MR. BOB PETERS: So the information that -- that the Board of Directors is referring to wasn't fully fleshed out in the information --

MR. CAMPBELL ADAMS: That's -- that's
my view. Mr. Flanagan...?

MR. KIERAN FLANAGAN: And the lowest
cost wasn't realistic, as we all know today.

MR. BOB PETERS: All right. But --
but, let's say, we don't have the rearview mirror, Mr.
Flanagan, and we're -- we're back in -- in the day
when this contract had to be considered.

Are you saying that it was too good to
be true?

MR. KIERAN FLANAGAN: Put it this way,
I was shocked to see that the labour norms used for
concrete were based on a contract twenty-five (25)
years ago.

MR. BOB PETERS: And you're shocked
because you would've expected there to be something
against which that could be checked in a more -- a
more recent past?

MR. KIERAN FLANAGAN: Old fashion way,
people worked twenty-five (25) years ago.

MR. BOB PETERS: I'm sorry?

MR. KIERAN FLANAGAN: People worked
twenty-five (25) years ago. They were more
productive.

MR. BOB PETERS: And I suppose there's

reasons for -- for that; perhaps attributed to safety standards --

MR. KIERAN FLANAGAN: Of course there's safety standards. There's different work methods but one (1) of the main things is when the craft people were working, they worked hard all day. A fifteen (15) minute break was a fifteen (15) minute break.

MR. BOB PETERS: And you're saying you saw different standards apply on the Keeyask site?

MR. KIERAN FLANAGAN: I'm not saying the Keeyask site. I -- throughout the whole industry. So it's not -- there's an element that people worked harder, there's an element at the fifteen (15) minute break you had to eat your lunch in the fifteen (15) minute break. The same with lunchtime.

But there's also an element with safety and other elements, that should've been taken into account; that a project twenty-five (25) years ago is not achievable today. On productivity, sorry.

MR. CAMPBELL ADAMS: There's also some assumptions arou -- around the productivity, not to get into the numbers, but that they're much, much better than what was achieved on the last -- the last project. That -- that to us seems somewhat

optimistic, somewhat unrealistic, and I think that
history, sadly, has borne that to be true.

MR. BOB PETERS: So when you say that
the productivity was better than the last project,
you're referring to Manitoba Hydro's Wuskwatim
project?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And then your answer
is that because of Manitoba Hydro's relatively recent
experience with Wuskwatim, that should have let
Manitoba Hydro know that the productivity being
forecast by at least one (1) of the bidders wasn't
likely to materialize?

MR. CAMPBELL ADAMS: I think it
should've raised the question as to why did to the --
why did that proponent think that they could do that,
and also compare that to what the other proponents
were offering, and a take -- take a realistic view as
to how achievable this is, because that underpins what
was a -- a low, as it turned out to be, initial target
price.

MR. BOB PETERS: And if Manitoba Hydro
then meets with the contractor and discusses the --
the relative size of the productivity forecast and is
given assurances that can be met, what is Manitoba

Hydro supposed to do differently?

MR. CAMPBELL ADAMS: Well, convert your price to a lump sum. If you think you can do for that, you can stand over. And you're competent contractor and you're warranting that your price is sufficient for doing the work, well stand over them. And then watch their face lose its blood.

MR. BOB PETERS: I want to turn in the few minutes that I have remaining to one (1) other area. On Volume VI, page 25, of Board counsels' book of documents, in one (1) of the answers that Manitoba Hydro has provided to the Public Utilities Board, and it's at the bottom of the page, the main contributing factors to the underperformance of BBE were set out, and there were three (3) of them.

And you're familiar with those?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: First of all, without indicating any dollar amounts, are you able to rank them based on the highest contributor to cost overruns to the lowest contributor of cost overruns, from what you've seen?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: We -- we could accept the -- the bullets in the order in which they're given.

MR. BOB PETERS: And, Mr. Campbell, because one (1) of them deals with geotechnical issues, and you have a colleague that specializes in that, have you looked at it from that perspective as well?

MR. DAN CAMPBELL: We didn't look at bullet 2, but certainly the order between 1 and 3 is correct.

MR. BOB PETERS: Thank you. Mr. Campbell, can you explain to this Board why geotech caused a problem, when KCB finds that the quantities estimated by Manitoba Hydro were very accurate?

MR. DAN CAMPBELL: No, I don't believe I -- I can.

MR. BOB PETERS: That's not something that KCB investigated?

MR. DAN CAMPBELL: When we looked at them, as I -- as we said in our report, we found some issues which -- would it -- change the costs a bit, but we were not able to come up with anything that would make such a dramatic change, as has -- has actually occurred.

MR. BOB PETERS: And that -- and that's specifically tied to the geotechnical issues?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: And, Mr. Adams, is the impact of geotechnical issues found in the contingency? Is that where it -- it -- where it lies?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Could you please rephrase your question, so I can better understand what you're seeking from me?

MR. BOB PETERS: I'll ask it better, or I try -- I'll try.

MR. CAMPBELL ADAMS: Thank you.

MR. BOB PETERS: If there are additional costs related to the actual experience with geotechnical and geological conditions, where's the money to pay for that in Amending Agreement Number 7?

MR. CAMPBELL ADAMS: I'm not sure -- I'm not sure where that -- where that is. I believe Amending Agreement Number 7...

(BRIEF PAUSE)

MR. BOB PETERS: Gentlemen, it may have been asked poorly, or maybe it's late in the day, or both, but --

MR. CAMPBELL ADAMS: Sorry, is -- is your question to determine whether the -- the cost of geotech was included in the -- the target price that is included in Amending Agreement Number 7, or how was it paid for eventually?

MR. BOB PETERS: No, we're talking about the construction year 2016, and that there were a number of problems, and three (3) of them are listed here on the screen. One (1) of them is the productivity, the other --

MR. CAMPBELL ADAMS: Okay.

MR. BOB PETERS: -- is the slow ramp-up, and the third is the geotechnical issues.

And is it correct that the geotechnical issues and the additional cost that that drives is born a hundred percent by Manitoba Hydro?

MR. CAMPBELL ADAMS: That is correct, yes.

MR. BOB PETERS: And so for Manitoba Hydro to cover that expense, it would have to be included in the -- in the contingency account?

MR. CAMPBELL ADAMS: It -- it might

come from there, yes.

MR. BOB PETERS: All right. A last area is on the -- well, the same area, but Exhibit 117, page 2, of the Appendix A. Again, we're back to that KPMG report. And the very last -- sorry, the second last paragraph, it indicates that, in talking about MGF and the analysis -- I'm sorry, I've given you the wrong reference.

It's Appendix B, on page 2. And this is in the Hatch Report. And it is on page 2. It is in the last paragraph. And it's a comment about MGF.

Have you had a chance to see this report before? This was attached to Manitoba Hydro's rebuttal evidence?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: In this report, the last part of the paragraph, the last paragraph on page 2, indicates that the MGF report fails to identify reasons behind BBE's poor productivity performance.

Do you agree with that?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: We -- we have not identified the reasons behind the poor productivity.

We have taken the -- the actuals provided from BBE via Hydro into -- into consideration.

(BRIEF PAUSE)

MR. BOB PETERS: Mr. Chair, I'd suggest this is a good time today to adjourn. I was just a -- I just want talk about -- to Keeyask scheduling tomorrow, as well as some remaining risks, and then I wanted to shift over to Bipole III, and the transmission lines, and the converter stations. I'm expecting I can finish that within an hour in the morning.

And after I am complete, and subject to any re-examination, the public evidence would be finished, and we would be in a position to move right into the in camera session.

In terms of a direct presentation from the witnesses in camera, I'm expecting it would be approximately a third as long as it was today, but Mr. Haight might have a better time estimate than I.

MR. WILLIAM HAIGHT: I -- I think that's reasonable. Perhaps, even less than a third.

MR. BOB PETERS: And My Friend opposite, Ms. Van Iderstine, hasn't suggested a lot of time would be needed for Manitoba Hydro's view in camera. I don't know if that -- that view has changed. And she can speak for herself.

MS. HELGA VAN IDERSTINE: No, we're not anticipating a lengthy cross-examination. Probably -- much less than we -- I think -- I'm not sure how much we had anticipated. I say an hour. I'll be well --- I'll be down -- if -- if I'm a half hour I would be very surprised.

MR. BOB PETERS: All right. What you're hearing, Mr. Chairman, is an indication that I think the parties in this room would like to finish before the Board adjourns for lunch tomorrow, even if it means we slip a little bit into the lunch hour. But the promise, or the carrot, we can hold out as the afternoon would -- would be -- would be yours.

So until tomorrow morning at nine o'clock, I have no further questions.

THE CHAIRPERSON: I don't know what to do with all that freedom. Thank you, we'll adjourn till nine o'clock tomorrow morning.

(PANEL RETIRES)

--- Upon adjourning at 5:33 p.m.

Certified Correct,

____

Winnipeg, Manitoba R3C 0C4

Dear Mr. Christle:

RE: MANITOBA HYDRO 2017/18 & 2018/19 GENERAL RATE APPLICATION ("GRA") – REBUTTAL EVIDENCE ON THE MGF REPORT

Please find attached Manitoba Hydro's Rebuttal Evidence with respect to the written evidence of MGF Project Services Inc., on their report titled *Manitoba Hydro Capital Expenditure Review for the Keeyask Hydroelectric Dam, the Bipole III, Manitoba-Minnesota, and GNTL Transmission Lines*.

Manitoba Hydro is enclosing, for the public record, copies of its Rebuttal Evidence with confidential information redacted and with redaction codes inserted thereon. Manitoba Hydro Is also enclosing copies (on blue paper) of its Rebuttal Evidence with redactions removed, which copies Manitoba Hydro requests be received and held in confidence pursuant to Rule 13 of The Public Utilities Board Rules of Practice and Procedure.

If you have any questions or comments with respect to this submission, please contact the writer at 204-360-3946 or Odette Fernandes at 204-360-3633.

Yours truly,

MANITOBA HYDRO LEGAL SERVICES DIVISION

MANITOBA HYDRO PUBLIC UTILITIES BOARD

IN THE MATTER OF *The Crown Corporation Public Review and Accountability Act*

AND IN THE MATTER OF Manitoba Hydro's 2017/18 & 2018/19 General Rate Application

REBUTTAL EVIDENCE OF MANITOBA HYDRO

WITH RESPECT TO THE WRITTEN EVIDENCE OF:

MGF Project Services Inc., Independent Expert Consultant for the Public Utilities Board, on the Manitoba Hydro Capital Expenditure Review for the Keeyask Hydroelectric Dam, the Bipole III, Manitoba-Minnesota, and GNTL Transmission Lines

Manitoba Hydro

January 16, 2018

Table of Contents

In its 2017/18 & 2018/19 General Rate Application ("Application") filed on May 12, 2017, Manitoba Hydro provided a brief description of its Bipole III Reliability Project ("Bipole III"), its Keeyask Generating Station Project ("Keeyask"), and the U.S. Tie-Line Project made up of the Manitoba-Minnesota Transmission Project in Manitoba ("MMTP") and the Great Northern Transmission Line in Minnesota ("GNTL"). Included in those descriptions were the budget estimates in place as at that time, and the projected In-Service Dates for each as of May, 2017. The Application also made reference to the review of those projects by the Boston Consulting Group.

On December 8, 2017, Manitoba Hydro was provided with a copy of the Report from MGF Project Services Inc. ("MGF"), an entity retained by The Public Utilities Board of Manitoba ("PUB") to review Manitoba Hydro's capital expenditure program in relation to the above projects and to provide its opinion on Manitoba Hydro's updated costs for each. Manitoba Hydro has had the opportunity to review that report, to put forward its Information Requests, and to review the answers provided by MGF on or about January 5, 2018, to all of the Information Requests it received.

In order to provide background and context to the remarks made in the Report of MGF, and to fully respond to the opinions expressed therein, Manitoba Hydro has prepared separate rebuttal for each of Bipole III, Keeyask and MMTP. It was not felt necessary to provide rebuttal on GNTL and the Manitoba-Saskatchewan Transmission Project.

1. KEEYASK GENERATING STATION PROJECT

The Keeyask Generating Station is a 7 unit 695-megawatt hydroelectric generating station situated at Gull Rapids on the lower Nelson River in northern Manitoba. Keeyask will be the fourth largest generating station in Manitoba and the sixth generating station located on the Nelson River. The Keeyask Project is owned by a partnership between Manitoba Hydro and four Manitoba First Nations, known as the Keeyask Hydropower Limited Partnership ("KHLP"). Manitoba Hydro has been tasked with the responsibility of managing the construction of the Keeyask Project and the operation of the facility when it enters into service on behalf of the KHLP. Construction of the Keeyask Project consists of the construction of the generating station as well as construction of supporting infrastructure and the Keeyask Transmission Project which will transport the power produced at Keeyask onto the Manitoba Hydro system when the generating station enters into service.

MGF was retained on Keeyask to review and explain the increases in cost estimates and capital cost increases, as well as project cost overruns. It was to determine and assess the reasonableness of the updated forecast and to identify aspects of the updated cost estimate and schedule that are at risk. It was also to recommend risk mitigation strategies and, further, to review and make recommendations with respect to Manitoba Hydro's:

- practices on its pre-construction design and engineering work;
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling;
- its choice of contract types;
- geotechnical analysis; and
- the governance structure.

Manitoba Hydro staff received dozens of requests for information and data, and staff was fully transparent in sharing more than 1,900 documents including contracts, cost estimates, schedules and various other project management documents.

Key Manitoba Hydro project staff had more than two dozen meetings by phone and in person with MGF representatives and hundreds of emails were exchanged between the parties over the course of the review. MGF also met with senior staff from the General Civil Contractor BBE Hydro Constructors Ltd ("BBE"), and the project design engineer ("Hatch"). MGF personnel attended the Keeyask site on three separate site visits.

In MGF's *Report for Manitoba-Hydro Capital Expenditure Review for The Keeyask Hydroelectric Dam, The Bipole III, Manitoba-Minnesota and GNTL Transmission Line* report dated December 8, 2017 ("MGF's Report or the Report"), MGF and their sub-consultant Klohn Crippen Berger ("KCB"), provide a number of observations, findings, recommendations and conclusions related to Keeyask. Manitoba Hydro has grouped a majority of these items into three major themes which Manitoba Hydro will comment on in the subsequent sections of this rebuttal. The three major areas which Manitoba Hydro will address are as follows:

1) The contract model selected for the General Civil Contract ("GCC");
2) The people and the competency of the people managing the construction of the Keeyask Project; and
3) MGF's findings related to the forecasted cost and schedule of the Keeyask Project.

The key responses to those three major areas (detailed more fully below) are:

1) The contract model selected for the General Civil Contract;

- The GCC is being managed under a target price contract where the contractor is reimbursed for actual costs. The contractor is incentivized to perform and minimize cost and schedule as their profit and General Administration and Overhead are at risk if they exceed their target price. The contractor is also subject to liquidated damages for delays to the project schedule.
- The decision to proceed under the cost reimbursable target price contract model was made in 2012/2013 and was part of a larger Project Delivery Strategy for the Keeyask Project. This decision was informed by lessons learned on the recently completed Wuskwatim Generating Station Project and prevailing market conditions at the time.
- The North American major capital project market around the time of the GCC procurement was extremely competitive. Contract models that transferred additional risk to the contractor including fixed price and unit price would have been cost prohibitive as contractors were not willing to accept additional risk in a competitive environment.
- An extensive 24 month, three phase procurement process was undertaken to select a General Civil Contractor. BBE was the selected contractor as they were determined to be the best value contractor based on the evaluated criteria.

2) The people and the competency of the people managing the construction of the Keeyask Project.

- The Manitoba Hydro team delivering the Keeyask Project is comprised of project management and construction management professionals with experience in managing some of the largest construction projects in Manitoba over the past decade.
- Manitoba Hydro has contracted BBE as the GCC to serve as Construction Manager for General Civil scope of work. Manitoba Hydro taking over the role of Construction Manager as implied by MGF throughout their report would expose Manitoba Hydro to additional risk and claims from the contractor.
- From the start of construction, Manitoba Hydro has continually attempted to undertake actions to progress the work while not crossing the line of explicitly directing the means and methods of the contractor. Crossing this line will expose Manitoba Hydro to interference claims from the contractor and increase the level of risk assumed by Manitoba Hydro.

3) MGF's findings related to the forecasted cost and schedule of the Keeyask Project.

- MGF does not provide data to support its conclusion that the expected cost of Keeyask will be \$9.5 B to \$10.5 B. Manitoba Hydro and the PUB submitted Information Requests to MGF requesting the details underpinning these calculations; however, MGF failed to provide the requested backup.
- Without the backup to substantiate MGF's claims, Manitoba Hydro reviewed the data in an attempt to understand how MGF arrived at their conclusions. From the information available, it is Manitoba Hydro's opinion that MGF has likely overstated the range of potential costs as they incorrectly applied General Administration and Overhead and indirect costs to their estimated cost overruns.
- MGF's forecasting methods are overly simplistic and do not consider the efforts undertaken by Manitoba Hydro and BBE to reduce cost and schedule outcomes.

1.1. The General Civil Contract, Contracting Strategy, and Selection of the Contractor.

<u>GCC Contracting Strategy:</u>

<u>MGF Report:</u>

Section 1 - Executive Summary, page 1

Scope Item 5: Finding # 1 page 50; Finding # 5 and 6 page 56; Finding # 12 page 62

Scope Item 9: Finding #10 page 80
Section 8 – Conclusion, page 161

<u>KCB Report:</u>
Section 5 page 33 – 35
Section 7 Pages 39 -40

Recognizing that the GCC was the largest and most important contract on Keeyask, in 2012 Manitoba Hydro developed and executed a detailed project delivery strategy which included a procurement strategy for the General Civil Contractor. The project delivery strategy was provided to Knight Piésold ("KP") (the independent expert consultant retained by the PUB) during the Need for and Alternatives To ("NFAT") review in 2014 and more recently to MGF in July 2017 during the current review of the Keeyask Project. On Executive Summary page II of IV of Knight Piésold Independent Expert Consultant Report Rev.1 dated January 23, 2014, in reference to construction management, schedule and contracting plans, KP stated that:

> *"The overall approach follows well documented internal standards developed by Hydro's NGCD. The contracting method varies by project component but the principal civil works contracting strategy is an Early Contractor Involvement (ECI) Project Delivery Strategy. Overall the project delivery strategy has been to transfer risk away from Contractors and to Hydro in order to better understand and share the risks and obtain a better contract price as a result."*

Manitoba Hydro's selection of a contracting strategy was informed by a number of factors including, but not limited to, the following:

- Market conditions that influence the availability of major contractors willing to bid on the work;
- Allocation of risk to the party best suited to manage the project's most significant risks;
- The project schedule;
- Completeness of engineering at the time of tender;
- Lessons learned from past projects including Wuskwatim and Pointe du Bois; and

- Internal expertise and resource availability. Manitoba Hydro evaluated its internal expertise, resource availability and corporate structure as part of its analysis of an appropriate contracting strategy. It was recognized that although Manitoba Hydro had significant and expert resources required to function as the overall project and site manager, it lacked the experience necessary to manage the day-to-day activities typically performed by the general civil contractor. To perform this role would require significant changes and the addition of considerable construction and support staff to Manitoba Hydro's organization.

KCB states:

> *"While we were not part of the process that selected the contracting model, we surmise that MH either had success with this model elsewhere, or there were significant reasons to push the project into construction quickly relying on the early contractor involvement, the expectations of a quality design from Hatch and an experienced contractor with a realistic target price to make the project a success."* (Page 39)

KCB is correct in its assumption that Manitoba Hydro was applying lessons learned from previous major capital projects that it had managed, including the recently completed Wuskwatim Generating Station and Pointe du Bois Spillway Replacement Project. It is not accurate in its assumption that the contract was impacted by any desire or need to push the project into construction quickly.

The lessons learned by Manitoba Hydro that led to its selection of the cost reimbursable target price contract for the GCC are explained below. Lessons learned from past projects were also previously discussed at a high level during the NFAT in 2014 hearings as well as during the 2015/16 and 2016/17 General Rate Application (Manitoba Hydro Exhibit #104 – Undertaking #44).

> *"Manitoba Hydro originally tendered the General Civil Contract for the Wuskwatim Generating Station in 2007 as a unit price contract using the design, bid, build model. This resulted in receiving only one bid from the market with a price nearly double the Engineer's Estimate and well beyond the expected value*

of the work. After suffering schedule delay because of the lack of reasonable bids, the work was re-tendered and four competitive proposals were received with a cost-reimbursable, target price contract awarded to the successful proponent in November 2008.

Based on the Wuskwatim Project experience, Manitoba Hydro also chose to include the river management, rock excavation, and electrical/mechanical scope into the Keeyask GCC to reduce the interface risk between contractors otherwise held by Manitoba Hydro. The rock excavation and electrical/mechanical work were packaged as separate contracts on the Wuskwatim Project leading to many challenges in interface management between the various contractors. On Keeyask, this work is bundled together within the GCC's scope.

At the time when Manitoba Hydro was developing the contracting strategy for the GCC, potash was increasing in demand, oil prices were more than $100/barrel and any available forecasts anticipated continued price increases. As a result, there was a boom in the major capital project market in North America, particularly in the energy industry including the Northern Alberta oilfields as well as many oil and natural gas projects within the Bakken Formation underlying portions of Saskatchewan, Montana and North Dakota and the Muskrat Falls project in Labrador, which resulted in increased competition for skilled labour (See for example http://publications.gov.sk.ca/documents/310/81353-2014-MPI.pdf). In this 'hot' construction market, many of the major contractors had already committed experienced personnel and resources to the other projects and were not as hungry for opportunity. In this type of economic environment, Manitoba Hydro's experience was that contractors were also not as willing to accept risk in a job and their pricing reflects this reality. Economic conditions were similar for the procurement phase of Keeyask as they were for procurement during Wuskwatim when the original General Civil Contract was unsuccessfully tendered as a unit priced contract and then re-tendered competitively as a cost reimbursable target priced contract.

> *Labour productivity (amount of hours per unit of work) has been one of, if not the largest risk for contractors since the early 2000's across Canada, particularly in remote, fly-in fly-out operations such as Keeyask. As was learned on Wuskwatim, this caused contractors to avoid or submit extremely high bids for any contract that transferred this risk to them (such as fixed cost or unit price contracts). For Canadian hydro, the absence of large scale projects from 1990 to the mid-2000's magnified the productivity issue creating a skilled labour shortage across the country and a shortage of qualified supervision. Manitoba Hydro was well aware that many contractors were wary to provide competitive estimates for hydro work."*

In 2012, Manitoba Hydro selected a cost-reimbursable target price model with Early Contractor Involvement ("ECI") that balances project risk between two parties. If the contractor completes the work under the target price, they earn profit plus a share of the savings. However, if the contractor exceeds the target price, they forfeit a substantial portion of their profit for every dollar of overrun, up to the value of their total profit amount. A contractor will not go bankrupt on the job, but they are at risk of not earning any profit if they exceed the target price by a certain threshold. No return (i.e. profit) on a 5+ year investment of resources by a major contractor is not what shareholders want to see and thus the contractor is incentivized and motivated to perform.

A fixed price model was considered but would have necessitated a contractor bidding higher to factor in risks over which they have no control (e.g. geological conditions, interest rates, commodity price escalations over the duration of the work, labour skill and availability, etc.). This would have raised the initial cost of the project and limited the number of parties interested in proposing on Keeyask, thus driving up the project cost.

Another reason the target price model was chosen was because it allowed for an opportunity to leverage ECI. As the final design engineering was not yet complete, there was an opportunity to engage a contractor early to help influence the design from a constructability standpoint. Engaging a contractor earlier also allowed the contractor more lead time to establish project process and work plans, understand the labour agreement and understand the local labour and supplier market.

Manitoba Hydro also had experience with the target price model having recently completed Wuskwatim in 2012 ($1.4B) and Point du Bois in 2014 ($0.6B).

KPMG, a consultant experienced in the management of major capital projects, was engaged by Manitoba Hydro in May 2016 to undertake an independent review of the current status of Keeyask. KPMG subsequently provided advice on the development and implementation of a Recovery Plan for Keeyask and has provided project management support since that time for the Manitoba Hydro project delivery team. Manitoba Hydro requested KPMG to provide commentary on the following three topics:

1. Provide commentary on the contract model and any incentives included.
2. Define Manitoba Hydro's role in the GCC contract. Define the role of the Contractor and comment on Manitoba Hydro's ability to manage the Contractor in this role.
3. Provide commentary on Manitoba Hydro acting as the builder and taking on a Construction Management role.

KPMG's response to these items is attached as Keeyask – Appendix A. In terms of contract type, KPMG's response indicates the incentives used in this contract have been used in other cost reimbursable contracts as well as other forms of contracts. The incentives align the owner's and contractor's interests and help to mitigate the exposure the owner has to poor performance by the contractor.

General Civil Contract Procurement:

MGF Report – Scope Item 5: Finding #12, page 62
KCB Report – Section 5: page 33

Manitoba Hydro undertook an extensive three phase procurement process for the GCC beginning in 2012. This included a six month market-sounding exercise where 21 major international contractors were contacted to determine their level of interest in the

Keeyask Project. This process served as a marketing effort to generate interest for Keeyask in the marketplace with the intent of maximizing the number of capable contractors responding to the Request for Pre-Qualification to obtain competitive pricing. This process also served to inform Manitoba Hydro on the factors that were of interest to the potential contractors. Feedback on contracting models was also solicited from these organizations. Many of these experienced companies indicated they would not bid on a project the size and remoteness of Keeyask on a fixed price model due to the risks involved.

The second phase of procurement was the prequalification phase. Seven contractors submitted proposals in response to Manitoba Hydro's call for submissions. The contractor submissions were evaluated on 17 different criteria including demonstrated experience in remote, arctic heavy civil construction projects with an emphasis on concrete, earthworks and river management. Other factors that were considered in the evaluation included schedule, risk mitigation and safety. Four contractors that Manitoba Hydro believed were capable of building the work were pre-qualified and were provided the opportunity to bid on the Keeyask General Civil Works Contract in a competitive, cost-based evaluation.

The proposal stage was the third and final step in the procurement process. Manitoba Hydro engaged a third party ("Chant Construction") to provide their estimated price for the work as an additional pricing comparator (in addition to Manitoba Hydro's Engineer's Estimate). The pricing proposed by Chant Construction was generally in line with the Engineer's Estimate and was within the range of bids received from the four Proponents. A summary of the pricing information from the GCC proposals was provided in confidence to MGF as part of their review, and to the PUB and its independent expert KP during the NFAT hearings as exhibit NFAT CSI Manitoba Hydro-3.

As part of the evaluation of the contractors' proposals, Manitoba Hydro evaluated the initial target price proposed by the contractors based upon a number of pre-defined factors that were valued by Manitoba Hydro including potential schedule advancements, size of workforce against available camp capacity, and quantity change sensitivities to ensure that the contractor who provided the best value was selected.

The bids were also compared against one another and against the estimate provided by Chant Construction for reasonableness. After nearly a two year procurement process to conduct the market sounding, prequalify capable proponents and evaluate proposals to select the best value for Manitoba Hydro, the General Civil Works Contract was awarded to BBE, a limited partnership between Bechtel Canada Co., Barnard Construction of Canada Ltd. and EllisDon Civil Ltd. in March 2014.

Throughout its report, MGF is critical of the form of contract selected for the GCC. On page 80, MGF states:

> *"The GCC Contract strategy of adopting a cost reimbursable commercial arrangement for this project was flawed from the outset, with a predictable outcome, i.e. it promotes and rewards inefficient work and doesn't encourage efficient work."*

MGF fails to identify and understand the factors that led to Manitoba Hydro proceeding with the selected form of contract for the GCC. MGF's comment also does not address the target price aspect of the contract that puts the contractor's profit and General Administration & Overhead ("GA&O") at risk. The opportunity for profit and maintaining the GA&O incentivizes the contractor to attempt to meet or beat its target price. Manitoba Hydro provided MGF with the procurement documents for the GCC, evaluation matrix and criteria, related recommendations and presentations to the Manitoba Hydro Electric Board, the awarded contract with BBE and all seven amending agreements. These documents provide the rationale for selecting BBE as the GCC and clearly articulate the incentives that are intended to motivate contractor performance.

The Keeyask Project standards and procedures referenced on pages 50 – 53 of the MGF report were used to support the development of the contracting strategy and throughout the procurement process for the GCC. On page 53 of the report, MGF states that *"the standards, procedures and processes supporting Contracting Strategy, Contractor Prequalification, Individual Contract Plans and Tender, Evaluate, Negotiate and Award are sufficient and well documented."*

The contracting strategy, the GCC contract documents and a summary of proposal was reviewed with KP as part of the NFAT process. KP did not raise any significant concerns with the contracting strategy at the time of their review and the benefits and risks of the contract model were understood and communicated during the NFAT hearings.

It is not clear to Manitoba Hydro whether MGF and KCB were aware of the information provided to the PUB during the NFAT, or of the NFAT conclusions. As seen below, Manitoba Hydro addressed the contracting strategy with the PUB's independent expert in the NFAT process and the PUB's decision reflects that this, along with the risks, were discussed and reviewed.

On page 132 of the PUB's final NFAT report dated June 20, 2014, section 7.6.0 Conclusions of the Panel, the PUB stated the following regarding the Keeyask Project:

> *"The actual construction cost of Keeyask will increase beyond Manitoba Hydro's currently projected capital cost of $6.5 billion. Budgeting at least for Manitoba Hydro's "high" estimate of $7.2 billion would be prudent. This conclusion is not reached as a result of the history of past capital cost increases. The Panel accepts Manitoba Hydro's argument that the past is not necessarily a predictor of the future. Rather, the Panel bases its conclusion on its review of the Keeyask general civil contract, which is a cost-reimbursable contract that leaves a significant portion of cost risk with Manitoba Hydro. It would be a fallacy to assume that the contract provides anywhere near the same level of cost certainty as a fixed-price contract, which would be more expensive. This is not a criticism of the Keeyask general civil contract or Manitoba Hydro's approach to contracting. The Panel is satisfied that Manitoba Hydro's approach to developing and negotiating the contract, as well as its approach to managing risk, has been appropriate to date. Rather, it reflects the general nature of a large infrastructure project with inherent risks that can be mitigated, but not avoided."*

1.2. The People and the Competency of the People Managing the Construction of the Keeyask Project

MGF Report: Section 1 – Executive Summary, page 1

On page 1 of MGF's report, MGF states that:

> *"There is an opportunity for Manitoba Hydro to implement contract management improvements, take ownership for the GCC and drive the GCC contractor to higher levels of predictable performance, to accelerate project schedule and to lower the likely forecast cost at completion".*

MGF goes on to say that:

> *"Manitoba Hydro staff are competent and professional but they are not a construction manager with the experience and skills to direct the GCC. As such, its project management and control effectiveness is low."*

MGF makes these assertions without describing the skills and experience of Manitoba's senior team managing Keeyask, the roles and responsibilities under the General Civil Works contract, or even the actions that Manitoba Hydro has taken to improve outcomes from this contract. As MGF has failed to address these points in its report, the following section describes Keeyask's governance structure, an assessment of skills and experience of Manitoba Hydro's senior project team from a third party and a description of some of the key actions Manitoba Hydro has taken to enhance performance.

Governance:

Manitoba Hydro is experienced in the execution of major capital projects having delivered some of the largest capital projects in Manitoba over the last 10+ years.

In early 2016, Manitoba Hydro established the Major Projects Executive Committee ("MPEC") which is chaired by Manitoba Hydro's President & CEO and consists of five Vice Presidents who have accountability over the areas of the company responsible for the execution of major capital projects. MPEC is an executive management forum that provides oversight, direction and executive/strategic decision making with respect to major capital projects (i.e. Keeyask, Bipole III, MMTP and the GNTL Project in Minnesota). MPEC meets every two weeks or as required.

The Manitoba Hydro executive team is ultimately accountable to the Manitoba Hydro-Electric Board ("MHEB"). Periodically (and conforming to the corporate approval authority levels), major project decisions are reviewed and approved by the MHEB. The Keeyask Project team also provides project update reports and presentations to the MHEB on a regular basis. Site visits by both the Manitoba Hydro executive team and MHEB members have taken place.

As Keeyask Project is owned by the KHLP, there are additional accountabilities beyond the Manitoba Hydro organization structure. The Keeyask Project team is also accountable to the KHLP Board that is comprised of representatives from each of the four Keeyask Cree Nation ("KCN") Partner Communities and Manitoba Hydro. The KHLP Board is chaired by the Manitoba Hydro Vice President of Generation and Wholesale. The Keeyask Project team provides monthly update reports to the KHLP, as well as makes quarterly update presentations at the Board meetings.

The Keeyask Project team is comprised of project management and construction professionals with significant experience in the execution of major capital projects. As stated, Manitoba Hydro requested that KPMG review and comment on the experience of Manitoba Hydro's senior leadership team responsible for delivering Keeyask, and those comments are also found in Keeyask – Appendix A.

<u>Management of the General Civil Contract:</u>

MGF Report: Section 1: Executive Summary – page 1.

On page 1 of their report, MGF states that Manitoba Hydro's *"project management and control effectiveness is low".* MGF does not recognize the efforts of the Manitoba Hydro team in helping to manage the GCC.

Manitoba Hydro has been pushing, and will continue to aggressively push, the General Civil Contractor to perform. To be successful, this will require that Manitoba Hydro and BBE work together. After the award of the GCC in March 2014, work commenced on July 16, 2014 following receipt of all required regulatory approvals. Work by the GCC for the remainder of 2014 and all of 2015 was focused on establishing infrastructure including temporary buildings, haul roads, rock quarries as well as temporary river management structures (cofferdams) to control the flow of the Nelson River. These cofferdams allowed for the areas to be dewatered and rock excavated to allow for the construction of the permanent structures. In early January 2016, work on the North

Dyke commenced representing the milestone of the first permanent earthworks on the project.

At the beginning of the 2016 construction season, the project was generally on track and the project team was forecasting that the control budget and schedule of $6.5B and November 2019 unit 1 ISD (established during the NFAT hearings) would be achieved.

Manitoba Hydro reported to the PUB on March 2016 that the project was on schedule and on budget. Manitoba continued to actively monitor the progress of the GCC through the beginning of the construction season as it has throughout the project. Concrete work on the principle structures (Spillway, Intake, Powerhouse, Service Bay and Tailrace) began in early May 2016.

<u>2016 Issues:</u>

In early June 2016, approximately 6 weeks into concrete activities it was evident that the contractor's actual volume of concrete completed to date was significantly less than the contractor's plan. On June 19, 2016, Manitoba Hydro formally requested that the Contractor develop a recovery plan to increase their manpower ramp-up and concrete production in order to bring their production back in line with the 2016 plan. Manitoba Hydro staff continued to monitor the progress carefully during this time.

By July 2016, it was apparent that that the initial recovery efforts by the contractor were not going to be impactful enough to recover to the original plan. As well, both the GCC and Manitoba Hydro were becoming aware that the work could not be built as it was originally planned. As work continued to progress, the need for a new execution plan crystallized and required the team to understand the issues and problems and address them going forward. This led to the Recovery Plan described below.

By the end of the 2016 construction season, concrete placement was at 41% complete of the original plan for the year while earthworks were at 65% complete of the original plan. The concrete plan was to complete nearly 200,000 cubic metres of the 360,000 cubic metres required for Keeyask in the first year, while only 77,000 cubic metres were completed in the first year of concrete (2016). The production rates accomplished during the first concrete construction season saw the project schedule rapidly change from having a potential 6-month advancement opportunity at the start of the year shift to a potential of up to 2+ year delay by the end of the year. At this time it was also apparent that the $304M Labour Management Reserve in the $6.5B control budget to help offset productivity risk would not be sufficient. The large variance between actual and planned production also resulted in the Contractor having no opportunity to earn profit for the remainder of the project under the existing contract structure. This was already making for disengagement and the risk of worsening performance could occur for the remainder of the project if not addressed.

Recovery Plan:

Manitoba Hydro could not wait until the end of the 2016 construction season to begin to address the issues and plot a new path forward. Manitoba Hydro, with the assistance of industry experts KPMG, developed a Recovery Plan in September 2016 that covered both short and long term issues. The Recovery Plan incorporated a number of key features required to address the trajectory of the Project in order to achieve successful completion. The Recovery Plan needed to improve production and remove inefficiencies, and included:

- The development of a plan for the continuation of concrete through the winter months (previously not included in the original schedule);
- Identification of root causes of performance issues;
- Engagement of senior leadership, Executive Sponsors and CEOs;
- Development of refined processes, systems and tool based upon the findings of the root cause analysis;
- Implementation of a change management program to enable a culture shift within the project team;
- Initialization of activities to reforecast the cost and schedule for the project;
- Analysis of the Contractor’s claims; and
- Supplementing of the commercial expertise of the Manitoba Hydro team.

Manitoba Hydro and BBE assessed the underlying causes of the challenges experienced to date. The main contributing factors to the underperformance included:

- Unachievable labor productivity rates in the current market which were contained within the contractor’s bid;
- Slower than planned progress in ramping-up the on-site labour force in preparation for the concrete works beginning in 2016. This ramp up required a doubling of the labour force of roughly 1,000 workers to 2,000 workers in a period of roughly three months.

- Geotechnical and geological conditions different than anticipated based upon the extensive pre-construction geotechnical testing, resulting in additional effort to "get off the rock" to allow for construction of the concrete and earthworks structures off of the bedrock.

As part of the Recovery Plan, Manitoba Hydro, leveraging support from third party experts, including KPMG (Recovery Plan support), Revay (claims valuation and management), Borden Ladner Gervais LLP (legal support) and Validation Estimating (contingency development) undertook a thorough process to evaluate alternatives for, and impacts, to the GCC. The review demonstrated that the best course of action was to amend the existing contract with BBE, specifically to lower the overall cost and schedule risk for Manitoba Hydro and permit BBE an opportunity to re-establish a reasonable profit level. All other alternatives introduced significant additional risks to the Project as well as guaranteed impacts to cost and schedule that were greater than the selected alternative of amending the contract with BBE.

General Civil Works Contract Amendment:

In early 2017, Manitoba Hydro and BBE were able to achieve the mutual agreement that was required to amend the contract. The negotiation required 'gives and takes' from both parties and the outcome was a contract that lowered the overall cost and schedule risk for Manitoba Hydro and allowed the Contractor an opportunity to re-establish a reasonable profit level if they are able to perform relative to their revised target price. This aligned the interests of both parties to deliver a "Best for Project" approach.

The details of the amendment to the contract are formalized in Amending Agreement #7 between Manitoba Hydro and BBE. Amending Agreement #7, in addition to all previous versions of the agreement between Manitoba Hydro and BBE were provided to MGF in support of their review. The key features of the amendment include:

- Cost and schedule incentives providing motivation for BBE to earn profit by delivering the work to Manitoba Hydro with minimum cost and best schedule;
- Outstanding contractor claims were reconciled;
- GA&O mark-up was capped at target price;
- Narrowed ability for future claims;
- New liquidated damages provisions were established for late delivery;
- Productivity rates in line with 2016 actual performance used to inform the estimate of remaining costs on this contract.

Both MGF (MGF Report page 80) and KCB (KCB Report page 34-35) are critical of the contract model for the GCC. In Keeyask-Appendix A, KPMG describes the original and the amended contract for the GCC. KPMG describes the challenges inherent in attempting to renegotiate a contract in a non-competitive environment on page 2 of their submission:

> *"The amended contract continues to be a Target Price Cost Reimbursable contract, fundamentally the same as the original contract. The ability to transfer additional risk, such as geotechnical, hydrology, labour, extreme weather, and northern logistics to BBE by changing the contract to a Unit Rate or Lump Sum contract, would have required directly negotiating a new form of contract with BBE in a non-competitive environment or descoping/terminating BBE and going back to the market for a Unit Rate contract. It was expected that in a non-competitive environment and given BBE's performance in 2016, the costs of transferring this risk to BBE would have been prohibitive and/or not achievable."*

<u>New Control Budget and Schedule Established:</u>

With the General Civil Works Contract amended, further efforts were required to re-establish a new control budget and schedule for Keeyask. Manitoba Hydro reviewed the impact of the delay, along with known trends for the impacted work packages. The outcome of the review process was a revised control budget of $8.7B with a P50 contingency and a first unit in service date ("ISD") of August 2021. The revised control budget and schedule was formally approved by the MHEB in February 2017. The following table from PUB/MH MFR-122 highlights the major changes between the control budget established at the NFAT in 2014 and the revised control budget:

Figure 1.0

Keeyask Budget Summary (in Billions $)				
Item #	**Item**	**Previously Approved Budget (2014$)**	**Current Approved Budget(2016$)**	**Variance**
1.1	Generating Station	4.046	5.948	1.902
1.2	Generation Outlet Transmission (GOT)	0.164	0.202	0.038
1.3	Escalation @ CPI	0.244	0.249	0.005
1.4	Interest (including Interest on Equity)	1.343	1.749	0.406
1.5	Contingency	0.307	0.578	0.271
1.6	Labour Management Reserve	0.304	0.000	-0.304
1.7	Escalation Management Reserve	0.088	0.000	-0.088
1.8	**Total**	**6.496 B**	**8.726**	**2.230**
1.9	First in-service Date	Nov-2019	Aug-2021	21 months.

2017 Performance:

The 2017 construction season saw improved performance over the 2016 season with approximately 12% more concrete placed in 2017. This improvement is significant as the work done in 2017 was more complex, specifically, most of the placements in 2017 were generally smaller, required more formwork and were greater complexity pours (such as draft tubes) and concrete at height (head blocks and piers).

For the earthworks, productivity rates improved by 15% and the total of material placed in permanent structures in 2017 was 1.03 M cubic metres, an improvement of roughly 90%.

Contributing factors that influenced performance in 2017 included:

- Improved contractor leadership/management and their ability to plan and manage the work;
- More complex and better developed sequencing of concrete work and interfaces with earthworks;
- Learning curve to perform "first" work on the concrete in the Intake, Powerhouse and Service Bay;
- Challenges with the craft labour including maximizing work time at the work front.

Despite the improvements over 2016 described above, the target quantities for concrete and earthworks were not fully achieved. By the end of the 2017 construction season, while the Contractor had achieved considerably more concrete and earthworks volume than the previous year, concrete was approximately 20% less than planned and earthworks was 25% less than planned. Despite these shortfalls in volume, the key milestones for the year were achieved allowing the Keeyask project to remain on schedule. Achieving the following major milestones in 2017 ensures that the project will be delivered within the shortest duration schedule possible and protect the opportunity for schedule advancement of the unit 1 ISD:

- Completion of the Spillway concrete and handoff of the Spillway to the Gates, Guides and Hoists Contractor (Canmec) on November 15, 2017 (on schedule);
- Installation of the Powerhouse Cranes in the Service Bay in November (on schedule);
- Enclosure of Powerhouse Units 1 and Service Bay completed by December 31, 2017 (on schedule);
- Enclosure of Powerhouse Units 2-3 by February 2018 is on track to allow for the start of turbine and generator work;
- Significant progress on earth structures (dams and dyke) such that Keeyask is on track to divert the river through the Spillway in July/August 2018

As a consequence of the above milestones being met the project is still on track to be completed on or below the revised budget with the first turbine coming in service in or before August 2021.

<u>Management of the GCC:</u>

MGF Report – Section 1: Executive Summary, page 1

It was suggested by MGF on page 1 of their report that "*There is an opportunity for Manitoba Hydro to implement contract management improvements, take ownership for the GCC and drive the GCC contractor to higher levels of predictable performance, to accelerate project schedule and to lower the likely forecast cost at completion*". This statement appears to suggest that MGF is recommending that Manitoba Hydro should take over the role of Construction Manager from BBE. MGF goes on to soften this recommendation in MH/MGF I-2j and state that "*the recommendation is not for*

Manitoba Hydro to become the construction manager and replace BBE, but for Manitoba Hydro to exert more control and hold BBE accountable for its performance."

Manitoba Hydro is not a general contractor, nor does it have on hand the necessary personnel to manage and build Keeyask as the general contractor. If it were to undertake some or all of this task as recommended by MGF, it would have to retain significantly more staff with sufficient experience and expertise to take on the work without any delays. Such personnel are not readily available and, as outlined in more detail in Appendix A, there would be risk to the schedule because of the time it would take to find the personnel, to give them time to get up to speed on the project, and to develop a team to surround themselves with whom they would have confidence. As stated by experts KPMG and Hatch, this would simply introduce more risk to the project at this stage.

Hatch has been involved in Keeyask as the detailed design engineer and as an organization, has considerable experience in the delivery of major capital projects. Hatch was asked to provide commentary around expanding Manitoba Hydro's role with the GCC, as recommended by MGF. Hatch's response can be found in Keeyask - Appendix B, and like the response from KPMG, Hatch did not recommend such action.

According to Hatch (page 3 of Keeyask - Appendix B), Manitoba Hydro taking a greater role in the construction is of equal or greater risk to the project than the status quo. Hiring a Construction Management team to manage the construction on behalf of Manitoba Hydro would also carry risk until proven. Some of the risks identified in the Hatch review that informed their opinion include:

- Lack of availability of qualified professionals required to staff an entire team;
- Time to recruit, hire and mobilize a team;
- The new team would have a steep learning curve which would add risk to the successful execution of the project;
- Manitoba Hydro would lose leverage within the BBE contract.

BBE was hired by Manitoba Hydro as the Construction Manager to complete the General Civil Works scope. Keeyask – Appendix A provided by KPMG defines Manitoba Hydro's role in the GCC contract and provides commentary on the expected implications of Manitoba Hydro acting, instead, as the builder and taking on a Construction Management role, rather than acting in its capacity as owner.

MGF states on page 1 that Manitoba Hydro is "*not a construction manager with the experience and skills to direct the GCC"*. However it fails to address the activities Manitoba Hydro has undertaken to progress the work, without crossing the line of explicitly directing the means and methods of the Contractor, and without exposing Manitoba Hydro to interference claims. If Manitoba Hydro did step into the role of Construction Manager, it would be likely that the Contractor could claim for their entire performance bonus(es) regardless of the final cost and in-service date of the project. This would also inhibit ownership/accountability of the Contractor to perform.

KPMG was asked to provide commentary on Manitoba Hydro acting as the builder and taking on the Construction Management role. KPMG has indicated that they are unaware of any Canadian public sector owner with the skill-set required to directly manage a multi-billion dollar construction project (Keeyask – Appendix A).

In an attempt to better understand MGF's perspective, Manitoba Hydro requested additional information related to this conclusion in MH/MGF I–2. Specifically, Manitoba Hydro was interested in understanding if other owners/utilities have successfully taken ownership in the middle of a major capital project and the outcomes of those interventions. Manitoba Hydro was also interested in the Corporation's exposure to risks arising from undertaking such a change however MGF did not provide a response to MH/MGF I–2 that provided an answer to these questions. Manitoba Hydro posed this question to KPMG and requested their professional assessment. This information can be found in Keeyask – Appendix A. Hatch also provided commentary on the potential liabilities associated with taking over the role of Construction Manager in Keeyask - Appendix B.

Throughout 2017, Manitoba Hydro has increased the pressure on the Contractor to perform, and to have its workers become more productive. Some of these areas include:

- Contractor's management of the trades;
- Travel logistics for the contractor's workforce;
- Site wide respectful workplace campaign;
- Contractor's revised organizational structure and increased supervision capacity and experience;

- The development of an effective monitoring and control system to provide daily feedback to contractor workforce;
- Combining and streamlining BBE's and Manitoba Hydro's quality control and assurance teams and processes;
- Establishment of single mission and team ethics for the Manitoba Hydro and BBE teams.

Manitoba Hydro has also been leading efforts to gain efficiencies, improve methods/processes and achieve cost and schedule savings. A few examples of key initiatives where Manitoba Hydro spearheaded efforts that led to significant cost and/or schedule benefits:

- The decision to procure a new draft tube formwork system to utilize on the remaining 5 units. This decision shortened the schedule to install the bottom portion of the draft tube and improved cost performance.
- The decision to utilize column extenders in the Powerhouse and Intake allowed for structural steel to be installed at lower elevations. This provided an opportunity to enclose the Powerhouse and Service Bay earlier. A schedule savings of over 1 year resulted.
- Advancement of the south dyke in 2018 and supporting design changes. This will allow for additional quantities to be placed during the winter 2018 and reduce risk to the project schedule.

<u>2018 Plan:</u>

In 2018, a 10% increase in performance by the GCC is required to meet control budget ($8.7B) and achieve IDS's for the units that are in advance of the control schedule of August 2021. This also assumes that no significant risks materialize with other contracts or risks that could impact the critical path. Manitoba Hydro is confident that this rate of improvement is attainable as the year-over-year improvement between 2016 and 2017 was similar. In addition, much of the remaining concrete work in 2018 is similar to the work completed over the previous year and lessons learned over the last year and the inherent repeatability of seven nearly identical units is expected to improve productivity. Manitoba Hydro and BBE are currently working on their planning for 2018. Some of the key initiatives in 2018 include:

- 2018 winter work (placement of additional concrete over the 2018 winter months);
- Building a high performance culture at site;

- Cold eyes review;
- Manitoba Hydro and BBE leads identifying efficiencies and improvement;
- Improved management of indirects;
- Productivity studies and planning.

Third Party Reviews and Involvement:

Continuous improvement is ingrained in the culture of the Keeyask team but can always be improved. Prior to, and during the construction of Keeyask, external experts have been engaged to support and, in some cases, augment the skills of the existing project team. The project recognizes that the decision to manage the project using a team with strong internal expertise and knowledge brings both benefits and risks. To reduce the risk of an internal-only perspective, external expertise from across the utility and construction industries was retained and reviews were completed in the areas noted below. In addition, a handful of experts/consultants are used on a regular basis to support the project. Key reviews and supports external to Hydro alone include:

Figure 1.1

Third Party	Scope	Date
KPMG	KPMG was engaged due to their industry expertise in the areas of project management and contract administration to assess the health of the Keeyask Project. KPMG has since been regularly involved in helping to augment Manitoba Hydro's project management expertise.	2016 - current
Boston Consulting Group	In spring 2016, the Manitoba Hydro Electric Board retained Boston Consulting Group (BCG) to among other things, undertake a review of the Keeyask Project. The report of BCG's findings was released in September 2016.	2016
BBE/MH Cold Eyes Review	BBE & MH jointly carried out a review of BBE's operations on April 25 – 28, 2016. Teams consisted of 3 individuals from Bechtel and 3 individuals from MH (2 of which are Hydro-X and 1 construction management expert consultant). The purpose was to review BBE's operations and to ensure readiness of site project team for the upcoming first season of concrete.	2016
KPMG	In early 2016, KPMG carried out an independent review of the catering contract and the Keeyask Project Safety Management Plan. The purpose of the catering review was to ensure quality of service is sustained and to develop strategies to provide this level of service at the least cost. The purpose of the safety review was to ensure the Keeyask Project Safety Management Plan was	2016

	focused on the right things to achieve our safety goals with all contractors.	
Hatch	Quality Management support for Hatch's quality lead from the Mississauga office supports the project through the preparation of key Quality Program documents and the review of quality initiatives for the project. This support is especially strategic at this time given work underway to reset BBE's focus on its strategy for meeting quality requirements for the GCC.	2015 - current
Nalcor and BC Hydro	On-going informal dialog is taking place with Nalcor's Lower Churchill Project team and BC Hydro's Site C team to exchange ideas and lessons learned. Muskrat Falls is about one year ahead of the Keeyask schedule and their 824 MW project is similar to Keeyask's scope.	2015 - current
Validation Estimating	John Hollman of Validation Estimating is retained for assistance in the development of the project control budget, contingency pool, and management reserves. The risk profile for the project is reviewed at regular intervals in comparison to projects of similar size and complexity.	2012 - current
Hatch	A panel of Hatch senior engineers/managers from outside the Keeyask Project was retained to conduct a "cold eyes" review of the management of the engineering in an effort to identify gaps in the scope and quality of the engineering design, and ability to deliver the required product.	2014/2015
Knight Piésold	Knight Piésold (KP), the independent expert consultant retained by the PUB during the NFAT process in 2013/2014 reviewed project processes, the estimate, and contingency, KP was generally satisfied with these practices and methodologies stating that they were consistent with industry best practices.	2013/2014

1.3. MGF's Findings Related to the Forecasted Cost and Schedule of the Keeyask Project

MGF Report: Scope Item 5 – Finding #13, pages 63 – 64

In its report, MGF states that the expected cost of Keeyask will be \$9.5 B to \$10.5 B (MGF report page 63 & 64). However, MGF did not provide or substantiate how it arrived at these values. Manitoba Hydro (MH/MGF I-26), as well as the PUB (PUB/MGF–14), requested a breakdown of how MGF arrived at these values. MGF provided the following in response (MH/MGF I-26a):

"MGF used MH's spent to date and cost to go figures, on top of these MGF applied additional costs for items such as earthwork productivity; concrete productivity; additional scaffold & crane costs; additional indirect costs; etc.

In addition, MGF applied interest and escalation in line with MH's percentage.

Finally, MGF applied a 10% contingency to take into account project risk and uncertainty."

Manitoba Hydro has attempted to understand how MGF came to their expected cost of Keeyask of \$9.5 B to \$10.5 B. Manitoba Hydro does not know exactly how MGF developed the values as they have failed to provide the requested supporting information (MH/MGF I-26).

Manitoba Hydro notes that the range of values identified by MGF happen to align with the potential range of outcomes identified in Manitoba Hydro's own analysis done when the Keeyask project budget was revised early in 2017. At that time, the potential cost of the project with P90 contingency was identified to be \$9.6 B which roughly aligns with the lower end of MGF's range. The sum of a potential management reserve budget to cover severe event risk (that would result in a one-year delay and costs between \$500M to \$800M) added to the potential P90 budget would closely align with the \$10.5B upper end of the range identified by MGF.

In early 2017, when Manitoba Hydro revised the control budget, the Keeyask Project budget with P50 contingency was selected. This established the \$8.7B control budget to ensure Manitoba Hydro was proceeding with the lowest cost execution for the project. Other alternatives were considered at the time; however considering the level of completeness of the project (roughly halfway through with many key risks still remaining) the P50 contingency balances the potential costs from the remaining risks and provides a challenge to the execution team. This approach drives the lowest cost delivery and the most efficient outcome.

The following is a summary of items that MGF states will result in additional costs to the Project:

Figure 1.2

MGF Scope #	MGF Finding #	MGF Report Page	Description of Finding	MGF Order of Magnitude Estimate
5	9	60	Increased use of overtime and double time	[redacted]
5	10	61	BBE indirect costs	[redacted]
9	3	74	Earthworks productivity	[redacted]
9	5	76	Scaffold and crane costs	[redacted]
9	7	78	Concrete productivity direct costs	[redacted]
9	7	78	Concrete productivity indirect costs	[redacted]
			Total	**$678M**

1a

In the MGF report, the sum of the estimated value of the Findings that MGF states will result in an increase to the cost of Keeyask of approximately $678 M. By applying the methodology described by MGF in their response to MH/MGF I-26a, it could be assumed that applying interest, escalation and a 10% contingency to the $678 M and adding the value to the $8.7B control budget would arrive within MGF's expected cost of $9.5 B to $10.5 B. For most of their Findings, MGF included a factor for GA&O and Indirect Costs. GA&O and Indirect Costs as they relate to the GCC are described below:

General Administration & Overhead - GA&O is intended to cover support to the project from the Contractor's home offices including but not limited to expenses such as Human Resource Management, Corporate Procurement, and I.T. support.

