide please. The terms of reference lack Bipole III review. We -- we regard this as a very significant matter. The Bipole III high-voltage DC transmission line and converter station is not covered by the NFAT. This portion of the terms of reference caused the parties to treat future investments as sunk costs, even though much of it has not yet been made; that is, the investment. And some of that investment may be avoidable. This element of the terms of reference, I believe, distorted the analyses to favour hydro-centric alternatives.

Next slide please. Number 5. We addressed the seventy-eight (78) year study period as too long. I think, from my review of the transcript, you've probably heard quite a bit of comment on that. Let me just quickly pass through the things that struck us.

It's no -- it's longer -- the seventy-eight (78) year period is longer than typical, even for Manitoba Hydro, which uses a twenty (20) year

projection for its financial forecast and a thirty-five (35) year period for its Power Resources Plan.

Second, the use of the seventy-eight (78) year period favours the hydro-centric plans that have been proposed. They have near zero energy costs, but they add generating capacity in very large blocks that cost a great deal, require export sales until their capacity and energy is recaptured for use by Manitoba Hydro. And even after it has been recaptured, export sales are a -- remain a large factor in their power supply economics. They take a long time to build and are projected to generate savings only after much of their initial cost has been depreciated.

Third, the seventy-eight (78) year study periods makes the plans susceptible to very difficult to predict -- slide 6, sorry -- to predict structural changes such as those that could alter relative costs of assets and lower domestic demands, and also changes in export prices.

Fourth, the seventy-eight (78) year study period kind of masks the need for near-term rate increases to support the hydro projects before they begin to generate savings.

And one (1) -- one (1) final thing is over a seventy-eight (78) year period, we can expect to

see changes in laws and changes in judicial findings which will affect how revenues and costs are treated. We've been through that in New York State, where our clients have had an interest in the Niagra project, a -- a 2,000 megawatt project -- hydro project. It was built in the late 1950s. It was a very low cost. Its costs have crept up over the years.

In -- when the New York ISO was restructured and formed, the ancillary services from that project became very valuable, so much so that it represented a substantial portion of the revenues obtained from the project. Because of our series of decisions and administra -- administered by the New York Power Authority, our clients were denied the revenue credits associated with that, and those revenue credits were instead diverted to the state treasury.

Now, those kinds of things can happen. So even though we're looking at something that looks like a benefit to the ratepayer, had this project been analyzed from the ratepayer benefit in New York beginning in 1950, looking forward seventy-eight (78) years, I'm sure no one would have admi -- envisioned that it -- throwing off substantial revenues which would have cut its costs would have -- would have redounded to the benefit of the state and not to the

customers intended to receive that power. So our clients are paying more than they otherwise would.

Slide 7 please.

THE CHAIRPERSON: Could we go back to slide 6, please? I -- and I -- I'm a bit surprised by the initial statement on bullet 4, "Masks the need for near-term rate increases," because we know that the Preferred Development Plan encompasses 3.95 percent rate increases for a generation, basically, per year.

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: So I'm -- I'm trying to put that -- this initial statement in the context of what is before us as a panel.

MR. WHITFIELD RUSSELL: I'm just saying that as compared to the outlays of cash and the large risks that are being undertaken with respect to Keeyask and Conawapa in their early years, that they really represent and -- and affect rates over the long term, which may not be seen immediately because we're ramping up slowly. If we took those costs into account currently, with construction work in progress, as is often the case in other jurisdictions, then we'd see the full impact as we go along of those large outlays for capital.

But because we borrow and we capitalize

interest and we put those things in service later, at the same time they start throwing off export revenue, you kind of mask the impact in the early years of what you're undertaking.

Slide 8. Oh, I'm sorry. Slide 7. Now, the net benefits claim for plans involving Keeyask and Conawapa are highly dependent upon the magnitude of the export revenues. That's not news to any of you. Publicly available data on the historical magnitude of these exports and the average price per kilowatt hour sold revealed a disturbing trend of considerable volatility and decline in export prices since 2006 and '07.

Slide 8, please. And we see these declines here in -- as you go down the chart. The firm power price peaked out around fifty-nine dollars ($59) in 2005/2006, had a resurgence in 2009/2010, and then, as the great recession took its toll, these prices plummeted. And that's on the firm part, which you would expect to be able to maintain its value over time.

I noticed that there was a decline in the gigawatt hours sold. But just looking at this from the outside, it didn't offer all the protection that one would have expected associated with firm -- firm

sale, dependable sales.

On the opportunity sales, of course, there was a real plummet. These prices peaked around sixty-nine dollars ($69) in 2003 and '04. And for the last period we have data reported by Manitoba Hydro, in 2012 and '13, it was down to twenty-three sixty-two (23.62), twenty-three dollars and sixty-two cents ($23.62) a megawatt hour. That's -- that's quite a -- quite a hit.

In my business -- and -- and I have some utilities like Manitoba Hydro as clients, the Navajos in the Northeast portion Arizona, and they spill their -- their reserve -- you call it a reserve; we call it a reservation -- spills over into New Mexico. They have their own utility. It's sparsely developed, but they're a -- they're a winter-peaking entity in the middle and adjacent surrounded by summer-peaking entities. They have a very different need profile from all of their neighbours, and as a result they benefit from seasonal diversity.

And so -- but when someone like that goes into the marketplace, and we do on behalf of the NTUA, they're careful to watch the price at which market power is available as compared to what they would sell -- or -- or pay if they develop projects on

the -- on the reservation. And so that's a -- that's a major thing.

So when I see these kinds of declines in prices, it's kind of a red warning light. It's a -- it's a buy signal. This is -- this is a strong sign to anybody who's developing power that, If I sell, I'm not going. And -- and if I depend on sales of my surpluses, I'm looking in -- into a diminishing market. And secondly, there's a real opportunity out there perhaps to develop long-term purchases and -- at those low prices. Sellers will be desperate when these -- when these conditions develop.

Now, I ask you just to keep in mind this final price, the average price for 2012/'13 for the weighted average blend of the opportunity sales and the dependable sales. Note that it's thirty-four point five-seven dollars ($34.57), the actuals for 2012/'13.

Slide 9, please. There is a risk associated with the export revenue forecast. And the overall forecast of weighted average export prices of Manitoba Hydro has dropped in each successive forecast since 2009, often by large percentages and amounts.

Slide 10, please. What we have here is a tabulation of successive forecasts of off-system sales revenues. And I want to draw your attention to a

few things. First, the -- the first at the top is IFF09, the -- the distinction between the integrated financial forecast for '09 and -- and 2010. And then it goes down, has four (4) more, with the final being a comparison of the IFF12 to the NFAT prices.

And I want to recall that we had a actual price of 2012/'13 of thirty-four point five-seven (34.57). But compare that to what the actual price for '09 was forecasted back in '09 for that same time period. So they were forecasting sixty-six point nine dollars ($66.9) and fifty-eight point seven (58.7), and the actuals came in at thirty-four point five-seven (34.57).

Now, everybody's had the same problem. I'm not saying that anybody's done a bad forecast or -- or anything of the sort. But what I'm saying is that the trend here was clear at this period. And the trend was we had declining prices historically and -- and an expectation of declining prices going forward as we made each successive forecast.

Let me ask you to look at one (1) other comparison on -- this is what, nine (9)? Okay. Two (2) other numbers to look at on -- on slide 10. Look at the column 2009/2020, and look at the top as of 2009. It was forecast in 2010. It was forecast that

the price would be a hundred and eight dollars ($108). It's ten point eight (10.8) cents.

It's -- the latest forecast in the NFAT was fifty-nine point two (59.2). And notice that the sixty-six point five (66.5) and fifty-nine point two (59.2) also are roughly where the forecast was in the IFF09 for 2012/2013. We've just seen a tremendous plunge, not only in market prices, but in expectations. Again, to me, this is -- this is a signal to buy power, not to be entering the marketplace dependent upon very large sales.

Slide 11, please. Manitoba Hydro's selection of the Preferred Development Plan seems to reflect its predisposition to build high-cost resources largely for export in the initial period of the life of the resources. And that, in -- in the face of these prior data, makes -- raises a question in my mind.

Second, the market for firm exported power is primarily determined by the marginal costs of alternative thermal resources which presently tend to have capital costs much lower than those of hydro. And I've put there the nominal prices for simple-cycle gas turbines and -- and combined cycle. And they're far below the nine thousand dollars ($9,000) a kW.

Now, there's another thing about a

market for -- for firm power if you're going into a market as a winter-peaking entity into summer-peaking supply base. The marginal cost will not be dictating the price I pay. The marginal cost in the summer will deta -- will dictate the price that I sell.

But when I go into the market as a winter-peaking entity in a -- in a region dominated by summer-peaking entities, there's lots of surplus capacity in those off-peak periods, and the price of it is far below the marginal cost. Frankly, sellers are anxious to sell at a period when there is no real demand locally for their power. And so I add that as a reinforcement of this buy signal. Manitoba Hydro is uniquely situated to make firm purchases during its winter peak season, owing to its geographic location.

Slide 12, please. I get into a discussion of how export revenues will not fully recover costs of hydro. And I -- I do this not based upon detailed access to the CSI information, because I -- I didn't have that. So we went again to the best available information that we could find. And -- and, frankly, the Board's opinions, particularly one (1) in January of 2012, was a very useful indicator of expectations of costs of hydro projects, and also indications of what had transpired with respect to

those costs versus the costs -- the prices of power that could be expected in the export market.

Now, the -- there is a substantial gap between the initial high -- the -- the high initial in-service annual revenue requirement to recover the cost of power for Wuskwatim, Keeyask, and Conawapa, which was then specified by the Board. And -- and I mean no offence by referring to the Board order as 'BO'. And if you'll excuse me, that's unfortunate.

But they -- the costs that they were projecting and -- and seeing for -- the completed cost of power from a completed Wuskwatim, Keeyask, and Conawapa were then a hundred dollars a megawatt hour and up. And so there's a substantial gap between that and the much lower prices at which Manitoba Hydro can expect to sell its firm and surplus power at that time in export markets. And they were looking at unit sale prices of now more than six (6) or seven dollars ($7) -- sixty (60) to seventy dollars ($70) per megawatt hour on average for firm sales and oppity -- opportunity sales combined.

And those are the kinds of prices that I was addressing in those two (2) tabulations. It's a blend of opportunity and firm prices.

DR. HUGH GRANT: Can I ask for

clarification, what -- what you mean by 'initial in-service annual' --

MR. WHITFIELD RUSSELL: Well --

DR. HUGH GRANT: -- revenue 'requirement'?

MR. WHITFIELD RUSSELL: Yes, sir, Mr. -- Mr. Grant. We all know when you have a -- a large capital investment, be it a thermal plant or -- or a transmission line, or a -- or a hydro plant, that we're going to have a life-cycle cost expectation that's relatively well below the cost of that resource when it first enters service.

When you've got the full capital investment and the initial cost at the in-service date, you're going to have a much higher than average, or a live -- levelized, price that you're going to need. And for something that lasts sixty-seven (67) years, that high initial price will last a long time, because you're only taking a little bite of depreciation each year.

So your fixed charges for financing, added to the depreciation costs, added to insurance, and all of the other costs associated with a fixed asset are going to be at their highest at the beginning of that project. So that's -- that's what I'm

comparing here, is the high initial in-service revenue requirement for these projects is -- is pretty stiff. And it will do down over time, make it more attractive for export sales. But in the meantime, the -- the retail ratepayer of Manitoba is -- is seeing the full cost, the front-end cost. And the -- over time, they'll get the benefit of that declining cost of power on the fixed charges; but for the time being they won't, initially.

Slide number 13. Here we've plotted the prices that are projected for average dollars per megawatt revenue on total export sales to the US. And these are taken from the materials prepared by Manitoba Hydro in the NFAT Appendix 11.3. And it's for the three (3) -- three (3) cases indicate: the All Gas, which is in light blue; the K19/Gas/250 case, which is the red; and the K19/C25/750 scenario.

And what you'll see here is that these prices remain below ten dollars ($10) a megawatt hour until about 1038 (sic). So going back to your Board order --

MS. GENEVA LOOKER: 2038.

MR. WHITFIELD RUSSELL: 2038, pardon me. So going back to your Board Order of 2012, they're forecasting a price at the front end when you put a

Keeyask and Conawapa, the plant alone is going to cost around ten (10) cents a kilowatt hour and we're looking at these forecasts of prices blended from and opportunity sales of well below -- sometimes well below a hundred dollars a megawatt hour looking forward in time. And in fact, on this chart it shows until 2038.

Slide 14, please. Just to comment on the impact of prices and the study length. Manitoba Hydro has incentive to maximize the firm exports and lock in pricing for those firm exports. They command a higher price. But it's constrained by the buyer resistance that I described before and the cost of alternatives to those potential buyers.

So you've heard this many times, as costs escalate on the projects that you're adding in Manitoba Hydro and during this long construction period, the opportunity for costs to increase is of course enhanced vis-a-vis the three (3) year building period for, say, a simple-cycle or a -- or a combined-cycle gas.

So as the costs escalate and the forecast evi -- for -- for export prices fall or remain low, the point in time at which the export revenue can recover the increased costs is pushed farther and farther into the future. And I think this is what's

going on, and it may have some bearing on the -- the incentive to lengthen the study period associated with these projects.

Slide 15 please. Keeyask and Conawapa are depreciated over their sixty-seven (67) year lives, and their costs will fall, will decline to a level that's projected to fall below the price of exports. But that crossover is not expected to occur for a long time. And in the meantime, losses will accumulate before eventually being reduced.

In comparison to the All Gas benchmark case, we fee -- we see a very similar trend in La Capra's analysis, showing negative cumulative NPVs for the first thirty (30) years for Plans 4, 5, and 6. Now, 4 is the K19/Gas24/250. Based on the transcript, I can't believe I have to make reference, but I'll do it out of caution. You -- you've been told this many times. Case 5 is K19/Gas25 with 750 megawatts and the PUB service arrangement with both its investment and its sale. And finally, Case 6 is K19 -- Keeyask19/Gas31 and 750 megawatt interconnection.

So this is just a copy of the chart from LCA slide 24 -- slide 16, pardon me. And the -- you see that with the Preferred Development Plan, there's a very large dip in the cumulative NPV; and it doesn't

recover until something like 2054, as I recall. And this -- this is showing you that you have very large accumulations of negative net present value as the -- vis-a-vis gas in these early years. And it -- and it recovers over time to become the best case.

I'm not holding myself as an expert on the nuances of these La Capra calculations. But to me, they were a vivid demonstration of the kind of risks you take on with some of these Hydro plans.

And this -- this is a calculation of cumulative NPVs over time. It's consistent with my concern about the long time period over which it'll take to get export revenues that become compensatory with respect to the cost of the project being sold.

Slide 17. There was a concern expressed by the Board in its 2012 order about Manitoba Hydro's failure to incorporate up-to-date cost estimates in its analyses and negotiation of export contracts. And the recent increases in the capital costs of Keeyask and Conawapa would exacerbate the squeeze. And they were apparently not known at the time Manitoba Hydro negotiated term sheets and export contracts.

Slide 18. There's an erosion of benefits as the impacts the plan choice. So the favourable economics of Hydro erode as their capital

costs increase. And we've seen a demonstration of that in this proceeding. The initial $1.7 billion advantage enjoyed by the Preferred Development Plan over the All Gas Plan diminished to 374 million as a result of an $800 million increase in estimates of capital costs associated with Keeyask and Conawapa and the removal of the Wisconsin Public Service investment decision. And you can see that on Manitoba Hydro Exhibit 95 at slide 123.

And then with the addition of DSM at Level 2, the Preferred Development Plan advantage over the All Gas Plan falls to only 45 million. And again, that's at slide 130 of the Manitoba Hydro Exhibit 95.

Slide 19. Hydro's levelized cost comparison obscures the impact of the upfront costs of its hydro plants. Manitoba Hydro reports a sixty-seven (67) year life cycle levelized cost of six (6) to seven (7) cents. And this is in Chapter 7 of the NFAT, Table 7.3. And it's also supported by the LCA/MH I-308 response.

These costs do not include the sunk costs of Keeyask and Conawapa up through June 2014. These numbers are far different from those found in the Board order discussion in -- back in 2012, which showed starting non-levelized costs in -- or -- or -- and

rates of nine (9) to ten (10) cents for Keeyask and Conawapa. And this was before Manitoba Hydro made its new cost estimates known in this proceeding.

Neither of these cost estimates include about three (3) cents per kilowatt hour, which the Board was using as the cost of a fully loaded -- that is, fully utilized -- Bipole III. And that's discussed at the Board order Nove -- in January of 2012 at page 55.

Slide 20, please. Adding the Bipole II cost to hydro -- to their hydro plans drives up the costs of those plants. A ten (10) cent cost of power from Keeyask and Conawapa, which I'm using for this illustration and from the -- from the Board order, is forecast to be above the overall weighted average forecast price of exports for many years, as I showed on my slide 13.

When fully loaded, the cost of Bipole III, as I noted, was about -- was then estimated to be about three (3) cents a kilowatt hour. But when the cost of Bipole III is added to the cost of Keeyask alone, the deficit is even larger, because the incremental costs of a 2,000 megawatt Bipole must be spread across the incremental energy produced from only a 630 megawatt project.

And when you make that calculation based upon these illustrative data, it drives the incremental cost to about seventeen point three (17.3) cents per kilowatt hour. And that's before additional cost allocations are considered in both Keeyask, Conawapa, and potential for cost overruns on Bipole III.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: Okay, slide 21. What we've done here on slide 21 is we've taken that combined cost of a hundred and seventy-three point two (173.2) for Keeyask and Bipole III and we've plotted it on those forecast embedded prices projected for the same time period. And what you see is a very drastic chart indicating non-recovery of the costs of Keeyask and Conawapa for these many years, out until the mid-two -- 2040 -- 2040s.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: Slide 22. This is not news to the Board, but I'll just -- I found this statement in the January 2012 Board order to be significant.

"To the extent that Manitoba Hydro's real costs with respect to these projects are not recovered from export customers, it will fall to Manitobans to bear financial responsibility through reduced annual net income of Manitoba Hydro and reduced overall retained earnings and increased electricity rates for Manitobans."

Slide 23, please. Sunk costs are a disadvantage to the hydro -- alternatives to the hydro.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: By adopting the analytical framework for the NFAT that Bipole III is a sunk cost, Manitoba Hydro has biassed its analysis in favour of the Preferred Development Plan and other hydro resources that would make use of it.

Under the Preferred Development Plan, Bipole II will be built first for commercial service in 2017 to 2018 to accept the output of Keeyask in 2019 and Conawapa in 2026. And again, if Conawapa is not built, Keeyask is going to have to bear, on an

incremental cost basis, the full share of those Bipole III costs.

What I've shown here is that -- slide 25 -- slide 24... Slide 24, pardon me. The $3.3 billion cost of Bipole III exceeds the incremental benefits which the PDP is said to produce under many scenarios, as compared to the benefits of the All Gas Plan. Accordingly, adding the $3.3 billion cost of Bipole III to the NPV of the PDP and to other hydro plans while removing it from non-hydro plans would make a vast difference in the probability analysis.

And the next slide, slide 25, shows the Manitoba Hydro quilt for several plans with updated capital costs from Manitoba Hydro Exhibit 95 at slide 125. And as you scan this matrix, you will see that subtracting the $3.3 billion cost throws many of the favourable results into negative territory and, of course, reduces some of those, which are even bigger.

Slide 26. Process for approval on capital projects is prejudice the result in favour of the hydro alternatives. And we're in slide -- yes. So it's apparent that the process by which Manitoba Hydro obtains approval from moving forward on capital projects warrants examination, although the Public Utilities Board has regulatory authority over the rates

that Manitoba Hydro imposes on ratepayers, it doesn't not appear to have authority to approve or disapprove of its capital spending unless requested to take a look at it by the Minister of Energy. That's my understanding. I haven't done all of the legal research, but that's my understanding of the conundrum that is facing the Board.

And the Board noted in January 2012 that while its jurisdiction does not extend to the approval of the capital expenditures, the Board does have jurisdiction over the approval of Manitoba Hydro's rates in which Manitoba Hydro seeks to recover the financing, operating, amortization, and expenses directly attributable to Manitoba Hydro's capital expenditures.

Most significantly is that at page 200, they -- the Board noted that its role as a regulator is to make sure the rates are justified and that Manitoba Hydro is not seeking increased rates for recovery of losses from mistakes, errors, and inefficiencies. It must ensure inefficiency -- efficiencies are maximized and that it exercises the discipline of maintaining lowest cost.

Slide 27, please. In this case, substantial amounts have been spent by Manitoba Hydro

prior to the government asking for this NFAT. And although the Board could arguably deny cost increases to cover any mistakes, errors, or inefficiencies found in those -- those actions, that such an action by the Board would undermine the financial indicators of financial health. And I think that sort of summarizes the conundrum in which the Board finds itself.

Now, the new evidence produced in this proceeding appears to demonstrate that much less costly scenarios are possible. But because of the sunk costs, these -- these sorts of lower-cost scenarios may be coming to light -- too late to help the ratepayers.

So the only -- given what I understand to be the structure of the regulatory market here, the only real remedy that's available is to subject all major capital expenditures to an NFAT review before the sunk costs become too substantial, before this type of NFAT.

Slide 28. La Capra's Plan 17 looked very --

THE CHAIRPERSON: Excuse me, Mr. Russell, I -- I think it's probably an appropriate time for us to take a rece -- to recess, because it's about 12:30. So I suggest that we break now and we have lunch and then resume the proceedings at one o'clock.

We're about halfway through your presentation, so I think it's an appropriate time to -- to make the break.

So we'll see each other again at one o'clock. Thank you.

--- Upon recessing at 12:29 p.m.

--- Upon resuming at 1:07 p.m.

THE CHAIRPERSON: Good afternoon. I believe that we're in a position to recommence the proceedings. So I would, I guess, turn the microphone over to Mr. Russell, please.

MR. WHITFIELD RUSSELL: Thank you.

THE CHAIRPERSON: I believe -- I believe we're at slide 28.

MR. WHITFIELD RUSSELL: Thank you, sir.

LCA's Plan 17 looks promising. Plan 17 was the No New Generation scenario, and I think it came as a surprise to La Capra themselves. Because of its low cost, low risk, and substantial economic benefits, I think that makes a strong case for refining this option into a full-fledged plan or an early stage of a long-term plan in order to reduce the risk and cost of going forward.

Now, La Capra recognizes that Plan 17 is

not a fully fleshed-out plan but asserts that its benefits are so significant that its elements warrant serious consideration. And a few -- a few paraphrases from the transcript, 6,076. I think it was Mr. Athas or Athas, I'm not -- said, "Boy, that did a nice job on economics." But his colleague said:

> "However, it's not -- it's not that we're done, go do this plan."

And then he said:

> "I would recommend it only to the extent that it raises issues that seem to have promised improved economics."

And then, in a dialogue with Mr. Bel at 5,727, he -- 5,730:

> "It allows us to use existing hydro more efficiently, imports on the nights and weekends, and give us more degrees of freedom."

It -- it was a surprising case to me too, because it was accompanied by a relaxation of the 10 percent limit on imports that had been a mainstay of the Manitoba Hydro planning criteria.

Slide 29. The LCA No New Generation scenario involves DSM at levels one point five (1.5)

times the DSM assumed in Manitoba Hydro's initial studies, the substitution of natural gas heating for electric heating, development of a new 750 megawatt interconnection to enter service in '29/'30 with the US, increases both import and export capacity.

And the reason for that is the same reason that the colloquy with Mr. Bel pointed out, that this is kind of a -- Hydro has kind of an alchemy that you can bring power in during off-peak periods, store it, and send it back out as firm power at a higher price. And this increases exports.

It relies on the relaxed import limitations of 20 percent instead of 10 percent of domestic load plus export obligations. And it called for a continuation of existing diversity exchange agreements.

Slide 30, please. Including sunk costs, the Plan 17 appears advantageous -- advantageous. It demonstrates favourable economics, despite being burdened by 4.3 billion in sunk costs that Hydro incurred in connection with developing new hydro and transmission features that add little or nothing to Plan 17's value.

Slide 31. Switching gears now, we're going to move over to reliability. According to

Manitoba Hydro, the existing transmission system is vulnerable to a common mode failure, such as a catastrophic outage of either or both Bipoles I and II for a period of months and years. It would be an extreme event, and the regul -- the reliability standards of NERC. It's catastrophic failure of both Bipoles I and II would involve a simultaneous outage of all four (4) single Bipoles, which is called an N-4 event, all four (4) single poles of Bipoles I and II.

Utilities must evaluate such scenarios for risks and consequences, but they don't need to mitigate them. The loss of a single pole of a Bipole is considered an N-1 event, which has a less than 1 percent probability of occurring. And you can see the response of CAC/MH II-013b.

Although the industry reliability criteria require that Manitoba Hydro continue to serve all firm load obligations after the occurrence of any single contingency, which is called an N-1 event, those criteria do not require that it continue serving all the firm load after an N-2 event, let alone after an N-4 event. Nonetheless, it is on the basis of an N-4 event and fear of an extended outage that caused Bipole III to be built before Keystone and Conawapa.

Slide 32. Manitoba Hydro reliability

standards seem to have changed. In justifying Bipole III for reliability reasons, Manitoba Hydro adopted a deterministic standard requiring that it be able to meet its peak demand after loss of both Bipoles I and II for a period of months or years.

The deterministic reliability standard used to justify Bipole III may not have been carried over in developing plans for comparison in the NFAT. That deterministic standard could be met either by strengthening the interconnections to the US or by adding Bipole III. For that purpose, Hydro chose the more expensive option: adding Bipole III.

Slide 33. And I am recalling that the third bullet has been redacted. The planned hydro generation additions diminished the claimed reliability benefits of Bipole III. Bipole III was initially justified because it would enable power to be delivered through the parallel path of Bipole III during the outage of Bipoles I and II. So out of the northern hydro that was available, 2,000 megawatts could continue to be developed -- delivered if Bipoles I and II were forced out.

The 2,000 megawatt spare transmission capacity initially created by adding Bipole III would drop, however, when Keeyask is added and will virtually

disappear once Conawapa is added. And under the Preferred Development Plan, Manitoba Hydro plans to upgrade its ability to import capacity from the USA to replace the diminishing spare transmission capacity in Bipole III.

What this is telling us is that Bipole III, as a reliability -- in its reliability function, is totally fungible with an upgrade of its import capacity for Manitoba Hydro. You could solve the problem either way.

Slide 34. Each of the Hydro plans causes greater concentrations of the province's hydro resources along the Lower Nelson River, and it's even higher than the present 70 percent concentration. And Manitoba Hydro failed to -- failure to evaluate these impacts seems to be an oversight in that the same type of catastrophic events that could take out Bipoles I and II could also take out Bipole III as well, trapping immense portions of Manitoba Hydro's resources without an outlet for potentially extended periods of time, cutting off remendues from -- revenues from export sales as well. Without sufficient import capacity from the United States, Manitoba could be plunged into darkness under that scenario.

In the recently filed Manitoba Hydro

rebuttal they -- they qualified, and we didn't dispute, that this would reduce the probability of such events over what they are now with just Bipoles I and II. That is, Bipoles -- Bipole III wouldn't, in its unloaded providing spare capacity, improve reliability. And they -- they -- we don't disagree that it would lower risk. But there -- and -- and they calculated something like one (1) in thirty-one hundred (3,100) years after Bipole III from -- from environmental events such -- earthquakes and so forth, winds, tornadoes, and so forth.

But I did note in reading the PES report -- and it was kind of difficult because we had to patch our way around the redactions, substantial redactions. But it did appear from the PES, Power Engineering, report that they raised the risks inherent in Bipole's III addition that were unrelated to weather events and discussed possibilities of certain outages of all three (3) Bipoles.

I don't know where that stands in the record. I do know it was raised as an issue. I think in the rebuttal Manitoba Hydro discussed the need for more detailed modelling of Bipole III, to get a grip on it. But putting three (3) Bipoles are not just susceptible to environmental events. They're also

susceptible to systemic failures simply because of the additional complexity of adding it to the very, very complex control scheme which governs the use of the HVDC system after outages of any of the poles or after outages of the major 500 kV interconnection to the United States. And I just want to highlight that that's not -- the environmental factors are not the only thing which would -- could potentially precipitate a loss of all three (3) Bipoles.

Slide 35 was deleted in its entirety.

Could we go to 36? LCA's Plan 17 promotes both exports and imports. It's been characterized in some of the documents as import-only line, but it's -- it's really not. In addition to the addition -- simply stated, addition of another 500 kV US interconnection without additional hydro capacity will increase Manitoba Hydro's exports as well as increase its ability to import power. And that's according to the -- the LCA analysis itself. And this is important because Plan 17, again, is not an import-only case.

Slide 37. This, what I found, is a very interesting chart from LCA's discussion of the No New Generation Plan. And what -- what you see in this chart is the existing hydro and existing thermal -- new

thermal, you see being added there off to the years on the far right side -- and imports. And what you see is that when the new line under the LCA No New Generation case is added in 2029, you see a bump up in exports.

And it's -- it's associated and really correlated with increments of imports. And it's this special alchemy that hydro projects with storage have. They can shut them down, accumulate water in the reservoirs behind the dam, and buy imported power to serve the Manitoba load. That extra power-producing capability accumulated during the off-peak hours, during the purchase period, is then available in the same amounts, later hours, when prices are higher. And that's what is apparently demonstrated by the analysis that LCA received from Manitoba Hydro and of its No New Generation case.

Slide 38. And I wanted to focus on this because below the figure in the La Capra report that I just discussed on slide 37, the figure indicates that adding the 750 megawatt line, along with purchasing firm power, but not constructing additional generation would enable Hydro to export substantially more power in the annual amounts shown above the dotted line.

Now, this additional import capabilities associated with that line, if that line were greater,

one would expect the import capability to be commensurately greater, increasing the benefit of this storage and return function that the hydro system can perform.

Moreover, there's no reason to expect that building that import line, that -- that line for increasing imports, at an earlier point in time wouldn't produce the same benefits. So we have those benefits starting earlier and, with an upgraded line above 750, maybe increased benefits starting earlier.

The final -- the bot -- the sentence at the bottom of the first paragraph is -- after the diagram in the La Capra report is:

> "There is also an increase in exports, which is the difference between the load line and the top of the resource bar mix (sic)."

And the final paragraph on the page states:

> "More input capacity..."

That is, transmission import capacity:

> "...could allow higher imports in off-peak periods, allowing exports of hydro during peak price periods. The value of these exports and of the

additional capacity in this scenario is not like -- is likely to be significant but at this point is unknown, as that analysis has not been conducted."

This indicates that much of the increase in exportable energy in Plan 17 is a result of energy imported in off-peak hours, stored as elevated water, until needed as a source of firm capacity and energy for on-peak exports.

Slide 39. Manitho -- Manitoba Hydro objects to LCA's import line; that -- that's the characterization that Hydro has given that proposal. We contend that the Minnesota regulators would not approve a new transmission line designed for exports to Manitoba and, further, that there is insufficient firm generating capacity in MISO that could be imported cost effectively by Manitoba. And this -- these points are made generally in the rebuttal testimony of Mr. Eric Swanson of Winthrop & Weinstine, P.A.

I disagree with this for a number of reasons. Slide 40. As we discussed earlier, MISO, PJM, and SPP -- that's the Southwest Power Pole, which is the large regional ISO south of MISO -- there are summer-peaking regions that should have substantial

surplus capacity and energy available in the winter when Manitoba Hydro experiences its peak demand.

The entities owning generation in the US would have an incentive to increase their sales of firm and non-firm power during the off-peak winter period, and also to engage in diversity exchanges with Manitoba Hydro.

The transmission providers in those regions are required by FERC policies and rules to provide transmission service under their open-access transmission tariffs at cost-based rates. And they're required to build needed upgrades when requested to do so by a -- a transmission request and if the requesting entity is willing to pay for the studies and pay for the upgrades.

I further disagree -- slide 41. FERC has established incentives -- because FERC has established incentives to build and own transmission facilities that make such activities quite lucrative for the utilities in the United States. And one need only look at how much Manitoba Hydro will pay Minnesota Power for the Great North -- the Great Northern Minnesota line, as in -- indicated in Mr. Jacobson's slide 88. There's four hundred and ninety-nine dollars ($499) to $567 million in ongoing O&M expenses that

Manitoba Hydro is expected to pay to Minn. Power.

Now, much of it -- to -- to compensate Minnesota Power for this ownership and -- of 60 -- the 66 percent of the line above the 49 percent that Manitoba Hydro will own. Those -- those -- when you set rates for transmission in the United States and you have an equity return for a large part of it, FERC has been very permissive in allowing entities to claim very high equity components of their capital structure. Those equity components get very favourable treatment on rates of return.

In addition, the utilities get to collect taxes in what we call a normalized tax, normalization, which in effect allows them to collect a lot of taxes in the early years of a project that they don't have to pay; it's paid back in later years. And oftentimes, FERC will allow capital structure reflecting more equity than the owner of the line actually invests.

So here you've got a case of collecting income taxes you don't pay on equity you didn't invest and the associated returns. FERC has made the construction and ownership of transmission facilities, that's the bottom line, very, very attractive. And we're seeing one (1) -- some evidence of that in -- in

the case -- in the exhibits of Mr. Jacobs.

FERC Order 1,000 requires transmission products -- projects for public purposes, such as renewable energy, to be considered in developing transmission plans; while Hydro's ability to store off-peak wind is a great enhancement to the ability of wind machines to get demand charges and firm up their ability. So if you're going to be proposing projects to move wind power to Manitoba, those would arguably fall within the public purposes defined in Order Number 1,000.

Next, Minnesota Utilities had petitioned the Minnesota Public Utilities Board -- Minnesota Public Utilities Board to consider a competing alternative to the Great Northern Transmission Project. In other words, this is another manifestation of how lucrative and attractive it is to build transmission in the US. You've got some Western Minnesota entities are filing a competing application to the -- to the Great Northern Transmission Project. And that's discussion in a Megawatt Daily article on April 17th of this year.

Next, firm power sold during an off-peak season tends to command only about half the demand charge associated with on-firm peak power. So when you're going -- that's another illustration of -- of

when you're going, as a winter entity, to a summer peaking region to buy power, it's off-peak power, it's not -- the pricing is not governed by marginal cost of new capacity, there's plenty of surplus capacity in the off-peak period, and those demand charges tend to be lower than what you would see if you wanted round-the-year, seasonal peak, summer power.

Slide 43. Forty-two (42) is deleted, as I recall. Oh, I'm sorry. There is one (1) bullet. If Plan 17 had been evaluated earlier, and if Bipole III did not already exist, its cost would have to be added to the cost of any plan for developing Keeyask and Conawapa.

That's at the heart of my criticism of the NFAT analysis of economic plans, is that if -- if these sunk costs associated with Bipole III did not already exist, when you came to evaluate Keeyask and Conawapa, you'd have to add those costs into it. And that would make it certainly less attractive when you carried out these economic studies going far into the future.

Forty-three (43). Now I'm beginning my response to the Manitoba Hydro rebuttal. The Hydro rebuttal to us addresses the reliability justifications for Bipole III as described in the response MH/MMF/WRA-

004a and 'b'.

Hydro proceeded with development of Bipole III to address the risk of an extended outage -- extended loss of both Bipoles I and II in an event expected to occur no more than one (1) day in seventeen (17) years. It's a one (1) day in seventeen (17) event, we'd say. Except to the proposition on our part that the spare transmission capacity created by Bipole III without Keeyask or Conawapa would lessen the risk and the costs associated with loss of both Bipoles I and III.

I'm going to skip over the redaction here.

We also questioned how Bipole III could fulfil its role as a backup to Bipoles I and II once it is loaded with Keeyask and Conawapa power. And for that reason, we had favoured an additional tieline to the US.

Slide 44, please. Hydro recognized that an additional link to the US was a valid alternative to Bipole III; didn't dispute the concept. But in analyzing the alternatives to Bipole III for purposes of reliability after loss of Bipoles I and II, they created a different and deterministic reliability standard for judging the adequacy of that alternative.

And by 'deterministic', I mean it's like the N-1 criteria. It's not probabilistic; it's deterministic. And it doesn't matter if you have a piece of switch gear which is 2 feet long. If it's subject to an N-1 outage that will affect the system, we look at it. If it's a 100-mile-long line, it's still subject to an N-1 criterion as -- as would align just 4 or 5 feet long.

These -- this -- this is what we mean by a deterministic criteria. it's not probabilistic; it's black and white. If you meet it, you keep all loads in service after an N-1, that's what we mean by 'deterministic'.

So they invented a new one (1) -- well, I shouldn't say, "invented." They applied a new deterministic reliability standing -- standard in judging the adequacy of the alternative to Bipole III for reliability when you went and built enhanced interconnection to the United States.

The alternative involved a 1,500 megawatt AC line. Now, the Bipole III would have provided 2,000 megawatts of backup so they could continue bringing hydro from the North in the amount of two thousand (2,000) in the event they lost Bipoles I and II. The alternative being investigated and

rejected would have called for a 1,500 megawatt import line, 500 megawatts of additional gas in Manitoba; but it also insisted upon the 1,500 megawatt line being backed up by an additional 1,500 megawatts of gas turbine capacity.

The additional cost of this new generation made the alternative of a new interconnection across the border more expensive than Bipole III without new generation, which involved no new generation. And that alternative of a new interconnection was rejected.

Now, at page 5 of its new rebuttal, Manitoba Hydro states that the alternative to Bipole III considered in the CEC proceeding was a new US interconnection that they characterized as an import-only transmission scenario. I am unfamiliar with the notion of an interconnection that would function as a import-only line.

Any new US transmission line tying Manitoba to the US would be no different in this respect from the proposed 750 megawatt tie that Manitoba Hydro itself is planning and could be expected to provide opportunities for both imports and exports. Indeed, this was supported by La Capra's presentation on the No New Generation Plan.

Slide 45. Manitoba Hydro further insisted that it added on the cost of 1,500 megawatts of new gas turbines because an import-only line must be connected to some form of firm generating capacity. We believe that a new tie to the US would not need to be backed up by additional firm gas generation, especially generation that would be needed only once in seventeen (17) years.

Manitoba Hydro could rely upon its contingency reserves while it shops for longer-term supplies for a week, a month, or port -- or longer periods, to back -- during an extended outage to provide backup during Bipoles I and II. This is indeed what happens in the US historically with large delays or long delays of large nuclear plans. It also happened after the loss of Three Mile Island I and II.

It's -- people don't plan and build extra capacity to back up their systems for these out-of-the-ordinary, extreme losses. What they do is they rely upon the installed reserves of the interconnected system as a whole. And, sure, they have to go into the market in a disadvantageous position. They have to pay more power -- pay more for the power they buy.

But the fact of the matter is having interconnections -- and this is one (1) of the major

advantages of interconnections -- is that you can rely upon your neighbours. There's a long history in the industry of doing so. And indeed, in the NFAT, I quote in my report portions where Manitoba Hydro cites just this kind of opportunity as being available from enhanced interconnections.

Manitoba Hydro's CEC analysis show that it would need backup for loss of both Bipoles I and II primarily during the winter peak. With a new tie to the US, Manitoba Hydro could expect to call upon winter surpluses of generating capacity in the primarily summer-peaking system in the US, and obtain that power at a relatively low cost vis-a-vis peak price power in the US.

Manitoba Hydro seems to agree with me on this. At page 6, lines 2 to 6 of its latest rebuttal testimony, in speaking of its new US tie, they sta -- they stated, quote:

> "The proposed transmission line will have the added benefit of providing firm import transmission capacity to Manitoba. As a result, Manitoba Hydro will be able to gain access to surplus energy from the MISO market at essentially no incremental capital

or operating costs. There will only be variable costs associated with the cost of energy needed to supply Manitoba in times of unexpected outage."

Close quote. Moreover, by insisting that a new -- new US tie would have to be accompanied by an additional 1,500 megawatts of gas generation, they create an apples-to-orange comparison. In other words, because all Bipole III provides, if Keeyask and Conawapa are not built, is an alternative path for Hydro to reach its existing northern hydro. It doesn't create an additional 2,000 megawatts of generating capacity for the system.