Indirect Costs – Costs that are required to support the direct work at site including temporary buildings, small tools, and worker transportation expenses.

It is Manitoba Hydro's opinion that these "order of magnitude" costs are overstated in the MGF report and result in an inflated forecasted cost for the following reasons:

1) **MGF has incorrectly applied the GA&O mark-up percentage to potential cost increases.**

As part of Amending Agreement #7, GA&O has been capped at the target price to disincentive the Contractor for exceeding the revised target price established in AA#7. This also encourages the Contractor to complete the work at the lowest cost. It appears that MGF did not account for this GA&O cap in their values, but rather applied the full amount on all of the forecasted increased costs disregarding the cap. This results in an over-estimate of at least $26 M.

2) **MGF has overstated their forecasted indirect costs for BBE by simply extrapolating the current spend.**

MGF Report: Scope Item 5, Finding #10, page 61

On page 61 of their report, MGF provided a forecasted value for an increase to the indirect costs. It appears to Manitoba Hydro that MGF used the overall physical percent complete from the Bill of Quantities for their estimate and assumed that the indirect costs from the BBE Cost Report will continue similarly for the remainder of the work (i.e. they extrapolated these values for the remainder of the contract on a straight line basis).

The forecasting method used by MGF is overly simplistic and flawed as it does not consider upfront costs that will not occur again in the future such as temporary buildings, and roads (i.e. fixed indirect costs) and progress on areas of the work that may incur more (or less) indirect costs than others. The values also do not consider the efforts that Manitoba Hydro is undertaking with BBE to manage BBE's indirect costs. Managing BBE's indirect costs is a key area of focus for Manitoba Hydro in 2018. Manitoba Hydro hired an Indirects Lead with over 19 years of related experience in project controls, project management and accounting in the major capital project environment to help manage BBE's indirect costs. These factors are considered in Manitoba Hydro's forecasting methodology. However, they do not appear to be considered in MGF's cost estimate, as they should.

In addition to the specific forecasted indirect cost value presented on page 61 of its report, in other findings including: Scope Item 9: Finding 3, page 74; Scope Item 9: Finding 5, page 76; Scope Item 9: Finding 7, page 78, MGF has added a factor for indirect costs calculated by dividing the total direct costs by total indirect costs. This suggests that MGF double counted indirect costs by identifying indirect costs related to earthworks productivity, concrete productivity, and scaffolding/crane costs beyond the values MGF provided on page 61 of its report in the calculated "BBE Indirect Costs" value.

Manitoba Hydro is of the opinion that utilizing this indirect to direct cost ratio for potential cost increases is inappropriate as this ratio includes both **variable indirect costs** such as maintenance costs, transportation costs for workers, additional supervision, and consumables/small tools, as well as **fixed indirect costs** such as installation of temporary buildings and roads. These fixed indirect costs would not be impacted by changes in directs work. For example, if concrete productivity is worse than expected and additional labour hours are required (i.e. direct work); costs that were originally incurred to build the carpentry shop **(i.e. fixed indirect cost)** would <u>not</u> be incurred again. It appears as though MGF has failed to account for this reality in its report, resulting in an overestimate of future costs.

Manitoba Hydro has conducted a line by line analysis of the cost accounts to determine which indirects could be affected by direct work and has concluded that a lower ratio is more appropriate. However, the nature of the direct work in question is important. For example, if concrete productivity would cause the project to be extended, it is likely that most indirects would be impacted and therefore a ratio on the higher end of Manitoba Hydro's range would provide a reasonable estimate of the associated indirect costs. In contrast, if the craft-to-foreman ratio were to change, it would not impact as many indirect cost accounts and the ratio of indirects could be significantly lower. In its analysis, MGF failed to recognize that the relevant indirect costs need to be considered when estimating the cost impact associated with a potential increase to direct costs rather than using a broad ratio of total indirect to direct budgets.

The following are additional miscellaneous points that Manitoba Hydro would like to rebut that fall outside the 3 main areas addressed:

1) Selection of the Contractor:

Scope Item 5, Finding #12, page 62

On page 62 of their report, MGF states that they *"were advised by Manitoba Hydro that Bechtel were self-performing Contractor's on Limestone and this predicated their decision to appoint BBE"*. Manitoba Hydro provided MGF with the documentation related to the procurement of the GCC including the RFPQ and evaluation criteria. Manitoba Hydro did not select BBE, a limited partnership that included Bechtel, strictly on the basis of Bechtel's Limestone experience as it is implied in the MGF report. In addition to considering the work self-performed by Bechtel, the pre-qualification process described above also considered the experience with self-performed work by both Barnard and Ellis Don. It is the combination of experience and knowledge across all three partner companies that informed the decision to select BBE as one of the four contractors that would ultimately compete on a cost basis for the work during the final phase of the three-phase competitive tendering process.

A strength of the joint venture was that each partner would lead different areas, but would still share overall responsibility. The division was as follows: Bechtel for concrete structures, Barnard for earthworks, and Ellis Don for their infrastructure work and knowledge of the Canadian labour marketplace. Each proponent offered key personnel that had experience in all of these areas.

2) Earthworks Embankment Fill Measurement

Scope Item 9, Finding 2, and page 73

On page 73 of their report, MGF describes a site visit to Keeyask on November 9 and 10, 2017 where the two MGF staff who attended the site visit performed a survey of the earthworks to compare to the value reported by BBE. From this assessment, MGF concluded that the embankment fill claimed by BBE is approximately 10% higher than the quantity assessed by MGF.

During this site visit, MGF representatives spent approximately 12 hours in the field which included safety orientations, a site tour, and meetings with Manitoba Hydro staff, in addition to their time surveying quantities. In MH/MGF I–28, Manitoba Hydro requested that MGF describe the methodology used to calculate this value. MGF provided the following description of the methodology they employed:

> *"Average end area method was used to calculate the volume. Heights of existing embankment and remaining fill heights were determined by referencing the existing known elevation point at concrete structures, survey stakes and speaking with MH site personnel. Survey profiles of existing embankment and center line profiles provided to MGF staff on site by MH were also used in the calculation of the volumes."*

Manitoba Hydro was present during this survey and reports that the review was rudimentary and involved measuring the structures with no equipment but a borrowed measuring tape and 100 metre chain. While these methods are appropriate for checks to determine approximate quantities, they are not as reliable as the detailed methodology employed by Manitoba Hydro numbering thousands of checks on BBE's performance over the course of the last three and a half years, described below.

In their report, MGF did not refer to the actual methods used by Manitoba Hydro and BBE to measure quantities for the earth structures on the Keeyask site. In addition to the Manitoba Hydro earthworks inspectors that monitor performance of the Contractor, Manitoba Hydro has a survey crew of seven full time staff dedicated to earthworks with at least four staff on site at all times (2 on day shift, 2 on night shift). BBE also employs an earthworks survey crew of 12 staff with at least 8 staff on site at all times (4 day shift, 4 night shifts). There are additional surveyors from both organizations dedicated to the concrete structures as well (e.g. Powerhouse and

Spillway). Manitoba Hydro and BBE earthworks surveyors take independent measurements before, during and after the placement of material on each earth structure. Both crews use a combination of Trimble GPS and total station survey equipment to measure quantities. The survey data is used to develop detailed 3D models using AutoCAD 3-D for modeling and calculating quantities. These models are updated weekly and quantity runs by both Manitoba Hydro and BBE are generated to report on weekly production. Typically, the difference between the survey data captured by Manitoba Hydro and BBE surveyors is between 3-5% and is reconciled regularly. Manitoba Hydro and BBE meet to review these numbers and agree upon the final installed quantities.

On page 73 of their report, MGF recommends that Manitoba Hydro performs "spot checks" on the quantities claimed by BBE to ensure the quantity progress being relied upon for scheduling is accurate. Manitoba Hydro and BBE are continuously measuring quantities via their respective survey teams. As an example of the degree of rigor with respect to the survey process, on a portion of the Central Dam, 104,820 survey points were collected for the foundation (bedrock and back slopes) and 127,729 survey points were collected for the fill (including dental concrete). This methodology is superior to spot checks because data is gathered continuously at every stage of construction to ensure quantity measurements are accurate. The suggestion that the methods employed by the MGF employees on the two-day site visit are superior to the methods employed by Manitoba Hydro's constant and continuous surveillance of the work site are nothing short of ridiculous.

<u>3) Issues with methodology employed on Keeyask</u>

Scope Item 9, Finding 10, and page 81

On page 80 and 81 of their report, MGF provides a picture of earthworks from summer 2016 from a Manitoba Hydro report and has overlaid a number of notations. In addition to this picture, MGF states that:

> *"The application of incorrect machinery and work methods causes delay and additional cost. The following picture depicts an example where both Schedule*

> *and Cost are pushed out in favour of the Contractor and at the expense of the Client.*
>
> *While the above is an example, the poor productivity achieved on site reflects poor Supervision and Management by the Contractor. If Manitoba Hydro wants to reduce cost and schedule overruns they should have a more hands on approach."*

The date stamp on the photo is July 28, 2016, approximately 1 year prior to MGF first attending the Keeyask site. In MH/MGF I-32a, MGF has confirmed that their notations are based on the photo and personal experience, and therefore, not as a result of directly observing the work taking place or speaking to Manitoba Hydro staff at the Keeyask site who were involved in the specific work depicted in the photo.

In MH/MGF I-32e, MGF states that a technical specification does not necessarily need to be followed in instances where there are opportunities to improve productivity and cost. MGF goes on to say a test program may be implemented.

The scope of work depicted in the photo occurred on the North Dyke and when the excavation occurred in this area, four distinct areas of saturated clay material were discovered requiring additional excavation. The resulting excavation of the localized area was 1-2 metres lower than the surrounding areas and susceptible to ground water infiltration. In this case, BBE attempted to follow the Technical Specification but found it challenging due to the prevailing ground conditions. The Manitoba Hydro Earthworks and Excavations Resident Engineer and the BBE earthworks team worked together to engage in a test program which was successful in keeping the work moving. In the case of the photo on page 81 of MGF's report, MGF has taken a situation with limited context, without speaking to Manitoba Hydro to understand the situation, and applied the finding in an attempt to substantiate an unfounded conclusion.

<u>4) Extended Overtime:</u>

Scope Item 9, Finding #8, page 79

On page 79 of its report, MGF states that, upon reviewing BBE's progress payments from May and June 2017, there were 73 instances of individuals working over 16 hours in a day during that 2 month period. MGF goes on to state that these extended hours will not be as productive as straight time hours and will result in diminishing output for every hour worked, in addition to raising concerns about potential personnel safety. Manitoba Hydro reviewed these 73 instances and found that a majority of the records were either supervisory staff or craft workers performing concrete-related work. In most cases, when a concrete placement is started, it needs to be taken to conclusion to avoid a cold joint (which is a potential water pathway through the concrete structure). During larger concrete placements, additional overtime is periodically warranted meaning that some of these cases where individuals were required to work extended hours were justified. However, safety was not sacrificed as supervisors were on hand to ensure the work was performed safely and in accordance with the established procedures.

To put these 73 instances of individuals working over 16 hours in a day into perspective, in May and June 2017 there were a total of 61 days worked. Considering that BBE had an onsite workforce on average of approximately 1,500 individuals, this would result in more than 90,000 days worked by the contractor's workers. These 73 instances account for less than 0.08% of the total days worked by the contractor's workforce during that 2 month period, and are the exception rather than the rule.

Manitoba Hydro reviewed the May and June 2017 progress payments and found that the average hours worked by the entire field workforce is approximately 10.7 hours per day and 10.5 hours per day for the field workforce for all of 2017. This average does exceed the standard onsite working day of 10 hours. Manitoba Hydro agrees that extended overtime could impact worker productivity and could have cost implications. As such, it will continue to work with the contractors in 2018 to more effectively manage overtime. These changes will help to minimize the need for additional overtime and is expected to increase productivity.

Manitoba Hydro also prides itself on its safety record and works diligently in this regard. From project commencement to November 30, 2017, there have been approximately 15 million person hours worked on the project and only 22 lost time incidents averaging slightly over 6 lost time days per incident. In addition, BBE has gone more than 14 months (over five million person hours worked) without a lost time incident. This safety record is impressive given the size and remoteness of the project, but Manitoba Hydro and BBE will continue to focus on eliminating safety incidents until the goal of "zero hurts" is reached.

<u>5) Inconsistencies in Estimate Documentation:</u>

Scope Item 3, Finding #2, page 36

MGF reviewed Manitoba Hydro's estimate documentation on Keeyask and stated the following on page 36 of their report:

> *"CEF 2016 Estimate Sheets were provided in the Basis of Estimate appendices as supporting details to the cost estimate, however, the values included within these estimate sheets did not align with the values carried in the actual estimate. In the 2014 Capital Project Justification Addendum, Basis of Estimate variances occur because of SAP's use of a more accurate treatment of overhead. It was also noted through conversations that these variances are the result of updated labour rates themselves which are to be applied throughout the next fiscal year. Rates current at the time the CEF 2016 Estimate Sheets were generated, and then adjusted prior to being carried in the final estimate. This was not specified within the 2017 Capital Project Justification Addendum, Basis of Estimate and the reconciled estimate sheets that were provided in 2014 were also neither provided nor developed for the 2017 Estimate. This made one-for-one reconciliations difficult to perform."*

Manitoba Hydro has calculated the approximate "discrepancy" between the estimate sheets (item 1.0 below) and the Capital Expenditure Forecast ("CEF") 2016 Plan in SAP (item 2.0 below) referred to on page 36 of MGF's report. The total variance (item 3.0 below) is under $500K on a total value of almost $3.5B resulting in a difference of 0.013%.

To understand this statement, in MH/MGF I-13, Manitoba Hydro requested that MGF provide the specific networks which are misaligned along with the dollar value and what percentage of the CEF2016 estimate the value of the total misalignment represents. MGF did not provide this detail in their response to MH/MGF I-13. Manitoba Hydro reviewed the total budget values found in the available CEF2016 estimate sheets and compared to the values in SAP, and focused on networks valued over $1M. The outcome of the analysis is listed below:

Figure 1.3

Item	Description	Value
1.0	CEF2016 estimate sheets	$3,488,545,769
2.0	CEF2016 Plan in SAP	$3,489,007,738
3.0	**Variance**	**$461,969**
4.0	**% difference**	**0.013%.**

As part of the estimating process that feeds into Manitoba Hydro's CEF, the Work Package Leads on the Keeyask Project who are responsible for managing the scope, schedule and budget for their respective work packages, complete estimate spreadsheets where they estimate the costs of managing their scope of work (i.e. work packages). As part of this exercise, the Work Package Leads estimate the level of effort (labour hours) in managing their work package. These hours are multiplied against a labour rate that is extracted from SAP, the corporation's cost management system (item 1.0 above). After a verification process, the estimated hours from the Work Package Leads are then loaded into SAP to form the CEF Plan in SAP (item 2.0 above). In some cases it may take 1-3 months for this process to be completed. Some of the labour rates that were taken from SAP and included in the estimate spreadsheets may change slightly from the time they are extracted for the spreadsheet and the labour hours are uploaded to SAP. The labour rate in SAP multiplied by the labour hours provided by the Work Package Leads is the value that becomes part of the CEF plan (item 2.0 above). The labour rates carried in SAP trump the labour rates in the spreadsheets. The labour hours captured in the spreadsheet by the Work Package Leads (and subsequently uploaded into SAP) is the key deliverable. The labour rate in the spreadsheet that may have changed in SAP since it was originally extracted is not updated on the spreadsheet (because the labour hours have already been entered into SAP to form the Plan).

While there is technically a minor difference in the values referenced above, MGF has failed to recognize if this difference is a material one. Manitoba Hydro is alert to any changes which might impact the estimates and monitors these factors. In the context of the budget the issue raised by MGF does not materially impact the estimates.

6) Cash and Trade Discounts

Scope item #5, Finding #8 – Keeyask Cash and Trade Discounts (page 59 and 60)

MGF reviewed progress payments for BBE for the months of October 2016 and June 2017 and noted that trade discounts were "negligible" and no cash (prompt payment) discounts were identified. MGF goes on to recommend that all contractors negotiate trade discounts with their subcontractors and suppliers.

In MGF's observations and findings, MGF implies that BBE could achieve 10% savings from their suppliers and pass this savings on to Manitoba Hydro. When considering BBE's total purchases for the entire Keeyask project, MGF believes this equates to a potential savings of approximately $115.8 million for Manitoba Hydro.

Manitoba Hydro provided MGF with a copy of the General Civil Works Contract with BBE. In the contract, Section 7.8 Process of Selection of Subcontractors outlines the process that BBE is required to follow for the award of major subcontracts (includes contracts for both subcontractors performing work under BBE and suppliers of equipment/material). BBE is required to solicit three competitive bids for every contract valued over $500,000. The contract also provides Manitoba Hydro the ability to review and sign off on procurement over $500,000. If the contractor does not follow this procedure and subcontracts work without receiving the required approval from Manitoba Hydro, the work is not eligible for reimbursement under the contract. Therefore it is in the contractor's best interest to follow the terms of the contract. BBE has operationalized this section in the contract as a Desktop Procedure for

Subcontractor Selection Process. Manitoba Hydro provided MGF this document on October 7, 2017.

In MGF's conclusion regarding cash and trade discounts, MGF fails to mention how BBE can realistically achieve this 10% savings from their suppliers and if this is even possible under the existing agreements BBE has with their suppliers and subcontractors. Since BBE is required to competitively tender work valued over $500,000, the vendor selected should already provide the lowest cost or best value proposal. Manitoba Hydro reviews these tenders to ensure that this philosophy is maintained. Manitoba Hydro is skeptical that a further 10% savings as implied by MGF could be achieved as the major subcontracts are already competitively tendered by BBE.

7) Hatch Schedule

Scope Item #4, Finding #2 – Hatch Schedule (page 41)

MGF reviewed the schedule for the detailed design engineer Hatch and concluded that while the schedule is well-developed, many activities are behind schedule.

Manitoba Hydro and MGF had a number of discussions regarding the engineering schedule and the status of engineering deliverables. During these discussions, Manitoba Hydro described that during the time of Amending Agreement #7 with BBE, the decision was made to manage engineering deliverables based on Construction Work Packages (the pieces of work to be undertaken by the GCC) rather than on the specific engineering deliverables that were incorporated into Hatch's baseline schedule (i.e. on a drawing by drawing basis). This ensures that the contractor has all the drawings they require to build a specific piece of work (such as a Powerhouse Unit 1 base slab) with the required lead time to plan and procure materials.

Since neither Manitoba Hydro, Hatch nor BBE are no longer managing their respective work to Hatch's baseline schedule, efforts have not been expended to update the Hatch baseline schedule.

On page 33 of MGF's report (Scope Item #2, Finding #1), MGF confirms that on October 23, 2017, in a video conference with senior representatives from BBE, BBE advised MGF that construction had not been delayed on account of the issue of Issued for Construction drawings. This informed MGF's conclusion that "*The production of Issued for Construction drawings has not impacted BBE's progress*".

<u>8) BBE Schedule – Negative Float</u>

Scope Item #4, Finding #3 - Keeyask – BBE Schedule: Negative Float (page 42)

In reviewing BBE's schedule, MGF identified a number of activities in BBE's schedule that have negative float. MGF concludes that until these deficiencies are reviewed and corrected, Manitoba Hydro cannot have confidence in BBE's schedule. Manitoba Hydro was aware of the presence of negative float in BBE's schedule and its significance and has been working with BBE over the last few weeks to develop a valid recovery schedule. This recovery schedule recovers the delays in BBE's baseline schedule and eliminates negative float. This recovery schedule was submitted to Manitoba Hydro in 2017.

<u>9) BBE Forecast at Completion Date</u>

Scope Item #4, Finding #6 – BBE Forecast at Completion Date (page 44)

MGF reviewed Manitoba Hydro's schedules and methodologies and believe the first unit ISD will be approximately 3 months later while the last unit will be 4 months late. MGF goes on to context this finding stating that no mitigation strategies or schedule recovery options have been added to this forecast. In MH/MGF I-19F, MGF confirms that the forecasted delay could be reduced using schedule mitigation activities and successful improvements at site. Some of these mitigation activities are referenced previously in this report.

On page 78, MGF indicates that actual average concrete productivity is likely to worsen, as there are more complicated pours to come and three more winter seasons to work through. Manitoba Hydro expects that concrete productivity to improve. A majority of the progress to date on the Powerhouse structure has been on units 1, 2 and 3. There has been a learning curve for the contractor and the craft labour who are building the work on these first three units. Given that a generating station is comprised of seven nearly identical units, it is expected that performance on the remaining units will be improved. It should be noted that on page 78, MGF states that the expected cost increase due to lower than planned productivity on the concrete structures is approximately $136.5 M. In MH/MGF I-30c, MGF indicates that they have not included factors such as improvements due to repeatability into their estimated costs. It could also be assumed that this factor was also not considered in the finding related to schedule.

2. Bipole III Transmission Reliability Project

The Bipole III Transmission Reliability Project, currently under construction, is a high-voltage direct-current ("HVDC") transmission project that will enhance the reliability and increase capacity of Manitoba's electricity supply. More than 70 percent of electricity generated in Manitoba is delivered to customers on the two existing HVDC transmission lines (Bipole I and Bipole II). These lines run alongside each other for much of their route and end at the same point in southern Manitoba at the Dorsey Converter Station. Due to their proximity to each other and the single terminus point for both lines, damage to Bipole I and II or Dorsey Converter Station could mean Manitoba Hydro cannot carry enough electricity to meet its customers' demand. Bipole III will add 2,000 megawatts to Manitoba Hydro's HVDC transmission capacity.

MGF was retained by the PUB on Bipole III to review and explain the increases in cost estimates and capital cost increases, as well as project cost overruns. It was to determine and assess the reasonableness of its updated forecast and to identify aspects of the updated cost estimate and schedule that are at risk. It was also to recommend risk mitigation strategies and, further, to review Manitoba Hydro's:

- practices on its pre-construction design and engineering work; and
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling.

MGF's evidence was that Bipole III Transmission Line is generally well organized and managed efficiently. It stated that it was on schedule and had used contracting strategies that were commercially astute, allocating risk appropriately. It also stated that Manitoba Hydro was managing a key risk, cause by poor performance of a contractor. MGF, in its Executive Summary on page 1 of its report, have highlighted that the HVDC Converter Stations "are well managed by Manitoba Hydro and the potential for cost over-runs is low."

Manitoba Hydro generally agrees with the MGF findings related to the Bipole III Project. Manitoba Hydro continues to manage the project appropriately, and maintain and affirm that Bipole III will be in service by the end of July 2018. This will be achieved within the approved $5.04 billion control budget.

Manitoba Hydro agrees with MGF that there remains risk to completing Bipole III on time. Specific risks related to Transmission Line contractor Rokstad's performance have been highlighted. As noted in the MGF report, Manitoba Hydro is managing this risk by de-scoping work from Rokstad and awarding it to another contractor. Manitoba Hydro was in the process of taking the action independently from this review. However, as noted on page 112 of MGF's report, the contingency amount for the Transmission Line will be sufficient to address this mitigation action and remaining risks on the work.

Despite Manitoba Hydro's general agreement with MGF's findings on Bipole III, there remain some areas within MGF's report that Manitoba Hydro disagrees with, and some areas in which it would like to provide clarifying information. There are also a number of instances where MGF has misunderstood the information provided, or drew an incorrect assumption that Manitoba Hydro would like to clarify on the record. In some of these instances, MGF was provided clarifications by Manitoba Hydro prior to the report being completed. However, it did not incorporate those into its final report.

2.1. Additional information to provide some clarity on the MGF report.

There are a number of items on which Manitoba Hydro would like to provide some additional information to provide some clarity on the MGF report.

<u>Scope Item 10, Finding 2, page 84</u>

MGF recommends that "the Manitoba Hydro Estimating Team prepare the overall estimate with input from each department." Manitoba Hydro can advise that approach to managing the estimate update process through the Estimating Team was in place prior to the MGF review. The Estimating Team coordinates all inputs from contributing areas/Departments. The Estimating Team also conducts reconciliations and confirmation of values for items input and updated within SAP.

<u>Scope Item 15, Finding 2, page 99</u>

On page 99 of its report MGF concludes that the 2014 pre-construction Basis of Estimate was extremely well done, however recommends further improvements in the supporting backup documentation to align costs captured within the SAP accounting software used by Manitoba Hydro and the project Work Breakdown Structure.

A Basis of Estimate document details the scope of the project on which the estimate is developed, the estimating methodologies applied and key assumptions upon which the estimate is based. As noted by MGF, the 2014 Basis of Estimate document was extremely well done. Part of the Basis of Estimate is to document project costs entered directly into Manitoba Hydro's SAP accounting system. These costs would include internal labour hour estimates, expense estimates and similar internal costs. In contrast to MGF's recommendations, Manitoba Hydro considers the backup documentation included within the Basis of Estimate document associated with these costs to be aligned with the Work Breakdown Structure and considers the level of documentation of these costs included within the Basis of Estimate document to be sufficient.

Scope Item 17, Findings 5 and 6, page 105

MGF has correctly identified that Rokstad Power's work remains one of the critical risks to the on-time completion of the Bipole III Project. Manitoba Hydro would like to clarify the following regarding this scope item:

- The report notes an end date of April 21, 2018 for Rokstad's work. In IR MH/MGF I – 44 MGF clarified that the activity considered the end date "Final Record and As Built Submissions" is in fact a trailing /post-construction activity and does not correspond directly with the completion of construction work. Construction work will be completed in March 2018.
- MGF correctly states on page 106 of its report that "A recovery plan has been developed and submitted by Rokstad Power Company to Manitoba Hydro, but has not been approved at this time." Manitoba Hydro continues to work with Rokstad to develop a sufficient recovery plan for their remaining scope and Rokstad's progress will be closely monitored to determine whether any further actions are required. .
- Manitoba Hydro agrees with MGF that removal of scope from Rokstad and placement of this work with another contractor does not guarantee the project will finish on schedule. However, Manitoba Hydro can advise that the new contractor has mobilized and has begun construction on this removed scope. The new contractor has committed to a schedule that will ensure on-time completion of the transmission line and they are currently on-track to this schedule. As such, this risk is substantially mitigated.

Scope Item 20, Finding 3, Page 117

MGF recommends that Manitoba Hydro properly record costs associated with placing the removed scope with another contractor and record the extra over costs it has incurred in having the new contractor in place. Manitoba Hydro agrees with MGF and is in the process of recording these costs appropriately and taking the appropriate steps contractually to recover any additional costs from Rokstad that are associated with the scope removal and Rokstad's lack of performance.

There is a finding on page 111 of the report regarding the Bipole III Project cost estimates for the Rokstad contract and a recommendation that the estimate be updated to reflect this change. Manitoba Hydro's estimate has already been updated with these costs. All reductions to the contract budget are returned to the project control budget, Transmission Line Contingency, as part of ongoing change management on the project.

2.2. Areas of the report that Manitoba disagrees with the conclusions drawn by MGF

There are a few areas of the report that Manitoba disagrees with the conclusions drawn by MGF.

Scope Item 18, Finding 1, page 108

On page 111 of its report, when determining the reason for project cost overruns since the final pre-construction control budget, MGF concludes that "Many of the additional costs appear to be a result of a project that was perhaps not at a stage of readiness at the time of project approval in terms of permit approvals, design development, land acquisitions and execution planning (i.e. procurement cycle and delivery time, market underpinned costing based on a tested and firm strategy, etc.)." Manitoba Hydro does not agree with this assessment.

The project was at an appropriate stage of "readiness" to proceed recognizing that the environmental License had been received and a sufficient number of winter construction seasons were necessary to execute the work. Specifically, as the transmission line work proceeds sequentially from clearing, to anchors and foundations, to tower erection and stringing, it was appropriate that clearing, work began immediately after the Licence was obtained and the tower erection and stringing contracts proceeded later. The project correctly identified uncertainty in the transmission line construction marketplace and carried both contingency and management reserve related to this. Events related to weather and material procurement that transpired were not an issue of "readiness", but rather general and typical areas of uncertainty and specific contractor issues/challenges.

<u>Scope Item 10, Finding 1, page 83</u>

MGF identified Manitoba Hydro as having internal labour costs budgeted beyond the project in-service date that are being incorrectly applied to capital expenditures as opposed to operating expenditures. Manitoba Hydro provided clarification and, through the IR process, MGF responded that it was their "..opinion these costs should not be part of a capital budget." Manitoba Hydro disagrees with the treatment of all costs immediately after the ISD being classified as operating expenses (as opposed to capital). After the ISD, there are still significant construction activities to be completed; such as:

- completion of synchronous condensers 3 and 4 at Riel,
- demobilization and clean-up by Contractors at each construction site,
- decommissioning of the camp infrastructure at Keewatinohk, and
- deficiency clean-up and commercial contract close-out.

All of these activities will require Manitoba Hydro labour after ISD that is directly attributable to capital construction costs associated with the asset. To ensure appropriate allocation of costs to capital or operating expenses, all project costs are carefully scrutinized by Manitoba Hydro accounting professionals to ensure that costs meet the criteria for capitalization as set out in International Financial Reporting Standards. When costs are deemed not to be eligible for capitalization, they are charged directly as an operating expense to the Corporation. Additionally, the allocation to capital or operating is considered in the annual external accounting audit that the Corporation undertakes as part of preparing its yearly financial statements.

<u>Scope Item 13, Finding 3, page 95</u>

On page 97 of their report MGF states "The current value of contingency at a P75 confidence level does not appear to be based on a current or updated Contingency review. As such, this would not take into consideration the events and updated risks that the project has been or may be exposed to. Manitoba Hydro's corporate standard states that contingency is set at a P50 or 50% confidence level." Manitoba Hydro disagrees with this statement. The current P75 contingency value for the Converter Stations was developed based on the 2014 risk and contingency assessment as the general risk profile of the project was unchanged. This approach does appropriately account for risks realized to-date.

Scope Item 19, Finding 3, page 112

MGF further concluded on page 114 when reviewing the Bipole III transmission line that the current P80 confidence level does not appear to be based on a current or updated review. The current P80 contingency value for the Transmission Line was also developed based on the 2014 risk and contingency assessment as the general risk profile of the project was unchanged. This approach does appropriately account for risks realized to-date. It was also reviewed against the Risk Register at the time, contrary to MFG's finding that it does "not appear to be based on current or updated review." The Risk Register is a document used as a tool to track issues and address problems as they arise. It acts as a repository for all risks identified and includes additional information about each risk such as the nature of the risk, the owner of the risk, and mitigation measures.

The decision to increase the P-value of the contingency for the Bipole III Project (transmission line and converter stations) in 2016 from a P50 to an overall P75 contingency level on the project was based on a number of anticipated risks having been realized and the desire to have an increased confidence level in the Bipole III control budget recognizing that there was only 2 years remaining on the work before the project was brought into service. With construction work on the project now largely complete, the project has progressed to a point where budget risks are largely reduced and the primary risk relates to schedule. This is supported by MGF's findings that the contingency on both the transmission line and converter stations are sufficient to complete the work on-budget.

It is the project management team's responsibility to recommend the appropriate P-level for contingency on a project. While this can be a P50 contingency, the project management team may alternatively recommend a different P-value (e.g. P75 contingency) based on factors such as: realized risks, project status, remaining work-to-complete, and remaining risks. The recommended P-level of the contingency together with the project estimate is reviewed and approved at the Executive level.

2.3. Misinterpretations, errors and incorrect characterizations in the MGF findings.

MGF provided many of their findings to Manitoba Hydro in advance of issue the report as drafts and Manitoba Hydro advised MGF that, in its opinion, there were a number of misinterpretations, errors and incorrect characterizations in the findings.

It also suggested corrections. However, based on the MGF responses obtained through the Information Requests process, MGF did not include any of these suggested corrections within its final report. As such, Manitoba Hydro will provide this information directly to the PUB through this Rebuttal.

Scope Item 10, Finding 3, page 86

MGF has incorrectly stated a risk identified in the June 2017 Bipole III Converter Stations Project Controls Report was repeated/again identified in the September 2017 Controls Report, although the wording in the report was in no way the same. The risk from the June 2017 report addressed both concerns related to the on-time completion of work by the Keewatinohk 230kV AC Switchyard contractor and the commissioning schedule for the Riel Converter Station Synchronous Condensers, whereas The risk from the September 2017 report identified concerns related to the overall complexity of interface work between the major contractors, potential delays to commissioning due to HVDC equipment damaged during installation, the risk of commissioning delays on the AC Switchyard and equipment delivery delays potentially impacting commissioning schedules.

Based on MGF's interpretation that the identified risks were identical, they incorrectly concluded that Manitoba Hydro did not mitigate the risk originally identified in June 2017. These two risk items were, in fact, different issues. Regarding the June 2017 risk, Manitoba Hydro took specific actions, including taking-over the work in parts from the contractor to ensure the AC Switchyard work was completed and handed over to Manitoba Hydro in time to accommodate commissioning. Similarly, Manitoba Hydro has required the Riel Synchronous Condenser Contractor to review its commissioning plan and ensure it is achievable. The risks noted in the September 2017 report were addressed as follows:

The “complexity of interfaces” risk relates to schedule risks on the overall interface work that is to be executed to “connect” or “link” the major components of work on the converter stations (for example linking the HVDC station to the Synchronous Condensers). Manitoba Hydro is actively managing and mitigating this risk through execution of its interface contracts and interface schedule management

The damaged HVDC equipment identified as having the potential to impact commissioning, relates to damage that occurred to Converter Transformer turrets during installation. The Contractor has addressed this risk by obtaining replacement turrets. There will be no impact to schedule.

The delays related to commissioning of the Keewatinohk AC Switchyard, related to new delays that had arisen in the completion of installation and finalization of equipment. These items were addressed and recovered by the contractor and the final handover of the switchyard to Manitoba Hydro for commissioning occurred on schedule.

The risk related to delayed equipment delivery potentially impacting commissioning schedules, related primarily to remaining (minor) equipment deliveries on the HVDC contract and remaining equipment deliveries on the Riel Synchronous Condensers. These delays are both being actively managed and mitigated by the Contractors and both are not anticipated to have any impact to schedule and the in-service date of the project

<u>Scope Item 11, Finding 3, page 90</u>

MGF has misinterpreted the application of mark-up on several of the lumps sum Variations reviewed. MGF have indicated that the contractor improperly applied mark-up to lump sum Variation values already including mark-up (i.e. double application of mark-up). This double application of mark-up did not occur. The instances identified by MGF only included a single markup of 15% as part of the total lump sum pricing. This mark-up happens to be the same as prescribed for on Actual Cost Variations but was not additional application (or double counting) of mark-up. As such, in the identified Variation, the amount paid by Manitoba Hydro was equal to the agreed upon lump sum price included in the approved variation.

<u>Scope Item 15, Finding 1, page 98</u>

MGF stated "CEF 16 carried a cost of [redacted] Manitoba Hydro wishes to clarify that the entire Rokstad Contract budget has been adjusted for reduced scope (primarily foundations scope removed in N4) and updated unit rates once the contract was awarded in December 2016, which was post the finalization of CPJA 08a (2016). All reductions to the contract budget are returned to the project control budget, Transmission Line Contingency as part of the ongoing budget alignment process for changes. 1a, 7a, 8a

<u>Scope Item 15, Finding 3, page 100</u>

MGF has incorrectly identified that the CEF2016 estimate failed to include costs for Distribution Line Crossings and the Transmission Line Construction Yard. These costs were included in the CEF2016 and current CPJA 08a approved control budget in the 2016 estimate and summaries provided to MGF. Bipole III – Appendix A is a summary of an extensive spreadsheet that was provided to MGF with relevant items expanded that summarizes the approved budgets and that these items were in fact included in the control budget.

<u>Scope Item 17, Finding 1, page 102</u>

MGF alleged that there were several missing attributes to the Bipole III Risk Register. These attributes are actually addressed in the Risk Register and have been missed by MGF. MH wishes to clarify that the Risk Register was originally developed through SharePoint and as such there is an identified creation date for each risk. However, in the spreadsheet output of the Risk Register provided to MGF a column outlining the creation date of each risk had not been included.

Scope Item 20, Finding 1, page 115

On page 115 in its review of the Risk Register, MGF recommended that the Risk Register be updated to include the date the Register was last updated and the date the risk ID was last updated. In fact, the Risk Register is actively and properly managed and the Risk Register information suggested by MGF to be collected is already captured within the SharePoint document management and collaboration tool where the Risk Register is held and is updated regularly.

Scope Item 17, Findings 2, 3 and 4, page 102

On page 103 and 104 of its report, MGF states that the Variation Summary only records those variations that are "approved." Manitoba Hydro does maintain variation log/summaries with all variations, and further reviews those for cost impact through the "Project Change Authorization" or PCA process, which is a document that authorizes and documents the use of contingency or return of contingency on the project budget and is key component of the change management process that Manitoba Hydro follows on Bipole III.

On page 102 of its report, MGF identifies Contract 031074 with Valard Construction as open, with a contingency remaining of [redacted]. This contract is shown as closed in 1a, 7a
the Contracts Listing. All un-used Purchase Order funds that were held in budget and/or in allocated contingency for the Order are returned to the project control budget, Transmission Line Contingency, as part of the ongoing budget alignment process for changes.

While Manitoba Hydro generally agrees with the MGF findings related to Bipole III and agrees that construction of the project is tracking on budget and on schedule with all equipment installations nearing completion, and commissioning of the project underway, it did want the record to accurately reflect the facts above. Manitoba Hydro will continue to manage the project appropriately and is committed to meeting the scheduled ISD of July 2018 and completing within the $5.04 billion control budget.

3. MANITOBA-MINNESOTA TRANSMISSION PROJECT

The Manitoba-Minnesota Transmission Project consists of a 500 kV transmission line from the Winnipeg area to the U.S. border in southeastern Manitoba, as well as upgrades to three existing electrical stations in southern Manitoba. If the Project receives environmental licences and approvals from both the Provincial and Federal Governments, it will transport power to the United States to meet sales contracts, improve reliability of the transmission system, and bring electricity to Canada from the United States in emergencies.

MGF was retained by the PUB on MMTP to review Manitoba Hydro's:

- practices on its pre-construction design and engineering work;
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling; and
- capital cost estimates.

MGF's review was generally favourable, indicating that MMTP was currently on schedule and that Manitoba Hydro's estimating methodology is consistent with industry standard. Manitoba Hydro does wish to respond to three areas contained within the MGF Report, as set out below.

3.1. Acumen Fuse

Acumen Fuse is a software tool used for reviewing the quality of schedules prepared in Primavera. Primavera is a scheduling tool that Manitoba Hydro uses to create project schedules.

Project schedules are comprised of activities associated with the work involved to construct the project, such as designing towers, ordering materials, constructing foundations, etc.

Manitoba Hydro links these activities together within Primavera using "schedule logic" to ensure that changes to durations and start dates are reflected in the schedule as the project progresses. An example of this "schedule logic" would be a link between a tower steel delivery activity and an installation of the tower steel activity. The tower can't be installed until the material is delivered, thus these activities would be linked in the scheduled using finish to start "schedule logic".

On the MMTP Manitoba Hydro also used Primavera to schedule the spending on the project. Activities in Primavera were also linked to the budget for the project and spending associated with activities was distributed from the start of the activity until the end of the activity. Using this technique Manitoba Hydro creates two types of activities, those that impact the duration of the project, and those that are solely used to record labour charges against the project, which Manitoba Hydro refers to as "Charging Activities". An example of this would be an activity used by our material procurement staff to record their time against while they answer questions about delivery dates, Manitoba Hydro would refer to this activity as a "Support" activity.

In the case of the 500kV Transmission Line schedule MGF stated the following (Reference: On page 125 of the MGF report):

> *"Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Dorsey Stn: Manitoba – US 500kV baseline schedule scored 42, giving it a 30% probability of success."*

In addition, MGF responded the following with respect to Manitoba Hydro's information request pertaining to Acumen Fuse (In response to MH/MGF I-4 on page 13 and 11 respectively):

> *"MGF agrees that activities within the schedules that are used for capturing internal labour expenses significantly reduce the Acumen Fuse score. MGF disagrees they would have no actual impact to the project schedule success."*

In essence, MGF is stating that missing "schedule logic" is impacting the Acumen Fuse score which is reducing the project success rate.

Manitoba Hydro is of the opinion that its scheduling methodologies are appropriate and accurate. Manitoba Hydro has successfully used these scheduling practices to deliver numerous transmission line projects in the past and have refined our scheduling practices and templates based on our experience on previous projects, most recently the Bipole III, Lake Winnipeg East 115kV line, and two 138kV transmission lines built for Keeyask.

Manitoba Hydro is of the opinion that Acumen Fuse has a number of limitations with regards to scoring the success rate of the project. These include:

- Acumen Fuse cannot recognize if "schedule logic" between activities is correct, for example if the activity to install the material was linked to start before the material delivery activity Acumen Fuse would not penalize the schedule rating.
- Acumen Fuse doesn't recognize if there are missing activities.
- Acumen Fuse penalizes the project success rating for missing logic, even if the logic is associated with activities that are not influential in the project schedule.
- Acumen Fuse doesn't measure the typical duration of a transmission line schedule in comparison to the time allotted by Manitoba Hydro.
- Acumen Fuse does not consider any other factors that contribute to project success beyond the quality of scheduling practices used to create the schedule.
- Acumen Fuse rates project success on schedule quality, and has no measure for a project team's ability to execute a project, their past experience, or if the current schedule has activities in the correct sequence.

Manitoba Hydro is of the opinion that MGF has overstated the relevance of the Acumen Fuse score with respect to missing "schedule logic" and project success. In Manitoba Hydro's opinion, the activities identified by MGF will not impact the schedule because of the nature of the activities with missing "schedule logic". The majority of these activities are not used by Manitoba Hydro to control the start and finish dates of activities within the schedule and therefore don't impact the duration of the project schedule. Instead they are used for accounting and reporting purposes only.

For example a "Support" activity is scheduled during the procurement and construction of the transmission line, which is used by procurement staff to record their labour against the project while they provide support to design and construction staff, such as answering questions pertaining to material delivery. If this activity is late to start in the schedule it won't prevent the procurement staff from answering questions and providing support and since it's not linked to other activities it will have no impact on project duration or success. This is a standalone activity that spans a long duration of work and its purpose is only to schedule the spending budget for the support work. Normally these activities are omitted by the Acumen Fuse analysis however a certain activity type needs to be assigned within the Primavera software for this to occur automatically, which was not done by Manitoba Hydro. Not assigning the activity type doesn't change the intent of these activities, it just lowers the result of the Acumen Fuse output, which is not a tool that Manitoba Hydro uses.

Manitoba Hydro believes these activities are of little relevance to the project success because these activities are not used by Manitoba Hydro to control the duration of the project schedule. These activities do not influence start and finish dates of other activities in the schedule and whether or not they have started is irrelevant to when actual critical activities would start. Tangible events are more likely to have impacts on the project success, such as delivery delays or incremental weather, than missing "schedule logic" on activities used to record labour

Acumen Fuse is a tool to help improve the quality of the project schedule but can't be used to evaluate the success rate of a project. While poor scheduling can have negative effects on the project outcome, scheduling errors which Acumen Fuse can't identify such as missing activities, overstated durations, and incorrect logic would have more substantial impacts than missing "schedule logic" on activities not used to control the project's duration. The Acumen Fuse tool can't take away from the experience of the project team and their ability to execute the project.

3.2. Industry Standard Costs

MGF (Stanley) has compared the MMTP estimate for the Transmission Line portion of the project to a white paper prepared by the Western Electricity Coordinating Council ("WECC") and a report prepared by the Midcontinent Independent System Operator ("MISO") in which an "Industry Standard" cost per kilometer of transmission line was developed. MGF believes that Manitoba Hydro's estimate is lower than the industry standard and that Manitoba Hydro should revise its cost estimate.

Through the information request process Manitoba Hydro questioned, whether or not the "industry standard" costs took into account the tower type used on each project when developing the measure, to which MGF (Stanley) responded there was no significant impact on the costs based on tower type.

More specifically, in response to MH/MGF IR I-47, MGF (Stanley) has stated:

> *"WECC and MISO data have indeterminate structure design. Calculated data projects included self-supporting lattice tower (1 project) and tubular steel structures (5 projects). None of the projects included guyed tangent lattice towers. It is worth noting that type of transmission structures does not have a significant impact on overall cost per mile for comparison purposes."*

Manitoba Hydro disagrees with this position as it previously stated in its Information Request Round 2 response in the Clean Environment Commission Hearing, Question #MWL-IR-89:

> *"based on an internal cost comparison for transmission structures in southern Manitoba, installed construction cost (not including line hardware) for a single tubular tower is approximately 70% of the installed cost for a single self supporting lattice tower. However, with the increased number of tubular structures required, the total cost of a tubular line is higher. Assuming 500m spans for lattice and 250m spans for tubular structures, a line constructed with tubular towers would increase the cost of the line by as much as 40%. This is based on 240 kV structure costs in southern Manitoba."*

The Western Electricity Coordinating Council ("WECC") white paper on Capital Costs for Transmission and Substations developed by Black & Veatch in 2014 which Stanley Consultants has used in preparing the industry standard comparison states on page 2-4 that there is a 1.5 multiplier for using tubular steel compared to lattice as shown in the figure below.

Figure 3.0

2.2.3 Transmission Structure Type

In 2012, Black & Veatch quantified the capital cost multipliers associated with each type of transmission support structure. Structure types included lattice towers and tubular steel.

Table 2-3 below shows the transmission structure type cost multipliers for all voltage classes. An additional voltage class was added for the 600 kV HVDC bi-pole alternative based on the 500 kV HVDC bi-pole multiplier. The 500 kV HVDC bi-pole multiplier was originally developed based on the relative costs of lattice structures and tubular steel at very high voltage.

Table 2-3 Transmission Structure Type Cost Multipliers

STRUCTURE	230 KV SINGLE	230 KV DOUBLE	345 KV SINGLE	345 KV DOUBLE	500 KV SINGLE	500 KV DOUBLE	500 KV HVDC BI-POLE	600 KV HVDC BI-POLE
Lattice	0.90	0.90	1.00	1.00	1.00	1.00	1.00	1.00
Tubular Steel	1.00	1.00	1.30	1.30	1.50	1.50	1.50	1.50

This multiplier is used in the Transmission Calculation Methodology stated on page 2-8 of the WECC white paper.

Figure 3.1

2.6 TRANSMISSION CALCULATION METHODOLOGY

Multiplying the right of way acres per mile by the land cost per acre yields the total right of way cost per mile of transmission line. This value was added to the base transmission costs discussed in Sections 2.2, 2.3, and 2.4 to develop the total transmission line capital cost.

Total Transmission Line Cost = [(2014 Base Transmission Cost) x (Conductor Multiplier) x (Structure Multiplier) x (Re-conductor Multiplier) x (Terrain Multiplier) + (ROW Acres/Mile) x (Land Cost/Acre)] x (# of Miles)

It is clear from the equation that the WECC agrees with Manitoba Hydro's assessment that the structure type does have an impact. In the equation above, the base costs would be multiplied by a factor of 1.5.

In summary, Manitoba Hydro is of the opinion that structure type does have an impact on the costs per kilometer, and that using tubular steel towers typically increases the project costs. This could explain why Manitoba Hydro's estimates are lower than industry standard costs which seem to be determined mainly from tubular steel projects as stated above in the response to MH/MGF IR I-47. Manitoba Hydro's current estimates are based off of recent construction bids that were provided for the Bipole III Project which Manitoba Hydro believes is the best source of comparison as it reflects current market conditions for 500kV towers in the Manitoba market place, compared to historical industry costs in differing market conditions. Manitoba Hydro is committed to keeping the costs of capital work as low as possible and is confident in its estimating process.

3.3. Internal vs. External Design

MGF (Stanley) has stated that the project delivery model, with respect to internal compared to external designs have no significant impact on the overall cost per mile of transmission line.

In response to MH/MGF IR I-47, page79 MGF (Stanley) states,

> *"WECC and MISO project delivery methods are indeterminate. Calculated data projects were design-build with mixture of internally designed (2 projects) and contracted design (4 projects).*
>
> *It is worth noting that internal vs. externally contracted design does not have a significant impact on overall cost per mile for comparison purposes."*

Manitoba Hydro is of the opinion that its approach to tower design is appropriate and cost effective. It disagrees with MGF's position regarding the impact of internal or external design on project costs. While the labour costs associated with internal design and contracted design firms are negligible in terms of the overall project budget, the indirect benefits of the internal design approach are significant.

The internal design approach protects Manitoba Hydro from design firms and material vendors "over designing" towers in order to protect themselves from risk, such that the costs of materials on the project could increase.

Manitoba Hydro's design approach is to design towers all the way to fabrication drawings, which prescribes to vendors exactly what is to be built. In addition, Manitoba Hydro arranges for tower testing which verifies the minimum amount of steel required on each tower and allows Manitoba Hydro to optimize its design and reduce costs.

Manitoba Hydro generally agrees with the MGF findings related to the MMTP. Manitoba Hydro continues to manage the project appropriately and is committed to continuing efforts to secure the June 2020 ISD. MGF recommends that Manitoba Hydro should update the project estimate and include awarded contracted values instead of estimates whenever possible. Manitoba Hydro intends to do so at an appropriate time when those contract values become available.

RE: Response to Manitoba Hydro's Questions

KPMG was engaged by Manitoba Hydro ("MH") on May 2, 2016 to undertake an independant review of the current status of the Keeyask Generating Station ("Project") and subsequently provide advice on the development and implementation of a Recovery Plan for the Project. The Recovery Plan was approved by the Manitoba Hydro Executive Board ("MHEB") in February 2017 and the implementation of the Recovery Plan has been the focus of the Project Team throughout 2017. In mid-December 2017, as part of MH's information gathering related to the Public Utility Board General Rate Application, MH requested KPMG to provide comments on the following matters:

1. Provide commentary on the contract model and any incentives included.
2. Define MH's role in the GCC contract. Define the role of the Contractor. Comment on MH's ability to manage the Contractor in this role.
3. Provide commentary on MH acting as the builder and taking on a Construction Management role.

In responding to the three matters in this letter, KPMG reviewed the documents provided by Manitoba Hydro as well as incorporated leading industry practices from both the Hydro industry and public sector projects greater than $1 billion. The documents provided by MH were: Recovery Plan Strategy (undated), the Capital Project Healthcheck, Cost and Schedule Assessment (July 2016), monthly Manitoba Hydro Status Update and Step Change Incentive Profit reports, the amended Keeyask Generating Station General Civil Works Contract #016203 (Feb 28, 2017), and weekly Issues Logs.

The response to Manitoba Hydro's questions was led by Gary Webster, National Lead for KPMG Global Infrastructure Advisory. Gary has more than 30 years of experience as a Professional Engineer specializing in the organization, procurement and implementation of large scale infrastructure projects.

Please note that this letter is subject to KPMG's engagement terms dated December 2015 with MH related to its work on the Keeyask Project. This letter is provided to MH and based on the review of the documents provided by MH and KPMG experience with industry leading practices. KPMG does not accept any liability or responsibility to any third party who may use or place reliance on this letter.

Question 1: Provide commentary on the contract model and any incentives included

MH awarded the General Civil Works Contract ("GCC") to a limited partnership between Bechtel Canada Co., Barnard Construction of Canada Ltd and Ellis Don Civil Ltd. ("BBE"), three recognized, experienced and well established companies. The contract was a Target Price contract, where payment to BBE was on a cost reimbursable basis with a gain share/pain share incentive formula. The gain share/pain share formula was introduced into the contract to incent BBE to deliver the Project under or on the target price.

KPMG

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

There was no early delivery incentives in the original contract but liquidated damages were included for late delivery.

As a cost reimbursable contract, the owner was responsible for all of BBE's actual costs. However, with the inclusion of the incentives, it ensured that the contractor's profit (and to a limited extent their general administration and overhead ("GA&O")) was at risk based on their performance. The incentives used in this contract have been used in other cost reimbursable contracts as well as other forms of contracts. The incentives align the owner's and contractor's interests and help to mitigate the exposure the owner has to poor performance by the contractor.

The gain share/pain share formula was structured as follows:

- The gain share formula for cost savings was 80% for MH and 20% for BBE. If BBE delivered a project under the Adjusted Target Price (as defined in the contract), their profit increased from 1[redacted]% by [redacted]% of the additional savings. 1a
- The pain share formula, however, was more punitive to the contractor. If the costs went over the adjusted target price, BBE was responsible for 80% of the cost overruns and their [redacted]% profit could erode to zero profit based on the amount of cost overrun. 1a

Additionally, once the actual costs exceeded the target price by 1.3 times, BBE would no longer receive their [redacted]% GA&O. The objective of this cap on GA&O was to ensure that the contractor would not benefit from escalating project costs and removed the incentive for the contractor to increase project costs to improve their overall position. 1a

By fall of 2016, MH realized that BBE's opportunity for profit would likely be eroded and that there were no longer any achievable incentives remaining in the original contract. The result was a mis-aligned relationship between MH and BBE where BBE could be motivated to regain their profit to the detriment of the Project. During this period, MH developed and implemented a Recovery Plan. As part of the Recovery Plan, MH addressed a number of root causes that led to cost and schedule overruns that were being incurred. They also negotiated an amended contract with BBE.

The amended contract continues to be a Target Price Cost Reimbursable contract, fundamentally the same as the original contract. The ability to transfer additional risk, such as geotechnical, hydrology, labour, extreme weather, and northern logistics to BBE by changing the contract to a Unit Rate or Lump Sum contract, would have required directly negotiating a new form of contract with BBE in a non-competitive environment or descoping/terminating BBE and going back to the market for a Unit Rate contract. It was expected that in a non-competitive environment and given BBE's performance in 2016, the costs of transferring this risk to BBE would have been prohibitive and/or not achievable. Additionally, in its Recovery Plan, MH analyzed the impact of terminating or descoping BBE's work. MH analysis shows that the additional delay to the project required for the re-procurement of this work along with additional risks associated with re-procurement, would have resulted in an additional increase to the Adjusted Project Budget.

The amended contract remains a Target Price Cost Reimbursable contract with limits on GA&O and performance incentives tied to achieving the target price. The amended contract was designed to achieve the following:

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

- Reset the target price and schedule milestones;
- Improved gain share/pain share incentive formula. The new incentive program is now structured around cost, schedule and management performance;
- Limited BBE's right to claim for additional adjustments to the target price;
- Improved the relationship with BBE that allows for a more collaboration on site; and
- Allow MH, as they deem necessary, to alter the scope of BBE.

The amended contract now includes incentives for not only cost, but also schedule and management performance. The balance of the incentives is now [redacted]% of any cost savings that it may generate capped at [redacted]M and [redacted]M based on meeting schedule milestones. Cumulatively, BBE could earn up [redacted]M 1a
profit for meeting all their cost, schedule and management targets, conversely they risk losing not only all their profit and GA&O expenses above the capped amount but an additional [redacted]M for poor project performance. The amended incentive pool was designed to further motivate BBE to perform and take day to day responsibility for the work it has been contracted for.

It should be noted that in contract management, a high risk exists when cost performance incentives are entirely disconnected from schedule. Namely, a perverse incentive could exist for a contractor to forsake schedule in an effort to maintain a low cost position. To address this risk, the amended contract contains a deduction associated with very strong cost performance and very weak schedule performance. This incentive structure is designed to eliminate the incentive to ignore schedule performance in order to capitalize on cost incentives.

The amended contract also has a component where BBE can gain an additional [redacted]M (included in the [redacted]M referred to above) for improved management performance ("Step Change Incentive") based on 1a
their ability to better perform their construction management responsibilities. This includes improvements such as site leadership, planning and scheduling, reporting and better coordination with MH.

Finally, the general administration and overhead ("GA&O") is [redacted]%. The provision of GA&O expenses, 1a
which are standard in the construction industry for any contractor, affords for cross-functional and project-wide resources to be accessed throughout the initiative and allows for ease and efficiency in administration without the need for micro-management. MH was able to cap the GA&O at the Final Target Price versus the original 1.3x the target price.

MH has taken reasonable steps to renegotiate the contract. The amended contract addressed a number of concerns MH had with BBE and their performance. It includes multiple systems of financial incentives and disincentives to mitigate risks associated with cost reimbursable contracts. The contract amendments were designed to promote better alignment of BBE and MH objectives, and create a collaborative environment that allows MH to take on a more proactive management style with BBE.

Question 2: Define MH's role in the GCC contract. Define the role of the Contractor. Comment on MH's ability to manage the Contractor in this role.

MH's Role in the GCC Contract.

Manitoba Hydro's Role in the GCC Contract is to function as the overall Project and Site Construction Manager. As Project Manager, MH is responsible to ensure integration, alignment and quality of the

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

project as a whole. As Site Construction Manager, MH is responsible for the overall coordination and oversight of site work, while delegating the construction planning, management of labour and construction means and methods (along with other responsibilities) to the contractor. It should be noted that construction management is a term used which can cover a wide range of responsibilities and functions. From public sector owners' perspective, construction management is often the term used to oversee the construction of the project. Canadian public sector owners do have experience managing construction works; however, these works tend to be routine and relatively minor. KPMG is unaware of any Canadian public sector owner who would have the capabilities, systems and processes to allow for direct management of complex multi-billion construction projects.

In its role, Manitoba Hydro provides oversight and approval of BBE's activities by providing channels for controls, as well as strategic level issue and risk management. Their general duties would include:

- Overall responsibility to complete the planning, design and engineering and to oversee the construction and commissioning of the proposed Keeyask Generating Station which includes the General Civil Works contract;
- Overall responsibility of the site and coordinating the interfaces with the various contractors and suppliers they enter into contracts with;
- Approving contract changes;
- Agreeing to the Contract Schedule, and all amendments thereto, in the course of BBE's performance;
- Providing oversight and surveillance audits of BBE's processes;
- Reviewing any potential changes to the overall work plan, that could alter the target price and/or construction schedule;
- Addressing stakeholder issues;
- Acquiring Project permits; and
- Providing access to the Site and timely payment to the contractor.

Ongoing monitoring and collaboration by MH continues to be essential. MH has retained an experienced construction management consortium to undertake the direct management of the construction works. If MH drives for more aggressive involvement in the direct construction management, MH could be potentially frustrating BBE in their execution of the work. This could result in a number of reactions from BBE including claims for lost profit if the project does not meet the performance requirements associated with the gain share/pain share incentives. Furthermore, it may also result in MH unintentionally taking on additional risk with respect to performance results that are currently under BBE's control that MH does not have the experience to manage.

The Role of the Contractor

MH has a contract with BBE to manage the construction of the general civil works. As per their contract, BBE is obligated to construct and commission the GCC work. This would include providing the material, labor, construction planning and supervision expertise to construct an end product that meets the cost, schedule and specifications outlined in the contract. The general responsibilities of BBE include:

- Working with MH to deliver their work;
- Executing site safety processes and procedures as outlined in the project safety plan;

KPMG LLP

Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

- Providing construction planning expertise and collaborating with MH (and other parties), throughout the design development phase (in particular reviewing constructability and completeness of detail of the design);
- Developing the contract budget and schedule;
- Procuring equipment, material and labour;
- Providing qualified management and supervision;
- Planning and supervising construction;
- Implementing quality control and assurance program and maintaining quality management records;
- Maintaining and meetings all permit and environmental requirements;
- Monitoring the costs and schedule; and
- Reporting on progress. This would include costs, productivity, down time, schedule, work plans, etc.

MH's Ability to Manage the Contractor Based on the Contract

MH and the current Project team have experience managing large complex hydro projects and have completed Pointe du Bois and Wuskwatim ($0.6B and $1.4B respectively). The table below highlights the relative experience of each of the key leadership team members.

Name	Project Role	Experience
Senior Management Team		
Dave Bowen	Project Director	20 Years
Ryan Ward	Commercial Contracts Manager	19 Years
Barry Nazar	Site Construction Manager	32 Years
Jeff Strongman	Business Manager	24 Years
Tom Tonner	Engineer Manager	25 Years
Senior Technical Team		
Terry Armstrong	Construction Quality Engineer	27 Years
Dave Little	Site Support Manager	30 Years
Gene Piasta	Head of Project Controls	27 Years
Glen Schick	Head of Infrastructure	29 Years
Charles Wright	Structures Resident Engineer	25 Years
Guy Remillard	Mechanical/Electrical Resident Engineer	32 Years
Brian Beyak	Earthworks & Excavations Resident Engineer	26 Years

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

As summarized in the above table, the Senior Management Team has 120 years of combined experience managing and overseeing large complex projects.

Over the course of 2017, Manitoba Hydro has managed their internal responsibilities while managing BBE to meet their contractual obligations. MH has demonstrated they understand their role in administering the contract with BBE as well as the risk they have to manage associated with the contract.

MH has enhanced its internal systems and processes to manage the overall project since the commencement of the project. This included initiating a "Step Change Program" that focused on their own improvement as well as that of BBE. The Step Change program was designed to address the root causes identified in the Recovery Plan and implement the following improvements for MH and BBE respectively.

Manitoba Hydro:

- Organizational structure to reflect the stage of Project;
- Leadership accountability;
- Authority residing at the Site;
- Communications between the Site and Winnipeg offices;
- Project controls function;
- Risk management and project reporting; and
- Escalation of issues to senior leadership team.

BBE:

- Organizational structure to reflect the construction management activities required by BBE;
- Alignment with MH counterparts;
- Contract reporting;
- Management of indirect costs;
- Travel logistics;
- Collaborative working environment;
- Relationship with Allied Hydro Council;
- Construction planning; and
- Construction supervision personnel.

Based on the above, the current division of roles and responsibilities between MH and BBE is appropriate and the Project team has experience and qualifications to manage and oversee the GCC Target Price contract.

Question 3: Provide commentary on MH acting as the builder and taking on construction management role

As highlighted in Question 2, we are unaware of any Canadian public sector owner who would have the capabilities, systems and processes to allow for direct management of complex multi-billion dollar

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

construction projects. The contractor brings a significant amount of skills to a project that an owner does not have. The following is a brief, non-exhaustive list of such skills:

- Construction labour recruitment and labour relations expertise;
- Corporate construction safety plan;
- Construction equipment corporate discounts;
- Extensive cost control system;
- Management, supervision and engineering personnel with construction experience;
- Access to labour; and
- Previous work experience in order to better plan and perform the work.

Some project owners do have the internal capabilities and experience to act as the builder and to take on a construction management role. Generally, this skillset is developed through experience with multiple projects and owners have gained experience in building and managing projects of scale which they regularly undertake. However, public sector owners do not perform large projects with sufficient frequency to have developed the internal skills to manage the additional complexity that are associated with multi-billion dollar projects.

MH has relied on general contractors to manage large projects in the recent past. The most recent hydro projects completed by MH are Limestone ($1.43B and 1,350MW completed in 1990), Wuskwatim ($1.37B and 211MW completed in 2012), and Pointe du Bois Spillway Replacement, ($600M completed in 2016). MH has only completed these three projects since 1990 and all of these were executed using external general contractors. This would generally not be considered adequate experience for MH to be considered a low-risk builder or construction manager.

This letter is addressed to Manitoba Hydro and in response to MH's three matters. As noted on page 1, we will not accept any liability or responsibility to any other party to whom the letter may be shown or who may require a copy of the letter.

Yours Sincerely,

Gary Webster, P. Eng.
Partner, National Lead Infrastructure Advisory

Project Memo

H341433

January 15, 2018

TO: Dave Bowen

FROM: Alan O'Brien/Sylvain Laramee

cc: Ian Ainslie

Manitoba Hydro
Keeyask GS Engineering Consulting Services

MGF Report on Keeyask

1. Introduction

At the request of The Manitoba Public Utilities Board, MGF Project Services Inc have conducted an independent review of Manitoba Hydro's Capital Expenditures program. The conclusion of their finding presented in their report issued at the end of 2017 was inclusive of a certain number of recommendations especially with regard to the Keeyask Hydroelectric Dam.

Following their receiving of the said report, Manitoba Hydro has mandated Hatch to provide commentary regarding MGF's suggestion that Manitoba Hydro expand its role with the GCC. Alan O'Brien and Sylvain Laramee have reviewed MGF's report and subsequently prepared their joint response which follows their own personal bios.

2. Bios

2.1 Alan O'Brien

Alan is a seasoned project and business manager with more than forty (40) years of experience in Engineering design, project, business and commercial management. He has been involved in projects of various sizes in a variety of industries including Oil & Gas, Petrochemical, and Power (Hydro, Nuclear, Thermal and Wind). He has managed contracts both domestically and internationally.

He has worked for two major engineering Contractors (Amec/Agra and Hatch). In his capacity of Project Manager and/or Director, he has delivered projects using various execution models, such as EPCM, EPC, fixed fee, target price and cost reimbursable. As Global Director of Commercial Management he was responsible for overseeing the group that undertook commercial and implementation reviews on all major contracts. The experience gained over many years working both in the engineering office and at site has given him a broad exposure to different types of contract execution strategies and their advantages and disadvantages.

HATCH™

Alan is currently acting as Project Sponsor on a few Hatch projects. In this role, he works with the Project Manager and his/her team in an oversight role to provide ongoing review, guidance and support.

2.2 Sylvain Laramee

Sylvain is an experienced project professional with thirty-four (34) years' experience in project and construction management of major capital projects in the Mining and Energy sectors which have allowed him to develop a broad range of management skills that are uniquely adapted for project work. His experience, both on the EPCM and contractor's side, coupled with the diversified leadership roles (Engineering Manager, Area Manager and Construction Manager) held on major capital projects has provided him a unique perspective of innovative implementation strategies and successful project outcomes.

For the past decade, Sylvain has fulfilled the role of Managing Director, Construction Management, leading Hatch's global group of construction management professionals and taking responsibility for all domestic and international major capital project construction assignments. He has considerable experience in developing implementation strategies suited to specific project challenges including, project remoteness, complex logistics, lack of skilled labor, extreme weather conditions and security issues. During this period, he assembled and mentored a core group of competent construction professionals as well as developing and implementing construction tools and work processes targeted at addressing and overcoming the complexity of each of those projects.

3. Hatch commentary around expanding Manitoba Hydro's role with the GCC as suggested by MGF

MGF's recommendation at the end of their Executive Summary reads as follows: "The recovery of this project will require Manitoba Hydro taking a construction management, hands-on approach to design and implement a recovery plan and hold the GCC contractor to perform" (Page 3, Dec 8/17 MGF Report). There is no doubt that MH has the experience of similar major projects and could put together a team of construction managers as suggested. However, given that this was not the implementation strategy that was chosen initially to execute this project and given that MH does not have available the type of construction resources needed to take over the construction lead, one would question how viable it is to significantly change at this late stage the current approach and make MH the "Constructor". It would be our views that the proposed suggestion is of equal risk if not riskier than the status quo, as described below.

Interestingly, MGF when referring to the GCC contract points out that: "The largest single contributor to the budget increase is the sum to the original GCC on account of the Contractor's poor productivity and increased indirect costs as the GCC would take longer to perform" (Page 1, Dec 8/17 MGF Report). Unfortunately, their report fails to identify the reasons behind BBE's poor productivity performance. Hence it is unreasonable to make any recommendations for changes without the root causes being identified and solutions being proposed as well as those solutions and/or recommendations then being evaluated against the costs and risks inherent to their implementation. Naturally, MGF was unable to identify potential solutions to improve the productivity for the very same reasons.

The absence of a clear understanding of the said root causes makes it impossible to identify and implement the proper corrective measures. As an example, MGF suggest as a potential saving by modifying the ratio of craft to foreman from roughly 4:1 to 6:1. Should one of the problems be the quality of the supervision then this suggestion would in fact creates the opposite effect as there would be a further deterioration of the productivity.

Based on our experience, what MGF is suggesting, is of equal or greater risk than the status quo. Whilst MH would have the experience and capability to hire a competent CM team, such a team would carry a risk until proven. Hence to create this new CM team in the midst of this mega Project, is more likely to cause the overall Project to forecast to keep increasing because it introduces pitfalls and unknowns.

The risks associated with a major shift in the contracting strategy, especially for the single most important contract, include:

- It will remain a challenge to gather a team of construction professionals from the open market that will commit to the Project for the long haul knowing that the required caliber is typically under employment by the large constructions firms hence, and not readily available
- It will likely take several months to recruit, hire, onboard and mobilize such a team. And likely not in the optimal sequence.
- Clearly it will take some time for the new CM team with no previous working together experience, to understand the challenges, find the appropriate solutions, get efficient as a team and finally drive the performance improvement. Considering the complexity of this major Project, its remote location and its many work fronts, this team will undergo a steep learning curve regardless of their experience.
- In our experience in such drastic organizational changes, there is a fair chance of MH losing critical resources that are knowledgeable, and up to now, committed to the success of this Project.
- Until a new CM organization is in place, there would be transition period of high uncertainty that inevitably will prevent people from making decision and thus, some of the initiatives currently being developed to help driving the Project in the right direction could be lost.
- Should MH follow the recommendation, it will change the nature of BBE’s contract, leaving the contractor the freedom to maximize their revenue under a de facto time and material with fee contract. MH leverage over BBE using the pain/gain sharing and liquidated damages would not be retained.
- Once BBE would become aware of MH plan to take over the management of their contract, it is doubtful that they will remain engaged in finding ways to drive productivity or find solutions to existing challenges.

HATCH™

- It cannot be ruled out that BBE could walk away from the Project considering that MH would be effectively breaking the terms of their current contract thus leaving MH with an even greater challenge to overcome.

Contrary to what MGF is stating in their report, and based on our limited knowledge of the contract between MH and BBE, we understand from MH that the GCC contract is a target price with contractor's fee at risk which includes schedule incentives and liquidated damages for late delivery. It is very difficult to imagine that MH would take over as the builder as this could result in a forfeiture of their contractual rights and a forfeiture of their leverage over the contractor to get their full attention and cooperation in addressing the seriousness of the situation. We're of the opinion that enforcing the contract to force the contractor to come to the table, put its best foot forward and make available their strengths and wherewithal will produce more upside than downside.

One interesting recommendation can be found in the report under Scope Item 9, Finding No. 1: Keeyask – Structural Steel Progress which states: "*MGF recommends that Manitoba Hydro work with BBE on a recovery plan to improve BBE's construction management, construction planning, coordination and supervision of construction work.*" This in our views is the logical beginning of a solution that ought to be applied to the overall contract and is currently being pursued by Manitoba Hydro

We understand that Manitoba Hydro is actively involved with the contractor in addressing the situation and we can only encourage them to remain focused on the work at hands and continue to hold BBE accountable by working jointly with them in accomplishing the following:

- Re-assess the final forecast
- Understand the root causes behind the poor performance and identify ways to improve and/or execute the works differently
- Identify all the risks that could impact the final forecast and elaborate a mitigation plan for each one
- Find innovative ways to improve productivity using latest technology available on the market
- Develop an optimal execution schedule that could be used as a baseline moving forward
- Deliver a comprehensive recovery plan that can be easily monitored and audited on a regular basis

There is an advantage to developing a plan jointly and making sure in the process to understand the areas where the GCC contractor could try to take advantage at the end for claims. In short, by doing this, it allows MH to limit or eliminate the General Contractor's ability to make claims by removing the obstacles and ultimately leaving the GC with only the burden of performing. Even in circumstances where there may be a requirement to supplement temporarily the Owner's team with some ad hoc resources, we believe the benefits will by far outweigh the investment and bring the best value to the Project. As time is of the essence, such exercise must take place sooner rather than later and should not disrupt what is happening at site

In summary, the suggestion by MGF to make such a fundamental change at this stage is, in our opinion, a mistake which could lead to a serious disruption of the Project with a very high potential of adding both to the costs and the schedule.

Al O'Brien/ Sylvain Laramee

Keeyask Generating Station
General Civil Contract Procurement

November 26, 2013

Major Capital Projects

Outline

- Summary of Contracts
- Allocation of Risk
- Scope of work
- Lessons Learned – PdB and Wuskwatim
- Project Delivery Strategy
- Contract Model
- Procurement Strategy
- Evaluation Process
- Project Budget
- Procurement Timeline

Summary of Contracts

Keeyask Infrastructure Project (KIP)	<$450 M
Road	
Bridge	
Startup and Main Camps	
Worksite Area Development	
Service Contracts	
Final Design Engineering	<$100 M
General Civil Contract	~$1,700 M
Turbines and Generators	<$260 M
Spillway & Intake Gates and Hoists	~$300 M

Red items indicate contracts negotiated or awarded

Summary of Contracts (con’t)

Governors & Exciters	~$20 M
Transformers	~$35 M
Powerhouse and Draft Tube Cranes	~$25 M
Transmission Lines and Towers	~200 M
Service Contracts	<$260 M
Main Camp Phase 2	<$100 M

Red items indicate contracts negotiated or awarded

Allocation of Risk

- MH Risk
  - Contract Interfaces
  - Design
  - Project Schedule
  - Escalation (labour and commodities)
  - Scope changes
  - Environmental Approval
  - Quantities
  - Geotechnical
  - River Flow

Allocation of Risk

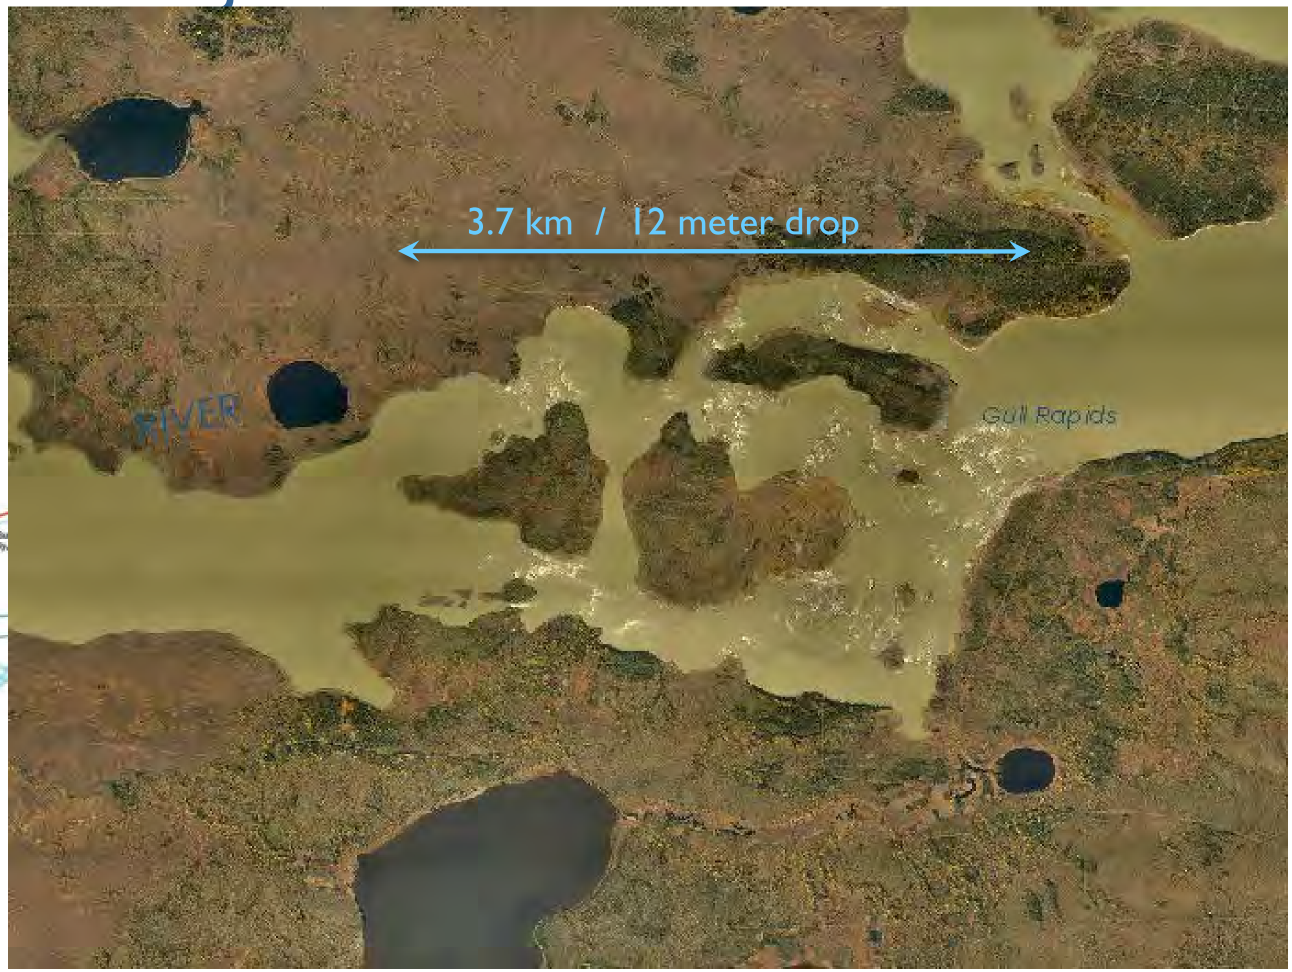
- GCC Risk
  - Contract Schedule
  - Attraction/Retention of Staff and Craft
  - Labour productivity
  - Subcontracts

Scope of Work

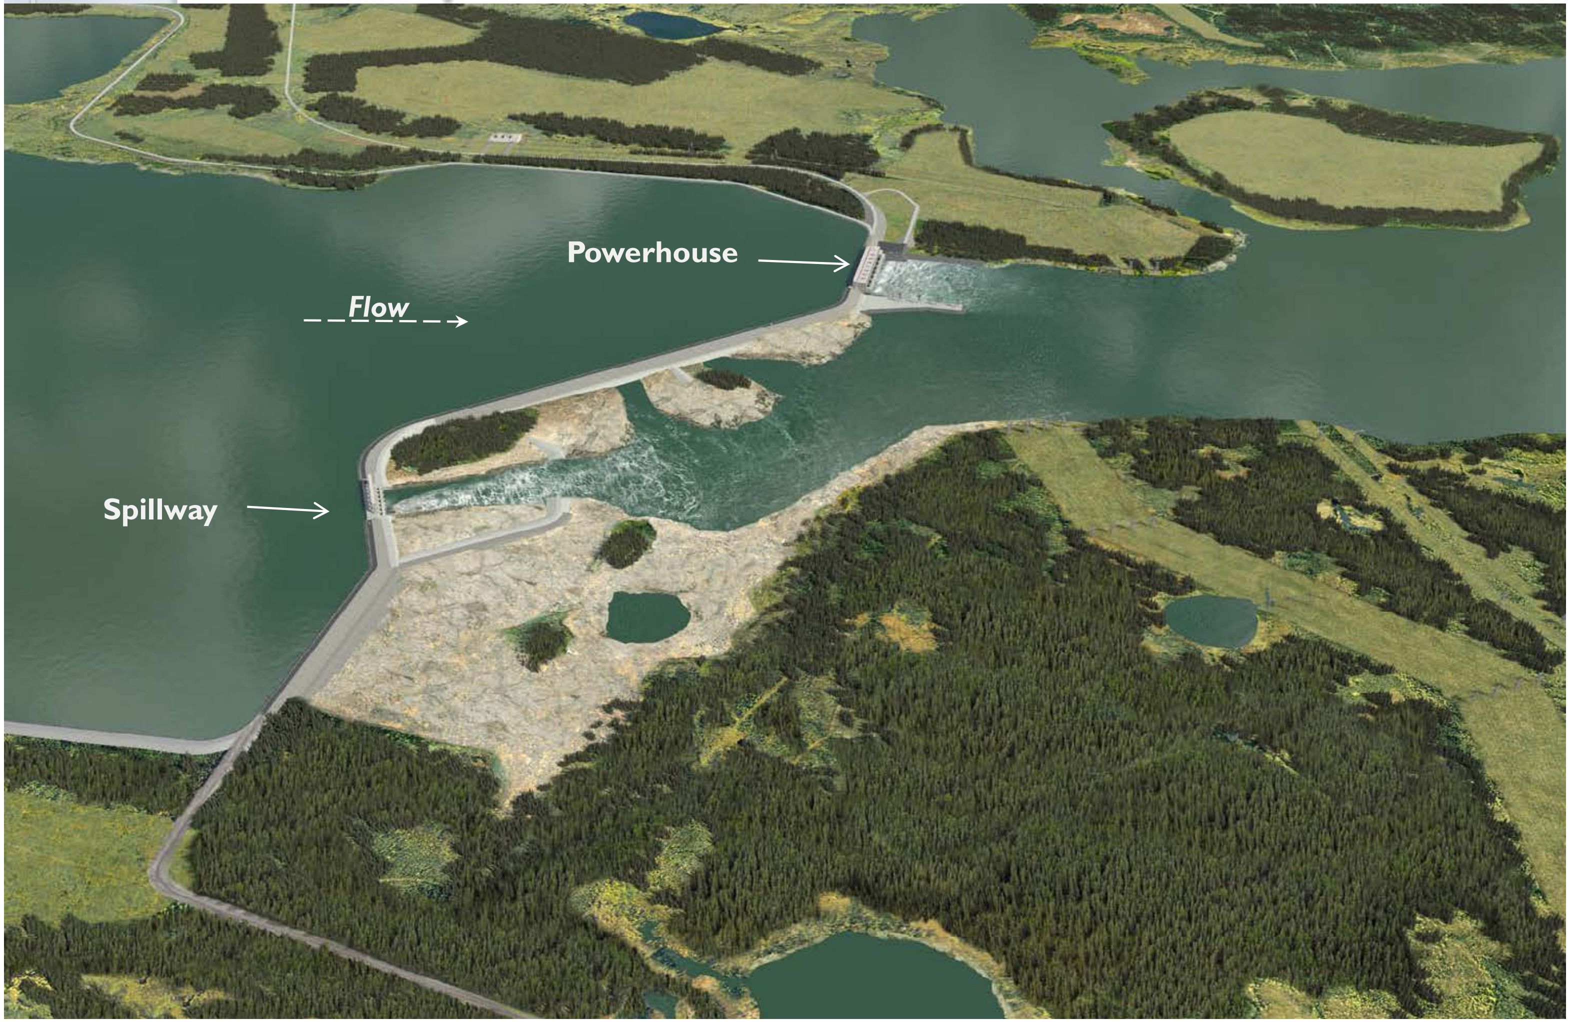
- The Keeyask General Civil Contract (GCC) will be the largest valued contract in Manitoba's history.

- GCC includes:
    - Cofferdam construction & River management
    - Excavation
    - Concrete for Powerhouse Complex and Spillway
    - Earth Dams
    - Containment Dykes
    - Electrical and Mechanical works

Project Location



Principal Structures



Cofferdam/River Management

Excavation

Powerhouse Complex and Spillway

KEEYASK

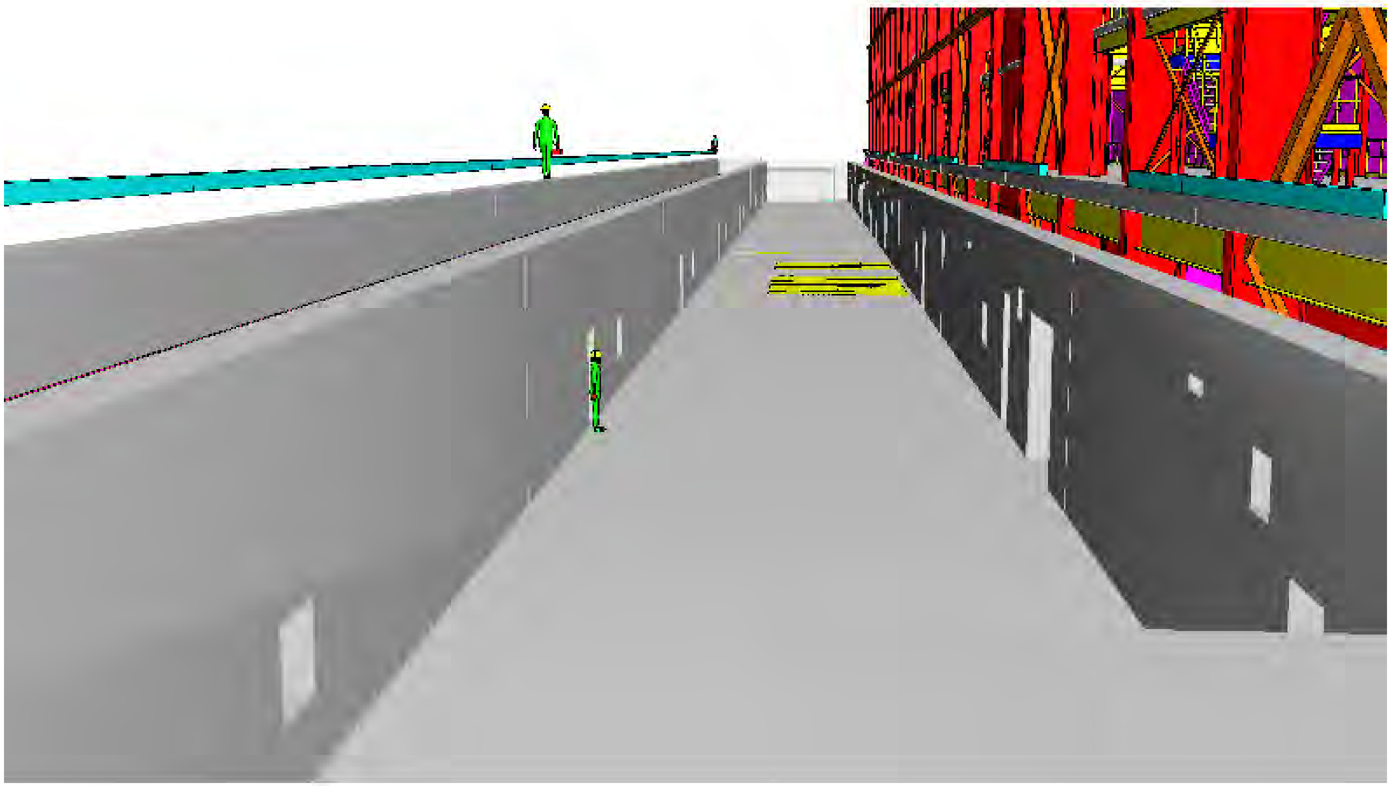
Earth Dams

2010/ 8/ 7

09 07 2011 14 57

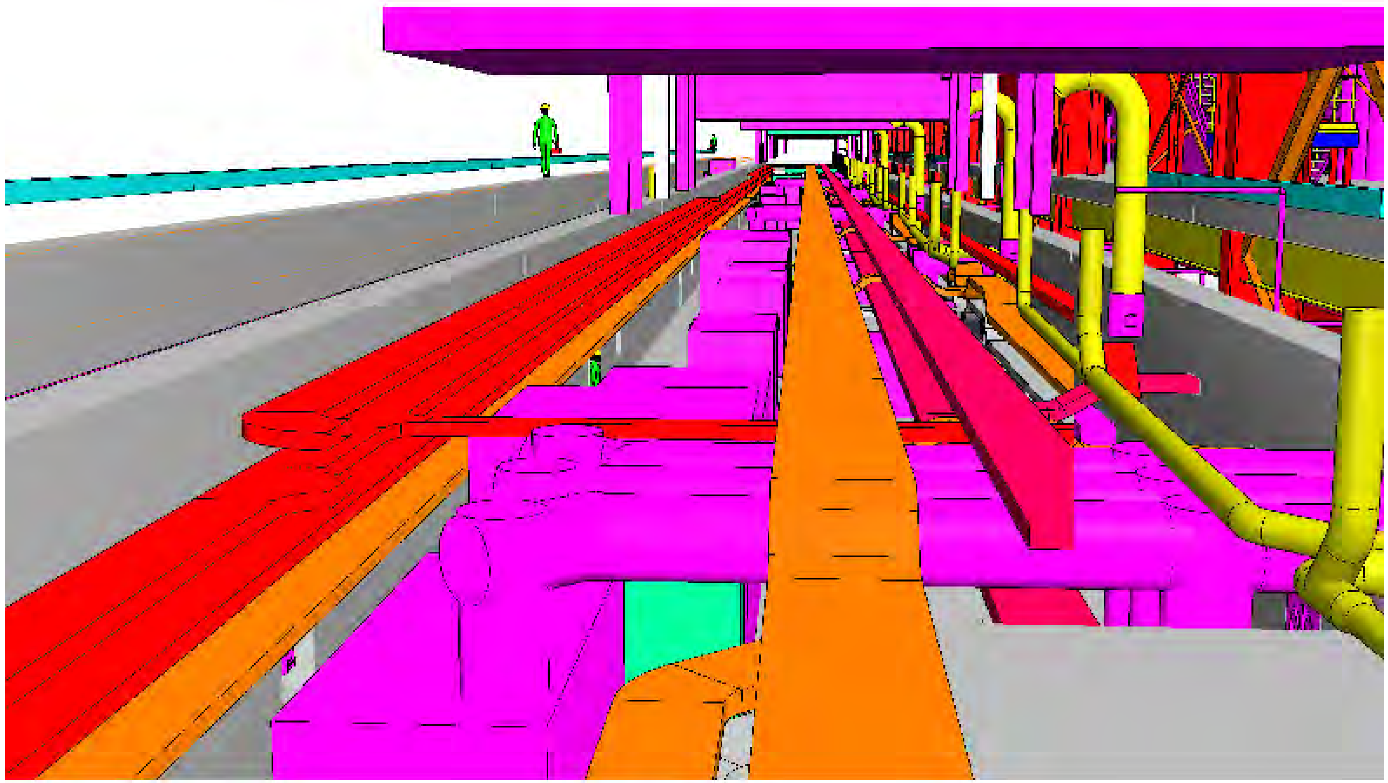
Containment Dykes

Electrical and Mechanical



Electrical and Mechanical

Include E&M works in the GCC



Lessons Learned (PdB and Wuskwatim)

- Include E&M works in the GCC
- Allow time to develop work plans
- Manage engineering to ensure efficient construction
- Initial bid price is not equal to the target price
- Bonuses tied to leading indicators of success
- Market the Contract
- Select a GCC competitively on pricing
- Face time is critical to success.
- Negotiate contract during proposal phase

Project Delivery Strategy

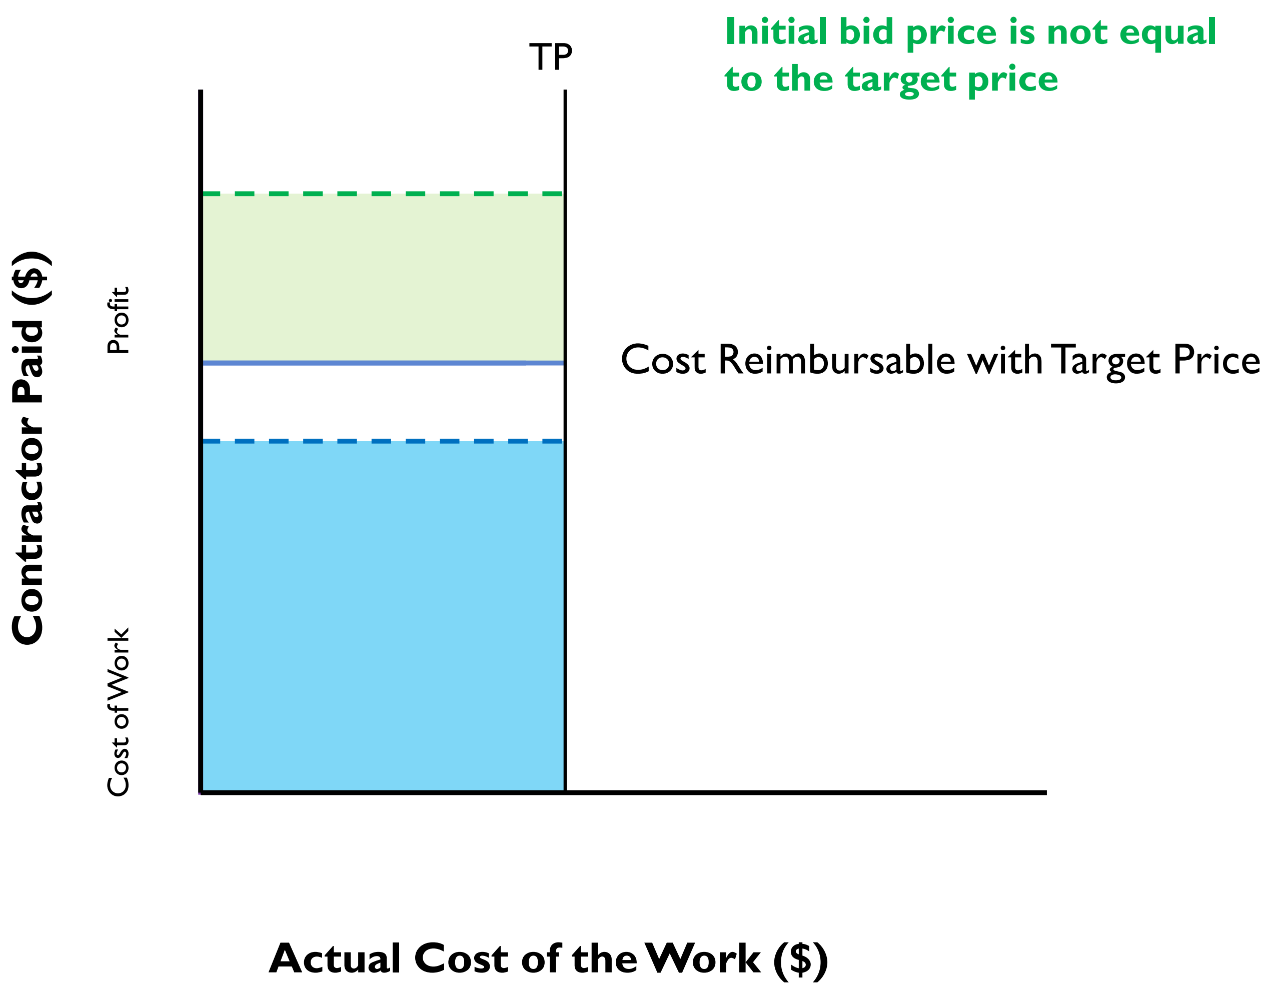
- Early Contractor Involvement (ECI) was selected for the GCC.

Allow time to develop work plans

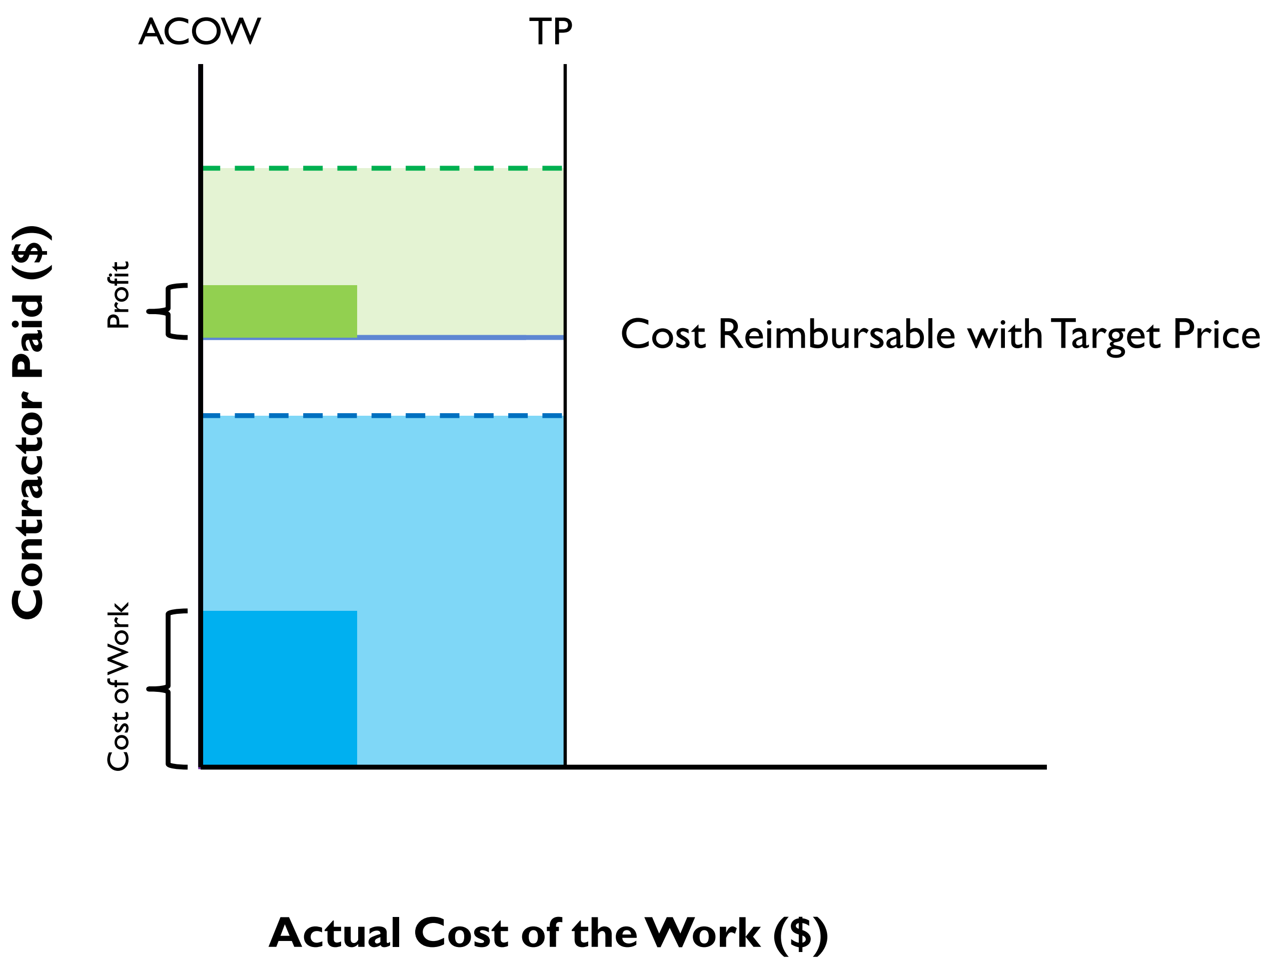
Manage engineering

- Goals of the ECI:
  - Develop Construction Plans
  - Provide opportunity for value engineering and schedule advancements
  - Contractor has a better understanding of our specifications

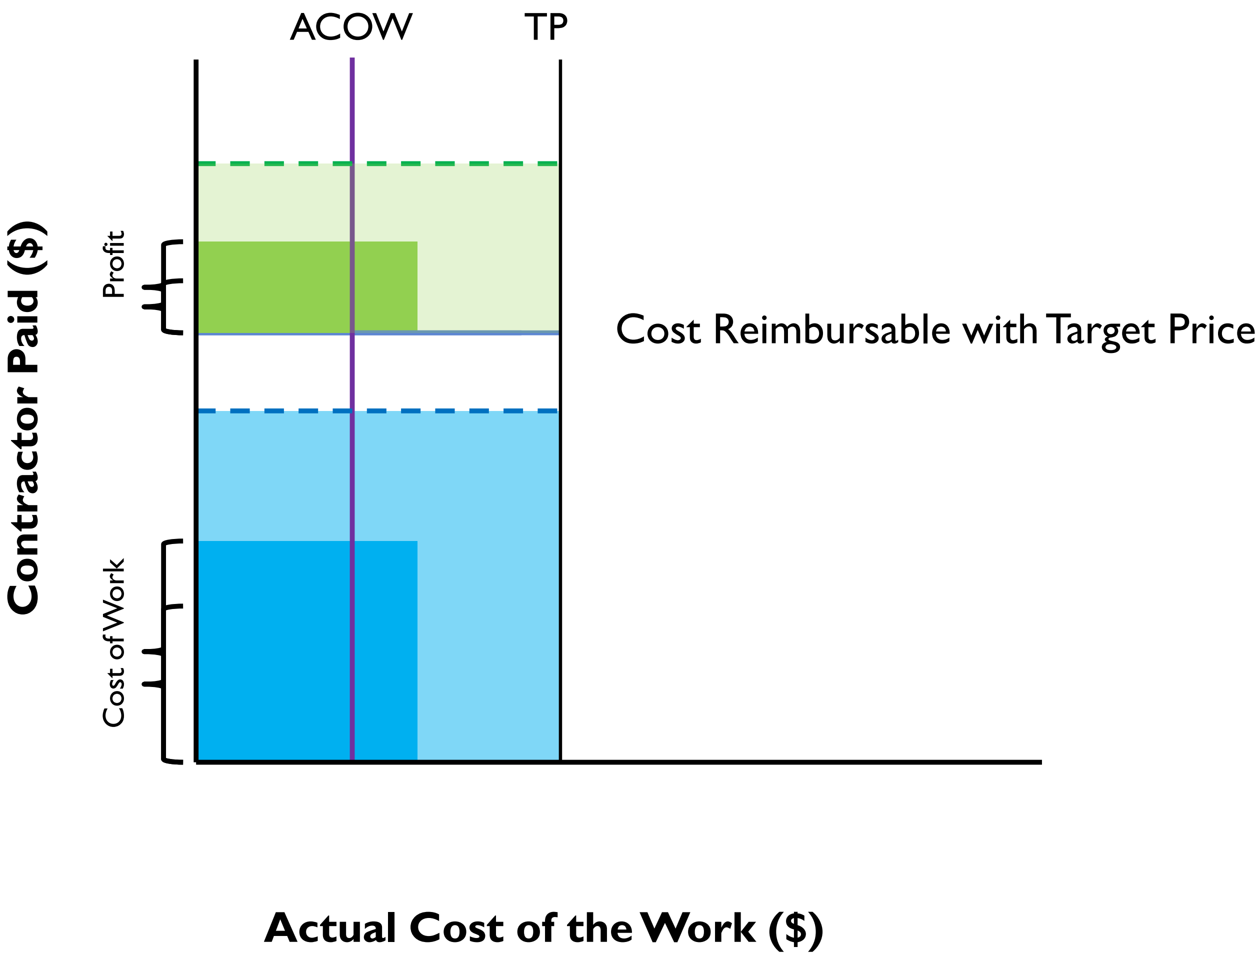
Contract Model



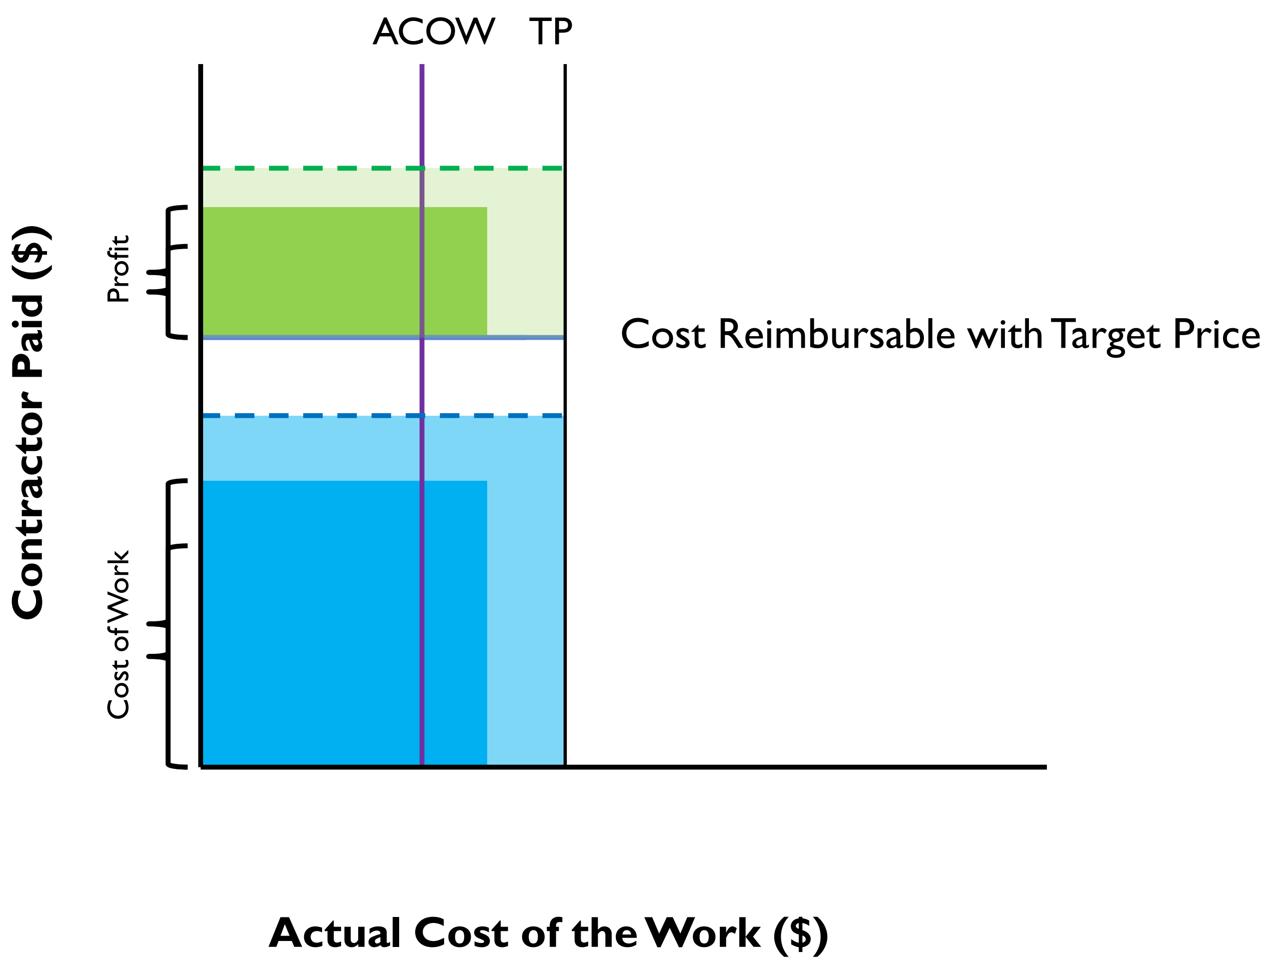
Contract Model



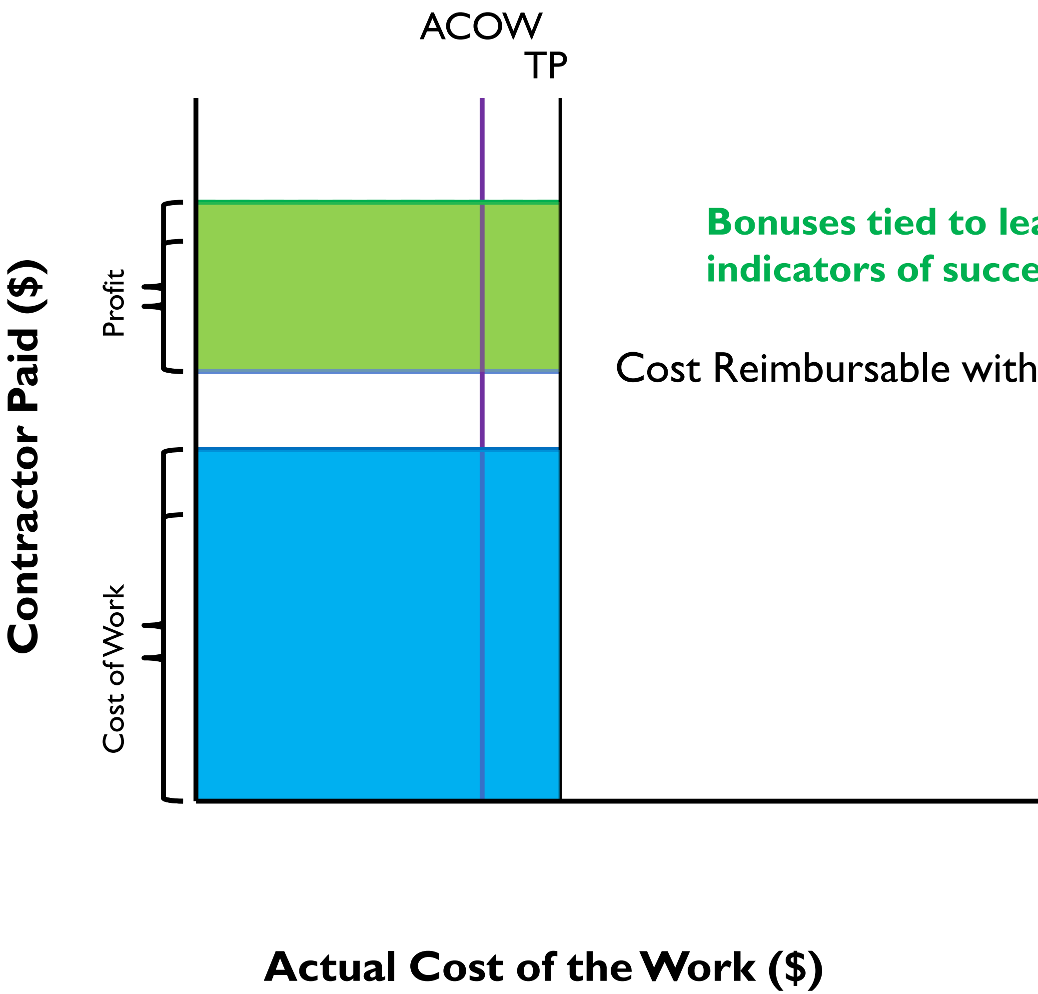
Contract Model



Contract Model



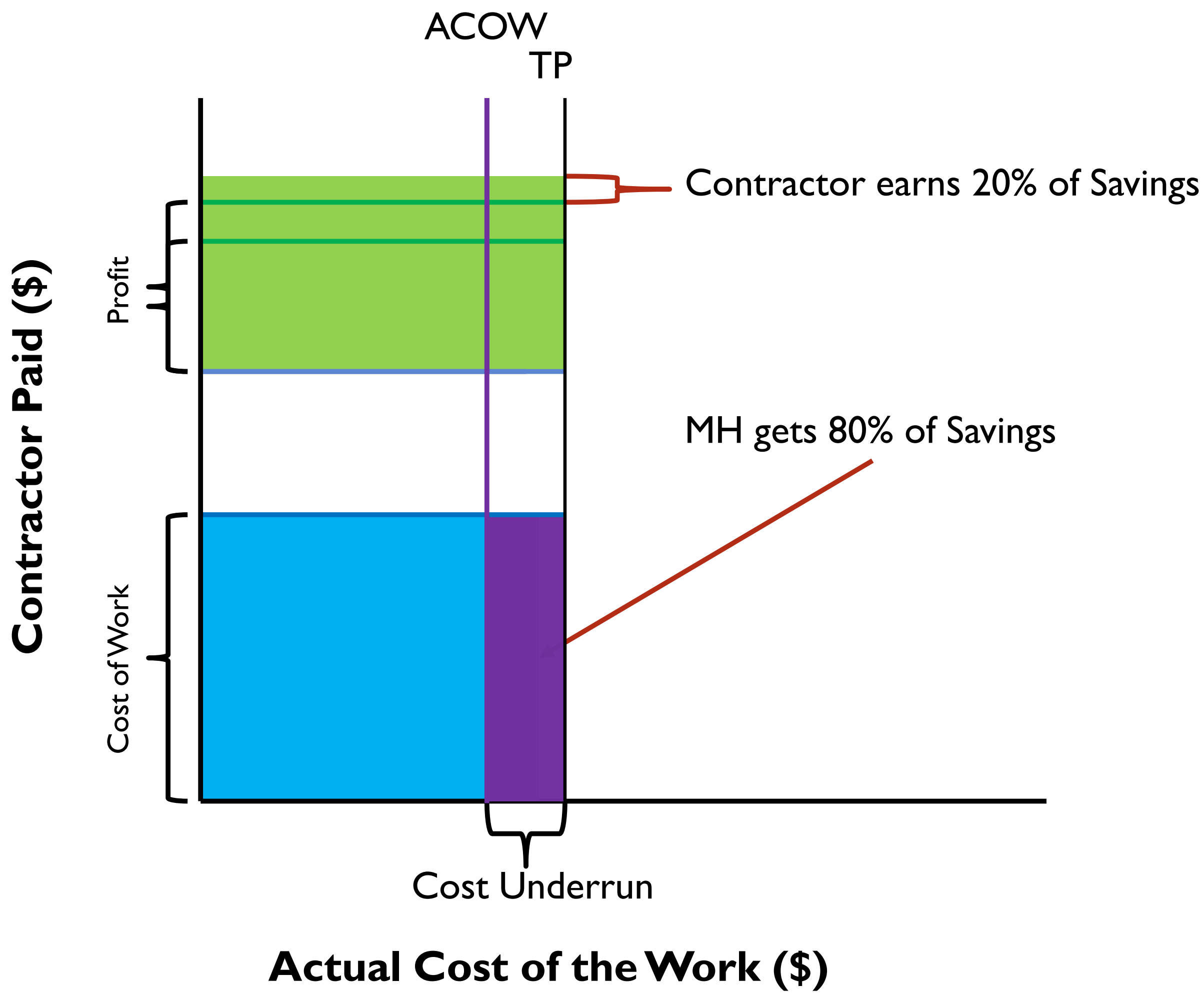
Contract Model



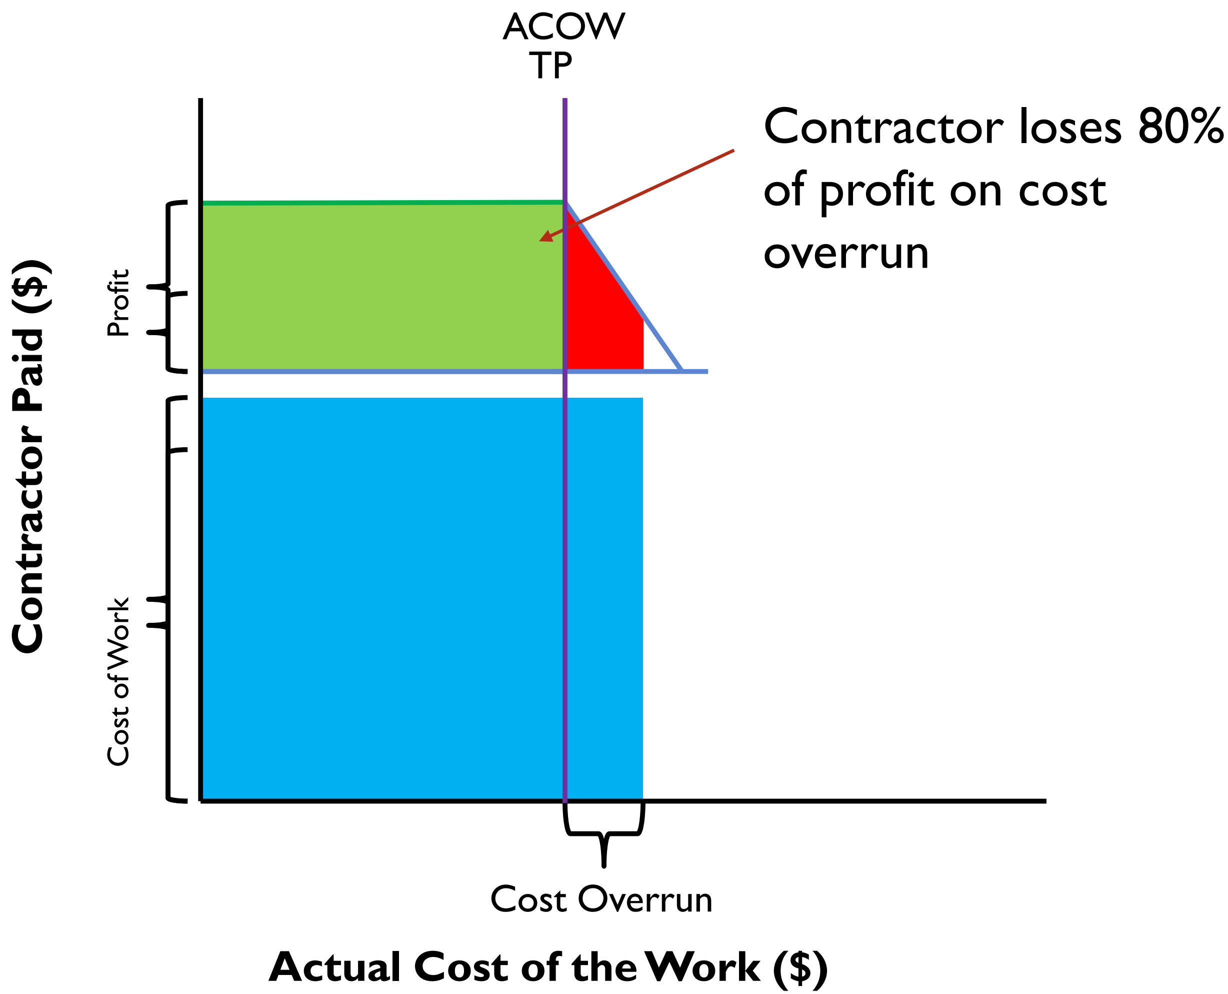
Bonuses tied to leading indicators of success