So to insist that a new tie to the US go out and -- and bear the burden of those additional megawatts of firm generating capacity is -- is an apples-to-orange comparison. That, in reality, the 1,500 megawatt tie to the US has access to an array of generation sources as compared to Bipole III, which could only access existing Northern generation.

47. At pages 1 to 3 of the rebuttal, Hydro challenges our position that it has implemented a less-restrictive standard than it did in the CEC proceeding. Hydro seems to have missed my point. Its

rebuttal focusses on the adequacy of the spare transmission capacity and not upon adherence to its -- its insistence that imported generating capacity meet the strict new deterministic standard and be firm and backed up.

My calculations indicate that with Bipole III in the NFAT case, Manitoba Hydro has not arranged for sufficient imports to meet the strict standard it set out in the CEC for covering a loss of both Bipoles I and II. Let me clarify what I'm driving at here.

In putting Bipole III, it provides a spare path for the existing hydro. Once you add Keeyask, that's cut -- that spare capacity is cut by six thirty (630). Once you add Conawapa, the spare capacity for the outage of Bipoles I and II is gone. They then, under their Preferred Plan, enhanced transmission import capacity from the United States, the very concept they rejected in the CEC proceeding.

And so what I'm saying is, as opposed to the CEC proceeding, where they -- Hydro insisted all the capacity be firm, to meet firm loads without Bipoles I and II, in the Preferred Development Plan they fall short. They're importing less firm capacity than they insisted was the standard in the CEC.

The second bullet. I think the Board should care about the sequence of -- of events because Hydro created a stiff reliability standard to support the need for Bipole III and then seemed to back away from it in the -- in the NFAT. The stiffer standard occasioned little or no mention until Hydro filed its most recent rebuttal.

As a consequence, Bipole III has been treated as a sunk cost. And then, in the NFAT -- then in the NFAT, and then has been repurposed. In other words, it served as a spare for Bipoles I and II. And then when you load it up with capacity, we need some other spare. And that would be the inter -- interconnection -- the new interconnection capacity to the United States.

The second bullet. Moreover, by backing away from the CEC standard in the NFAT proceeding, they reduced the needed amount of firm purchases but has not updated its evaluation of a US tie on that same basis.

Slide 48. And I understand the last clause of this has been redacted, so I'll just read to that point. In the NFAT, the hydro-based plans call fulfilling the spare capacity of Bipole III with the output of Keeyask and Conawapa. This would diminish the ability of Bipole III to provide spare capacity for

both Bipoles I and II.

In those hydro-based plans, Hydro would rely upon a new tie to replenish the spare Bipole III capacity with capacity on their new US tie. Thus, Hydro is planning to provide backup from the US to replenish the diminishing ability of Bipole III to cover the loss of both Bipoles I and II. One wonders why it did not build a new lower-cost interconnection to the US in the first place.

And this next chart is from Hydro's rebuttal at Figure 1. And what it shows you is -- the blue line is showing the amount of surplus ability to meet firm load created dur -- during an outage of Bipoles I and II, created by Bipole III. And you'll see there in 2019 it -- 2017, the deficit in their ability to do so today is reduced from about twelve fifty (1250) and -- and becomes a -- a surplus of around seven hundred (700) to seven-fifty (750).

Then as you see, that line tails off to the right as Keeyask and Conawapa and load growth kick in. You'll see that the second US tie kicks in. What this shows us is that capacity on the interconnection, from the US, and reliability provided by Bipole III are fungible. They're one (1) and the same.

The chart shows, slide 50, that the US

provides -- the US tie provides reliability of benefits that are like those provided by Bipole III.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: The amount provided by the 750 megawatt 500 kV Manitoba-Minnesota Transmission Project and the tie within Minnesota itself could have been increased and could be built to a higher megawatt level.

Slide 51. At page 6 to 7 of its new rebuttal, Hydro claims that Footnote B to NERC standard TPL002 allows it to drop firm exports after an N-1 contingency. And I'm shifting gears here. We're talking about another disagreement we had with Hydro over the reliability criteria.

However, Footnote B addresses an exception to the general rule. The general rule is if you have an N-1 contingency, firm transfers cannot be curtailed for those kind of events. Instead, Hydro employs a number of special protection schemes to deal with its unique transmission system that cannot meet the usual operating reliability levels. So they can't meet the N-1 standard and keep a firm export to the US going if they lose the major tie. That violates the

general rule. They look for solace and comfort in Footnote B. I don't think it's there.

Note B says:

> "Planned or controlled interruption of electric supply to radial customers and some local network customers connected to or supplied by the faulted element, or by the area, may occur in certain areas without impacting the overall reliability of the interconnected system. To prepare for the next contingency, system adjustments are permitted including curtailments of power contracted firm, non-recallable reserved electric power transfers."

Now, that's two (2) sentences. The first sentence if the -- is the original and primary reason for Footnote B. What they're talking about is we always analyze the system. Every N-1 contingency that's possible in a transmission system is analyzed to see its consequences.

So if you've got a large load served from a line as a tap, and that line sof -- suffers an -- an N-1 outage, the protection equipment takes the

line out. And as a consequence of that, what was otherwise a firm load is dropped during an N-1 condition. Now, if it's very expensive to build duplicate transmission to that load, and it's not a major consequence for purposes of operations, Footnote B was drafted and originally intended for that situation.

Now, the Footnote B goes on to permit curtailments with -- through system adjustments of firm exports if necessary to protect the system from further risk. System adjustment is a different category of event -- or reaction than what Hydro uses in response to its loss of the main tie to the US.

When Hydro loses it 500 kV tie to the US all the exports on that line are cur -- are -- are intercepted and stopped by what we call a special protection system. Without human intervention, that outage is sensed, and an equivalent signal -- let's say the 1,732 megawatts, which is the rated capability of the existing 500 kV tie.

If you lose the 1,732 megawatt export on that line, a signal is sent to the Northern Hydro, and that amount is shut down very quickly so that we don't have excessive amounts of power pouring into southern Man -- Manitoba where there's no place to use it. That

would just drive up the frequency in Manitoba and add to the potential for instability across its ties with the United States.

So this special protection scheme without human intervention is different from what is commonly called a system adjustment. A system adjustment means we have the N-1 event, the line has -- the transaction still keeps going. And oftentimes, we have a twenty (20) or thirty (30) or half-hour rating on the line, and the transaction can keep going for a while. But under the rules, we're supposed to bring the rating and power flow on the line back within rated capabilities within certain time periods.

That's what this system adjustment is all about. You go out and find somebody on the far side of the export to bring up its generation while you back down generation on the near side, on the exporting system. That's what's talked about. The SPS, with its -- without human intervention, this is not a system adjustment as I understand the term.

Slide 52. Manitoba Hydro's special protection system, in dropping firm transfers to the US, goes well beyond the radial customers of some local network permitted in Footnote B. The US is not simply a remote load served by a radial transmission line, and

it is not a local network on the Manitoba Hydro system.

Note B is applicable to minor firm load interruptions that would otherwise be costly to avoid. Note B does not preclude the normal practice of system adjustments to prepare for the next contingency. And it can include dropping firm customers or reducing firm transfer in a controlled manner. However, automatically dropping firm customers or transferred -- transfers with an SPS would not qualify as doing so in a controlled manner.

In conclusion, Hydro's Preferred Development Plan has not been supported by the NFAT submission, and if approved and built will impose unnecessary and excessive risks on ratepayers.

The pursuit of DSM, imported power supported by enhanced import capacity on its system in connections and future gas generation would -- would be far lower in cost in the years through 2031, and lower in risks than would be pursuit of the Preferred Development -- Preferred Development Plan.

The Preferred Development Plan would exacerbate the concentration of its generating resources along the Nelson River hundreds of kilometres north of its Manitoba Winnipeg load centre, and would put more eggs in that basket.

And that concludes my presentation.

(BRIEF PAUSE)

MR. RICHARD BEL: Could you go over that last bit about the SRS event?

MR. WHITFIELD RUSSELL: The SPS --

MR. RICHARD BEL: So what is the argument between you and Hydro?

MR. WHITFIELD RUSSELL: Well, they're -- what they're saying is -- and -- and don't get me wrong. I'm -- I'm not -- I'm not suggesting we abandon it. I think a little bit of history is worthwhile and -- but -- but in essence, what they do is this.

When they lose the major tie to the US, oh, and they lose one (1) of the poles on the HVDC, the SPS system backs down generation and curtails exports to the US, okay? And it does it without human intervention, under the control of protected systems. It does it quickly, and it provides a -- a protection to the system.

However, on its face, it violates the N-1 standard that you've got to keep your firm exports going after the N-1 event. It's always been that way. US understands it. The -- the -- it's what makes the

exports of low-cost power, hydro power, available.

I'm not suggesting we get rid of it. I'm suggesting that maybe the -- MISO is -- is reluctant to allow any more SPS, and they will allow -- they seem to have grandfathered this one (1). And -- but they don't allow any increase in the amount of run back on the hydro systems, the northern hydro, or a run back on the DC Bipoles whenever Hydro expands.

So that kind of constrains a little bit the planning that could go on. For example, the 1,732 megawatt line -- rated line going to the US. It is capable of being uprated by about -- from 2,000 amps up to 2,500 amps, about a 25 percent increase in delivery -- in transfer capability. But it cannot be done that way. And it could be done by increasing the rating of what they call a Roseau series capacitors, but it can't be done because MISO has a firm policy against allowing an increase in the amount of run back that's required and dropping of exports as -- as a result of this SPS.

So the situation is we don't want to get rid of this. It's been there a long time. The buyers are aware of it. But there is resistance, on the part of MISO in its -- in its role as enforcing reliability, to expanding it. And they're also firmly -- strictly limiting any further or future SPS. But the SPS is --

it's -- it's an automatic protective system for Manitoba which kicks in without human intervention and violates the general rule that you can't cut a firm export after an N-1 event.

MR. RICHARD BEL: Okay. Good. Second question. You're recommending that the 750 transmission line be uprated for --

MR. WHITFIELD RUSSELL: Yes, yes.

MR. RICHARD BEL: -- and that would enhance exports and imports?

MR. WHITFIELD RUSSELL: Possibly. But I was more focussed on the import. Now, what happ -- what -- you'll notice that there's a -- quite a large discrepancy between the transfer capacity for exports and the transfer capacities for imports, both on the existing line and with the enhancement of the new 500 kV line.

It's not that it's limited by the capability of the conductors. The conductors themselves are probably worth about 3,000 megawatts on each circuit. The existing circuit, because of reactive resistance and the characteristics of the system, is operating at 1,732 megawatt rating.

When you add that second line, the import capacity does not go up commensurately to 1,732

megawatts. What I understand is the problem, and I think we have a data response to that effect, the limit on import capability -- enhancing import capability to Manitoba is the result of a concern with voltage collapse down around Minneapolis and points north on the 500 kV line.

Voltage collapse means that you've got a lack of reactive support, which can be fixed without adding new poles and wires, but by adding reactive support and devices which ena -- enable the system to avoid voltage collapse during the precipitating event. Those kinds of things can be added and upgrade the capacity to near its ampacity rating of the conductors.

MR. RICHARD BEL: Thank you.

THE CHAIRPERSON: Now, some of the statements you made address the transmission capacity that would be available on Bipole III in a context where Keeyask and Conawapa were built.

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Now, say we take Conawapa out of the picture.

MR. WHITFIELD RUSSELL: Okay.

THE CHAIRPERSON: Then it would leave up transmission capacity -- there would be some free transmission capacity on Bipole III.

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Does that change any of your conclusions?

MR. WHITFIELD RUSSELL: I think -- no, I think the amount of firm imports shown in the Preferred Development Plan are still less than would have been required under the deterministic criteria set forth at the CEC. So in degree, yes. But in -- in consequence, no.

In other words, if you cancel Conawapa, there would still be 2,000 megawatts less the six-thirty (630) would still be available for spare. So you would reduce the spare capacity available from Bipole III if you did not -- by adding Keeyask, but you wouldn't wipe it out. And -- and that's your question, I take it.

THE CHAIRPERSON: Yes. But that kind of obviates the need for an intertie then for -- from the standpoint of needing US imports for reliability purposes?

MR. WHITFIELD RUSSELL: Yes, it argues in support of that, yes. It indicates.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: Oh, I -- I miss -- I misunderstood your question. Negates the need for an import capacity increase for reliability?

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: May -- may I have you re-ask the question, please?

THE CHAIRPERSON: Well, you know, I think it would be best if we went back to the slide that indicates that -- I'm trying to find it. But it indicates that, you know, if -- once Conawapa is built, then the available transmission capacity on the Bipole III is used up --

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: -- the shortage. In fact, there's a shortage.

MR. WHITFIELD RUSSELL: That's correct. Correct.

THE CHAIRPERSON: Right. And so -- and that kid supports the thesis that an intertie would be the approach that should be used to address that shortage?

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Okay. Now, if you

take Conawapa out of the picture, what does that -- does that change your recommendation?

MR. WHITFIELD RUSSELL: It'll distinguish --

THE CHAIRPERSON: So Conawapa's out of the picture. You have excess transmission capacity out of Bipole III. You don't -- you don't need to rely on US exports in that scenario. I mean, adding an intertie would certainly increase the reliability?

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: But you don't need it. I mean, you don't need it because you have plenty of export -- you have plenty of capacity on that Bipole III transmission line?

MR. WHITFIELD RUSSELL: Well, the Bipole III transmission line would read its -- its function as a backup would be reduced by 630 megawatts, okay.

So if there were insufficient transmission import capacity in that situation you -- you would need more -- another line, yes. But that -- your -- your question is related to transmission capacity. And my -- my testimony was about the amount of firm capacity backing up any kind of interconnection.

And what I'm saying is that the insistence that the increased 1,500 megawatts of transfer capacity in the alternative to Bipole III as a reliability premise -- at the CEC they said you had to go out and buy 1,500 megawatts of firm capacity in the US to put on that line, and I disagree.

So I took and I went to the pre -- the -- the load capacity tabulations for the Preferred Development Plan and I said, Well, did they impose the same standard on themselves when they expanded the system under the Preferred Development Plan. And what I found was that under the Preferred Development Plan, use of the CEC proceeding would dictate -- a CEC standard would dictate something like 748 megawatts of firm purchases, but they only had six hundred (600) and -- six hundred and five (605) planned.

So that -- that's my point. My point is that it -- it -- that insistence of megawatt-for-megawatt backup on the interconnection to the US was not carried forward in the NFAT, and it helped the economics of the NFAT to depart from that prior -- from that prior insistence.

So -- but -- but to go to your transmission question, I'll -- I just have to do some calculations and -- and answer you. I -- I don't have

it at my fingertips.

THE CHAIRPERSON: Now, I guess the -- one (1) of the suggestions that was made by La Capra is to consider removing a 10 percent cap on imports?

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Now, there are strategic considerations involved here, aren't there, in a sense that, you know, if Manitoba was to remove that 10 percent cap, it then becomes increasingly reliant on US sources of energy to supply its needs?

MR. WHITFIELD RUSSELL: Yes, but there seems to be plenty of it. And because they can store so much energy in the hydro system, I don't think that that poses an -- an immense risk.

THE CHAIRPERSON: But don't -- let's not forget here, we're talking about resource planning. And you're planning ten (10) years ahead of time. And you're saying in lieu building a dam or building a gas plant, we're going to increase imports from the US up to 20 percent, allow us to import power from the US?

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: That's assuming that power's available in the US for us to import, isn't it?

MR. WHITFIELD RUSSELL: Yes, and for the reasons that I stated, I think a winter-peaking

system shopping for power from a summer-peaking system, there should be plenty in the off -- off-peak season in the -- in the US.

THE CHAIRPERSON: But to the extent that you're going to rely on US power, you're going to have to firm it up. You're going to have to -- to sign a contract to get that power in place so you -- you know -- you -- it's available when you need it?

MR. WHITFIELD RUSSELL: Yes, but a -- a reservation -- as I said, a reservation for -- let -- let me just say it this way. When you look at rate schedules for industrial power, when you look at rate schedules for contracts for purchase power -- that is, one (1) wholesale buyer buys from another -- the price of capacity, firm capacity, in the off-peak season -- you take a summer-peaking system in the US. It's being asked to provide firm power in the off-peak period.

Those demand charges associated with that power are well below the marginal cost of capacity. They are delighted to have an additional sale during their off-peak season, because they've got extra capacity and it's -- it's like incremental revenue without much in the way of incremental cost.

So, yes, you would increase -- you would -- you would need some more power, but it tends to be

much cheaper than the marginal cost of adding capacity in -- in Manitoba itself. So the -- the question is: Is it going to be deliverable on a reliable basis? And there's no reason to believe that reliance for 20 percent of your energy, much of which could be brought in during the off-peak hours, even during the winter peak, would -- would endanger the hydro system. I haven't seen calculations or -- or claims that that's the case.

THE CHAIRPERSON: But, you know, the -- the -- if -- if we were to go along with that idea though, we are -- would then become dependant on US supply in a context when we need it without having the knowledge that it's firmed up. Without --

MR. WHITFIELD RUSSELL: Oh --

THE CHAIRPERSON: -- without being sure that there's contract supply available that will be supplied if something goes wrong?

MR. WHITFIELD RUSSELL: I'm -- I'm not making myself clear, and -- and let me say it again. And maybe I should just devise a hypothetical. Let's say instead of looking at Keeyask, looking at firm power new gas generation in Manitoba, e decide to go to MISO or Southwest Power Pole, or maybe over to Chicago in the -- in the PJM area, their western extremity, and

line up a firm purchase, okay? And -- but I only want it for the peak months of the winter. And that -- that -- believe me, in the -- in a summer-peaking system there will be capacity available, and it will command a far lower price. Firm power during the off-peak in the US, will command a far lower price than it would for year-round or a peak period.

So it's there and it's available at a price below what you would pay to build something new in Manitoba to meet the winter peak in Manitoba. And now that -- that's my experience in -- in buying power and selling power.

THE CHAIRPERSON: Well, I -- I think that -- you know, where I'm disagreeing with you is that we're -- we're talking about supplanting firm, you know, generation capacity in Manitoba in favour of US generation capacity.

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Now, we would be doing that at a time when -- you know, admittedly, we're arguing about when -- when Manitoba needs extra generation capacity, but admittedly, we'd -- we'd be contracting for firm power at some point in the future, relying on US sources to gen -- to provide the capacity for -- for Manitoba.

And we'd have to -- we'd have to sign contracts to ensure the power is there when we need it.

MR. WHITFIELD RUSSELL: If you want a firm power --

THE CHAIRPERSON: Now, we have some inkling of the kind of contracts that Manitoba Hydro has been able to sign in US for -- for selling firm power into the US. So we know what the prices are. They're -- they're good prices for firm dependable capacity. So flip that around now. Now, we're into the US, we're negotiating for firm power at a time when Manitoba needs it.

Do you -- do you really think that we'll get better prices than what Manitoba has -- you know, I -- do you think that we'd get modest prices for that firm dependable capacity?

MR. WHITFIELD RUSSELL: Yes, that's my experience. And -- and like I said, we worked for the Navajo Tribal Utilities in the Four (4) Corner area of the US, a very big bulk power marketing hub. And the demand charges that we're negotiating are literally 50 percent in the winter, because that's the -- that's the peak in the winter for the Navajos. The price they pay for their power during their peak in the winter is literally half the demand charge they incur for

purchases during the summer. They don't need much during the summer, and so it's -- it's very advantageous.

But, yes, and then if you look at the industrial rate schedules of, like, Pacificorp in the -- the Warren Buffett company in Utah and the surrounding states, those demand charges in the winter are -- are 50, 60 percent of what they are in the -- in the summer. And power in the wholesale market is sold on those kind of principles and on those kind of prices.

In the winter, when nobody is particularly demanding lots of extra capacity in a summer-peaking system, you -- you can negotiate much better deals. And the price at which they'll sell during their off-peak season is below the marginal cost you would incur to build something new in Manitoba.

THE CHAIRPERSON: Now, you know, I hear you on the winter capacity.

MR. WHITFIELD RUSSELL: Yeah.

THE CHAIRPERSON: We just finished a very cold winter. And I'm -- I'm reading the material that comes out of the MISO footprint indicating the strains that that cold winter has placed on the -- on that MISO system --

MR. WHITFIELD RUSSELL: Okay.

THE CHAIRPERSON: -- in the northern part.

MR. WHITFIELD RUSSELL: Yeah.

THE CHAIRPERSON: And so here we are, winter-peaking capacity, and relying on -- on the availability of US capacity in the wintertime, it seems to me that we're exposing ourself unduly to a potential shortfall of power at the very time when we need it.

MR. WHITFIELD RUSSELL: And -- and I just don't see that. If the transmission capacity is available, your import capacity is sufficient, the power can be delivered from the supplier to your Manitoba border, you can survive N-1 events, then it seems to me that that's not a great risk that's taken on.

I mean, I work for many invest -- some investor-owned utilities, and -- and a far greater number of publicly owned co-ops or municipals. They're entirely dependent upon another supplier. But because they're embedded within a large integrated network and they have strong interconnections to their suppliers, that's not viewed as a particular risk.

You -- you do the -- you do your reliability analysis on the deliverability of the firm

capacity. You check out the firmness of the capacity itself, how -- how much its backed up with, in the form of installed reserves and how it's operated in terms of operating reserves, and that's not an unusual or non-traditional risk. It's -- there's -- as I see it, there's nothing unique about Manitoba's situation which would make that an unwise strategy.

Now, one (1) more thing. The LCA Plan 17 scenario recommending reliance upon imports, they are very clear, and I want to endorse it. But it's not a standalone alternative. It has a lot of advantages in deferring the need for generation in Manitoba, and it may well be it's a stepping stone to a later installation of Keeyask and Conawapa.

So, you see, what -- what adoption of an import or -- or a no new gen case for a while, where you rely on imports, as a transition to a time period when your hydro capacity may be able to command better prices in the US, when the market picks up and stabilizes and gets better, that's what I see the value of that No New Generation case to be.

So you -- you take advantage of low costs that prevail for the -- for the foreseeable eight (8) or ten (10) years, let's say, and go and see what you can find in the way of purchases. See what kinds

of outlays you have to incur to import -- increase your import capacity to a point where you're safe with an N-1 or maybe an N-2 of types. And then go back to Keeyask and Conawapa, when the prospects for that look a lot better.

That, I think, is where the -- the LCA No New Generation case brings a lot of value to the table.

THE CHAIRPERSON: I think that's all the questions that the panel has for now, so I'll turn the microphone over to Ms. Menzies.

MS. MEGHAN MENZIES: Thank you. Thank you, and CAC (Manitoba) has no questions for this witness. Thank you.

THE CHAIRPERSON: Thank you, Ms. Menzies.

Mr. Gange, please?

MR. WILLIAM GANGE: Mr. Chair, I have no questions for the witness panel.

THE CHAIRPERSON: Thank you, Mr. Gange. And, Me. Monnin, s'il vous plait?

MR. CHRISTIAN MONNIN: Merci, M. President. We have no questions either.

THE CHAIRPERSON: So, Ms. Ramage, back to you.

CROSS-EXAMINATION BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Hang on. Yes, I do have a few questions. Mr. Russell, you'd agree that the Board should be concerned with the financial impact of the Preferred Development Plan, that goes without saying, correct?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And the proper means of examining the financial impact of a -- of the Preferred Development Plan is a full scale financial analysis, correct?

MR. WHITFIELD RUSSELL: Presumably, yes.

MS. PATTI RAMAGE: And that would be revenue requirement impacts, and rate -- rate impacts?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And in terms of economic evaluation, this hearing has heard much about it being standard in practice in -- or it's standard and good economic evaluation practice to exclude sunk costs when deciding whether a project should proceed or not.

Do you -- do you disagree that this is standard practice based on sound economic theory?

MR. WHITFIELD RUSSELL: Can -- can I

have the premise for your question?

MS. PATTI RAMAGE: That --

MR. WHITFIELD RUSSELL: That -- you say the Board has already found that it's -- it's proper to ignore sunk costs?

MS. PATTI RAMAGE: No, no. I -- I said that the hearing has heard much evidence that it's standard and good economic evaluation practice to exclude sunk costs when deciding whether a project should proceed or not. And I'm wondering if you disagree that this is standard practice, or that it -- disagree that that's sound economic theory.

MR. WHITFIELD RUSSELL: Oh, no, I disagree. I mean, we -- we've been down this road in the United States many times with nuclear plant over -- cost overruns. And what the story goes oftentimes is this:

You get a cost overrun. They're challenged by the regulators. And they say, Oh, well, just ignore those sunk costs. Completing this nuclear plant is going to be cheaper than looking at all the other alternatives on the table. So they go ahead it again and there's further cost overruns. And again, the scenario repeats itself.

I think racking up large billions of

dollars of sunk costs is something that ought to be looked at and -- and develop a strategy for catching them early and seeing whether they can be avoided. And so I just don't think it's -- it's appropriate in any way to ignore sunk costs in a going-forward under all circumstances. We ought to -- we ought to be trying to avoid the costs of -- of large sunk costs that don't contribute to the overall lowest cost plan.

MS. PATTI RAMAGE: You said you don't think, but in -- in economic theory is it not standard practice to -- to ignore sunk cost?

MR. WHITFIELD RUSSELL: You mean -- you mean...

MS. PATTI RAMAGE: Yeah, when you're calculating an IRR or an NPV, you don't include the sunk costs, correct?

MR. WHITFIELD RUSSELL: Well, that -- that's what you've done here, but we're talking about a regulatory situation where we're concerned about excessive rates. The customer's going to pay for those sunk costs. If there's a way to avoid those sunk costs, yes, I think we should look at a methodology to lessen them and avoid them insofar as possible, so that we don't have a large amount of sunk costs for attributes of a plan which don't contribute to its --

to its cost effectiveness and efficiency.

MS. PATTI RAMAGE: But you acknowledge the money's already been spent and that it has to be paid somehow, correct?

MR. WHITFIELD RUSSELL: Oh, I'm not disputing the facts that the -- the money's been spent. The question is what could we have done to avoid it.

I think if you had the No New Generation case on the table at the time Bipole III was approved, and Bipole III was subjected to an NFAT, and -- and La Capra came in with a repo -- with a -- with a -- some version of Plan 17, I think we'd be in a very different world today.

MS. PATTI RAMAGE: Sir, do you have an example of a proceeding like this where sunk costs are ignored?

MR. WHITFIELD RUSSELL: I -- I don't, no. But I do know that sunk costs and cost overruns have been a subject of many disallowances by investor owned utilities that built excessively costly nuclear plants. So that's -- that's the concern we're trying to address.

MS. PATTI RAMAGE: So that disallowance though is in the rate-setting -- is in a rate-setting mode, not whether to move forward or not?

MR. WHITFIELD RUSSELL: Yes, but the regulatory authority typically had jurisdiction over the planning and irriga -- and the integrated resource plan which lead up to it being placed in rate-based -- or being requested for rate-based treatment.

So the -- the thing -- the thing which distinguishes matters here in Manitoba is that this Board has jurisdiction over rates, but it seems to me it doesn't have any cost-effective way to control the buildup of the sunk costs which go into those rates. And disallowing the inclusion of sunk costs in rates, you know, with -- with a province-owned utility system, I -- I just -- I think all that does is undermine the indicators of financial health.

So it's just a no win situation that I think the Board finds itself in.

MS. PATTI RAMAGE: Okay. Thank you. And it occurs to me, Mr. Chairman, I jumped in, I actually have some documents to distribute and a stick. So if I could just have a moment to pass those out?

THE CHAIRPERSON: Go ahead, please.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And just a couple of

housekeeping matters as we go. I had also passed out the response to GAC's Pre-ask which we had identified as Manitoba Hydro Exhibit 199, and we should probably get that on the record so that we can call this short, little book of documents Manitoba Hydro exhibit 200.

--- EXHIBIT NO. MH-199: GAC Pre-asks of Manitoba Hydro

--- EXHIBIT NO. MH-200: Manitoba Hydro Book of Documents - MMF/WRA

CONTINUED BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: And I'm not going to the book of documents right away, but I was wondering if Diana could bring up page 11 of the WRA presentation this morning.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And on page 11 of your presentation, in the second bullet, you refer to the market for firm exported -- exported power.

Do you see that?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And are you...

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: It's back on. I said, "yes."

MS. PATTI RAMAGE: When you refer to market are you referring to Manitoba Hydro's market in this bullet?

MR. WHITFIELD RUSSELL: I'm referring to the market for exported power in the US.

MS. PATTI RAMAGE: So the -- the market that Manitoba Hydro can export its power to?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: You're aware that Manitoba Hydro has signed contracts with Minnesota Power, WPS, and NSP?

MR. WHITFIELD RUSSELL: I understand they're contingent on completion of additional -- well, some of the contracts are not con -- conditional. Yes, they have signed contracts.

MS. PATTI RAMAGE: And these contracts are -- are for energy from new hydraulic generation?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And would you agree

then that these customers are not interested in power from Manitoba Hydro thermal resources? They've contracted for hydro generated power?

MR. WHITFIELD RUSSELL: I agree, they have, yes.

MS. PATTI RAMAGE: So on what basis would you conclude that the price Manitoba Hydro's customers are willing to pay -- pay for power is based on the cost of thermal resources?

MR. WHITFIELD RUSSELL: Oh, that would be their alternative if they didn't have access to Manitoba Hydro. Now, the -- let's -- let's just refine that a little bit. To the extent this satisfies a renewable portfolio standard requirement, and -- and -- then -- then I think what -- what you're comparing is a slightly different issue; that is, if Manitoba Hydro power in the hands of the purchaser qualifies it for satisfaction of its renewable portfolio standard. And if it would otherwise have to go to wind generation in combination with thermal resources, we wouldn't be -- we wouldn't be confined to this narrow set of alternatives that I've laid out in this -- in this bullet.

MS. PATTI RAMAGE: If we could turn to page 14 of the presentation now. On page 14 at the

third line of the -- on the third line there, you refer to customer resistance to buy power from Manitoba Hydro.

Do you see that? Or buyer resistance.

MR. WHITFIELD RUSSELL: Yes. If -- if the cost of the Manitoba Hydro is going to be higher than their alternative portfolio which would satisfy their needs, yes, there would be resistance.

MS. PATTI RAMAGE: Are you aware of Mr. Cormie's testimony in this hearing that Manitoba Hydro has effectively sold out all of the new hydraulic energy from Keeyask?

MR. WHITFIELD RUSSELL: I was not.

MS. PATTI RAMAGE: Okay. Are you aware of Mr. Cormie's testimony that Manitoba Hydro's 308-megawatt agreement with WPS represents roughly 30 percent of the output of Conawapa?

MR. WHITFIELD RUSSELL: I wouldn't dispute it, but I'm -- my -- my issue is at what price as compared to the cost.

MS. PATTI RAMAGE: And you haven't seen that price, correct?

MR. WHITFIELD RUSSELL: No. That's all CSI. I wasn't allowed to see the contract prices.

MS. PATTI RAMAGE: Right. You're aware

that Manitoba Hydro has signed MOUs with SaskPower and Great River Energy for a total --

MR. WHITFIELD RUSSELL: I was generally aware, yes.

MS. PATTI RAMAGE: And that's 1,100 megawatts of power from Conawapa?

MR. WHITFIELD RUSSELL: I -- I'll accept that.

MS. PATTI RAMAGE: Okay. Would you accept then that these agreements and MOUs add up to 1,408 megawatts of power which, when you add the 10 percent required to get that -- to move that power, is 1,550 megawatts, or greater than the capacity of Conawapa?

MR. WHITFIELD RUSSELL: I'm -- I'm not disputing that. The question is at what price? The incremental price versus the incremental cost. And I haven't seen that.

MS. PATTI RAMAGE: If we could turn to page 40 of the presentation.

Now, at page 40, you suggest that there are entities with surpluses willing to sell energy to Manitoba Hydro.

Do I have that correct?

MR. WHITFIELD RUSSELL: Yes. I would

expect so, yes.

MS. PATTI RAMAGE: And are any of these entities the ones that Manitoba Hydro already has sales agreements with?

MR. WHITFIELD RUSSELL: Not necessarily. In other words, further south where there's less exposure and more surpluses, the -- the -- I would expect there to be more firm surpluses in -- in the winter for -- for use by Manitoba Hydro. The question is whether you can transmit it, the upgrades can be justified, and -- and can be accomplished.

In other words, all the intervening parties with which you have bilateral arrangements have an obligation to transmit power to other buyers and sellers.

MS. PATTI RAMAGE: So when you're saying further south, can you identify any -- any party in particular that has this surplus power --

MR. WHITFIELD RUSSELL: No.

MS. PATTI RAMAGE: -- or are we just -- it all conjecture?

MR. WHITFIELD RUSSELL: I -- I don't -- it's not conjecture. I know such transactions are available, and in the ordinary course of my -- of my consulting business over the past thirty (30) some

years, that's -- that's been -- that's been the -- the way it's done. That's been the expectation, and it's been proven out in practice.

MS. PATTI RAMAGE: Now, I note in slide 40 you refer to PJM and SPP.

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: You're -- you're aware of course that there's no transmission path between PJM and SPP to -- to Manitoba Hydro?

MR. WHITFIELD RUSSELL: Of course there is.

MS. PATTI RAMAGE: There -- firm transmission?

MR. WHITFIELD RUSSELL: Well, yeah, from -- from Chicago it would be a backhaul, I would think. Sure, why not. The prevailing flow is from west to east during the summer peak. Why -- why wouldn't -- why wouldn't Commonwealth Edison in Chicago, or someone in eastern Wisconsin want to sell power to you in the winter?

MS. PATTI RAMAGE: The testimony that we've heard to date is that there is no firm transmission from further -- further east. So are you able to confirm -- confirm absolutely that that exists, or are you just guessing that that might be there?

MR. WHITFIELD RUSSELL: I'm -- I'm making a very different point. The absence of existing firm transmission capability should not be a constraint in a long-range arrangement. Each of those transmission owners between you and a potential supplier has an obligation under their Open Access Transmission capaci -- Tariffs to build transmission upgrades in first-come first-serve basis as requested.

If you identified a low cost supplier, which was able to sell you power at -- at a commensurately reasonable rate in the winter and there was some constraint between your potential supplier and the Manitoba border with the US, you can file a request under the OATT. In the case of MISO, MISO would administer the OATT. And they -- if you long -- as long as your supplier met the milestones and paid the fees for the studies, and they would get their firm transmission upgrades and be able to deliver.

Very often, however, the situation in -- in a -- the US is that if you're going to do a backhaul, say from Chicago, I expect the prevailing flow, in my experience working in -- in Wisconsin, the prevailing flow on the transmission systems is towards Chicago. If Chicago -- Commonwealth Edison in Chicago, or Exelon, wanted to generate and sell power for sale

in Manitoba, there would be a backhaul. They would be unloading facilities when they cranked up generation.

So I have two (2) expectations: 1) that a supplier from a backhaul would be feasible, and second, that if it's not, you can exercise -- your supplier can exercise his rights under the OATT. O-A-T-T.

MS. PATTI RAMAGE: Under the Open Access Transmission Tariff though, you'd be paying point-to-point rates through various trans -- jurisdictions, correct?

MR. WHITFIELD RUSSELL: It -- it depends. If you want to -- if you want to establish yourself as a network customer you could get network service.

MS. PATTI RAMAGE: Have you studied the costs of either network service or point-to-point to do that?

MR. WHITFIELD RUSSELL: I have not. That's the whole purpose of making a request under the OATT, so the -- the intervening utilities, or the transmission provider, is obligated to give you those prices on a -- on a first-come first-serve basis.

THE CHAIRPERSON: Mr. Russell, could you move you -- could you move your microphone this way

a little bit? Yeah, a little bit more.

MR. WHITFIELD RUSSELL: Yeah, I apologize.

THE CHAIRPERSON: I think just -- we're getting too much echo. Thank you.

MS. GENEVA LOOKER: I just wanted to add also that between PJM and MISO there is no double transmission charge, that they have removed the pancaked rates and you only pay one (1) transmission charge.

(BRIEF PAUSE)

CONTINUED BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: If we could turn to page 41 of the presentation. Here you're referring to FERC Order 1,000?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And it's intent to incent construction of new transmission in the US?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: Are you also aware of state legislation in Minnesota that provides incumbent utilities with the right of first refusal when transmission is built?

MR. WHITFIELD RUSSELL: I would be surprised if that would withstand challenge, but I don't deny that it exists. We have the national -- what is it, NIETC -- National Interest Electric Transmission Corridor bill, which is addressed to those very situations where you've had repeated instances in the United States where needed interstate transmission is -- is frustrated and stopped by a refusal of a state commission to approve facilities needed by an out-of-state buyer or seller.

And so this -- this federal legislation in the US was put in place to -- to resolve just that situation. I think -- I think it would be a problem in the short-term but not in the long haul.

MS. PATTI RAMAGE: Would you be suggesting to this panel that it's a good ideal to drop Manitoba Hydro in the middle of a state versus federal battle in the US?

MR. WHITFIELD RUSSELL: No. I'm saying that if the economics are sufficiently robust, your potential seller would be delighted to take on such -- such a trans -- such a challenge. But in the meantime, they have their rights under the OATT, So I'm not sure how the -- how the state of Minnesota could under the federal preemption principles that govern FERC's

jurisdiction over transmission.

I mean, FERC has exclusive jurisdiction over transmission. If -- if FERC, in administering or enforcing its OATTs of it's jurisdictional utilities, tells -- tells you that you are entitled to get transmission from a supplier, then the battle becomes between FERC and the state of Minnesota. I don't think that's going to withstand a challenge.

MS. PATTI RAMAGE: Page 41, we're still there. In the last bullet you suggest that Manitoba Hydro may be able to buy firm power on a seasonal basis.

Do I have that correct?

MR. WHITFIELD RUSSELL: During the off-peak season, yes.

MS. PATTI RAMAGE: Are you familiar with MISO resource -- the MISO Resource Adequacy Construct?

MR. WHITFIELD RUSSELL: Not -- I'm not -- I'm aware that such a thing exists. I'm -- I'm not familiar with the details.

MS. PATTI RAMAGE: Well, sir, would you accept, subject to check, that there exists a MISO requirement that capacity resources be available year - - year-round?

MR. WHITFIELD RUSSELL: For what purpose?

MS. PATTI RAMAGE: Well, MISO requires the capacity be available year-round. And -- and that being the case, how -- I'm asking how Manitoba Hydro could contract for seasonal capacity?

MR. WHITFIELD RUSSELL: I just can't answer until I see the -- the -- see what the policy is. It doesn't make sense to me.

You couldn't pull forced -- you couldn't pull a maintenance outage if that was the requirement. You had to be available year-round. I -- I'm not sure I understand your point.

MS. JESSICA SAUNDERS: Yes, Ms. Ramage, if I could just intervene here. Is there anything in your book of documents that you could refer Mr. Russell to?

MS. PATTI RAMAGE: Not -- no, it's not in the book of documents.

MS. JESSICA SAUNDERS: Okay.

MS. PATTI RAMAGE: But I'm asking Mr. Russell if he understands the MISO -- but we can back up a step.

Does he have knowledge of MISO's Resource Adequ -- Adequacy Construct when making these

recommendations? Is he confident that his recommendations meet with that construct?

MS. JESSICA SAUNDERS: And I just want to confirm that Mr. Russell has a full understanding based on what you've explained of the construct in order to respond.

MS. PATTI RAMAGE: I would suggest it should be his understanding, not mine; but if he -- if he's able to confirm that he understands that construct.

MR. WHITFIELD RUSSELL: As I said, I'm not familiar with the details of that, so I can't really help you there.

CONTINUED BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: This morning during -- or I guess more this afternoon during your testimony you were discussing the import-only line. And I'll say my understanding of import-only line was no new long-term firm contracts at the front-end to justify the line or -- or no counterparty purchasing firm power from Manitoba Hydro to justify that line.

Is that consistent with your understanding?

MR. WHITFIELD RUSSELL: May I have the

question again, please.

MS. PATTI RAMAGE: I'm asking: Is no new long-term firm contracts at the front-end of the import-only to justify the line? Is that what you understand import-only line to mean?

MR. WHITFIELD RUSSELL: I don't know what you mean by "import only line." Is that what you're saying? You want me to say --

MS. PATTI RAMAGE: I'm asking you -- my understanding of what import-only line is no new long-term firm contracts to justify the line. And is that consistent with yours, or do you -- your understanding, or do you apply a different meaning?

MR. WHITFIELD RUSSELL: I just -- I just don't have an understanding of what that term means. If that's what you mean by that term, that -- that's...

MS. PATTI RAMAGE: Well, in your evidence you -- you critiqued this -- the import-only line as being, as I recall, something where you didn't believe that a line would ever import only. Which I'm saying is not my understanding of what La Capra meant when it called it an import-only line. What they meant was -- my understanding was that they meant that there would be no contract.

MR. WHITFIELD RUSSELL: All right. Let me -- let me clarify. And I'm not -- I'm not trying to be argumentative here. This import-only term was invoked in your rebuttal testimony with respect to a new AC interconnection to the US in the CEC proceeding as an alternative to Bipole III. You invoked it. I didn't -- it didn't have any meaning to me in that context. And -- and that's what I was responding to in my testimony.

MS. PATTI RAMAGE: So you weren't responding to the La Capra import-only line --

MR. WHITFIELD RUSSELL: No, no.

MS. PATTI RAMAGE: -- in that scenario?

MR. WHITFIELD RUSSELL: I was responding to your rebuttal.

MS. PATTI RAMAGE: Okay. If I could, in the -- the book of documents that we've brought up -- on the first page of that book of documents. I wanted to explore with you the commentary regarding LCA's Plan 17.

And here you've said Plan 17 looks promising, correct?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And if we turn to page 7 --

MR. WHITFIELD RUSSELL: I didn't use those words specifically, but I think -- I think that's -- that's a fair characterization.

MS. PATTI RAMAGE: Oh, I think the heading actually says, "LCA's Plan 17 looks promising."

MR. WHITFIELD RUSSELL: Oh, yes. Okay. Yeah. Okay.

MS. PATTI RAMAGE: I tried not to read. I'm sorry, panel. I was trying not to read a quote, but see what happens when I try to paraphrase.

MR. WHITFIELD RUSSELL: Good catch. Thank you.

MS. PATTI RAMAGE: At page 17 --

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: -- and now I'm going to read -- the third bullet. And this is slide 33 from La Capra's presentation. And they said:

> "While a hypothetical plan, the results point to potential for added elements to other plans such as increased import capability and DSM."

Do I take it from your evidence that both you and La Capra agree Plan 17 is a hypothetical plan?

MR. WHITFIELD RUSSELL: Yes, they were

wary of recommending its implementation and adoption without sub -- substantial further study. They also, as I read their testimony, wanted to -- it to be considered in connection with other plans -- its elements in connection with other plans, especially for its cost effective attributes.

MS. PATTI RAMAGE: And you're aware that Manitoba Hydro has filed in its Exhibit 104 an analysis of additional levels of DSM?

Is that -- are -- were you aware of that analysis?

MR. WHITFIELD RUSSELL: I -- I had -- I had read that that was the case, the Levels 1, 2, and 3 DSM, yes.

MS. PATTI RAMAGE: And if we could go to page 4 in this -- I hate to call it a book of documents, this pamphlet of documents. This would Manitoba Hydro's Exhibit 171, and it presents the results of some of that analysis. And if we look at -- of Exhibit 171 and look at the Level 2 DSM which is the -- the large box in the middle of the page --

MR. WHITFIELD RUSSELL: I see it.

MS. PATTI RAMAGE: -- on the left-hand side.

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: We see that three (3) of the plans shown in that exhibit, Plans 5, 6, and 14 include the 750 megawatt interconnection.

Do you see that?

MR. WHITFIELD RUSSELL: I see 5, 6, and 14, yes.

MS. PATTI RAMAGE: Now, if I could have you turn to page 5 in the documents. Here we have tran -- a section of the transcript. And we have Mr. Peaco of La Capra responding to Board member Bel's question regarding the 750 megawatt interconnection and the thought of raising the import floor. And if I -- I could read for the record, Mr. Bel asks:

> "So it's -- we have the 750 megawatt interconnection, and we have a raise in the import floor. So we doubled the amount of the imports that are allowed?"

And Mr. Peaco answered, "Yes."

Do you see that?

MR. WHITFIELD RUSSELL: On page which --

MS. PATTI RAMAGE: Sorry, it's 5,727, the bottom left-hand corner --

MR. WHITFIELD RUSSELL: I was -- I was looking at the wrong place. I apologize. Excuse me.

MS. PATTI RAMAGE: Yeah, sorry. Beginning at lines 20 through 24. I'll give you a minute to read that.

MR. WHITFIELD RUSSELL: Thank you.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: I see it, yes.

MS. PATTI RAMAGE: Yeah. And I'm then going to have you turn the page to transcript page 5,732. And this is the continuation of that discussion. And here, I'll -- I'll read it into the record. And I'm looking at page 5,732, lines 5 through 15, which read -- Mr. Peaco says:

"There's -- there's a determination as it -- you know, how much -- how much are we going to rely on imports is really a policy determination, because there's -- there's a policy that Manitoba Hydro uses in its planning and it -- and it could be different. And we've talked about the issue separately in our reports. And -- and this -- this case was an -- an -- was an opportunity for us to

test, you know, does it make any difference if we relax that? And -- and so you see the combined effect of both those things in that effect -- or, sorry, in that case."

And when I'm reading that, would you agree that the combined effect that is being referred to is relaxing the import policy and the effect of the import line?

MR. WHITFIELD RUSSELL: I so took it, yes.

MS. PATTI RAMAGE: Okay. So if we could now turn to page 8 in this document, we're going to see -- we have here Manitoba Hydro Exhibit 104-14. And here, Manitoba Hydro has provided a comparison of La Capra's hypothetical Plan 17 to Plan 14.

Have you -- are you familiar with this exhibit?

MR. WHITFIELD RUSSELL: I -- I have seen this exhibit before, yes.

MS. PATTI RAMAGE: So you see the table on the left-hand side. There's a comparison of Plan 1, being the All Gas Plan, Plan 17, together with three (3) different variations of Plan 14.

Do you see that on the left?

MR. WHITFIELD RUSSELL: I do, yes.

MS. PATTI RAMAGE: Okay. Plan 17 is labelled 'LCA No New Generation' and is described as LCA load reduction 750 megawatt, relaxed import criteria, extended diversities.

Do you see that?

MR. WHITFIELD RUSSELL: I do.

MS. PATTI RAMAGE: And the associated incremental NPV for Plan 17 is $1,421 million.

Do you see that?

MR. WHITFIELD RUSSELL: I -- I thought it was 1 billion four (4), but --

MS. PATTI RAMAGE: Oh, 1.421 billion would be the other way to say that.

MR. WHITFIELD RUSSELL: I thought it was 1.4 -- 4 billion, yes.

MS. PATTI RAMAGE: Okay.

MR. WHITFIELD RUSSELL: Yeah.

MS. PATTI RAMAGE: Now, the first Plan 14, which is the Keeyask19/Conawapa25/750 --

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: -- you see that the incremental NPV for that 1.696 billion?

MR. WHITFIELD RUSSELL: I do.

MS. PATTI RAMAGE: Okay. Now, Plan 14

is then repeated and labelled as Keeyask19/Conawapa30/750 megawatts.

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And it's described as LCA load reduction, MP sale, WPS sale, and investment.

Do you see that?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And GRE diversity extension. I forgot to -- to -- that's also included in that plan, correct?

MR. WHITFIELD RUSSELL: I so took it.

MS. PATTI RAMAGE: And the associated incremental NPV is $2.607 billion for that plan, correct?

MR. WHITFIELD RUSSELL: I understand, yes.

MS. PATTI RAMAGE: So the comparison between the two (2) plans labelled as Plan 14 provides a direct comparison of the impact of the load reduction and the diversity extension between those two (2) plans, correct? That's the difference.

MR. WHITFIELD RUSSELL: I -- I note that the All Gas Plan it's being compared to is with no load reduction. Is that right?

MS. PATTI RAMAGE: That's correct.

MR. WHITFIELD RUSSELL: I'm -- I'm puzzled about the -- the meaning of this without also doing the load reduction on the no -- All Gas Plan. Is there some reason that wasn't done?

MS. PATTI RAMAGE: For our purposes, what we're doing is comparing the LCA No New Generation Plan to the Plan 14. So what we're trying to do here is -- is demonstrate the difference between the load reduction -- no load reduction and the load reduction.

MR. WHITFIELD RUSSELL: I understand that, but if we're comparing LCA with a load reduction, Plan 14 with a load reduction, why wouldn't we also do the All Gas load reduction? I -- I'm not sure.

MS. PATTI RAMAGE: Yeah, yeah. That -- that may be done in another analysis, but for the purposes of -- of this is to compare these -- the plan -- the 14 with no load and with load reduction. So if you could just follow me on that. You'd agree that the difference between the 2.6 billion and the one point six (1.6) is roughly $900 million.

Is that correct?

MR. WHITFIELD RUSSELL: I -- I agree, but I question the significance. Yes.

MS. PATTI RAMAGE: Well, would you

agree that the value of the load reduction, if we're talking to Plan 17, where it has LCA load reduction, that would also have the same LCA load reduction as the second Plan 14?

If we're talking LCA load reduction in that Plan 17 and the second Plan 14 also has LCA load reduction, that would be the same load reduction, correct?

MR. WHITFIELD RUSSELL: I think we'd want to see the All Gas case with load reduction to reach any significant conclusion here.

MS. PATTI RAMAGE: You'd agree, though, that Plan 17 load reduction -- with load reduction and Plan 14 with load reduction would be dir -- directly comparable?

MR. WHITFIELD RUSSELL: Yes, yes. But you must understand that my opinion is the NCA -- the LCA No New Generation case would not need Bipole III, but case 14 would. And if you took 5 -- 3.3 billion in avoided Bipole III costs and put them on top of case 17, it would be substantially higher than case 14 with load reduction.

MS. PATTI RAMAGE: But, sir, Bipole III is in every single one (1) of these. We reviewed that this morning.

MR. WHITFIELD RUSSELL: I know that. That's -- that's the point of my testimony. It shouldn't be.

MS. PATTI RAMAGE: But these numbers, it is.

MR. WHITFIELD RUSSELL: That's right.

MS. PATTI RAMAGE: That's right. And the difference between those two (2) numbers is 900 million, correct?

MR. WHITFIELD RUSSELL: Oh, yes. Yeah, I -- I -- yes, I don't dispute that. Well, six ninety-six (696), it's a little less. It's --

MS. PATTI RAMAGE: I think it's nine eleven (911) to be exact. And that --

MR. WHITFIELD RUSSELL: Six-nine-six (696), yes. Okay. Yeah.

MS. PATTI RAMAGE: And that same nine hundred and eleven (911) on account of load reduction that's in 14 would be the same nine hundred and eleven (911) that's on account of load reduction in Plan 17.

That -- nine hundred and eleven (911) would make up -- or of that fourteen (14) -- $1.421 billion, 911 million is on account of load reduction, correct?

MR. WHITFIELD RUSSELL: I see the

arithmetic. I don't see the significance of it without doing a load reduction on the All Gas case.

MS. PATTI RAMAGE: Sir, I'm -- I'm somewhat limited in terms of how I can help you, because this is LCA's calcula -- or this is -- they started this -- this plan. So I -- I have to deal with what I have here. And -- and I'm simply trying to confirm that of the $1.421 billion, $911 million of it is on account of a load reduction.

That's what this -- this exhibit tells us.

MR. WHITFIELD RUSSELL: May I have the question again? I didn't follow it.

MS. PATTI RAMAGE: I'm asking you whe - - to confirm that if -- if the load reduction is $911 million, as between -- when you compare a plan with the -- with no load reduction and a plan with load reduction, and that's the comparison of the two (2) Plan 14s, we -- we've confirmed that $911 million is on account of the load reduction, correct?

MR. WHITFIELD RUSSELL: Yes, but the significance of it without redoing the All Gas case with load reduction is lost on me, so.

MS. PATTI RAMAGE: It -- it's lost on me why the All Gas case is -- why you need that load

reduction, because we're determining that amount by comparing the two (2) 14s. We have a consistent figure in All Gas, and then we have the two (2) Plan 14s: one (1) with, one (1) without. And we -- we know that the difference is $911 million. I think we've agreed on that number.

And what I'm -- I'm trying to understand -- or trying to get you to is that same nine hundred and eleven (911), that's the amount of load reduction, that's the value of the load reduction portion of this NPV?

MS. GENEVA LOOKER: I would like to add that where we have a problem with this comparison that you're trying to make is that we believe that there should be a comparable run of case 17 with no load reduction. You're trying to make us compare these two (2) case 14s to a case 17 that doesn't have a comparable run.

We don't know what all of the elements are and how they combine together in case 17. And -- and this is why we are reluctant to agree with your question here.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Are you suggesting then that you've recommended this alternative without understanding the difference between these?

(BRIEF PAUSE)

MS. GENEVA LOOKER: No, as we've stated, we -- and I think everyone has felt that they were all amazed at the difference and the positive benefits that arose out of these elements. And it would have been nice to have been able to explore more and had more runs done with variations to them.

And the problem is here you're showing -- you're trying to make a comparison, and without more information we don't feel that we can agree with that comparison.

(BRIEF PAUSE)

MS. PATTI RAMAGE: You'd agree though that it certainly -- this suggests that a lot of the benefit is -- as between the -- a lot of the benefit of these plans is as a result of the load reduction?

MS. GENEVA LOOKER: Yes.

MS. PATTI RAMAGE: Okay. And do you

adopt that, Mr. --

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: -- Russell?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: Thank you.

MR. WHITFIELD RUSSELL: I -- I volunteered to jump in if I had to. I didn't have to.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Russell, you spoke about your clients who count on external suppliers to help them meet their peak load.

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: Do those customers experience long periods of minus 30 degrees or colder over those peak periods?

MR. WHITFIELD RUSSELL: It gets pretty cold around Messina, New York, yes.

MS. PATTI RAMAGE: As cold as Winnipeg?

MR. WHITFIELD RUSSELL: Not as cold as Winnipeg, but it gets pretty bitter, and in Maine too. I grow -- I grew up in Maine.

MS. PATTI RAMAGE: And do those customers count on electricity for heat?

MR. WHITFIELD RUSSELL: Less so in the non -- in the investor owned ones that rely on thermal fossil fuel, no. But there are some -- there are some communities served by the New York Power Authority, which is pretty much all hydro, and I think there's some substantial reliance on electric heat there, yes, because it's so cheap.

MS. PATTI RAMAGE: And if I could just have a moment.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And with that, I think that concludes our questions, so I want to thank you both --

MR. WHITFIELD RUSSELL: Thank you.

MS. PATTI RAMAGE: -- for coming up and testifying. And if I could maybe turn over the mic to Mr. Peters, but I'm going to suggest we have a quick break, because I got rushed down here right after lunch.

THE CHAIRPERSON: That's a very good idea. So I think we'll take ten (10) minutes.

--- Upon recessing at 2:56 p.m.

--- Upon resuming at 3:15 p.m.

THE CHAIRPERSON: I believe that we can resume the proceedings. So, Mr. Peters, please.

CROSS-EXAMINATION BY MR. BOB PETERS:

MR. BOB PETERS: Thank you. Thank you, Mr. Chairman. Good afternoon, Ms. Looker, Mr. Russell.

MR. WHITFIELD RUSSELL: Good afternoon.

MR. BOB PETERS: I'll start my questions going through your slide presentation. Just for ease of following, if Diana can assist me on that. But we'll start off on your slide number 5, please. And that's slide 5 of MMF Exhibit 31 revised.

The general thrust, Mr. Russell and Ms. Looker, of -- of the -- this portion of your written pre-filed evidence also found in MMF Exhibit 14 is to the effect that from Whitfield Russell Associates's perspective, the seventy-eight (78) year study period is not the correct period of time in which to analyze Manitoba Hydro's needs.

Would that be correct?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And are you suggesting a shorter period of time, such as the twenty (20) year

that was used in the financial resources, or is it thirty-five (35) years as done in the Power Resource Plan?

What number does WRA suggest is more appropriate than the seventy-eight (78) years?

MR. WHITFIELD RUSSELL: Well, in -- in fairness, we're -- we're not used to dealing with hydro systems, so there is -- there is that unique thing. But we're -- we usually see twenty (20) to thirty (30) year horizons on planning studies.

MR. BOB PETERS: And are those -- are those -- sorry, I didn't mean to interrupt. Are those twenty (20) to thirty (30) year planning studies done primarily for thermal plants?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And does that twenty (20) to thirty (30) year life equate to the probable useful life of the -- of the --

MR. WHITFIELD RUSSELL: Well, it's the economic life. But -- but we've -- we've come across -- Bonneville has -- Bonneville Power Administration has 30,000 megawatts of hydro. I don't recall seeing any of their studies that went seventy-eight (78) years, so. But, of course, they haven't built a lot of new hydro.

You know, they -- but this just is so far out of the range we've every encountered. And it incorporates so much in -- in the way of speculation that it -- it kind of lends itself to -- it kind of lends itself to -- to getting the answer you want sometimes.

MR. BOB PETERS: Do you recall what study period was used in the previous Manitoba Hydro review of Conawapa back in 1990?

MR. WHITFIELD RUSSELL: I do not.

MR. BOB PETERS: One (1) of the other witnesses in this proceeding, I believe it was La Capra, had -- had used what they called cumulative present values, where they took snapshots along the path to seventy-eight (78) years.

You're familiar with that?

MR. WHITFIELD RUSSELL: Yes, we -- we incorporated that exhibit. If you will look at page -- slide 16.

MR. BOB PETERS: And that slide 16 was from the La Capra evidence, but it's not been updated to the most current evidence.

Would that be correct?

MR. WHITFIELD RUSSELL: That's how I took it, yes.

MS. GENEVA LOOKER: It -- this was corrected, but I'm not sure if it includes the updated capital cost information or anything like that.

MR. BOB PETERS: Well, Ms. Looker, if we look in the top right-hand corner on your slide 16, I see the number one billion, six hundred and ninety-six million dollars ($1,696,000,000)?

MS. GENEVA LOOKER: You're corre -- you're right. I believe they corrected it for the years. That's why they called it corrected. But you're right, it is -- it is using the old 2012 NFAT material.

MR. BOB PETERS: All right. Thank you. And -- but they also, in -- in taking their snapshots at different points in time along the cumulative present value, they may have gone twenty (20), thirty-five (35), fifty (50) years?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: Is there one (1) metric that is more valuable than any other metric in the measurements?

MR. WHITFIELD RUSSELL: Well, we -- we work mostly for people that buy and sell power, and so the revenue requirements are -- are of significance to us in our work, and it -- it's just what we're the most

familiar with.

MR. BOB PETERS: So if the revenue requirements are what -- what should drive, that speaks to perhaps the twenty (20) year financial forecast outlook that --

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: -- the utility generally uses?

MR. WHITFIELD RUSSELL: Correct.

DR. HUGH GRANT: It would be helpful to know what the discount rate is on this graph.

(BRIEF PAUSE)

MR. BOB PETERS: Board member Grant, the answer that you've heard is the understanding of the witnesses, which I'm not disagreeing with. But I also think this may be a matter that the panel has asked for La Capra to provide additional information, perhaps a revision. So that, I believe, is still to be filed.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: If we turn to slide 8 as we work our way through, Mr. Russell, Ms. Looker,

the -- this document, I think, the panel has seen before.

But under the US dependable sales, did Whitfield Russell Associates recognize that the US dependable sales included diversity exchange sales at MISO market prices?

MR. WHITFIELD RUSSELL: I did not. That -- that would make a difference.

MR. BOB PETERS: Well, let's -- if -- if we assume that is the case, and if that's found to be the case, what would that -- what imp -- impact would that have on the -- the comments you've made relative to this -- this page?

MR. WHITFIELD RUSSELL: In other words, if you had a diversity transaction with firm power going out and firm power coming in and the dollars balanced out, I'm not -- I'm not sure how the megawatt hours and the dollars would be accounted for on a diversity transaction. But I -- I could see how that would scramble the results, yes.

MR. BOB PETERS: And are diversity transactions a common contractual arrangement in many of the jurisdictions you're familiar with?

MR. WHITFIELD RUSSELL: Yes, they are. We -- we see a lot of that, particularly in the Pacific

Northwest with California.

MR. BOB PETERS: And it's a swapping of capacity basically as between two (2) -- two (2) different entities?

MR. WHITFIELD RUSSELL: Yes. There's a variety of -- of formats. Some, it's you just exchange kilowatt hours at certain guaranteed capacity rates. Sometimes there's no guarantee on the capacity rate. Sometimes -- for a long time, Bonneville sold capacity for 2,500 kilowatts of energy every year. And so that was a way to get energy, but not get a capacity charge.

MR. BOB PETERS: And are you aware that Manitoba Hydro's diversity exchanges are done at market -- MISO market prices without -- without capacity charges?

MR. WHITFIELD RUSSELL: I -- I was not. We -- we didn't have access to unredacted contracts, so I didn't invest a lot of time in that. I -- I did not know that.

MR. BOB PETERS: All right. Speaking of contracts, on page 11 of your presentation, you talk about different contracts.

Have you -- have you reviewed in detail the -- the public versions of Manitoba Hydro's export contracts?

MR. WHITFIELD RUSSELL: I read through some of them and some of the term sheets. But without the prices and -- there was some extensive redacted sections in some of the contracts, so -- but, no. It's a very thick book of contracts, and I can't say that I invested a lot of time in it.

(BRIEF PAUSE)

MR. BOB PETERS: I wanted to make sure the panel understood, and I think you and the Chairman may have had some discussion about the second bullet on page 11.

And that had to do with the market for firm exported energy being determined by the marginal cost of the alternative source, correct?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And your suggestion here is that counterparties will pay a certain price for energy regardless of the marginal cost of its generation.

MR. WHITFIELD RUSSELL: Yes. There -- there -- a buyer's going to look at his alternatives. And -- and -- well, I did -- I had some questions from -- I think it was Hydro. If the alternative is

capacity and energy from hydro versus capacity and energy from a thermal plant, that's one (1) set of questions.

If the -- if the issue is buying enough renewable power in the US to meet a renewable portfolio standard, plus firming it up, firming up wind with thermal, that's a different calculation. I think hydro would look better in -- in that sort of a situation. Most -- as you know, most renewable resources other than geothermal, you really can't hold a flat schedule. It's intermittent power and to serve a customer around the year on a firm basis there's not much beyond hydro that provides renewable power that's schedulable and -- and can hold a schedule and be firm.

So this was just a shorthand for making a capacity comparison. I understand that the -- that the calculus engaged in by a US buyer subject to a renewable portfolio standard would -- would encompass a great deal more than what's seen here.

MR. BOB PETERS: When you and the Chairman had some discussion, Mr. Russell, about the purchase of -- Manitoba Hydro purchasing firm energy, you referenced that -- and it may have also been in discussion with Ms. Ramage, that you referenced that there could be a backhaul arrangement, if I understood

correctly.

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And where could power suppliers be located under a backhaul arrangement?

MR. WHITFIELD RUSSELL: Well, downstream as the flow goes. In the US the prevailing flow is from the west, midwest, toward the east coast. And it -- it almost never reverses except possibly during some cold strikes we've had which reversed some power flows.

So if the prevailing flow when you want your power is toward the -- toward the east, and the prevailing flow on the -- and -- and your buyer is located downstream, and if he wants to back schedule some power to Manitoba he's going to unload the transmission network between, say, Chicago and Manitoba when the prevailing flow is toward the east. So you really -- you can expect to have a lot more transmission available for a backhaul arrangement.

MR. BOB PETERS: Would these be firm bilateral arrangements?

MR. WHITFIELD RUSSELL: Sure. They could be. Yes. Or -- or you could have a network arrangement. In other words, if you bought network power you wouldn't have to tie it to a specific

resource. You could tie it to a group of network resources.

MR. BOB PETERS: And how does transmission congestion impact that arrangement?

MR. WHITFIELD RUSSELL: Well, on a backhaul you're much less susceptible to congestion. In fact, you're relieving congestion.

MR. BOB PETERS: On page 10, which I glanced over, it was a page with a lot of numbers on it, Mr. Russell and Ms. Looker. The purpose of your showing this information is -- is to look at the forecasting of Manitoba Hydro relative to certain years, correct?

MR. WHITFIELD RUSSELL: Yes. Yes. And -- and really it was -- it was to reinforce the point made on slide 8 with the historic sales. In other words, the historic sales were plummeting and at the same time the forecast of future sales was plummeting. So that -- that to me was a strong buy signal and certainly not an aggressive sell signal for someone developing a high cost -- capital cost hydro plant.

MR. BOB PETERS: Are you suggesting that the export prices have -- have now bottomed out, so to speak?

MR. WHITFIELD RUSSELL: I -- I was not

saying any such thing. I'm -- I'm -- I don't know how we can be certain of that until it happens.

MR. BOB PETERS: Only in the rearview mirror?

MR. WHITFIELD RUSSELL: Yes. I mean, you have to make a guess. And you do your modelling and you make your best guess, but with the US Congress in charge of carbon emissions we don't know when that's going to happen.

MR. BOB PETERS: On slide 12 you talked about the in-service costs, and you explained your understanding of that to -- to Dr. Grant. Did Whitfield Russell Associates actually calculate the initial in-service costs, that is the annual revenue requirements, for Wuskwatim or Keeyask or Conawapa?

MR. WHITFIELD RUSSELL: No, we -- we know that -- that a $6.3 billion Conawapa cost and a 9 percent levelized annual -- levelized fixed charge applied to a declining rate base. It would start up in the thirteen (13) cent range, I think on Keeyask, yes.

MR. BOB PETERS: The 6.3 million you referenced was for Keey --

MR. WHITFIELD RUSSELL: Six (6) point - - 6.3 billion --

MR. BOB PETERS: Sorry.

MR. WHITFIELD RUSSELL: -- the -- the new one.

MR. BOB PETERS: And that was referencing Keeyask?

MR. WHITFIELD RUSSELL: Yes. So we -- we were -- in other words, by using these ten (10) -- ten (10) cent numbers, the ten (10) hundred dollar per megawatt hour, we -- we were understating the potential impact.

MR. BOB PETERS: Did Whitfield Russell Associates analyze the unit sale prices of the combined-cycle gas turbine electricity going into the future?

MR. WHITFIELD RUSSELL: We've done that on many occasions in the past. We haven't done it recently for this case.

MR. BOB PETERS: What -- what has been the unit sale prices of CCGT?

MR. WHITFIELD RUSSELL: The general rule of thumb when we -- we checked this last fall and got -- got indications from a number of developers and it was around twelve (1,200) hundred a kilowatt completed, was the rule of thumb for combined-cycle gas with no coal generation. With no steam load, in other words.

So you got a -- like a seven thousand (7,000) heat -- or a sixty-three (63) hundred heat rate and twelve (1,200) hundred times whatever the -- the capital structure of the developer was. But it -- it all depends on -- on who the developer is and how his capital structure -- how his project financing is done, and so forth.

MR. BOB PETERS: On your slide 11 you were comparing then that -- that twelve (1,200) hundred dollar per kilowatt number to the nine thousand ($9,000) --

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: -- dollar per kilowatt for -- for the hydro capacity?

MR. WHITFIELD RUSSELL: Correct.

MR. BOB PETERS: And what does the CCGT price work out to in terms of an energy price per kilowatt hour?

MR. WHITFIELD RUSSELL: Well, it depends on the gas price. If you've got a seven thousand (7,000) heat rate on the combined cycle and four dollar ($4) gas, it's twenty-eight dollars ($28) a megawatt hour, and then you add three (3) or four (4) -- two (2) -- two (2) to four dollars ($4) for -- for O&M, so that's another -- that's in the thirty (30),

thirty-two (32) range, and then your fixed charges.

So I haven't -- I haven't done the arithmetic, but that's the general framework.

MR. BOB PETERS: And how much are the fixed charges?

MR. WHITFIELD RUSSELL: Like I say, it depends upon who's financing it and what format. If it's an investor owned utility financing it to put in rate base, you'd -- you'd run a calculation with his -- with his normalized taxes and his -- his capital structure, and you'd get a life cycle cost that way. If it was a project financing with a -- with a 20 percent equity and 80 percent debt, and you'd get a very different and lower cost per capita.

So I'm -- I'm not trying to evade your question. I'm saying it depends on who -- who's building it and for what purpose.

MR. BOB PETERS: Oh, I understand your point. On slide 13 you plotted, from Manitoba Hydro's Appendix 11.3, some average export revenue on -- on its exports to the United States?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: How does Whitfield Russell explain -- Whitfield Russell Associates explain the low value of exports in the All Gas Plan relative

to the -- to the other plans?

MR. WHITFIELD RUSSELL: I -- I don't know what the pattern of sale was. There's certainly going to be fewer sales with the All Gas Plan. So I -- I didn't delve into it, but I would expect that there's -- there's less for sale, and the All Gas Plan probably wouldn't have much in the way of firm sales.

So that would bring whatever they did sell down closer to an opty -- opportunity sale price. But, again, we didn't investigate the details of that modelling.

MR. BOB PETERS: You didn't determine whether or not there was firm export capability?

MR. WHITFIELD RUSSELL: On the gas?

MR. BOB PETERS: Yes, on the All Gas Plan.

MR. WHITFIELD RUSSELL: Correct.

MS. GENEVA LOOKER: The material came from Appendix 11.3. And I don't know whether it's broken down into dependable and opportunity sales. Maybe. I'm not sure.

MR. WHITFIELD RUSSELL: It's -- it wasn't, that I recall.

(BRIEF PAUSE)

MS. GENEVA LOOKER: It is -- it is not broken out. It's just total export sales to the USA.

MR. BOB PETERS: All right. Thank you for that.

(BRIEF PAUSE)

MR. BOB PETERS: On slide 20 -- slide 21, can you explain how the unit cost of Keeyask and Bipole III line was calculated?

MS. GENEVA LOOKER: This was meant to be a very simple analysis. So what we did was I took $6.2 billion for Keeyask, $3.3 billion for Bipole III, summed them up to 9.5 billion, then depreciated them over sixty-seven (67) years and used an 8 percent carrying charge to sort of look at what the revenue requirement would be over time, and then divided by the average megawatt hours output of Keeyask.

MR. BOB PETERS: So the decline in annual unit cost was because of the depreciation that you -- you employed over the --

MS. GENEVA LOOKER: Yes.

MR. BOB PETERS: -- sixty-seven (67) years?

(BRIEF PAUSE)

MR. BOB PETERS: One (1) of the subjects that you talked with, I think, both the panel, as well as Ms. Ramage about, was the -- what's been called the import line. And we could start, I guess, at your slide 39 in terms of a reference slide.

I want to explore and understand better: the suggestion from WRA is that an import line is possible?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: Can you give this panel any examples where an import line has been used?

MR. WHITFIELD RUSSELL: Sure. Southern California Edison is quite dependent upon imports from the desert southwest, which is this -- coal-fired plants to its east, and firm purchases from -- historically, firm purchases from the Pacific Northwest.

So they have a very extensive EHV network dependent upon the availability of those resources. And it's a combination of resources that they own in whole and part, and it's in the desert southwest and -- and sometimes firm purchases.

But these regions, like Southern

California, are -- are very much dependent upon firm imports.

MR. BOB PETERS: And are these transmission lines owned as a merchant line by an investor?

MR. WHITFIELD RUSSELL: Typically, no. It -- they can be now, but, no. Typically, historically, no. They were -- now they're managed and planned by the California ISO. Ownership is private for the most part, and management operation is by the ISO.

MR. BOB PETERS: And is the ownership by -- by an entity that is also the utility, or is it a standalone transmission company?

MR. WHITFIELD RUSSELL: It's -- it's some vertically integrated and some without generation.

MR. BOB PETERS: And is the decision to build or not build made by the investor or is it mandated by the ISO?

MR. WHITFIELD RUSSELL: The OATT administered by the California ISO is what determines, but it's under the general management of California ISO.

Now, there is a hierarchy. In other words, first and foremost, you got to meet the

reliability standards, and if nobody's offering to build a line for import, low cost imports or -- for economic reasons, it's got to be built to maintain reliability standards.

Then if, in addition, someone wants to build a line for economic purposes that's over and above what's required for reliability alone, that -- that's a different kind of calculus, and that also is permitted. And now with Order 1000, planning must been -- must be done to incorporate the need for public policy, satisfying public policy needs, such as renewable power.

So there's -- there's a hierarchy, but it tends to be under the auspices of the California ISO. In my dealing with them on behalf of wind generators, you make your filing with the California ISO and you negotiate with the local owner of the transmission for your needed upgrades.

So if I'm a wind generator in Palm Springs and I want to sell to a customer in the California -- Southern Cal. Edison area, I -- I got to California. The -- the ISO will send me to Southern California Edison for interconnection and transmission, the administration of my needed upgrades.

MR. BOB PETERS: So let's bring that a

little closer to home, or at least my home. And if Manitoba Hydro wanted to have a -- a line into the United States for its exports and also the ability to import, who would it approach? Does it approach the ISO, or does it go to an investor and see if it can strike a --

MR. WHITFIELD RUSSELL: Are we talking about an interconnection to MISO?

MR. BOB PETERS: Yes.

MR. WHITFIELD RUSSELL: All right. Yes, I think -- I think the dealings would be with MISO, but the studies might be conducted -- in the case of the studies we've looked at, the studies might be conducted by one (1) of the investor-owned utilities. We've seen one (1) by XL, and NSP. But this is usually a consortium of engineers from different participants in MISO, and they get together and conduct these studies.

In fact these kind of consortiums date back to my days with PEPCO in the '70s: Multi-company arrangements are -- or groups are assembled to do analysis of needed upgrades.

MR. BOB PETERS: Under the example, who would own the land -- the line -- the line into MISO?

MR. WHITFIELD RUSSELL: Typically in

the US, whoever's service territory it's in owns the line. That was one (1) of the major controversies surrounding Order 1000 because FERC was trying to push independent developers and give them an opportunity to compete for construction of transmission lines. And they finally reached a -- FERC sort of reached a -- a compromise arrangement in which anything built on the existing -- in a transmission owner's rights-of-way would be built by the existing owner; anything on a new right-of-way would be up for competition.

MR. BOB PETERS: So it would have to be the utility whose service territory is going to receive the line that would have to sponsor it through the US regulatory approvals?

MR. WHITFIELD RUSSELL: Not necessarily, no, no. But you'd have to deal with him for getting it done in that territory.

There -- there is a custom, I would say it's a default, that the local in -- investor owned utility owner would -- would build and -- and develop the line sometimes for -- for a joint ownership, and sometimes solely own it, and then render transmission service to the customer. I think you have a mix of both under the arrangements for the line to -- to Minnesota Power.

MS. GENEVA LOOKER: I would note, however, that there has been an increase in merchant -- I'm not sure they're merchant transmission lines, but they are transmission-only companies who have been coming in and proposing to build lines, especially in MISO, currently in order to access wind power and send it to the load centres. And some of those are -- are not the local transmission provider.

MR. WHITFIELD RUSSELL: That's true.

MS. GENEVA LOOKER: And so that is an opportunity -- there are opportunities now to work with some of these newer entities that are out there who are trying to profit from building transmission.

MR. BOB PETERS: Would Manitoba Hydro's, if it could build into the United States a transmission line, have to be coupled with renewable energy proposals to get approval?

MR. WHITFIELD RUSSELL: Not -- not necessarily, no. It would get -- the -- the transmission proponent would file his transmission service request and get in the queue. That's -- that's the typical way you proceed.

MR. BOB PETERS: In terms of Manitoba Hydro having the best access into the MISO market, how deep into the MISO market would it want to have its

transmission?

MR. WHITFIELD RUSSELL: Well --

MR. BOB PETERS: To maximize its return and its ability to sell?

MR. WHITFIELD RUSSELL: The -- it depends. It depends on how much displacement capability there is. And, of course, it depends upon whether you're looking for a backhaul. If -- if you were going east for a supplier, I think you'd benefit more from the -- from the backhaul -- benefits of the backhaul. If you were going to the west, I think there'd be -- some major reinforcements might be needed because you'd be asking for power to be sent in -- in -- as increments on top of the prevailing flow. So you'd need more capability. If you were going south, somewhere in between.

And now the other thing is this power moves thousands of miles -- a thousand miles from California to -- to Bonneville and from -- and even BC Hydro has made sales in Southern California as long -- as far back as the 1960s.

And this is -- this is done by displacement. So you don't have to build a new dedicated line from the buyer to the seller to get the trans -- to get the transaction done. What you do is

you find the choke points on the transmission system through the studies and you upgrade the checkpoint -- the choke points to create the capacity that you need. And very often the power will flow by displacement instead of over a dedicated line.

And again, the only time you get a one (1) to one (1) relationship between the buyer and seller is if you have a direct current line. And so when you see transactions over the DC line from the Columbia River, say, to Los Angeles at Sylmar, S-Y-L-M-A-R, those will be what you put into the -- what you put into the terminal of the line is exactly what you get, less losses, at the far end of the line. And that's the only -- that's the exception to the rule.

All of the AC, alternating current, flows, the power flows by displacement. It's a long answer to your question, but let me just say it this way: If I wanted to go to -- if I wanted to go to St. Louis and buy from Union Electric, which now is called Ameren, A-M-E-R-E-N, a coal-fired utility and I wanted to buy power and have it moved, then he would -- that -- that entity, or you -- or Manitoba Hydro would -- would file their application. And then the studies would be conducted to tell you where all the choke poin -- choke points are and -- and those upg -- and the

cost of making the upgrades to relieve the constraints between Ameren and the -- the Manitoba border with Minnesota.

So that's -- that's the way the process plays out. But you wouldn't have to build a new dedicated line all the way to St. Louis to get that power. You'd pay for the upgrades.

MR. BOB PETERS: And until the study is done, you don't know how many upgrades, or where they are, or what they're going to cost?

MR. WHITFIELD RUSSELL: That's right. And they're done in -- and they're done in the order of the queue.

Now, there's an interesting thing in your case here in Manitoba. Because of those multi-value projects that were underway by MISO, what happens is you do the upgrades under the multi-value program is -- multi-billion dollar upgrades have been -- and if your timing is right and you're shrewd, enough you can get your transmission capacity without making large capital investments in upgrades, because just in association with people prior to you in the queue, sometimes capacity becomes available.

And I think that's one (1) of the arguments that I hear in -- in defence of maintaining

the proposed arrangements, that if -- if you didn't go forward with the Pub Service and the Min Power deal, that preferred position in the queue where you're getting east to west access to Minnesota Power and to Pub Service, if you -- if you struck the deal, you'd fall out of the queue and the guy next in the queue would get that capacity, and you'd go to the end of the queue to make a new request.

So there -- there is -- there is sometimes some savings to be realized on transmission upgrades if your timing is right and -- and you make your request when there's capacity available at no upgrade cost.

MR. BOB PETERS: And when you say, "Pub Service," you're referring to WPS?

MR. WHITFIELD RUSSELL: Yes, Wisconsin Public Service. That's our shorthand for that company.

MR. BOB PETERS: Have you studied Manitoba Hydro's transmission capabilities into the United States at this point in time?

MR. WHITFIELD RUSSELL: Beyond -- no, we were -- we were -- we asked many questions about that. We were not permitted to see the studies. It was all declared to be CSI. We did -- now, there is an Appendix N and an Appendix O to the MISO studies and we

have cited some of those in our -- in our report. We did review those studies, because they -- they evaluated, I think, 2,000 megawatts of additional wind in combination with an 1,100 megawatt export from Manitoba. And those studies are available. We can get them for you.

MR. BOB PETERS: I don't think that's necessary. I think we have access to them, as well, as required. But on slide 40 -- I'm sorry, on slide 41, we're still on the same topic that we've been discussing, and that is what has been called the import line. And you reference on slide 41 many of the things we've talked about.

But the suggestion when you presented this slide was that, based on how much money Manitoba Hydro is having to pay Minnesota Power on account of its taking additional ownership and paying additional capital costs, that suggests that there's an incentive there for parties to come in and pick up the cost of transmission?

MR. WHITFIELD RUSSELL: Yes. And I'm referring specifically to Mr. Jacobson's slide 88 on Exhibit 95.

MR. BOB PETERS: Maybe we'll ask Diana to pull that up. I don't have that committed to

memory, perhaps unlike Dr. Jacobson, but sorry about that. So Exhibit Manitoba Hydro 95, slide 88?