Cost Reimbursable with Target Price

Contract Model – Below Target



Contract Model – Above Target



GCC Procurement Strategy

- 3-Step Procurement:
- Market Sounding

Market the Contract

- Pre-Qualification Phase
  - 4 of 7 Respondents qualified based on their capacity to meet MH critical success factors

- Proposal Phase

Select GCC competitively on pricing

  - Proposals close December 5th
  - Proposals based on the current design in a competitive process
  - Ensures future changes can be managed based on the competition

Pre-Qualified Proponents (4)

- BBE (JV)
  - Bechtel Canada Co. (lead), Barnard Construction of Canada Ltd. and EllisDon Civil Ltd.
- Dragados/Ledcor/Bird (JV)
  - Dragados (lead), Ledcor & Bird Industrial
- Peter Kiewit Infrastructure Co.
- UAB (JV)
  - URS (lead), Alberici and Black & McDonald

Face time is critical to success

Proposal

- Contractual terms negotiated with the four proponents during the RFP period.

Negotiate contract during proposal phase

- Contractor will be selected based on best value to MH, not strictly based on the Bid Price.

- Proposals will be based on BNA.
  - Will submit recommended modifications to BNA conditions

BNA Modifications

- Proposed changes will likely include:
  - Wage rates
  - Retention incentives
  - Provision for Temporary Foreign Workers

- BNA alternations will improve the project value and project schedule.

Evaluation - Value Adjustments

- Items that will directly impact MH costs:
  - Initial Target Price
  - Corporate Overhead and Profit
  - Benefit for early in-service
  - Penalties for late in-service
  - Changes in camp size
  - Adjustments to other contracts (i.e. T&G)
  - Camp Operating cost
  - Sensitivity adjustment on quantities

Evaluation - Value Adjustments

- Financing cost to proposed cash flow
- Escalation Adjustment
- Cost of Purchaser Delay (1 year)
- Breakage fee for Termination for Convenience
- MB Content

- Quality Items:
  - Project team
  - ECI team
  - Methodology

Project Budget

- Keeyask budget is $6.2B based on a 2019 in-service.

Construction	$3,450 M
Licensing (pre-construction)	$629 M
Interest & Escalation	$1,641 M
Total Budget Authorized to the President	$5,720 M
Management Reserve	$ 500 M
Total Budgeted Cost	$6,220 M

- Use of management reserve requires approval of the board.

GCC Value

- Largest single contract representing half of the construction costs.
- The estimated GCC Purchase Order upset limit is $1.7B.
- Escalation and taxes will be extra.
- May require additional top up from the $500 Management Reserve due to potential BNA changes.

Timeline of Procurement Process

Item	Date
RFP Close	December 5
RFP Evaluations	Dec to Jan
Negotiations with Preferred Proponent	January
Board Recommendation	February
Award Contract	March 4
Construction Start	June 29

February Board Recommendation

- The recommendation will be a value higher than the target price.

- The recommendation will be in the range of $1.7B plus additional top up from the Management Reserve to cover any BNA changes.

Questions?

EXECUTIVE COMMITTEE RECOMMENDATION

SUBJECT:

Keeyask Project – General Civil Works Contract 016203

RECOMMENDATION:

That the Executive Committee recommend to the Manitoba Hydro Electric Board that it approve a contract to the Bechtel Barnard EllisDon joint venture at a price not to exceed [redacted] excluding taxes and escalation.

BACKGROUND:

In March of 2013 four proponents were prequalified to submit a proposal. The proponents included Bechtel Barnard EllisDon joint venture (BBE), Peter Kiewit Infrastructure (PKI), Dragados Ledcor Bird (DLB) and URS, Alberici and Black and MacDonald (UAB). A request for proposal (RFP) was issued to the four proponents on June 7, 2013 with a closing date of December 5, 2013. All four proponents submitted a proposal.

The scope of work for the General Civil Contract includes: river management, rock and unclassified excavation, concrete for the powerhouse and spillway, earth structures and electrical and mechanical works.

The contract is a cost reimbursable, target price contract with an Early Contractor Involvement (ECI) process. In this model, Manitoba Hydro pays the actual cost of the work, but the Contractor is at risk to the limit of the profit and bonus for any target price overruns. Any target price under run is shared, 80% to Hydro and 20% to the Contractor. The ECI will allow the contractor to influence the design for constructability resulting in lower risk and possible cost savings. The ECI will also be used to develop the construction sequence so the site team is better prepared to deliver the project on schedule.

The Initial Target Price (ITP) for the four proposals is outlined below. This includes the Contractors profit percentage and General Administration and Overhead (GA&O).

	BBE	DLB	UAB	PKI
ITP	[redacted]	[redacted]	[redacted]	[redacted]

BBE has the best evaluated cost and demonstrated that they have the knowledge and experience to complete the work. BBE indicated they are willing to enter into a contract with Manitoba Hydro based on the negotiated commercial conditions.

The initial target price of [redacted] is greater than our point estimate of [redacted] and requires the addition of [redacted] from the contingency pool. The upset limit of the Purchase Order consists of the following items:

A) Purchase Order (external) = Initial Target Price:	[redacted]
B) Contractors Bonus	[redacted]
C) Contingency for Manitoba Hydro held risks – this includes quantity variation, engineering scope changes, permitting, Purchaser caused delay, force majeure, etc.	[redacted]
Purchase Order Upset Limit (internal)	[redacted]

JUSTIFICATION:

Bechtel is an experienced contractor and was involved in the construction of the civil works for the Limestone Generating Station. Bechtel also has experience gained from other dam construction projects. Barnard brings extensive experience in construction of large earth structures and has demonstrated they utilize modern technology to manage large earthmoving projects. EllisDon has local experience with the labour markets in Manitoba and Canada with the recent completion of the Winnipeg International Airport.

BBE demonstrated a good understanding of the scope of work in their proposal and during the proponent presentations. They are the lowest cost and offer the best value to the project.

RISKS:

If BBE does not achieve productivity estimates the $0.[redacted]B labour management reserve would have to be used. Concrete productivity assumptions are the primary difference between their price and the price of the other proponents. BBE demonstrated they are carrying contingency for this risk and will work with Manitoba Hydro during the Early Contractor Involvement (ECI) phase to develop plans to recover the schedule in the winter for productivity shortfalls. The contractor is at risk to repay their profit when the target price is exceeded.

Attachments

Table 1: Details of Purchase Order Upset Limit
Table 2: BBE Relevant Project Experience

Table 1: Details of Purchase Order Upset Limit

Initial Target Price	[redacted]
Contractors Bonus	[redacted]
Contingency for Manitoba Hydro held risks – This includes quantity variation, engineering scope changes, permitting, Purchaser caused delay, force majeure, etc. • Quantity Risk – (5% for concrete works, 10% for dams, 15% for embankment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation). • Contract Changes (Extra Work Orders & Change Orders, including contractors profit and Indirects.) Wuskwatim experienced 5% change; therefore carry 5% of ITP. • Purchaser Caused Delays (forest fires, civil unrest, blockades, contract interface issues, etc.) – Carry 2% of ITP.	[redacted] [redacted] [redacted]
Total Purchase Order Upset Limit (internal)	[redacted]

Table 2: BBE Relevant Project Experience

Project - yr completed	Concrete Volume (cubic meters)	Earthwork Volume (cubic meters)	Contract Value	Other Information
Bechtel				
Limestone Generating Station - 1992	650,000	7,100,000	$236 M	Lead JV partner
Itiquira Hydro	77,000	5,500,000		Bechtel provided supervisory personnel, and were responsible for complete direct-hire construction
James Bay Hydro - 1985	1,800,000	203,000,000	$5.8B	Lead JV partner
Kemano Completion Project	3,500	16,000		Prime Contractor
Prairie State Energy Campus - 2012	125,000	2,000,000		Prime Contractor
Surmont Phase 2		2,500,000		Prime Contractor
Ankara – Gerede Motorway Turkey Highway, Bridges - 1998	1,273,000		$1.22B	Integrated JV
Jamnagar Refinery Complex Port, India - 2000	1,200,000		$6B+	Engineering, procurement, project management, and construction consulting
Muscat International Airport, Oman - Current	473,300 of 505,500 placed		$1.8B	Prime Contractor
CSPC Nanhai Petrochem Complex, China - 2006	413,000		$3.0B	Prime Contractor
Croatian Motorway, Croatia - 2004	400,000		738 M Eur	Managing Construction and Design
Khursaniyah Gas Plant Saudi Arabia - 2008	314,000		$3.0B	Prime Contractor
Antamina Peru Dam Excavation - 2001	165,000			Prime Contractor
ALMA Smelter, Canada - 2001	165,000		$1.7 B	Construction, engineering & management
Tacoma Narrows	136,000		$482M	Engineering, procurement,

Suspension Bridge, US - 2007				construction, and project management
Fjardaal Aluminum Smelter - Iceland - 2007	135,322		$1.8 B	Prime Contractor
Barnard				
Saluda Dam Remediation, US - 2006	1,000,000 RCC, 23,000 concrete	11,500,000		Prime Contractor
Snoqualmie Falls Hydro, US - 2013				Prime Contractor
EAA A-1 Reservoir, US - 2006		18,750,000	$400M US	Joint Venture
Los Vaqueros Reservoir, US - 2012	5,200	795,500	$35.3M	Prime Contractor

Seymour Generating Station			$6.3M	Prime Contractor

EXECUTIVE COMMITTEE
MINUTES OF MEETING

Held 2014 02 25 at 8:30 a.m.
in the President's Meeting Room, 22nd floor, 360 Portage Avenue, Winnipeg

1476.02 ***Keeyask GS***

The President reviewed a paper dealing with the award of the Keeyask General Civil Contract and the implications of the contract value being higher than planned. It was agreed that the contract price should be shared with the Board and with the Public Utilities Board at the NFAT review. It was further agreed that, despite the reduced level of profitability, there continues to be a net economic benefit as well as intangible benefits and benefits for Manitobans for proceeding with Keeyask as planned.

BOARD RECOMMENDATION

SUBJECT:

Keeyask Project – General Civil Works Contract 016203

RECOMMENDATION:

That the Manitoba Hydro Electric Board approve a contract to the Bechtel Barnard EllisDon joint venture at a price not to exceed [redacted] excluding taxes and escalation.

BACKGROUND:

In March of 2013 four proponents were prequalified to submit a proposal. The proponents included Bechtel Barnard EllisDon joint venture (BBE), Peter Kiewit Infrastructure (PKI), Dragados Ledcor Bird (DLB) and URS, Alberici and Black and MacDonald (UAB). A request for proposal (RFP) was issued to the four proponents on June 7, 2013 with a closing date of December 5, 2013. All four proponents submitted a proposal.

The scope of work for the General Civil Contract includes: river management, rock and unclassified excavation, concrete for the powerhouse and spillway, earth structures and electrical and mechanical works.

The contract is a cost reimbursable, target price contract with an Early Contractor Involvement (ECI) process. In this model, Manitoba Hydro pays the actual cost of the work, but the Contractor is at risk to the limit of the profit and bonus for any target price overruns. Any target price under run is shared, 80% to Hydro and 20% to the Contractor. The ECI will allow the contractor to influence the design for constructability resulting in lower risk and possible cost savings. The ECI will also be used to develop the construction sequence so the site team is better prepared to deliver the project on schedule.

The Initial Target Price (ITP) for the four proposals is outlined below. This includes the Contractors profit percentage and General Administration and Overhead (GA&O).

	BBE	DLB	UAB	PKI
ITP	[redacted]	[redacted]	[redacted]	[redacted]

BBE has the best evaluated cost and demonstrated that they have the knowledge and experience to complete the work. BBE indicated they are willing to enter into a contract with Manitoba Hydro based on the negotiated commercial conditions.

The initial target price of [redacted] is greater than our point estimate of [redacted] and requires the addition of [redacted] from the contingency pool. The upset limit of the Purchase Order consists of the following items:

A) Purchase Order (external) = Initial Target Price:	[redacted]
B) Contractors Bonus	[redacted]
C) Contingency for Manitoba Hydro held risks – this includes quantity variation, engineering scope changes, permitting, Purchaser caused delay, force majeure, etc.	[redacted]
Purchase Order Upset Limit (internal)	[redacted]

JUSTIFICATION:

Bechtel is an experienced contractor and was involved in the construction of the civil works for the Limestone Generating Station. Bechtel also has experience gained from other dam construction projects. Barnard brings extensive experience in construction of large earth structures and has demonstrated they utilize modern technology to manage large earthmoving projects. EllisDon has local experience with the labour markets in Manitoba and Canada with the recent completion of the Winnipeg International Airport.

BBE demonstrated a good understanding of the scope of work in their proposal and during the proponent presentations. They are the lowest cost and offer the best value to the project.

RISKS:

If BBE does not achieve productivity estimates the $0[redacted]B labour management reserve would have to be used. Concrete productivity assumptions are the primary difference between their price and the price of the other proponents. BBE demonstrated they are carrying contingency for this risk and will work with Manitoba Hydro during the Early Contractor Involvement (ECI) phase to develop plans to recover the schedule in the winter for productivity shortfalls. The contractor is at risk to repay their profit when the target price is exceeded.

Attachments

Table 1: Details of Purchase Order Upset Limit
Table 2: BBE Relevant Project Experience

Table 1: Details of Purchase Order Upset Limit

Initial Target Price	[redacted]
Contractors Bonus	[redacted]
Contingency for Manitoba Hydro held risks – This includes quantity variation, engineering scope changes, permitting, Purchaser caused delay, force majeure, etc. • Quantity Risk – (5% for concrete works, 10% for dams, 15% for embankment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation). • Contract Changes (Extra Work Orders & Change Orders, including contractors profit and Indirects.) Wuskwatim experienced 5% change; therefore carry 5% of ITP. • Purchaser Caused Delays (forest fires, civil unrest, blockades, contract interface issues, etc.) – Carry 2% of ITP.	[redacted] [redacted] [redacted]
Total Purchase Order Upset Limit (internal)	[redacted]

Seymour Generating Station			$6.3M	Prime Contractor

COMMUNICATIONS IMPLICATIONS:

None.

MINUTES OF MEETING of The Manitoba Hydro-Electric Board held on Wednesday, February 26, 2014, at 8:30 a.m. in the Boardroom, 22nd floor, 360 Portage Avenue, Winnipeg.

845-14-06

G.P.F. Schick and R.J Wittebolle entered the meeting and reviewed a submission dated 2014 02 24 dealing with the award of the Keeyask General Civil Works contract. It was noted that there are provisions in the contract dealing with the risk of cancellation or delay to commencement of the contract.
Following discussion, the Board resolved as follows:
That the corporation be authorized to award the above contract to Bechtel Barnard EllisDon joint venture, at a price of up to [redacted] billion plus escalation.

Keeyask – General Civil Contract

Keeyask Generating Station
General Civil Contract Procurement

February 26, 2014

Major Capital Projects

Outline

- Scope of Work
- Proponents
- Initial Target Price
- GCC Purchase Order
- Contingency
- Management Reserve
- Labour
- Timeline

Scope of Work

- The Keeyask General Civil Contract (GCC) will be the largest valued construction contract in Manitoba Hydro's history.

- GCC includes:
  - Cofferdam construction & river management
  - Excavation
  - Concrete for Powerhouse Complex and Spillway
  - Earth Dams
  - Containment Dykes
  - Electrical and Mechanical works

Scope of Work

- GCC does not include:
  - Turbine and Generators (awarded to Voith)
  - Intake & Spillway Gates (3 companies Prequalified)
  - Environmental Mitigation
  - Cranes
  - Stoplogs
  - South Access Road (DNC)
  - Forebay Clearing (DNC)

Pre-Qualified Proponents (4)

- BBE (JV)
  - Bechtel Canada Co. (lead), Barnard Construction of Canada Ltd. and EllisDon Civil Ltd.
- Dragados/Ledcor/Bird (JV)
  - Dragados (lead), Ledcor & Bird Industrial
- Peter Kiewit Infrastructure Co.
- UAB (JV)
  - URS (lead), Alberici and Black & McDonald

Initial Target Price (ITP) $Billions

	MH	BBE	DLB	UAB	PKI
Initial Target Price *	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]

* Including GAO and Profit

ITP & PO Upset Limit

Contingency for Manitoba Hydro risk [redacted]

Total Purchase Order Upset Limit (internal) [redacted]*

* escalation and taxes extra

Contingency Breakdown

Quantity Risk – (5% for concrete works, 10% for major earth dams, 15% for containment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation).	[redacted]

Contingency Breakdown

Quantity Risk – (5% for concrete works, 10% for major earth dams, 15% for containment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation).	[redacted]
Contract Changes (Extra Work Orders & Change Orders, including contractors profit and indirects). Wuskwatim experienced 5% change, therefore carry 5% of ITP.	[redacted]

Contingency Breakdown

Quantity Risk – (5% for concrete works, 10% for major earth dams, 15% for containment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation).	[redacted]
Contract Changes (Extra Work Orders & Change Orders, including contractors profit and Indirects). Wuskwatim experienced 5% change, therefore carry 5% of ITP.	[redacted]
Purchaser Caused Delays (forest fires, civil unrest, contract interface issues, etc.) – Carry 2% of ITP.	[redacted]

Contingency Breakdown

Quantity Risk – (5% for concrete works, 10% for major earth dams, 15% for containment dykes, 25-100% for electrical and mechanical works, 20% for cofferdams, 10% for rock and unclassified excavation).	[redacted]
Contract Changes (Extra Work Orders & Change Orders, including contractors profit and Indirects). Wuskwatim experienced 5% change, therefore carry 5% of ITP.	[redacted]
Purchaser Caused Delays (forest fires, civil unrest, contract interface issues, etc.) – Carry 2% of ITP.	[redacted]
Total Contingency	[redacted]

Management Reserve

- Labour Productivity of the concrete is one of the items established as a risk that may require access to the Management Reserve funds.

- If required, KECD will present justification and seek Board approval to access the Management Reserve funds.

BBE ITP Lower than Others

- Controls on Costs
  - Bonus plan to assure reporting is undertaken to MH satisfaction
  - Very steep profit draw down
  - Bonus is returned if target is surpassed
  - ECI to assist in planning and increase probability of success

Labour

- Contract Requirements
  - The Contractor must follow the BNA
  - Manitoba Hydro requirement to utilize a minimum number of Manitoba Resident Level I Apprentices on the Site.
  - Manitoba Hydro requirement to conduct Project Employment Information Sessions.

Labour

- Opportunities

BNA	Hiring Preference
Stage 1	Northern Aboriginals residing in the CBNR area
	Northern Resident Union Members
	Other Northern Aboriginals
	Other Northerners
Stage 2	Manitoba Union Members
Stage 3	Other Manitobans
Stage 4	Others

Labour

- Opportunities
  - The Manitoba Resident Level I Apprentice will follow the BNA hiring preference.
  - Direct Negotiated Contract with Fox and York Keeyask JV to provide Employee Retention Services.
  - Up to 150 opportunities to be created for new people to join the Trades

Labour

- BBE Plan for On-the-Job-Training
  - Develop a project-specific staffing plan tailored to the construction schedule
  - Work with the trades unions to determine labour pool availabilities and assess skill levels
  - Implement measures to utilize people of the region
  - Aggressive utilization of Apprentices and other trade development programs.

Labour

- Once on the job BBE to Provide
  - Safety Training
    - Job Hazard Analysis
    - Aerial Work Platforms
    - Harness Awareness
    - Incident Investigation
    - First Aid
    - Confined Space Entry
    - Working at Heights
  - Environmental Training
  - Apprentice Mentoring Program

Labour

- BNA
  - BBE – No BNA Changes Required
  - Other Proponents Proposed BNA Changes
    - Increase hourly rates by 5 to 35%
    - Change isolation leave from 21/7 to 20/10.
    - Bonus of $2.60 to $15.60/hr paid upon return to site after isolation leave.

Timeline

- Mar 10th – Contract Signing
- Mar 11th – ECI Mobilization
- June 27th – Order in Council Received and site mobilization for Stage I CD
- July 15th – In-stream work starts
- May 1, 2016 – First Concrete
- November, 2019 – First Power

Contract Terms

- 2 rounds of review, comment and revision of the Contract Terms during RFP period.

- All Proponents agreed in principle to the Contract Terms before RFP close.

- MH and the Preferred Proponent completed final negotiations in less than 2 weeks.

Negotiations Highlights

- Reduced Bonus to [redacted]
- Used [redacted] to fund Best for Project Pool
- Set the Camp expectations
- Added wording to make design expectations clear
- No changes required to BNA

Allocation of Risk

- MH Risk
  - Actual Cost of the Work
  - Project Schedule
  - Contract Interfaces
  - Design
  - Escalation (labour and commodities)
  - Scope changes
  - Environmental Approval
  - Quantities
  - Geologic Conditions
  - River Flows above 1:20 yr

Allocation of Risk

- GCC Risk
  - Contract Schedule
  - Attraction/Retention of Staff and Craft
  - Labour productivity
  - Subcontracts

Budget

- Do we announce a CPJ change or is this separate? MH Pres to decide.

BBE ITP Lower than Others

Canadian LNG Projects

Context

Much has changed in the North American liquefied natural gas (LNG) market in the past decade. Throughout the early to mid-2000's, concerns over decreasing conventional supplies of domestic natural gas led to bullish predictions about future LNG demand in North America, resulting in an investment boom to build new LNG import facilities.

Around 2008, dramatic changes in the North American natural gas market began, driven by surging U.S. unconventional natural gas production (mostly from shale gas). This changed the outlook for LNG imports. Natural gas production increased, North American prices fell significantly, and the expected need for imported LNG collapsed. In fact, LNG exports began to be contemplated.

As unconventional gas production increases, the U.S. is becoming increasingly self-sufficient with respect to natural gas. Pipeline exports from Canada to the U.S. are decreasing. With ample unconventional resources, industry has shifted its focus from importing LNG into North America to exporting LNG from North America. The export of LNG could facilitate Canadian natural gas production growth and result in significant investment, jobs and economic growth.

Canadian LNG Projects

Eighteen LNG export facilities have been proposed in Canada – 13 in British Columbia, 2 in Quebec and 3 in Nova Scotia – with a total proposed export capacity of 216 Million tons per annum (mtpa) of LNG (approximately 29 Billion cubic feet per day (Bcf/d) of natural gas). Since 2011, 24 LNG projects have been issued long-term export licenses. Canada's only operational LNG terminal (an import terminal) is Canaport LNG's regasification import terminal located in Saint John, New Brunswick.

According to a Conference Board of Canada study, which estimates the potential contributions LNG exports may make to the Canadian economy, an LNG export industry equivalent to 30 mtpa in British Columbia could add roughly $7.4 billion to Canada's annual economy over the next 30 years, and raise national employment by an annual average of 65,000 jobs. The Government of Canada is working closely with British Columbia, other provinces and industry partners to create conditions to support the development of an LNG industry in Canada.

EXISTING IMPORT TERMINAL

Project	Location
Canaport LNG	Saint John, New Brunswick

Canadian LNG Import and Proposed Export Facilities

Project	Export Licence	Export Volume Million Tons per Annum (Mtpa) - Billion Cubic Feet per day (Bcf/d)	Cost of the Project ($Billion)

12765

13 West Coast (British Columbia) Export Terminals			
Kitimat LNG	20 Years	10 Mtpa - 1.3 Bcf/d	$15
LNG Canada	40 Years	26 Mtpa – 3.5 Bcf/d	$25-$40
Cedar LNG Project	25 Years	6.4 Mtpa – 0.8 Bcf/d	
Orca LNG	25 Years	24 Mtpa – 3.2 Bcf/d	
New Times Energy	25 Years	12 Mtpa – 1.6 Bcf/d	
Kitsault Energy Project	20 Years	20 Mtpa – 2.7 Bcf/d	
Stewart LNG Export Project	25 Years	30 Mtpa – 4.0 Bcf/d	
Triton LNG (On Hold)	25 Years	2.3 Mtpa – 0.3 Bcf/d	
Woodfibre LNG	25 Years	2.1 Mtpa – 0.3 Bcf/d	$1.6

Stolt LNGaz (Quebec)	25 Years	0.5 Mtpa – 0.7 Bcf/d	$0.6
Total		**216 Mtpa – 29 Bcf/d**	

Canadian Government Position

12767

The Minister of Natural Resources Canada has stated "*The Canadian Government is taking steps to grow the Canadian economy, create good jobs and opportunities for Canadians, while protecting our environment for future generations. As the Prime Minister has emphasized, in the 21st century we must get our resources to market sustainably and responsibly. For all natural resource projects, the government is working closely with provinces and territories, Indigenous peoples, and other interested parties to ensure that the highest standards of public and environmental safety are being met, while creating new export opportunities for Canada's natural resources.*"

Regulations and Permitting

While the ongoing operation of LNG terminals generally falls under provincial regulation, most LNG terminal proposals require both federal and provincial environmental assessments and permits.

Most of the proposed LNG facilities require new pipelines or the expansion of existing pipelines. Intra-provincial pipelines are provincially regulated, while pipelines that cross a provincial or international border are federally regulated. For more information on pipelines, please see Frequently Asked Questions (FAQs) Concerning Federally-Regulated Petroleum Pipelines in Canada.

A permit from the Canada Energy Regulator (CER), Canada's federal energy regulator, is required to export LNG from Canada. The NEB reviews export licence applications to ensure that the proposed volume of gas to be exported is surplus to Canadian requirements. Since 2011, 24 LNG projects have been issued long-term export licenses ranging between 20-40 years. More information on export licences is available on the CER's website.

LNG Facilities and Safety Regulations

LNG facilities are classified as industrial sites and must meet all federal, provincial and municipal standards, codes and safety regulations. These regulations are constantly updated to ensure that the health, safety and security of the environment and Canadian public are protected. The Canadian Standards Association (CSA) has a specific standard for LNG production, storage and handling (CSA Standard CAN/CSA Z276-01). This standard establishes essential requirements for the design, installation and safe operation of LNG facilities.

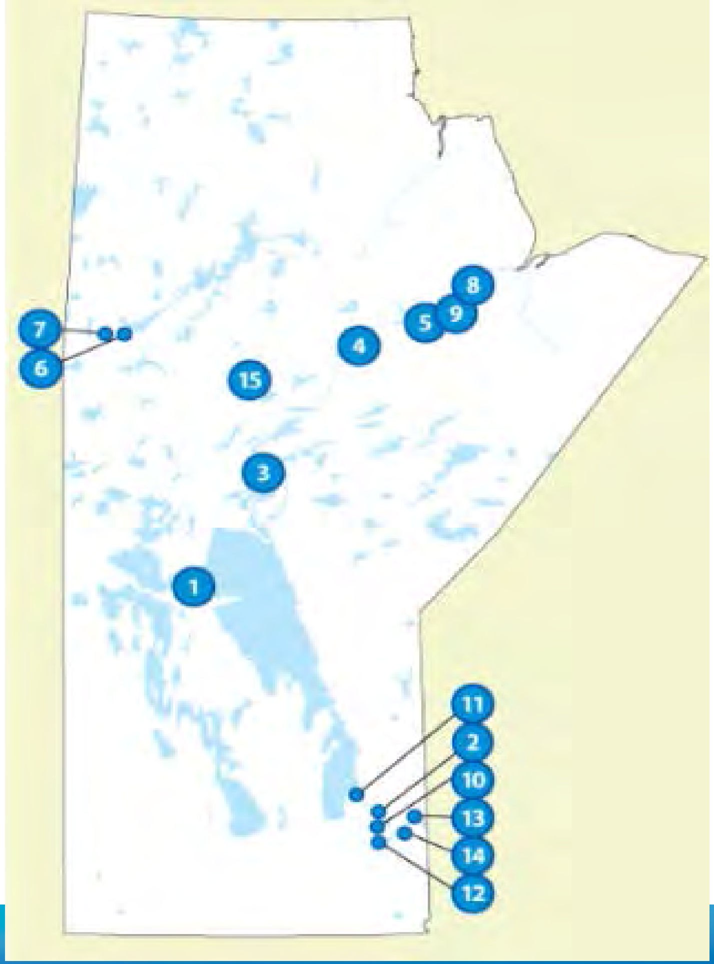
Keeyask Project Overview

- Lorne Midford P. Eng, MSc – Vice President, Generation & Wholesale
- Jeff Strongman P. Eng, MBA – Keeyask Business Manager
- Dave Bowen P. Eng, MSc– Keeyask Project Director

Manitoba Hydro System

Generation:

- 15 Hydro Generating Stations



Transmission:

- 3 HVDC converter stations
- 18,500 km of transmission lines
- Bipole I & Bipole II
  - 1,800 km HVDC

12772

Keeyask Overview

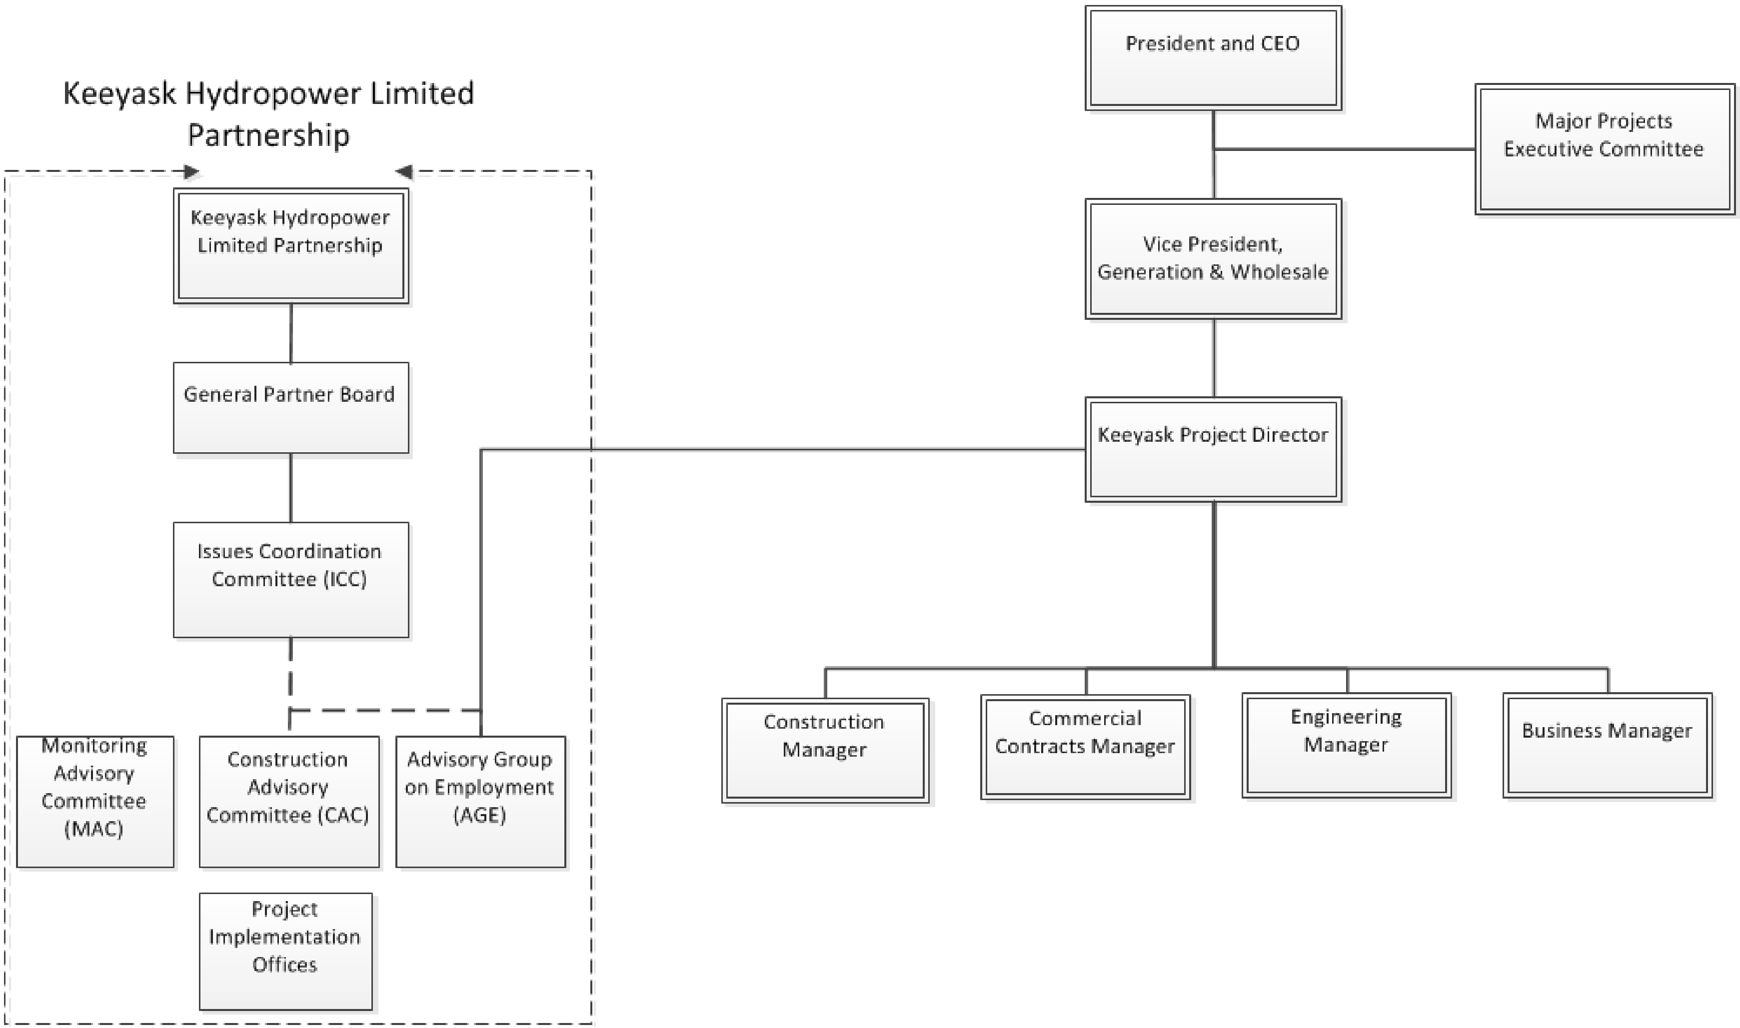
- Collaborative effort between Manitoba Hydro and 4 Manitoba First Nations working together as the Keeyask Hydropower Limited Partnership (KHLP).
  - Tataskweyak Cree Nation and War Lake First Nation (acting as the Cree Nation Partners);
  - York Factory First Nation; and
  - Fox Lake Cree Nation.
- The Partnership is governed by the Joint Keeyask Development Agreement (JKDA).
  - Long-term revenue opportunity for KCN communities
  - Training, employment and business opportunities during construction.

Respecting the Communities

- Incorporating the Cree world view into the project activities
- Face in the rock
- Community Liaison staff
- Involvement from partner communities

12774

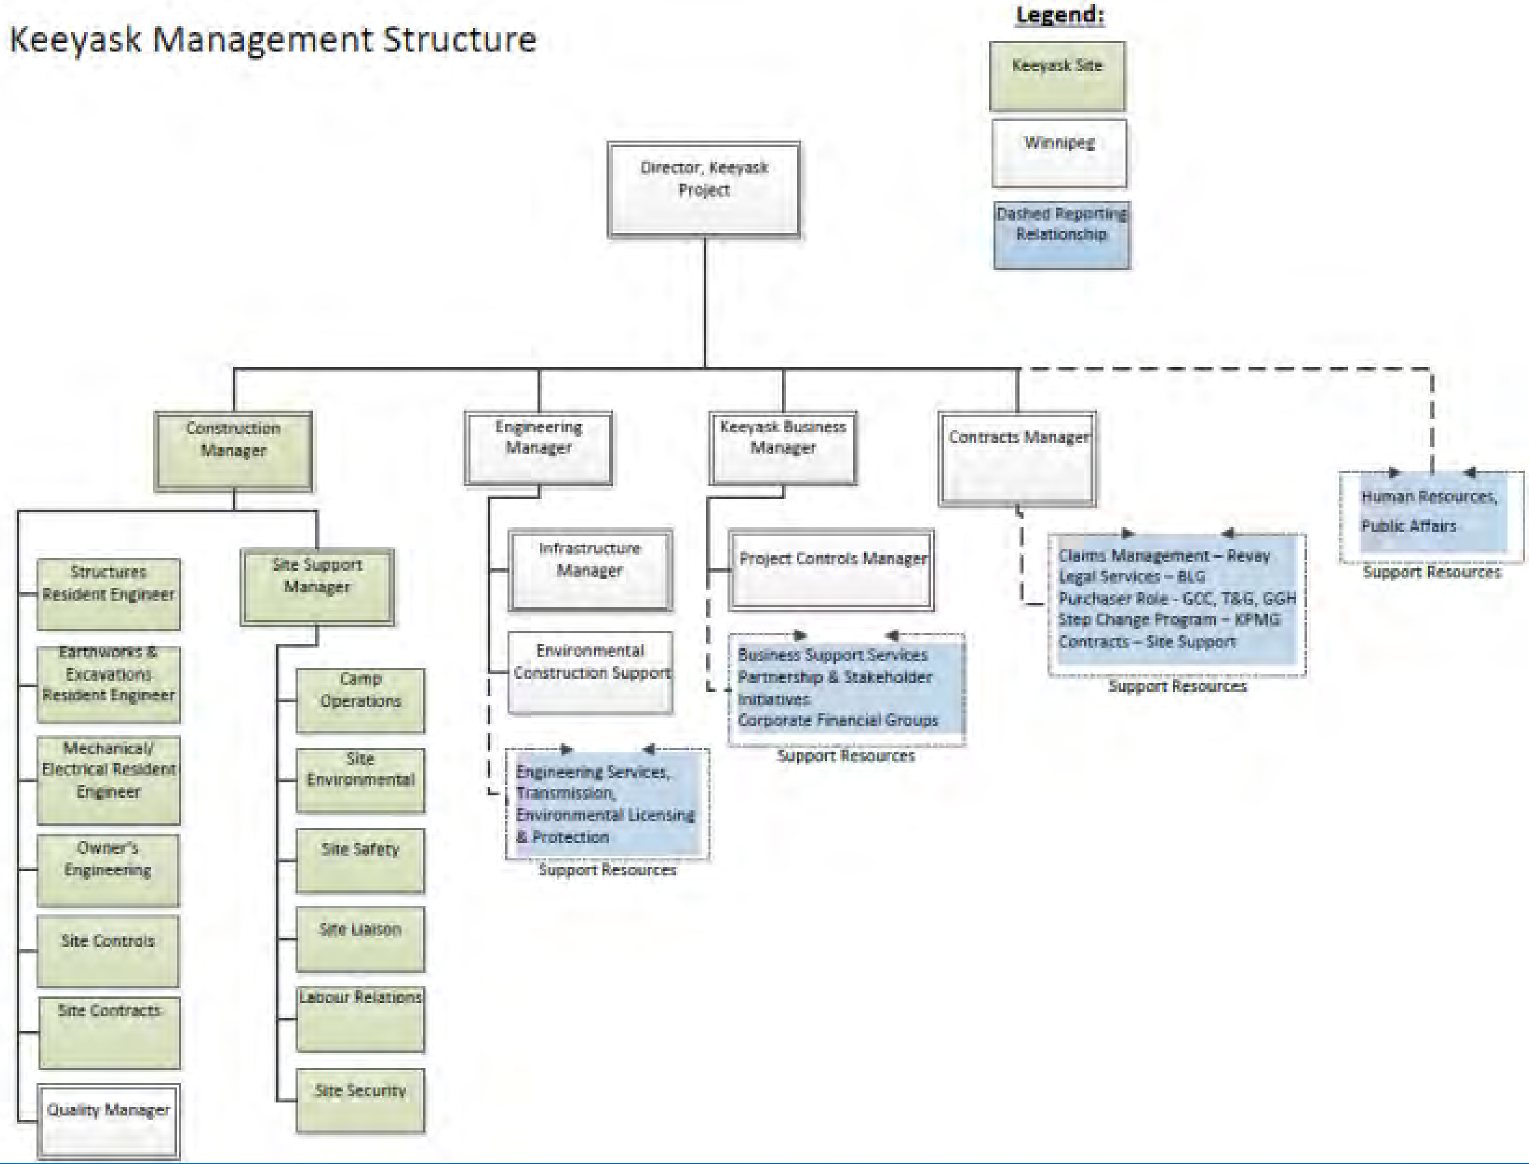
Project Governance Structure



Major Projects Executive Committee

- Established in early 2016.
- Oversees, directs, and make strategic decisions on Manitoba Hydro's major capital projects.
- Membership includes:
  - The President & CEO
  - VP Transmission
  - VP Generation & Wholesale
  - VP HR & Corporate Services
  - VP Indigenous Relations
  - VP Finance & Strategy
- Meeting every 2 weeks (or as required)

Project Execution Team



12777

What are we Building?

A 695-megawatt hydroelectric generating station

Keeyask Project includes:

- Powerhouse
- Spillway
- Dams & Dykes
- All supporting infrastructure (camp, roads, cofferdams)
- All required transmission facilities

Infrastructure

12791

Keeyask Transmission

The Keeyask Transmission Project fulfills two purposes:

1) Provide power to the Keeyask site during construction of the GS;
2) Facilities required to integrate power generated by Keeyask (when online) into the Manitoba Hydro system.

Lessons learned

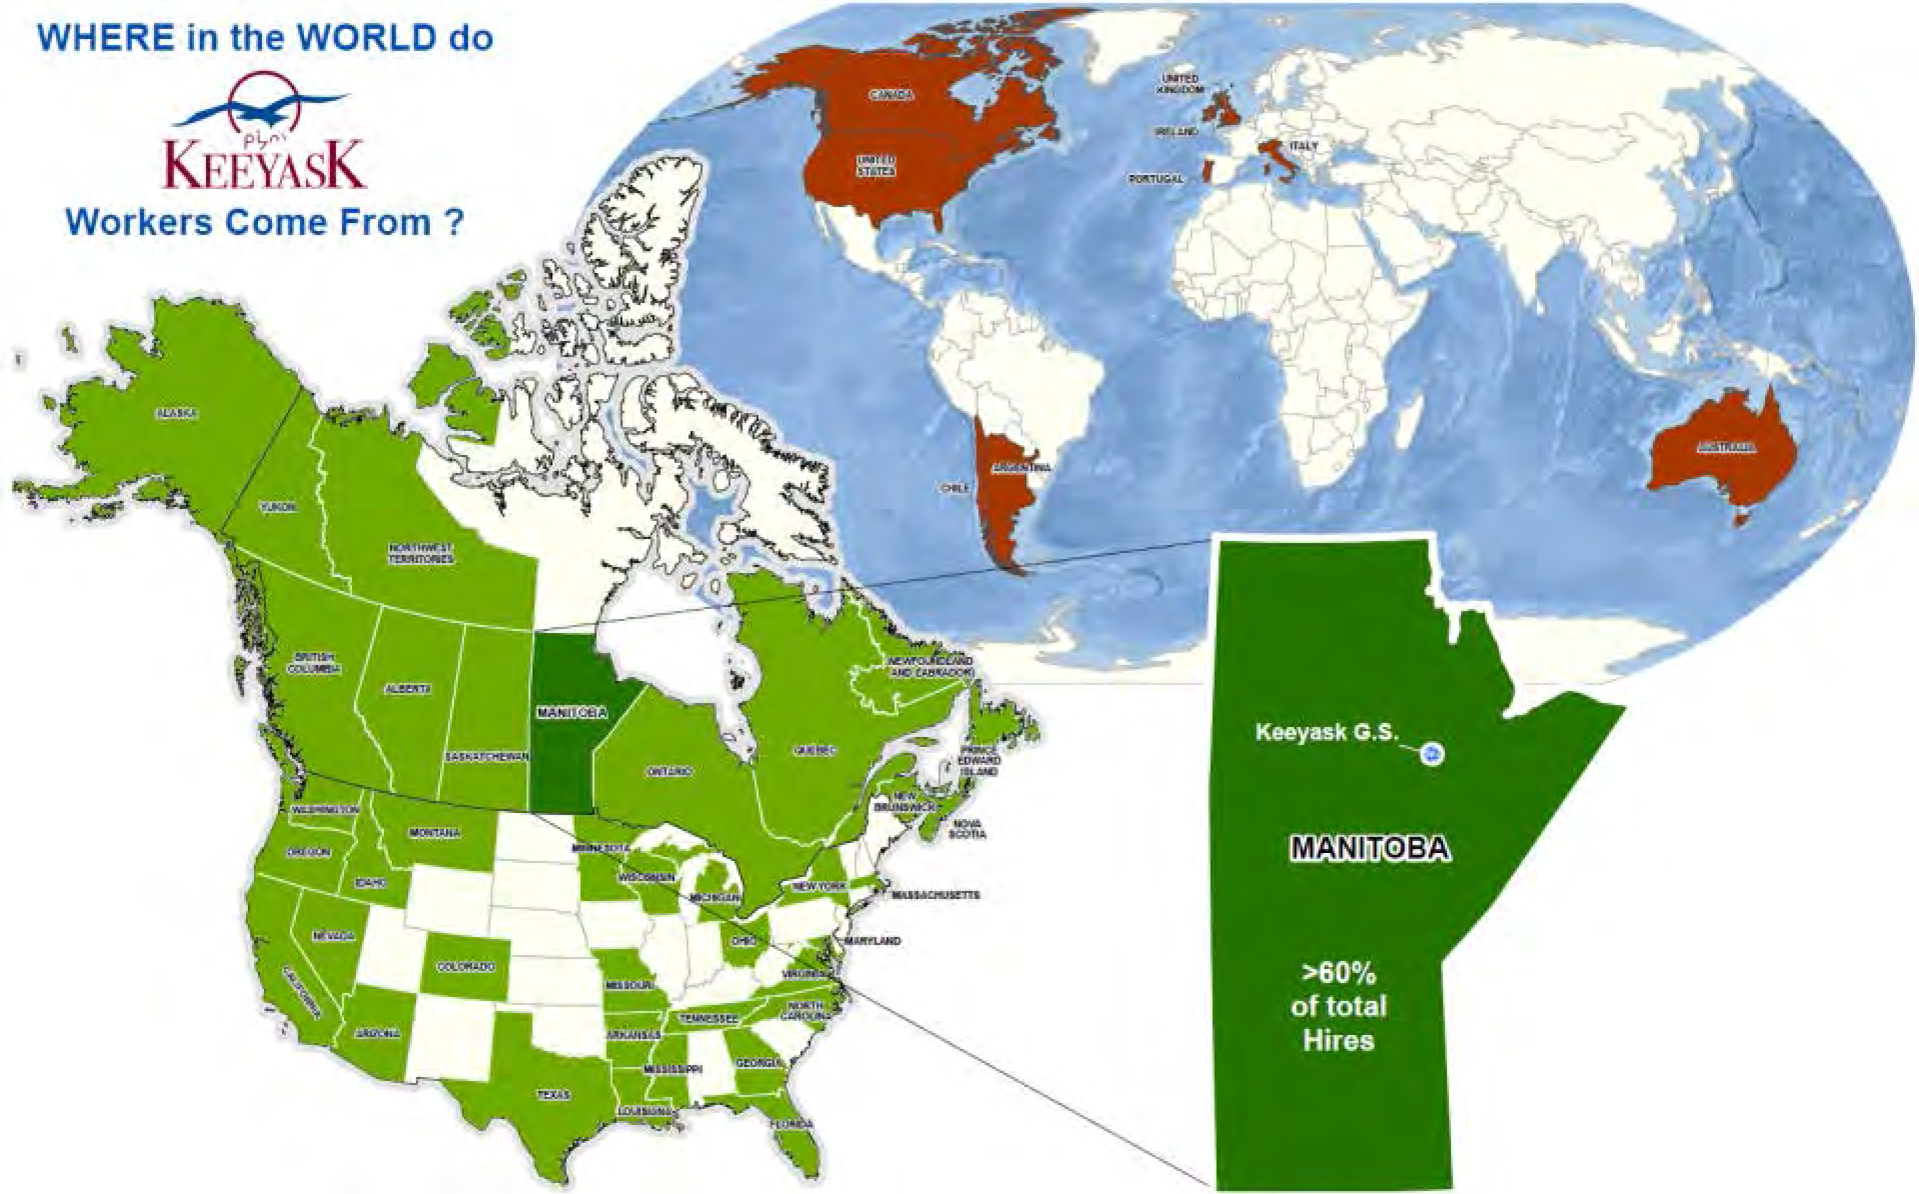
- Experience gained from past projects:
  - Early contractor involvement;
  - Contracting model;
  - Third-party reviews;
  - Continuous improvement and rigorous oversight;
  - Project integration;
  - Contract interfaces;

Complex Project Environment

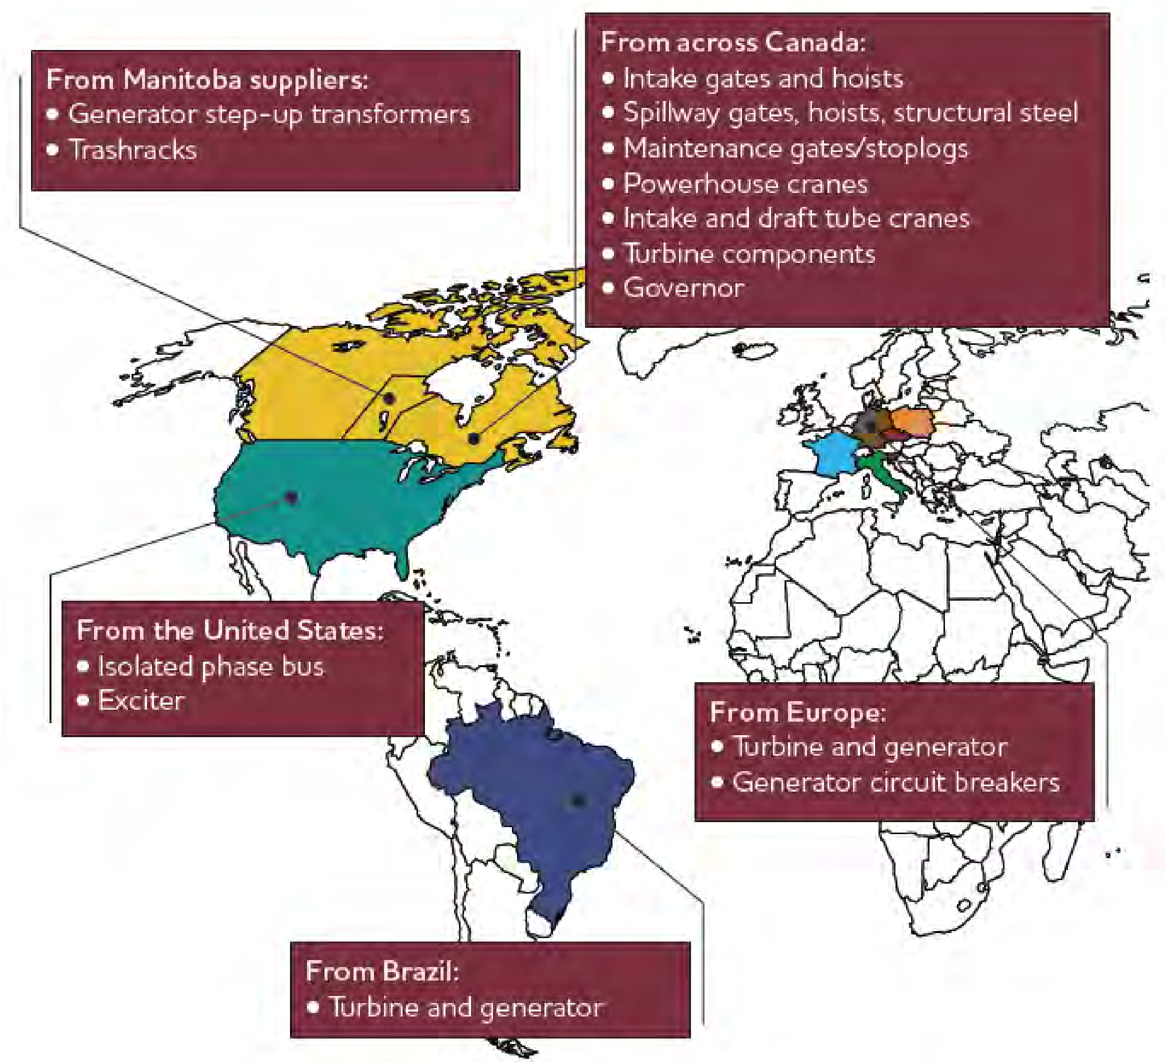
Employment

- Employment milestone reached this summer on Keeyask.
  - 2 million person hours worked by KCN members
  - 4 million person hours worked by Indigenous employees
- 73% of total hires are Manitobans.