MR. WHITFIELD RUSSELL: Yes, sir. And so what this portrays is the various combinations of Pub Service participation in the new 500 kV line and for a 40 percent ownership. I -- I'm not sure what that 40 percent represents. The 66 percent, I understand, are the percentages of cost responsibility borne by Manitoba Hydro under that scenario.

So there's a 66 percent of the -- of the cost of the capital -- capital cost of the line and the O&M for which Manitoba Hydro is responsible, but it's putting in 304 million to own 49 percent. That's how I understood the -- the testimony.

And then I looked at the ongoing O&M, 567 million. And said to myself, That -- that's a very, very disproportionate amount for O&M. I understand it's a present worth number of future O&M, I took it.

And but I understood from the testimony of Mr. Jacobson that that is accounted for in some substantial part by the fixed charges Manitoba Hydro will pay to Minnesota for the ownership costs differential between its 49 percent ownership and the 66 percent responsibility. And those are some fairly

substantial dollars, as I understand it.

(BRIEF PAUSE)

MR. BOB PETERS: While we're on this slide, and I was pausing to consider whether I would go to -- and maybe I will -- go to Manitoba Hydro's Exhibit 139. It's a public -- it's a public record exhibit. It has some redactions on it. It probably has Dr. Jacobson's fingerprints on it, too.

And I'm not sure if you've had an opportunity, Ms. Looker and Mr. Russell, to review this particular exhibit. And I don't even know what date it was filed.

But is it one that you're familiar with?

MR. WHITFIELD RUSSELL: I have not seen this before.

MR. BOB PETERS: All right.

MR. WHITFIELD RUSSELL: It sound -- it sounds to be on point though.

MR. BOB PETERS: Well, if we could just scroll to the next -- to page 2, I think what we get to is a further explanation. There's a series of tables dealing with capital O&M and -- and certain investments in the -- in the line. And I should indicate that

there have been some written questions posed recently to Manitoba Hydro to clarify certain aspects of this.

So the point I want to get to though is Manitoba Hydro is making an investment in this line because WPS has determined it will not be investing in the line.

Is that your understanding?

MR. WHITFIELD RUSSELL: I so understood, yes.

MR. BOB PETERS: And that being the case, and you're showing us on the previous slide that you looked at which was Manitoba Hydro Exhibit 95 and slide 88 of the revenue that would flow from that arrangement to suggest that there's an incentive in there to -- to build or own transmission, does all of this suggest that Manitoba Hydro will be able to, in my words, sell all or part of their interest in this Great Northern Transmission Line if they so desire?

MR. WHITFIELD RUSSELL: I would think there would be interested buyers, yes.

MR. BOB PETERS: And what would be the process in -- in terms of marketing that? Is that a -- is that one (1) where there's an opportunity to put it out to see what the market would pay for them? Or do they have to negotiate with a counterparty?

MR. WHITFIELD RUSSELL: I know that some transmission systems have been sold in their entirety by taking bids. For example, the Consumer's Power System was bought by a company affiliated with Trans-Elect. And then -- but I think some negotiation would be expected. But, you know, it might be preceded by a request for proposal and then evalu -- negotiate with the best bids.

MR. BOB PETERS: All right. On the same -- on slide -- back to slide 41 of Exhibit MMF-31 revised, the third bullet, an indication that certain Minnesota utilities have petitioned the Minnesota Public Utilities Board to consider a competing alternative to the Great Northern Transmission project.

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And you're relying on a Megawatt Daily article of April 17th, 2014, for that information?

MR. WHITFIELD RUSSELL: Yes, and I followed up by phone calls to Missouri River, who was one (1) of the participants.

MR. BOB PETERS: And --

MR. WHITFIELD RUSSELL: And I confirmed the -- what's going on, yes.

MR. BOB PETERS: Well, first of all,

could -- could you, through your counsel, undertake to file a copy of the Megawatt Daily for April 17, 2014?

MR. WHITFIELD RUSSELL: Of -- of course, sure.

--- UNDERTAKING NO. 147: Whitfield Russell Associates to provide a copy of the April 17, 2014, article from Megawatt Daily

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: And in addition to that you said that the utilities have petitioned the Minnesota regulator.

Does that suggest there is opposition to the Great Northern Transmission Line?

MR. WHITFIELD RUSSELL: Yes, they -- the story that I got from my contact was that there was some interest on the part of these other folks to get -- build transmission to Manitoba in -- in lieu of or in addition to. But for this purpose, in lieu of the Great Northern Transmission project.

MR. BOB PETERS: And is it your understanding that that interest in building a transmission line would be available to serve Manitoba

Hydro?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: Is there a public filing that you're aware about as to whether there's any costs associated with that line that would have to be borne by the Manitoba utility?

MR. WHITFIELD RUSSELL: I haven't looked. I expect there is a part of a petition. I don't know.

MR. BOB PETERS: All right. Well, then I'm going to ask --

MR. WHITFIELD RUSSELL: I'd be surprised if there weren't.

MR. BOB PETERS: -- I'm going to ask for some more homework for Ms. Saunders and Mr. Marques, if -- if Whitfield Russell Associates could undertake to determine whether there is, on the public record, indication as to what alternative arrangement is being proposed and whether or not there is any suggestion that Manitoba Hydro would have to contribute financially to that project.

MR. WHITFIELD RUSSELL: Okay. And I do know that the line was going to -- is proposed to go to Fargo, where it would pick up the capex lines for deliveries to the East. But they were also interested

in taking deliveries back to the West, because there's been a very great increase in loads in North Dakota in connection with the Bakken Reserve development, B-A-K-K-E-N.

I was also told that the -- the loop flow problem associated with the Fargo line would not be as significant -- it was likely not as significant for an import line as it would be for an export line.

MR. BOB PETERS: At the risk of sounding like I understand what that means, can you explain to the panel what the loop flow problem is at--

MR. WHITFIELD RUSSELL: Yes

MR. BOB PETERS: -- Fargo?

MR. WHITFIELD RUSSELL: I'm sorry, it was too cryptic. The -- the MISO studies of the proposed Great Northern Transmission Project evaluated both a line to Fargo and a line to -- planned to Blackberry.

And one (1) of the -- even though it's a longer line and more expensive to go to Blackberry, it had in its favour less loop flow would enter Manitoba from North Dakota and Minnesota and make its way through the Manitoba Hydro transmission system and be superimposed on the exports that would go to Black -- Blackberry.

So that -- that loop flow problem would be far worse, apparently, if you go to Fargo than it would be if the line goes to Blackberry. I raised that issue with my contact at the Missouri River Energy System. And his -- his response was that they thought it was less of an issue if Manitoba were importing. But he didn't offer any refined analysis.

MR. BOB PETERS: Well, we'll see if anything you're able to provide to the panel is supported in the filing to that effect. That would perhaps --

MR. WHITFIELD RUSSELL: Okay.

MR. BOB PETERS: -- assist in understanding.

MR. TONY MARQUES: Mr. Peters, just so that I understand what one (1) of the two (2) of us are going to have to do, we are undertaking to determine whether there was anything on the public record or, I suppose, that's not on the public but that can be disclosed, because obviously Mr. Russell has a number of sources, as to whether Manitoba Hydro is able to benefit from any such line that's -- that's being contemplated and whether or not it would be expected to pay in order to participate?

MR. BOB PETERS: Yes. And -- and a bit

more generally, Mr. Marques, there's a sugge -- the -- the one (1) request was for a copy of that -- that article --

MR. TONY MARQUES: Yes, we have that.

MR. BOB PETERS: -- which I don't think was -- which is understood. But then it was to -- to whether or not there is information available that would explain the -- the third bullet on slide 41 where Minnesota utilities have petitioned the Minnesota PUB to consider a competing alternative and, in looking to see what that information is, whether there is any indication as to whether a financial contribution from Manitoba Hydro would be part of that.

Would that assist you, sir?

MR. TONY MARQUES: Yes. Thank you.

--- UNDERTAKING NO. 148: Whitfield Russell Associates to determine whether or not there is information available that would explain the third bullet on slide 41 where Minnesota utilities have petitioned the Minnesota PUB to consider a competing

alternative and, in looking to see what that information is, whether there is any indication as to whether a financial contribution from Manitoba Hydro would be part of that

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: And are you able to disclose, Mr. Russell, other than Missouri River, what other Minnesota utilities are involved in the petition?

MR. WHITFIELD RUSSELL: It's NSP, which is part of Excel. And I -- I forgot. I think Great River. Great River and -- and maybe Otter Tail Power, but the article will tell you that.

(BRIEF PAUSE)

MR. BOB PETERS: Did you want a couple of minutes on that matter, or can we just move forward?

MR. WHITFIELD RUSSELL: We can go.

MR. BOB PETERS: All right. Also on page 41, the last bullet talked about firm power sold during an off-peak season commands only about half the

demand charges associated with on-peak firm power during on-peak seasons, correct?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: Would that apply to both firm winter supply as well as diversity exchange purchases?

MR. WHITFIELD RUSSELL: Diversity exchange typically does not have a demand charge, so it would not apply.

MR. BOB PETERS: Well, then what about firm winter supply?

MR. WHITFIELD RUSSELL: A firm winter supply would probably have a reduced demand charge. And I said firm power sold; I should say that the demand charge on the firm power sold tends to be lower, not the entirety of the power.

MR. BOB PETERS: All right. Thank you for that clarification. I want to turn to some of the reliability issues. There was just a couple of questions that...

(BRIEF PAUSE)

MR. BOB PETERS: Perhaps a better approach would be on slide 33.

(BRIEF PAUSE)

MR. BOB PETERS: The upshot from the first bullet point is the point that you made, is that the building of Keeyask and Conawapa is going to use up most of Bipole III capacity, correct?

MR. WHITFIELD RUSSELL: Keeyask would use up six thirty (630) out of the two thousand (2,000), and Conawapa would use it all up.

MR. BOB PETERS: All right. Maybe -- maybe a better chart -- and I'll Diana if she could pull up your pre-filed evidence which is MMF Exhibit 14. And on page 24, there was a chart that I think will help. That was in direct response -- I think the Chairman and -- and yourself had some questions on it.

What you're showing the panel on this chart in the evidence is that Bipoles I and II have a capacity of 3,854 megawatts?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And that -- the -- the existing northern generation that's using the DC line uses up about 3,562 megawatts.

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And the remaining capacity is not sufficient for Keeyask --

MR. WHITFIELD RUSSELL: Correct.

MR. BOB PETERS: -- at least on a -- the way you've presented it here, correct?

MR. WHITFIELD RUSSELL: Correct.

MR. BOB PETERS: And if that's the case, you then add Bipole III at about 2,300 megawatts, at least at the northern end?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And if that leaves a surplus of 1,962 megawatts, that's more than enough room for Conawapa to fit on at 1,395 megawatts, correct?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: So at the end of -- of the -- the Preferred Development Plan, there'd be remaining capacity of 567 megawatts on the Bipole III line?

MR. WHITFIELD RUSSELL: Yes, and -- and there are a couple of refinements needed here. First, the Bipole III only goes to twenty-three hundred (2,300) when Conawapa is added. And second, when Conawapa is added, because the network has a stability limit of forty-seven fifty (4,750), that is the wires can carry their full load but the -- it would be unstable if done so, the Northern Collector System must

be broken up into two (2) pieces.

And when you redo that, there's some considerable testimony by I think Hydro and -- and of course the NFAT itself, a lot of data responses, and by power engineers telling how that works.

My understanding is that the end result is that 300 megawatts at Kettle has to moved over to the AC system and moved south through Winnipeg in that way, one hundred (100) to three hundred (300).

MR. BOB PETERS: All right. And there was a slide that Dr. Jacobson took the panel to in the slide deck, which was Manitoba Hydro Exhibit 95. I believe slide 85. It's close. It's a -- it's a drawing. And I'll look to Ms. Ramage if she has a better guesstimate. Still getting close. There it is there, yes. Thank you very much. Slide -- slide 83.

MR. WHITFIELD RUSSELL: I have it.

MR. BOB PETERS: Have you seen this slide before?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And what you're reminding the panel of is that on both Keeyask and Conawapa coming in service, some of the Keeyask output would be -- I'm sorry, the -- at that point the Kettle output would be moved over to a north-south upgrade

project?

MR. WHITFIELD RUSSELL: Yes, sir.

MR. BOB PETERS: And under the reliability criteria that Hydro used in the Clean Environment Commission proceedings, would Hydro need to build additional north-south transmission after Keeyask and Conawapa comes online, or is this shown here until the Kettle unit on AC the required upgrade?

MR. WHITFIELD RUSSELL: May I have the question reread, or restated? It's -- it's simply -- the reference to the CEC proceeding is what threw me.

MR. BOB PETERS: You had referenced in your materials Manitoba Hydro's reliability standards and -- and what it would need to do for Bipole III when it was before the Clean Environment Commission?

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: And my understanding is that as a result of that analysis, Manitoba Hydro would propose doing what they show the Board here on slide 83 of Manitoba Hydro Exhibit 80 -- 95?

MR. WHITFIELD RUSSELL: I presume that that would be the way they would incorporate Conawapa, yes.

MR. BOB PETERS: Has the cost of this additional transmission been included in the NFAT

analysis, do you know?

MR. WHITFIELD RUSSELL: I --

MR. BOB PETERS: The initial north-south?

MR. WHITFIELD RUSSELL: Yes, I think it's the difference between 2A and 2, the plans for the AC upgrades. I'm not -- I'm not recalling the details, but I do remember that discussion.

MS. GENEVA LOOKER: I -- I do believe that the costs of the north-south transmission project are included in those plans that require both Keeyask and Conawapa.

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: If your question is whether you'd still need the import line with this reconfiguration to provide backup for loss of Bipoles I and II, the answer would be yes.

MR. BOB PETERS: And I was looking at it perhaps from a -- a different perspective. If we go back to page 23 of MMF Exhibit 14.

Where Bipole III was available, if there was a -- an outage on Bipoles I and II, that same ability doesn't exist once Bipole III is loaded with

Keeyask and Conawapa?

MR. WHITFIELD RUSSELL: Correct.

MR. BOB PETERS: And so at that point if we're going to talk to the same reliability standards, are we envisioning that there's a -- a further requirement, if not for the import line, a further requirement for another Bipole after Keeyask and Conawapa are built to improve reliability to the same standard that has been -- that it's being built in the first place?

(BRIEF PAUSE)

MR. WHITFIELD RUSSELL: Well, obviously if we load up Bipole III with Conawapa, and Limestone, and Long Spruce, and in combination with Bipoles -- yeah, you've got a different configuration; a loss of Bipole I and II would be a very different situation here, wouldn't it.

MR. BOB PETERS: Well, let's not get -- let's not get too deep into the -- into that configuration, if we -- if we can, Mr. Russell. But from a -- from a Manitoban's reliability requirement, if Bipole III was supposed to provide a certain level of reliability to us in the case of outages on Bipoles

I and II, that reliability, from your evidence, only exists if Keeyask and Conawapa Power is not already on Bipole III?

MR. WHITFIELD RUSSELL: Correct. And it -- it -- when Keeyask comes on by itself you diminish this reserve and, yes, but it disappears with Conawapa.

MR. BOB PETERS: And if Manitobans want the same reliability level after Conawapa and Keeyask are constructed and after Bipole III is constructed what options does Manitoba Hydro have?

MR. WHITFIELD RUSSELL: I think that's the subject of our -- the rebuttal testimony and the chart at...

MR. BOB PETERS: Slide 49?

MR. WHITFIELD RUSSELL: Forty-nine (49), yes.

MR. BOB PETERS: All right. I'll ask Diana to find, as she has, slide 49 of your PowerPoint.

So can you then explain your answer to the Board using this chart?

MR. WHITFIELD RUSSELL: Yes. As the -- as the Board could see, without the second -- without the orange line, which is the interconnection to the US, the ability of Bipole III to provide reserve would

diminish until 2026. Then with the 300-megawatt upgrade associated with Conawapa, it would prolong the ability to meet the standard until 2030, and then Bipole III couldn't -- couldn't do it anymore. But by adding the AC intertie upgrade to the US in 2020, the ability to backup the loss of Bipoles I and II is extended until 2041. And I'm not sure what additions are represented by the bumps at 2041 and 2044, but that -- that's the general -- that's the general plan for meeting that criterion.

But -- and I want to reiterate that -- that there's no indication here that the amount of capacity would be firmed up with firm purchases as well on the Preferred Plan. You get transmission capacity, but part of the deterministic standard was that the import capacity from the US also be backed up with gas turbines. And this doesn't go to that issue.

MR. BOB PETERS: I -- I understand that point. That would just layer on additional cost --

MR. WHITFIELD RUSSELL: Yes.

MR. BOB PETERS: -- if that was to be the case?

MR. WHITFIELD RUSSELL: Correct.

MR. BOB PETERS: Now, instead of this orange line, what would a fourth bipole look like on

this chart? Would it replicate -- just be slightly higher than this orange line on here or would it be something configured differently?

MR. WHITFIELD RUSSELL: Well, a fourth bipole unloaded would restore the reserve at any -- or increase the reserve against loss of Bipoles I and II at -- at any point in time, as would an increase in the import cap -- the interconnection capability to the United Stated. They're fungible, that's my point.

MR. BOB PETERS: All right. I want to turn to your slide 51, if I could, please. I don't want to get between you and Dr. Jacobson when you're fighting over some exciting things like standard TPL-002, but for those of us who don't read that regularly, the -- the concern that you've voiced is that the N minus 1 event can occur, but firm transfers are not supposed to be curtailed?

MR. WHITFIELD RUSSELL: That's the rule. If you look at the standard, that's the general rule you start with, yes.

MR. BOB PETERS: And you've indicated Manitoba Hydro appears to have employed, or does employ, some special protection systems to deal with its system that could meet operating reliability levels?

MR. WHITFIELD RUSSELL: It doesn't meet the standard. What it does is it's grandfathered. And MISO has grandfathered it. They're willing to live with it. And it can -- so long as the amount of curtailment from the SPS is not increased, it can -- it can continue on. Now, that doesn't change the standard, however. It -- it does not meet the standard.

MR. BOB PETERS: All right. And in terms of this Footnote B that's been talked about by yourself as well as other witnesses, has NERC provided an opinion or a clarification on whether the special protection systems qualify under Note B?

MR. WHITFIELD RUSSELL: I'd be surprised if there weren't some -- because the -- the reliability standards do address SPS, but I have not studied that. There was a dispu -- you -- you're going to be surprised -- there was a contested proceeding at FERC with respect to this footnote. And -- and it arose because the NERC reliability standards are being applied to the jurisdictional utilities, and financial penalties will be imposed for failure to meet the standards. So it became very important how this was -- was interpreted.

But the -- the focus was entirely upon

the first sentence of Note B, whether you could curtail a radio customer or a local network customer connected to or supplied by the faulted element. I don't see -- I never saw any dispute or interpretation on the SPS.

(BRIEF PAUSE)

MR. BOB PETERS: You'd indicated, Mr. Russell, that you'd be surprised if the NERC hadn't provided some clarification on Footnote B and whether or not a special protection system is -- is -- qualifies under that footnote.

Did I understand that correctly?

MR. WHITFIELD RUSSELL: Yes, there are a number of SPSs around the country; New England, many of them in California, and there is, of course, this one which is highly prominent.

MR. BOB PETERS: And does it change your view if -- if the SPS is qualified under Footnote B and accepted under Footnote b by -- by NERC?

MR. WHITFIELD RUSSELL: If -- if they -- if they confronted the issue and addressed it and resolved it, I guess that it lends some weight to Manitoba Hydro's position. I'm just unaware of it.

MR. BOB PETERS: And is -- and I'm not

saying it does exist. I'm just wanting to know what your position would be if it did exist.

MR. WHITFIELD RUSSELL: Well, it -- the point is this: This is quasi-firm power. So if I'm buying power from Manitoba Hydro -- we had a very similar situation in California where firm transmission meant quasi-firm because it was subject to an SPS and had to be curtailed. So in terms of the buyer, it seems to me that the use of the SPS on an N minus 1 transaction reduces the price that Manitoba Hydro might otherwise get for that firm power. That is, if there was enough AC backup to continue the transaction afterwards and allow for a controlled adjustment -- system adjustment, I think that would increase the value of the power and it could be sold for more.

MR. BOB PETERS: I'm going to ask one (1) last undertaking then, Mr. Russell. You said you hadn't done -- you weren't aware of -- of any clarification in this specific situation here, and don't take from my question that I'm aware of there being any. But if you could just undertake through your counsel to advise this panel whether or not NERC has provided an opinion on whether the SPS qualifies under Footnote B, that would be appreciated.

MR. WHITFIELD RUSSELL: Okay. I will

endeavour to do so if my counsel permits.

MR. BOB PETERS: Well, you'll have to explain it to them first.

MS. JESSICA SAUNDERS: We were able to follow. Thank you.

MR. BOB PETERS: It wasn't -- it wasn't you, Ms. Saunders, I was concerned about.

--- UNDERTAKING NO. 149: Whitfield Russell Associates to advise whether or not NERC has provided an opinion on whether the SPS qualifies under Footnote B

MR. BOB PETERS: Okay. That's enough. Mr. Chairman, those are my questions of Mr. Russell and Ms. Looker. I'd like to thank them very much for their cooperation.

THE CHAIRPERSON: I have a few questions that I want to resolve in my head because, you know, frankly, you've been somewhat dismissive of some of the evidence that we've heard in these proceedings in respect of getting regulatory approval in Minnesota in particular.

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: Yet we've heard lots of evidence to the contrary, and now you're suggesting to us that what we heard about the difficulties of getting approval from Minnesota are being exaggerated. And I have some problems with that because, you know, I don't know.

Have you been before the Minnesota regulator?

MR. WHITFIELD RUSSELL: Yes, I have.

THE CHAIRPERSON: In respect of transmission?

MR. WHITFIELD RUSSELL: Yes. I've testified there on a merger case of what was called Primergy, which failed, and it seems to me I've testified there on the Arrow headline.

THE CHAIRPERSON: So -- so this was a recent case or --

MR. WHITFIELD RUSSELL: No. This -- the Arrow headline was -- must have been eight (8) or ten (10) years ago.

THE CHAIRPERSON: Yeah. I guess that's -- that's part of the difficulty I have, you know, it's you being -- you -- you asking us to draw conclusions based on the experience you've had some time ago with

respect to what the Minnesota regulator will do.

Now, I -- I grant you your considerable experience in transmission issues generally without you having to state your knowledge of NERC and FERC and so on. But the reality is that, you know, I have to believe that -- that Man -- Manitoba Hydro had to work really hard to put a proposal before the regulator that they think they can sell, and its partner.

So now you're suggesting that -- that we should abandon that approach in favour of redirecting energy flows within that state and so on. So increase my level of confidence.

MR. WHITFIELD RUSSELL: All right. Let -- let me say it this way, Mr. -- is it Gosselin, Mr. Gosselin?

THE CHAIRPERSON: Yeah.

MR. WHITFIELD RUSSELL: The general rule of thumb that all of us in this business know is FERC has jurisdiction, exclusive jurisdiction, over transmission, access, not -- and -- and that -- that jurisdiction has been implemented through these open-access transmission tariffs. They've been in place since 1996 and is a well-defined and understood policy by which you ask for and obtain upgrades to the transmission system with a queue and application and

studies and milestones.

In fact, you know, the -- if you wanted Minnesota or MISO to -- to do it, they -- they have to respond to you in a specific time. If you pay the bill, they have to give you the study in forty-five (45) days. If you pay the next bill and you like the study, they'll do the facilities design in the next one eighty (180) days. And then after that, you proceed to your interconnection or transmission arrangement. I think it's within eighteen (18) months. So it's -- it's a very structured, mandatory procedure.

Now, if Minnesota were to inject themselves into that procedure and start denying people access to transmission in Minnesota on some basis unrelated to FERC's primary jurisdiction, that sets up a fight between those two (2) jurisdictions. There have been a number over the decades I've been in the business. FERC usually prevails.

The second is this: This issue became so frustrating to the industry that Congress passed something called the National Interest Electric Transmission Corridor Legislation. And it's -- it's -- and I'll confess, it's been off to a rocky start. There have been some -- some appeals which have frustrated one (1) of the corridors that were

designated.

But the general rule is this. If you have enough need for transmission to be built and you've got a state or states which is obstructing the need for this transmission, FERC, through the -- in the NIETC legislation, can override that by designating a corridor, and then it becomes a federal matter. It -- it's merely another way of reinforcing the general rule that transmission is under the primary jurisdiction of FERC.

So that's -- that's how I view the posture. Yes, Minnesota no doubt could frustrate Manitoba in trying to obtain transmission through Manitoba, but maybe not through North Dakota, maybe not through -- you know, down to Fargo.

So it's a -- to me, it's -- it's a problem. We all litigate for a living, and we know how it can hold you up and be expensive. But as a matter of ultimate outcome, I have no doubt that Manitoba and its opposite parties wanting to transact power could make the case and get transmission service.

THE CHAIRPERSON: Yeah, and -- and that -- you know, we're talking -- again, what you've just cited to me is a generalized approach to transmission in the United States and so on. But there are

responsibilities in -- that -- that accrue to the -- to the state, relative to the responsibilities that accrue to FERC.

I mean, for example, renewable energy standards are state driven, aren't they?

MR. WHITFIELD RUSSELL: Oh, yes.

THE CHAIRPERSON: Yeah. So --

MR. WHITFIELD RUSSELL: Yes.

THE CHAIRPERSON: -- I mean, there are a number of elements here that go beyond FERC's jurisdiction that relate directly to the responsibility of the state. And -- and in this case, the state is being asked to consider a particular proposal. And you can't just say, We're going to resubmit another proposal expecting that there'll be a -- a counterparty willing to -- to stand shoulder to shoulder with Manitoba Hydro.

I mean, you'll -- you'll concede that much, if there were -- there is at least something that is available to consider in respect of what Manitoba has put before us, and you're -- you're suggesting that it would relatively easy to come up with another proposal.

And I'm -- I'm having trouble with that.

MR. WHITFIELD RUSSELL: And -- and let

me say there's another middle ground here, which is you've got a proposal on the ground. You've got the parties that agreed to it in Minnesota and -- and Pub Service and Manitoba. And if -- if you can't go forward with the line as planned, you can go forward with a rearrangement of the economic conditions and renegotiate that, but you wouldn't change the 750 megawatt line.

I'm not saying that that's something you want to do or undertake, but you don't lose the opportunity to build this line simply because you alter the economic terms under which it's built.

MS. GENEVA LOOKER: I would just like to point out that at that at -- one (1) of our conclusions, I believe, is that we do favour a second interconnection to the US. So it is not that we are anti this line.

MR. WHITFIELD RUSSELL: Right.

MS. GENEVA LOOKER: We see a lot of benefits, especially reliability benefits, to this line, or another line like it to the United States.

THE CHAIRPERSON: In this case it's not available to us. I mean, we can -- we can surmise that there's another proposal that could be put on the table at some point, but it's either we -- we support the

notion of this line, or we don't support it. We -- we have no alternative that -- that's before us.

So coming back to the original point, I mean, does this line satisfy what you've -- you've expressed as support for an intertie?

MR. WHITFIELD RUSSELL: Well, yes. I think our -- our original pitch is that this AC interconnection, especially one that was reinforced, would have been a substitute for Bipole III. And then when you get to Keeyask and Conawapa, Bipole III would be a part of that -- that analysis and that incremental investment required.

It's too late to go back and rewrite history. And so how -- how you proceed from here with respect to pursuing -- the -- the real issue here is pursuing elements of the LCA No New Generation case while still keeping that 750 megawatt line. And I think there is probably room to negotiate that with deferrals of Keeyask and Conawapa.

THE CHAIRPERSON: Now, again, I'm having -- now, I'm having trouble again, because you're suggesting that we pursue the new -- new generation when I'd thought you conceded -- you'd agreed with La Capra that that was a hypothetical case that could be used to alter the mix of future generation

possibilities?

MR. WHITFIELD RUSSELL: I do agree with that, yes. But we've got a -- we've got a specific plan for -- for poles and wires going to the US, a 500 kV line, which is indispensable to the La Capra plan. Where it departs from the -- Plan 17 is Keeyask and Conawapa is the first element.

The benefits of the Plan 17 come from the deferrals of Keeyask and Conawapa in-service dates. That's -- that's where the real -- where the real saving is. So to recast the issue here, if you find the Plan 17 to be attractive, and Lord knows it needs that line to make it attractive, then the -- the -- then the process is what can be done to preserve the line while deferring Keeyask and Conawapa. That seems to me what's best for Manitoba. And if that's what's best for Manitoba, why -- why is that, you know, hypothetically not -- not the objective and the -- and the thing we should pursue?

Now, you -- you postulated a good qualification on that. We don't know yet for sure. It hasn't been a fully vetted Plan 17. So the no new generation case, how -- how it fits with a deferral of Keeyask and Conawapa while still maintaining an early completion of the line is -- is the problem to

confront.

And I don't know the answer to that. I'm sorry.

THE CHAIRPERSON: Thank you for those. Ms. Ramage, please?

RE-CROSS-EXAMINATION BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: I just have a couple of quick follow-up questions and some exhibits to file, so don't let me sign off without doing it.

Now, you spoke of requesting transmission service, getting in the queue, getting an application, getting studies done, and that's one (1) line of the process. But can you confirm, to be clear, that while you're doing that part of the requirements is a state certificate of NAIT (phonetic) will be required from the state in which the line is physically located, correct?

MR. WHITFIELD RUSSELL: Typically, yes. Yes.

MS. PATTI RAMAGE: Okay. And in terms of that queue and application and studies, would you accept that Manitoba Hydro went into the queue for this particular project in 2008, that would be six (6) years ago, to get to this point?

MR. WHITFIELD RUSSELL: Yes. And -- and I made the point earlier that by virtue of your position in the queue you're going to get the benefit of a lot of transmission capability without any upgrade cost. We -- I recognize that.

MS. PATTI RAMAGE: Okay. And when we look at the article from Megawatt Daily, and it says that:

> "A group of Minnesota utilities is urging the PUC to consider an alternative to the Great Northern Transmission Project. Great River Energy, Missouri River Energy Services, NSP, Minnesota, and Otter Tail Power want the PUC to more closely study an alternate project that would run into the -- run to Manitoba along Minnesota's western border."

They do not have anything in the queue right now, correct?

MR. WHITFIELD RUSSELL: I don't know.

MS. PATTI RAMAGE: Okay.

MR. WHITFIELD RUSSELL: But they certainly have -- the east-west portion of it is in the

queue of being built. In other words, when you get down to Fargo the capex project is under development and portions of it are complete. So they don't need anything in the queue. They finished the queue on that leg of the triangle.

MS. PATTI RAMAGE: And when -- when tho -- if we assume those utilities wanted to move forward and involve Manitoba Hydro, Manitoba Hydro would have to be part of, for lack of a better term, the solution, correct? It would have to be beneficial to Hydro, too?

MR. WHITFIELD RUSSELL: Yes.

MS. PATTI RAMAGE: And so when we're looking at a project right now that is over six (6) years in the making, you're suggesting that we start all over with a group of utilities that have not put anything down; there -- there's nothing solid to -- to move forward with right now; it's an idea?

MR. WHITFIELD RUSSELL: I -- I don't know where that is. That's correct.

MS. PATTI RAMAGE: Okay. Thank you. Oh, and some exhibits. We have two (2) exhibits to enter before we adjourn for -- till final argument. We'll adjourn the evidentiary portion. I'll get those. I will pass them out.

But they're -- one (1) is Manitoba Hydro

Exhibit 154. It is our Undertaking number 74 revised. This is an undertaking given to the MMF, and they requested additional information be included in it, so we've revised that exhibit and we'll be distributing that.

--- EXHIBIT NO. MH-154 REVISED:
Response to Undertaking 74

MS. PATTI RAMAGE: The other is Manitoba Hydro's response to Undertaking number 142. That will be Exhibit 201. And that is dealing with the -- the section in the contract saying the contracts will require Keeyask. This is a redacted version of that undertaking. There will also be a CSI version of that filed.

--- EXHIBIT NO. MH-201: Response to Undertaking 142

THE CHAIRPERSON: I believe that completes today's proceedings. So that's it for the evidence that we're going to hear. And then what's left for this panel is presentations from the public and closing arguments from the parties.

So on behalf of the panel I'd like to

thank both of you for attending today and for having contributed to these proceedings. And I hope that you have a safe trip back home. So I know that this has been a difficult project for you, as it has been for other participants in this process, so thank you very much for your work so far.

And, everyone else, we'll see each other again on next -- next Tuesday, I believe.

MR. WHITFIELD RUSSELL: Thank you.

MR. BOB PETERS: That would be the 20th of May.

THE CHAIRPERSON: Thank you. Okay. With that, have a good evening, everyone, and we'll see other again next week.

(PANELS STANDS DOWN)

--- Upon adjourning at 4:41 p.m.

Executive Summary

Scope of Work

MPA was retained by the PUB to provide a commercial evaluation of the Manitoba Hydro Preferred Development Plan Business Case, as detailed in the NFAT. Specifically, MPA's review is to include

a) Consideration of the overall costs, risks and benefits being assumed by Manitoba Hydro in the pursuit of the Preferred Development Plan, particularly in light of potential alternatives to the Preferred Development Plan which could satisfy provincial and ratepayer objectives (commercial reasonableness of the Preferred Development Plan);

b) Consideration of the costs assumed, risks taken, and compensating benefits expected for each relevant stakeholder of Manitoba Hydro, including ratepayers, the Government of Manitoba, Manitoba taxpayers, and others (relative commercial reasonableness of the Preferred Development Plan for various stakeholders);

c) Consideration of commercial risks being assumed by Manitoba Hydro as part of its export agreements, and specifically how these risks relate to the risks being taken by Manitoba ratepayers in the event that export agreements do not perform according to optimal scenarios (commercial reasonableness of the export aspects of the Preferred Development Plan in relation to the domestic services portions); and

d) Consideration of specific financial impacts and risks being assumed as part of the Preferred Development Plan by the Government of Manitoba and the taxpayers of Manitoba, as they relate to the Province's credit rating, borrowing capacity, potential impact on other budgetary priorities, credit availability, and credit rates in the future.

Summary of Financial Model

MPA has constructed a financial model on Manitoba Hydro's electrical operations in order to address the scope of work put to MPA by the PUB under the NFAT. MPA relied upon the NFAT Business Case, the appendices thereto, and numerous discussions and correspondence with Manitoba Hydro management and employees on the matter of Manitoba Hydro operations, and economic and financial conditions. MPA received SPLASH (Simulation Program for Long-term Analysis of System Hydraulics) output from Manitoba Hydro with respect to the development plans considered under the NFAT.

MPA matched the SPLASH data with the development plans detailed in Appendix 11.4 of the NFAT Business Case, eliminating plans for which pro forma financial statement data was not provided. MPA extracted chained, opportunity export revenue for every given hydrological regime and model year, allowing for the determination of actual, annual opportunity export revenue, calculated for a given supply mix that Manitoba Hydro anticipates to eventuate in a given year. This information and extraction (from SPLASH), and application (to Appendix 11.4) allowed MPA to produce a set of financial

statements (income statement, balance sheet and cash flow statement) for every development plan modelled under Appendix 11.4 under all scenarios, and under all previous hydrology regimes.

In reaching our conclusions contained in this report, MPA has run the All Gas and Preferred Development plans, and Plans 4, 6 and 12 under the 2012 reference Manitoba load for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 495 total runs).

The All Gas and Preferred Development Plans were further run at high and low 2012 Manitoba load for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 396 total runs).

The Preferred Development Plan was further run at 4x 2013 DSM and 1x 2012 DSM (both at 2013 reference Manitoba load) for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 198 total runs).

The All Gas and Preferred Development plans, and Plans 4,6 and 12, were run for 21 different years of hydrological history, for every combination of reference, high and low economics, energy and capital costs, for a total of 546 runs per development plan, or 2730 total runs.

In total, MPA performed 3,819 different runs of the financial model. The financial model, as constructed in the manner detailed above, formed the basis for our financial conclusions reached in this report.

Findings on Ratepayer Total Costs

- Findings are in reference to the average probability weighted present value basis of domestic revenue
- Resource Plans 4 and 6, which include Keeyask, some level of transmission interconnection and natural gas plants, appear to fare consistently better than the other options
- Plans 14 and 12, which include Conawapa, are consistently ranked as more costly to ratepayers than Plans 4 and 6, which include Keeyask but not Conawapa
- Plan 1, the All Gas Plan, ranks poorly when economic variables such as inflation and interest rates are low, but better when they are moderate or high; this is particularly true with respect to the Preferred Plan 14, which is superior to All Gas in the low economics environment but not otherwise
- Plan 1, the All Gas Plan, ranks relatively poorly when the discount rate is lower at 6%, but better when the discount rate is higher at 10%, suggesting that the relative time value of money is an important consideration
- Plan 4, with a 250 MW interconnection, always ranks better than Plan 6, with a 750 MW interconnection

- Similarly, Plan 14 is better than Plan 12 in every case but one, suggesting that an earlier construction and export orientation for the Conawapa facility is better than a later one

- Changing Manitoba demand does not actually affect the total cost to ratepayers over 48 years very much, if all other variables are kept constant; the difference in total cost to ratepayers between High and Low Manitoba demand futures is not more than about 2% in any of the cases

Findings on Government Revenues

As might be expected, the differences between Resource Plans with respect to revenues for the Government of Manitoba are clear, and align with the construction of hydroelectric facilities.

Average Probability Weighted PV of Revenue to the Province of Manitoba
High, Ref and Low Economics, Energy and Capital
(2015-2062)
($ in millions)

	Development Plan				
Revenue	**1**	**4**	**6**	**12**	**14**
NPV @ 6.00%					
Water Rentals	$1,702	$1,883	$1,879	$2,034	$2,091
Provincial Debt Guarantee	$2,614	$3,031	$3,075	$3,561	$3,783
Capital Taxes	$1,584	$1,874	$1,883	$2,229	$2,275

In the Preferred Development Plan (14), Conawapa is built and built soonest, and hence water rental fees are greater, more debt must be guaranteed, and capital taxes are highest.

The differences between Plans (14) and (12), where Conawapa is built a few years later, are very modest. Similarly, the differences between Plans (4) and (6), which both include Keeyask but not Conawapa, are very minor, but these totals are noticeably lower than the Conawapa-based Resource Plans.

Findings on Export Orientation

As might be expected, the Preferred Development Plan (14), which includes the building of Conawapa earlier in time with the intention of signing long-term export contracts, includes the highest export revenues as a percentage of total Manitoba Hydro revenues.

Average Export Revenue as a Percentage of Total Revenue
All Gas and Preferred Development Plan
Reference Economics and Capital
(2015 - 2062)

	Development Plan	
Energy Scenario	**1**	**14**
Reference	9.5%	20.9%
High	11.9%	26.2%
Low	6.4%	14.3%

- Resource Plans which have a higher reliance on export revenues are more sensitive to changes in export prices; this is borne out by reference to the model results if all variables except energy prices are kept constant: for example, average present value costs to ratepayers in Preferred Plan (14) are 10% lower if export prices are higher; whereas in All Gas Plan (1) there is little difference between the total ratepayer costs between scenarios with High and Low export prices

- For government, higher exports mean that more of its revenue from Manitoba Hydro is actually coming from export jurisdictions, rather than ratepayers, which means that, *other things being equal*, the province as a whole should be receiving a net benefit

Findings on Hydrology

- Hydrology is critical to short-term issues, such as the potential for financial distress, but is less relevant to longer term issues such as the present value of ratepayer costs over a 48-year period or longer

- Though hydrology is less critical over longer terms, it does not mean that it is not relevant: even over a 35-year period the standard deviation of water flow is almost 5% of the historical average

- Resource plans heavy in hydroelectric investment, such as the Preferred Development Plan (14), are more sensitive to hydrology, and will therefore demonstrate greater variation in all financial results (including Manitoba ratepayer costs), especially in the short term but also over the longer term, other things being equal

Findings on Financial Distress

- Despite the fact that the most severe situations of financial distress caused by drought overwhelm distinctions between Resource Plans, there are useful distinctions that can be made

- These include sensitivity to hydrology, sensitivity to the timing of distress, and overall financial strength

- Some Resource Plans are more sensitive to hydrology than others

- It is inescapable that the net income of Manitoba Hydro will be more sensitive to hydrology if Keeyask, Conawapa or both are built

- It should be noted that this sensitivity goes both ways: these Resource Plans will be exposed to higher highs and lower lows in net income and other financial indicators based on the future course of hydrology

- Timing is extremely relevant, and there are distinctions between the resource plans

Conclusions

Analysis of the available data and construction of a financial model capable of incorporating hydrology has allowed for the illumination of a number of patterns, and a variety of observations that will, it is hoped, assist the PUB in making its recommendations to government on the NFAT Review of the Manitoba Hydro Preferred Development Plan.