WHERE in the WORLD do KEEYASK Workers Come From ?



Global Supply Chain



Keeyask Project Safety

- Strong safety culture
- Over 15 million person hours worked
- Better than industry standards
- GCC has gone over a year without a lost time incident
- MH and all our contractors will continue to focus on our goal of zero injuries

Delivery Strategy

- Contracting model for each scope of work.
- Considers market capacity
- Risk allocation

Types of Contracts

- Cost-reimbursable
- Target price
- Fixed price
- Unit price

Major Contract Types

Contract	Contractor	Contract Model
General Civil Works	BBE Hydro Constructors	Target Price
Camp Operation Services*	Fox, York & Sodexo JV	Cost Reimbursable
Main Camp	Britco	Fixed Price
Turbines & Generators	Voith Hydro	Fixed Price
Engineering – Final Design	Hatch	Cost Reimbursable with Cap
Maintenance Services*	Maintenance Services JV	Cost Reimbursable
South Access Road*	Amisk Construction	Unit Price
Reservoir Clearing*	Amisk Construction	Unit Price
Spillway GGH	Canmec Industriel	Fixed Price
Intake GGH	Canmec Industriel	Fixed Price
Security Services*	Fox, York and Sodexo JV	Cost-reimbursable

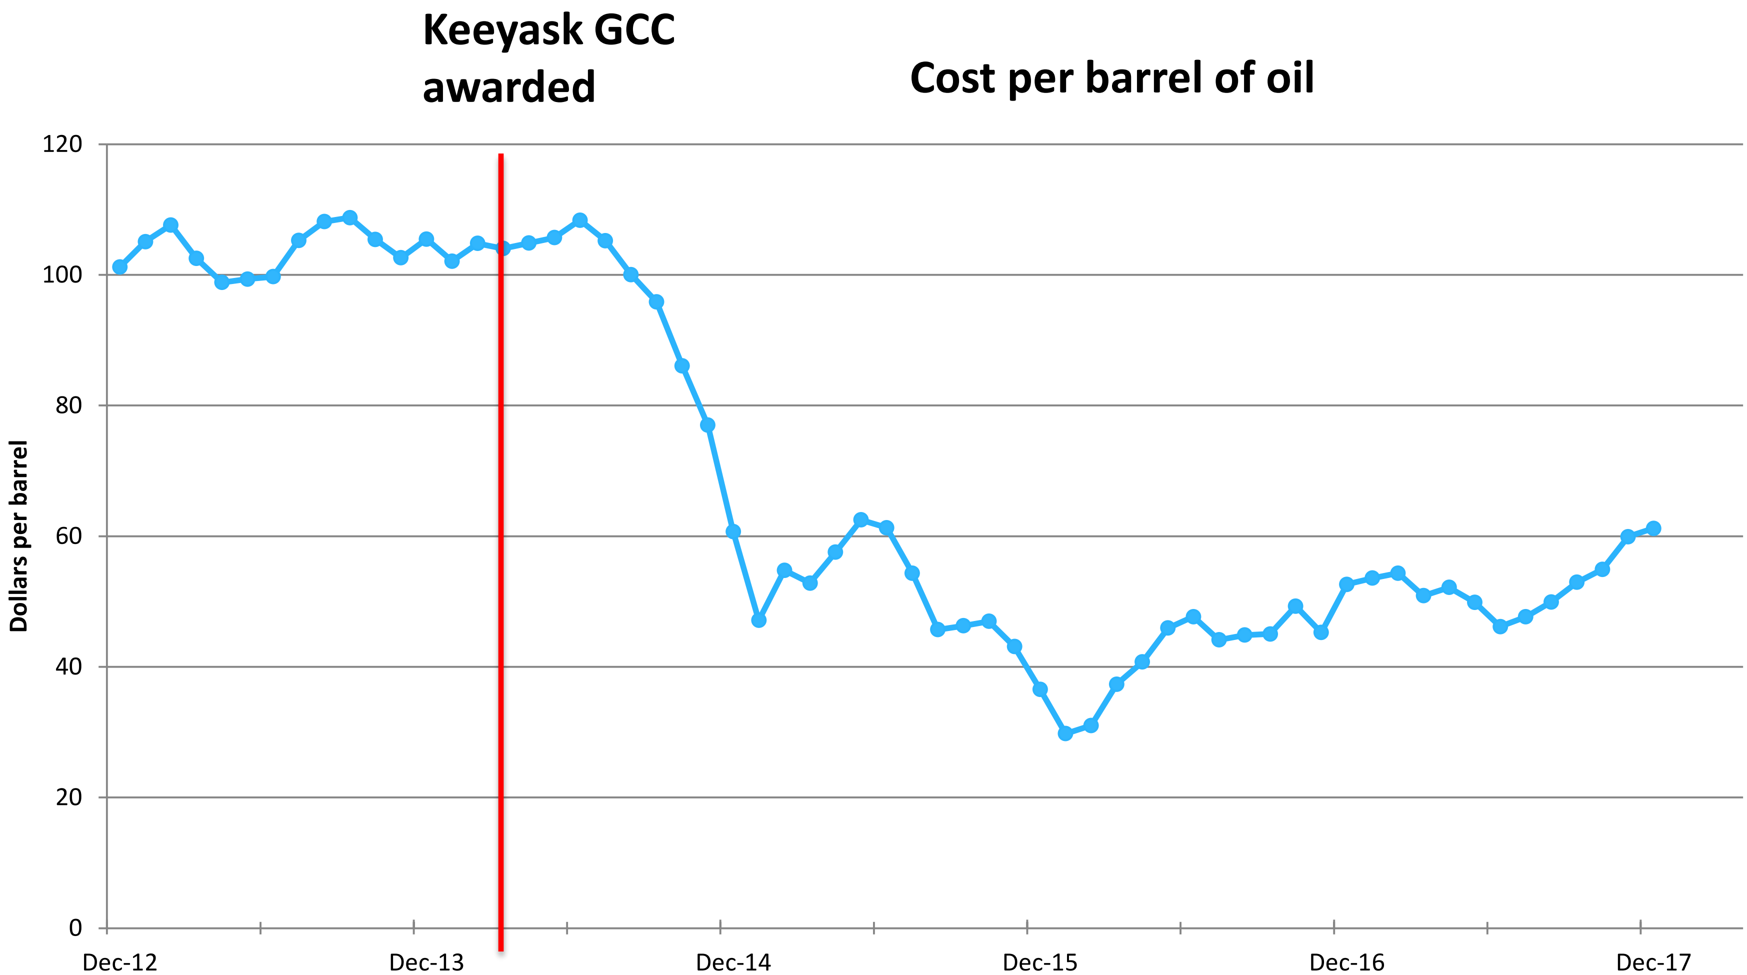
* Directly Negotiated Contract (DNC) with KCN businesses

Contract Complete

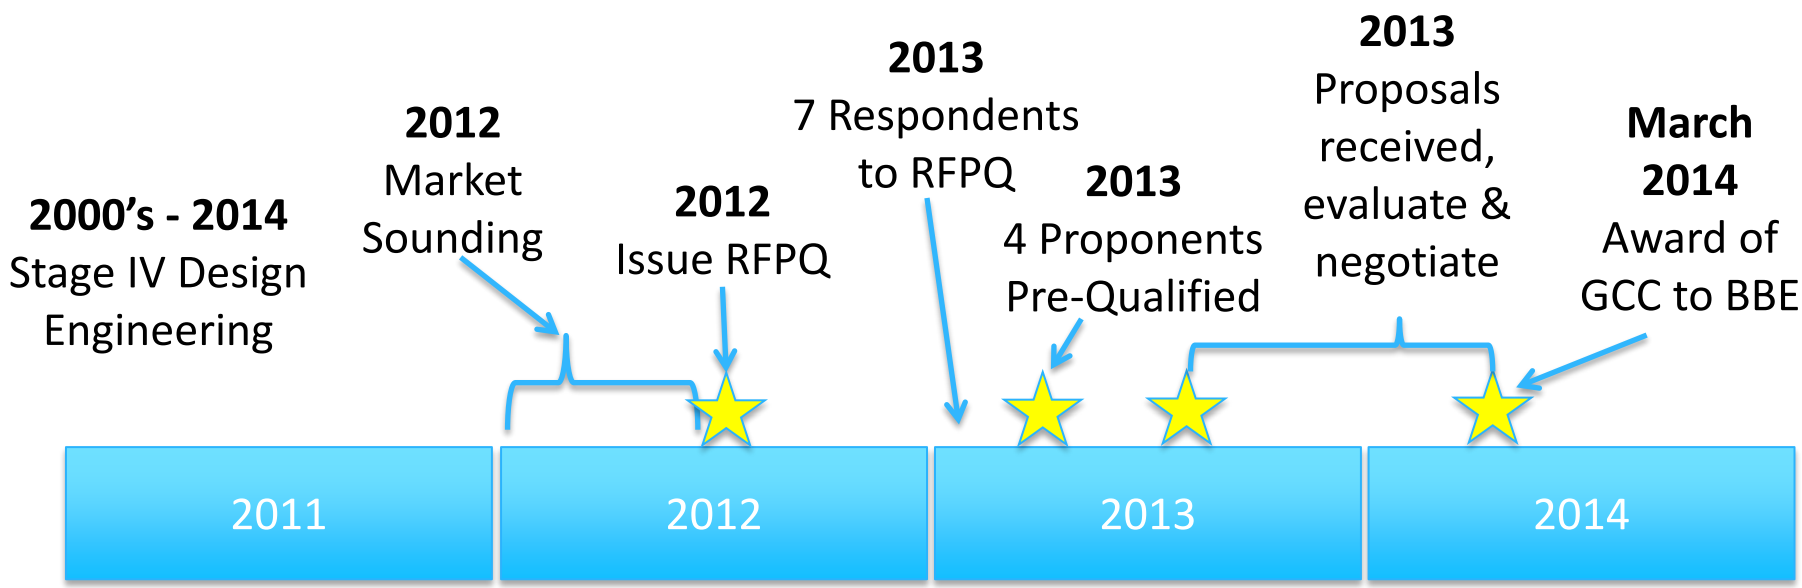
General Civil Contract

- General Civil Contract awarded to BBE in 2014.
- Largest contract on the project and includes:
    - Cofferdams,
    - Rock excavation,
    - Concrete structures,
    - Earthworks structures,
    - Electrical and mechanical work.

Keeyask GCC Tendered in 'Hot' Market



GCC Procurement



= Milestone

General Civil Contract

- Target price contract where the contractor is reimbursed for actual costs.
- Contractor has profit at risk.
- If the project cost is over the target the contractor loses a proportional amount of his profit margin and overhead.
- If the cost is under the target, the contractor shares a portion of the savings and gets his predetermined profit and overhead set out in the contract.

Construction Milestones Achieved

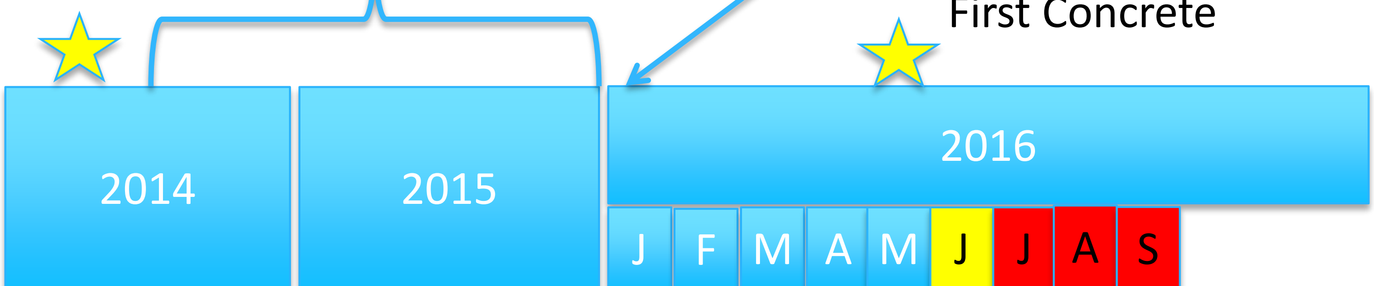
Timeline of 2016 Challenges

March 2014
Award of GCC to BBE

2014 - 2015
Cofferdam construction and rock excavation

January 2016
First Permanent Earthworks (North Dyke)

May 2016
First Concrete



June 2016
Concrete not meeting plan. Letter issued to BBE requiring immediate recovery strategy

July & August 2016
Concrete still not meeting plan

Sept. 2016
Formal Recovery Plan Initiated

★ = Milestone

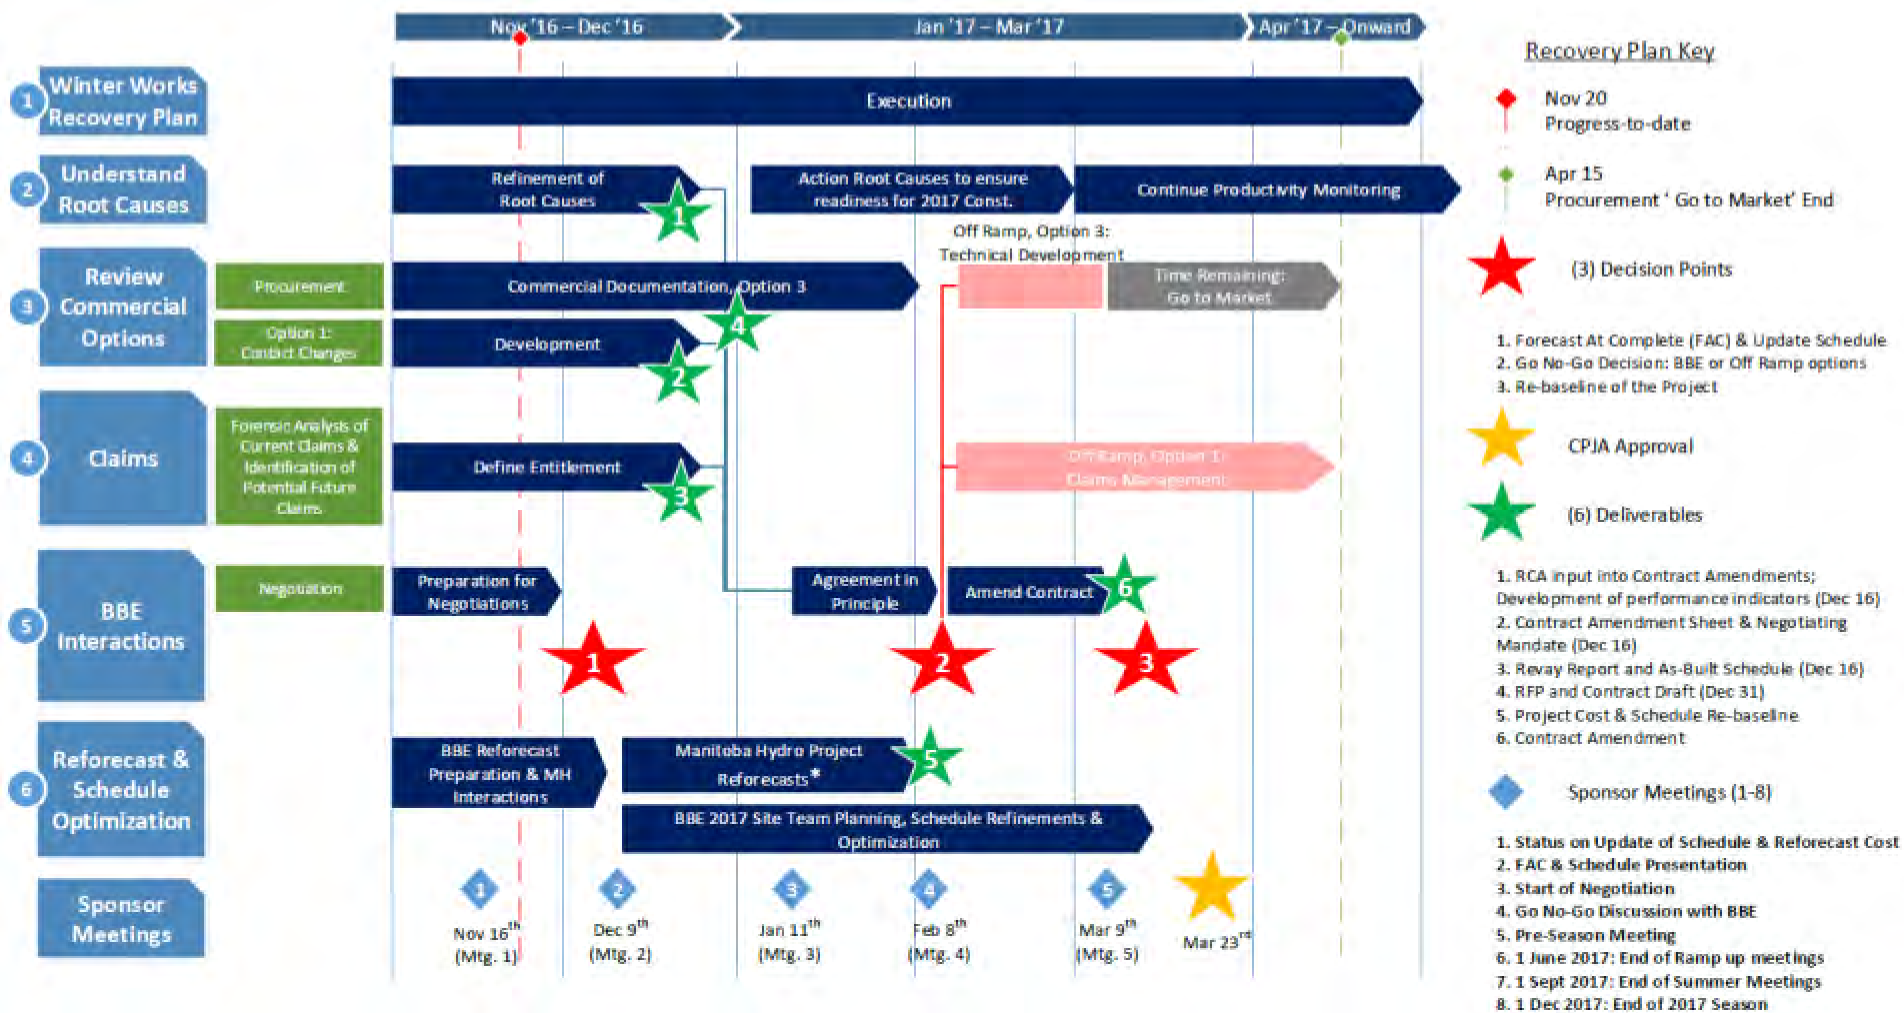
2016 Recovery Plan

- A call to action for BBE’s project team, Executive Sponsors and CEOs.
- The development of a plan for the continuation of concrete through severe winter months.
- Identifying root causes of performance issues
- Initiating activities to reforecast the cost and schedule for the project.
- Undertaking analysis around Contractor’s claims.
- Supplementing the commercial expertise of the Manitoba Hydro team.

2016 Challenges

- In 2016 the GCC only achieved 41% of the concrete plan and 65% of the earthworks plan.
- Main contributing factors were:
  - Aggressive concrete production assumptions by Contractor
  - Slower than planned progress in ramp-up on site, and
  - Actual experience with geotechnical and geological conditions.
- Schedule rapidly changed from having a 6 month advancement opportunity to a potential 2+ year delay.

Recovery Plan Implementation



Commercial Options

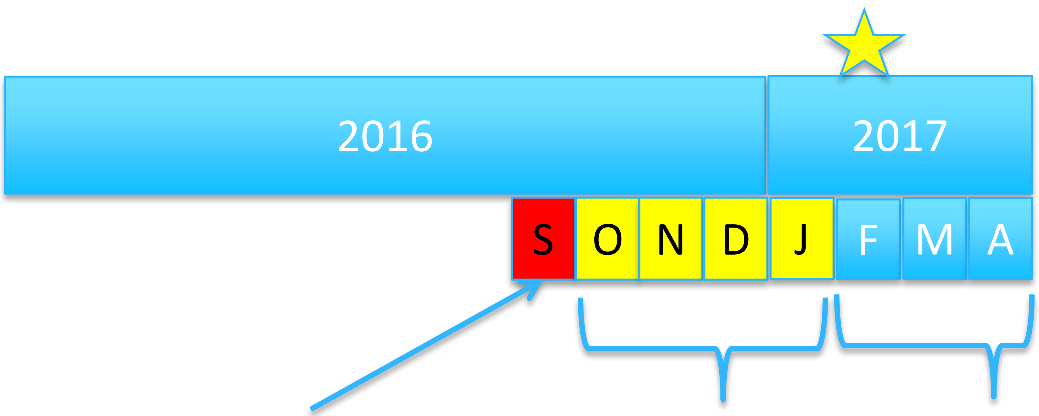
- Manitoba Hydro undertook a thorough process to evaluate alternatives for and impacts to the General Civil Contract.
- The process included input from industry experts including:
  - KPMG – Recovery Plan support.
  - Revay – Claims valuation and management.
  - Borden Ladner Gervais LLP (BLG) – Legal support.
  - Validation Estimating – Contingency development.

Evaluation Outcome

- The review demonstrated that the best course of action was to amend the existing contract with BBE.
- All other alternatives introduced significant additional risks as well as guaranteed impacts to cost and schedule that were greater than the selected option of amending the contract with BBE.

Timeline of Recovery Plan

February 2017
Revised Control Budget and Schedule Approved



Sept. 2016
Formal Recovery Plan Initiated

Fall/Winter 2016
a) Improved Production
b) Immediate Plan
c) Long Term Plan

Winter/Spring 2017
Recovery plan implementation

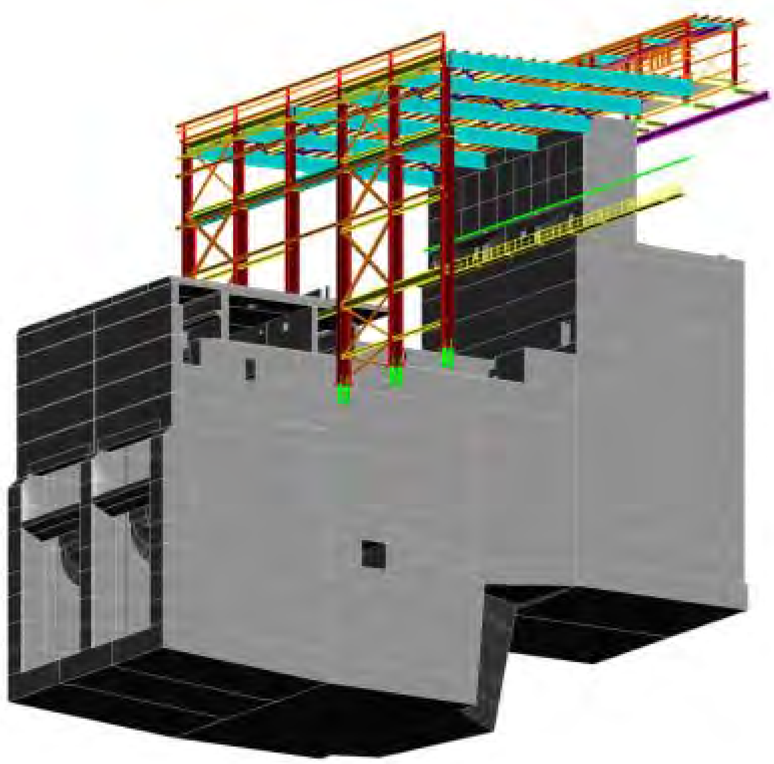
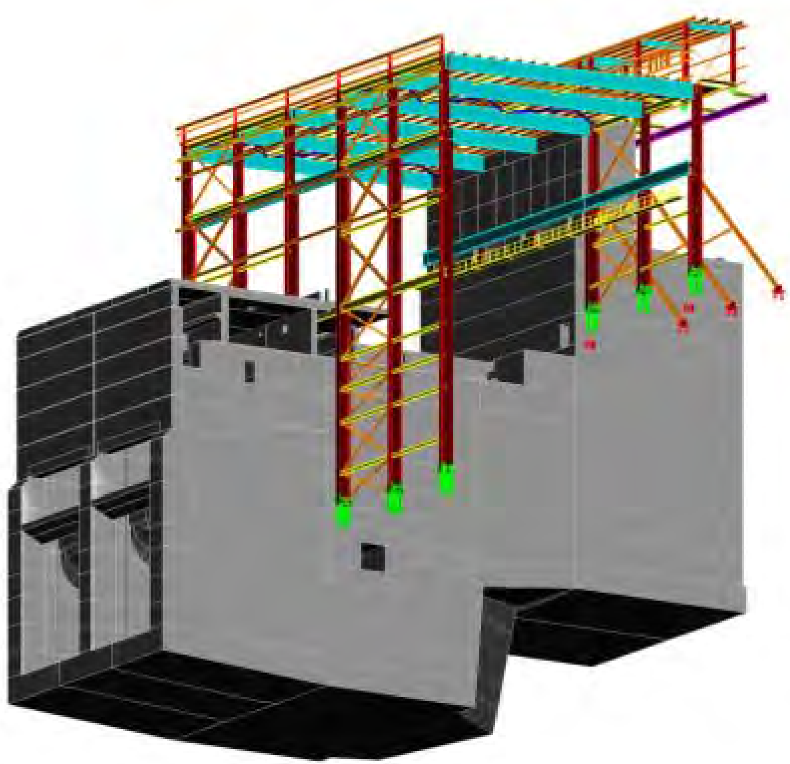
Previous Design – No Column Extenders



New Design – With Column Extenders



Contract Amendment Achieved

- Manitoba Hydro and BBE were able to achieve mutual agreement that was required to amend the contract.
  - The negotiation required ‘gives and takes’ from both parties.
- Lowered the overall cost and schedule risk for Manitoba Hydro and allowed BBE an opportunity to re-establish a reasonable profit level.
- The terms of the agreement aligned the interests of both parties to deliver a “Best for Project” approach.

Features of the Amendment

- The details of the amendment to the contract are formalized in Amending Agreement #7 between Manitoba Hydro and BBE.
- Key features of the amendment include:
  - Contractor claims “wiped clean”;
  - Schedule and cost incentive pool provides incentive for BBE to earn profit and MH to minimize Project cost and schedule;
  - General Administration & Overhead (GA&O) capped at target price;
  - Narrowed ability for future claims;
  - Liquidated damages.

Establishing a New Control Budget

Project in Service Cost (Billions $)	Original Control Budget	Third Party Recommended Contingency		
Base Estimate Including Spent, Costs to Go, Interest and Escalation				
Delay (months)	-	11		
First Unit In-Service	Nov-19	Oct-20		
Total Base Estimate	**6.2**	**7.8**		
Contingency		**P50**	**P75**	**P90**
Additional Delay (months)	-	10	14	18
First Unit In-Service	**Nov-19**	**Aug-21**	**Dec-21**	**Apr-22**
Estimated Contingency	0.307	0.578	0.914	1.246
Additional Interest & Escalation on Contingency	-	0.339	0.464	0.588
Project Estimate (with Contingency)	**6.5**	**8.7**	**9.1**	**9.6**

Note: Interest and escalation are reasonable approximations; full financial-model calculations will be incorporated into control budget.

12834

Keeyask Budget Summary

(From PUB MFR 122)

Keeyask Budget Summary (in Billions $)				
Item #	Item	NFAT Approved Budget (2014$) CPJA #4	Current Approved Budget (2016$) CPJA #4	Variance
1.1	Generating Station	4.046	5.948	1.902
1.2	Generation Outlet Transmission (GOT)	0.164	0.202	0.038
1.3	Escalation @ CPI	0.244	0.249	0.005
1.4	Interest (including Interest on Equity)	1.343	1.749	0.406
1.5	Contingency	0.307	0.578	0.271
1.6	Labour Management Reserve	0.304	0.000	-0.304
1.7	Escalation Management Reserve	0.088	0.000	-0.088
1.8	Total	6.496 B	8.726	2.230
1.9	First in-service Date	Nov-2019	Aug-2021	21 months.

2017 Performance

	2017 Actual Quantities (m^3 rounded)	% Improvement over 2016
Concrete	86,000	~12%
Earthworks	1,030,000	~90%

- There was a significant improvement in performance over 2016 which occurred in both concrete and earthworks.
- Actual quantities were less than planned.
- However, key milestones were achieved in 2017 which maintain the schedule for the shortest duration.

2017 Key Milestones

Milestone	Date	Status
Completion of the Spillway concrete and handoff of the Spillway to the Gates, Guides and Hoists Contractor (Canmec).	November 2017	Completed on schedule
Installation of the Powerhouse Cranes in the Service Bay.	November 2017	Completed on Schedule
Enclosure of Powerhouse Units 1 and Service Bay	December 2017	Completed on Schedule
Enclosure of Powerhouse Units to allow for the start of turbine and generator work.	February 2018	On track
Significant progress on dams and dykes required to divert the river through the Spillway in July/August 2018.	July/August 2018	On track for river diversion

Milestone - Spillway Concrete Complete

Milestone - Powerhouse Crane Installation Complete

Milestone - Enclosure of Service Bay and Unit 1

Milestone - Earthworks on Track for River Diversion in Summer 2018

2018 Plan

Improved performance by the GCC is required to meet control budget ($8.7B) and a first unit ISD 10 months in advance of control schedule.

Main contributing factors will include:

- 2018 winter concrete and south dyke work;
- Continuing to learn from past experiences;
- Earthwork foundation preparation is now complete for 2018 work;
- Cold eyes review; and
- MH and BBE leads continuing to drive improvement;

2018 Key Risks

- With 4+ years of construction ahead there are still significant risks that have the potential to jeopardize meeting the control budget and schedule.
  - This risk is typical for projects of this scale and complexity.
- The top risks include:
  - Execution/productivity rates of the GCC;
  - Loss of site access/work stoppages;
  - Unexpected geotechnical/geological conditions at the South Dam/Dyke;
  - Unseasonable weather

Current Forecast at Completion

- Manitoba Hydro is currently forecasting the following cost and schedule outcomes for the Keeyask Project:
  - Cost - A final project cost on or below the control budget of $8.7 B.
  - Schedule – A first unit in-service date in advance of the control schedule of August 2021.
    - All seven units are forecasted to be within control schedule dates.

Key Messages

- Manitoba Hydro is capable of successfully delivering the Keeyask Project and has effective governance.
  - Manitoba Hydro will continue to leverage third party expertise as required.
- Amending the contract with BBE was the best path forward with least impact to cost and schedule.
- The necessary milestones were achieved in 2017 to maintain the shortest duration schedule.
- Plans continue to be developed to cause a 10% improvement going forward to achieve our control budget.

Summary

- Hydro has a number of capital projects underway at varying levels of completion
- We are managing the risks
- We are incorporating lessons learned across the projects as we move forward
- There is a strong team in place supported by external expertise
- MH is open and transparent, gave MGF access and answered any question they had
- We want the Panel, intervenors and public to know where we are, what challenges we face, and how we address them

Bipole III Transmission Reliability Project
Overview

Manitoba Hydro

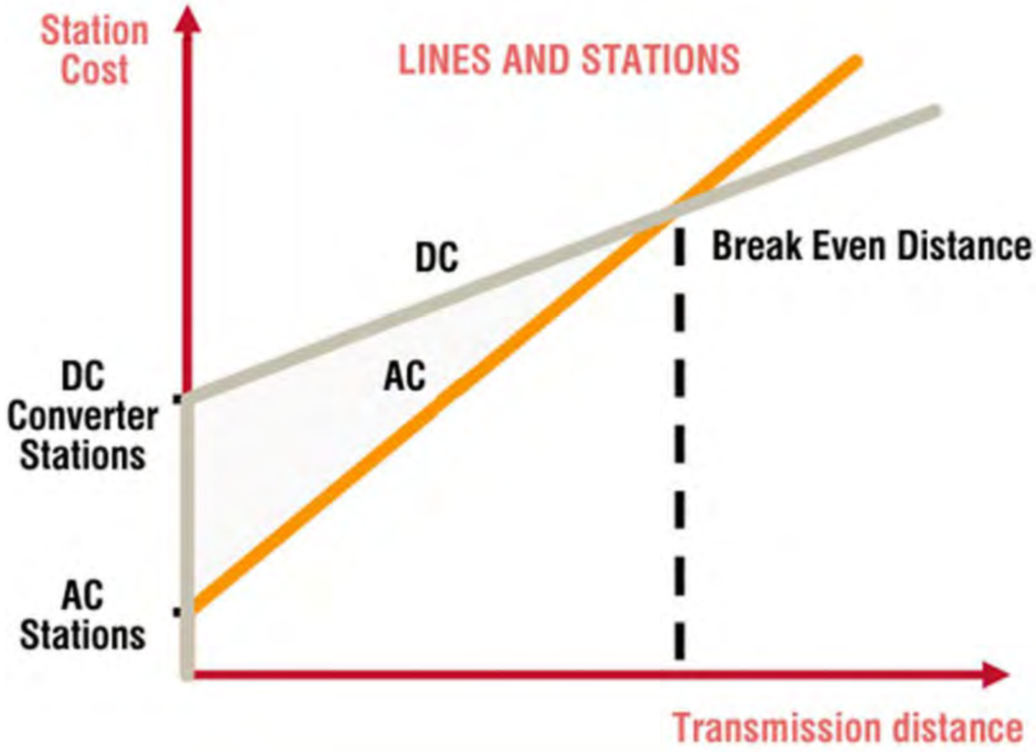
Presentation Outline

- What is HVDC
- Existing HVDC system
- Bipole III overview
- Bipole III status update
- Remaining risks
- Video

Why HVDC?

"Bulk" transmission

Why HVDC?



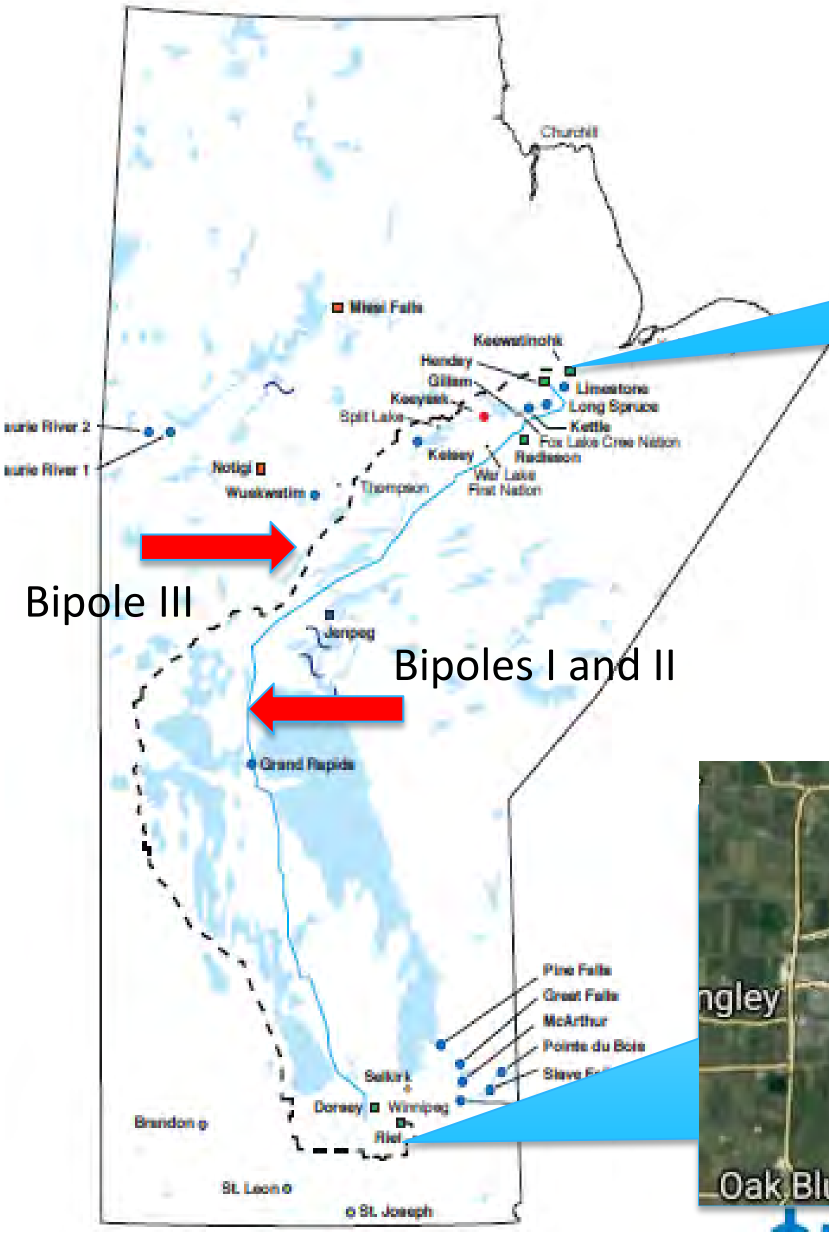
Station Cost
LINES AND STATIONS
DC
AC
Break Even Distance
DC Converter Stations
AC Stations
Transmission distance

The Existing Bipole I and II System

- Link to 70% of the Province's generating capacity
- Bipole I and II HVDC lines constructed on the same Right-of-way (same corridor)
- 900km overhead lines, difficult terrain and access in the north
- Terminated at a common station – Dorsey (inverter)

12851

Keewatinohk Converter Station



Riel Converter Station

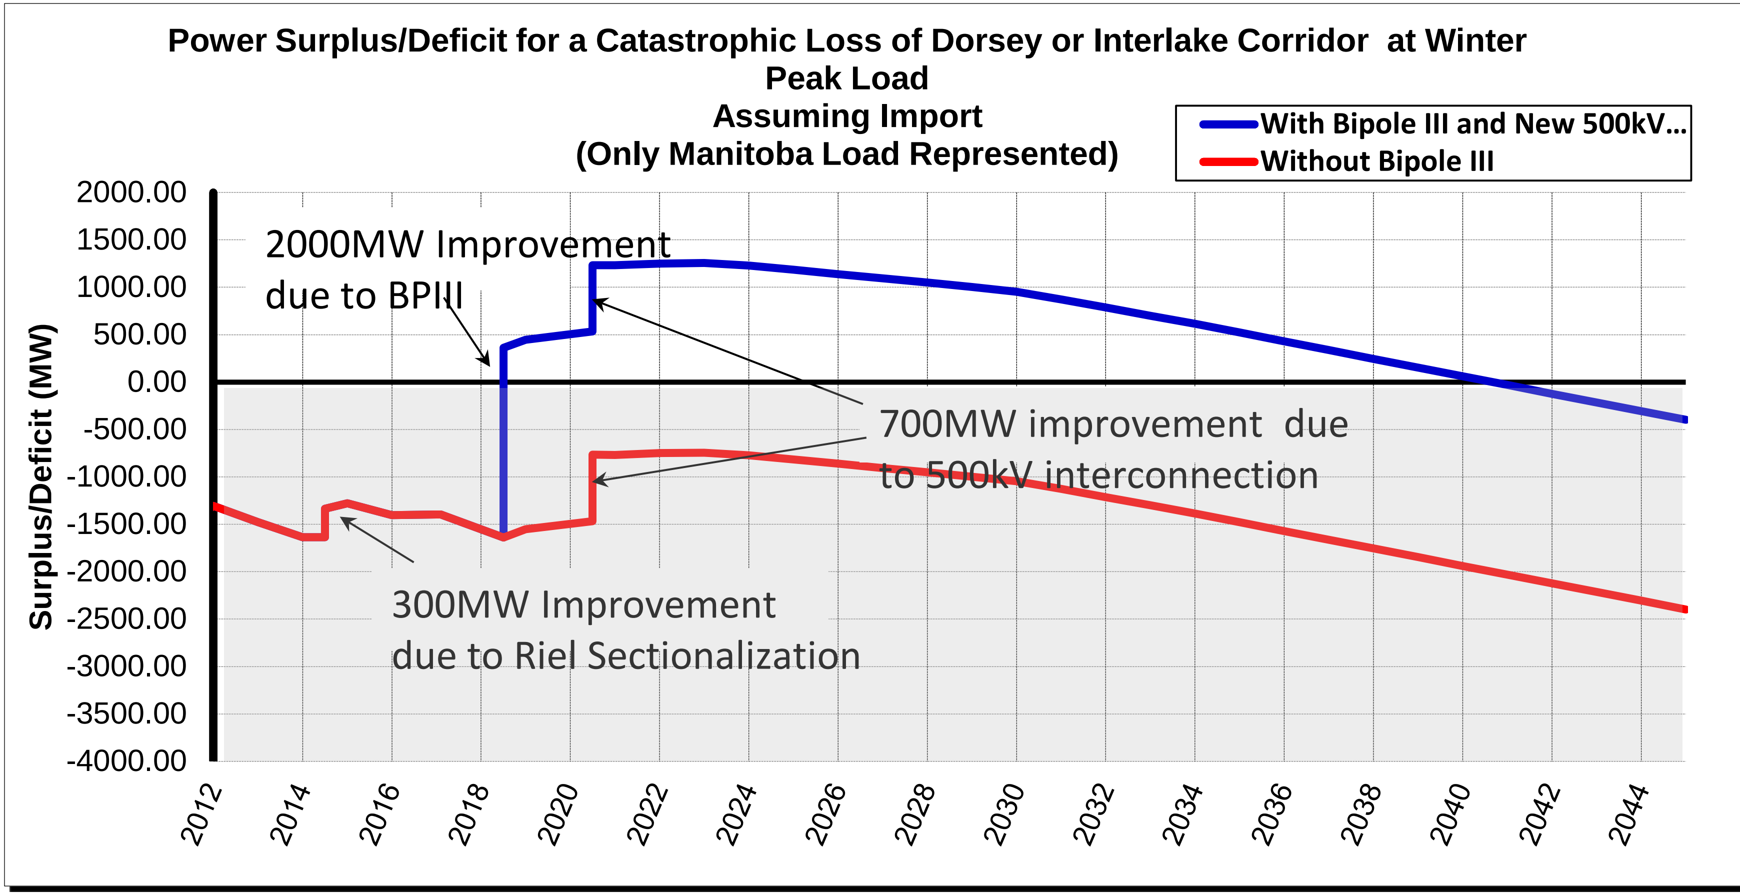
Riel Converter Station

Reliability Risk – Dorsey Converter Station

Elie F5 tornado
Approximately 40 km from Dorsey

- Dorsey is currently single terminus point for HVDC system
- Significant weather events (tornados, etc.) in the vicinity of Dorsey in the past
- A loss at Dorsey could mean loss of connection to northern generation for up to 3 years.

Supply Deficit

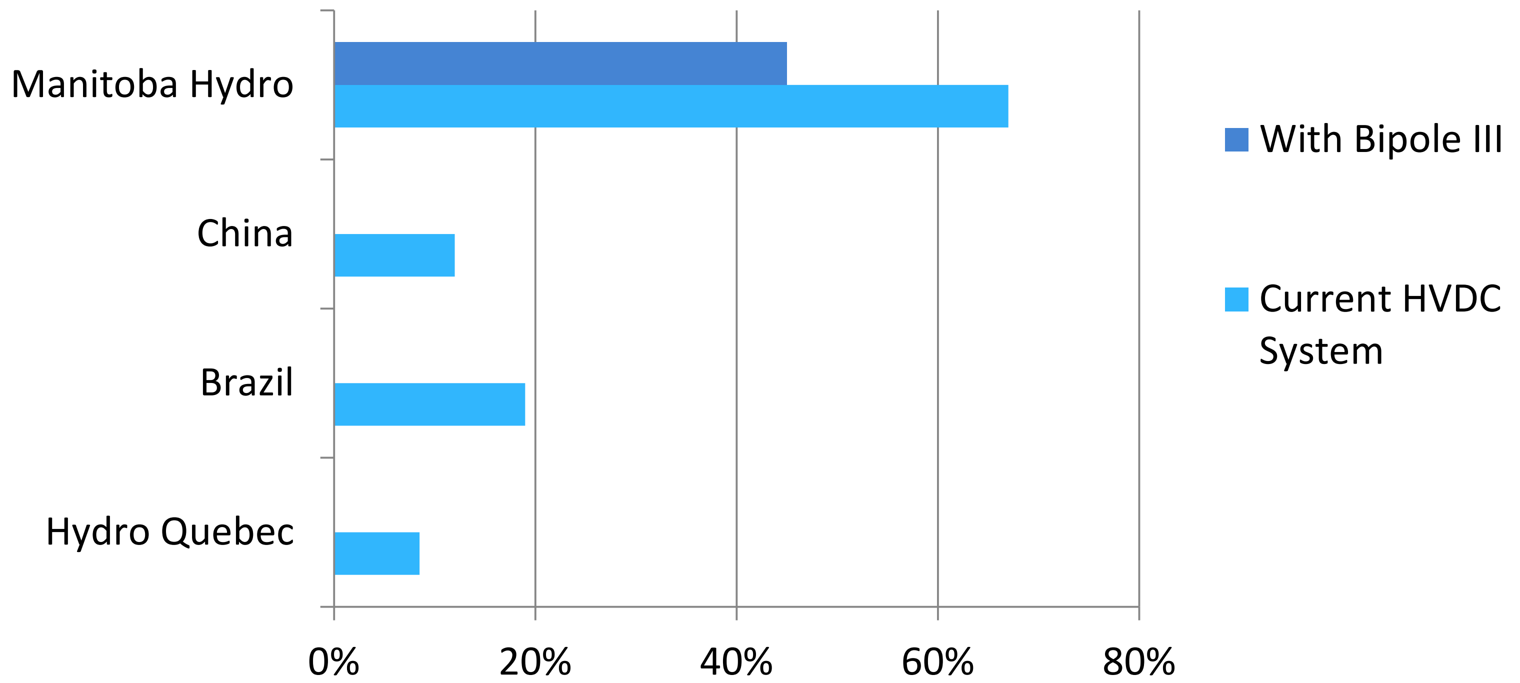


- Supply deficit of approx. 700MW for Bipole I/II line loss in winter of 2020 vs. 1,300MW surplus with Bipole III.
- Rotating blackouts for about 140,000 homes (5kW per household), even with new 500kV import line

12854

Maximum Percentage Power through a Single Facility

- Manitoba has highest percentage of power concentrated in a single facility for a major network in the world.
- "Too many eggs in one basket"

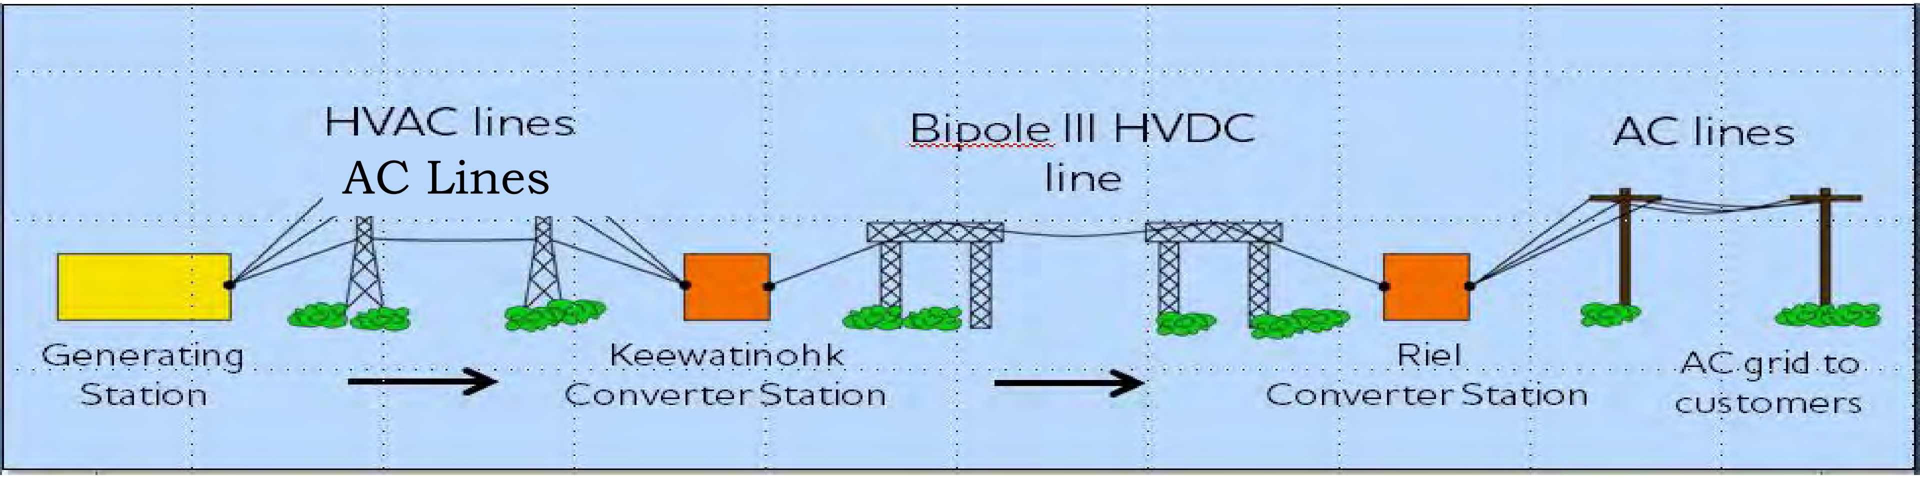


Bipole III Overview

1997 wind events near Dorsey

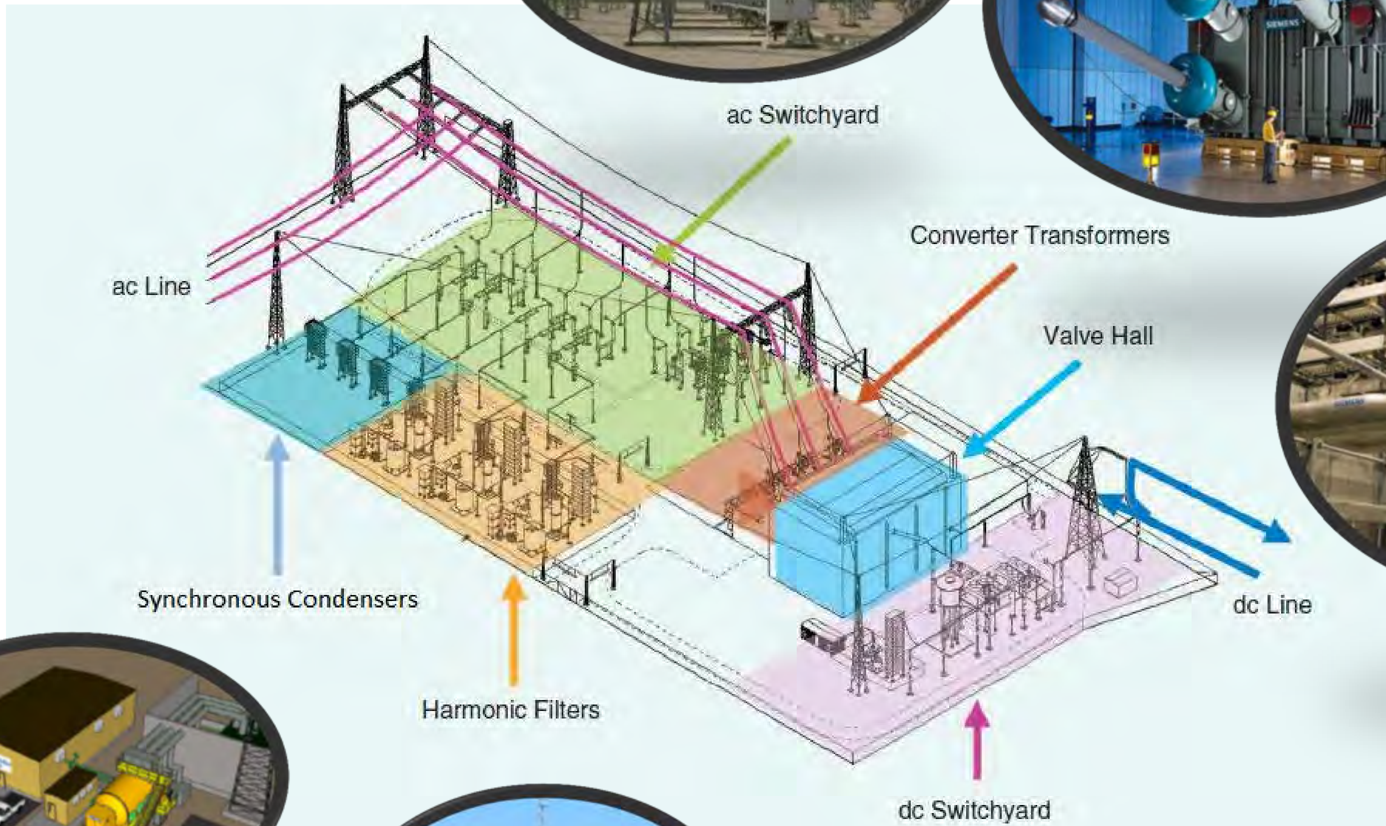
- **Increase reliability**
  - Second corridor for northern generation
  - Supply deficit of 700MW with loss of Bipole 1 & 2 (~140,000 homes)
  - Additional conversion facility
- **Increased capacity**
  - Increase of 2,000MW
  - Keeyask or associated power sale requires the transmission capacity of Bipole III

Bipole III Overview



- 230kV Collector Lines (5) to connect existing system to new Keewatinohk Converter station
- 2 HVDC Converter Stations
  - Keewatinohk Converter Station - 80 Km North East of Gillam Manitoba
  - Riel Converter Station – just East of Winnipeg
- 500kV HVDC Transmission Line (1384 km)
- Keewatinohk 600 person Construction Camp
- Tie into the southern transmission system

Converter Station



Transmission Line

Bipole III-500kV HVDC

- 500kV HVDC Transmission line
- 3,076 towers starting from Keewatinohk to Riel
- 1,388km length (actual constructed length)

Collector Lines-230kV AC

- Five AC collector lines to transfer all AC power from the Henday and Long Spruce stations to Keewatinohk
- Total length of 165km and 384 towers.

Keewatinohk Converter Station

Riel Converter Station

Bipole III Transmission Line

12862

SCOPE HISTORY OF BIPOLE III

Post Licence Control Budget

*In Service Date July 2018

2014

$4,652*

2012 2013 2015 2016

- Complete project re-estimate
- Based on updated line routing and environmental act Licence requirements
- Updated land acquisition costs
- LCC HVDC technology based on vendor pricing
- Includes Synchronous Condensers
- Includes costs for the Community Development Initiative (CDI)

SCOPE HISTORY OF BIPOLE III

Control Budget

*In Service Date July 2018

2016

$5,042

2014 2015 2017 2018

- Actual transmission line construction unit rates (market rates)
- Updated transmission line material costs
- Southern route change
- Actual land acquisition
- Increase contingency

Bipole III Status

- Converter station construction is 91% complete
- Transmission line construction is 84% complete
- Budget is 79% spent and is on target

In Service Date July 2018

- 6 months of work left to test and energize thousands of components
  - The remaining risks are more an impact to schedule, not budget

Keewatinohk CS Current Status

- HVDC equipment has been installed at site
- AC Switchyard construction is complete and energization is well underway
- Construction on Auxiliary Buildings is complete

Riel CS Current Status

- HVDC equipment has been installed at site
- AC Switchyard expansion is complete and has been commissioned
- Three Synchronous Condenser units are onsite and under installation. One Synchronous Condenser unit remains to arrive at Riel

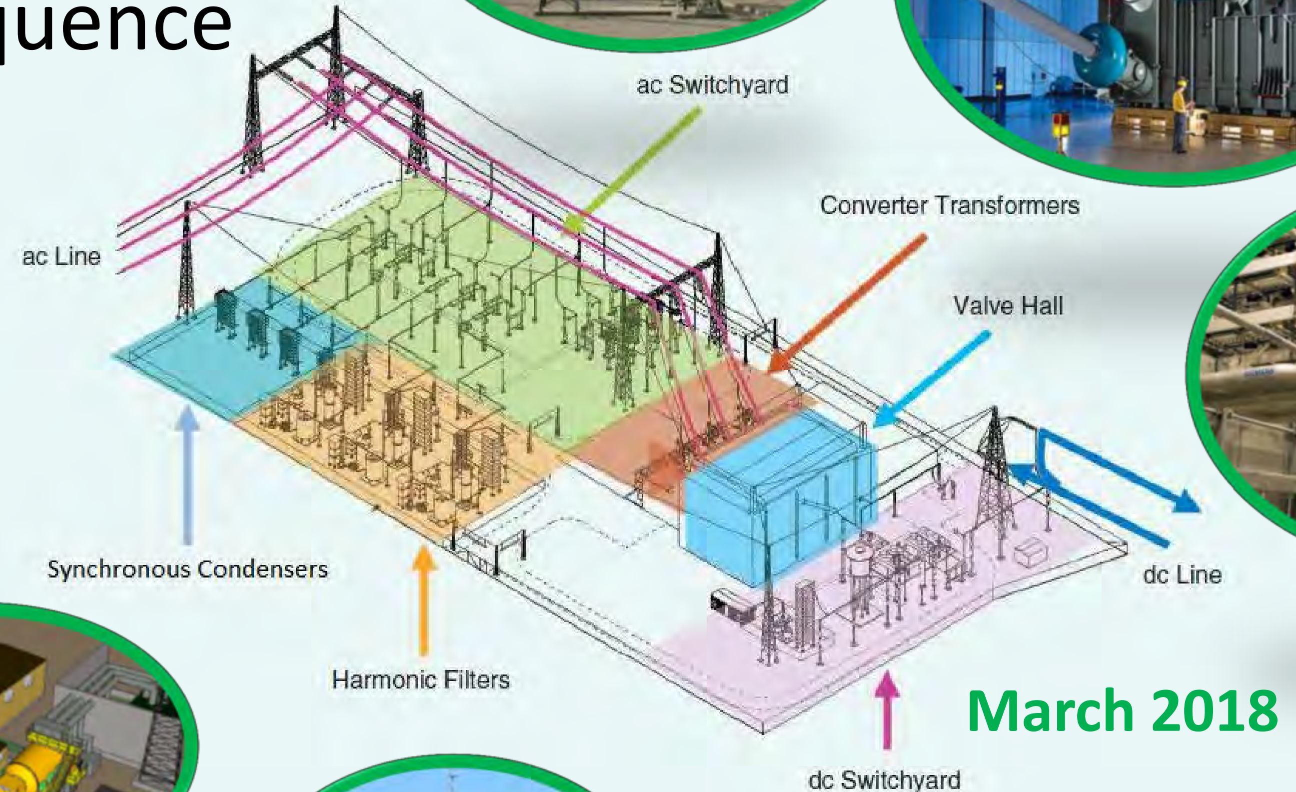
Transmission Line Current Status

- Tower anchor and foundation installation is at 99%
- Tower erection is at 84**%**
- Stringing is at 45%
- Transmission line construction will be complete March 2018

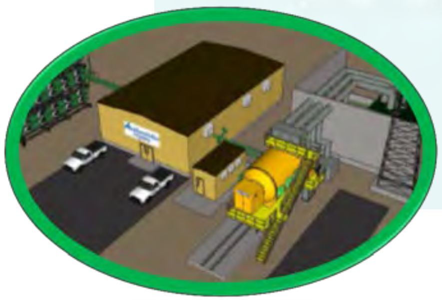
As of January 1, 2018

January 2018

Commissioning Sequence



March 2018



February/March 2018

Bipole III Commissioning

- Quality assurance to ensure manufacturing of equipment meets technical specifications prior to being placed in-service

- Equipment is tested in the factory to ensure technical compliance prior to being shipped to site

- Subsystems are verified on-site prior to being connected to the Manitoba Hydro network

- Energized system testing is conducted to integrate the Bipole III HVDC system to the existing network

Integrating Bipole III into the Existing System

- Integrating a state of the art digitally controlled Bipole into a system that was designed in the 60s and 70s

- Simulated the operation of Bipole III at the factory level with over 2000 tests

- Equipment and sub systems tests - over 500 equipment tests and 450 subsystem tests

- System testing – approximately 250 tests

- Trial operation – 30 days

Remaining Schedule Risks

- Transmission Line
  - Contractor performance
  - Weather
- Converter Stations
  - Synchronous condenser transformer delay
- Commissioning
  - 6 months of work remain to test and energize thousands of components

[Bipole III Video – 3 minutes]

Conclusion

- Construction is on schedule to be in service July 2018
- Budget is tracking to the control budget of $5.04 Billion
- Will be an asset in operation for the upcoming fiscal year
- Capital costs will begin depreciation this year

Great Northern Transmission Line Project

David Cormie, Director

Wholesale Power and Operations

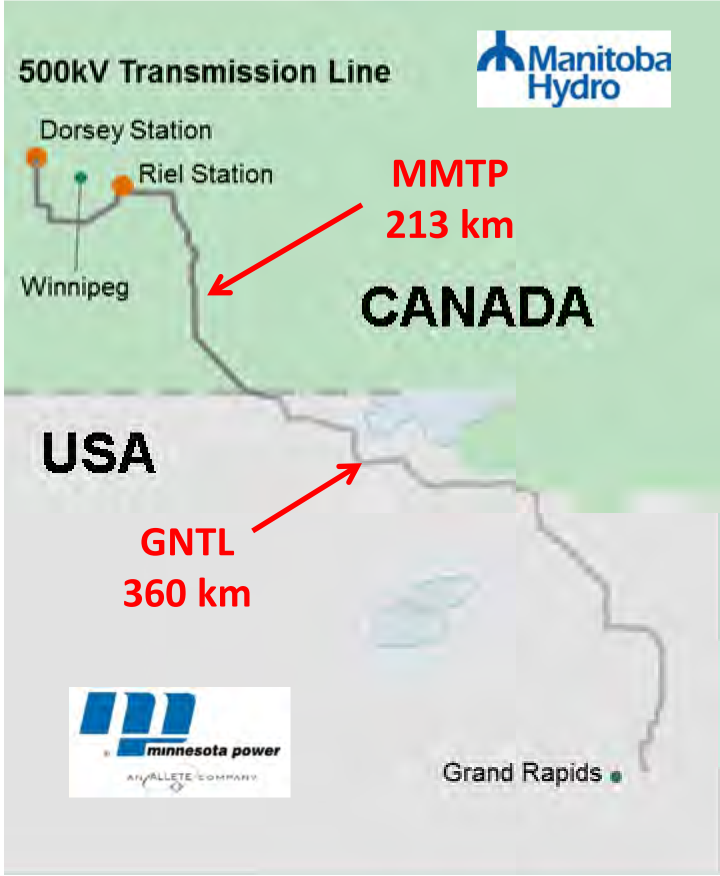
GREAT NORTHERN TRANSMISSION LINE

Connecting Manitoba and Minnesota

Manitoba Hydro

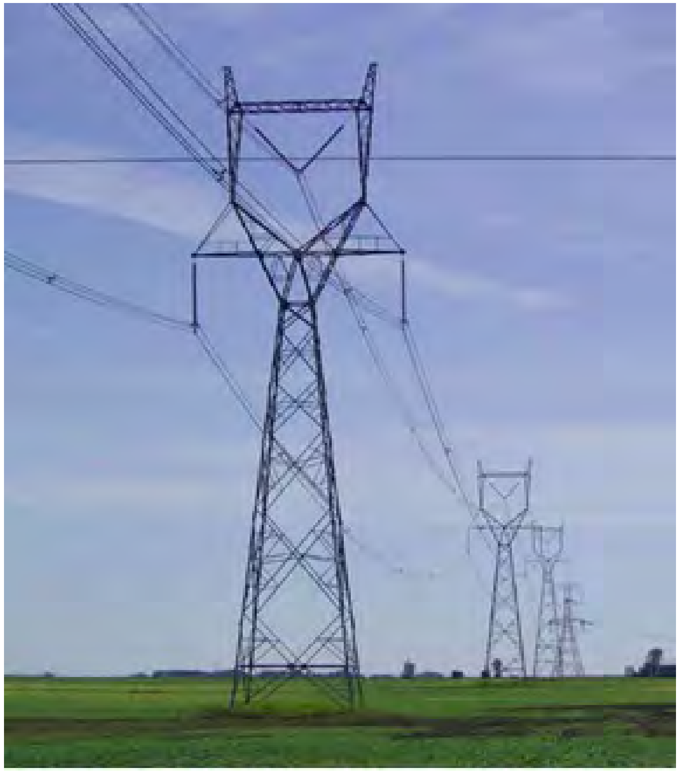
500 kV Manitoba – U.S. Interconnection

- MH Development Plan
  - Keeyask
  - New major interconnection
  - Export sales
    - Minnesota Power
    - Wisconsin Public Service
    - Northern States Power
    - SaskPower (subsequent)
- In Manitoba
  - Minnesota Transmission Project (MMTP)
- In Minnesota
  - Great Northern Transmission Line (GNTL)
- Capital cost is approximately $1 billion



U.S. Interconnection Objectives

- Import
  - Increase import capability by 100% or 700 MW
  - Improve energy security, emergency response and system reliability
  - Reduce import costs
  - Improve market prices
- Export
  - Increase export capability by 50% or 900 MW
  - Increase export market prices
  - Improve bi-lateral market access with Wisconsin utilities by 600%



The 40 year MP Transmission Deal

MH pays 72% of the construction costs

		MH Responsible	MP Responsible
Construction Costs	MMTP	100%	0%
	GNTL	71.7% (54% upfront + 17.7% MTF)[1]	28.3%
Property Taxes	MMTP	0%	0%
	GNTL	66.7% (49% ownership+ 17.7% MTF)	33.3%
Capital Taxes to MB	MMTP	100%	0%
	GNTL	100%	0%
Operating Costs	MMTP	100%	0%
	GNTL	66.7% (49% ownership+ 17.7% MTF)	33.3%
Sustaining Capital	MMTP	100%	0%
	GNTL	0%	100%

Note 1. MTF is the Monthly Must Take Fee established in Section 2.6 133 MW Energy Sale Agreement for MH use of 133 MW of MP capacity. Ownership costs on 500 MW of capacity are established through a Service Fee defined in Article 6 of the Operation and Maintenance Agreement

Manitoba Hydro

6690271's Role is to Protect Manitoba Hydro

- Responsible for MH's interests in the Great Northern Transmission Line

- GNTL Facilities Construction Agreement (FCA)
  - Between 6690271, Minnesota Power and MISO

- GNTL Construction Management Agreement (CMA)
  - Between 6690271 and Minnesota Power
  - Appoints Minnesota Power as Construction Manager
  - Establishes governance structure for the construction project
  - 669 has consultation and veto rights
  - Provides for an independent oversight engineer

GNTL Governance

Executive
(MP and 6690271)

Management Committee
(MP and 6690271)

Construction Manager

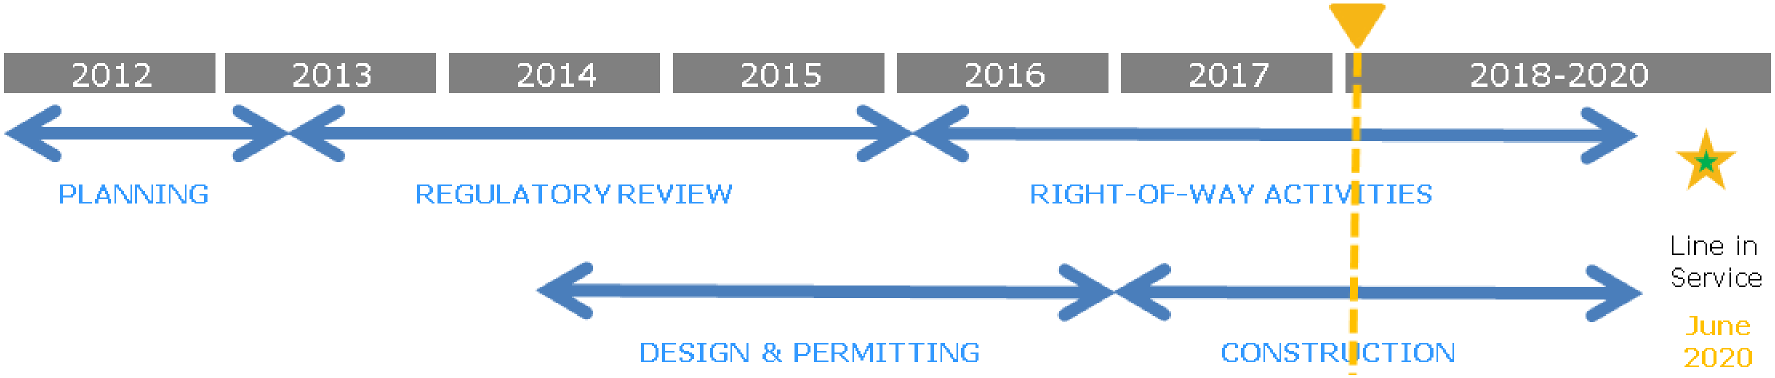
Independent Third Party Engineer

Key approval areas

Pre-construction	• Materials & equipment procurement lists • Project schedule & budget
Contracting	• Major Contracts • Major Change Orders • Material Actions
Bidding	• Pre-qualification guidelines • Approved bidder lists
Construction	• Budgetary change requests • Work schedule changes • Delay/disrupt/suspend orders

GNTL Schedule and Budget

- GNTL is on schedule for June 1, 2020
- GNTL is on budget
  - 10% spent to December 1, 2017
- MH expects GNTL to be under budget



Manitoba – Saskatchewan
230 kV Transmission Project

David Cormie, Director

Wholesale Power and Operations

Manitoba Hydro

Saskatchewan System Power Sale Agreement

- 100 MW of capacity and firm energy
- Term is June 1, 2020 to May 31, 2040

- Existing firm export transfer capability is insufficient
- Studies indicate the need for another line
  - If project is delayed use of interim firm service, to the extent it is available, will be used
- "Both power contract and transmission line project remain economic[1]"

LEGISLATIVE ASSEMBLY OF MANITOBA

THE STANDING COMMITTEE ON CROWN CORPORATIONS

Wednesday, December 19, 2007

TIME – 6 p.m.

LOCATION – Winnipeg, Manitoba

CHAIRPERSON – Mr. Daryl Reid (Transcona)

VICE-CHAIRPERSON – Ms. Flor Marcelino (Wellington)

ATTENDANCE – 11 QUORUM – 6

Members of the committee present:

Hon. Mr. Selinger

Mr. Altemeyer, Ms. Braun, Messrs. Caldwell, Cullen, Goertzen, Ms. Marcelino, Messrs. McFadyen, Reid, Mrs. Rowat, Mr. Saran

APPEARING:

Hon. Jon Gerrard, MLA for River Heights

Mr. Bob Brennan, President and Chief Executive Officer, Manitoba Hydro

Mr. Victor H. Schroeder, Chairman, Manitoba Hydro-Electric Board

MATTERS UNDER CONSIDERATION:

Annual Report of the Manitoba Hydro-Electric Board for the year ended March 31, 2004

Annual Report of the Manitoba Hydro-Electric Board for the year ended March 31, 2005

Annual Report of the Manitoba Hydro-Electric Board for the year ended March 31, 2006

Annual Report of the Manitoba Hydro-Electric Board for the year ended March 31, 2007

* * *

Mr. Chairperson: Good evening, everyone. Will the Standing Committee on Crown Corporations please come to order.

This meeting has been called to consider the annual reports of Manitoba Hydro for the years ended March 31, 2004, 2005, 2006 and 2007.

Before we get started, are there any suggestions from the committee on how long we wish to sit this evening?

Mr. Cliff Cullen (Turtle Mountain): Mr. Chair, just for the committee's perusal, I wondered about 8:30 and then review at that time.

Mr. Chairperson: It's been suggested that the committee sit until 8:30 and then review at that point in time. Is the committee in agreement? *[Agreed]*

Are there any suggestions as to which order the committee wishes to consider the reports as previously mentioned?

Mr. Cullen: I just wondered if we could maybe review the reports on a global basis.

Mr. Chairperson: It has been suggested that the committee review the reports on a global basis. Is that agreed? *[Agreed]*

Thank you to members of the committee. We'll now proceed.

Does the honourable minister wish to make an opening statement, and to also introduce his officials at the table with us here this evening?

Hon. Greg Selinger (Minister charged with the administration of The Manitoba Hydro Act): Yes. First, I'll like to introduce Chairman of the Board, Vic Schroeder, and President and CEO, Bob Brennan, who are with me tonight.

I was wondering, also, if I could ask the critic: Is there an intention to try and pass a report tonight?

Mr. Cullen: Yes. We'll certainly give it serious consideration to passing a report and probably the oldest report that's on the record.

Mr. Selinger: I appreciate that.

In terms of opening statements, I was wondering if we could indulge the committee for a few minutes and ask the president and CEO just to give us a little short update–I'm not trying to divert the committee from other concerns they have–on where we stand with wind, the short list, and a little bit on the low-income energy efficiency project. Then, of course, I think there may be a lot of follow-up on the questions that were answered. I know the president tabled with this committee, and I believe all members have a copy of the questions and the answers that were given. Then I think the chairman of the board would like to make a statement. Then, of course, I may follow up on that myself. Okay?

Mr. Chairperson: We thank the honourable minister for the opening statement.

We'll now proceed to the critic for the official opposition to make an opening statement.

Mr. Cullen: Just very briefly, certainly, it's nice to have the opportunity to get together with representatives from Manitoba Hydro, and we look forward to questions going forward. That's all I have to say. Thank you.

Mr. Chairperson: We thank the critic for the official opposition.

We'll now proceed to statements by the officers from Manitoba Hydro, Mr. Brennan and Mr. Schroeder. Whichever one you–

Floor Comment: Mr. Brennan.

Mr. Chairperson: Mr. Brennan. Please proceed, sir.

Mr. Bob Brennan (President and Chief Executive Officer, Manitoba Hydro): What a start, eh? Got it right.

On December 14, Manitoba Hydro issued a press release pointing out that we're moving to the next step in our process for the 300 megawatts of wind that we'd like to add to our system. At that point, we came up with a short list of seven various suppliers. The total amount of wind that's included in that is approximately 1000 megawatts, and we're asking those people to firm up their price and come back with a firm price. Some of the technical specifications were changed as to what we require, and now the suppliers have some benefits in terms of the federal government incentive credit, as well as any credits for gas emissions or carbon credits. They are to incorporate that in their firm prices that they're to give back to us. We're hoping to get everything back near the end of January, at which time we'll try to get something available very quickly to take to the Hydro board.

Mr. Selinger: Bob, did you want to just talk a little about the low-income energy efficiency program that we announced last week?

Mr. Brennan: I have copies of the press releases that we did issue at that time should anybody want one.

On the same date, we issued a press release and announced a low-income program for low-income people in Manitoba. The particular program we have is done in conjunction with the Affordable Energy Fund, Manitoba Hydro's Power Smart program, and it's incorporated with the federal ecoENERGY program.

The program is going to be delivered in two ways, through a community-based approach or through individual applications. The program itself is targeted at, as I mentioned, the low-income people of Manitoba, and we have a range on salary depending on whether it's in the city of Winnipeg or outside the city of Winnipeg. All of them are in accordance with the ecoENERGY program, retrofit program, of the federal government. We're going to have to require an audit at the beginning and the end to make sure that the money is directed at the right type of saving for each house, as well as the actual savings having been achieved.

When they go out and do the first audit, they will get compact fluorescent lights, showerhead aerators, low-flow showerheads and the like, and then the program itself includes insulation in basements, attics and crawl spaces as well as high-efficiency natural gas furnaces. That's it, Mr. Chairman.

Mr. Chairperson: Thank you, Mr. Brennan.

Mr. Brennan: One other thing I should mention–I'm sorry.

Mr. Chairperson: Mr. Brennan, please proceed.

Mr. Brennan: When I did commit to responding to some of the questions that were left dangling, and I did that recently, and sent it to the Clerk.

Mr. Chairperson: Thank you.

Mr. Schroeder, please proceed, sir.

Mr. Victor H. Schroeder (Chairman, Manitoba Hydro-Electric Board): I just wanted to give some background. I'm going to be tabling a report. I am hoping there are copies available.

Manitoba Hydro suspended its preliminary consultations with east-side communities back in 2003, in the context of the East Side Planning Initiative. In '04-05, the board asked Manitoba Hydro to consider alternatives to the east side for bipole 3. Hydro studies into a range of options concluded that the west side was the best other viable solution to improve reliability. Based on the technical scope of their studies, in fall 2006, Hydro management recommended proceeding with bipole 3 on the west side if the east side was not available. The Hydro board at that time requested additional information beyond the technical aspects on the routing options, including environmental impacts and risks associated with environmental opposition to the east-side route. The board performed what we believe is thorough due diligence, considering risks to export markets and resultant risks to Hydro customers, potential of licensing delays, capital costs, reliability issues, technical issues, environmental factors, as well as public policy considerations of the government in making its routing decision.

***** (18:10)

This year, CMC Consultants Inc.–David Farlinger is the principal; I think most members of the committee are familiar with his background–was engaged to prepare a report on the environmental considerations and risks benefits associated with environmental opposition, including with respect to Hydro's export markets. His study recommended that government play a major role in routing assessment, noting that many routing considerations fall outside of Manitoba Hydro's mandate, and government is significantly impacted and has much at stake in the decision: debt, reputation, duty to consult, responsibility for environmental stewardship and community and economic development.

In light of the government's election platform statements made ruling out bipole 3, the board requested that government detail its public policy position on the issue. Government was provided with the Farlinger report. Government then provided its position to the Manitoba Hydro board in writing. Management repeated its recommendation to proceed with a west-side routing if the east side is not available. I'd like to table the Farlinger report. The report also has in Appendix I, I believe it is, its terms of reference.

Mr. Chairperson: Thank you, Mr. Schroeder, for the comments.

Before we proceed to open up the floor for questions, I just want to remind committee members, as Chairperson, that for the benefit of our good folks with the *Hansard* behind me here that if you could please pull your microphones close when you're speaking, it would be helpful. Also, if we could have the questions addressed through the Chair and wait until the Chair recognizes you before speaking in response to the question or asking the original question, that would be helpful too, for the benefit of our *Hansard* folks. We hope members of the committee will help us in that regard.

Floor will now be open for questions.

Mr. Selinger: Yes, as a result of the Farlinger report and a request I received from the chairperson of Hydro, I was asked to give the government's perspective on east side versus west side. As we all know, it had been enunciated earlier in the election window, and I provided a letter to the chairman of Manitoba Hydro, Vic Schroeder. I'm proposing to table a copy of that letter tonight with the committee. I'd like to do that and make sure everybody has copies of it. I think I have enough copies for everybody. So I'll take one for myself and you can just distribute as many of them as you can.

In the letter–and I know people will need some time to absorb it, which is why I'm circulating it before I make my comments and we can have the evening to discuss any of these things if you wish–I stated just the history of our experience with the east side since we came to government and start out by pointing out that, as early as August 2000, we made a commitment to initiate broad area planning on the east side of Lake Winnipeg as a result of accepting the Consultation on Sustainable Development and Implementation report, commonly known as COSDI. They had recommended broad area plans.

The east side was chosen for a variety of reasons that are delineated in the letter. Some of them were that the area is unique and environmentally spectacular, containing a vast expanse of undeveloped contiguous boreal forest. The east side is the home to a population that is 96 percent First Nation. It's one of the largest habitats for the threatened woodland caribou and home to the Bloodvein River as well as the Manigotagan River, the Bloodvein being a Canadian Heritage River, both rivers renowned for their marvellous recreational significance and access to transportation and networks. Many economic opportunities are more limited than in other parts of the province. As well, the east side has begun to feel the effects of climate change.

So I go on to make a variety of points in the letter. As well, I identify some of the issues that were discussed in the Farlinger report. The Farlinger report made no recommendations as to routing. It made a process recommendation, which is why I've asked for these items to be tabled tonight. The process recommendation, essentially, is that the issues are broader than the technical considerations for where the line should go. There are broad public policy matters here and that Manitoba Hydro should get the views of government on this, and that's why the chairperson asked me for my views in writing, even though they had been stated in broad terms in the election. So the letter is my commitment to provide the chairperson and the Hydro board with our views in writing. We can discuss the contents of the letter as you wish to go on this evening.

But, in general terms, and we've discussed this in the Legislature as well as in the public, we saw this as an attempt to manage a variety of risks. One risk that we accepted, that needed to be acted on, was to increase the reliability of the hydro-electric system in the province and that had been a concern of Manitoba Hydro for many years. They were suggesting that they needed to take decision and take action on moving on increased reliability. What that really meant was they needed another bipole. The bipole was, in part, a response to the challenge that was identified in the Farlinger report that in 1996 there had been a serious problem with the existing bipoles. I think something to the effect of 16, 17 towers went down and created quite a risk to customers. Fortunately, at the time, it wasn't a peak period for demand. They were able to respond to and manage that risk and get the system back in shape.

But, ever since 1996, there was a heightened awareness that there needed to be action, so the government started working with Hydro on figuring out solutions to this. Previous ministers of Hydro announced that they thought, based on broad consultations with communities on the east side, a west-side option should be considered by Manitoba Hydro. So reliability risk was one of the risks that needed to be addressed in terms of broad public policy.

The other risk was the question of the environment and the boreal forest which has become a higher profile issue throughout North America. We know that many scientists have weighed in on this and many groups have asked that there be consideration to the east side being a UNESCO World Heritage Site. There's a lot of work that's being done on that and more work that needs to be done. We'll have a good discussion about that this evening as well.

Thirdly, there was the issue of insuring that the reputation of Manitoba Hydro, which is a good reputation, continues to be protected as a supplier of green energy, as a corporate entity in the public sector in Manitoba, as a Crown corporation that acts in both an environmentally responsible and a socially responsible way.

So, when you put it together, you've got reliability risk, environmental issues and risks to our reputation in terms of customers and market, maintaining a good reputation in the markets that we sell in, primarily in the Minnesota region and in that part of the United States. Our views in the letter expressed the concern that we consider other alternatives. We didn't say to Manitoba Hydro, you shall pick this route. We asked them to consider another route other than the east side. The Farlinger report was an attempt by Manitoba Hydro, as I understand it, to look at those broader issues, and that led to their request to me to give them some of our views in writing. The reason I'm tabling these documents tonight is I think there's important information in here that we may wish to discuss to get more specificity about where this whole project is going and a greater understanding of the thinking that went into this.

With those comments, I'll leave it and perhaps we can start with questions or any issues that are arising, not only out of the documents we've tabled tonight, but out of the responses that the president tabled as the result of questions that were left unanswered or required further clarification at the last meeting.

Mr. Chairperson: I thank the honourable minister. I take it, then, that all committee members have been presented copies of the letter and the report for their viewing.

The floor is now open for questions.

***** (18:20)

Mr. Hugh McFadyen (Fort Whyte): Thank you, Mr. Chairman, and thank the minister for the comments. Also, thank you, Mr. Schroeder, for your comments and Mr. Brennan as well, and would note that this is the second time this committee has met in as many months. We certainly appreciate the fact that there's time involved in preparing, time involved in following up on questions and the fact that it's been some time since the committee met previously. We appreciate the fact that we're having this opportunity to meet twice in a short period of time and that people have been good enough to make their schedules available.

It is an important process fundamental to legislative oversight of Manitoba Hydro as a

Crown corporation. We certainly acknowledge in that vein that there is a role for government in establishing guidelines and policy and other parameters within which the corporation must operate, and that, certainly, you know, our criticisms and comments have been more directed toward those guidelines and frameworks than they have been toward any decisions made at the level of the corporation. Much of the debate around the location of the bipole line surrounds the guidelines that Hydro has been provided to operate within.

So I just want to say that we have appreciated the very thorough and candid technical information that's been provided to date. Certainly, on reviewing the record and looking at the responses that have been provided, we know that every effort has been made to provide full, candid responses on all of the technical points. We are into a debate that has policy implications certainly, but which is informed by the factual basis and the technical issues that arise.

I would just like to come back, if I could, just initially, with a couple of questions to Mr. Schroeder just arising from his opening statement as chairman of Manitoba Hydro. There were a couple of points that were of particular interest, some of which, I think, is already on the record and has been established, some of which, I think, is at least new to me if not anybody else tonight.

The first question I have is to come back and confirm or clarify that, when the east-side consultations were suspended in 2003, you're saying that they were suspended because of the east side planning process that was then under way. Is that correct?

Mr. Schroeder: That's right, thank you, Mr. Chairman. The minister at that time anticipated that there would be a three-to-six-month process, and then what happened was one of the people involved in that process became the national chief, Phil Fontaine, someone else became–was it–in any event, another person had a career change and so on and there were numerous delays. That certainly was not something anyone was happy about.

The background was the government had announced its wide area planning initiative on the east side in about 2000. We, completely independent of that, started our consultations on the east side in 2001, and by 2003 there were people in the wide area planning initiative process who were not happy with our being out there in the field at the same time as a whole other wider set of consultations was going on.

Mr. McFadyen: The east side planning process you're referring to is a process that ultimately culminated in what's known today as the WNO agreement that was signed in April of this year. Is that correct?

Mr. Schroeder: That's my understanding of it, but from 2003 that was the end of our involvement.

Mr. McFadyen: Can I just ask then, as part of the east side planning process that took place that overtook essentially the consultations that were then ongoing by Manitoba Hydro, was there a proposal in front of east-side communities with respect to the possibility of a transmission line, or was that removed from the table in 2003 as the east side planning process was getting under way?

Mr. Schroeder: I am not aware that it was removed. We were consulting between 2001 and 2003 with east-side communities with respect to proposed bipole 3 on the east side. We temporarily abandoned that and never did get back to it.

Mr. McFadyen: One other comment that you made that got my attention was, you said that in light of election platform commitments made in the general election of earlier this year, the board felt that, or essentially felt that the government had a mandate, or the board had an obligation to remove the east-side route as an option. Are you aware that, in the course of that same election campaign, the Premier (Mr. Doer) committed on two different occasions, publicly, that the west-of-Lake-Winnipegosis route would not be used, and that the next bipole would go through the north?

Mr. Schroeder: I'm not aware of that. We had a presentation from Crown Corporation Council back in 2000, discussing and suggesting to us the role and responsibility of boards of Crown corporations. And, of course, there's a legal responsibility in the Hydro act for me to consult with the minister.

According to the information we received, the board must ensure that the corporate mandate is consistent, obviously, with legislation, but also with government objectives. So the board wanted to make sure that there were no misunderstandings, No. 1. We wanted to make sure that all issues were on the table had been fully considered, and that's one of the reasons we asked for the Farlinger report. At that point it seemed to us that it was appropriate, given that it appeared to be public policy on the part of government that we not proceed down the east side, that that be made clear to us, in which case there really was not a decision for us to make other than what is the best other route, and that's what we did.

Mr. McFadyen: I think we can probably agree, but get your confirmation that, obviously, there are pros and cons to either an east-side route or a west-side route. There are different considerations: financial, environmental, impact on communities, all of these things; impact on species and other things. And I think that there is consensus that the west-side route, which is being pursued currently, compared to the east-side route that had earlier been recommended by Manitoba Hydro; when you consider the cons of that west-side route, that it is more expensive, it will produce a less reliable power grid, it will take two years longer to complete and result in more lost power, would you agree that those are the cons of the west-side option?

***** (18:30)

Mr. Schroeder: I would agree with all except the two years longer to complete, because I think that's a question that's very, very much in play. The question of whether we would've ever been able to get a licence for the east side, certainly, is something that's a legitimate concern. That's, you know, going back to the previous board, back in 1999. They chose to leave 150 megawatts stranded at Wuskwatim because they weren't sure they could get a licence getting the full value. So 150 megawatts will stay there for the next 100 years. They also, as we were very concerned about their green image. The green image of this corporation is important for our sales efforts outside the province. Those sales efforts are what keep our electricity rates low. So I certainly don't think that one could say with any degree of certainty that we would have a line down the east side two years earlier or ever. You know, 30 years ago I represented the Province of Manitoba in the Mackenzie Valley pipeline hearings. We still don't have a pipeline. There are a number of those kinds of examples where you have environmental opposition that can hold things up.

Mr. McFadyen: So you're not prepared necessarily to accept that it will take longer to complete, but you do agree that the west-side route is more expensive, will produce a less reliable power grid, and will result in more lost power than the east-side option.

Mr. Schroeder: Yes, if we could build it.

Mr. McFadyen: If I can just come to Mr. Brennan then, just with respect to the completion times issue. You, the corporation issued, in response to questions from the Manitoba Industrial Power Users Group in connection with the general rate application before the PUB, responded to questions, and in a document dated December 5, 2007, two weeks ago today, the indication or the document states, and I don't know if you've got–do you have a copy of that document in front of you, Mr. Brennan?

Mr. Brennan: It's a huge document.

Mr. McFadyen: Right. There's a specific question and answer that I just want to ask you about. If I may, I am providing, it's a–the reference, sorry.

Floor Comment: Are there copies for tabling?

Mr. McFadyen: Yes, he does.

Mr. Chairperson: Are we okay to proceed?

Floor Comment: We're just making copies for the rest of them.

Mr. Chairperson: Okay. Is everybody ready?

Mr. McFadyen: Thank you, Mr. Chairman.

The document that's being referenced is a document prepared by Manitoba Hydro. The heading is MIPUG\MH I-10 and it's referenced to major projects and its question, lowercase c). In the answer provided by Manitoba Hydro two weeks ago, it states, and I quote: "The longer route will involve dialogue with a larger array of local governments, towns and villages. This is estimated to add one year to complete the multi-year public/community consultation program associated with Manitoba Hydro's site selection and environmental assessment process. Manitoba Hydro believes that the public/community consultation process and related environmental assessment/licensing activities for either a west or east side option are challenging." And then, "Construction of a western routed line is estimated to take a year longer than an eastern routed line."

This is consistent with what you had previously testified to in committee, which is that the western route–setting aside the risk of not being granted a licence, which I want to come to in a second–but that the process of going through consultations and then ultimately building the west-side route is two years longer than it would be on the east-side route. That's the view of Hydro, is it?

Mr. Brennan: Putting aside the possibility of not getting a licence, it is estimated and, at this point, it's only an estimate, that it would take a year longer to go through the consultation process, and it would also take another year longer to go through the construction phase. Those are certainly estimates, but that's our current estimate.

Mr. McFadyen: If I can just come back to a question I put to Mr. Schroeder. Coming to the cons of west side versus east side, and we're going to come to the arguments in favour of west side in a second because I know they are laid out in the report that's been tabled by the minister, but, on the con side, the issue with west side is that it is more expensive; No. 2, it's less reliable; No. 3, it's going to take longer to complete, setting aside the issue of licensing risk which we'll get to, and, No. 4, it is going to result in more lost power.

Would you agree that those are four major problems with the west-side route?

Mr. Brennan: Are you asking me or Mr. Schroeder?

Mr. McFadyen: Sorry, that's to Mr. Brennan.

Mr. Brennan: I think that's correct.

Mr. McFadyen: I would, then, just like to ask you whether it is for those reasons that you recommended an east-side line at the time that you were making recommendations.

Mr. Brennan: We certainly needed to take care of our reliability issues as soon as we could, but, for the most part, the fact that we believed we can handle the environmental issues and the issues associated with it, I guess, we hadn't gone through the consultation process the way the Province did, so we certainly thought we could get a commitment to the east side. So the reasons that you gave, I think, are valid from management's perspective.

Having said that, we did find that, after the Province went in and consulted, they seemed to get a different result than we thought we were going to get.

Mr. McFadyen: So, just to be clear, your view was that you thought you would get agreement to proceed east side, but it was the Province's process that produced a different view on the issue of the likelihood of getting east side approval.

Mr. Brennan: We didn't complete our consultations at all, because, as Mr. Schroeder said, we stopped when the east side planning review started.

Mr. McFadyen: Would it be fair to say at this stage we don't really know which side is going to produce more opposition?

Mr. Brennan: I think that's fair.

Mr. McFadyen: So, if I could, what you're saying then is that, in effect, we don't know because the consultations haven't yet taken place which side will produce more opposition, but that you have been directed by your board to proceed with an option that is more expensive, less reliable, will take longer to complete and will result in more lost power. Is that right?

Mr. Brennan: The board of Manitoba Hydro asked management what was the best alternative if the east side wasn't available. On that basis, we recommended the west side.

Mr. McFadyen: So it was the board that took away the east-side option?

Mr. Brennan: That is correct.

Mr. McFadyen: And who appointed the board?

Mr. Selinger: Well, I can answer that. Government did. Just like all governments appoint the board of the Crown corporations, as you well know.

Mr. McFadyen: On the issue of the process yet to be undertaken, I want to just ask you, who do you need to get licences from in order to proceed with a new bipole line?

***** (18:40)

Mr. Brennan: The provincial regulatory body.

Mr. McFadyen: Which regulatory body is that?

Mr. Brennan: Clean Environment Commission.

Mr. McFadyen: Maybe Mr. Selinger will want to take this question: Who appoints the Clean Environment Commission?

Mr. Selinger: I believe when you were in government, it was the government of the day that appointed it, and when we were in government, we followed the same practice.

Mr. McFadyen: Can I just come back and then get you to indicate, Mr. Brennan, whether you think that this decision is in the best interests of Manitoba Hydro as a corporation?

Mr. Brennan: I don't think it's my job to question policy. My job is to implement policy when it's given to me. I make the best recommendations I can considering what I know, and certainly, if people that make policy decisions have different environment or different considerations, I respect that, and I implement that which they approve.

Mr. McFadyen: So you made one recommendation and that recommendation was rejected, and what you are saying is you are proceeding based on the limited option, the one option that you were provided by your board.

Mr. Brennan: Yes, we're doing it with enthusiasm.

Mr. McFadyen: I want to just come back. You know, I would suggest that the role of a corporate CEO, even of a Crown corporation is broader than simply taking direction from government. There's a statutory duty to do what's in the best interest of the corporation. So, setting aside policy considerations, I wonder if you can indicate whether you think the west-side route is in the best interests of Manitoba Hydro as a corporation.

Mr. Brennan: As a corporation, as being responsible for making recommendations to the board of Manitoba Hydro as to what I thought, and once a policy decision is made though, it's not my job to start arguing about it; it's to get on with the job.

Mr. McFadyen: If I can just turn to the report that was tabled just at the beginning of this meeting, *The Bipole III Transmission Routing Study* prepared by CMC Consultants Inc. dated September 2007. This is the report that was tabled by the minister, and it examined various issues, including environmental considerations and broader policy and procedural issues.

I would just like to, if I could, go to page 1 under the heading of Introduction and ask you, Mr. Brennan, if we can just turn our attention to the second bullet on page 1, there's a question followed by an answer. The question is: "Is there support from the First Nations on the east side of Lake Winnipeg?" The answer given in this report is, and I quote, "Government meetings in 2004 concluded that there was none. However, recent statements made by First Nations to the media and east side planning documents suggest that there is now some support."

I just want to ask you if that indication of recent support is consistent with the indications of earlier support that Hydro was receiving prior to the suspension of the Hydro consultations in 2003.

Mr. Brennan: Although we did not complete ours, the early indications were that we were getting sort of a mixed review. Certainly, some of the elders weren't as supportive as some of the younger people.

Mr. McFadyen: There's been a reference to international opposition. That's referred to in the third bullet of the report that we're referencing right now. Do you have, in your records, any documents outlining international opposition to an east-side bipole route?

Mr. Brennan: After the last meeting we had, I did point out that there are a good number of letters of opposition that did come in. I went back and checked, and, without counting them or anything like that, they estimate the number to be 10,000. But, certainly, environmental groups were getting together. Now with the Internet it's easy to do. The estimate given to me was 10,000, or over 10,000.

Mr. McFadyen: Those are letters from international, from outside of Canada or outside of Manitoba? Or is that–sorry.

Mr. Brennan: They were global.

Mr. McFadyen: Does the opinion of Manitoba engineers and east-side residents who have been writing to express support for the east-side route factor into this, or do we only pay attention to form letters from international organizations?

Mr. Brennan: Probably your question should be directed at the chairman. From my perspective on that question, we listen to everybody.

Mr. McFadyen: If I could just go to the third bullet of page 1 in the report. The question that's posed there is, and I quote: "Will there be international opposition from environmental groups to an east side route even if there were First Nations agreement to proceed?" The response is: "Very likely, but the tenor of the debate may change, as environmental groups could no longer point to a lack of First Nations support for the east side route as part of their opposition, and it could potentially place them in conflict with First Nations communities, with whom they have previously partnered."

Can I just ask you whether, of the international form letters that have come in, is there acknowledgment in those letters of the growing east-side community support for an east-side line that's referenced in the second bullet of this report?

Mr. Brennan: I would say no. They tend to reference the support. Most of it was a, prior to that, I believe, most of the letters coming in to hearing that opinion.

My concern, and I'm not sure if I made this clear at the last time, my concern about a lot of environmental opposition to anything Manitoba Hydro does is getting our purchases of our power outside the Province concerns. Most of them are on a rate of return basis for obtaining rate increases and, consequently, any–and they definitely look at the lowest cost option. Although it's a market we're selling into and market prices prevail, if, in fact, there are a lot of problems with purchasing power from, let's say, Manitoba Hydro, they would just move to say all this concern and hassle on our part is not worth it; we'll go the next lowest cost and not have the hassle. That is the concern that I have. It's a major concern just because of the amount of revenue we get for the power we sell.

Mr. McFadyen: Is it also your observation that there's a desire in the environmental movement globally to reduce the amount of coal-burned energy, whether it be within Manitoba or outside of Manitoba?

Mr. Brennan: For sure, greenhouse gas emissions are a problem everywhere.

Mr. McFadyen: Is that a major factor that would be in Manitoba Hydro's favour when it comes to the environmental arguments that might be made to regulators or companies that might be purchasers of Manitoba Hydro power?

Mr. Brennan: It's certainly an argument we make.

***** (18:50)

Mr. McFadyen: You have indicated that environmental assessment and licensing activities are, and I quote: For either a west- or east-side option are challenging.

Can you just outline what the challenges would be with respect to environmental assessment and licensing activities, or the anticipated challenges because we're not there yet, but the anticipated challenges with respect to the proposed west-side route?

Mr. Brennan: It seems that anybody who's opposed to a line, no matter what the reason, uses environmental issues as a reason not to build. So I would expect there would be opposition on both sides. I think from a straight environmental perspective, though, there would be more opposition for the east side for sure.

Mr. McFadyen: Could it be that the opposition of the east-side route that has been received to date would appear to outweigh the west-side route only because the west-side route was just announced two months ago and there has been little opportunity for analysis of the environmental impacts of a west-side route? Sorry, it was announced three months ago.

Mr. Brennan: I would think from an environmental perspective we'd get more opposition from the east side just because of where it's going. The west side has definitely been more developed.

Mr. McFadyen: So, at this stage, the assumption is that there would be more opposition to east side than west side, but, at this stage, that's only an assumption because the west-side option was only announced three months ago and there has been little opportunity for analysis. Would that be fair?

Mr. Brennan: I think it is fair. I think it's a judgment on my part.

Mr. Selinger: I'm just wondering if I may make a comment there. The rising concern about the boreal forest has been growing for several years in the environmental community and in the scientific community. They have made comments about the intact, large tract of boreal forest on the east side. They've also always had the opportunity to make comments about boreal forest in any other part of Canada. Even before the specifics of this decision became under active debate in the last several years, the environmental community and the scientific community have identified the east side as an area of boreal forest that has outstanding universal value. That's the phrase that's used by UNESCO.

I think the member is asking would there be opposition. I think there will be opposition probably to hydro lines no matter where they are put. I think Farlinger actually does a very fair job of discussing that. There are exposures on both sides, but I think there is something specific and unique about the east side in that it's less developed, in that it has a large intactness to it which I think the report we've tabled with you attempts to try and discuss that. Again, I think they try to discuss it fairly.

So, when the president of Manitoba Hydro says he thinks, he makes an assumption there would be more opposition on the east side. Demonstrably up to this date, knowing about the boreal forests anywhere in Canada, there has been more support to protect the east side than there has been to protect other areas of boreal forest across the country. There is demonstrable support for greater protection on the east side. Would there be opposition on the west side? Likely as well.

Mr. McFadyen: If I could then, the minister has picked up on this and it is the broader policy issue that is at stake here. I just note on page 9 of the report under the second bullet there is reference there, and I'll just quote the passage. It says: "A west side routing will cross not only boreal shield but also boreal plains ecozones (from roughly Ponton to Red Deer Lake). This latter ecozone is considered to be highly impacted and at greater risk – according to Global Forest Watch, less than 15% remains in large, intact areas. This includes the same ecozone that was identified for protection as part of the proposed Manitoba Lowlands National Park. Although there are potential routing options through this ecozone that could parallel existing developments, an argument could be made that this region has greater urgency for protection of ecological integrity than the vaster boreal shield forest of the east side."

So, in light of the fact there is an argument that the west side has greater urgency for protection than the east side, I wonder if this changes the minister's mind with respect to which route the line should go on.

Mr. Selinger: I just wish the member would read into the record the last sentence there, that how this forest on the west side does not have the same profile and emotional appeal as the east side. I think what the comment here that's made by the report is that there are sensitive and important areas to be protected on the west side as there are on the east side, and that's what I think is valuable about the report. It doesn't try to pull any punches in regard to either option. It says that whatever route you choose you're going to have to be very careful to protect ecological values. But later on in the report, and I know the member has just received it tonight and he'll want to read all of it because, I mean, there's so many things in here that are worth discussing, he does discuss the unique notion of the intactness of the boreal forest on the east side, which distinguishes it from other sensitive areas on the west side. There are challenges wherever you route hydro lines these days.

So the report and my letter that follows up on that report, to the Hydro, draws out of the report those points that were of a concern to us with respect to an east-side option. But we have always said that we think there will be concerns on the west side as well. And Manitoba Hydro has acknowledged there would be concerns on the west side as well, and very careful planning and consultation will have to go into whatever option is chosen.

Mr. McFadyen: I can't help but follow up on the very last thing you said, careful planning and consultation for whichever option is chosen. Are you saying that there's still more than one option on the table?

Mr. Selinger: I'm saying the west side has been chosen, but my point is that there had been a lot of work done on the east side, to consider it, and there had been considerable opposition expressed to it. Manitoba Hydro has, after receiving our reviews and knowing where the government stood prior to the election and also being aware of the WNO process, is now proceeding to consider our route on the west side in a wide territory, and they will have to look at the most efficacious, least environmentally sensitive option on that side. That will require careful planning and consultation.

Mr. McFadyen: I want to thank the minister for acknowledging that there are sensitive ecological areas along the west-side route as well as the east side, because what I'm taking from this report, which has been tabled, is that there are issues on both sides. Arguably, they say the west side is more urgent in terms of the need for protection, but let's put that aside. If there is urgency in protecting the forest on both sides–they say more urgency on the west side; you appear to be saying more urgency on the east side–if there is uncertainty, then, as to which route has the least negative environmental impact, then why would you choose an option that is hundreds of millions of dollars more expensive, is going to produce a less reliable transmission system, is going to take two years longer to complete, and it's going to result in more lost power?

Mr. Selinger: I just want the member to be careful about what he is interpreting out of that. It says an argument could be made. It didn't say definitively that an argument should be made. It didn't say that for certain. It says an argument could be made. The point that we are making here is that the Farlinger report brings out many issues that are worthy of consideration with respect to a west-side option. It doesn't definitively come down and make a hard statement. It says that there could be an argument that there are urgent areas to be protected on the west side, and that will have to be considered in the west-side option.

Now, the member says that it will be more expensive. It will be more expensive only if you can actually build it on the east side. I mean, this is a hypothetical example here. If you can't build it, if there's a resistance, and we've seen this with other projects, it could wind up being more expensive. We just saw a project in Alberta that had to be cancelled and redone after many millions of dollars of expense because of the concerns that arose as a result of that.

Clearly, it's a longer route. That's been acknowledged from day one. When you build a longer route, it's more expensive than a shorter route just on the cost of the actual physical requirements to do that. But that longer route, depending on whether or not it achieves acceptance in terms of the constituencies affected by it, may actually wind up being more cost-effective than a route on the east side that has a huge amount of resistance attached to it and can't get built. So these are questions that require careful consideration, as I've said earlier.

***** (19:00)

Then the member also suggests, in his points, that it's less reliability. Well, it's over the base case. The base case is that there is no additional bipole right now. For many years, there've been recommendations to proceed with the bipole. What's happening now is there's a bipole being built which will increase reliability. That's the whole purpose of this exercise, is to increase reliability over the status quo, not over a hypothetical alternative that may not be able to be built.

Mr. McFadyen: You've indicated that there was a global, or Mr. Brennan indicated that there were global signatures or petitions that came in opposing the east side, roughly 10,000. Now, I just want to ask the minister if 10,000 Manitobans sign a petition in opposition to the west side will you withdraw that option and proceed with the more reliable, shorter, less costly, quicker-to-complete route on the east side?