Key observations have included:

- The ability of Manitoba Hydro to meet its financial targets over the next ten years without increasing rates beyond two times the rate of inflation – under all Resource Plans – is entirely dependent on the continued absence of a significant drought

- Different Resource Plans extend that period of fragility, including the Preferred Development Plan, which should not be expected to enter a time of more financial capacity for 20 years, unless rates are allowed to rise at more than double the rate of inflation for an extended period of time

- In the face of a sustained, severe drought, the choice of Resource Plan is irrelevant to the occurrence of distress, as the financial consequences of such a drought would overwhelm the differences between Resource Plans

- Choice of Resource Plan does affect the occurrence of financial distress due to drought in milder drought cases, and it also affects the magnitude of the problem that would be faced by government in the event of a drought of any kind

- The total, probability-adjusted present value of ratepayer costs over 48 years across all five Resource Plans is likely too narrowly distributed to allow for definitive selection of the “lowest cost” choice. These outcomes are essentially within the margin of error of the many calculations, estimates and assumptions that were required to construct the model

- The consistent patterns of sensitivity of specific Resource Plans to certain variables indicates that model analysis can provide a guide to identifying the concerns that should be part of any decision-making process

- An extremely important inter-generational decision is embedded in the choice of Resource Plan, as costs to Ratepayers will be distributed very differently over time.

Bearing these and other observations in mind, we would suggest the following recommendations:

a) Plans 4 and 6, which were largely indistinguishable from each other, resulted in costs to ratepayers that appear to be lower than other Resource Plans in many scenarios, if only marginally; this suggests that proceeding with Keeyask may be a prudent step to take at this time, but a more thorough review of the proposal to build Conawapa as part of the Preferred Development Plan should be undertaken closer to its final commitment date

b) Given the expected fragility of Manitoba Hydro during the first ten years of any Resource Plan, and beyond that in others, the Government of Manitoba may wish to calculate and reserve some of the funds it generates (e.g., through permits, approvals, income taxes, etc., related to the construction projects) to act as an initial financial buffer for the government in the event of drought and the need for financial assistance to Manitoba Hydro

c) Given the inevitability of a drought at some point in the future, and the expected financial impact that such a drought would have on Manitoba Hydro, particularly in the near term, consideration should be given to the development of an explicit policy on the future course of customer rates in such a situation; this policy could then be shared with credit rating agencies and others to address the potential concern that they may have that in the event of a drought some fraction of Manitoba Hydro debt might be financially unsupported.

1. Introduction

Morrison Park Advisors was retained by the Manitoba Public Utilities Board (hereinafter the "PUB") to assist in the consideration of various commercial aspects of the "Needs For and Alternatives To" (hereinafter the "NFAT") Review of Manitoba Hydro's Preferred Development Plan (hereinafter the "Preferred Development Plan").

1.1. Morrison Park Advisors

Morrison Park Advisors is an independent, partner-owned, Canadian investment bank providing financial advisory services to corporations and governments. MPA focuses on several industry sectors, including the regulated utility/energy infrastructure sector, in which it has substantial background and expertise. We provide independent expert advice to clients involved in regulatory processes; commercial litigation and arbitration; commercial and balance sheet restructuring events; debt and/or equity capital raising; and mergers, acquisitions and divestitures. Our ability to deliver top-tier financial advisory services is based on decades of combined experience and expertise developed at some of Canada's leading investment banks, while serving many of Canada's largest and most sophisticated corporate clients as well as federal, provincial and municipal governments and quasi-government entities.

Information on the MPA partners who participated in the preparation of this Report is available in Appendix A.

For more information on MPA, please visit our website at www.morrisonpark.com.

1.1.1. Independence of MPA

MPA confirms that:

a) neither MPA nor any of its affiliated entities is an associated entity or affiliated entity or insider of Manitoba Hydro or any of its affiliates;

b) prior to the date hereof, MPA has not been engaged as financial advisor to Manitoba Hydro or any of its affiliates; and

c) during the term of its engagement, MPA will not be engaged by Manitoba Hydro or its affiliates as a financial advisor in respect of the NFAT.

1.2. MPA's Mandate and Scope of Work

MPA was retained by the PUB to provide a commercial evaluation of the Manitoba Hydro Preferred Development Plan Business Case, as detailed in the NFAT. Specifically, MPA's review is to include:

e) Consideration of the overall costs, risks and benefits being assumed by Manitoba Hydro in the pursuit of the Preferred Development Plan, particularly in light of potential alternatives to the Preferred Development Plan which could satisfy provincial and ratepayer objectives (commercial reasonableness of the Preferred Development Plan);

f) Consideration of the costs assumed, risks taken, and compensating benefits expected for each relevant stakeholder of Manitoba Hydro, including ratepayers, the Government of Manitoba, Manitoba taxpayers, and others (relative commercial reasonableness of the Preferred Development Plan for various stakeholders);

g) Consideration of commercial risks being assumed by Manitoba Hydro as part of its export agreements, and specifically how these risks relate to the risks being taken by Manitoba ratepayers in the event that export agreements do not perform according to optimal scenarios (commercial reasonableness of the export aspects of the Preferred Development Plan in relation to the domestic services portions); and

h) Consideration of specific financial impacts and risks being assumed as part of the Preferred Development Plan by the Government of Manitoba and the taxpayers of Manitoba, as they relate to the Province's credit rating, borrowing capacity, potential impact on other budgetary priorities, credit availability, and credit rates in the future.

1.3. Report Structure

The Business Case and supporting evidence presented by Manitoba Hydro in favour of the Preferred Development Plan is extremely detailed (the initial filing ran to approximately 5,000 pages, and responses to Information Requests have been similarly voluminous). We have attempted to condense many concepts in a relatively brief narrative in order to highlight critical issues that we believe should be considered by the PUB. In addition to the sections of this Report described below, we have provided Appendices which provide greater detail on certain matters which, while important, would distract from the narrative and its core issues.

Table 1. Report Structure

Section	Title	Matters Addressed
2	Context	• Manitoba Electricity System • Stakeholders and Their Interests • Risks Relevant to Electricity Resource Planning
3	Resource Alternatives	• Features of Plans • Variables that Should be Considered
4	Financial Modeling	• Approach Taken • Findings
5	Specific Issues	• Weighted Average Cost of Capital and Discount Rate • Exports • Potential Impact on Province of Manitoba
6	Costs, Risks and Benefits	• Ratepayers • Government of Manitoba • Relative Distribution Issues
7	Recommendations and Conclusions	• Report recommendations and conclusions

1.4. Note on the Use of Projections and Models

In preparing our Report, we have made use of the following:

a) Information that was made available by Manitoba Hydro through this regulatory process, inclusive of the NFAT Business Case and supporting evidence admitted, responses to all information requests, and direct discussions that were organized by the PUB for Independent Expert Consultants;

b) Information that was publicly available, whether from Manitoba Hydro, the Government of Manitoba, from public authorities such as electricity system and market operators in other jurisdictions, or from general corporate, economic and financial sources;

c) Financial information available through paid subscription services;

d) Information, advice and opinions of other Independent Expert Consultants participating in this regulatory process on behalf of the PUB, in the form of discussions, meetings and reports;

e) Our general experience, qualifications and skills in financial analysis and the preparation of valuations and opinions on fairness from a financial point of view.

A very significant component of the work of this Report involved the use of forecasts, projections and estimates, and in particular those provided by Manitoba Hydro in evidence and in response to information requests. We have not passed any judgment on the validity or reliability of these projections and estimates (except in select cases specifically addressed below), but rather have assumed

that they were prepared with all due care based on the professional qualifications of those responsible for them.

It is critical to point out, however, the fundamental uncertainty that underlies many of the projections in question, particularly as they extend out not only years, but decades. Useful forecasts for the near to medium term are typically based on the belief – sometimes proven by subsequent events to be erroneous – that the future will consist of incremental changes to the practices of the past. However, the longer the time horizon of the forecast, the more likely that changes will cease to be incremental, and become truly unpredictable. What may appear to be reasonable today may at some point in the future – with the benefit of hindsight – look like a terrible mistake, or a massive stroke of luck. Prices change, technology changes, market dynamics change, the relative cost of goods changes: all in unpredictable ways over time.

Technological advances, in particular, can render assumptions obsolete even in relatively short periods of time. The development of hydraulic fracturing in the natural gas industry over the past decade is only a recent example of expectations about future market conditions being totally undermined: widespread expectations a decade ago were that North America would by now be supply constrained and increasingly reliant on expensive imports of natural gas from elsewhere, yet now there is a rush to find ways to export an overabundant commodity that has dropped dramatically in price. In earlier decades similar received wisdom was overturned (for example, there was a time in the mid-twentieth century when many experts believed that nuclear power would render electricity "too cheap to meter".[1] Needless to say, the aspiration was never achieved).

There is a significant danger in assuming that a view of the future from the perspective of today will be very accurate. All such assumptions should be approached with humility, and treated with respect as the best available basis for decision-making, but without claiming them to be more than what they are. Decisions cannot be made without taking a view of the future, but the future may prove unwilling to agree with the forecasts made of it.

It is commonplace that commercial transactions are analyzed using mathematical models, often providing a degree of precision measured in decimal points, which sometimes gives the illusion of accuracy or predictive power. We have used such models in the preparation of this Report. However, these models are only as accurate as the assumptions about the future that underlie them. Since those assumptions must be given a broad range because of the difficulty inherent in predicting the future, especially over decades, the models should and do result in outputs with an equally broad range. This means that mathematical models sometimes may be capable of excluding certain decision options from the realm of reasonable commercial choice, but cannot always point to a single preferred outcome among several. In these cases, decisions still must be made, but they must be rendered on the basis of judgement.

Commercial decisions are ultimately about judgement, and judgement is extremely difficult to quantify.

[1] The phrase was coined by Lewis L. Strauss, Chairman of the United States Atomic Energy Commission in a 1954 Speech to the National Association of Science Writers.

2. Context

The Preferred Development Plan is a long-term resource plan for electricity in the Province of Manitoba. Analyzing its features requires an understanding of the electricity system in the Province, and its expected needs.

2.1. Manitoba Hydro

Manitoba Hydro is the sole utility provider of electricity in the province, and is a Crown Corporation with the mandate[2] to:

- Provide electricity to Manitoba ratepayers as economically as possible, consistent with a safe and reliable system; and
- Exploit opportunities to export electricity and electricity-related services to the benefit of the Province of Manitoba and its ratepayers.

As a Crown Corporation, Manitoba Hydro does not pay dividends to the province of Manitoba (the "shareholder"),[3] nor does it pay income tax. Notwithstanding the organization of the entity on corporate lines – with debt and "equity" on its balance sheet – it is not a profit-maximizing enterprise. By legislation, it is entitled only to seek revenues sufficient to satisfy its operating costs, debt servicing needs, and to maintain reserves for various purposes, including the management of contingencies and smoothing of rates over time.[4] The corporation's "equity" is better understood as a form of reserve fund, and its "profits" in any given year as a contribution to that reserve.

[2] The *Manitoba Hydro Act* describes the objects and purposes as follows:

> 2. The purposes and objects of this *Act* are to provide for the continuance of a supply of power adequate for the needs of the province, and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power and, in addition, are
> (a) to provide and market products, services and expertise related to the development, generation, transmission, distribution, supply and end-use of power, within and outside the province; and
> (b) to market and supply power to persons outside the province on terms and conditions acceptable to the board.

The *Terms of Reference* of the Manitoba Hydro Electric Board specify the following:

> The corporation is charged with responsibilities which include, to ensure a safe, reliable, economical and environmentally responsible supply of energy for Manitoba, and to earn revenues to keep rates low for Manitobans through the export of power and the provision of energy-related services.

[3] Note that in fiscal year 2002-3, the Government of Manitoba received a special dividend payment of $203 million. This payment was specifically required by amendment of the *Manitoba Hydro Act*. See Statutes of Manitoba, c. 41.

[4] Please see *Manitoba Hydro Act*, s. 39(1) and s. 40(1).

By agreement with the shareholder, the target level of "equity" in the corporation is 25% of total capital,[5] as defined by the following formula:

Formula 1. Equity Ratio Calculation

$$\frac{\text{Total Equity} = \left\{\text{Retained Earnings} + \text{Contributions in aid of Construction} + \text{Accumulated Other Comprehensive Income} + \text{Non-controlling Interest}\right\}}{(\text{Long-term Debt} - \text{Sinking Funds} - \text{Cash}) + \text{Total Equity}} = 25\%$$

However, this is a long-term target, which serves as a financial guideline only, not an annual requirement. As a result, the equity ratio floats over time, depending upon actual financial results in any given year, the capital investment program being pursued at the time, and the rates set by the PUB. For example, the equity ratio for the past ten years has been reported as follows:

Table 2. Equity Ratio Performance

2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
13%	15%	19%	20%	27%	23%	27%	27%	26%	25%

Source: Manitoba Hydro, *62nd Annual Report*, year ending March 31, 2013

In addition to the equity target, Manitoba Hydro also attempts to meet two other measures of financial health, which are to ensure that its Interest Coverage Ratio ("ICR") is above 1.2, and that typical capital needs (not including major investments such as generation facilities) can be funded through internal resources.[6] The formula in use for ICR is:

Formula 2. Interest Coverage Ratio Calculation

$$\frac{\text{Net Income} + \text{Interest Payments on Debt}}{\text{Interest Payments on Debt}} = \text{ICR}$$

In essence, targeting a minimum ICR of 1.2 means that Manitoba Hydro will organize its affairs – and seek rates from the PUB – consistent with maintaining a 20% cushion of annual cash availability over and above its expected costs of interest.

[5] The 75:25 target ratio was first established in September 1995 by the Manitoba Hydro Electric Board. Please see the response to Information Request MPA/MH I-011a.

[6] The Capital Target is 1.2 times typical capital needs, not including major generation or transmission projects, according to the most recent Debt Management Strategy, April 2012, filed with the PUB as part of the General Rate Application.

Over the past ten years, the company's performance on this measure has been as follows:

Table 3. Interest Coverage Ratio Performance

2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
0.17	1.25	1.77	1.23	1.69	1.49	1.32	1.27	1.10	1.15

Source: *62nd Annual Report*

The notably low performance in 2003-04 coincided with a drought that year, which dramatically affected the company's net income, in fact resulting in losses for that year (since net income was negative, the resulting ICR for the year was below 1.0; ICR can actually be negative itself, if losses in a year are greater than interest payments).

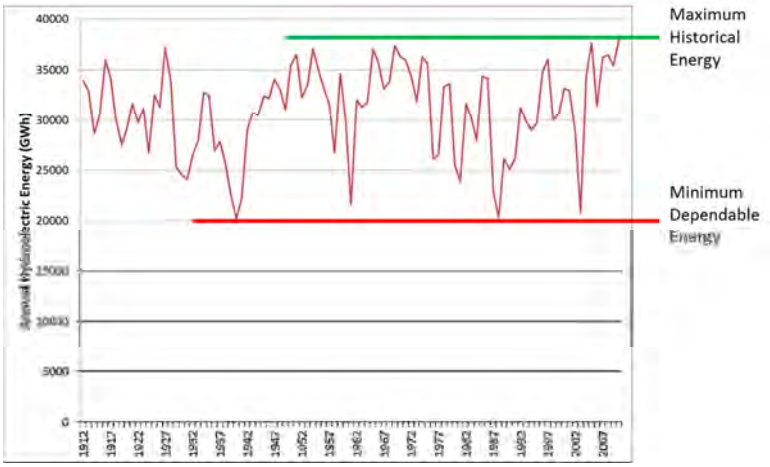
Manitoba Hydro has two sources of capital: internally generated cash flow, and debt. Long-term debt resources are provided by advances from the Government of Manitoba.[7] The Government of Manitoba raises debt from Canadian and international capital markets in the amounts and with the terms and conditions agreed upon with Manitoba Hydro, and then provides that debt on a back-to-back basis, with the addition of a "debt guarantee fee", currently equal to an annual payment of 1% per year on all outstanding long-term debt. Given that the debt is raised by the Government of Manitoba directly on its own account, and then subsequently advanced by the Government to Manitoba Hydro, the Government and taxpayers of Manitoba are directly liable for the full amount of the debt, regardless of the ability of Manitoba Hydro to make good on its annual interest and principal payments to the Government.

Crucially, notwithstanding the fact that the Government of Manitoba raises the required long-term debt for Manitoba Hydro, and on its face this debt is debt of the Province, credit rating agencies and the capital markets do not in practice treat that debt as debt of the province, but rather as debt supported by Manitoba Hydro and its ratepayers.[8] This is a very important element in the calculation of the Province's credit-worthiness, and hence the overall credit rating on provincial debt. This issue will be addressed further below, in section 4 (financial distress).

2.2. Manitoba's Electricity System Resources

Virtually all electricity users in Manitoba are connected to Manitoba Hydro's electricity system.[9] Manitoba Hydro currently serves approximately 550,000 customers, and does so with a generation system amounting to over 5,500 MW peak capacity. More than 90% of the generation resources are

[7] Manitoba Hydro issues a small amount of debt on its own account through Manitoba Hydro bonds, however the vast majority of debt is through Government of Manitoba advances. As per the March 31, 2013 Annual Report, Government advances amounted to $9,775 million out of total long-term debt of $10,012 million.



[8] See for example *Credit Analysis of Province of Manitoba*, Moody's Investor Service, July 23, 2013, p. 3: "Roughly one third of the province's total direct and indirect debt is attributed to Manitoba Hydro (issued and on-lent by the province) and is considered to be self-supporting."

[9] A small number of remotely located customers are served through standalone diesel generators.

water powered, which puts Manitoba into a select group of "hydro" jurisdictions, which includes Quebec, British Columbia, Newfoundland & Labrador, Norway, Paraguay, and Iceland.[10]

Like all other predominately water powered systems, Manitoba Hydro must manage the reality of ever-changing annual precipitation. In any given year, water flow through hydroelectric generation facilities can be much higher or much lower, resulting in very different levels of annual energy production. As Figure 5.8 from the NFAT Business Case makes clear, the lowest water flow of the past 100 years was only 47% of average, while the highest year was 168% of average.[11] That is a range of more than 3.5 times the water flow from lowest year to highest year on record. Yet for reasons of reliability, it is only safe to count on the lowest levels as "dependable" energy. If Manitoba's current hydroelectric facilities had been in place over the past 100 years, it might have had the following annual performance (note that this is an illustration only, based on a certain set assumptions about reservoirs, water management, transmission facilities, etc.).

Figure 1. Illustration of Hydroelectric Performance

If the system included no other electricity resources, then it would be necessary to ensure that the minimum dependable energy level was sufficient to satisfy all domestic needs. If Manitoba demand were expected to grow in the foreseeable future to the point that demand would exceed minimum dependable energy, then more hydroelectric generation capacity would be required.

In most years, however, the system will produce more (and in some years much, much more) than the minimum level of energy. Since demand is fairly stable on a short-term basis, all of the excess energy in any given year may be exported to neighbouring jurisdictions, or if possible "saved" by filling up water reservoirs and not producing the energy in the first place.[12] To the extent that existing facilities can

[10] Iceland's electricity system is approximately 75% hydro, and 25% geothermal, which is also renewable and relatively inexpensive. Newfoundland & Labrador is currently building a new hydroelectric generation facility – Muskrat Falls – which, once built, will allow for the closure of the Holyrood oil-fired station, and which will result in the province having an electricity system which is 100% supported by wind and water powered generation.
[11] Data from Figure 5.8 provided by Manitoba Hydro in response to Information Request MPA/MH II-021.
[12] In the event that reservoirs are full, and exports have reached the maximum possible based on transmission line capacity, then remaining water will be spilled over dams and not run through generators.

produce more dependable energy than is needed domestically, then that "extra" dependable energy can be exported through firm contracts to other jurisdictions.

In the case of Manitoba today, the Province is not solely dependent on water power: the electricity system includes two thermal energy facilities (one coal unit, and four natural gas units), two wind power facilities (wind power suffers good and bad years like water power, but generally is not as variable, and on its own schedule, not correlated to water flow), and the ability to import electricity from other jurisdictions. All of this means that total dependable energy is somewhat higher than what can be relied on from Manitoba Hydro's hydroelectric generation facilities.

In order for thermal plants to be maintained in good working order and available when needed, they have to be operated for a small percentage of any week, regardless of whether there is sufficient water power to meet needs. It is the nature of wind turbines that they produce energy whether needed for system purposes or not, so they also increase by a small amount the system's total output every year. Imports, however, need only be purchased when they are needed. The combination of these factors means that total system energy output is always greater than annual water power output, and in years where water is extremely low, other resources ensure that the system's minimum total energy is delivered.

Currently, Manitoba's electricity system has the following output characteristics:

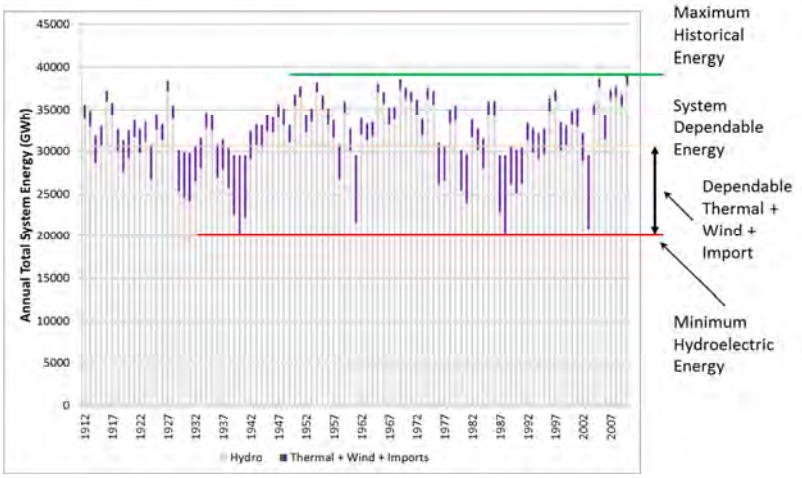


Table 4. Manitoba System Resources

System Dependable Energy	**Energy (GWh)**
Minimum Dependable Water Power	21,950
Dependable Energy from Thermal, Wind & Imports	8,303
Total System Dependable Energy	30,253
Maximum Water Power Potential	38,000 (approx.)

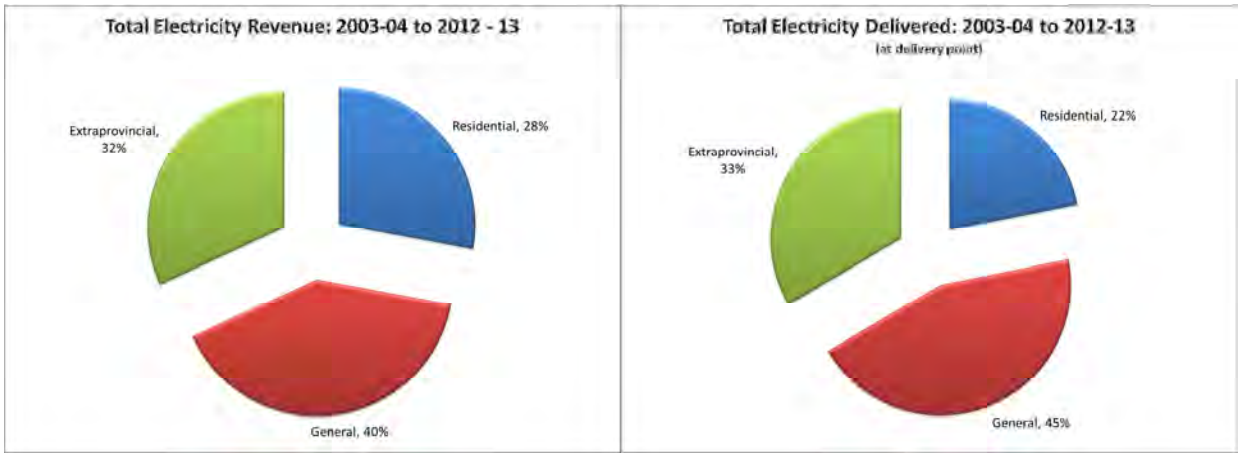
Source: NFAT Business Case, Appendix 4.2; IR MPA/MH II-022

The following chart depicts how Manitoba's current electricity system would have performed if it had been in place over the past hundred years, assuming that demand in every year was equivalent to today:

Figure 2. Illustration of Manitoba Electricity System

In addition to measuring the total annual energy production of the Manitoba electricity system, it is also important to note the peak system capacity: the amount of power that the system can supply at any given moment to all of its customers. Because Manitoba's hydroelectric facilities are supported by a system of reservoirs and water control structures, they can be managed so that they operate at higher power output levels at certain times of the day or year, and at lower power output levels when less electricity is likely to be needed. In this way, even in years with less water flow the system can operate at peak capacity at critical times. Thermal facilities can always generate their peak capacity (unless they are out of service), and usually at short notice. Imports can only be relied upon if firm capacity contracts are in place for expected peak periods of time. Fortunately for Manitoba, the province's peak requirements occur in the winter, while in neighbouring jurisdictions peak requirements occur in the summer, so imports are generally available during Manitoba's periods of peak need. Finally, wind power is unreliable on an hourly basis, so it cannot be counted upon for peak capacity. Currently, Manitoba Hydro's system has the following peak capacity characteristics:

Table 5. Manitoba Peak Capacities



Total System Peak Capacity	**Capacity (MW)**
Hydroelectric Peak Capacity	5,177
Thermal	517
Contracted Imports	550
Total System Peak Capacity	6,244
2012-13 Manitoba Peak Demand	4,535 (approx.)

Source: NFAT Business Case, Appendix 4.2; *62nd Annual Report*

Revenues for Manitoba Hydro consist of the sum total of domestic ratepayer charges, contracted export revenues, and revenues from opportunity exports. Over the past ten fiscal years from 2003-04 to 2012-13, export revenues have represented approximately 32% of total Manitoba Hydro revenues from

electric operations (not including "other" revenues from consulting, etc.).[13] Exports delivered at the Manitoba border equaled approximately 33% of total energy delivered to customers.

Figure 3. Manitoba Hydro Electricity Revenues and Deliveries

Source: *62nd Annual Report*

Since the relative domestic and extra-provincial proportions of revenues and delivered exports was about the same, this means that the price per unit of energy for Manitoba ratepayers (on average for all ratepayers over the ten-year period) was about equal to the price paid by export jurisdictions for power received from Manitoba. *However, it is crucial to note that for Manitoba ratepayers, this was the all-in price for power, whereas customers outside Manitoba had to pay transmission, distribution and other costs in addition to the price paid to Manitoba for the raw energy received*. The result is that Manitoba ratepayers had a total average cost of electricity – including generation, transmission, distribution and all other services - over that ten year period that was much lower than surrounding jurisdictions. This is consistent with the view that electricity costs in Manitoba are relatively very low.

Hydro-Quebec produces an annual survey of electricity costs in twenty-one different cities across North America. They compare the total cost of electricity, before taxes, for seven different customer profiles ranging from typical residential customers to the largest industrial consumers (customers are classed based on monthly energy consumption and monthly peak demand). Winnipeg, and by extension the rest of Manitoba, ranks among the three lowest cost jurisdictions included in the survey in every customer category.[14] This status as a low-cost electricity jurisdiction is a competitive advantage for the province. Critically, in the two categories for the very largest customers, Manitoba is the lowest cost jurisdiction surveyed, with a 5% cost advantage over the next jurisdiction for the largest customer class, and a 10% cost advantage over the next jurisdiction in the second largest customer class.

[13] *62nd Annual Report*, for the year ended March 31, 2013, Manitoba Hydro, data from pages 98-99.
[14] Please see *Comparison of Electricity Prices in Major North American Cities, 2013*, by Hydro Quebec. Available online at www.hydroquebec.com.

2.3. New Resource Needs and Opportunities

Manitoba Hydro has identified that existing electricity resources will no longer be sufficient to meet domestic needs sometime during the mid- to late-2020s. This is claimed for both annual energy production and peak capacity. Moreover, since Manitoba Hydro currently has ongoing contractual obligations for dependable exports, the need for additional resources will occur even earlier.

In Chapter 4 of the NFAT Business Case, Manitoba Hydro describes their Planning Criteria, the history and expectations of demand growth in Manitoba, the past and expected future success of demand-side management programs ("DSM") to curb demand growth, and the resulting timing of the need for new resources.

Other experts retained by the PUB have examined closely the assumptions, methodologies and conclusions relied on by Manitoba Hydro to estimate the growth in domestic demand.[15] To the extent that there is doubt about the near-term expectations for Manitoba demand growth, or the ability of DSM programs to economically curb that growth, it is largely the timing of the need for new resources that would be affected. In the longer-term, however, the assumption that Manitoba demand will continue to increase relentlessly into the future is more controversial, and will be addressed further below in the discussion of risks in section 4.2.2 (Impact of Manitoba Demand).

In addition to growing Manitoba demand for electricity resources, Manitoba Hydro has identified new export opportunities. Several term sheets have been negotiated with counterparties interested in contracting with Manitoba for firm exports of electricity, if – but only if – Manitoba proceeds with new construction of hydroelectric generating stations.

The vast majority of Manitoba electricity exports are destined for utilities in the United States. Manitoba sells a small portion of its available exports to Ontario and Saskatchewan, but in the fiscal year 2012-13 approximately 88% of its export revenues were from sales to the United States.[16]

The Midcontinent Independent System Operator (MISO) is the organization which operates the multi-utility electricity transmission grid into which Manitoba Hydro sells most of its exports. MISO has a peak summer generation capacity of over 100,000 MW, and is many times the size of Manitoba's electricity system when measured by generation resources, customers and total energy consumption. Its resources are based largely on coal and natural gas-fired generation facilities, with a substantial and growing amount of wind power resources.[17] Given its reliance on coal and natural gas facilities which can run almost constantly when needed, the MISO market does not face any shortage of annual power output, but instead planning issues centre on the need to replace retiring coal capacity, and the need to reduce the carbon footprint of electricity output in the future.

[15] Please see reports submitted to the PUB by Elenchus Research Associates Inc. on the load forecast and DSM.
[16] *62nd Annual Report*, p. 49.
[17] Please see, for example, *2012 State of the Market Report for the MISO Electricity Markets*, June 2013; available online at www.misoenergy.org.

Given these characteristics, it is understandable why MISO utilities would only be interested in hydroelectric power from Manitoba: they have their own coal, natural gas and wind resources, and would have no economic need to import those from Manitoba Hydro (in fact, importing them would likely be uneconomic, because it would entail transmission costs to bring power across long distances). On the other hand, hydroelectric energy is carbon-free like wind, but if supplied in the form of a firm energy contract, would be much more reliable, and help them to meet their capacity needs while also reducing their system's carbon output.

Currently, when an export market buys power from Manitoba, it is 90%+ "carbon free", given Manitoba's generation mix. If Manitoba were to build new hydroelectric generation facilities, then its power would still be 90%+ carbon free (in fact, the figure would rise to 95%+). However, if Manitoba builds natural gas-fired facilities, or meets its needs in some other way, then it may no longer be able to claim that it meets that high standard of "carbon free" production. It is not unreasonable to believe, in these circumstances, that if Manitoba Hydro builds additional hydroelectric generation facilities, it would find willing buyers for firm energy contracts – at *some* price – for the sale of a substantial portion of the excess dependable energy that would be expected to be available post-construction.

2.4. Stakeholders and Their Interests

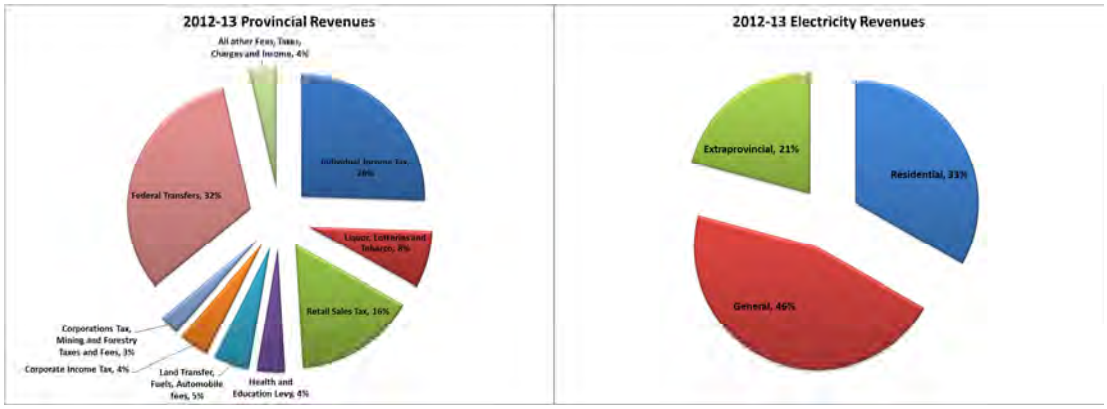
2.4.1. Manitoba Ratepayers

Manitoba Ratepayers benefit from Manitoba's electricity system, but are also obligated to pay all of Manitoba Hydro's costs, less whatever revenue can be earned from exports. Ratepayers are the primary stakeholder in Manitoba's electricity system, and hence in the consideration of Manitoba Hydro's Preferred Development Plan. Ratepayer interests are fairly straightforward to identify: they want safe, reliable electricity services at the lowest possible cost over time. In considering a forward-looking resource plan such as the Preferred Development Plan, however, it is not possible to specifically forecast future costs, because they depend on a great many variables that will only be known for certain in retrospect, as will be discussed much more extensively below. As a result, it is better to formulate ratepayer interests as: safe, reliable electricity services at the lowest possible *risk-adjusted* cost over time.

The notion of *time* also raises complications when considering ratepayers as a collective. Given that the Preferred Development Plan and its alternatives would play out over many decades, and that electricity costs over such a period would necessarily fluctuate, the costs and benefits of any alternative might be distributed differently between ratepayers over the next twenty years, for example, and ratepayers for the subsequent twenty year period, or the period after that. Inter-generational equity between ratepayers is therefore an issue which should be given consideration when reviewing Manitoba Hydro's options. This will be discussed further below, in section 4 (financial analysis).

2.4.2. Government of Manitoba

The Government of Manitoba, on behalf of the taxpayers and citizens of Manitoba, is the sole shareholder of Manitoba Hydro, and hence is also an obvious stakeholder in the decision to be made. The Government's interests, however, are more complex than for ratepayers, and include several priorities:



- *Ensure Competitive Electricity Rates*: As has already been noted, Manitoba currently benefits from very low electricity costs as compared to most jurisdictions in North America. This is clearly a competitive advantage for the province, as it may help attract industrial consumers of electricity to the province, who in turn are responsible for jobs and economic development. In addition, since electricity is part of the cost of doing business in every industry – to a greater or lesser degree – keeping electricity costs low generally makes Manitoba businesses more competitive than they would otherwise be. From the perspective of the Government of Manitoba, keeping rates competitive with other jurisdictions is therefore an important goal. However, it is not clear that it is necessarily important for Manitoba to attempt to *maximize* this goal: i.e., to be competitive with other jurisdictions, electricity costs do not need to be "as low as possible", only lower than elsewhere. If rates in other low cost jurisdictions are rising – for example by the rate of inflation – then Manitoba does not harm its competitive position by allowing its rates to rise by a similar amount.

- *Maximize Tax Revenue, Fees and Charges Paid to Government*: Manitoba Hydro does not pay dividends or income tax to the Province, but it does provide several other revenue streams to government. Water "rental" fees are calculated based on the flow of water through Manitoba Hydro's hydroelectric facilities. This is essentially a mechanism for the government to directly capture a fraction of the revenue associated with hydroelectric production. Capital taxes are based on the total equity and debt capital being put to use in Manitoba Hydro. Both of these items are considered operating costs for Manitoba Hydro, and are recovered from ratepayers. All other things being equal, it would be reasonable for the government to prefer options where its revenue streams were greater. For the government, these revenue streams are an alternative form of tax, which benefits the provincial budget. It could be objected that if these taxes were not charged to Manitoba Hydro, then electricity costs would be lower, and the government could simply increase some other tax to compensate. However, it is notable that "ratepayers" are not economically identical to "taxpayers", and hence there is a distributional impact of collecting government revenue through water rentals and capital taxes on Manitoba Hydro.

  As noted in the charts below, individuals and families pay a much larger portion of government revenues (through income tax, liquor/lottery/gaming taxes, retail sales tax, etc.) than they do electricity costs (the Residential customer class provided 33% of Manitoba Hydro's electricity revenues in 2012-13, but personal income taxes and liquor/lottery/gaming taxes represented 34% of Provincial revenues, and then a large share of retail sales tax, land transfer tax and other revenue line items would have to be included). On the other hand, Manitoba businesses and

institutions pay a far greater portion of electricity costs than they do government revenues. Clearly, government could substitute new provincial taxes for the revenue streams that are embedded in electricity costs, and if they did so electricity would become less expensive, but it would not necessarily be a simple substitution.

Figure 4. Taxbase and Ratebase Comparison

Source: Manitoba Estimates, 2013; *62nd Annual Report*

- *Minimize Risk of Default on Guaranteed Debt:* As noted above, the Province of Manitoba guarantees almost all debt incurred by Manitoba Hydro. While the government charges a fee for providing this guarantee, it is a potentially serious burden on the taxpayers of the province. In considering the Preferred Development Plan and its alternatives, a significant issue for government is minimizing the risk that the province would ever be required to make good on the guarantee.

On its face, the legislative requirement that ratepayers cover all costs of Manitoba Hydro (after export revenues are deducted) seems to mean that the government would never be called upon to pay Manitoba Hydro's debts. After all, if Manitoba Hydro needs more revenue to pay its costs, then it can simply request that the PUB raise customer rates. However, in an extreme situation of financial distress for Manitoba Hydro (for example, caused by a prolonged drought), the need to pay debt costs may conflict with the need to maintain competitive electricity rates. For example, if electricity costs were to rise dramatically, implying the need for a substantial rate increase, large manufacturers might threaten to close their doors and move production to other jurisdictions unless the government intervened to provide assistance. If rates were kept low, and Manitoba Hydro simply absorbed the financial losses for a period of years, then Manitoba Hydro's status as a financially self-supporting entity would be called into question. Credit rating agencies, which currently do not include Manitoba Hydro debt as an obligation of the Province of Manitoba, may reconsider that position, at least for a portion of Manitoba Hydro's debt, which could have significant implications for the government. What this illustrates is that despite the legislation under which Manitoba Hydro operates, a situation of financial

distress could force the government to make a difficult political decision. Avoiding the potential for such situations to arise is therefore assumed to be a priority for the government.

- *Maximize Job Creation and Economic Development:* Any infrastructure development plan will entail construction and engineering employment, purchase of supplies, etc., and depending on where that construction occurs, a range of indirect employment and economic development activity that benefits different communities across the province to varying degrees. Maximizing these benefits is an obvious interest of the government in considering the Preferred Development Plan and its alternatives. Not incidentally, the economic activity that is generated by construction of large infrastructure also has secondary benefits in increasing government income and sales tax revenues, as companies and their employees benefit in the form of profits, salaries and wages. However, infrastructure development must be paid for in the form of electricity rates over time, and higher electricity rates can lead to a loss of business competitiveness for the province with an attendant impact on jobs, so the maximization of job creation and economic development over the long-term is a more subtle issue than it immediately appears.

- *Protect the Environment:* Any major infrastructure development will have potential impacts on the environment that must be understood and potentially balanced against other economic and social impacts. In the case of the Preferred Development Plan and its alternatives, very different potential impacts would be felt depending on the choice made. Some alternatives entail direct impacts on land, flora and fauna through flooding, road construction, etc., while other alternatives entail air emissions including carbon, oxides of nitrogen, ground level ozone, etc.

2.4.3. Other Stakeholders

In addition to ratepayers and the Government of Manitoba, three other groups bear mentioning as stakeholders in the decision-making process about the Preferred Development Plan: First Nations, "the environment" as represented by Environmental Groups, and the Federal Government.