Mr. Selinger: Well, the member is assuming that the volume of e-mails was the critical factor in the decision of which side to pick. I suggest to him that that is a completely inaccurate analysis. There was much more consideration that went into which side should be chosen. Many of those considerations are discussed in the report, and we've had debates on this in the Legislature. So that kind of a question, I think, really misrepresents the basis upon which the decision was made.

Mr. McFadyen: Sorry, but it was you, Minister, that said that the decision to go west side rather than east side was because of international opposition. Mr. Brennan said, when I asked him what form that came in, that there were written submissions, 10,000 of them. So, if the basis for the decision is international opposition as evidenced by letters and petitions, then why would you not give the same weight to 10,000 letters in opposition to a west-side route?

Mr. Selinger: I think the member once again may be misinterpreting and may be misconstruing what was said. What we said was, and we have said this in discussion in the Legislature as well, that there is considerable risk to the reputation of the corporation of Manitoba Hydro in choosing a route that will generate a good deal of controversy. We have examples of this on other projects that have been attempted in other jurisdictions.

That reputational risk is something that has to be accounted for in the public policy decision because it could put at risk our major market. That could be up to $5.5 billion of revenues over 10 years. We never ever said that it depended on the number of e-mails one way or the other. I think the member, to try and put the question that way, really misrepresents the depth and the quality of the debate we've had up till now.

Mr. McFadyen: So what the minister's saying is that, if there is significant opposition to the west-side route, which could damage the reputation of Manitoba Hydro by virtue of the fact that that route is more expensive, less reliable, will take longer to complete, will result in more lost power, is running through highly endangered spaces that, according to this report, say are a greater risk, if opposition should arise for those reasons, then what you're saying, Minister, is that you'll change the decision and go with the less expensive, more reliable, faster to complete, less lost power, more environmentally friendly east-side route?

Mr. Selinger: The member is remarkable for his ability to try to put words into other people's mouths. That's actually what you're saying, and I don't think you should try to suggest that that's what other people are saying.

First of all, just to go back on your statement, there's never been an acknowledgment that it would be faster to complete. You've tried that question many times tonight. There's been *[interjection]*–if you would let me finish the question before you proceed with yours. Courtesy is usually the best way to proceed in this hearing.

So there's never been an acknowledgment it be faster to complete. As a matter of fact, there's considerable concern that an east-side alternative may never get completed. So that negates that point.

Loss of power. Even in your own document tonight, which you provided here to us, it says the differential of 16 megawatts, up to 32 megawatts, which has been far less than what you've been quoting in the Legislature.

On your third point: less reliable. The point is that it increases reliability over the base case where nothing has been done for many years after suggestions have been made that there should be something done. We understand that it will increase the efficiency of the system by up to 76 megawatts and add additional reliability to secure the ability of the corporation to provide energy not only to Manitobans, but to its external customers. So the reliability increases by proceeding with the bipole.

Mr. Chairperson: Before I proceed to the next question, as Chair, I am asking committee members to direct all their questions and answers through the Chair. It would help us with our proceedings here this evening. So, if you would co-operate in that fashion, I would appreciate it.

Mr. McFadyen, with the next question.

Mr. McFadyen: Thank you, Mr. Chairman.

We certainly understand that, from the base case, the debate, obviously, is east versus west in the route. We know that east is less expensive, more reliable, faster to complete. I want to take issue with your point about completion time when, two weeks ago, Manitoba Hydro issued a document that said there will be one year less in consultations by going east side and one less year in construction. So it's two years faster to complete on the east side, assuming it gets licensed by the government-appointed Clean Environment Commission.

So I just want to ask you, Mr. Minister, if there is some particular reason why you think your appointees on the Clean Environment Commission will reject an east-side application, and how it is that you would know at this stage in the process that that will be their conclusion?

Mr. Selinger: I don't think we've ever made a comment one way or the other on a hypothetical case that's being put in front of the Clean Environment Commission.

The one thing I do note, though, is that the member seems to suggest in the way he characterizes the question that perhaps the appointees to the Clean Environment Commission wouldn't exercise independent judgment on what they think would be the best alternative. I would just like to say that the people appointed–and I believe that was the case when you were in government as well–is we try to appoint, everybody, every government, I think, tries to appoint competent people that will exercise due diligence and good judgment on behalf of the public interest. So I think the characterization of your question is really an attack on the independence and credibility of the members of that commission. I would hope the member would consider withdrawing those kinds of comments.

Mr. McFadyen: So you can confirm, then, that you don't know what the Clean Environment Commission would decide with respect to an east-side proposal.

Mr. Selinger: What I can confirm is that, as we appoint people to these bodies, that exercise, as I said earlier, what we hope is good judgment based on their backgrounds and experience, and then try to make decisions in the public interest.

Mr. McFadyen: So you've made a decision that will cost hundreds of millions of dollars more, result in a less reliable energy grid, take longer to complete and result in more lost power on the basis that you're concerned about the ability to get approval from the Clean Environment Commission, but what you're saying right now is you actually don't know right now what they might decide.

Mr. Selinger: Actually, I didn't say any of those things. Those are things that you've been saying. You're, once again, putting words into people's mouths at the same time as you attack the credibility of the people on the commission.

What we've been saying is that we need to proceed with reliability improvements to manage risk in the corporation, improvements that have been recommended for many years, improvements that your government did not act on, even after they had a very serious incident in 1996. There was no follow-up action to increase reliability. We take the reliability risk of the corporation seriously. That's why we've worked with the corporation to find a way to move forward on reliability.

What we are also saying is that we have an historic opportunity to have a UNESCO World Heritage designation that will protect an important tract of boreal forest in Manitoba, which we think will provide long-term benefits not only to the environment, but to the peoples on the east side in terms of economic development, eco-tourism and those kinds of developments that have long-term sustainability.

We also think that we are proceeding in such a way, in co-operation with the corporation, that we will ensure the reputational integrity of the corporation in its marketplace where it sells products, to ensure that the product that is put out there is one that is well received by the consumers of that product, and that the ability to attack the credibility and the quality of that product is reduced so that the product will continue to generate profits, which keep the cost of Manitoba Hydro electricity low for Manitoban companies and citizens and families.

So it's a question of managing risk which is, I think, what good governments do. If you look at it compared to what you've suggested you would do, you have said you will ram a hydro transmission line down the east side regardless of what people think about it, one way or the other, regardless of what the environmental consequences are, regardless of what the potential risk is to customers in the marketplace. You have actually generated an alternative that could create a perfect storm that could put not only the profits and the viability of the corporation at risk, but could put the reputation at risk and also bring an enormous amount of grief not only to the peoples of the east side, but to the people of Manitoba in terms of the UNESCO World Heritage designation and the protection of the boreal forest. When you think about that, that's very high-risk gambling that you're proceeding with in terms of what you say you would do if you were government.

***** (19:10)

Mr. Schroeder: Just for clarification, it's not just the Clean Environment Commission. It's also Fisheries and Oceans. It's also, potentially, the Court of Queen's Bench. It's also, potentially, the Court of Appeal. It's also, potentially, the Supreme Court of Canada. So there are a variety of actors involved. When one says that there are difficulties, one looks at other cases to say that. Nobody can guarantee that that would or would not happen.

Mr. McFadyen: I think to be fair, what I'm pleased to hear tonight is that there is acknowledgment all around the table that there is risk of challenge and opposition regardless of what route is chosen, whether it's east or west. There are people who are going to have issues and are going to raise concerns about various options. Obviously, we have the report today tabled by the minister which says, and I quote, that the latter eco–*[interjection]* Excuse me, it's not a point of order. I thought you were interested in courtesy tonight. Can I just finish?

An Honourable Member: We'd just like to get the record straight.

Mr. Chairperson: Hold on, folks. Hold on a sec here. If there is a legitimate point of order, I have to recognize the attempt, at least, and then make a ruling on that and then we'll proceed with the question.

Point of Order

Mr. Chairperson: Honourable Minister, do you have a point of order?

Mr. Selinger: Yes, twice the member has put on the record that the report was tabled by the minister. I'd just like the record to show that the report was tabled by the chairperson of the Crown corporation in question, Manitoba Hydro.

Mr. Chairperson: Any other comments?

It's not a point of order; it's a dispute over the facts.

* * *

Mr. Chairperson: We'll now proceed back to the questioning.

Mr. McFadyen: Thank you, Mr. Chairman. The report tabled tonight by the chairman of Manitoba Hydro says, and I quote, the ecozone on the west side "is considered to be highly impacted and at greater risk – according to Global Forest Watch, less than 15% remains in large, intact areas. This includes the same ecozone that was identified for protection as part of the proposed Manitoba Lowlands National Park." It goes on to say, ". . . there are potential routing options through this ecozone that could parallel existing developments, an argument could be made that this region has greater urgency for protection of ecological integrity than the vaster boreal shield forest of the east side. However, this forest does not have the same profile and emotional appeal as the east side."

I wonder in light of that statement whether you continue to believe that the Clean Environment Commission is more likely to approve the west-side route than the east-side route, to the minister.

Mr. Selinger: Once again, we appoint people to these bodies such as the Clean Environment Commission that exercise impartial judgment in the public interest. Really, I don't think it's appropriate for me to speculate on what they would decide on a hypothetical case that they haven't had in front of them. I mean, I think we have to let them do their job.

Mr. McFadyen: So, then, when you say that the risk of not getting a licence is one of the reasons for the decision to go west side, what you're saying is that you actually don't know at this stage what the licensing body might decide.

Mr. Selinger: Actually, once again the member keeps trying to interpret other members' statements. The report itself and what we've debated in the Legislature up to now, indicates that there's a lot of concern about a route down the east side and that that concern has the potential to become a cause célèbre. That could bring a great deal of negative reputational risk, not only to the corporation, but to the Province. It could result in the delay, the serious delay, if not the permanent inability to build the route on the east side. We've said that consistently from day one.

We've also said, and this report confirms it, that there are issues wherever you route a hydro line, and they will have to be carefully considered in whichever route is pursued by Manitoba Hydro. But we do know for sure, and the member will see this when he reads the report further, that the east-side address has a high degree of saliency in terms of protection of the boreal forest because of its universal outstanding characteristics.

Those characteristics include the fact that it's a large tract of intact boreal forest. It is one of the primary habitats, which has the best chance of attracting the woodland caribou. It has not only unique environmental features that require protection, but it also has unique cultural communities over there that are part of the designation process for UNESCO. It's extremely rare in an UNESCO-designation process that you both have outstanding universal value of both on the ecological as well as the cultural side. These factors are the factors that needed to be considered in what the routing decision should be for the hydro transmission line. These factors are the kinds of factors that the report suggests Hydro should discuss with the government because they go beyond the mandate of what Manitoba Hydro normally takes into account when they make a decision.

Mr. McFadyen: Minister, to sit on a record that he didn't table the report, can I just ask him, did he issue a news release today releasing the study that we're making reference today to?

Mr. Selinger: There was a news release put out on the report today that was tabled by the chairman of Manitoba Hydro here tonight. Absolutely.

Mr. McFadyen: I've got the release in front of me. It says the Finance Minister and Minister responsible for Manitoba Hydro "today released a study on routing options." So I just want to ask you, Minister, are you the minister that's referenced here that released the study that we're referring to?

Mr. Selinger: Yes. I think the press release is quite clear in that regard. That's completely consistent with the chairman tabling the report here tonight.

Mr. McFadyen: I just want to ask the minister if the news release you put out today makes reference to the threatened boreal forest on the west side, or does it only refer to issues reflecting the east side?

Mr. Selinger: The news release identifies those issues that the government thought were salient in choosing not to recommend an east-side route. The report itself speaks from a broader range of issues which were in front of Hydro after they commissioned a report. We felt it was important that the report not only be tabled here by the chairman of Hydro, but be put into the public domain, because the report looks at a broader range of issues. The government identified those issues they thought were salient on an east-side choice.

Mr. McFadyen: By salient, what you mean are the release points to things in the report that support the government's predetermined position, and makes no reference whatsoever to any of the issues around the threatened west-side boreal forest or any environmental issues on the west side.

Mr. Selinger: Actually, my letter speaks to that in terms of process. The government's position was formed after many consultations. It was formed after, first of all, accepting the COSDI, Sustainable Development Implementation report, in 2000. It was formed after the broad area planning process was initiated with communities on the east side and was formulated after more than 80 meetings that the government undertook with peoples and communities on the east side. So, when the members say it's a predetermined position, it's actually quite the opposite of that. It's a position that was arrived at after our consultations with the peoples on the east side, broad area planning activity and the acceptance of the COSDI report. So quite a bit of process and consideration went into that, including many, many consultations with communities on the east side.

Mr. McFadyen: Mr. Chairman, through you to the minister, does today's news release make reference to the statement in the report that recent statements made by First Nations to the media and east side planning documents suggest there is now some support for an east-side route?

Mr. Selinger: Mr. Chairperson, the news release, I think, accompanies the report. The report itself speaks on page 1, as the member referenced earlier, about the fact that there has been some additional support expressed for an east-side route by some of the chiefs on the east side. So, when I look at the press release released today, it does not specifically mention that, but it comes along with the report itself, which identifies a variety of issues with respect to all of the alternatives that have been under debate for the last several months.

Mr. McFadyen: I just want to ask the minister why he wouldn't have made any reference in today's news release to any of the concerns raised in this report about the west-side route.

***** (19:20)

Mr. Selinger: Well, once again, the news release is simply identifying why the government has decided that an east-side route is not as preferable as others might have thought. The report speaks to the broader issues that go along with that. That's why the report was tabled here tonight and that's why the report was released to the public, so that people can know all the elements that might have been considered, as well as what the government decided were the important elements to it.

Mr. McFadyen: So, if a member of the public wanted to know both sides of the story, they'd have to ignore the government news release and read the report?

Mr. Selinger: If the public wanted to know the broader range of issues, they would review the report which was released by the government and by the chairman here tonight to the committee, and they would know the government's rationale and they could ask questions about any other points that were raised in the report, as we are doing right now.

Mr. McFadyen: Given that the report says that the environmental groups could no longer point to a lack of First Nation support for the east-side route as part of their opposition, I wonder if the minister can indicate–sorry, and I'll go on, the quote says on page 1: "and it could potentially place them"–that's making reference to the environmental groups–"in conflict with First Nations communities, with whom they have previously partnered."

I want to ask the minister: In the event of such a conflict between international environmental organizations and Manitoba First Nations, where First Nations are lining up in favour of an east-side route and international environmental organizations are opposed, which people the minister would line up with: Manitoba First Nations or international environmentalists?

Mr. Selinger: I think, if you read my letter, we make it very clear that there were extensive consultations with the peoples on the east side, and the overwhelming consensus at that time, when the consultations were done, was that there was a great deal of concern about an east-side transmission line. That was one of the important pieces of consultation that contributed to the government deciding that an east-side alternative wasn't appropriate.

Mr. McFadyen: So, to be clear, the opposition you're referring to is the opposition that is four years old?

Mr. Selinger: The concerns were those that were recorded and identified at the time that the experience occurred, and the member is suggesting that there have been different views expressed recently–those are on the public record, we're well aware of them–but the government has gone through a long process of consultation and it's very aware that there are a variety of views on the east side, but there are many, many people over there that are very concerned about an east-side transmission line.

Mr. McFadyen: So, as this issue revolves, given that the consultations stopped in 2003 and at the time the indication was that there was significant opposition on the east side, is the minister open to changing his mind based on more current information about the views of residents on the east side?

Mr. Selinger: Well, I think it's clear that we are now proceeding in consultation with the Manitoba Hydro to look at west-side alternatives.

Mr. McFadyen: If the basis for going west side, or one of the reasons was east side opposition, if that opposition has now turned into support, will that have any impact on the minister's decision making?

Mr. Selinger: Once again, we've had this discussion in the Legislature and the decision for all the reasons I've outlined earlier, the different kinds of risks that have to be managed, is to proceed with the west-side alternative.

Mr. McFadyen: Can the minister just indicate the names of the international organizations that are on the record as being opposed to the east-side route?

Mr. Selinger: Well, we're aware of several organizations that have concerns about protecting the boreal forest and concerns about the east side. The international organizations–the one that the member has referenced in the past is the Natural Resources Defense Council, which is an environmental action organization with 1.2 million members. We're also aware of the Sierra Club of Canada, the Canadian Boreal Initiative, the Western Canada Wilderness Committee, the Canadian Parks and Wilderness Society, sometimes known as CPAWS, the Nature Conservancy of Canada, and the boreal forest initiatives, as well as significant individuals including Sophia Rabliauskas, who has received the Goldman Environmental Prize, is an Aboriginal woman who lives in the Poplar River area on the east side and has been championing the protection of the boreal forest on that side.

We're aware a variety of other significant individuals have expressed their support for protecting the east side in terms of the intact boreal forest.

Mr. McFadyen: Is the minister aware that many of the organizations he has made reference to are opposed to any and all hydro development?

Mr. Selinger: We have not been made aware of these organizations that they're opposed to any and all hydro development.

Mr. McFadyen: Have these organizations taken a look at the impact of a west-side route and offered analysis and comment on the environmental impacts of the proposed west-side route, to the minister's knowledge?

Mr. Selinger: To my knowledge, not at this stage of the game, but they will have full and ample opportunity to do that as the west-side process proceeds.

Mr. McFadyen: In the event that they have concerns about the west-side route, will the minister listen to those concerns and not proceed with a west-side bipole transmission line?

Mr. Selinger: Well, once again, I think there will always be a willingness to listen to concerns that are expressed about the route that is potentially under consideration for the west side. Those concerns will be listened to and then decisions will be made based upon not only that, but other factors that go into the decision-making, including where local communities are at, where the reliability issue, as I've mentioned before, which is important to move forward on, the impact on markets, the impact on the environment, specific environmental aspects of the route chosen compared to the alternatives. All of those risk factors will have to be managed in such a way that we can continue to provide reliable, clean power with a good reputation for the corporation.

Mr. McFadyen: Given that we are in the early stages of that environmental review and the licensing process, I wonder if you can then just confirm that, in the event that persuasive arguments are made by either international organizations or Manitobans or others, that the west-side route is unacceptably damaging to the environment and damaging to the province in other respects, are you open to abandoning that option.

Mr. Selinger: Well, once again, there has been a decision to proceed with the west side. I think hypothetical questions that are unduly speculative really are a little too early to be discussed. I think we have to proceed to increase the reliability of the corporation, which we said earlier, a decision which had been not acted upon for many, many years even after serious incidents have occurred. It's incumbent upon all of us to find a way to move forward to increase the reliability. It's also incumbent upon us to do it in such a way that we don't take away opportunities to protect unique and intact, and some would call pristine boreal forest areas, and the opportunity to get a world class designation under UNESCO for what they call a landscape that has universal value.

Thirdly, it's important to proceed in such a way that we have the ability to market our product to our customers, a product with a good reputation, a good image and a good, quality product in terms of the fact that it's hydro-electricity and it displaces greenhouse gas alternatives.

So, all of those things are factors that have to be considered. It's not a one factor, singly. It's a complex of factors that have to be considered. As you know, we've talked about this earlier, any application to proceed has to be part of a full review by the Clean Environment Commission, which has people on it that act with impartiality and integrity and in the public interest of Manitoba.

Mr. McFadyen: So can you just confirm: you don't know at this stage, one way or another, whether the Clean Environment Commission would prefer the east side or the west side?

Mr. Selinger: I think, once again, we've never tried to second-guess what an independent body should do or what judgments it would have. It would be, I think, irresponsible to try and do that. I think they have to do their work and follow the proper process and render their decisions.

Mr. McFadyen: Since you would respect the process and have no idea at this stage what they might decide, how can you then use licensing risk as an argument for west versus east?

Mr. Selinger: Well, as we said earlier, there is experience in other jurisdictions of what happens when something becomes a cause célèbre. I think the question can be reversed: how could you discount those considerations in any choice you make? You have to make a judgment based on a variety of risk-management factors and without second-guessing, necessarily, what a body would do, but, at the same time, proceeding on something that has a chance of not only being successful, but will reduce risk for liability, will not bring reputational damage to the corporation or to the province, will continue to maximize opportunities to protect the environment and achieve designations which have long-term benefit to the province of Manitoba in terms of what that could do in terms of economic development, eco-tourism and green economic development, and, perhaps equally as important, to ensure that markets are willing to buy the product and accept that that product will have value to them and be prepared to pay a market return price for that.

***** (19:30)

We've heard testimony from the president of Manitoba Hydro that those markets are very important to us, and earlier tonight we heard a suggestion that if something becomes too much of a hot potato, in effect, that there are other alternatives that might be pursued that could put the profitability of the corporation at risk and the result of that could be a very negative impact on rates and Manitobans and the customers that consume that product in Manitoba.

Mr. McFadyen: Two weeks ago, Manitoba Hydro, in response to questions pursuant to the PUB process, said that the western route, because it is 50 percent longer, has and I quote, a greater probability of being interrupted by weather-related events, end of quote.

So the western route has a greater probability of being interrupted by weather-related events. Is that a risk factor you've considered with respect to your preferred western route?

Mr. Selinger: Well, Manitoba Hydro has themselves identified that as a risk factor in their technical review of what route they would have preferred. This is ground we've gone over. We know that at the engineering and technical level that a shorter route was to be preferred by Manitoba Hydro. We also know that in previous decisions to do routing they didn't choose the shorter route. They chose the Interlake route, which was longer, as opposed to the east-side route. So these factors were always on the table, and the corporation and the governments of the day make decisions what they think is in the broader public interest, given all the factors, not just the technical ones. They are important but other factors are important as well.

Mr. McFadyen: Just further to what the minister characterizes as technical quote unquote issues. Hydro said two weeks ago and I quote, further a western routed bipole is generally closer to the existing bipoles 1 and 2 in northern Manitoba than an eastern routed line. So the chances of all three bipoles being interrupted from a weather-related event are greater with a western routing, end of quote.

Has the minister factored in the risk of the interruptions in choosing the west side over the east side?

Mr. Selinger: Well, the west-side route is what's being considered by Manitoba Hydro for a west-side route includes a very wide swath of territory. Presumably they would pick a route that managed risk in terms of reliability to reduce the reliability risk as much as possible. That's the whole point of doing a third bipole and that's the whole point why we believe, based on recommendations and concerns by Hydro, that we have to act on a third bipole. It has been sitting on the books as a concern for many years. Now it has to be acted on.

The reality is that a third bipole will dramatically improve the reliability of the product, not only to Manitoba customers but to export customers as well. The route that is chosen will have to ensure that there is risk that's managed between the existing bipoles, which are right together down the Interlake. We must remember when they were built that was probably the highest risk was to build them together. At that time that was the decision to build them together.

There could have been a decision at that time to build bipoles 1 and 2 in routes that were farther apart in order to manage risk. But they decided to build them together. Now we know that it would probably still be cheaper or easier to put it down the Interlake, but that wouldn't do the job of addressing the reliability risk. So another route is to be preferred other than the Interlake route at this stage of the game unless technologies, cost-effective technologies are available through an Interlake route that would reduce that reliability risk.

Mr. McFadyen: Is it the minister's view that power interruptions are merely a technical issue?

Mr. Selinger: Well, power interruptions are a serious issue of reliability.

Mr. McFadyen: If there's a greater risk of power interruptions on the west side than the east side, which you say is a serious issue, then I wonder what are the reasons on the other side of the ledger given that there's a greater probability of power interruptions with your western route than the eastern route. How can you justify that?

Mr. Selinger: Well, I don’t think the member wants me to go back into the detail that I've mentioned earlier, but there are three types of risk that are being addressed here. One is reliability risk over the base case. The do-nothing option really doesn't seem sensible anymore. The do-nothing option was the one pursued when you were in government. Now we have to move beyond that. We have to actually move to the do-something option to increase reliability. The do-something option is the worst reliability option at this stage of the game, giving existing cost-effective technologies would be to build a third bipole in the Interlake, which was done when one and two were put together.

The recommendation is to look at something that provides separation between existing bipoles. So that's risk No. 1 that needs to be managed. Risk No. 2 that needs to be managed is that relating to the environment and the potential of having the boreal forest protected on the east side where it has some unique universal outstanding characteristics. The third risk that needs to be managed is the risk to markets and the reputational risk that relates to the ability to sell product into other markets. All of these things interact with each other, as we know.

What we're trying to avoid is the scenario that you seem to prefer, which is one that could create a perfect storm, where you would have increased reliability risk because of the controversy around it, delays in building it, increased risks to the environment because the boreal forest on the east side would be under attack and increased risk to markets because of the controversy that would flow out of that that might actually reduce the ability to sell product into those markets which would have enormous financial risk to the corporation and to Manitobans. So all of those things, that perfect storm scenario, seems to be advisable not to enter into that scenario, but to proceed to address reliability, environmental values, as well as market and reputational issues in a way that unpacks those issues so that there's the best chance of succeeding on all three of them.

Mr. McFadyen: Leaving aside base case, you've been in government for eight years and you've had every opportunity to move forward with a decision. But we're pleased that you are moving forward with a decision to build a third bipole.

You've identified three risks that need to be managed. We're talking about east side versus west side. We're not talking about the single west-side option that you've provided to Hydro versus the current status quo. We're talking about east versus west. So, on the first risk, do you agree with what was written by Manitoba Hydro two weeks ago that the west side has greater reliability problems than the east side?

Mr. Selinger: Well, once again, the member likes to isolate the discussion to east side versus west side. I think the most important place to start–

An Honourable Member: Really?

Mr. Selinger: The member likes to ignore the fact that the base case was nothing was happening. There had to be movement forward on the reliability risk management scenario. The option that was the least preferable was the Interlake option because it brings it into direct contact with the existing bipoles.

The alternative that needs to be pursued is one that provides separation between the existing bipoles and a third bipole. The west-side option, in the wide corridor that's being looked at, provides for that alternative.

Mr. McFadyen: We get that there's a need for a new bipole. There's no debate about base case versus west side. If we have the option between having no car or a car, most of us would want to have a car. If the issue is a choice between two cars, one of which is way more expensive, way less reliable, takes longer to get and is less fuel efficient versus one that is less expensive, more reliable, faster to get and more fuel efficient, I would think that most logical people would choose the latter option and so that's why we're having this debate. It's a completely disingenuous issue to argue base case versus moving ahead with a bad west-side option.

I want to ask you again, as between east side and west side, you've identified three risks. Hydro says that west side is less reliable than east side, so that's the first risk you've identified. So that is in favour of east side. Would you agree that, on the reliability argument, east side is better than west side?

Mr. Selinger: What I would say is that the important decision was to move forward off the base case, which was the do-nothing case.

An Honourable Member: Nobody favours that.

Mr. Selinger: Once again, it's important that we started from nothing having been done for a long time. There was a growing concern about increasing the reliability of Manitoba Hydro. A route had to be chosen that would increase reliability, as opposed to the do-nothing option. Then the question was which is the preferable route, considering a broad array of factors, of which I've identified three primary ones.

The first one was the reliability issue. We know that reliability is improved and efficiency gains are achieved by building a third bipole. That is–

***** (19:40)

An Honourable Member: What about versus east side?

Mr. Selinger: We know that by building a new bipole, wherever we build it, we again, except through the Interlake perhaps, that we increase our reliability and we increase the efficiency of the system. We know that on the east side the risks that could come together there, in a possible perfect-storm scenario, could make it impossible to increase reliability in a timely fashion. You insist that it could be built faster on the east side. There is actually no evidence to support that, given the other factors at play here. So that's where there's a major disagreement between us.

We also know that on the east side there are some unique and universal outstanding environmental values that need to be protected which you seem to think are not at risk here, and I think that's another fundamental difference. We do think that those values are at risk.

Thirdly, we think that that risk could interact with the ability to maintain and increase our markets outside of the province which would increase the profitability of the corporation, which I think there is an interaction between the controversy that could be generated on the east side and the ability to maintain market share in terms of our exports. That's something else that I think you underestimate the risk attached to that. So we are saying that we're choosing a methodology here and we're asking Hydro to consider a west-side corridor that will reduce the risk to markets, that will reduce the risk to environmental values, and increase reliability.

Mr. McFadyen: To the minister: He's indicated that there could be a perfect storm and could be a lot of opposition to the east-side route. Would the minister entertain the possibility of putting both options in front of the CEC and see what happens, so that we can get out of theoretical speculation and into reality?

Mr. Selinger: Well, actually, if we want to get to reality, we have to choose an option and proceed to do the due diligence around that. You can't have every option on the table at the same time. The resource requirements for that would be quite extraordinary. You have to pick an option based on good public policy objectives that will increase reliability, reduce environmental risk, and reduce risks to reputation and market, and you have to proceed with that. That was done after there were careful consultations done. That was done after there were broad area planning activities entered into. That was done after there was assessment done of the risk on the east side.

You know, the member suggests that there are changing levels of support on the east side and that is true. I mean there have been some people that have come forward and you've put some of those comments on the record in the Legislature, but there's also been a growing awareness of the need to protect boreal forest. I mean, there are changing conditions as we go forward, and the reality is you have to pick an option and proceed on it and then try to take a look at all the factors that will come up through that process and see what can be done to address them.

Mr. McFadyen: Given that the east-side option has been under study and analysis for more than 20 years and that the detailed work has been done, including examination of all of the impacts of an east-side route, I would just ask the minister: Given that the western route is going to cost hundreds of millions of dollars more, given that it's going to be less reliable, given it's going to take longer to complete, given that it's going to result in more line loss, why not just put all the detailed work done on the east-side option in front of the Clean Environment Commission and see if the theoretical perfect storm arises?

Mr. Selinger: Well, once again, I think to take the considerations up to now and just toss them in front of the Clean Environment Commission, I don't think they'd be very impressed with that kind of a presentation. Anytime you put a submission for an environmental licence in front of an environment commission, there is an enormous amount of due diligence that has to go into that. There's an enormous amount of technical work that has to go into that. There is an enormous amount of cost that goes into preparing those kinds of submissions, and I think that the approach the member is suggesting would ensure a lot of difficulty for the corporation if they proceeded that way.

Mr. McFadyen: So is it your view, then, that putting the 20 years' worth of analysis that's gone into the east-side option in front of the Clean Environment Commission for consideration is going to cost more than $410 million in two years?

Mr. Selinger: Well, once again, we have a disagreement about whether the two years is a realistic assumption that can be made, and it's only an assumption at this point.

Once again, there is a fundamental difference about that assumption based on experiences in other jurisdictions, the most recent one which we've seen in Alberta where, after all the work had gone in, that option had to be withdrawn because of the controversy generated around that and just the enormous amount of resistance to that. The $400-million cost of building a longer line is one that we've said would be more expensive in a perfect scenario, but it also acknowledges the fact that it would avoid other kinds of costs that could attach to a controversial east-side decision. It avoids risk to our markets which could cost us $5.5 billion in lost revenue over 10 years.

So these are factors that had to be considered. It's not a stand-alone additional cost. It's a stand-alone cost that preserves revenues that allows us to enhance markets and to increase sales to our customers. Those are positive things. As we've said earlier, one of the earliest pieces of information we had is that the west-side route would have a 75-, 76-megawatt gain in efficiency which will allow more power to be sold to our customers outside of Manitoba, which in itself would cover the cost of the west-side line. That was a statement that was put on the record by the corporation early on in our discussions.

Mr. McFadyen: So we are never going to know what opposition will arise to the east side because the government is not going to allow that proposal to be put before the CEC.

The minister has made reference to other projects in other places being stopped by regulators. Can the minister just outline what was the basis for the controversy in the Alberta scenario that he continues to refer to?

Mr. Selinger: Well, I was simply illustrating to the member an example of what can happen to any of these kinds of applications and the opposition. Once again, neither of us was there in terms of the details of it, but the opposition was one that they didn't find that that line was suitable for that environment at that level. They wanted a route that was less negative in terms of its impact on those communities. The alternative that they wanted to choose, I believe, was one that made more use of existing corridors and existing infrastructure which would be somewhat similar to some of the positives that could be pursued on the west side. It's well acknowledged, I think even by the member himself, that the west side has more development over the last 90 years of mining and logging and roads, and there are existing transmission corridors over there. So, overall, there is less intactness. There is less undisturbed boreal forest on the west side. There are, however, environmental issues that have to be addressed, but there is also clearly more development on the west side that would suggest that a hydro transmission line would be more readily accepted.

Mr. McFadyen: In the Alberta situation, the line that was rejected was on a corridor between

Edmonton and Calgary. As I understand it, the basis was that the company was engaged in practices that the regulators and the courts found distasteful in terms of the approach to the application, including surveillance of impacted landowners. Does the minister think that's a good analogy for what might happen in Manitoba?

Mr. Selinger: Well, the member will note that I didn't discuss those aspects of the difficulties out there, and some of those issues were going on, including with the regulator. That was one of the dimensions out there, but there was also just concern about the hydro transmission line, it's impact on the environment in the areas that it was going to go through. They were the points that I was referencing which were pertinent to the situation here.

Mr. McFadyen: Is the minister aware that some of those concerns arose from the fact that there were communities in the vicinity of that route who were concerned about the routing of a high transmission line close to highly populated areas?

Mr. Selinger: That may very well have been the case. I'm sure it was. I think what the communities out there were saying was they would prefer transmission lines to go into areas where there was already existing transmission capacity and there were already existing routes and there'd be less disturbance of them.

Mr. McFadyen: Well, the concern was that people didn't want major transmission lines in the vicinity of populated areas. Given that the west-side route is going to run in the vicinity of populated areas, isn't the lesson from Alberta that you should try to route transmission lines where you have fewer people?

***** (19:50)

Mr. Selinger: That might be the member's conclusion. I think the broader lesson is that you should try to choose transmission alternatives through a process that builds consensus and support from the communities that are impacted, as well as avoiding environmental issues; that increases reliability and protects your reputation and your markets. I think that would be the broader lesson.

Mr. McFadyen: I just want to just come back with some technical questions to Mr. Brennan. The prospect or the idea of running the next bipole line underwater has arisen in the public domain recently. I know it came up at committee last time. I wonder if you could just briefly address Hydro's analysis of that as a potential option, as an alternative to the two routes that are currently being debated.

Mr. Brennan: Before the article in the paper I was told that the costs would be significantly greater to do an underwater transmission line from the north, especially that long. After the article appeared in the paper, being a chartered accountant and not an engineer, it sounded like something that I should find out more about so I asked about it, and the problems associated with it are just totally humongous. They're just huge.

The cost is–an estimate which appears to be on the low side is about 10 times as high. The weight of the cable is such that you can't move it except in very small pieces and it has to be spliced together. It is an oil-filled cable so there's environmental concerns. The whole thing just appeared to be a no-starter.

Mr. McFadyen: Thank you, and one other question. There was a CBC story last week from an engineer who had visited Japan, who said that there was the possibility of technology that would allow cables to run underground. My initial reaction was, given that we're talking about thousands of meters of rock covered by a couple of feet of dirt on the boreal shield, it was that it seemed impractical. But I wonder if you're aware of that option or technology and whether you might have any comment on that.

Mr. Brennan: Yes, I asked about that one as well. It could have some merit should there be something that's just totally impossible to proceed with. The cost of that is also pretty high. When you go to go underground, you need a substation, and when you come back up and convert back to an overhead wire, conductor, you would need another one. It just didn't seem to be very practical. It would be if you just came up with something that just, you just didn't–you found impossible to have an overhead conductor going by.

Mr. McFadyen: Can you just indicate what is your estimate of the percentage of the east side boreal forest that would be impacted by an above-ground traditional bipole transmission line?

Mr. Brennan: I'm doing it just off the top of my head, so the actual boreal forest is virtually the whole line if you are on the east side. On the west side, the boreal forest is a smaller part near the top of the west side, then there are the boreal plains that are not as pristine as the boreal forest, and that's what Mr. Farlinger was referring to in the report.

Mr. McFadyen: Is it possible, in order to mitigate the impact on a forest arising from a transmission line, to take steps such as allowing for more undergrowth and other measures that might minimize the impact of a transmission line on a forest, other narrower corridors, more undergrowth, or other steps that could be taken if we assume, which we all do, that there's value in protecting the forest, even though it might give rise to slightly less convenient access for maintenance and upgrade? Is it possible to do those things if one was committed, as we all are, to doing what we can to minimize the impact on the forest?

Mr. Brennan: I think there are things that you could do to mitigate the impact on the forest, some of which are probably more reliable than others and some might have a reliability risk. I think if we had a–if we were ever to study it we could probably come up with some options that would at least mitigate that. Having said that, reliability is really a major issue now, and we should get on with an option that's acceptable. Certainly, without the east-side option, we should get on with the west side as soon as we possibly can.

Mr. McFadyen: I'm going to turn it over to the Member for Minnedosa (Mrs. Rowat). I might have a couple of questions toward the end, but I'm done for now. Thank you, Mr. Chairman.

Mrs. Leanne Rowat (Minnedosa): The question that I have is posed to Mr. Brennan. You had just indicated that time is wasting on movement on the west side and that there seems to be a sensitivity to move the project forward. You had indicated that Manitoba Hydro did not complete their meetings on the east side.

Can Mr. Brennan provide to us the number of communities he did meet with on the west side–or on the east side, sorry?

Mr. Brennan: I'd have to get that for you. We have a record of where the formal consultations took place. There was a separate group looking at that. In addition to that, I met with a–I think they were more tribal council meetings and groups of First Nations together, about three or four of them. But the actual formal consultations I'd have to get back to you.

Mrs. Rowat: The east-side chiefs have maintained that the meetings did not outline the possibility of a bipole line on the east side.

Can you indicate to me what level of involvement your meetings would have played with those communities, or are you aware of the level of involvement the government had in relation to the discussions on bipole 3?

Mr. Brennan: There were three sets of consultations taking place. There were Manitoba Hydro consultations; there was the east side planning group that was also having consultations; and then the government itself had consultations. Manitoba Hydro's consultations were only around the bipole and the transmission line. That's all we talked about was the transmission.

Mrs. Rowat: So, based on what you're saying is that Manitoba Hydro's discussions were specific to the bipole line on the east side. Based on your earlier comments, you had indicated that there were mixed comments coming from the communities.

I guess I would like to know, the meetings that you did have, what type of guidelines or what type of outline was used in the discussions on the east-side bipole? What were the discussions? What type of comments were you looking for from the communities and what type of questions were you asking the communities to participate in dialogue?

Mr. Brennan: As I mentioned, there were two types of consultations done by Manitoba Hydro. The ones I was doing, which were more a description of what we're proposing to do, how we are proposing to get First Nations involved in the process itself, how we intended to get them involved in the building of the line and later operation of the line and that sort of thing. We had a discussion of what we were proposing to do, after which there was a question and answer period.

***** (20:00)

In the case of the ones that were formally done as consultations associated with the line, there was a fixed process that we went through for every community. The whole process involves about three or four–well, probably even more than that–consultations with the various communities for any transmission line.

Mrs. Rowat: Mr. Brennan, would you be willing to share the guidelines that you used in this process?

Mr. Brennan: I don't see any problem with that. We're probably using the same ones on the west side, so I can get those ready.

Mrs. Rowat: Mr. Brennan, could you indicate to me what some of the challenges were that the communities identified on the east side?

Mr. Brennan: I'd have to go back. The meetings I had the concerns were mainly focussed around what kinds of impacts would be involved for the community and what kinds of benefits would the communities get out of it.

Mrs. Rowat: Recently, there have been a number of First Nation communities that have gone on record over the past several months favouring an east-side line, and recently there was a letter from MKO North, which represents all the northern Manitoba First Nation communities, stating that all of the east-side First Nation communities that they represent are in favour of an east-side bipole route. Over this period of time there hasn't been a single chief go on record opposing the line.

I would just like to ask Mr. Brennan: Does he have any documentation to show that any of the east-side chiefs have stated an outright opposition to the bipole line going along the east side?

Mr. Brennan: Yes, there is one First Nation that's been opposed to the line all the way through. As far as I know, they still are opposed. It's the one that's most prominent, and that's Poplar River.

Mrs. Rowat: In my discussions with the communities are on the east side, it would appear that the opposition from the Poplar River First Nations is softening. MKO has issued a proposal that would allow for an east-side route avoiding Poplar River traditional lands and have minimal impact on the proposed UNESCO World Heritage Site. Has Hydro explored this option, and have they been in discussions with MKO?

Mr. Brennan: We continually have discussions with MKO. We have not talked about the routing of the line since the decision was made to come down the west side.

Mrs. Rowat: So, based on your comments and based on earlier comments, can you please confirm then that you have not had discussions with MKO or Poplar River First Nations since 2003 or 2004? If I have the dates wrong, can you please confirm the last opportunity that the east-side line was discussed with either of those communities or groups?

Mr. Brennan: We've had no discussions since 2003 regarding the actual possibility of building a transmission line on the east side.

Mrs. Rowat: So, Mr. Brennan, based on the recent softening of the Poplar River east side and based on MKO's tabling of a route map, those discussions have gone to the wayside because all negotiations are off, is basically what you're saying on looking at an east-side opportunity or proposal?

Mr. Brennan: Once the east side was not available to the management of the corporation, we did not pursue that.

Mrs. Rowat: On page 2 of the document that was shared today by the minister and Manitoba Hydro, page 2 indicates that the west and south of Snow Lake, the position of First Nation on the west side is unknown. Based on that comment, plus the comments that were shared by Manitoba Hydro to MIPUG in their questions to Manitoba Hydro that the longer route will involve dialogue with a larger array of local governments, towns and villages, and that the estimated time frame will be estimated to add one year to complete the multi-year public consultations, can the minister indicate to me, based on your earlier comments about time lines and sensitivity, can Mr. Brennan share with me how many man-hours Manitoba Hydro has spent negotiating with the west-side chiefs on the topic of compensation for traversing traditional First Nations lands on the west side?

Mr. Brennan: We have not started our consultations with the communities on the west side. We're proposing to start that in January.

Mrs. Rowat: Can Mr. Brennan please provide for me how many kilometres of traditional First Nation lands does Manitoba Hydro expect it will traverse on the west-side route?

Mr. Brennan: I'll have to get that number for you.

Mrs. Rowat: The Premier (Mr. Doer) has maintained that the First Nation ownership of the line is not on the table for negotiations of a bipole route. Is this an admission of failure of ownership model of the Wuskwatim Agreement? How would you interpret that comment from the Premier?

Mr. Brennan: Manitoba Hydro all along has not contemplated First Nation ownership of the transmission line. The model with Wuskwatim, from our perspective, is something that we're really, really proud of and certainly hope it proceeds. I really believe it will be a model that in some form will be adopted for any kind of natural resource development in the country.

Mrs. Rowat: One further question and then I'll let the Member for Turtle Mountain (Mr. Cullen) ask a few questions.

Will Manitoba Hydro be offering compensation to the west-side First Nations community or private landowners for access to a bipole route on the west side? If so, how would this compensation differ from that which would be offered to the east-side communities?

Mr. Brennan: We pay compensation for any private land that we go through, no matter where it is, and we would continue to do that.

Mr. Cullen: We discussed earlier some feedback from people who were opposed to the east-side proposal. I know we've asked the Premier from time to time for any customers of Manitoba Hydro, if there are any customers of ours that disagreed with the east-side proposal. I'm wondering, Mr. Brennan, if you could point out if there are any customers that have raised that specific issue.

Mr. Brennan: No. No customers have specifically raised the issue of anything Manitoba Hydro does within its own area. I think my concern with our customers is if a problem comes up and it's a problem that we think we're having, or they think we're having difficulty managing, it would cause them to look at other options within their own system other than Manitoba Hydro as being a purchase option. That concerns us very, very much.

As I mentioned earlier, anybody who's only concerned about the rate of return doesn't have a real concern like Manitoba Hydro does with the least-cost option. They would just go to the next item in their sequence and pass that customer on to the–or the cost on to customers and get their normal returns. As a matter of fact, in a lot of cases, American customers are giving up something on the rate of return because they're not investing capital in their own system by buying from Manitoba Hydro.

So I think we have a good, reliable product that's well considered, and we certainly want to keep it that way.

***** (20:10)

Mr. Cullen: Just to confirm then, Mr. Chair, there have been none of Manitoba Hydro's customers specifically concerned about the east-side-proposed bipole 3 when it was proposed by Manitoba Hydro or the proposed UNESCO Heritage Site.

Mr. Brennan: As I mentioned, the concern would come if there's some kind of an outrage or some kind of a public concern about what we're doing, and that is a real major risk that the corporation and, certainly, all our stakeholders should be concerned about.

Mr. Cullen: Mr. Brennan, you pointed out earlier that, and maybe you can just clarify, you were out consulting with the First Nations communities on the east side because that was the proposal, the original proposal. What year did you stop the consultations with the First Nations communities on the east side?

Mr. Brennan: It was 2003.

Mr. Cullen: That corresponded with the Province going in there and having some discussions on the East Side Planning Initiative. I'm just wondering if the government, when they were in consulting with the First Nations communities regarding the east side planning at that time, did the Province of Manitoba, in their consultations, have a proposal for a bipole 3 running on the east side as part of their consultation package? Did they actually propose a bipole 3 as part of the consultation package?

Mr. Selinger: There was a different minister at the time, but as I understand it, the communities themselves had expressed concern about Manitoba Hydro being in there doing their consultations on the east-side bipole. They had, as early as 2000, started into the WNO, the broad area planning process. They were saying, Hydro's out here doing this bipole thing, we're in this WNO broad area planning process, we would like those two things not to be conflicting with each other. So the government went in to listen to the people on the east side and all of their concerns. One of the pieces of feedback they got from many of the people over there was that there was a great concern about the bipole proceeding down the east side.

Mr. Cullen: Would it be safe to say that there was some confusion at the time, then, when the government was in at the same time discussing east side planning and Manitoba Hydro being there discussing their proposal?

Mr. Selinger: I think they were expressing concern that the broad area planning process and the Hydro consultations were clashing with each other. They wanted the broad area planning process to be proceeded with without the other thing going on at the same time. The government's involvement over there was to listen to them as to what their concerns were and where they wanted to go with all of this. The conclusion that the ministers and government came out of it with was that there were major concerns from many communities that they met in about an east-side transmission line.

Mr. Cullen: So, once Manitoba Hydro ended their consultations in 2003, did Manitoba Hydro, the corporation, go back and do any follow-up in terms of a proposal or was there any follow-up after that time?

Mr. Selinger: Well, I think you're posing the question to Manitoba Hydro.

Mr. Brennan: No, we did not.

Mr. Cullen: I appreciate the response. We talked a little bit last meeting about Wuskwatim. Recognizing that there've been some issues come to light there in terms of securing a contractor, I wondered if that particular issue that's come to light in terms of securing a contractor, is that going to be setting back the completion date for that particular dam?

Mr. Brennan: If it goes on for an extended period of time, it will. At this point, it is not. There was on the table an option to advance it as a result of doing it in a different way, and that's being pursued with the contractor. At this point it hasn't, but if it goes on for an extended period of time, it will.

Mr. Cullen: It would appear that there's going to be a significant increase in cost to that particular facility. Would you care to comment on what kind of financial impact it's going to have in terms of just having that one contractor?

Mr. Brennan: What we're proposing to do before we commit to having a general contractor come in, we're proposing to take to the board of Manitoba Hydro an estimate, along with a contract, and look at the benefits of the entire project. We'll be doing it at that time.

Mr. Cullen: Are you saying then, that that entire project is going to be re-evaluated?

Mr. Brennan: No. What I am saying is we're making sure the board of Manitoba Hydro has all the knowledge it needs to make a decision and we always try to do that.

Mr. Cullen: Another issue that's certainly before us downtown here, and it's under construction, as well, is your new office building. We're certainly looking forward to having a tour of that facility sometime in the near future and I'm just wondering if you could comment on a completion date.

Mr. Brennan: We're still proposing to have the completion date, which will allow us to start having some people move in starting in June of this year. It sounds like it's pretty aggressive, but by the middle of June all the glass will be, or middle of January, all the glass will be on the building so it will be closed in and we're expecting to move the first people in at the end of May, or starting in June.

Mr. Cullen: At our last meeting you alluded to the fact that it looked like you were going to be over your budget amount. Do you have any estimate of where the final dollar amount is going to be for that particular structure?

Mr. Brennan: I sure hope I didn't say that. Our present budget is for $278 million and we still have that as our budget. We're on schedule to meet that and I'm hoping that it'll be right on schedule.

Mr. Cullen: Okay, thanks. Well, we certainly will look forward to hearing that and seeing how that turns out.

I want to get back to your–

Floor Comment: Can I just add to that?

Mr. Chairperson: Mr. Brennan.

Mr. Brennan: I think, with the rising costs in the construction business, I'm really pleased with the way the building is going. I think we're going to have a really great building, and I'm pleased with the way the costs have been contained in this wild environment we're in.

Mr. Cullen: I appreciate your response.

Getting back to our earlier discussion, your indication about the requests for proposals on the wind energy projects, I'm just wondering when you expect those particular requests will be submitted and when you intend to move forward on those particular requests.

Mr. Brennan: We are hoping to have the–well, we're expecting, and the schedule provides for those to be in in late January, and we would like the board to approve our direction by March.

Mr. Cullen: Can you provide the committee an idea of how those particular, those specific companies were selected, or those specific locations were selected? What was the criteria used for your selection?

Mr. Brennan: A whole series of criteria. The two most important ones are price and transmission costs related to our system to get the wind power into our system.

Mr. Cullen: When you evaluated the 84 submissions, did you have written criteria that you used, that Manitoba Hydro used to evaluate those?

***** (20:20)

Mr. Brennan: Yes. They used a series of criteria to do that and went through the exercise of looking at how the various proposals met against that criteria, the two most important ones being the cost associated with it, as well as the cost associated with transmission in getting it into our system. Those are pretty important criteria.

Mr. Cullen: Mr. Chairperson, I just wondered if Manitoba Hydro would share that rating process, that criteria with the committee.

Mr. Brennan: I think that's a pretty competitive thing that it'd be very difficult for us to do. We expect to go out and get more wind after the 300 megawatts. That's something, you know, I think we can be transparent, but we shouldn't be silly either.

Mr. Cullen: Yes, I'm not referring at the specific submissions. You would provide the analysis on each specific submission. I just kind of like to have it in the context of what Manitoba Hydro is looking at in terms of their logic for making certain criteria and making those selections.

Mr. Brennan: If I was a wind developer, I'd be concerned about those two main criteria I talked about, and that is the actual cost of power to Manitoba Hydro and the cost of any related transmission, both for the developer as well as for Manitoba Hydro. Those are the two main ones, and those are the ones that will make anyone fly.

Mr. Cullen: The Premier (Mr. Doer), within the last two weeks, when questioned about wind energy in Manitoba, made the comment that the numbers don't work. I'm just certainly concerned about that particular comment. Obviously, the 84 submissions that were received by Manitoba Hydro, those particular companies and individuals associated with it certainly would have some reservations.

I'm just wondering, from your perspective, is that a valid concern in terms of the numbers, in terms of wind energy production here in Manitoba?

Mr. Brennan: I didn't hear the Premier's comments, but I'm really pleased he said them.

Wind power is something that has to be compared against hydro power. Most people certainly like wind power. Wind power is something that everybody seems to be able to relate to. Having said that, we have to compare it against the cost of the main alternative we have which is firm, reliable hydro. We got a real good wind resource in Manitoba, but because of the capacity factor of wind it doesn't have the same cost as some of our hydro options. Certainly, in time, as we get through the least expensive hydro we have and get into more expensive one, the wind resource we have in Manitoba can be really, really capitalized on. So I think we got a real good wind resource, and I think we should integrate it into our system as it's cost effective.

Mr. Cullen: In terms of cost, and I don't want you to put yourself in a place where it would negatively impact your discussions that you're having with these developers, can you give me kind of a rate where companies in Manitoba can generate electricity? I'm looking for a range and a rate per kilowatt. Can you kind of give me a ballpark of what the expectation would be?

Mr. Brennan: I think it'd be a little unfair to those people that are trying to come up with a price now that we want them to submit by the end of January. When we went out with our original proposal though there was a price in there that could be used.

Mr. Cullen: Well, what I'm wrestling with here is, and you alluded to it, too, like, obviously, our current price that we're generating electricity for right now is pretty reasonable because we have a relatively old infrastructure. When we start adding infrastructure into the system, what kind of a rate are those new systems going to be? What kind of a rate per kilowatt are we looking at once we get Wuskwatim on and Conawapa? Can you give me some kind of a range of what we're looking at in terms of costs there?

Mr. Brennan: I think I should be real careful with numbers I do give you, but power coming from Conawapa on a per unit basis is really, really cost-effective. It would be the lowest thing in the country by far. It is really, really cost-effective. The big concern we have is we have so much power coming from it that it would be best if we could–you know, it's not like Wuskwatim. It's six times the size of Wuskwatim, so you've got to make sure you have a market for that power to carry all that cost. But it is by far the cheapest.

Mr. Chairperson: Mr. Cullen, did you have further questions?

Mr. Cullen: Yes, I do.

So, in essence, what we're doing with these proposals is these developers will be sharpening their pencils, if you will, and you're looking for probably the least-cost option so that you can buy it at the least cost and then turn around and sell it to your markets. Is that in essence how the process is going to work going forward?

Mr. Brennan: Yes, there's a cost to making sure it's a firm, reliable product because, you know, we have to–wind power comes into our system whenever the wind's blowing. It could be at a time when we don't want to sell it because the market prices are real low, you know, in the middle of the night or something. So what we want to do is cut back on hydro, not sell our hydro, and speculate on a time when we could sell both the wind energy and hydro power at a good rate. So there's a cost to that and that's got to be factored in.

So, to answer your question, we do want to buy the power out from the producer and resell it at a higher rate but there's cost to doing that, and we'd incorporate that into the whole mechanism.

Mr. Cullen: The whole premise of adding a generation capacity to Manitoba hinges on having a market to sell it to. Are you actively pursuing other markets, and what is the future capacity there in terms of export markets?

Mr. Brennan: As long as we don’t get into any of these environmental fiascos that we were talking about earlier, I think the market is just really, really wonderful for Hydro. The American market is very, very hungry for power. You know, there are transmissions constraints that we have to deal with like that we can only use existing transmission at this point. We do have a fair amount of it to the States, you know, 2200 megawatts. So we want to make sure that's fulfilled.

Saskatchewan is a market as well, as is Ontario. So, from my perspective, I think all these are real good markets that we want to take advantage of. I think in the immediate future you will hear more about us making good sales.

Mr. Chairperson: The hour being 8:30 p.m., this committee agreed to review the sitting time. What's the will of the committee?

Mr. Kelvin Goertzen (Steinbach): I understand there's been an agreement between myself and the minister to allow the committee to sit till quarter to nine to allow the leader of the independent party to pose some questions, at which point we'll proceed to pass, I believe, the oldest annual report that's listed on the agenda for tonight.

Mr. Chairperson: It sounds like there's a will of the committee, then, to extend the sitting time for an additional 15 minutes till 8:45 p.m.

Hon. Jon Gerrard (River Heights): A question for Mr. Brennan: At the last meeting, you indicated that the route for the west-side line is not precisely known. Do you have an estimate of when that route will be known in terms of time?