- First Nations have partnered with Manitoba Hydro in the past on the development of the Wuskwatim hydroelectric generation facility, and similar arrangements may be expected to apply to the proposed Keeyask and Conawapa facilities. Given the economic benefits that such partnerships could bring to affected First Nations, they have a clear interest in the decision. In addition, since the above facilities are located in lands of traditional concern to First Nations, potential environmental and social impacts should be taken into account.

- Environmental groups often challenge government, business and institutional proponents of large projects with respect to the environmental impacts that a proposed project will engender. With a single-minded focus on protecting the environment, and on understanding and mitigating against potential environmental impacts which may not previously have been brought to light, environmental groups are sometimes a stand-in for "the environment" as an independent stakeholder in a decision-making process.

- Given Canada's constitutional and fiscal relationships, the Government of Canada is often considered to be the ultimate guarantor of provincial credit.[18] Given the debt guarantee provided by the Government of Manitoba to Manitoba Hydro, the Government of Canada can, in some remote sense, be thought of as a guarantor of the debt that would be incurred through the Preferred Development Plan or its alternatives. In addition, the Government of Canada, through its authority over navigable waters, inter-provincial environmental issues, and First Nations, has other, more direct interests in the outcome of the decision-making process.

Notwithstanding the notional importance of these three stakeholder groups, it is fairly clear that their concerns overlap in important ways with those of the Government of Manitoba, even if they may not be perfectly captured. As a result, these additional stakeholder groups will not be included in any further analysis in this report, which will limit itself to considering the interests of the two main stakeholders, Manitoba ratepayers and the Government of Manitoba.

[18] In the *Credit Analysis* cited above in note 7, Moody's Investor Service states on p. 5, "Moody's assigns a high likelihood that the federal government (Aaa, stable) would act to prevent a default by Manitoba. The high likelihood of support reflects Moody's assessment of the incentive to the federal government of minimizing the risk of potential disruptions to capital markets if Manitoba, or any province, were to default, as well as indications of a moderately positive federal government policy stance as illustrated by the flexibility inherent in the system of federal- provincial transfers."

3. Resource Options

In the Business Case, Manitoba Hydro described multiple electricity resources that could be constructed in Manitoba to meet anticipated demand. Furthermore, a variety of alternative combinations and sequences of resources were considered. Many options were discarded because of environmental concerns or legislative restrictions (e.g., coal and nuclear), while other options were not pursued because they are currently prohibitively expensive compared to current Manitoba Hydro rates (e.g., solar). The options which were fully analyzed in the Business Case included various combinations of new hydroelectric stations, natural gas-fired stations, and new transmission interconnections with the United States.

One option that did not appear to be thoroughly addressed in the Business Case was the possibility of largely avoiding new construction through aggressive demand side management programs to flatten the growth of domestic demand, coupled with new transmission interconnections that could provide greater peak import capacity and higher total system dependable energy. In response to intervener and expert consultant requests, Manitoba Hydro is providing additional information to address this possible option, but did not do so in time for the preparation of this report. As a result, consideration of this option was not included here.

3.1. Resource Plans and Individual Elements

In the Business Case, Manitoba Hydro provided descriptions and partial analysis of fifteen Resource Plans, and full analysis including financial models for eight Resource Plans. Each included various combinations and timelines for several potential resources. Of these eight plans, the "All Gas" (Plan 1) and Preferred Development Plan (Plan 14) are the most significant contrasts in overall resource strategy, as they are furthest apart on two orientations: gas vs. hydroelectric, and domestic focus vs. export focus.

Of the remaining six plans that were fully modeled by Manitoba,[19] we dismissed three (plans 2, 7, and 13) because they were essentially similar to other plans, but with less transmission.[20] Even cursory comparison of Manitoba Hydro's analysis of plans having similar generation resources coupled with larger transmission shows the pattern that financial results are superior with additional transmission capacity. This is consistent with received wisdom in resource planning that transmission interconnections provide substantial system benefits.

For the purposes of our analysis, we limited our focus to the following five Resource Plans.

[19] Seven plans were not fully modeled (3, 5, 8, 9, 10, 11, 15) because they were either slight variations on others, or they were demonstrated to be clearly inferior through the first two stages of Manitoba Hydro's analysis.
[20] Plans 2 and 7 include hydroelectric generation but no transmission, and can be contrasted unfavourably to Plans 4, 6, 12 and 14 that all include transmission. Plan 13 includes Keeyask and Conawapa, but only a 250 MW interconnection, whereas both Plans 12 and 14 include a 750 MW interconnection.

Table 6. Resource Plans Examined

Plan	Elements
1	*All Gas* • Single cycle natural gas units are added in 2022-23, 2025-26, 2028-29, 2034-35, 2047-48 • Combined Cycle natural gas units are added in 2031-32, 2037-38, 2040-41, 2044-45
4	*K19/Gas24/250MW* • Keeyask Hydroelectric Station in 2019-20 • 250 MW Transmission Interconnect in 2020-21 • Single cycle natural gas units are added in 2024-25, 2029-30 • Combined Cycle natural gas units are added in 2032-33, 2038-39, 2041-42, 2045-46
6	*K19/Gas25/750MW(WPS Inv.)* • Keeyask Hydroelectric Station in 2019-20 • 750 MW Transmission Interconnect in 2020-21 • Interconnect will be partially owned and funded by a US investor • Single cycle natural gas units are added in 2025-26, 2026-27, 2028-29, 2031-32, 2033-34, 2045-46, 2047-48 • Combined Cycle natural gas units are added in 2042-43
12	*K19/C31/750MW* • Keeyask Hydroelectric Station in 2019-20 • 750 MW Transmission Interconnect in 2020-21 • Conawapa Hydroelectric Station in 2031-32 • Single cycle natural gas units are added in 2041-42, 2044-45, 2046-47
14	*K19/C25/750MW(WPS Inv.)* • Keeyask Hydroelectric Station in 2019-20 • 750 MW Transmission Interconnect in 2020-21 • Interconnect will be partially owned and funded by a US investor • Conawapa Hydroelectric Station in 2025-26 • Single cycle natural gas units are added in 2041-42, 2044-45, 2046-47

Source: NFAT Business Case, Chapter 8

Several basic elements are shared between the above Resource Plans, having the following characteristics when added to the existing Manitoba electricity system:

Table 7. Resource Elements

Resource	Dependable Energy	Maximum Energy	Winter Peak Capacity	Maximum On-peak Exported Energy	Maximum Off-peak Imported Energy
209 MW Single Cycle Gas Turbine	2,460 GWh	2,460 GWh	223MW		
308 MW Combined Cycle Gas Turbine	1,688 GWh	1,688 GWh	325 MW		
Keeyask	3,003 GWh	5,400 GWh	630 MW		
Conawapa	4,650 GWh	7,600 GWh	1,300 MW		
250 MW Intertie	Planning Limits		Depends on contracts	1,144 GWh	208 GWh
750 MW Intertie	Planning Limits		Depends on contracts	3,432 GWh	3,120 GWh

Source: NFAT Business Case, Chapter 7; SPLASH model outputs provided by Manitoba Hydro

The five Resource Plans selected, with their various combinations and timing of resource elements, allow for comparisons of financial performance over time between versions of the Manitoba electricity system with characteristics along several dimensions: Gas/Hydro; Less/More Interconnection; Domestic/Export Focus; Earlier/Later Construction.

- Gas/Domestic Focus vs. Hydroelectric/Export Focus: Plan 1 vs. Plan 14
- Less Interconnect/More Domestic Production vs. More Interconnect/Less Domestic: Plan 4 vs. Plan 6
- Earlier Hydro construction for Firm Export vs. Later for Domestic: Plan 14 vs. Plan 12
- Hydro/Gas vs. Hydro/Hydro: Plan 4 or 6 vs. Plan 14

3.2. Notable Features

3.2.1. Contrasting Impact of Resource Elements

Natural gas generation resources increase the system's dependable energy, but are unlikely to affect maximum annual energy production to a significant degree. In "wet" years, Manitoba Hydro's existing hydroelectric generation facilities are more than sufficient to satisfy domestic needs and create a

surplus for export. In such years, gas generation facilities will operate to the minimum extent. In "dry" years, natural gas units have the effect of increasing substantially the minimum system dependable energy, as well as contributing to peak winter capacity.

Hydroelectric generation resources increase both the system's dependable energy, AND the maximum energy possible in any given year, therefore driving up the average exports that should be expected from the system. Hydroelectric generation facilities therefore are inherently "export-oriented", and beg the question of the electricity system's transmission capacity for export (if there is insufficient export capacity, then in "wet" years water might have to be spilled/wasted).

Transmission interconnections potentially provide benefits for meeting peak capacity needs (if coupled with firm import contracts), and increase the ability to import power in "dry" years and export it in "wet" years. They are multi-purpose resources and can contribute in a variety of ways to system financial performance over time.

3.2.2. Long Term Plan but Near Term Differentiation

All fifteen Resource Plans proposed by Manitoba Hydro include natural gas-fired generation elements, though in some cases not until the 2040s. While in Chapter 7 of the Business Case Manitoba Hydro identified a number of other potential hydroelectric projects in the province,[21] they make no suggestion that any of these could be practical parts of current planning, because based on the stage of current project development and relative prices, they are uneconomic. However, it is notable that there is mention of the possibility that in the future several hydroelectric projects could be combined to create a more competitive alternative.[22] This suggests that choice of a Resource Plan today, such as the Preferred Development Plan (which only includes natural gas-fired generation in the distant future), could later be revisited in light of the opportunity to pursue additional hydroelectric energy. Similarly, even plans which indicate natural gas both immediately and in the longer term could be revisited at any time in the future if it is determined that hydroelectric options have become more attractive.

In short, while the Resource Plans are structured as long term multi-stage projects for the purposes of analysis, their true value is in highlighting the potential longer term implications of resource choices made in the near future. It should be assumed that all Resource Plans are subject to revisit and modification as they unfold.

3.3. Planning Variables

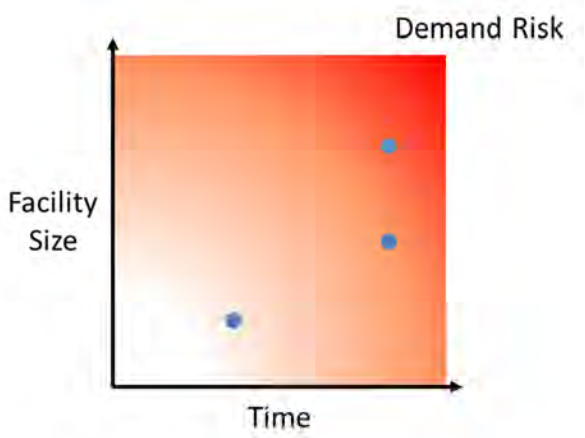
All electricity resource planning exercises entail risks, because they depend very much on future conditions, which are ultimately unknowable in advance. It is highly unlikely in any jurisdiction that there is a choice that is universally superior to all other options in all possible future conditions. Instead, the challenge is consider a wide variety of possible future conditions, and determine if each alternative is

[21] Please see Business Case, c. 7, pages 23 to 28.
[22] Ibid., p. 28.

robust in the way it performs across them. Results of such analysis would indicate the costs, benefits and risks that would be accepted by stakeholders if that option were chosen.

Manitoba Hydro has carefully screened its resource alternatives on the basis of safety and reliability standards. All of the options examined in detail in the Business Case passed those tests. As a result, the expected future performance of the *physical* electricity system is not an issue in the selection among options: all of the options considered would satisfy Manitoba's electricity needs safely and reliably according to the standards and criteria in place in Manitoba. What is at issue is the expected *financial* performance of the various resource options under future conditions that might obtain. There are a number of factors which affect Manitoba Hydro's financial performance, and which will vary in the future, in ways that are increasingly unpredictable further out in time. To the extent possible, testing the resource options consists of imagining plausible future paths for these variables, and calculating how the resource plan would perform in that possible future.

3.3.1. Manitoba Demand



The Preferred Development Plan and its alternatives were created because of a perceived need for new resources. The timing of that need, however, depends very much on the rate of demand growth in Manitoba. If demand growth is relatively high, then new resources will be required sooner, and if relatively lower, then later. The difference can amount to a few years, according to the analysis presented by Manitoba Hydro. One risk is that capital will be spent earlier than necessary, which means that a facility will not be fully utilized for a period of time. This loss of efficiency would be costly to ratepayers, but likely only temporarily.

Considering the different options, the risk of being incorrect about the timing of the requirement for new resources is in some measure proportional to the time required for development and construction of a new facility. For example, a natural gas-fired generation facility may take three years to build and put into service, while a hydroelectric facility may take five to seven. Given uncertainty in demand growth, the further out in time the projection is, the greater the likelihood for error. From this perspective, facilities which can be constructed more quickly have an advantage, because they can be more accurately targeted to the timing of needs.

Over the longer-term, however, the more important risk with respect to demand growth concerns the size and longevity of proposed resources. Large, extremely long-lived resources are susceptible to becoming "stranded assets": facilities which are built to serve a need which never fully materializes, and are therefore inordinately expensive for the purpose they ultimately serve. In the case of electricity resource options in Manitoba, this risk would be expressed in the case of Keeyask or, more likely, Conawapa, where the risk is that domestic Manitoba demand growth in the future could stall long before an additional 1,300 MW of capacity and 5,000 GWh of energy are fully required. The reasons for a long-term change in direction could be many, but most easily conceived of are some change in technology which allows consumers to dramatically reduce their consumption (e.g., a new cooling technology).

It is important to note, however, that "demand" need not specifically apply to Manitoba domestic demand. A new hydroelectric generation facility in Manitoba could, if Manitoba demand is lower than anticipated, simply serve export demand. However, from a financial perspective Manitoba ratepayers would then in effect be investors in a pure export project, rather than electricity consumers of a necessary facility which may for a time be larger than needed.

Figure 5. Demand Risk and Electricity Infrastructure

Gas plants, with a much shorter typical life of only twenty-five years and flexibility in size (smaller units can be built singly or in multiple sets, as required), do not suffer nearly to the same degree from demand risk. Transmission resources, with an average life between the two types of generation facilities, occupy a middle level of risk, also mitigated by the fact that they are flexible enough to serve several different purposes depending on need (i.e., winter peak capacity, higher exports in "wet" years, higher imports in "dry" years, etc.).

3.3.2. Fuel Availability/Hydrology

Electricity generation plants require inputs – or fuel – to operate. In the case of hydroelectric facilities, this fuel is water that derives from precipitation in relevant watersheds. For thermal plants, that fuel will be coal, natural gas, diesel fuel or some other hydrocarbon or biomass. Fuels for wind turbines and solar panels are self-explanatory.

Manitoba Hydro did not explicitly address hydrology/fuel availability in their financial modeling, except to test the sensitivity of the Resource Plans to a prolonged drought. They assumed that natural gas was available upon request for any number of new facilities. This is now probably a fair and reasonable assumption, given the existing identified natural gas resources in North America (note that ten years ago, before the "shale gas revolution", many analysts believed that North America might run short of

recoverable natural gas resources, and be forced to import liquefied natural gas, which would have represented real concerns about availability).[23]

Critically, Manitoba Hydro assumed average hydroelectric performance in every year throughout their models.[24] This allows them to consider factors which are longer-term than the annual swings in precipitation that lead to more or less hydroelectric generation.

However, review of the information on historical water flows supplied by Manitoba Hydro in the NFAT Business Case Figure 5.8 suggests that changes in water flows can have an impact beyond any one-year or short-term period. For example, on a five-year basis, average water flow has ranged from 70% of average to 130% of average. On a ten-year basis the range narrows only slightly to 80% to 120%. Even on a twenty-five-year basis the range of averages is 90% to 110%. Given that Manitoba is so heavily dependent on hydroelectric energy currently, and will continue to be so for an extended period even in the All Gas Resource Plan, understanding the impact of hydrology on the choice of Resource Plan appears to be potentially important.

3.3.3. Fuel Prices

The price of water as a "fuel" for hydroelectric facilities is set by the government, in the form of the water rental fee. This fee has been stable, and is assumed to continue at its current level for the foreseeable future. To take into account the general increase in prices, it is prudent to assume that the water rental fee will rise by inflation in the more distant future. However, the Government of Manitoba could change the water rental fee at any time of its choosing, which would have an impact on the relative attractiveness of hydroelectricity.

Natural gas prices are extremely volatile, and a review of prices over the past twenty years demonstrates the degree of uncertainty that should be placed on any forward estimates. From the perspective of Manitoba Hydro's production costs, however, fuel prices are not currently very important to financial results. Natural gas-fired generators are a small part of Manitoba generation capacity, and even in the All Gas Resource Plan it will take many years for the system as a whole to become very sensitive to natural gas prices. However, ultimately the balance between hydroelectricity and natural gas-fired electricity would shift significantly enough that fuel prices would have a stronger impact on net income.

Another expert consultant to the PUB has commented on the natural gas price assumptions adopted by Manitoba Hydro, not because of the role of natural gas prices in Manitoba's production costs, but because of the impact of natural gas prices on the next variable addressed.[25]

---

[23] See for example the International Energy Agency *World Energy Outlook 2013* for a discussion on natural gas availability. Also see the *BP World Energy Outlook 2035*, or the United States Energy Information Administration *Annual Energy Outlook*.

[24] The average chosen is the average hydroelectric output that would result from the application to the planned hydroelectric facilities in each Resource Plan of the water flows of the past 99 years. In other words, assuming that a Resource Plan contemplated no new hydroelectric facilities, and the continued maintenance and repair of all existing facilities, then approximately 31,000 GWh of annual hydroelectric production would be assumed.

3.3.4. Export and Import Prices

As noted above, over the past ten years Manitoba Hydro delivered a third of its electricity (measured at delivery point) to export markets, largely because the province's hydroelectric generation facilities were producing far more power than was domestically required. At the same time, it improved the financial value of its system by importing power at off-peak times while holding back hydroelectric generation, and then sold power into export markets at peak value times. When needed, especially in the drought year 2003-04, power was imported in large volumes to compensate for diminished hydroelectric production.

Prices paid per MWh of electricity by export customers are fundamental to the value of all of these transactions, and those prices change over time. A certain portion of these sales were through firm contracts, where prices are fixed for the term (generally rising with an inflation and/or other index), but a majority was exposed to whatever price was prevailing in the market. Given the destination for the vast majority of Manitoba's export electricity, the relevant market is the MISO market in the United States.

Prices in the MISO market are fundamentally out of Manitoba's control. MISO is a much larger system, and its supply and demand dwarfs that of Manitoba. At certain times Manitoba's transactions may have an impact on the marginal price in the market (especially regionally, where system congestion effects become important), but Manitoba is essentially a price taker. Another independent expert consultant retained by the PUB has commented in detail on the assumptions and expectations about future MISO prices.[26]

As noted above, building hydroelectric facilities as part of the chosen Resource Plan has the net effect of making Manitoba Hydro's financial results more dependent on export results, whose value will in turn be determined by both the quantity and price. Testing the Resource Plans with respect to a range of potential export/import prices over time is critical to estimating future impacts of the choice being made.

3.3.5. Construction Costs

Until a project is completed, its costs can be estimated, but not known. Given the size of some of the projects being considered, measured both in dollars, complexity and time required for development and construction, the risks associated with construction can be significant.

Manitoba Hydro appears to have made every effort to carefully estimate the cost of constructing different resources, while putting ranges around them to allow for testing of the financial consequences if errors are made. Another independent expert consultant retained by the PUB has provided

[25] Please see the report to the PUB of Potomac Economics.
[26] Ibid.

commentary on the construction cost assumptions made by Manitoba Hydro, and the price ranges that they have assumed.[27]

It is important to note, however, that despite the best efforts of proponents, large construction projects do sometimes go horribly wrong. History includes cautionary tales such as the Darlington Nuclear Plant in Ontario (195% over budget), the "Big Dig" in Boston (190% over budget), the Channel Tunnel (80% over budget), and the Denver International Airport (70%), among many others. Hydro dam projects have faced similar situations on occasion.

More recently and locally, the construction of the Wuskwatim hydroelectric facility in Manitoba suffered from substantial cost increases because of the unexpected rise in prices for commodities such as cement and steel, and the spike in labour and engineering costs driven by infrastructure spending across Canada and the rest of North America.

As a result, it is important to test the performance of Resource Plans in the face of different construction cost scenarios.

3.3.6. Cost of Capital

Manitoba Hydro's capital is a combination of retained earnings and debt. Retained earnings are driven in part by the rates approved by the PUB for electricity in Manitoba, which nominally should include a "return on equity" component in order to ensure that Manitoba Hydro actual earns net income that can be retained.

As noted above, Manitoba Hydro depends on the Government of Manitoba to raise debt from Canadian and international capital markets. Manitoba faces the prevailing rates of interest, and has no control over them over time (except insofar as the Province's state of finances affects its credit rating and hence the premium that must be paid compared to riskless debt instruments). Equity rates on regulated entities are typically set in relation to interest rates. Since interest rates are themselves affected by the general inflation rate, all of these factors often move in concert.

From the perspective of calculating the performance of Resource Plans in the future, various combinations of debt, equity and inflation rates should be tested, as these can have profound impacts on financial performance.

[27] Please see the report to the PUB of Knight Piésold Consulting.

4. Financial Analysis

The five selected resource plans were tested using a financial model.

4.1. Model Design and Construction

The following information from Manitoba Hydro formed the basis of the model:

- Outputs from the SPLASH model for each of the five Resource Plans under various assumptions about energy prices, Manitoba demand, the physical performance of the assets assumed in each Resource Plan, and 99 alternative hydrology patterns based on historical water flows;
- Information on Manitoba Hydro production costs and overhead costs consistent with each of three scenarios for economic variables, including inflation rates, exchange rates with the United States, and interest rates; and
- Information on capital costs for the resource elements in each plan, consistent with the three scenarios for construction costs, and the three scenarios for economic variables assumed by Manitoba Hydro.

In addition, we relied upon – except where specifically noted – the analysis of Manitoba Hydro with respect to the probabilities of occurrence of each of the twenty-seven scenarios suggested for combinations of energy prices, economic variables and construction costs assumed by Manitoba Hydro.

Critical assumptions and calculations in the model include:

- Manitoba electricity rates are treated as a combined, average rate per unit of electricity, with no differentiation between very large, general service or residential customers;
- Annual electricity rate changes for Manitoba domestic customers were restricted to not more than two times the rate of inflation in the economic scenario tested;
- The discount rate used to calculate the present value of cash streams over time was not the weighted average cost of capital used in the scenarios, but was instead either 6% or 10%, corresponding to either a lower or higher “time value of money” for ratepayers;
- The model ends after 48 years (because that is the extent of the data available), and no “terminal value” has been added to try and capture the future beyond that point; instead, specific discussion below will address this issue.

The model produces a full set of income statement, balance sheet, cash flow statement, and regulated rate calculations for Manitoba Hydro from the years 2014-15 to 2061-62.

The model was run over 3,000 times in total, so that multiple runs could be performed on each set of variables chosen by Manitoba Hydro, in combination with a variety of different hydrological patterns.

For additional information on the model, please see Appendix C (Tables of Results of the Present Value of Domestic Revenue).

4.1.1. Note on Uncertainty and Precision

The financial model produces outputs with a high degree of precision; in fact, to a practically infinite number of decimal points. This characteristic should NOT be confused with accuracy. It is simply the nature of mathematical operations that they result in precise outputs.

The model extends out almost 50 years from today. Included in the calculations are projections for prices and growth rates which are in many cases merely straight line extensions into the future of near term assumptions. A slight change in growth rates of certain variables could cause dramatic swings in outcomes, which is why a variety of such growth rates are tested. Similarly, in order to produce results that are "probability-adjusted", Manitoba Hydro assigned likelihoods to different scenarios. Giving a different weight to scenarios would change the probability-adjusted results.

All of this suggests that small differences in model outputs should be regarded with skepticism. The value of such models is in illuminating patterns and highlighting gross differences where they exist.

4.2. Findings on Ratepayer Total Costs

Minimizing risk-adjusted cost over time is the primary interest of ratepayers, after the maintenance of a safe and reliable electricity system.

The financial model calculates the annual payments that Manitoba ratepayers are presumed to make in the future, under each specific set of assumptions and each tested hydrological pattern. In order to meaningfully compare streams of cash flow that fluctuate over time, a discount rate is applied to result in a present value as of the first day of the model (April 1, 2014). In addition, Manitoba Hydro's probability weightings are applied to each set of future conditions, and the results from each set of conditions is then blended based on these weightings.

This process results in the following:

Figure 6. Risk-Adjusted Present Value Cost to Ratepayers

Average Probability Weighted PV of Domestic Revenue

Average Probability Weighted PV of Domestic Revenue
High, Ref and Low Economics
($ in millions)

	Development Plan				
Economics Scenario	**1**	**4**	**6**	**12**	**14**
NPV @ 10.00%					
Reference	$23,662	$23,593	$23,759	$24,448	$24,343
High	$27,728	$27,886	$28,142	$29,361	$29,550
Low	$20,037	$19,832	$19,906	$20,092	$20,010

Each column in each of the two matrices represents an estimate of 48 years' worth of Manitoba ratepayer costs for the identified Resource Plan. Each matrix has three rows, corresponding to the assumptions made about economic variables, a group which includes inflation, interest rates, and Canada-US exchange rates. The first matrix uses a discount rate of 6% to calculate present value, while the second matrix uses a discount rate of 10%.

Each of the figures represents a probability-weighted average of 189 model runs (i.e., for each of nine different sets of variables, the model was run for 21 different hydrological patterns, then the 48-year stream of domestic revenues in each of the 189 runs was discounted to the present by the discount rate).

The first thing that should be notable is that the range of figures in each matrix is more similar to each other than to the other matrix. Discount rate, representing the time value of money, is extremely powerful, and overwhelms all other distinctions. Since discount rate is a reflection of the average

assumed "time value" of ratepayer money, it does not make sense to combine these figures, but rather to consider each matrix separately.

The second notable fact is that within each matrix, rows of numbers are closer to each other than columns of figures are. This makes clear that the assumptions made about economics, and particularly the inflation rate, overwhelms any difference between Resource Plans. In other words, assuming an average of 2% inflation over 48 years instead of 3% makes a bigger difference to the outcome than choosing one Resource Plan over another. Since inflation over the next 48 years will average either 1%, 2% or 3%, but will not be all three simultaneously, it does not make sense to combine these rows of numbers, but rather consider them separately.

A third fact, less instantaneously obvious, but nevertheless easily calculated, is that within each row, the deviation from the mean of the row is not more than 2.5%. This means that regardless of the Resource Plan chosen, *the model results in total risk-adjusted present value costs to ratepayers over a 48-year period that are all within a maximum of 5% of each other*. In many ways, this is a remarkable result. The Resource Plans are radically different in their choices of infrastructure elements, use of fuels, orientation towards exports, etc., and yet the differences do not appear to translate beyond the marginal. However, it should be recalled that Manitoba Hydro's existing resources total more than 5,500 MW of peak capacity, with maximum annual energy output of more than 38,000 GWh. In the first fifteen years of the five resource plans, between 700 MW and 2,000 MW of peak capacity is added, and maximum system energy is increased by anywhere from 0 GWh to 13,000 GWh. In other words, since the existing electricity system, dominated by hydroelectricity, continues to be the majority of the system for a very long time to come despite the choice of Resource Plan made, it should not actually be surprising that the incremental Resource Plan choice does not have an overwhelming impact on total costs to ratepayers.

There is another contributor to this outcome, however, which can only be discovered through analysis of raw model outputs: prior to the implementation of any of the Resource Plans, the existing system is taking on a substantial amount of debt as a result of system investments (including Bipole III, the most significant single component). This is a particularly heavy burden to bear for the All Gas Resource Plan (1), because that plan is the least export oriented, and hence the least likely to generate "extra" revenues that could help to quickly amortize those debt burdens. For the higher capital plans, the existing debt burdens are less severe compared to the debt burdens being assumed as part of the resource plan itself, and the export orientation also provides much higher net income to compensate for the overall debt burden, and hence differences between the plans which might otherwise have been starker are somewhat muted.

A third factor contributing to the lack of difference between the outcomes of the Resource Plans relates to the treatment of sunk costs in the Keeyask and Conawapa projects. In the All Gas Plan (1), all spending to date on the proposed hydroelectric facilities is written off. For ratepayers, this amounts to an incremental debt burden which must be retired, without any compensating benefits (in the other plans, since the facilities are actually built the sunk costs are an investment with associated benefits, as opposed to a loss to be written off). This fact is inescapable, because real dollars have been spent and

must be recovered from ratepayers. However, the reality of the sunk costs does tend to moderate the differences between the 48-year outcomes of the Resource Plans.

A final observation to make on the matrices is the rank ordering of Resource Plans from lowest ratepayer cost to highest ratepayer cost:

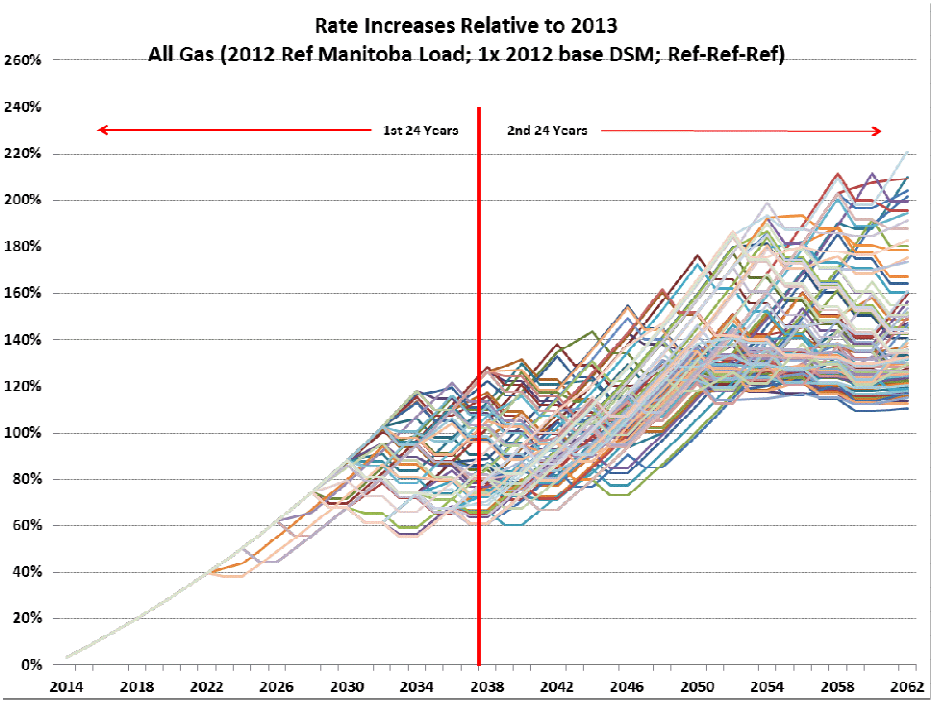
Figure 7. Rank Ordering of Resource Plan Cost to Ratepayers

Discount Rate	**Economic Variables**	Lowest				Highest
6%	Reference	4	6	1	14	12
	High	4	6	1	14	12
	Low	4	6	14	12	1
10%	Reference	4	1	6	14	12
	High	1	4	6	12	14
	Low	4	6	14	1	12

From this rank ordering, some patterns begin to emerge:

- Resource Plans 4 and 6, which include Keeyask, some level of transmission interconnection and natural gas plants, appear to fare consistently better than the other options
- Plans 14 and 12, which include Conawapa, are consistently ranked as more costly to ratepayers than Plans 4 and 6, which include Keeyask but not Conawapa
- Plan 1, the All Gas Plan, ranks poorly when economic variables such as inflation and interest rates are low, but better when they are moderate or high; this is particularly true with respect to the Preferred Plan 14, which is superior to All Gas in the low economics environment but not otherwise
- Plan 1, the All Gas Plan, ranks relatively poorly when the discount rate is lower at 6%, but better when the discount rate is higher at 10%, suggesting that the relative time value of money is an important consideration
- Plan 4, with a 250 MW interconnection, always ranks better than Plan 6, with a 750 MW interconnection; however, returning to the figures themselves it is notable that these two plans are never more than 1% apart from each other in any of the cases
- Similarly, Plan 14 is better than Plan 12 in every case but one, suggesting that an earlier construction and export orientation for the Conawapa facility is better than a later one; however, the difference between these plans is also always less than 1%.

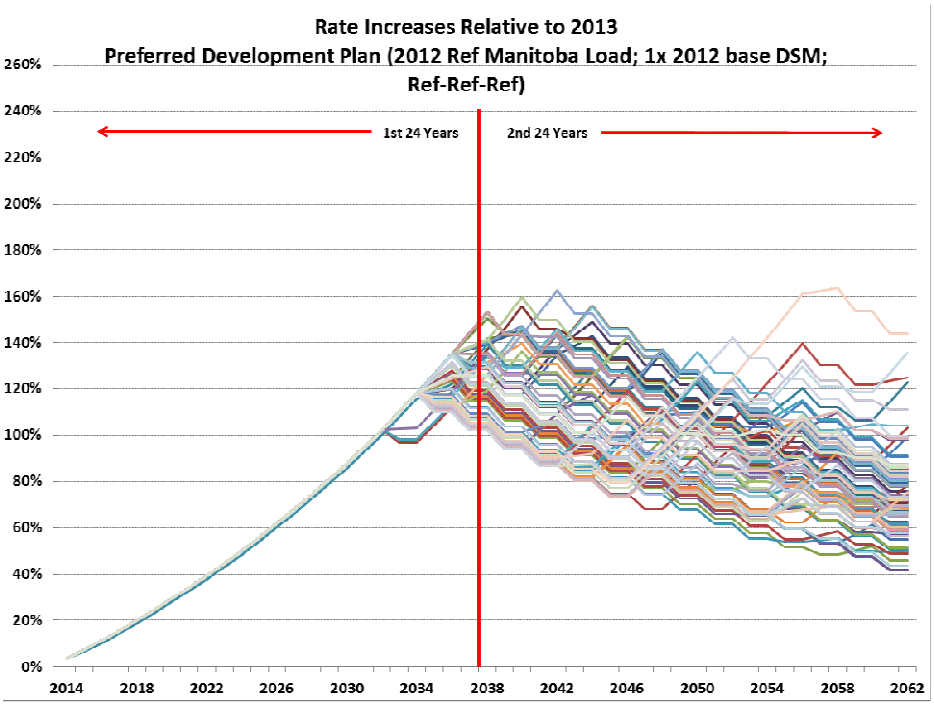
These are patterns and inferences that are drawn based on "probability-adjusted" weighting for groups of possible futures, according to the weights assigned by Manitoba Hydro. In reality, however, only one set of variables will be closer to the true 48-year average. In Appendix C (Tables of Results of the Present Value of Domestic Revenue) the outputs for the model runs for each of the 27 future scenarios have been provided. In each of the 27 scenarios, the domestic revenue results of the 21 hydrological runs have been listed, including high, low and average results, as well as the standard deviation (i.e., there is a two-thirds probability that results will be within one standard deviation of the average, assuming that hydrology is distributed on a normal curve over time, which is the typical assumption). For reference, Manitoba Hydro's calculated "percentage likelihood" for each of the 27 scenarios is also shown.



Based on these results, hundreds of other rank orderings of the Resource Plans can be calculated, depending on the scenario examined and the discount rate chosen. In addition, a sense of the impact from some of the possible 35-year hydrology patterns can be understood and compared with the impact of scenario choices.

4.2.1. Time Value of Money and Rates

One of the observations from the rank ordering of the present values of the ratepayer costs was that the ranking of the All Gas Plan, and other Plans, appeared to change depending on the discount rate assumed. To investigate this further, it is useful to examine the expected course of rate increases under the different Resource Plans. Since Manitoba demand is relatively similar across the Resource Scenarios, the pattern of rates essentially indicates the pattern of revenues.



The following chart depicts the pattern of rate increases that results from 99 different hydrological patterns, in a single combination of future variables (Reference economics, Reference energy costs, Reference construction costs), for the All Gas Plan 1.

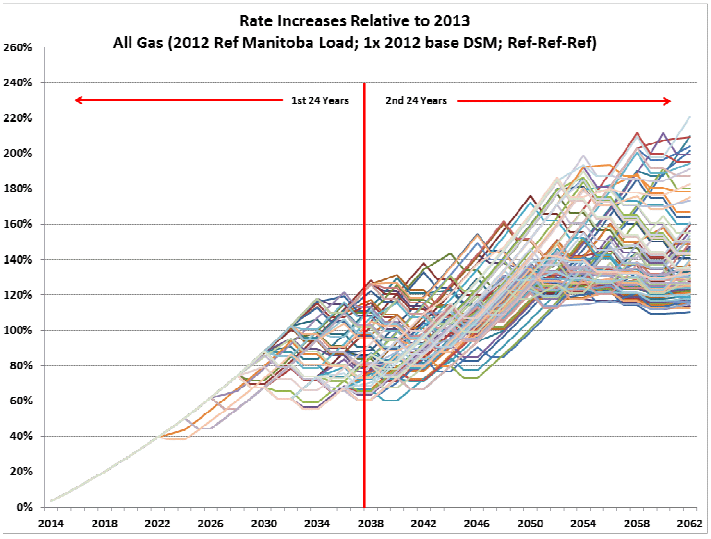
Figure 8. Rate Increases Relative to 2013 (All Gas)

Next is the same set of runs applied to the Preferred Development Plan 14.

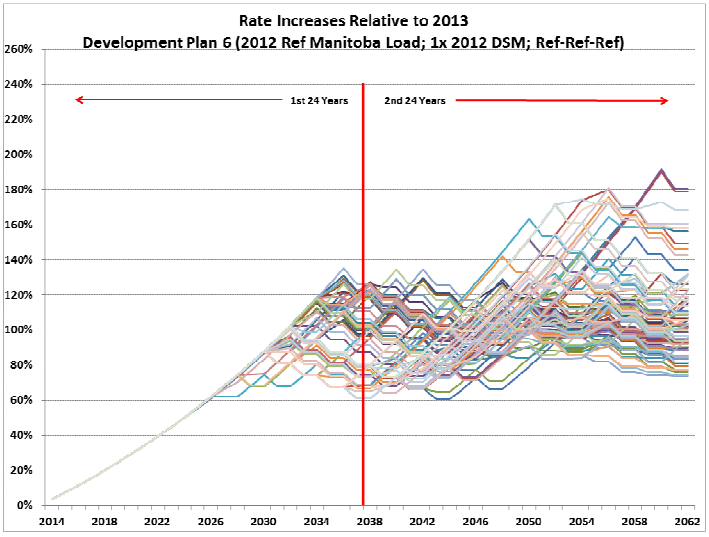
Figure 9. Rate Increases Relative to 2013 (Preferred Development Plan)

Note that both of these depictions assume the same interest rates and inflation rates, the same prices for fuels and exported power, and the same costs of construction materials and labour. They also each depict the same 99 hydrological patterns. The only difference is the choice of Resource Plan, and hence the selection and timing of construction of different electricity resources.

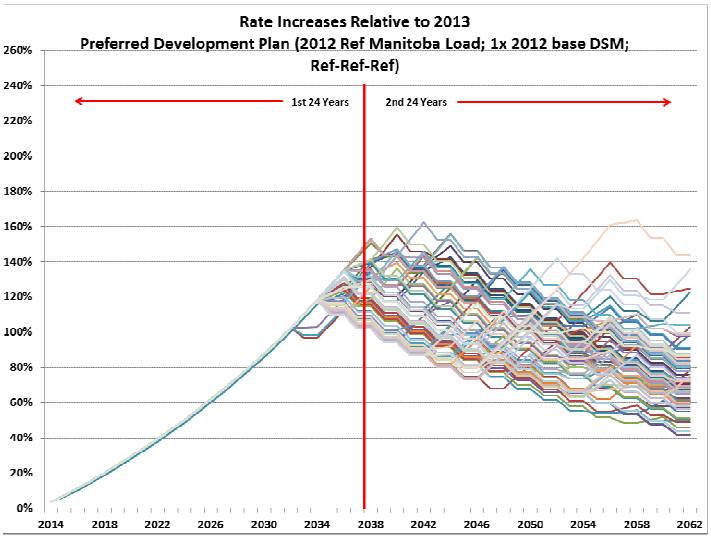
The difference between the two plans could not be made more starkly obvious.



The All Gas Plan consistently imposes the maximum allowable rate increase (set at two times inflation, which is 1.9% per year in this set of variables, resulting in rate increases of 3.8% per year) for the first ten years of the model. After that point, if there are exceptionally "wet" years, the rate increases can in some cases be moderated. By the 2030s, the impact of hydrology can be felt annually, but a general upward trend in rates is seen for the rest of the model, and in particular for the second half of the time. At the mid-point, rates are up anywhere from 60% to 120% compared to 2013. By the final year, rates are up between 110% and 220%.



The pattern for the Preferred Development Plan is very different. Maximum rate increases are applied until 2032, when they reach 100% above 2013 rates. Hydrology effects begin to be felt at that point, because rates have reached a level high enough to financially sustain the company. By the mid-point, rates are between 100% and 150% higher than 2013. However, after that point rates actually trend downward, with only a few very "dry" hydrological situations driving up rates in the late period. By the end of the model, rates are between 40% and 140% higher than 2013.



This pattern exemplifies the issue of "time value of money". In the All Gas Plan (1), the first "generation" of ratepayers faces rate increases, but those rate increases are less prolonged and severe than the rate increases expected in the Preferred Development Plan (14). However, for the second "generation" of ratepayers the situation would be reversed, according to the model. If ratepayers have a strong preference to save now and pay later (i.e., they have a high discount rate such as 10% or more), then they would prefer the pattern of the All Gas Plan (1). However, if they are willing to make a sacrifice in the near future to reap sizeable rewards later on (i.e., they have a low discount rate like 6% or less), then they might choose the Preferred Plan (14).

As might be expected, Resource Plans (4) and (6) have patterns that are somewhat between these two extremes. On the next page, the charts for Resource Plans (1) and (14) are repeated, with the chart for Resource Plan (6) placed in between for comparison.

Figure 10. Rate Increases Relative to 2013 (All Gas vs Preferred Development Plan vs Plan 6)

Consideration of these rate patterns also points to the issue of the future beyond the 48th year of the model. If the model were extended out even further, for example for another full twenty-four years (another "generation"), a few additional observations would be warranted:

- The Preferred Development Plan (14), and Plan (12) which also includes Conawapa, would produce lower ratepayer costs than would any of the other three Resource Plans, none of which include Conawapa

- The present value of that presumed set of additional results would be much higher if it were discounted at the low rate of 6% rather than the higher rate of 10%; at a discount rate of 10%, the total value of all years beyond 48 would be less than one twentieth of the total value of the first 48 years; whereas at a 6% discount rate, the total value of years beyond 48 would be several times greater

- For every year the model is extended beyond 48, the more the rank orderings of the Resource Plans will change in favour of Plans 14 and 12, particularly with the lower discount rate of 6%; however, with the higher discount rate of 10%, the shifting of the rank ordering will slow down and eventually stop because of the rapidly declining importance of those future years.

With respect to the issue of time value of money and the varying rate patterns displayed by the Resource Plans, it should be recalled that:

- The second half of the 48-year time period is inherently more uncertain than the first half, in the sense that future conditions are harder to predict so far in advance: technology is always changing, economic growth patterns change, climate may be changing, etc., so making accurate predictions about any variables (fuel costs, export costs, construction costs, the efficiency of equipment in the future, etc.) is that much more difficult;

- On the other hand, some things are undeniably knowable from today's standpoint, such as that waterpower is a very inexpensive "fuel", so that *at some point* facilities like Conawapa always become very attractive assets for ratepayers of the day; an important question is whether ratepayers today and in the near future do or should care about the welfare of ratepayers decades away.

4.2.2. The Impact of Manitoba Demand

All of the analysis to this point has assumed a single pattern for the electricity demand of Manitoba ratepayers in the future. However, as has been noted above and by others, there is considerable uncertainty about what Manitoba demand will actually be, particularly as decades pass.

Manitoba Hydro provided raw SPLASH data for the performance of the electricity system in high and low demand alternative futures for both the All Gas Plan (1), and the Preferred Development Plan (14). When this data was applied to the financial model, the following results for ratepayer costs resulted:

Figure 11. PV of Domestic Revenue (All Gas vs Preferred Development Plan)

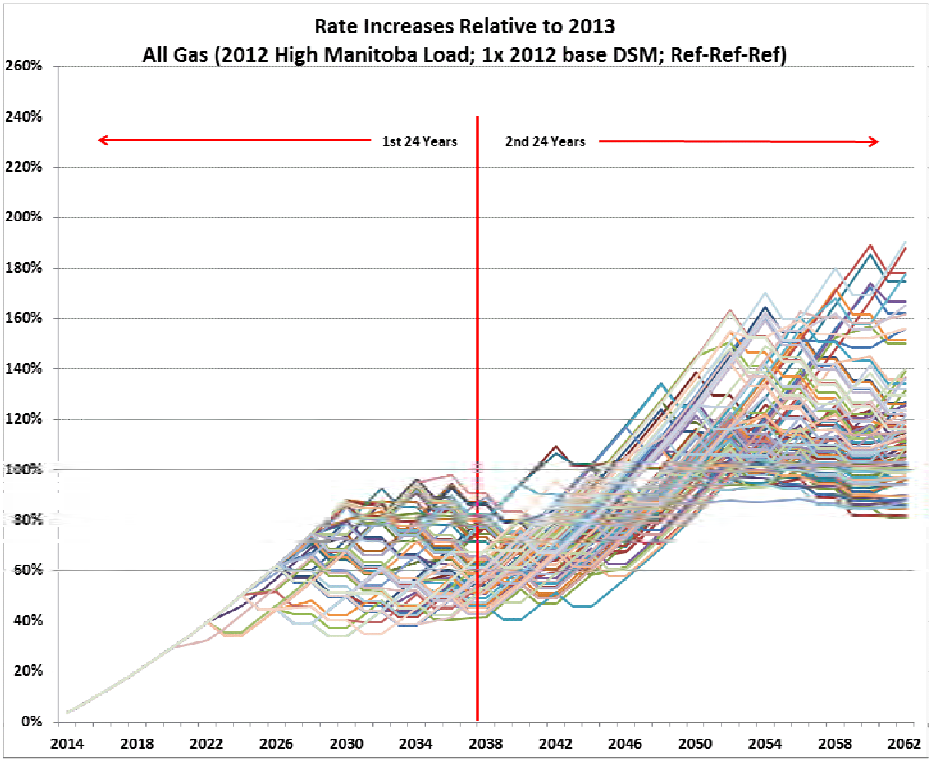
PV of Domestic Revenue
Ref Economics, Energy and Capital
(full hydrology regime of 99 years)
($ in millions)

	All Gas			Preferred Development Plan		
	Manitoba Load (2012)			Manitoba Load (2012)		
	Ref	High	Low	Ref	High	Low
NPV @ 6.00%						
Average	$43,675	$43,595	$43,838	$44,073	$44,207	$44,197
Maximum	$45,530	$45,256	$45,711	$46,123	$46,591	$45,811
Minimum	$41,724	$41,648	$41,884	$42,155	$41,649	$42,123
Standard Deviation	$783	$770	$798	$952	$997	$1,031

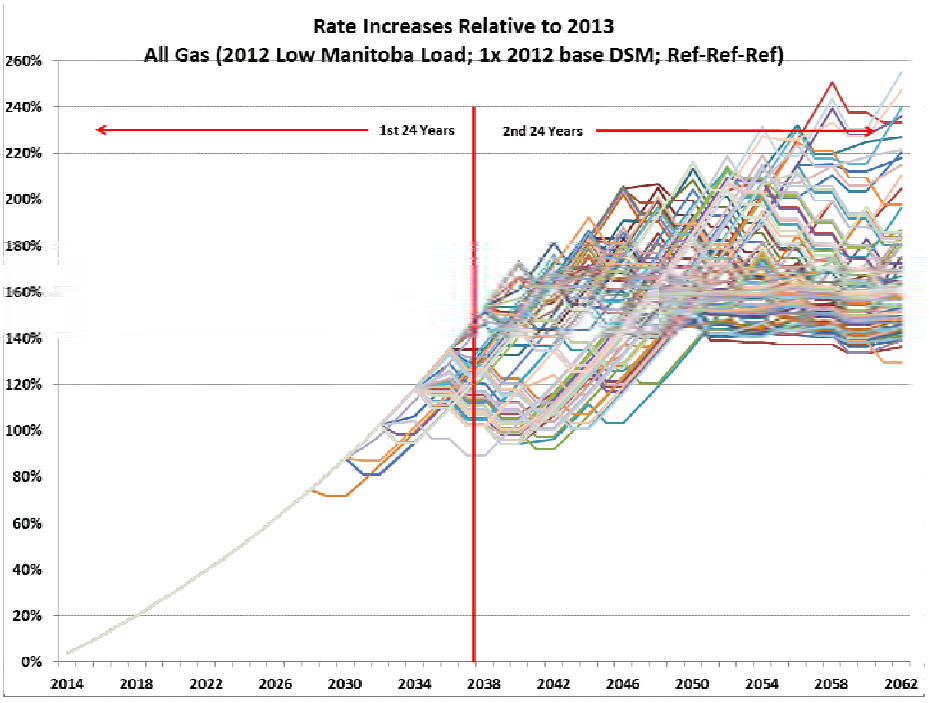
PV of Domestic Revenue
Ref Economics, Energy and Capital
(full hydrology regime of 99 years)
($ in millions)

	All Gas			Preferred Development Plan		
	Manitoba Load (2012)			Manitoba Load (2012)		
	Ref	High	Low	Ref	High	Low
NPV @ 10.00%						
Average	$23,548	$23,795	$23,241	$24,110	$24,542	$23,550
Maximum	$24,278	$24,436	$23,788	$24,779	$25,474	$23,985
Minimum	$22,839	$22,852	$22,580	$23,497	$23,233	$22,967
Standard Deviation	$365	$417	$295	$317	$458	$290

What these matrices depict is the performance of the two Resource Plans in a single set of future variables (Reference interest rates, Reference fuel costs and export prices, Reference construction costs, etc.), but with three different Manitoba demand curves. Also, each column represents the results of running the model 99 times, for different hydrological patterns, with a resulting average, maximum, minimum and standard deviation resulting from the hydrology. The two cases of a high discount rate and a low discount rate were applied and are shown separately in the first box and the second box.



Some observations can be drawn:



- Changing Manitoba demand does not actually affect the total cost to ratepayers over 48 years very much, <u>if all other variables are kept constant</u>; the difference in total cost to ratepayers between High and Low Manitoba demand futures is not more than about 2% in any of the cases
- On its face, this observation is surprising, because lower domestic demand means that more electricity should on average be exported, while higher domestic demand means that exports are decreased, and domestic ratepayers should be paying a larger portion of Manitoba Hydro's total costs.

To gain more insight into this situation, it is helpful to review the expected rates that Manitoba ratepayers will pay under the High and Low demand futures:

For the All Gas Plan (1), the rate paths are as follows:

Figure 12. Rate Increases Relative to 2013 (All Gas) (2)

Some differences become more apparent:

- When Manitoba demand is higher, the maximum rate increase is applied every year until the early to mid-2020s, but then rates for Manitoba ratepayers begin to diverge based on hydrology

- When Manitoba demand is lower, the maximum rate increase must be applied every year until the mid-2030s before rates begin to diverge based on hydrology
- This suggests that in this scenario, export prices are not high enough to satisfy Manitoba Hydro financial needs, even when export volumes are higher, and the burden is on ratepayers to do so
- In the higher demand scenario, charging Manitoba ratepayers the highest possible rate generates more revenue, which allows for faster retirement of debts, and eventually reduces the rate pressure of debt in later years
- In the lower demand scenario, charging Manitoba ratepayers the highest possible rate does not generate as much revenue because there is less total demand, so debt is not paid as quickly and continues to compound, which creates a heavier burden in later years that results in higher rates per unit of electricity
- When the total resulting revenues are discounted back to today, the result of the varying patterns is that the totals are very similar.

One of the inferences that can be made from these observations is that if export prices were assumed to be higher, then the benefits of lower domestic demand in terms of total ratepayer costs might be greater. Unfortunately, Manitoba Hydro did not provide SPLASH data for such alternative export prices combined with High and Low demand assumptions, so the inference cannot be thoroughly tested.

For the Preferred Development Plan (14), the differences in the rate patterns between the High and Low Manitoba demand assumptions are similar to what is depicted above for the All Gas Plan (1), and the inferences that can be drawn are the same. In short, if export prices are higher in the future, then reducing domestic demand is beneficial for Manitoba ratepayers, but if export prices are lower, then reducing domestic demand only raises cumulative rates in Manitoba, without providing ratepayers with much benefit.

4.3. Findings on Government Revenues

As might be expected, the differences between Resource Plans with respect to revenues for the Government of Manitoba are clear, and align with the construction of hydroelectric facilities.

Figure 13. Average Probability Weighted PV of Revenue to the Province of Manitoba

Average Probability Weighted PV of Revenue to the Province of Manitoba
High, Ref and Low Economics, Energy and Capital
(2015-2062)
($ in millions)

	Development Plan				
Revenue	**1**	**4**	**6**	**12**	**14**
NPV @ 6.00%					
Water Rentals	$1,702	$1,883	$1,879	$2,034	$2,091
Provincial Debt Guarantee	$2,614	$3,031	$3,075	$3,561	$3,783
Capital Taxes	$1,584	$1,874	$1,883	$2,229	$2,275

In the Preferred Development Plan (14), Conawapa is built and built soonest, and hence water rental fees are greater, more debt must be guaranteed, and capital taxes are highest.

The differences between Plans (14) and (12), where Conawapa is built a few years later, are very modest. Similarly, the differences between Plans (4) and (6), which both include Keeyask but not Conawapa, are very minor, but these totals are noticeably lower than the Conawapa-based Resource Plans.

These results are presented here for the lower discount rate, rather than the higher discount rate. This is appropriate because the time value of money for governments is very low. Arguably, for governments, the time value of money should be equal to its weighted average real cost of debt,[28] which would be substantially less than 6%. Using such a discount rate would accentuate further the differences between Resource Plans on this metric.

4.4. Findings on Export Orientation

Again as might be expected, the Preferred Development Plan (14), which includes the building of Conawapa earlier in time with the intention of signing long-term export contracts, includes the highest export revenues as a percentage of total Manitoba Hydro revenues. The chart below compares the revenue from exports as a percentage of total revenue, averaged over 48 years for a variety of hydrology patterns. Economic variables and construction costs are kept constant, but the group of variables including export prices and natural gas prices are tested at High, Reference and Low levels.

[28] Since both government expenditures and revenues typically rise with inflation, and government cost of capital is weighted between short, medium and long-term borrowings.

Figure 14. Average Export Revenue as a Percentage of Total Revenue (All Gas vs Preferred Development Plan)

Average Export Revenue as a Percentage of Total Revenue
All Gas and Preferred Development Plan
Reference Economics and Capital
(2015 - 2062)

	Development Plan	
Energy Scenario	**1**	**14**
Reference	9.5%	20.9%
High	11.9%	26.2%
Low	6.4%	14.3%

This outcome is relevant principally in two different ways:

- Resource Plans which have a higher reliance on export revenues are more sensitive to changes in export prices; this is borne out by reference to the model results if all variables except energy prices are kept constant: for example, average present value costs to ratepayers in Preferred Plan (14) are 10% lower if export prices are higher; whereas in All Gas Plan (1) there is little difference between the total ratepayer costs between scenarios with High and Low export prices[29]

- For government, higher exports mean that more of its revenue from Manitoba Hydro is actually coming from export jurisdictions, rather than ratepayers, which means that, *other things being equal*, the province as a whole should be receiving a net benefit.[30]

4.5. Findings on Hydrology

In any given year, or in any short-term period of a few years, hydrology affects Manitoba Hydro's financial performance more than any other variable tested.

The following table records the results of analysis done on a single year of the model, 2030:

[29] Note that since Manitoba Hydro's "Energy Prices" set of variables includes both export prices AND natural gas prices, for the All Gas Plan (1), higher prices means that exports are more valuable, but domestic production costs rise with fuel prices, with the two effects cancelling each other out to a great degree. The same is true in a lower prices environment, where lower export prices reduce export revenues, but lower gas prices reduce production costs. Since in the Preferred Development Plan (14) there is far less reliance on natural gas generation in Manitoba, the export price impact dominates and the difference between the high price and low price environment is very noticeable.

[30] Note that "other things being equal" is a crucial statement, since if pursuing higher export plans causes Manitoba competitiveness to suffer overall, then receiving a higher percentage of revenues from exports is not necessarily beneficial.

Figure 15. Average Difference Between Highest and Lowest Net Income (All Gas vs Preferred Development Plan)

Average Difference Between Highest and Lowest Net Income By Scenario, or by Year ($ in millions)	**Development Plan**	
	1	**14**
Within each scenario, all modelled years		
Difference, expressed as dollars ($)	$1,501	$1,972
Difference, expressed as % of highest (%)	171.8%	609.1%
Within a given year, all scenarios		
Difference, expressed as dollars ($)	$203	$780
Difference, expressed as % of highest (%)	27.3%	63.8%

What the model captures is that in the year 2030, the results for all of the model runs for both Resource Plans (1) and (14) were extracted. For each Resource Plan, the model was run 567 times (21 different hydrology patterns run separately for 27 different combinations of price variables). For each of the 27 combinations of variables, Manitoba Hydro's net income had 21 different results for the year 2030 based on the hydrology pattern used. The absolute difference between the highest and lowest net income result was recorded, both in dollar terms, and expressed as a percentage of the highest net income result. Then, the 27 different results from the 27 scenarios were averaged, to determine the average maximum impact of hydrology on the net income results of that year. For the All Gas Plan (1), the result was a potential difference in net income of $1,501 million (a swing from $550 million of net income to a loss of $950 million), and for the Preferred Development Plan (14) an even greater potential difference of $1,972 million (a swing from $275 million of net income to a loss of $1,690 million).

The second set of numbers represents holding the hydrology pattern for the year 2030 constant (the hydrology pattern was chosen so that water flow in the year 2030 and for several years before were approximately historically average), and comparing the difference in net income that results by testing all 27 different sets of variables and recording the maximum, minimum and resulting difference. For the All Gas Plan (1), this difference is only $203 million (a swing from $160 million of net income to a loss of $40 million), and for the Preferred Plan (14), the difference is $780 million (a swing from $475 million of net income to a loss of $305 million).

This analysis could be compared for other years and other plans, but the general result will be the same: hydrology drives Manitoba Hydro financial performance in any given year, much more profoundly than the expected range of any other variables will. However, it should be recalled that the historical record of hydrology demonstrates potentially massive swings on an annual basis, but tends towards the mean as longer and longer timeframes are examined.

One way of measuring this is to consider the standard deviation of the 100-year historical record of water flow in Manitoba. Over the entire 100 years, the standard deviation for annual flow is over 20, which means that in any given year, water flow can be expected to be in the range of +/- 20% of the historical average, two thirds of the time (however, fully one third of the time, it will be above 120% or below 80%). If water flow is averaged on a ten year basis, however, the standard deviation falls in half, with two thirds of ten-year averages falling between 110% and 90% of the average water flow. Over a longer period of time, the deviation shrinks further.

Put differently, the change in water flow on an annual basis can be dramatic. In an average year over the past 100 years, water flow was 18% higher or lower than the previous year. Eight times in the past century water flow has changed by +/- 40%! However, these gyrations just mask the fact that water flow tends to return to the mean.[31]

In terms of relevance to the choice of Resource Plans, it can be observed that:

- Hydrology is critical to short-term issues, such as the potential for financial distress, which will be addressed in the next section, but is less relevant to longer term issues such as the present value of ratepayer costs over a 48-year period or longer

- Though hydrology is less critical over longer terms, it does not mean that it is not relevant: even over a 35-year period the standard deviation of water flow is almost 5% of the historical average

- Resource plans heavy in hydroelectric investment, such as the Preferred Development Plan (14), are more sensitive to hydrology, and will therefore demonstrate greater variation in all financial results (including Manitoba ratepayer costs), especially in the short term but also over the longer term, other things being equal.

4.6. Findings on Financial Distress

It should be very apparent from the previous section on the impact of hydrology on Manitoba Hydro's financial results that there are scenarios where Manitoba Hydro may find itself in challenging circumstances. In average water flow years, it is apparent from the modeling that Manitoba Hydro's financial results will be adequate, across all 27 scenarios proposed by Manitoba Hydro, regardless of the choice of Resource Plan. "Adequate" in the sense of meeting its standards for debt:equity ratio in the longer term, keeping its Interest Coverage Ratio above 1.2,[32] and not increasing or decreasing rates by more than double the rate of inflation in any given year.

[31] Note that climate change and other long-term factors such as industrial development and water usage in watersheds can have long-term impacts on the mean water flow reaching Manitoba. This issue is not addressed here.
[32] Note that in some scenarios the ICR falls below 1.2 even in average water years, particularly between 2015 and 2025 when investment is greatest. However, this has already been signalled to the capital markets as an inevitable result of the intended long-term investment program, and there is no reason to believe that such a pattern would be cause for concern.

However, as the historical data makes clear, water flow need not be average, and in fact could at some point be well below average. In that case, Manitoba Hydro's financial results will not be within the planned ranges.

Many of the hydrology patterns applied to the model include "drought" scenarios at some point. If drought is defined as any year in which water flow is below the historical average, then an alarming number of droughts become readily apparent. If drought is defined as any five-year period when average water flow over five years is less than 95% of the historical average, then a more stringent test is being applied. In that case, there have been 37 such periods out of the 97 periods that can be counted in the last 101 years.[33] Very serious droughts with substantial financial impacts on Manitoba Hydro might be defined as five-year periods where average water flow is below 85% of average: there are 12 such periods out of the past 97. Most of these encompass periods centred in the 1930s and late 1980s. The last such five-year period was from 1988-89 to 1992-93.

Notably, the past 20 years have been extremely "wet" by historical standards, with only seven years below the historical average water flow, and a 20-year average of 110% of the historical water flow, one of the best such periods on record.[34]

There have historically been extended periods of serious drought:

- in the seven years from 1918-24 inclusive, every year was below average, and four of the seven years were below 85% of the average
- in the *eighteen* years between 1929-1946 inclusive, only three were above the historical average, and *nine* were 85% or less; this can be considered the "drought of the century" both in terms of length and severity, as it also includes the worst five-year period (from 1936-40, but that is almost equaled by the period 1987-91, when records are more accurate)
- in the sixteen years between 1980-95 inclusive, only three years were above average, and eight were 85% or less, including the severe period from 1987-91, the second-worst five years on record.

According to our model, it is absolutely clear that in the event of a severe, prolonged drought of the sort described here, Manitoba Hydro faces financial distress *regardless* of the Resource Plan selected, AND regardless of which of the 27 scenarios best describes the many variables that affect financial performance. In fact, distress is caused of such magnitude that the distinctions between the Resource Plans and scenarios are not particularly relevant.

The distress caused by a drought manifests itself in several ways:

[33] I.e., given data beginning from 1912 to 2012 inclusive, five-year periods would be counted from 1912-16, 1913-17, etc.
[34] In general, the "wet" decades have been the 50s, 60s, 70s and the 00s, while the 30s and 80s were both very "dry".

- The system's hydroelectric production falls dramatically, which reduces exports and export revenue, increases thermal production and therefore fuel costs, and increases imports and import costs
- The result is reduced operating income
- When depreciation and interest are deducted from operating income, net income will often be negative, which leads to interest coverage ratios below 1.0; in the worst years declines in operating results will be so severe that the interest coverage ratio is actually itself negative, which implies that cash flow before capital investments is insufficient to cover interest
- If net income is negative for a series of years, then retained earnings will steadily decline (possibly to the point of negative equity in the business), while at the same time all capital investments will have to be funded increasingly by debt, which compounds the interest burden for future years;
- Until the drought ends, and net income returns to positive territory, the company will continue to suffer deteriorating financial indicators from the compounding of debt increases.

There are two potential responses to this situation: raise rates, or borrow ever more to fund requirements. However, it should be made clear that solely raising rates to the level required to compensate for a drought is highly unlikely to be the practical solution. In some model runs across Resource Plans, rates would be required to rise by anywhere from 25% to 50% or more for a sustained period in order to maintain Manitoba Hydro's financial probity. Then, several years after the drought ends, rates could again fall steeply. This kind of response would play havoc with the business plans of Manitoba Hydro ratepayers, could undermine the competitiveness of many businesses, and would certainly change the competitive standing of the province with respect to other electricity jurisdictions.

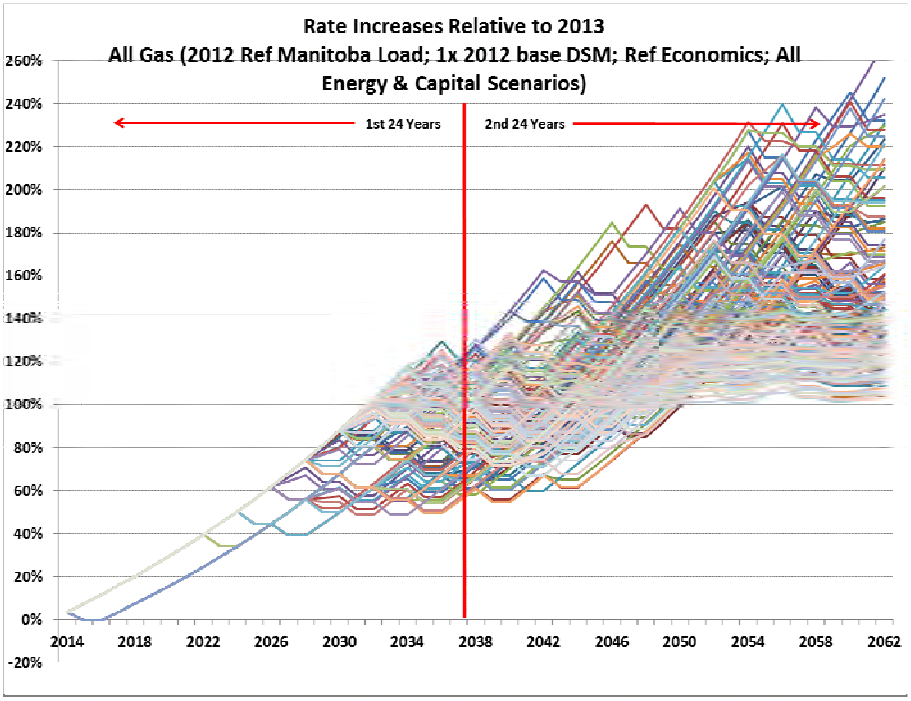
A more realistic scenario is that rates would increase at something more than double the rate of inflation, but that the Government of Manitoba would also fund Manitoba Hydro's business with a combination of additional debt and possibly temporary relief from fees and taxes paid to government (water rental fees, capital taxes, and debt guarantee fees).

Speculating as to the magnitude of allowable rate increases in such circumstances is difficult: would rates be allowed to rise at triple inflation for a few years? Or, perhaps 10% per year? What balance would there be between a willingness to allow an "emergency" increase in the first year of a drought, and subsequent sustained increases when it is determined that drought is continuing unabated? If drought were to become the "new normal" over the course of a decade, would ratepayers/citizens be willing to see a Crown Corporation systematically raise rates during what would likely be seen as a time of hardship for many?[35] Since Manitoba has not faced this type of circumstance for more than 20 years, it is difficult to place a range on the potential response.

[35] For example, in a severe and prolonged drought, it can be expected that the agricultural community would suffer most acutely, creating a public and media awareness of drought, and the typical calls for government support.

A separate question would arise with respect to Manitoba Hydro's firm export contracts. Manitoba's electricity system is designed to ensure that these can be satisfied in all conditions where water flows are above the historic minimum. In "dry" years, however, meeting these firm commitments might require the burning of expensive fuel, making the contracts temporarily uneconomic. However, the contracts contain provisions ("adverse water") where delivery requirements can be suspended in the event of drought, so technically this situation could be avoided. However, actually suspending a firm export contract would be an extraordinary step to take,[36] and could change the standing of Manitoba Hydro as a potential commercial partner for years afterward.

4.6.1. Relative Susceptibility to Distress



Despite the fact that the most severe situations of financial distress caused by drought overwhelm distinctions between Resource Plans, there are useful distinctions that can be made. These include sensitivity to hydrology, sensitivity to the timing of distress, and overall financial strength.

First, the point made in s. 4.5 above that some Resource Plans are more sensitive to hydrology is relevant. It is inescapable that the net income of Manitoba Hydro will be more sensitive to hydrology if Keeyask, Conawapa or both are built. A less severe drought may not affect Resource Plan 1 enough to drive Manitoba Hydro into distress. It should be noted that this sensitivity goes both ways: these Resource Plans will be exposed to higher highs and lower lows in net income and other financial indicators based on the future course of hydrology.

Second, timing is extremely relevant, and there are distinctions between the resource plans. In the first ten years of the model, all Resource Plans – including the All Gas Plan (1) – assume that rates increase at double the rate of inflation under all of the 27 scenarios and virtually all of the 21 hydrology patterns tested. For example, the following is the rate increase pattern for the All Gas Plan (1) in the 189 model runs that include reference economics (but varying hydrology, fuel costs, etc.).

[36] In 2003-04, when Manitoba suffered a significant one-year drought, all firm contracts were fulfilled and "adverse water" was not declared. However, it is notable that in the two following years after the drought, water flow levels shot up well above historical averages.

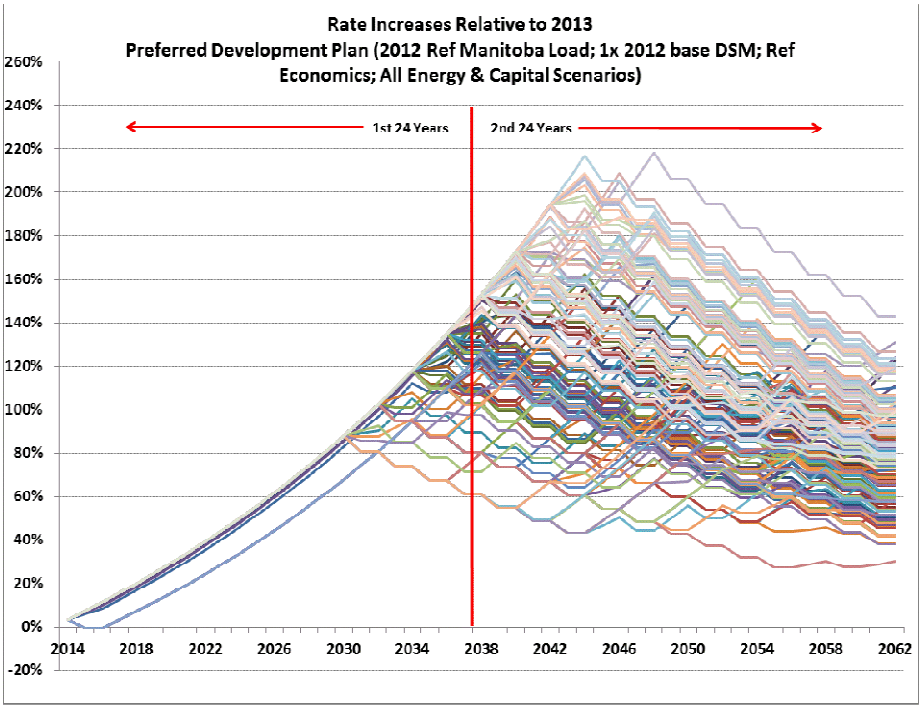


Figure 16. Rate Increases Relative to 2013 (All Gas) (3)

Until the late 2020s, very few model runs out of 189 include anything other than 3.8% annual rate increases. One implication is that Manitoba's competitive advantage with other jurisdictions may be deteriorating from its strong current position based on the steady increases. However, after that point, rate increase moderate in many scenarios and hydrology patterns, indicating that financial stress on the company is abating. To the extent that rates are flattening or declining, Manitoba's competitive rate flexibility could be improving. If a drought were to begin after that point, then the first response would be to return to 3.8% rate increases (which is exactly what many lines on the chart depict), and only then would other options have to be considered.

For the Preferred Development Plan (14), however, timing is different.

Figure 17. Rate Increases Relative to 2013 (Preferred Development Plan) (2)

Here, significant rate differentiation does not begin until the early to mid-2030s. Rates rise at a steady clip for the next 20 years, which must have some competitiveness consequences (depending on developments elsewhere, of course). This means that any financial challenge suffered during those two decades could only be addressed by extraordinary measures, whether in the form of higher rates or declining financial indicators coupled with government support. However, upon reaching the 2040s, rates begin a steady decline under virtually all scenarios, which indicates tremendous capacity to absorb shocks without unduly compromising the province's competitive position.

The third factor is the relative ability of Manitoba Hydro under each of the Resource Plans to absorb the potential deterioration to financial indicators that could be caused by drought. One possible measure of this factor is to compare the maximum negative net income that could occur in a drought year with the size of the interest payment that is due in that year. For example, in s. 4.5 above, the year 2030 was reviewed for Resource Plans (1) and (14) with respect to the potential impact of hydrology and scenario conditions. In the worst modeled case for that year (in the High Economics, High Energy Cost, High Capital Good Costs, with the hydrology of 1988), Resource Plan (1) had a net loss of $1,366 million and an interest coverage ratio of only 0.29x, while Resource Plan (14) had a net loss of $2,896 million but an interest coverage ratio of 0.33x. The size of the net loss caused by the drought in absolute terms was larger, but with respect to its impact on a financial indicator such as the interest coverage ratio it was actually relatively smaller, because of the larger balance sheet of the company in Resource Plan (14).

Such calculations change from year to year, Plan to Plan, and scenario to scenario, and cannot be calculated with confidence without meticulously testing the entire 3000+ model runs. However, a

general assumption can be made that the Resource Plans with larger balance sheets will be better able to absorb these situations over the full life of the model, other things being equal.

4.6.2. Magnitude of Distress

Assessing the relative "magnitude" of the distress to which each of the Resource Plans is susceptible is challenging because of its amorphous definition.

Is the magnitude the absolute size of a possible net loss in a single year? (Adjusted for inflation?) Is the magnitude the absolute size of the operating cash shortfall that might be suffered in the worst situations?[37] (Again, adjusted for inflation?) If government could compensate for temporary financial distress by exempting Manitoba Hydro from payments to government (water, debt guarantee and capital tax), is it the amount by which losses exceed these payments?

The purpose of attempting to calculate the magnitude of distress is to understand the problem in relation to the government, which is providing Manitoba Hydro with a debt guarantee, and which would be concerned if the company were no longer perceived by the credit rating agencies to be "financially self-supporting". The key test can be inferred from comments made by the credit rating agency Moody's in its report on the Province of Manitoba in July, 2013:[38]

> "This Crown Corporation's ability to meet its own financial obligations without recourse to provincial subsidies is a positive credit attribute for the province."

In a "normal" situation, Manitoba Hydro's guidelines target not only an interest coverage ratio of at least 1.2, but also coverage of typical capital spending requirements from internally generated funds. If the company were not able to meet this objective during a one or two-year drought, it would be unlikely that credit rating agencies would reassess their position on the ability of Manitoba Hydro to be self-sustaining.[39] However, if drought conditions continued, and rates were not allowed to rise sufficiently to meet these interest and capital targets, then the shortfall in meeting them would become a focus for attention.

In this case, *longevity* of financial distress caused by drought would be the indicator that the problem had ANY magnitude. Only secondarily, the size of the cash shortfall in successive years would then be an indication of the magnitude of the problem.

Returning to the example mentioned above relating to the model year 2030, if the losses described occurred in only one year, because of a sudden drought, but then in subsequent years financial indicators turned around, then there would be no magnitude to the problem. However, if those net losses were part of a repeating pattern because of a deep and long drought, and there was an

[37] I.e., the amount by which a potential annual net loss exceeded 1.2 times debt interest.
[38] Moody's Investor Service, *Province of Manitoba Credit Analysis*, July 2013, p. 3.
[39] Manitoba suffered a short, sharp drought in 2003-4. The DBRS Credit Report on the Province of Manitoba on June 22, 2004 noted that the province suffered "an unexpected, and likely non-recurring, loss of $359 million at The Manitoba Hydro-Electric Board ("Manitoba Hydro") as a result of unexpectedly low water levels." No further impact occurred, as water flow returned to average and subsequently above average levels in the following years.

unwillingness to drastically raise rates to compensate for the need for revenues, then it would be absolute size of the net loss that would indicate the magnitude of the problem. In short, for Development Plan (1), where the net loss was $1,366 million, the magnitude would be less than for Development Plan (14), where it was $2,896 million.

Moreover, in provincial terms, because of the debt guarantee provided by the Province of Manitoba to Manitoba Hydro, these cash shortfalls would be translated into the form of supported debt. Since these situations occurred in the High economics environment, where the cost of Manitoba Hydro debt is assumed to be nearly 9%, then the magnitude of debt that would be lacking support would be $15 billion in the case of All Gas Plan (1), and over $30 billion in Preferred Plan (14).

It should be noted that hydrology year 1988 was a singularly severe drought year, and there was some recovery in each of these model runs subsequently, so shortfalls of that magnitude would not be repeated. However, the assumption about financial capacity being related to size of balance sheet is reversed with respect to magnitude of exposure to financial distress. In the event of a sustained, severe drought, Resource Plans with a larger balance sheet due to investment in hydroelectric facilities will have a greater magnitude of exposure, commensurate with that balance sheet and amount of debt. Once a drought ends, the sensitivity to hydrology will again become a positive, and quickly return the magnitude of exposure to zero.

In order to test the magnitude of financial distress more carefully, several assumed droughts in the 2020s and 2030s were examined. Sustained, deep drought hydrology patterns were used, with the same pattern used for each of the decades. The Preferred Development Plan (14) was particularly susceptible to drought in the earlier period, facing shortfalls of over $1,000 million per year in a number of years (that represents rate increases of 35% to 50%, depending on the year). However, when the same drought experience is faced in the mid-2030s, no financial distress is experienced. At that point, debt had been declining at Manitoba Hydro for several years, and rates were actually in the midst of falling when the drought occurred. Reversing the rate direction in that situation was sufficient to address the challenge. For All Gas Plan (1), circumstances are reversed: it was able to weather the storm in the 2020s with two years of poor results, but in the example of the 1930s, a sustained $1,000 million shortfall resulted unless rates were hiked systematically.

4.6.3. Cost Overruns

While drought is the most likely and expected source of financial challenges for Manitoba Hydro in considering its Resource Plans, it is not the only possibility. As was described in s. 3.3.5 above, there have been instances around the world where large construction projects have gone horribly wrong, resulting in substantial hardship for stakeholders.

Two observations seem pertinent: first, given that a construction cost overrun would be manifested in Manitoba Hydro's case as an increase in debt, it is only the debt interest amount that would present an immediate challenge. Second, given that it is only changes in revenue of a size potentially caused by hydrology that actually undermine Manitoba Hydro's performance, an overrun would have to be truly massive in proportion to be significant.

For example, a cost overrun of $1,000 million under the High economics scenario would generate a year two debt interest of just under $100 million. In the case of financial distress caused by drought, swings in cash flow of ten times that size were under examined. An unnecessary cash cost of $100 million per year would not be welcomed, but would not undermine the performance of the company (that would even be true at two or three times the size).

This is not to say, however, than an extraordinary construction cost overrun would not be important: such events would change the full 48-year cost to Ratepayers, as follows:

Figure 18. PV of Domestic Revenue (Average Impact of Additional Capital Expenditures on Conawapa)

PV of Domestic Revenue
Average Impact of Additional Capital Expenditures on Conawapa
Preferred Development Plan
Additional capital outlay in 2025 (real 2014 $)
NPV @ 6.00%
($ in millions)

	Additional Capital Cost		
	$0	$1,000	$2,000
PV of domestic revenue	$44,230	$45,016	$45,839
Increase relative to nil increase	0.0%	1.8%	3.6%

While the sensitivity to cost overrun may not be sufficient to undermine the company, it would greatly damage the value proposition of the Resource Plan in question.

5. Specific Issues of Interest

5.1. Cost of Capital and Discount Rate

In Appendix 9.3 of the Business Case, Manitoba Hydro provides details concerning the construction of the High, Reference and Low sets of variables included in the 27 scenarios used in the analysis of the Resource Plans. MPA accepted and utilized these scenarios as preparation for this Report to the PUB, however some observations can be made about the cost of capital which the PUB may find useful. In addition, MPA did not utilize the costs of capital constructed by Manitoba Hydro as discount rates in our financial model, and hence some additional commentary appears appropriate on this issue.

5.1.1. Cost of Capital

The following is a summary of the various components of Weighted Average Cost of Capital (WACC) utilized by Manitoba Hydro.

Figure 19. Weighted Average Cost of Capital (Manitoba Hydro)

Weighted Average Cost of Capital (WACC)

		Nominal			Inflation			Real		
	Ratio	High	Ref	Low	High	Ref	Low	High	Ref	Low
Debt	75%	8.95%	6.30%	3.65%	3.00%	1.90%	1.00%	5.78%	4.32%	2.62%
Equity	25%	11.95%	9.30%	6.65%	3.00%	1.90%	1.00%	8.69%	7.26%	5.59%
WACC	100%	9.70%	7.05%	4.40%				6.50%	5.05%	3.37%

The foundation stone for all calculations is the reference nominal cost of long-term debt (6.30%), based on the consensus forward forecast for long Canada bonds, plus adjustments for the actual cost of debt to Manitoba Hydro. This figure is used to calculate the "real" cost of debt, discounting it for the reference inflation rate (1.90%), which is again based on a consensus forward forecast. At the same time, the cost of equity is assumed to be a fixed amount of 3.00% higher than the cost of debt.

On any given day, a slightly different calculation could be used to calculate the real cost of debt that Manitoba Hydro would be expected to face:

Cost of Canada bond at whatever length of term is desired (typically 10 or 30 years)

\+ Province of Manitoba Spread (over the past 20 years ranging from 0.2% to 1.0%+)

\+ Debt Guarantee Fee (currently 1%, but subject to unilateral change by the Province)

For example, on January 15, 2014, the benchmark Canada Long-Bond traded at 3.12%, and the Manitoba spread was approximately 0.85%. Adding the 1% Debt Guarantee Fee results in a Manitoba

Hydro cost of 4.97%. In comparison, the reference nominal debt rate used in the Business Case is not insignificantly higher.

However, the Canada Long-Bond rate may be implied from the nominal reference cost of debt used by Manitoba Hydro in the Business Case:

Figure 20. Implied Canada Long-Bond (1)

Implied Canada Long-Bond		
Reference nominal debt	6.30%	6.30%
less:		
Provincial debt guarantee fee	1.00%	1.00%
Province of Manitoba spread	0.40%	0.60%
Implied Canada Long-Bond	4.90%	4.70%

By this calculation, the reference nominal debt rate assumes a Canada Long-Bond in the range of 4.70% to 4.90%. Comparison to the history of the Canada Long-Bond, which is readily available on the Bank of Canada website, confirms that a rate in this range was indeed common in the 1920s, early 1930s, 1950s and early 1960s, and again in the first half of the last decade, before the financial crisis in the latter half of that decade.

Similar derivations for the high and low debt rates used in the Business Case appear as follows:

Figure 21. Implied Canada Long-Bond (2)

Implied Canada Long-Bond	**High**	**Ref**	**Low**
Cost of nominal debt	8.95%	6.30%	3.65%
less:			
Provincial debt guarantee fee	1.00%	1.00%	1.00%
Province of Manitoba spread	0.70%	0.50%	0.30%
Implied Canada Long-Bond	7.25%	4.80%	2.35%

Again, reference to the historical record shows that a Canada Long-Bond in the range of 7% has occurred, but only for relatively brief periods in the early 1970s and early 1990s, when the world was entering and then exiting a period of very high interest rates that lasted from approximately 1975 to 1995 (Manitoba Hydro did not include a “very high” rate that would attempt to capture such an economic environment, where the Canada Long-Bond was above 9.00% for thirteen consecutive years). Moreover, a Canada Long-Bond in the low 2.00% range has occurred even more rarely, having occurred

only in the last two years. Even in the 1930s and the 1950s, two periods which are historically recognized for lower interest rates, the Canada Long-Bond breached the 3.00% mark only rarely.

It should be recalled that the purpose of the scenarios is to construct sets of variables that are to be used in long-term models, and used *throughout the duration* of the model. In the case of Manitoba Hydro's "real" economic model, that term is 78 years, and in the case of Manitoba Hydro's nominal dollar model (and MPA's financial model), that term is 48 years. The scenarios should be understood as "averages" that would apply to the whole period in question.

Manitoba Hydro assigned probabilities of 35% for high, 50% for reference, and 15% for low with respect to the cost of debt. By reference to the historical record, there does appear to be strong support for the reference scenario, and some support for the high scenario, but little if any support for the low scenario as it is constructed, at least with respect to the cost of debt.

A similar review could be undertaken for the inflation rate options, set by Manitoba Hydro at 3.00%, 1.90% and 1.00%. Again, reference to available resources suggests that there is ample historical justification for the higher two rates (and even for a "very high" rate for long periods of the last century), but very limited justification for a 1.00% inflation rate as a potential average rate for a fifty-year or longer period.

Finally, Manitoba Hydro constructs its cost of equity by the straight addition of 3.00% to the selected cost of debt. To the extent that this cost of debt already includes the Provincial Debt Guarantee Fee and the Province of Manitoba spread, an equivalent calculation indicates that the notional return on equity that is assumed in the cost of capital is approximately 4.50% above the Canada Long-Bond at any given time.

On this issue, reference can be made to a study undertaken by the Ontario Energy Board in 2009,[40] which included analysis by five economists/experts on equity rates for regulated utilities across North America, with reference to historical market data, regulatory practice in a number of jurisdictions, and a variety of recognized techniques for deriving appropriate equity rates. The conclusion of a lengthy review process (and the availability online as part of that process of a full literature review of equity costs of capital), was that "low risk" transmission and distribution utilities were considered to have an equity cost of capital approximately 5.00% higher than Canada Long-Bonds.

Given Manitoba Hydro's high degree of exposure to hydrology risk, its financial exposure to market export prices, and the ambitious program of construction included in the Preferred Development Plan, legitimate issues can be raised with respect to the adoption of an equity rate of return that is even lower than a "low risk" premium of 5.00%.

[40] *Report of the Board on the Cost of Capital for Ontario's Regulated Utilities*, Ontario Energy Board, EB-2009-0084.

5.1.2. Discount Rate

Manitoba Hydro chose to utilize its WACC as the discount rate in all of its present value calculations. The justification is presented as follows in s. 9.2.3 of the Business Case:

> The starting point for development of a discount rate is a company's overall cost of financing. As a discount rate is used to guide investment decisions based on uncertainty, a risk premium may be identified to arrive at a discount rate which makes the investor indifferent between cash amounts received at different points in time.

Manitoba Hydro used the reference WACC as its discount rate (either nominal of 7.05% or real of 5.05%) throughout its analysis, except with respect to updated 2013 figures, when the reference real WACC was increased to 5.40% because of increases in some of the underlying consensus forecasts.

Several observations can be offered:

- WACC is the appropriate concept to consider the present value of cash streams in the future for the purposes of an investor considering an investment decision, however, Manitoba Ratepayers are not investors
- While it is true that Manitoba Hydro will source the capital required for its chosen Resource Plan from a combination of debt and retained earnings, and while the retained earnings are at least partially derived from ratepayer revenues, ratepayers can in no sense be understood to be making a voluntary investment decision, particularly given the monopoly nature of the utility service that is being offered, and the decision-making authority that rests in the hands of the government
- Calculation of the WACC, and its use in models predicting Manitoba Hydro's financial results – and hence electricity rates that ratepayers will face – is entirely appropriate given the likely use of the formula in the setting of rates over time by the PUB, however, this does not automatically qualify the WACC for use as the discount rate relevant to all parties considering the Business Case
- From the perspective of ratepayers, or any other stakeholder considering the Business Case, the primary value of the discount rate is in providing a means to compare varying cash streams over time from the perspective of today, in essence, a "time value of money" which is appropriate to that stakeholder
- The primary stakeholders in the Business Case identified in this Report are ratepayers and the Government of Manitoba; notably, neither of these parties is directly and voluntarily investing equity in the project
- It can be argued that governments have very low "time values" of money, given the permanence of the institution, and typically its access to the lowest cost of funds; ratepayers,

however, are a heterogeneous group for whom generalizations are very difficult, and for whom the adoption of a single, blended time value of money may not be appropriate.

While there is an existing literature with respect to the choice of appropriate discount rates to represent ratepayers, we have not pursued this issue further. For the purposes of this report the use of two discount rates was adopted, both nominal, at 6.00% and 10.00%. These rates bracket the rate adopted by Manitoba Hydro, and offer the possible consideration of the various resource plans from more than one perspective.

5.2. Exports

As has been discussed elsewhere in this report, Manitoba Hydro has generated a substantial portion of historical revenues from exports. Of these revenues, a significant portion is directly tied to short-term market prices, while another portion is the result of longer-term firm contracts. These contracts, however, are not specifically tied to any asset, but instead are based on the output of the Manitoba electricity system as a whole. As a result, their length, pricing schedule, and terms and conditions all reflect the underlying export electricity markets and counterparties with which Manitoba Hydro interacts.

These contracts can be contrasted with Manitoba Hydro's own contracts with the wind farms that have been constructed in the province. In those cases, Manitoba Hydro has purchased all of the output of the wind farms for their full expected life, at rates that were negotiated between the parties based on the cost of construction and operation of the wind farm plus an amount meant to represent a return on investment for the wind farm owners. These are classic "infrastructure project" contracts which effectively apportion and minimize the risks and costs of a project for both parties.

Manitoba Hydro has negotiated a number of agreements with parties as part of the development of the Preferred Development Plan, as described in the Business Case. The electricity resources that will be built as part of the Preferred Development Plan are hydroelectric facilities with an expected life of over 100 years. The contracts negotiated, however, have terms which last a fraction of that time. In addition, the price of the contracts is based on prevailing market conditions, and not in any way related to the cost of the electricity resources being built. They are in fact system energy arrangements, similar to the system energy arrangements that Manitoba Hydro has signed in the past. As such, their chief usefulness is in providing Manitoba Hydro with a guaranteed buyer for a portion of the system's expected surplus power, and a firm price for a period of time, which provides additional predictability to cash flows.

Considered more broadly, Manitoba is simply a price taker in the MISO market, whether it is taking prices in short-term markets, or in a longer-term market for bilateral arrangements with specific counterparties. The value of the longer-term contracts negotiated at any time are likely, as Potomac Energy, another independent expert consultant to the PUB, has argued in their report,[41] to be based on the cost of new entry into the MISO market (or in other words, the cost of constructing new supply resources in the MISO market at the time a contract is negotiated). As a result, the longer-term firm

[41] Please see Report to the PUB provided by Potomac Energy on January 15, 2014.

contracts are not mitigating market risk or exposure for Manitoba Hydro, but merely apportioning the market risk accepted in pursuing the Preferred Development Plan.

In this respect, Manitoba Hydro is acting as a "merchant" investor, taking substantial market risk based on expectations, or bets, about the future. While "probabilities" have been placed on different potential futures through the scenario modeling process, fundamental market risks are necessarily imbedded in some Resource Plans to a far greater extent than in others. Prices will either turn out to be high, and ratepayers will benefit, or they will turn out to be low, and ratepayers will have to shoulder more of the burden of Manitoba Hydro costs. Either way, ratepayers can have no certainty in advance, and no choice in the matter.

Given the legislative mandate of Manitoba Hydro to reinvest all earnings, and keep rates as low as possible, it is clearly not a merchant investor. However, the tacit acceptance of risks that would be normally within the scope of a merchant investor suggests the issue deserves scrutiny.

5.3. Impacts on the Government of Manitoba

In s. 4.6, the potential for and magnitude of Manitoba Hydro financial distress was discussed. It was suggested that depending on the choice of resource plan, the timing, and the depth of a drought event, it is possible that for a period of time Manitoba Hydro could suffer a sustained period of financial distress which could result in the view that the company is no longer fully self-supporting. Many factors would play into this conclusion, including the longevity of the distress, and the severity. However, in certain scenarios, if a severe drought were to occur in the 2020s, there is the possibility that the approximate equivalent of $10 billion or more of Manitoba Hydro debt could be viewed as not "financially supported" by rates.

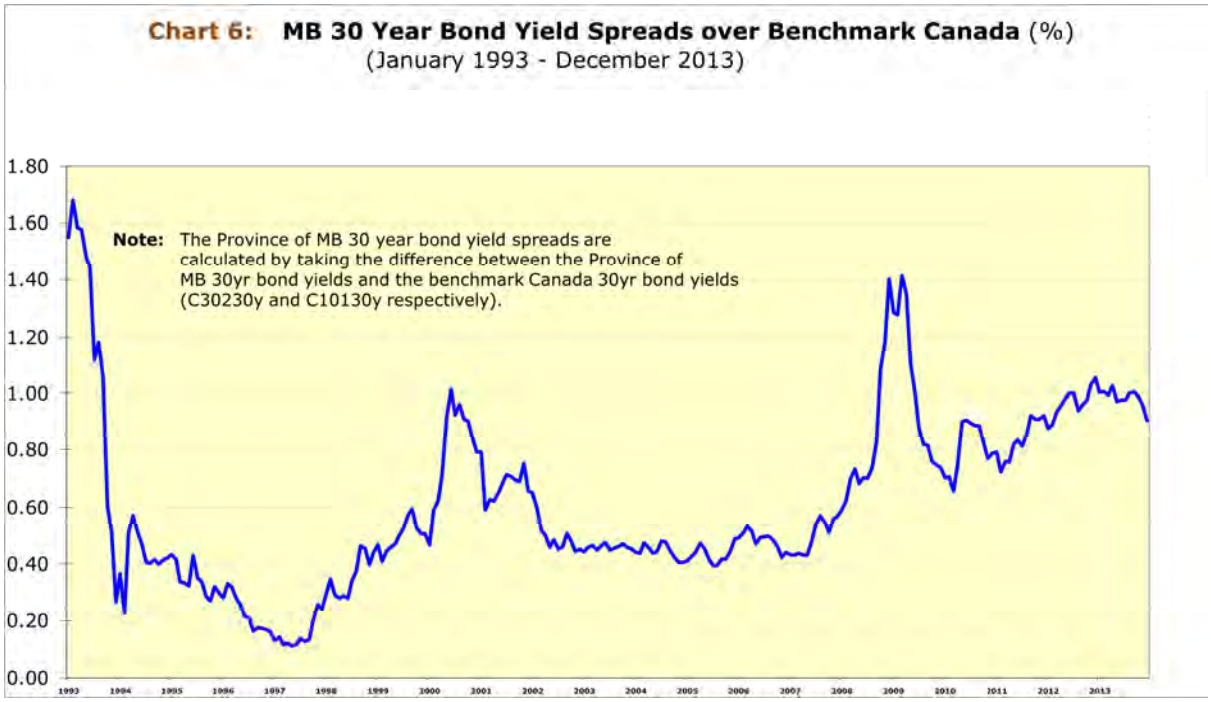
In practice, what this would mean is that the Government of Manitoba would have to lend additional sums to Manitoba Hydro in order for the company to meet its cash requirements (both to pay debt interest and refinance expiring principal, and to finance the purchase of necessary capital goods). The ability of the government to provide such funding is not called into question, but rather it is the potential impact on the view of the Province by credit rating agencies and other capital markets actors that is in question.

5.3.1. Manitoba Financial Profile

Currently, Manitoba is positively viewed by credit rating agencies, and maintains a high rating (Aa1 from Moody's, AA from Standard and Poors and A (high) from DBRS). Recent credit reports, which have been provided as part of the NFAT process, have highlighted the relatively strong and stable economic performance of the province in the years since the financial crisis of the last decade, the varied sources of strength in the province's economy, its population growth through immigration, and the stable fiscal and financial management of the government.

Projecting forward ten, twenty or thirty years to a possible financial distress episode at Manitoba Hydro on the basis of current estimates is a tenuous exercise at best, both because of the time involved, and

because of the vagaries of the credit rating world. In the past twenty years, Moody's has upgraded Manitoba's credit rating three times, while Standard and Poors did so only once in the last fifteen years, and DBRS has not changed its rating for the past 10 years. DBRS rates Manitoba equal to Quebec, but less than Ontario, while Standard and Poors rates Manitoba one notch above Ontario and two notches above Quebec. Managing the perceptions of the capital markets is an art, not a science.



Currently, Manitoba Hydro's debt is considered to be self-supporting, and hence is not included as part of Manitoba's net tax-supported debt. Across the credit rating agencies, Manitoba's net tax-supported debt is calculated to be between $15 and $20 billion, depending on the agency in question. Debt to GDP ratio is calculated as approximately 30% to 35% of GDP. According to a calculation by DBRS, Manitoba's Debt to GDP ratio is similar to that of Nova Scotia and New Brunswick (with whom it shares an A (high) rating), but less than Ontario's 41% (but Ontario is rated higher at AA (low)), and much lower than Quebec at 60% (though the province has the same rating as Manitoba).[42]

Manitoba's GDP growth has been averaging approximately 2% per year in the last five years (while many other jurisdictions suffered severely), yet net tax-supported debt has grown substantially faster. The province is widely expected to pursue a substantial infrastructure program that could dramatically increase debt even further. If, for example, the province's economy continues to grow at 2% per year, then GDP will reach $70 billion in ten years (if the province were to reach a 3% average growth rate, then GDP would grow to $77 billion). However, if tax-supported debt were to grow by $10 billion, then the debt to GDP ratio would rise to approximately 42%, which is the reported level of Ontario today.

In this discussion of credit rating and credit rating agency overviews, it is important to consider the practical impact of these positions. The metric by which provincial credit is judged on a daily basis is the credit spread between a province's bonds and Government of Canada bonds. The following chart, provided to MPA by Manitoba Hydro, depicts the progress of the credit spread over the past 20 years.

[42] Please see the DBRS 2013 Provincial Fact Sheet.

Figure 22. Manitoba 30 Year Bond Yield Spreads Over Benchmark Canada (%)

It is immediately notable that the pattern of the credit spread between Manitoba bonds and Government of Canada bonds does not correspond to rating agency views. In fact, what is more noticeable is major economic trends and events, such as the financial crisis in 2008, the terrorist attack on the United States in 2001, and the Asian credit crisis in 1998. Along the way, the constant gyrations of the credit spread do not seem to be related to the overall stability in credit rating reviews that Manitoba has enjoyed. Finally, both Moody's and DBRS increased Manitoba's credit rating in 2003, after the spread had already declined, and with no apparent further affect once their new positions were announced.

It is quite possible that Manitoba's capital markets position could deteriorate over the next twenty years, but it is also possible that it could improve, through prudent fiscal management, balanced budgets and continued focus on economic development and prosperity. Despite all of that, the credit spread could still widen, or contract, with little to no relation to any local accomplishment or failing.

5.3.2. Context for Potential Manitoba Hydro Distress

As discussed, Manitoba Hydro, particularly in the context of the Preferred Development Plan, is financially sensitive to hydrology. If there were to be a prolonged and severe drought, particularly in the 2020s when the company would be most susceptible to financial distress, then a substantial portion of the company's debt could cease to be considered "financially self-supporting".

There are several issues which should be taken into account with respect to the impact of such a situation on the Province of Manitoba:

- All droughts, even the most severe, eventually end, and with the end of the drought would be the return of revenues and profits for Manitoba Hydro; all of the credit rating agencies and capital markets will understand this reality

- Concern is likely to mount progressively through a drought, with impact on the Province only becoming an issue over time (a one-year event, such as occurred in 2003-04, would simply not register)

- If a severe drought was indeed occurring, it would be affecting far more than just Manitoba Hydro; in fact, Manitoba Hydro would be one of the last focuses of attention, as the agriculture sector, forestry, parks and wildlife and many others affected by drought would gain attention first

- In a situation of severe natural disaster, governments are expected to step in with assistance, which would include not only the Manitoba government but also the Government of Canada (though not necessarily on an issue such as electricity prices)

- Given that the watersheds serving Manitoba Hydro's facilities are spread across several provinces and states, a drought of this magnitude would not be localized, adding to the overall attention to it.

In such a context, Manitoba Hydro would be faced with a drought and deteriorating financial indicators, and need to advocate for rate increases to improve its finances. While only a small fraction of Manitoba's economy is dependent on agriculture, there are still many people in the agriculture sector who would be affected by drought, and who would be resistant to increases in electricity prices. Moreover, insofar as electricity rates will have been rising steadily at 3.8% per year for the next ten years, rate fatigue may well have set in.

If no or only low rate increases are implemented, and a shortfall in cash requirements continues, then several practical consequences will ensue:

- Manitoba Hydro will suffer repeated years of losses, which will reduce equity over time, leading to a deteriorating debt:equity ratio

- For the Province of Manitoba, Manitoba Hydro's earnings appear in the budget as revenues, and losses as expenses, so a drought would have an immediate bottom line impact on the deficit (however, since no dividends are ever paid to the government, credit rating agencies and other sophisticated analysts already deduct Manitoba Hydro earnings from the "adjusted" versions of Manitoba's annual budgets)

- Water rental payments would drop significantly in a drought, which has a real cash impact on provincial budgets, but substantially smaller than the potential impact of losses, as described above

- The provincial government would need to decide what form(s) of relief it would provide to Manitoba Hydro in such a situation, beyond allowing extraordinary rate increases at some level; the choice would likely be between some combination of lending additional funds, or exempting Manitoba Hydro from certain payments

- If the province exempted Manitoba Hydro from any payments, then that step would have immediate budgetary consequences, whereas simply extending additional credit would be a capital account transaction

- An additional consideration would be that lending to Manitoba Hydro would simply be the extension of credit support to ratepayers, not an actual cash transfer between taxpayers and ratepayers, as would be the case if Manitoba Hydro were provided with any kind of tax holiday or exemption; in the case of additional lending, ratepayers would ultimately be responsible for the full amount over time, including underlying interest and the debt guarantee fee.

As with so many issues in the capital markets, perceptions would be crucially important. If prior to the onset of a drought, Manitoba continues to enjoy a strong competitive position with respect to electricity rates elsewhere, then financial distress from an ultimately time-limited drought might simply be perceived as a temporary phenomenon that would eventually resolve itself through steadily increasing rates, and an eventual return of water flow. In that scenario, little to no impact would be expected on the province. On the other hand, if prior to the drought Manitoba Hydro's competitive position had already deteriorated, then the potential to reassign multiple billions of dollars of debt from Manitoba Hydro to the Province could be viewed as a more likely course, with all of its attendant possible impacts.

6. Costs, Risks and Benefits

6.1. Ratepayers

As identified in Chapter 2, the primary interest for Manitoba ratepayers is to pay the lowest risk-adjusted cost for their electricity over time.

In some sense, both the cost and the benefit for ratepayers is the same thing: the monthly bill for the electricity they consume. Through financial modeling, the five Resource Plans were compared across all 27 scenarios and 21 hydrology patterns. The rank ordering of the Resource Plans very much depends on whether a scenario is isolated, or whether several scenarios are allotted probability weights.

Risk is the principal differentiator between the Resource Plans. Choice of a Resource Plan is in large measure a choice about the risks that Manitoba Hydro will be financially sensitive to, and which will be passed on to Ratepayers in the form of rates.

Table 8. Risk and Impacts Across Development Plans

Risk	Impacts
Demand	• Smaller, shorter construction-time resources can be more accurately targeted to expected domestic demand, favouring Plan 1 • All Plans can suffer if domestic demand stalls or declines after resources are built, though larger individual facilities in Plans 12 and 14 face such stranded asset risk to a greater degree; mitigated by the fact that "demand" need not be domestic demand • The impact in the event of lower demand depends on the relationship between export prices and domestic rates at the time the expected demand does not materialize; if prices have to rise steadily for a longer period, as in Plans 12 and 14, then more of this competitive advantage may be lost
Hydrology	• There is a clear difference in sensitivity to hydrology as between the Plans, with Plans 12 and 14 being most affected by water flows • The volatility of water flows translates directly into volatility of cash flows, which can be positive as well as negative
Export/Import Prices (& Fuel Prices)	• There is a clear difference in sensitivity to export markets and market prices between the Plans, with Plans 12 and 14 being most sensitive, but again, sensitivity can be both positive and negative • The reduced sensitivity in Plan 1 to changes in this set of variables may have much to do with the fact that fuel prices and export prices are tied together
Construction Costs	• The absolute magnitude and complexity of building a project like Conawapa increases risks
Interest Rate	• All Plans are dramatically affected by interest rates and inflation assumptions
Technology	• Plans with longer – lived assets forego the possibility of adapting to improvements in technology

It should be recalled, however, that the overall "risk-adjusted" impact of the choice of Resource Plans will only be marginal over the very long term, when considered from a present value perspective. The existing system will continue to be the backbone of electricity supply for many years to come, and the Resource Plans do not change the fundamental hydroelectric nature of the Manitoba electricity system.

The second critical aspect for Ratepayers is the treatment of time: while this is not a risk in the normal sense of the word, there is an apparent difference in intergenerational treatment between the Resource Plans. The rate paths described in s. 4.2.1 make clear that a strong opinion on the time value of money can have an almost deterministic effect on the choice of Plans from a Ratepayer perspective.

6.2. Government of Manitoba

The Government of Manitoba has a clearer set of costs, benefits and risks to consider.

The Preferred Development Plan and Plan 12 both include Keeyask and Conawapa: these Resource Plans would require the largest balance sheet, most guaranteed debt at risk, the longest construction times, and the longest sustained period of initial rate increases. On the other hand, they will provide the most government revenues, generate the most significant construction employment and attendant economic development, and hold the promise of maintaining or improving the province's electricity competitiveness for decades into the future.

From the perspective of the government, the relatively minor distinctions that result based on the outcome of the twenty-seven scenarios is largely irrelevant. The Government's focus is not on having the lowest possible costs, only a competitive cost. While the Preferred Development Plan is virtually guaranteed to require a doubling of electricity rates over the next 20 years, it holds the promise of actual rate declines in the following period and beyond.

The critical issue for the government is the ever-present threat of drought. While there has not been a severe and prolonged drought in Manitoba for twenty-five years, there will inevitably be another one. Timing will matter with respect to the degree of sensitivity to financial stress, and the choice of Resource Plan will determine the seriousness of the impact. The pattern is nearly identical to rates for consumers: The Preferred Development Plan has a heightened sensitivity to drought in the first twenty years, but less sensitivity to drought in the subsequent period.[43]

[43] For consideration of broader economic development issues, please see the Report to the PUB of Typlan Management and Planning. For review of environmental issues, please see the Report to the PUB of MNP. While these issues are of obvious concern to the Government of Manitoba, they are outside the scope of this report.

7. Conclusions

Analysis of the available data and construction of a financial model capable of incorporating hydrology has allowed for the illumination of a number of patterns, and a variety of observations that will, it is hoped, assist the PUB in making its recommendations to government on the NFAT Review of the Manitoba Hydro Preferred Development Plan.

Key observations have included:

- The ability of Manitoba Hydro to meet its financial targets over the next ten years without increasing rates beyond two times the rate of inflation – under all Resource Plans – is entirely dependent on the continued absence of a significant drought
- Different Resource Plans extend that period of fragility, including the Preferred Development Plan, which should not be expected to enter a time of more financial capacity for twenty years, unless rates are allowed to rise at more than double the rate of inflation for an extended period of time
- In the face of a sustained, severe drought, the choice of Resource Plan is irrelevant to the occurrence of distress, as the financial consequences of such a drought would overwhelm the differences between Resource Plans
- Choice of Resource Plan does affect the occurrence of financial distress due to drought in milder drought cases, and it also affects the magnitude of the problem that would be faced by government in the event of a drought of any kind
- The total, probability-adjusted present value of ratepayer costs over 48 years across all five Resource Plans is likely too narrowly distributed to allow for definitive selection of the "lowest cost" choice. These outcomes are essentially within the margin of error of the many calculations, estimates and assumptions that were required to construct the model
- The consistent patterns of sensitivity of specific Resource Plans to certain variables indicates that model analysis can provide a guide to identifying the concerns that should be part of any decision-making process
- An extremely important inter-generational decision is embedded in the choice of Resource Plan, as costs to Ratepayers will be distributed very differently over time.

Bearing these and other observations in mind, we would suggest the following recommendations:

d) Plans 4 and 6, which were largely indistinguishable from each other, resulted in costs to ratepayers that appear to be lower than other Resource Plans in many scenarios, if only marginally; this suggests that proceeding with Keeyask may be a prudent step to take at this time, but a more thorough review of the proposal to build Conawapa as part of the Preferred Development Plan should be undertaken closer to its final commitment date

e) Given the expected fragility of Manitoba Hydro during the first ten years of any Resource Plan, and beyond that in others, the Government of Manitoba may wish to calculate and reserve some of the funds it generates (e.g., through permits, approvals, income taxes, etc., related to the construction projects) to act as an initial financial buffer for the government in the event of drought and the need for financial assistance to Manitoba Hydro

f) Given the inevitability of a drought at some point in the future, and the expected financial impact that such a drought would have on Manitoba Hydro, particularly in the near term, consideration should be given to the development of an explicit policy on the future course of customer rates in such a situation; this policy could then be shared with credit rating agencies and others to address the potential concern that they may have that in the event of a drought some fraction of Manitoba Hydro debt might be financially unsupported.

Appendix A Biographies of MPA Contributors

Pelino Colaiacovo

Pelino is a Managing Director at MPA. In this role he is responsible for origination and transaction execution, financial advisory and capital raising services. Since joining MPA Pelino has focused on advising clients in the energy, utilities, infrastructure and public sectors.

Utility clients have included Hydro One, BC Hydro, Enwin Utilities, Oakville Hydro, Woodstock Hydro, the Nova Scotia Utilities Review Board and the Alberta Market Surveillance Administrator, and more broadly in the energy sector Pelino has worked on a number of M&A and capital raising assignments for renewable energy companies.

Prior to joining MPA in 2005, Pelino was Chief of Staff to the Ontario Minister of Energy from 2003 to 2005. During that time, he assisted in significant restructuring of the Ontario electricity sector, including the drafting and implementation of new legislation, the creation of the Ontario Power Authority, and significant procurements of new electricity generation capacity for the province.

Previously, Pelino spent more than 10 years in management, policy and communications consulting in Canada and the United States, advising clients across a wide range of sectors, including energy, transportation, telecommunications, and healthcare.

Pelino holds a B.A. and an L.Lb., both from the University of Toronto.

Brent Walker

Brent Walker is a Managing Director and co-founder of MPA. In this role he is responsible for transaction origination and execution, financial advisory and capital raising activities across a wide spectrum of industry segments, including energy, technology, government and quasi-government entities and a variety of other commercial sectors.

Utility clients have included BC Hydro, Altagas Utilities, Crown Investments Corporation, Hydro One, Market Surveillance Administrator of Alberta, the Nova Scotia Utilities Review Board, the Ontario Ministry of Energy and many others.

Prior to founding MPA in 2004, Brent spent over 10 years in the investment banking and financial industry. From 1996 to 2004, he was a managing director in Scotia Capital's mergers and acquisitions department, where he was the most senior M&A banker in a number of sectors including power and infrastructure, pipelines, energy midstream and real estate. During this period, he worked on the sale of the Province of Nova Scotia's interest in Nova Scotia Resources Limited, the acquisition of Aquila by Fortis, the proposed privatization of NALCOR and Enmax, and many other utility assignments.

Brent started his investment banking career at Lancaster Financial, Canada's foremost independent M&A boutique which was acquired by TD Bank in 1994.

Brent holds a B.Sc. from Dalhousie University and an MBA from McMaster University.

Benjamin Kinder

Benjamin Kinder is a vice president at MPA. He is responsible for client engagement, transaction design and execution, client development and overall delivery of service.

Prior to joining MPA, Benjamin spent two years in Scotia Capital's investment banking and equity capital markets divisions. While there, he focused on the communications, media and technology sectors, advising clients on mergers and acquisitions, and capital markets transactions.

Benjamin has experience in a number of industry segments including power and infrastructure, regulated utilities, basic materials, technology, media, telecommunications, non-profits and quasi-government entities.

His work has included mergers and acquisitions advisory, restructuring, private capital raising for early and mid-stage companies, expert advisory work for regulators, and strategic advice to the clients in the face of substantial change.

Benjamin holds a Bachelor of Business Administration (B.B.A.) from York University's Schulich School of Business, and a Master of Arts (M.A. Cantab.) from the University of Cambridge.

Appendix B Description of Model

MPA has constructed a financial model on Manitoba Hydro's electrical operations ("MH") in order to address the scope of work put to MPA by the PUB under the NFAT. MPA relied upon the NFAT, the appendices thereto, and numerous discussions and correspondence with MH management and employees on the matter of MH operations, and economic, and financial conditions. MPA relied especially on Appendix 11.4 to the NFAT (Pro Forma Financial Statements), Appendix 11.2 (Projected Escalation, Interest and Exchange Rates), and Appendix 9.3 (Economic Evaluation Documentation). The model runs through year 2062 (inclusive) given that this was the time horizon selected by MH in the presentation of pro forma financial statements in Appendix 11.4, and is denominated in nominal Canadian dollars. All inputs received by MPA and not already presented in nominal Canadian dollars were converted accordingly such that the basis of comparison between all financial data was consistent.

MPA received SPLASH (Simulation Program for Long-term Analysis of System Hydraulics) output from MH with respect to the development plans considered under the NFAT. The SPLASH data detailed forecast adjusted load in the province of Manitoba, and firm and opportunity export demand, on a GWh basis, and the supply mix necessary to balance load and export demand. Crucially, this data was provided for ninety-nine years of hydrological history (1912-2010 inclusive), on a month by month basis, and modelled out to 2048 (or, 2049 as the case may be) given the supply mix and anticipated load and export demand for a given forecast year. Receiving actual, historical hydrological data modelled for a future, anticipated supply mix was crucial to MPA's efforts to model hydrological risk in the system and adequately address the scope of work put to MPA by the PUB.

By hydrological risk in the system is meant the effect of actual annual hydrology on the domestic revenue requirement, domestic revenue, net income, equity ratio, interest coverage ratio and other measures of MH financial risk and performance. The use of average hydrology by the model underlying Appendix 11.4 is instructive in understanding the system over a relatively longer period of time (Appendix 11.4 runs through 2062, inclusive). However, averages mask underlying variability (with respect to hydrology, both flood and drought), and thus MH's ability to realize opportunity export revenue in the event of a drought, or prolonged drought.

SPLASH data included monthly energies at generation for hydro, thermal and import energy (both on and off-peak) to produce total supply, balanced against adjusted provincial load, and firm and opportunity export demand (all on and off-peak). MPA summed all monthly data to annual totals and produced a data set for every variable modelling a given hydrological history (vertical columns) for a future model year (horizontal rows).

Further, MPA created chained data sets necessary to calculate net flow related revenue, including opportunity export revenue (both on and off-peak), and the cost of hydro, thermal and import energy (both on and off-peak). Chained data is created in a series of matrices, one for each variable under each

scenario, and under each development plan, and reflects the historical, physical hydrology experienced by MH through the years 1912-2010. Chained data sets follow a set pattern of down one row and right one column from unchained data, so that the actual hydrology that existed in 1960 (as an example year) may be followed through the model as if that hydrology were experienced in model year 2015 (model year start date). Model year 2016 would then reflect the actual hydrological conditions experienced by MH in the year 1961 given a hydrological start date of 1960. Any hydrological year on record may be selected, and any development plan, under any scenario, may then be considered.

MPA matched the SPLASH data with the development plans detailed in Appendix 11.4 of the NFAT, eliminating plans for which pro forma financial statement data was not provided. MPA extracted chained, opportunity export revenue for every given hydrological regime and model year, allowing for the determination of actual, annual opportunity export revenue, calculated for a given supply mix that MH anticipates to eventuate in a given year. This information and extraction (from SPLASH), and application (to Appendix 11.4) allowed MPA to produce a set of financial statements (income statement, balance sheet and cash flow statement) for every development plan modelled under Appendix 11.4 under all scenarios, and under all previous hydrology regimes.

By way of example, the Preferred Development Plan may be evaluated under twenty-seven different combinations of reference, high and low economic, energy and capital scenarios (3x3x3=27). Further, ninety-nine different historical hydrological patterns (the SPLASH data referenced above) may be run through any one of these twenty-seven possible scenarios to produce 2,673 (3x3x3x99) possible outcomes for the Preferred Development Plan alone. This process may be repeated for any development plan for which information was provided under Appendix 11.4 to the NFAT.

MPA embedded significant functionality into the model to allow for a thorough financial analysis. Such functionality includes selecting hydrological history, economic, energy and capital scenarios, and a development plan; rate increases by implied domestic revenue requirement or percent increase per year; unanticipated capital cost expenditures; term structure on new debt issued, deemed equity component of capital structure and deemed return on equity etc.

In reaching our conclusions contained in this report, MPA has run the All Gas and Preferred Development plans, and Plans 4, 6 and 12 under the 2012 reference Manitoba load for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 495 total runs).

The All Gas and Preferred Development Plans were further run at high and low 2012 Manitoba load for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 396 total runs).

The Preferred Development Plan was further run at 4x 2013 DSM and 1x 2012 DSM (both at 2013 reference Manitoba load) for all 99 years of hydrological history through year 2062 (at reference economics, energy and capital, for 198 total runs).

The All Gas and Preferred Development plans, and Plans 4,6 and 12, were run for 21 different years of hydrological history, for every combination of reference, high and low economics, energy and capital costs, for a total of 546 runs per development plan, or 2730 total runs.

For example, Development Plan 4 was run for 21 different years of hydrological history under 26 different combinations of reference, high and low economics, energy and capital costs (the ref-ref-ref scenario detailed above is excluded here, where all 99 years of hydrological history were considered).

In total, MPA performed 3,819 different runs of the financial model. Given that a full reckoning of the All Gas and Preferred Development Plans, and Plans 4,6 and 12 considered under only 2012 reference load conditions would have required 13,365 total runs of the model, MPA used professional judgment in the determination of what hydrological years to consider, under a given economics, energy and capital cost scenario and under a given development plan. While Appendix 11.4 to the NFAT considered plans 2,7 and 13, MPA did not further consider those development plans given the base similarity between those plans and others considered by MPA.

The twenty-one years of hydrology considered by MPA are a sampling of the ninety-nine years of actual hydrological history, and include the years 1912, 1916, 1920, 1928, 1932, 1936, 1940, 1948, 1952, 1956, 1960, 1968, 1972, 1976, 1980, 1988, 1992, 1996, 2000, 2008 and 2010.

All decades of hydrological history were included by MPA in our analysis of MH, and include both drought and flood years.

The financial model, as constructed above, formed the basis for our financial conclusions reached in this report.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

Technical Appendix 9A: Economic Analysis Part I

Table of Contents

I.	**Introduction**	**1**
A.	Scope of Report	1
B.	La Capra Associates Approach to Reviewing the NFAT Economic Analysis	3
C.	Structure of the Report	5
II.	**Economic Analysis – Reference Scenario**	**6**
A.	Introduction	6
B.	Manitoba Hydro Economic Analysis Methodology and Metrics	7
	Evaluation Process	11
	Study Period - 78 Years	13
	The 78 year Metric – Net Present Value	15
	Reference Scenario Results	17
C.	La Capra Associates' Review and Concerns	21
	The 78 year Economic Differentials Are Small	22
	A 78 Year Planning Horizon Analysis Is Susceptible To Forecast Uncertainty	24
	Singular Focus On The 78-year Net Present Value Metric	24
	Unleveraged Cash Flow Analysis	25
	Comparison of Annual Cash Flow Requirements of Plans	26
	Break Even Evaluation Of The Alternative Plans	35
	Alternative Economic Metrics Comparing Alternative Plans	39
	Consideration of Sunk Costs	49
D.	Synopsis	49
III.	**Economic Uncertainty Analysis**	**51**
A.	Introduction	51
B.	Manitoba Hydro Methodology	52
C.	La Capra Associates Critique of the MH Methodology	60
D.	La Capra Associates Changes to MH Methodology	62
	Comparison of Resource Plan Economics over Multiple Scenarios	63
	Additional Economic Analysis Study Periods – CPV Metrics	68