***** (20:30)

Mr. Brennan: What we propose to do is go through a consultative process with all the people on the west side and that would be about three or four rounds of that. So I would think that would take a couple of years to come up with, you know, a good route that is sensitive to people's requirements.

Mr. Gerrard: Will there be a look at the cost and a much better estimate of the precise cost of that route at the end of that two-year period? I would ask, in light of what you said last time, that much of the estimate was based on a per kilometre cost on the east side, which may or may not be precisely the same on the west.

Mr. Brennan: Yes, that will happen. Having said that, deviations in the price like the cost per kilometre is relatively high and I'm sure that over the whole length of it, it won't have a real major impact–whatever route we take–but certainly it would be revised as we go.

Mr. Gerrard: I would presume that, if there was an existing transmission line corridor, the costs there are likely to be significantly lower because you've got a route that would be fairly easy to use to get environmental permits for, et cetera. For example, the transmission line from, say, Thompson to Wuskwatim to The Pas; there is a corridor that's being built as a result of Wuskwatim. It, I presume, would be a lot less additional cost to add on to a route like that than it would be in developing a new route, for example, just south and east of Winnipeg itself.

Mr. Brennan: I think the cost of the route itself is, in percentage terms, a relatively small part of it. The cost is quite low, of course, if we go through Crown land versus private land. I don't think that that would have a material impact. I really don't.

Mr. Gerrard: Is there any work currently being done on the east-side option?

Mr. Brennan: No. The east side was ruled out from a management perspective.

Mr. Gerrard: Question to the minister. The minister and his government have talked about putting a road on the east side. I wonder if the minister could table the route for that road.

Mr. Selinger: I'll have to get that precise details for the member, but I'd be happy to get him the information and provide it to him, what they're proposing there.

Mr. Gerrard: Okay, I thank the minister.

With the west side, on page 6, it says: "If the Bipole III line, together with converters, is built along the West Corridor, only about one-third of northern capacity could be transmitted to the south in the event of total loss of transmission on the Interlake corridor."

Could you explain to the committee why only one-third, whereas, if bipole 3 were on the east side of Lake Winnipeg, you would be able to maintain two-thirds?

Mr. Brennan: This is basically a technical issue and I'm probably not the best one to do it, but that's the maximum capability of the line on the west side. With the conversion equipment and the lines it is only able to handle 2000 megawatts.

Mr. Gerrard: So my understanding, in terms of what you're saying, is that the line which is to be built on the west side would have a much smaller carrying capacity for hydro-electric power transmission than the bipole 3 if it were built on the east side?

Mr. Brennan: That's only if there's a loss of transmission on the Interlake route. So it's a paralleling situation that would only occur should we lose the Interlake route. That's the only time this would happen.

Mr. Gerrard: Yes, I understand that this is where you have a complete loss of power transmission capability on the Interlake lines, but why is the west-side line, as proposed, so much smaller in terms of capacity under those circumstances than the east line would be if it were bipole 3 there?

Mr. Brennan: It's my understanding that that was the optimum size for the design of the line based on our system.

Mr. Gerrard: Now, I would ask Mr. Brennan if that is a reflection of the line itself or the converter capacity.

Mr. Brennan: Both.

Mr. Gerrard: Given that the west-side bipole 3 has such a dramatically smaller power transmission capacity if there was failure of the Interlake lines compared to the east-side bipole 3, that's a huge difference if there was a failure. You know, I'm quite surprised at the extent of that difference in terms of what that would mean for backup for southern Manitoba and for export transmission. I'm still having difficulty trying to understand why it should be so big and to what extent this was or wasn't taken into account in terms of the final decision.

Mr. Brennan: Certainly, in the design of any line on these, it was taken into consideration. You know, I think it'd be best to get you a technical answer rather than me trying to continue to do this. I know for sure that the entire system, it cannot be paralleled equal to the Interlake system. I know that. That's a fact, and what the exact numbers are I'm not sure about, but it's definitely less.

Mr. Gerrard: Yes, also on page 6, there's a reference on page 6 to, you know, if there was full development of the northern power capability that you would actually need a bipole 4 or a bipole 5. What is the reference to full development? Which, and how many additional dams are you referring to when you talk about full development?

Mr. Brennan: I have to remind you that this is not Manitoba Hydro's report. I think it's definitely true–what Mr. Farlinger considered to be full development I'm not sure–but we know that we got more than 5000 megawatts that's not been developed so I presume that everything that would be transmitted by DC or the equivalent of DC, that would be impacted, so I would think it probably does get into a bipole 4 and bipole 5. I'm almost positive.

Mr. Gerrard: The dams, Wuskwatim, Gull or Keeyask and then Conawapa, represent something under 4000, so there's another thousand megawatts. Is that right?

Mr. Brennan: There's more than that. We have a map where it's all laid out though. We can provide that for you.

Mr. Gerrard: So, in terms of having a bipole 4 or bipole 5, if those were necessary in the future, could they run alongside of bipole 3, for example, if it was west or east?

Mr. Brennan: Once you get some diversity on lines you could put it almost anywhere, including going back to the Interlake because what you are concerned about is any lines going down in one particular area, and as long as you've got enough that would take care of the Manitoba load in the southern system, both through your AC transmission, any southern generation, as well as whatever DC lines you had coming down, as long as that took care of the Manitoba load it wouldn't matter.

***** (20:40)

Mr. Gerrard: Because the capacity on the east-side route is much greater than that on the west-side route. We just talked about that in terms of you being able, if there was no Interlake route, that your security of power, if there's population growth, increased power usage in southern Manitoba, would clearly be greatest on an east-side power route. Is that not right?

Mr. Brennan: I'm not even sure, I don't think that's right. But I'm not sure I agreed with your preliminary part. I don't think I did. I'm not sure if I remember what you said, but I don't think I agree with it.

Mr. Gerrard: My understanding is–and it's referenced here–that if the Interlake goes down, on an east-side power line you're able to maintain two-thirds of your power capacity going to the south. If the Interlake goes down and you've got a west line, you're only able to maintain one-third. So there's a dramatic difference in the amount of power that you can transmit on the proposed east side versus a proposed west-side bipole. And in a future 30, 40, 50 years from now, if you're looking at adding another bipole, and suppose you added that bipole 4 or 5 down the Interlake, you're going to be much more restricted with the design of the west-side line if you're only able to carry one-third of the power that you need versus on the east-side line where you can carry two-thirds.

Mr. Brennan: The whole problem comes about because we can't parallel, because the technical characteristics of the west-side line are not close to the Interlake. The technical characteristics of an east-side line are closer to that of the Interlake. That's why we have to put the conversion equipment in before we'd otherwise want to, and it's the very same reason as that. Once you put an additional generation on the system though, you'll be able to meet the Manitoba load by the additional generation anyway. So I don't think it really matters.

Mr. Gerrard: I mean, I think that you would be able to make the power so long as the lines were intact, but if you had a problem on the Interlake line, for example, then that problem would be much more severe with the west-side line than versus an east-side line.

Mr. Brennan: The real concern is making sure we can supply the Manitoba load until such time as we can fix the line. So we want to make sure that the Manitoba load is reliable until we get the line fixed, and I would think the 2000 megawatts would do it.

Mr. McFadyen: I just have two questions just arising from answers given to questions posed by the Member for River Heights (Mr. Gerrard), and then I think we're done from the perspective of our caucus.

The first is: Did I hear you correctly when you said that this report that was tabled today is not a Manitoba Hydro report?

Mr. Brennan: It is a report that was done for Manitoba Hydro, paid for by Manitoba Hydro, but it was not done by Manitoba Hydro people. Okay? It was done by an external consultant that we, you know, take a look at and use in our deliberations. That's what I meant to say. I probably didn't.

An Honourable Member: Right. That's fair.

Mr. Chairperson: The committee agreed to review our sitting time at 8:45 p.m., and we're at that point in time now. What's the will of the committee?

Mr. Selinger: I think there's one more question. Could we entertain an extension to answer the next question?

Mr. Chairperson: The committee agree to that additional one question, and then we'll proceed with the review of the reports?

Mr. Goertzen: Assuming that government members don't have any questions on this important file, but, certainly, if government members have questions, I think we would be willing to hear them as well.

Mr. Chairperson: Mr. McFadyen, proceed with your question, sir.

Mr. McFadyen: Thank you, Mr. Chairman.

Just arising from questions being asked by the Member for River Heights, and just back to Mr. Brennan on the issue of paralleling, the response provided to the question posed by the Industrial Power Users Group by Manitoba Hydro indicates that in the event the existing two bipoles in the Interlake were inoperative, the west-side route would be able to handle as much as a thousand megawatts less than an east-side route. I wonder if you can just indicate, in practical terms, what the loss of a thousand megawatts would mean in the event that the two existing bipole lines went down and we are left only with bipole 3 on the western route. Loss of a thousand megawatts: what does it mean in terms of the ability to continue to supply power to Manitobans or to export or any other practical ramification of a loss of that much power?

Mr. Brennan: I would have to look at that. I think it's a function of when it happened in terms of the time of day, that sort of thing. Also, whether there's any additional energy that would be coming down the west-side line. In other words, at that point, we could have additional generation coming down anyway. So the thousand that would be picked up, could be offset by any new generation. So it might not even be a problem.

One other comment on this particular question that I probably should have made earlier. I used to review all these answers. This particular one, I probably would've had some comments on had I reviewed, but one thing I don't think is included in here that I think should be, is if we have a major outage on the west side, it would definitely be easier to get at. We have roads and that sort of stuff. If we had to get–just even finding, you know, we'd have to get helicopters up and I'm sure they'd be going from both ends and then we'd have to get equipment in, and everything like that. If it happened on the west side, it probably would–well, I'm convinced it'd be easier. If I had've reviewed it, I would have added that.

Mr. Chairperson: Thank you, members of the committee. Mr. McFadyen?

Mr. McFadyen: Mr. Brennan, you just indicated you would come back with a response on the issue of the practical implications of a loss of a thousand megawatts. In some scenarios, it might have no impact. In others, it might. In preparing that response, would you be good enough just to indicate what the impact of that thousand-megawatt difference would be during a typical day at peak times; if it occurred during non-peak times, overnight, or just what the range of scenarios might be when you consider your response to that?

Mr. Brennan: We certainly will.

Mr. Chairperson: Is the committee ready to proceed with the reports?

An Honourable Member: Yes.

Mr. Chairperson: The annual report of Manitoba Hydro for the year ended March 31, 2004–pass.

Shall the annual report of Manitoba Hydro for the year ended March 31, 2005, pass?

Some Honourable Members: Yes.

Some Honourable Members: No.

Mr. Chairperson: I hear a no. The report is not passed.

Shall the annual report of Manitoba Hydro for the year ended March 31, 2006, pass?

Some Honourable Members: Yes.

Some Honourable Members: No.

Mr. Chairperson: I hear a no. The report is not passed.

Shall the annual report of Manitoba Hydro for the year ended March 31, 2007, pass?

Some Honourable Members: Pass.

Some Honourable Members: No.

Mr. Chairperson: I hear a no. The report is not passed.

Before we rise, it would be appreciated if members of this committee, if they had no need for the reports, if they could leave them behind for subsequent committee meetings, that would be appreciated.

The hour being 8:50 p.m., what's the will of the committee?

An Honourable Member: Committee rise.

Mr. Chairperson: We thank members of Manitoba Hydro for their appearance before the committee here this evening, and we wish everyone a Merry Christmas and Happy New Year.

Committee rise.

COMMITTEE ROSE AT: 8:50 p.m.

Tab 135

Manitoba Hydro

BR.S

APR 0 9 2008

Why the west side is the best side

Building Manitoba Hydro's new transmission line, known as Bipole III, on the west side of Manitoba makes sense for both environmental and economic reasons. Building westward ensures protection for the unique boreal ecosystem on the east side of Lake Winnipeg, while also ensuring a solid future for Hydro of clean reliable energy and affordable rates. To force the line down the east side is irresponsible because it puts both Hydro and the area at risk.

If Progressive Conservative Leader Hugh McFadyen truly wanted to dispel the myths about Bipole III, he should stop misleading Manitobans about the basic facts of the matter.

We have been open about the fact that the west route is longer and costs more than the east route. How much more? McFadyen claims the difference is $1.5 billion. He makes a gross exaggeration. Manitoba Hydro estimates the number is $400 million or a total of $2.2 billion for a west route versus $1.8 billion for an east route. McFadyen exaggerates again when he says the west side line leaks $700 million worth of energy. Hydro has said line loss could cost between $107 million and $230 million. McFadyen regularly triples Hydro's estimates of the cost difference and he knows it.

How much does protecting the east side forest really cost us? Independent consumer advocate Byron Williams has calculated that the cost difference in routes amounts to a three per cent increase on a hydro bill or approximately $23 per year. The cost of the project will not be accounted for until 2017 and then spread over 40 years. Hydro president and CEO Bob Brennan has stated: "Rate payers will pay for it over the life of the system, and of course, we'll have increased sales, so we'll probably come down at the end of the day to say export customers will probably pay for it."

Greg Selinger

McFadyen further misleads Manitobans by covering up the major risk of forcing a line down the east side. The province and Manitoba Hydro have received 30,000 e-mails from all over the world opposing an east-side line. In attempting an east-side route, Manitoba Hydro would encounter serious opposition campaigns and face a long and divisive licensing process. The project could be delayed indefinitely and permanent damage done to Hydro's reputation in export markets. McFadyen avoids this deal-breaking issue.

McFadyen is also proclaiming that a transmission line would lift the east side First Nations out of poverty. But according to Hydro, a transmission line only provides a total of six months of seasonal construction work per community. McFadyen seems to be promising east-side chiefs much more. He owes it to the chiefs, the people they represent and all Manitobans to be open about what that is.

Unlike McFadyen, this government believes the east side of Lake Winnipeg has more potential than simply being a route for a transmission line. The east side is the second-largest intact forest left on the planet. It is a unique boreal shield forest ecosystem that hosts the threatened woodland caribou, the animal featured on the 25-cent piece. Local communities are making a bid for an UNESCO World Heritage Site designation to recognize the region's natural and cultural "outstanding universal value." If achieved, this designation will bring ecotourism and jobs for decades to come, while protecting the spectacular ecosystem. Work is underway with local communities on the UNESCO bid and comprehensive area planning.

Imagine 10 and 20 years from now. Which route would we prefer to defend to our children and grandchildren: the one chosen because it is cheaper, or the one that cost more but allowed us to protect Canada's largest boreal forest?

It is unfortunate the Leader of the Opposition deals in distortions and exaggerations. We welcome public debate on this issue that is based on facts and accurate information. This government has been open about our position since we first announced it in 2005. We then made it part of our 2007 election commitments, after which it was debated in the media. Manitoba Hydro announced their decision last fall and it has been debated extensively in the Manitoba legislature.

Moving forward, we welcome upcoming public consultations, environmental studies and the determination of a precise western route for the new transmission line. We have also committed to hold Clean Environment Commission hearings on the project.

GREG SELINGER
Minister responsible for Manitoba Hydro

Tab 136

West side is wrong, but you don't have to take my word for it

VP6 A9

BR.S

APR 12 2008

I felt it was important to respond to Minister Greg Selinger's recent statements regarding BiPole III.

He would have Manitobans believe that I am alone crusading for the east side and I wish to set the record straight as to why I am part of the vast, informed and growing majority of Manitobans who know that the NDP making a massive policy mistake with its west-side route.

Former NDP MLA Elijah Harper, former NDP premier Ed Schreyer, Winnipeg Chamber of Commerce president Dave Angus, Manitoba Business Council president Jim Carr, James Blatz and seven fellow engineers, constitutional law expert Bryan Schwartz, 15 of 16 east-side First Nations, law expert Harold Buchwald, former UNESCO World Heritage Committee chair Jim Collinson, MKO (Northern Chiefs) Grand Chief Sydney Garrioch and president and CEO of Manitoba Hydro Bob Brennan — all of these groups and individuals oppose the west-side route for Manitoba's next hydro transmission line, or have directly discredited the arguments for the NDP's route.

Some have stated that it is the "worst policy decision yet" and cautioned about its "potential fiscal carnage." First Nations said they were "devastated" by the government's willingness to leave east-side communities in "poverty in perpetuity." Each agrees the NDP is making the wrong decision.

Selinger contends that the east-side budget is $1.8 billion. This is not true. He includes $1.1 billion for a converter station that is not needed. Hydro CEO Bob Brennan has confirmed this on the record and experts from the engineering community agree. This is why the extra cost of a west-side transmission line is $1.5 billion, not the $400 million the NDP mis-states.

The NDP also contends line losses will be $107 million to $230 million on its route. This assumes that we will never develop another hydro dam. When Conawapa and Gull-Keeyask come online, losses will total $700 million over the life of the line.

Mr. Selinger states that the NDP will not offer economic benefits to First Nations for a power line route on their land. If the NDP is content to leave the east side in poverty, that is its policy agenda, not ours. A PC government would ensure lasting benefit-sharing for east-side communities. This is the position I have stated to east-side residents and one I am committed to.

Mr. Selinger states potential export customers will refuse to buy power from us if we build on the east side. XCEL energy and the Minnesota Public Utilities Commission have said on the record that they do not care where the line goes and the commission has not had a single comment about the hydro line location one way or the other.

Lastly, the boreal forest stretches from Alaska to Newfoundland and Russia to Norway. The impact of a bipole line is minuscule and the longer west-side route will actually cut more trees. We feel it is not worth $1.5 billion — $6,000 for each Manitoba family — and keeping east-side communities impoverished, to build on the west side of the province. We hope the NDP eventually sees the light and rights its wrong.

LEGISLATIVE ASSEMBLY OF MANITOBA

Thursday, May 7, 2009

The House met at 1:30 p.m.

ROUTINE PROCEEDINGS

PETITIONS

Winnipeg Regional Health Authority

Mr. Kevin Lamoureux (Inkster): Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

The background to this petition is as follows:

Manitoba's Premier and his NDP government have not recognized the issues of public concern related to the Winnipeg Regional Health Authority.

The WRHA is building an administrative empire at the expense of bedside care.

Winnipeg Regional Health Authority needs to be held accountable for the decisions it is making.

Health-care workers are being pressured into not being able to speak out no matter what the WRHA is doing or has done.

We petition the Legislative Assembly of Manitoba as follows:

To request that the Premier (Mr. Doer) and the NDP government to call a meeting of a standing committee of the Legislature and invite representatives of the WRHA to appear before it.

Mr. Speaker, this is signed by J. Sarinas, J. Chan, K. Bradley and many, many other fine Manitobans. Thank you.

Mr. Speaker: In accordance with our rule 132(6), when petitions are read they are deemed to be received by the House.

Neepawa, Gladstone, Ste. Rose, McCreary–Family Doctors

Mr. Stuart Briese (Ste. Rose): Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition.

Access to a family doctor is vital to good primary health care. Patients depend on their family doctor for many things, including their routine health-care needs, preventative care and referrals for diagnostic tests and appointments with specialists.

Family doctors in Neepawa, Gladstone and Ste. Rose are unable to accept new patients. The nearby community of McCreary has not had a doctor available to take patients in months.

Without a family doctor, residents of this large geographical area have no option but to look for family doctors in communities as far away as Brandon and Winnipeg.

Residents of these communities are suffering because of the provincial government's continuing failure to effectively address the shortage of doctors in rural Manitoba.

We petition the Legislative Assembly of Manitoba as follows:

To urge the Minister of Health (Ms. Oswald) to consider prioritizing the needs of these communities by ensuring they have access to a family doctor.

To urge the Minister of Health to consider promptly increasing the use of nurse practitioners in these communities in order to improve access to quality health care.

This petition is signed by Leonard Law, Gladys Law, Reine Cameron and many, many other fine Manitobans.

Long-Term Care Facility–Morden

Mr. Peter Dyck (Pembina): Mr. Speaker, I wish to present a petition to the Legislative Assembly.

The background for this petition is as follows:

Tabor Home Incorporated is a time-expired personal care home in Morden with safety, environmental and space deficiencies.

The seniors of Manitoba are valuable members of the community with increasing health-care needs requiring long-term care.

The community of Morden and the surrounding area are experiencing substantial population growth.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Health (Ms. Oswald) to strongly consider giving priority for funding to develop and staff a new 100-bed long-term care facility so that clients are not exposed to unsafe conditions and so that Boundary Trails Health Centre beds remain available for acute-care patients instead of waiting placement clients.

This is signed by Richard Schmidt, Jeff Knaggs, Brent Laverty and many, many others.

Midwifery Services–Interlake Region

Mrs. Myrna Driedger (Charleswood): I wish to present the following petition to the Legislative Assembly.

These are the reasons for this petition.

Residents of the Interlake Regional Health Authority do not have access to midwifery services.

Midwives provide high quality, cost-effective care to childbearing women throughout their pregnancy, birth and in the post-partum period.

Women in the Interlake should have access to midwifery care.

We petition the Legislative Assembly of Manitoba as follows:

To urge the Minister of Health (Ms. Oswald) to consider working with the Interlake Regional Health Authority to provide midwifery services to women in this region.

This is signed by Rebecca Wood, Michelle Santchi, Angela Falk and many, many others.

Introduction of Guests

Mr. Speaker: Prior to oral questions, I'd like to draw the attention of honourable members to the public gallery where we have with us from Riverton Collegiate 25 grade 9 students under the direction of Ms. Linda Stevens. This school is located in the constituency of the honourable Member for Interlake (Mr. Nevakshonoff).

On behalf of all honourable members, I welcome you here today.

ORAL QUESTIONS

Provincial Debt Repayment

Mr. Hugh McFadyen (Leader of the Official Opposition): Mr. Speaker, three weeks ago, this House voted on a budget that contained within it $180 million in debt reductions over the next two years. Only two weeks later, the Minister of Finance (Mr. Selinger) introduced a bill that changed that to a $330-million reduction in debt payments over three years. This is, over two weeks, a change of $150 million in terms of the Finance Minister's budget plans.

Is the Premier not concerned that his Finance Minister, in the middle of this economic crisis, when he changes his plans by tens of millions of dollars in the span of two weeks, is starting to look a little bit unbalanced and unsteady?

Hon. Gary Doer (Premier): I've been meeting with a number of business organizations, labour organizations, community organizations over the last period of time. Members opposite, with their extreme views, are out there on the extreme edge of the debate, Mr. Speaker. The only instability I see is the teetering on this edge, this extremist edge that they're on.

Mr. Speaker, over and over and over again, people think it's sensible, first of all, to have a pension liability payment that wasn't made for 30 or 40 years actually, begun by our Minister of Finance and continued on in this budget. The old days of hiring a jail guard or a highway operator or a public health nurse paid 7 percent less for 40 years, those days were ended in 2001 with that budget.

The hidden liability that was underneath the table from members opposite is now above the table so everybody can see, and there's a payment plan. All the capital expenditures–again, there was no health capital and health capital debt in the budget before. All those are above the table now, not below the table, above the table, fully transparent and an amortization plan. There's some $450 million of obligations in the budget for repayments of past capital, past pension.

I think it does make sense, though, to deal with the stimulus package, to deal with needed priorities, to reduce the debt payment on the operating side of government. It is only reduced. The budget is balanced under GAAP financial planning as the Auditor General has recommended. It's one of only two provinces in Canada that's done so. I'm disappointed the members opposite voted against it, Mr. Speaker.

Mr. McFadyen: Mr. Speaker, again, the self-appointed historical fiction writer of the 1990s again is going off and providing incorrect information. In fact, the 1999 budget that he now seems to have so much difficulty with, how did he vote on that budget? Maybe he'd be honest enough to remind Manitobans he voted for the very budget that today he seems to be criticizing. That Tory budget of 1999, he's on the record voting in favour of.

Now, Mr. Speaker, bringing us to the year 2009, it was only five months ago that the Premier said, and I quote: I would also point out that we have a debt payment that we've also recommitted to of $110 million. So if you look at a potential draw of the rainy day fund of $60 million and you still have a $110-million debt repayment, we are actually at a situation that's very, very positive.

That's what he said five months ago. Now he says that's an extreme position, the position he was putting on the record five months ago. One week ago, Mr. Speaker, they introduced a bill that made a $130-million change in the budget that they introduced and voted on three weeks ago.

Mr. Speaker, where are they going to be next week when it comes to their fiscal plans, and is it going to be anything that resembles where they stand today?

***** (13:40)

Mr. Doer: Mr. Speaker, I would point out that the '99 budget that we voted against, some columnists thought that it was an unwise move. We actually thought–

Some Honourable Members: You voted for it.

Mr. Doer: Or voted for it. We voted for two budgets over 10 years. One was a copy of our election commitments on family tax credits. We thought that was a positive budget, and we voted for the budget in '99.

Now, I would point out, the '99 budget had a $185-million draw from the rainy day fund. It was the second year in a row for a $75-million debt payment.

This budget has $110-million debt payment, reduced to $20 million, which is obviously a $20-million better position, if members can add.

And, Mr. Speaker, not only that, this budget is much better than the '99 budget, even though we voted for it, because it has pension liability payments. That wasn't in the '99 budget. It wasn't in the '98 budget. It wasn't in the '97 budget. It wasn't in any budget right back to 1962. It was a ticking time bomb.

Members opposite, for 11 years, didn't pay one cent down on pension liability. The stability and balance of this budget includes that in this budget, and I'm proud of it, Mr. Speaker.

Mr. McFadyen: Mr. Speaker, five months ago, the Premier said a $110-million debt repayment commitment was a positive thing for Manitoba–this is after the financial crisis started–and then several months later, he said, no, that's wrong; we're going to reduce that to $20 million for the next two years.

Three weeks later, Mr. Speaker, they adopted a third position: We're not going to make any debt repayments for the next three years.

I want to ask the Premier: Will he at least go back to the position that they had three weeks ago, when they voted on the budget, and ask his Minister of Finance (Mr. Selinger) to amend the bill and at least go back to where they were three weeks ago when they voted on the budget, Mr. Speaker.

Mr. Doer: There's been $960 million of operating debt payments made by our government, including the $110 million that the member opposite references. We did not bring this budget in to be retroactive to the '08-09 year, Mr. Speaker. This is an '09-2010 budget.

Mr. Speaker, the federal government has gone from an infrastructure program that's seven years long. It has now gone to an infrastructure program that requires, in two years, to meet the obligations by provincial and municipal governments that were originally scheduled over seven years.

We actually know that the federal government is doing this. It's running a deficit. I know their friends are running a deficit, but they are running a deficit, Mr. Speaker, on the basis of stimulus for the economy.

Luckily, here in Manitoba, with the good work of our workers across the province, with the productive work of our farmers, with the innovation of our businesses, we can match those infrastructure investments by reducing the debt payment but maintaining a balanced budget.

No, we're not going to go backwards to three weeks ago. We always go forward, Mr. Speaker.

Manitoba Hydro
Bipole III West-Side Cost

Mr. Cliff Cullen (Turtle Mountain): It's painfully clear this government has lost touch with Manitobans.

Bill 30 proves we're in financial difficulty, yet this government forges ahead with its west-side bipole decision.

A concerned Manitoba taxpayer wrote to the *Free Press*, and it appeared in today's paper. J. Hugh McMorrow wrote: "Perhaps the NDP government requires bypass surgery to connect its decision-making process to its brain!" Mr. Speaker, this is the average Manitoban speaking.

Mr. Speaker, given our very difficult financial circumstances, will the minister reconsider his west-side decision?

Hon. Greg Selinger (Minister responsible for the administration of The Manitoba Hydro Act): I thank the member for the question because it allows me, once again, to put the accurate facts on the record about what we're doing, with respect to debt repayment, in the province.

There's $20 million on the general purpose debt repayment. There's $135 million for pension liabilities, never paid by members opposite in the entire 11 years they were in office. There's $135 million of amortization debt repayment, and there's $127 million of principal repayment, for a total of $417 million of debt repayments in the budget.

Now, I actually don't think the members were aware of that when they voted against the budget, and I would like to ask the members opposite, now that they know the facts, are they ready to reconsider their position and vote for the budget?

Mr. Cullen: Well, Mr. Speaker, we're hearing from Manitobans and they're speaking out about the bad decisions this government's making. It's clear after 10 years in government, they've simply lost touch with Manitobans. Mr. McMorrow talks about the confusion and dishonesty of the Doer government.

Mr. Speaker, Bill 30 is a classic example of a government losing touch. How can the minister justify running up the credit when we can't even pay off our own obligations right now?

Mr. Selinger: Mr. Speaker, one of the common things that the members opposite do is they like to ask for roads, schools, hospitals and facilities in their area, and then they like to separate from the reality that you have to pay for those things and blame that on the government.

Here are a couple of facts for the members opposite. Since '04-05, the gross domestic product in Manitoba has grown by 26 percent. The book value of our assets has grown by 49 percent, more than double that, and the per capita debt has grown by 6.4 percent.

We are getting value for the money. The amount of value, the amount of wealth in Manitoba, is more than eight times the amount that we have invested in debt. Manitobans are better off. Their debt-to-GDP ratio has gone down and their credit rating has gone up.

Mr. Cullen: Well, Mr. Speaker, here are the facts. There are no plans in place to reduce the debt. There is a plan in place, though, that will blow millions of dollars on a west-side line.

Yesterday, Manitobans were questioning the logic at the Cabinet table. Today, they're saying the government needs brain surgery.

When will this government come to its senses and make decisions in the best interests of all Manitobans?

Mr. Selinger: Mr. Speaker, the government has responded to the challenges of the day. We are in the middle of a global recession, the greatest economic meltdown since the Great Depression, driven by irresponsible financing arrangements made through the barons of Wall Street, the good friends of the members opposite, the members they like to emulate.

In response to that, the global community of all political stripes has said we need to have stimulus in the economy, a 2 percent stimulus. We are creating 10,000 person years of additional employment with this budget. The members opposite would rather that people go on the unemployment rolls so they can make a little debt payment. We think we can have fiscal discipline and more jobs in Manitoba to the betterment of everyone in Manitoba, and you vote against it.

Pediatric Allergy Testing
Wait Times

Mrs. Myrna Driedger (Charleswood): Today there are 575 children with allergies and asthma waiting to be seen for the first time by an allergy specialist at the pediatric allergy clinic at Children's Hospital.

Three hundred of them have appointments between now and the end of July; 275 of them are waiting on a waiting list for appointments to be set up after August 1.

I'd like to ask the Minister of Healthy Living if she thinks that it's safe to have so many children with allergies waiting so long to see a specialist.

Hon. Kerri Irvin-Ross (Minister of Healthy Living): We work with community partners across this province and we work on reducing lists. We have some exceptional programs that we work with: Youville community health centre where we provide a camp for children with asthma to come and play and learn about their disease and how to manage it, and we provide those ongoing supports for their family.

Mrs. Driedger: I don't blame her colleagues for not clapping for that response, Mr. Speaker.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mrs. Driedger: Mr. Speaker, wait times for these children are broken into three levels: Non-urgent cases wait for nine to 12 months; urgent cases, but non-life-threatening, wait for four to six months; but urgent and life-threatening cases have to wait one to three months.

Mr. Speaker, I cannot believe that children with life-threatening allergies and asthma have to wait one to three months, and this is according to a Freedom of Information document from the WRHA.

So I'd like to ask the Minister of Healthy Living to please explain why a child with life-threatening allergies has to wait one to three months before being seen by a specialist.

Ms. Irvin-Ross: This government has worked very hard to bring nurses and doctors to this province, and we have proven those successes.

I want the people of Manitoba to know, when there's a life-threatening issue, those issues are being dealt with immediately to support those individuals and those families, and that's the truth.

***** (13:50)

Mrs. Driedger: Mr. Speaker, this minister knows absolutely nothing about what she's talking about. Children who have life-threatening allergies and perhaps go into anaphylactic shock after eating a peanut–and we know about dangerous peanut allergies because peanut allergies can be very, very dangerous for children–these kids have to wait one to three months before seeing a specialist.

I'd like to ask the Minister of Healthy Living to explain how such a dangerously high waiting list can exist today for children in this province.

Ms. Irvin-Ross: The facts are that we have made investments in emergency departments across the province, including the Children's Hospital, to provide those emergency life-threatening supports that are required.

What we need to talk about–the member opposite talks about what the facts are. The facts are that we continue to make investments around children's asthma education program. We, right now, currently, have an expanded allergy and asthma clinic under construction, which will be up and running. While that is under construction, we continue to offer those supports through education programs and those emergency supports every day to families and individuals in Manitoba.

Photo Radar Tickets
Construction Zones

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, after being inundated with e-mails and phone calls, the Minister of Justice was in full retreat yesterday. He now seems close, however reluctantly he wants to do it, to be landing on the right position of refunding tickets to drivers who were driving below the regular posted speed limit at construction zones where there are no construction workers present.

The e-mails and the phone calls kept on coming today. One example is from a mother who was ticketed in a construction site where there were no workers and no equipment and who couldn't pay for the ticket because she was taking care of her sick husband. She and thousands of others now want to know when they're going to be able to apply and be eligible for their refund.

Hon. Dave Chomiak (Minister of Justice and Attorney General): Mr. Speaker, it's very interesting that the member's gone from the, I'm on the side of the angels, a couple of days ago, to say, refund everything to everybody, to now saying, now you should look at those people that were between the overspeeding level and the particular regulations in place, as administered by the police and the City of Winnipeg.

Very interesting that the member's understood the fact that legally we can't step in there and do that. In fact, it's the police and the City who are responsible for it.

Having said that, Mr. Speaker, I want to advise the member that we intend to meet with the mayor and the chief of police tomorrow. We intend to revise the regulation to make it official and move on that. We also intend to go forward with the City to look at their responsibility with respect to retroactive–

Mr. Speaker: Order.

Mr. Goertzen: In performing his political 180-degree turn yesterday, there was a number of surprising revelations from the minister. Among those surprises was his order to take down photo radar in construction sites, even where those construction workers are still present, as he undertakes a review of the regulation.

Can the Minister of Justice please tell us how quickly he expects this review to take place so that police, so that the public and so that construction workers will know where photo radar is eligible?

Mr. Chomiak: Well, the problem with the member's position today is that I don't have the legal authority to do that by just announcing it. We have to change the regulation with respect to that, and we will change the regulation because, Mr. Speaker, as the member indicated–as the member indicated, there are certain criteria that have to be met with respect to guilty pleas, not-guilty pleas, et cetera, and there's certain criteria that the City did not meet with respect to signage. Without the signage in place, we cannot enforce it in the courts.

We have to talk to the City. We intend to change the regulation as early as this weekend. We intend to have the photo radar back in construction sites under the three conditions: condition No. 1, workers present; condition No. 2, safety; condition No. 3, you have to meet the signage commitments that the City agreed to meet with respect to their agreement with the Province when they asked for photo radar to be put in place. I thought members opposite supported that.

Mr. Goertzen: Just as surprising and frankly a little unbelievable was the minister's statement yesterday that he only learned yesterday morning that there were 60,000 tickets given last year, an increase over 3,000 the year before, a 2,000 percent increase.

This is an issue that's been in the news not for days but for months. The Minister of Justice wants Manitobans to believe that he ignored the phone calls, the court cases, the media articles, all the money that was flowing in to the government, and they never, ever piqued his curiosity to ask how many photo radar tickets were coming from the construction zones.

Either this minister is living in a political bubble and he's completely out of touch with his own department, or he wasn't quite forthcoming with the truth yesterday. Which is it?

Mr. Chomiak: As I indicated, the Crown, the independent Crown–I know the member wants to play Crown all the time and stick himself in the decision-making process–decided to do an appeal. An appeal was undertaken. Evidence came forward that signage was inappropriate. The Crown ethically said, we cannot, on the basis of all Manitobans, prosecute these cases. The City is responsible. The police are responsible for this. We can't prosecute because we don't have the legal ability to do so, and we'll stay charges.

The member stood up the next day and said, pay back all the tickets. I said we don't have the legal responsibility. If someone's going 120 miles per hour in a construction zone, he'd want us to pay that back. I said we've got to look at that.

We'll ask the City to sit down and look at that, Mr. Speaker, but the member opposite has gone from his extreme, conservative, right-wing view, as members opposite, to actually realizing that there's a legal issue to be dealt with, an issue of public safety to be dealt with. Welcome aboard.

Building Permits
Value Reduction

Mr. Blaine Pedersen (Carman): Statistics Canada has released figures that show the value of building permits increased by 23 percent in Canada. That's the good news. Unfortunately, the value of building permits decreased by the same 23 percent in Manitoba.

When the NDP introduced their 2009 budget, they claimed it was steady and balanced. We already know it's not balanced. Today's statistics prove that it's anything but steady as the NDP would have us believe.

Mr. Speaker, how can the Minister of Competitiveness, Training and Trade claim that things are steady when the value of building permits is plummeting in Manitoba?

Hon. Andrew Swan (Minister of Competitiveness, Training and Trade): As the Member for Carman and I have discussed, there are issues that arise from month to month, and a much better view of what is going on in the economy is not from month-to-month fluctuations in building permits, which could be affected by cold weather, could be affected by a flood, could be affected by other issues.

If I look, as I suggest the member should, at Manitoba's change in building permits year over year from March 2008 to 2009, indeed, Manitoba compares very well with Saskatchewan. In fact, we are doing substantially better with, I suppose, his dream destinations for himself of Alberta and British Columbia.

Manitoba is indeed doing, relatively speaking, very well among other Canadian provinces.

Mr. Pedersen: Mr. Speaker, I guess with the late spring, they're having a lack of warm weather. That'll be the next excuse why building permits are down, but somehow other provinces, in spite of their weather, have posted increases in the value of their building permits. Yet Manitoba posts a 23 percent loss, according to the minister, because of the weather.

Mr. Speaker, when is this government going to wake up and realize that by crossing their fingers, closing their eyes and hoping for the best, it's not good enough? How can this minister explain to Manitobans why Manitoba's doing so poorly as compared to the rest of Canada?

Mr. Swan: I presume, Mr. Speaker, that the Member for Carman didn't understand what I said so we'll try it another way. Capital investment is actually a very important measure of how public sector and private sector entities believe in the strength of a certain jurisdiction. Indeed, last year, Manitoba ranked No. 1 among all Canadian provinces in the increase in private capital investment.

Private companies across the country, indeed across the world, are seeing that Manitoba is a very good place because of our stability, because of our diverse and our increasingly well-trained work force, that, indeed, they're voting with their feet and they're investing dollars right here in Manitoba.

***** (14:00)

Mr. Pedersen: Mr. Speaker, the minister talks about private capital investment and that's correct as long as you stay small, because the minute you start to grow in Manitoba, you get walloped with the payroll tax. That's not support. That's not how you do it for business. They're taxing growth and now we're seeing the result of this taxing growth in the decreasing value of building permits.

Mr. Speaker, when will this government realize that if we continue on this path, we're not going to reach our potential? Manitobans deserve better, not the rhetoric they hear from this government.

Mr. Swan: Well, Mr. Speaker, let's hear what Jayson Myers who's the president of the Canadian Manufacturers & Exporters Association said, who represents very many large companies across the country, many of which have growing facilities here in Manitoba. What does he say? He said on CJOB on March 11, 2009: I just wish that what's happening here in Manitoba could be replicated elsewhere across the country. When he talked about the recession, he said: Companies are affected by this but they are in a much stronger position right now, and I think a lot of that is because of the support that Manitoba's government's been giving.

What more does he need?

Manitoba Public Insurance Corporation
Enhanced Driver's Licences

Mr. Cliff Graydon (Emerson): There isn't a province in Canada that wouldn't appreciate a $4-billion transfer pay.

Mr. Speaker, we already know that the NDP government's enhanced ID cards projection has been a failure. Thirteen million is budgeted for these cards even though less than 1,500 have applied.

Can the minister responsible for this boondoggle tell the House exactly how much money has been spent on these ID cards and how much will be spent this year?

Hon. Dave Chomiak (Minister charged with the administration of The Manitoba Public Insurance Corporation Act): Mr. Speaker, last year when the members apparently supported enhanced ID cards, we provided the number to them.

The member will know, in fact, that the regulations aren't coming into effect in the United States until June 1. The member will know that only 31 percent of Manitobans have passports. The member will know that there's been a big issue I think with travel as a result of issues relating to perhaps viruses and issues perhaps relating to flood-related matters.

Perhaps travel isn't the first thing on Manitobans' minds, but we expect–as Ontario, as B.C. is doing, as Québec is doing–that there will be a need for an enhanced driver's licence that's totally voluntary. It will be not only convenient; it will be a cost savings giving Manitobans a choice and the ability of which the–

Mr. Speaker: Order.

Mr. Graydon: Mr. Speaker, I don't think the weather should have any effect on the deadlines that they had put on themselves of June 1.

Can the minister tell the House exactly how many staff have been contracted or hired by MPI to implement the enhanced ID card project and how much money it's costing Manitobans to keep them employed?

Mr. Chomiak: When we outlined the steps for the enhanced ID card, we outlined time lines and dates that we would have to establish going towards the June 1 kick-in date of the U.S. regulations. The member knows that. The member's making a point that there hasn't been as large an uptake for Manitobans right now as we expected. We expect more of an intake as we get closer to June 1.

The Emerson border is the third busiest border in the country where people go by car. Thirty-one percent of Manitobans have passports. Are they going to stop going? They'll have an opportunity for another choice of an enhanced driver's licence which will move us towards enhanced identification for all Manitobans that we have to go to anyway.

We think it's convenient for Manitobans. Members last year supported it. The project still is not complete because it's still being worked on according to the time lines. All of a sudden, the members have jumped up prematurely and, as in most cases, have jumped on this issue when, in fact, the issue is still an ongoing matter.

Mr. Graydon: Mr. Speaker, prematurely June 1 is the deadline that's there, the deadline they knew about, the deadline when they started this project. The new ID requirement travel to the United States comes into effect June 1, less than a month from now.

Can the minister tell this House where the ID cards are being printed and does he guarantee that the applicants, the few applicants, will have their cards in their wallet by June 1?

Mr. Chomiak: Mr. Speaker, I don't understand. In the first question, he said it was useless and a boondoggle, and in his third question, he says, can you guarantee that you're going to have it?

That's the problem when you're an extremist and you have extreme views. You go from one end of the equation to the other end of the equation, and it doesn't make any sense in the middle. We decided that we would have a plan, we'd stick to that plan, and we'd provide it to Manitobans, and we're working on that same plan and that same schedule, not, Mr. Speaker, on any kind of extremist viewpoint that we get every day from members opposite.

It's an extreme view, it's an out-of-touch view, and that's one of the reasons why we continue to work with Manitobans and not go on this extreme right-wing agenda.

Hog Industry
Economic Challenges

Hon. Jon Gerrard (River Heights): Mr. Speaker, today's prices for hogs on the Chicago Mercantile Exchange are 38 percent below the price a year ago, and the price a year ago was already low. Shipments of hogs from Manitoba to the U.S. a year ago were 25,000 a week and are now down to 1,000 a week. If you're a hog producer in Manitoba without a farm contract from Maple Leaf or not associated with Hytek in their plant in Neepawa, you may be in big, big trouble.

Yet the Minister of Agriculture (Ms. Wowchuk) insists she is standing by the industry, but she doesn't appear to have any plan to deal with the situation. Her previous plan to deal with country-of-origin labelling was a total disaster.

Will the minister today table her plan for the present situation for dealing with the hog industry?

Hon. Gary Doer (Premier): I know the member knows that the country-of-origin legislation goes back to former Ambassador Frank McKenna and now the Ambassador Michael Wilson and different trade ministers. I think there were seven different trade ministers under the former Liberal government, and a couple now, in Canada–the third one, I think, at this point.

Mr. Speaker, we personally believe that the rules that have been worked on by the hog industry and by the Canadian ministers and the Minister of

Agriculture in Manitoba on predictable issues of country-of-origin legislation, the rule that we worked on was an acceptable compromise. Unfortunately, the Secretary of Agriculture has provided, since then, a voluntary agreement from the producer–

Mr. Speaker: Order. The honourable minister's time has expired.

Mr. Gerrard: The problem is that when you know that a disastrous situation like country-of-origin labelling is coming, you should do something about it in Manitoba to protect Manitoba producers. The industry said, we want to build extra capacity, and you said, put it in Winnipeg, which was a disaster. When the industry said, we're going to put in additional finishing barns, you said, we'll put a moratorium on and end that plan.

What is the minister's plan now to deal with the major problems that the industry is facing? Where is the minister's plan? When is she going to table it? What is she going to do to help the hog industry at a critical time?

Mr. Doer: We know, Mr. Speaker, the member opposite wrote a glowing letter to Mark Chipman and then joined in the opposition to the new MTS Centre downtown, tied a yellow ribbon around his forehead and pranced around with about 10 other people opposing the arena.

We also know, on hog processing, he's got the same duplicitous position. He opposed the Olymel plant and OlyWest plant that was proposed in Winnipeg that would have processed hogs, delayed us a number of years. We're now building that plant in Neepawa. We're building more capacity in Brandon and again, the member opposite, all he can do is vote against it. He makes a lot of noise, votes against it. Why don't you vote for hog processing in Manitoba instead of voting against it, Mr. Speaker?

Mr. Gerrard: Mr. Speaker, I would have supported it if the Premier had had the common sense to locate it in rural Manitoba instead of in the middle of Winnipeg, the wrong place. The fact is that right now, as I was told earlier today by a knowledgeable Manitoban, much of the hog industry in our province is on the brink of disaster.

Where is the minister's plan? When is she going to table it? Is the minister going to offer a buyout to troubled producers? Is the minister, at the very least, going to join with other parties who I'm sure will be onboard with having a summer of pork barbeques to help the industry?

What is the minister's plan? When is she going to table it? What's going on here that you're standing by, standing up and doing nothing?

Mr. Doer: Mr. Speaker, I would point out that the member opposite voted against a new plant in Neepawa. The member opposite voted against the second shift in Brandon. Those are contrary to what he just says now, and he has a similar position about how to treat people with H1N1 as President Hu from China does, a position we don't accept on this side of the House.

***** (14:10)

Communities in Motion
Government Initiative

Mr. Rob Altemeyer (Wolseley): So, Mr. Speaker, in the last five minutes we've seen the Member for River Heights (Mr. Gerrard) say he knows where a rural processing facility should go. The Member for Carman (Mr. Pedersen) doesn't know anything about building permits. I'm going to show members opposite how to ask a question and not look silly. I'll do them a favour.

Could the Minister of Healthy Living please inform the House of any new initiatives her department may have initiated to help young people in Manitoba enjoy our gorgeous Manitoba weather and stay healthy and safe while doing it?

Hon. Kerri Irvin-Ross (Minister of Healthy Living): Well, I'd like to thank the member for that question.

I want to remind the House about an important event that happened today at Luxton School. I was joined with grade 1 students where we celebrated $1-million worth of investments in communities across Manitoba for Communities in Motion. Communities in Motion has been embraced by Manitobans across this province where they are offering programs such as snowshoeing, yoga, physical activity courses in the community as well as in the schools.

There are programs all over the province of Manitoba: St. Theresa Point, Erickson, Matheson Island, Cross Lake, Riverton, Norquay Colony, Swan Lake First Nation, Berens River, Pinawa, Steinbach, Winnipeg, Brandon, Portage la Prairie.

Orthopedic Surgery
Wait Times

Mr. Blaine Pedersen (Carman): Mr. Speaker, that was a hard act to follow, but I really do have a serious question.

There is a serious backlog for Manitobans requiring shoulder surgeries. Without timely surgery, there can be permanent damage to tendons in the shoulder. I ask the Minister of Health (Ms. Oswald): What is the average current wait time from the time of injury to the actual surgery day for shoulder surgeries?

Hon. Kerri Irvin-Ross (Acting Minister of Health): Mr. Speaker, I'd like to inform the House about what we've done about wait times. We have reduced hip and knee surgeries by 60 percent. We have continued to increase nursing and doctors. We have twice as many nurses as they fired; radiation.

What we've done is we've made investments in health across the board. As well as that, we provide healthy living strategies to ensure injury prevention.

Mr. Pedersen: Mr. Speaker, my constituent was referred to two different surgeons for shoulder surgery by his family doctor. Both surgeons declined my constituent as they were not able to do the surgery on a timely basis. My constituent was then referred to a surgeon in North Dakota by his doctor where the shoulder surgery was performed in less than two weeks.

Why is it Manitobans are forced to go outside of Manitoba to get timely surgery to repair tendons in the shoulder?

Ms. Irvin-Ross: Mr. Speaker, I ask the member opposite to please forward that information to us, and we will certainly follow up on this. You cannot talk about specific cases in the House, but I can tell you about what we've done around wait times.

We continue to have the shortest wait times in radiation therapy. We also have the shortest wait times, along with Alberta, in cardiac bypass surgery. Hip and knee wait times are 15 weeks down, 66 percent. CT wait times are down; MRI wait times, down. Ultrasound wait times are down.

We are committed to improving the health-care system and we will continue to do that work.

Mr. Pedersen: Well, Mr. Speaker, the minister will get the chance to hear this because my constituent now has to hire a lawyer, at his own expense, to plead his case to Manitoba Health for remuneration. Manitoba Health will have a lawyer, five directors and a consultant present at the hearing.

Who do you think's going to win this hearing?

Ms. Irvin-Ross: Mr. Speaker, I'll review for the member again the reductions that we've been able to make in wait times. These wait times are making a difference for Manitobans across this province.

We have reduced wait times for radiation therapy, cardiac bypass, MRI, ultrasound. CT wait times are down. We continue to make these investments across the province of Manitoba. There are these services that are provided in hospitals beyond the Perimeter. We will continue to work with Manitobans and we will continue to improve the health-care system.

Mr. Speaker: Time for oral questions has expired.

MEMBERS' STATEMENTS

Junior Achievement Award Recipients

Ms. Sharon Blady (Kirkfield Park): Mr. Speaker, I rise in the House today to share with my fellow members the accomplishments of some outstanding young people involved with Junior Achievement. On April 15, I attended the Futures Unlimited Banquet where achievers were recognized for their accomplishments within the JA Program.

Junior Achievement is the world's largest organization dedicated to educating students about work-force readiness, entrepreneurship and financial literacy through experiential hands-on programs. Junior Achievement programs help prepare young people for the real world by showing them how to generate wealth and effectively manage it, how to create jobs which make their communities more robust and how to apply entrepreneurial thinking to the workplace. Students put these lessons into action and learn the value of contributing to their communities. As a former Achiever, I know the value of this program and the mentorship that community leaders provide to students.

This year, for the first time ever, the students in the JA company programs had to meet the challenge of making their businesses green and address environmental sustainability within their business mandate and products. I am pleased to say that each company rose to the challenge and demonstrated ingenuity and passion in creating and successfully operating green small businesses. This combination of social responsibility and economic development is reassuring as we look towards growing our green economy in Manitoba and globally. I am sure these students will be among the leaders in the next wave of environmentally responsible economic growth.

Mr. Speaker, I would like to make special mention of some of the award recipients at this year's banquet: Web site of the Year went to Green Being; Club G was recognized for Best Business Plan; and Gogee Inc. was successful in three categories: Corporate Citizenship, Best Shareholders' Report and Company of the Year. This year's Achiever of the Year Award went to Caitlin Giesbrecht from Club G.

In closing, I would like to congratulate all of the students who took part in JA programs this year for their dedication and hard work and to recognize the dedicated JA staff, the volunteers and advisers for their contributions to another successful year for Junior Achievement in Manitoba. Thank you, Mr. Speaker.

Intermountain Sport Fishing Enhancement Group

Mr. Hugh McFadyen (Leader of the Official Opposition): Mr. Speaker, last Friday I, along with the Member for Lac du Bonnet (Mr. Hawranik), Member for Tuxedo (Mrs. Stefanson), Member for Arthur-Virden (Mr. Maguire), Member for Russell (Mr. Derkach), Member for Brandon West (Mr. Borotsik), Member for Ste. Rose (Mr. Briese) and Member for Emerson (Mr. Graydon) had the great pleasure of attending the International Sport Fishing Enhancement Group Banquet in Dauphin. This is an extremely popular event in the community, attracting more than 500 guests annually.

The Intermountain Sport Fishing Enhancement Group was established in 1990 to help promote sport fishing and tourism in the Parkland region. Among their stated objectives is to encourage proper management of the ecosystem and support initiatives to that end to guarantee the sustainability of the natural resources.

The group is active on many fronts. For example, they help educate the next generation of fishers, by offering activities like children's ice fishing and a kid's trout pond. The group has been involved in many fish and fish habitat enhancement projects. During the 1990s, they worked with the Dauphin Lake Advisory Board to get pool and riffle structures installed on the Vermillion and Wilson rivers and Edwards Creek to provide walleye spawning habitat. Another very important project in which the group is involved is the rearing ponds at Methley Beach. Approximately 200,000 walleye are reared in these ponds and then distributed to area lakes to help ensure the level of fish stocks is strong.

***** (14:20)

The group is involved with the Manitoba Fisheries Enhancement fund. This fund helps support research and other projects aimed at conserving and enhancing Manitoba's fishery resources.

Group members consult regularly with provincial departments like Manitoba Conservation on fish management issues such as slot limits and cash limits. Behind every successful group is a hardworking board of directors. I would like to take a moment to recognize them. The board includes president, Steve Hogue; vice-president, Todd Gardipie; treasurer, Dean Yarema; secretary, Doug Walker; past-president, John Boyd and directors, Jason Gibbs, Glen Zurba, Shelly Slyziuk, Stan Burdeniuk, Brad Durston, Shawn Bailey, Mark Talbot, Don Stokotelny, Rob Remple, Scott Fordyce, Dean Bodner, Glen Haugen, Malcolm Pelypiw, and Ron Harvey.

Members of the Intermountain Sport Fishing Enhancement group are deeply committed to ensuring the fisheries in Dauphin and area remain healthy for future generations, and we appreciate their ongoing efforts. My colleagues and I would also like to thank them for the tremendous hospitality we enjoyed at the banquet, and we look forward to attending future banquets. Thank you Mr. Speaker.

Collège Saint-Norbert Collegiate Drama Production

Ms. Marilyn Brick (St. Norbert): I'm pleased to rise today to share with this House some information about a play I attended on February 25 at Collège Saint-Norbert Collegiate. *Urinetown* is a satirical tale of industrial corruption in a Gotham-like town that is experiencing a terrible water shortage. In an attempt to regulate water consumption, the government creates a law whereby everyone must pay to use public washrooms which are owned and operated by the heartless Urine Good Company. Any citizen who refuses to pay is sent to the worst place in the world, Urinetown. When young Bobby Strong decides he'd had enough, he takes a lead to have a revolution to overthrow the greedy corporation.

I was incredibly impressed with the students' production. Based on the 2001 Broadway musical by Mark Hollmann, *Urinetown* is an entertaining look at the dark underbelly of capitalism and corporation mismanagement. With memorable characters like Officers Lockstock and Barrel, Caldwell B. Cladwell and Penelope Pennywise, and musical numbers like "Follow Your Heart" and "I See a River," this show was witty, fun and thought-provoking.

I would like to congratulate the cast, crew and band members who worked so hard to make the play a success, including: David Betz, Rebecca Gole, Mitchell Forrester, Shawnee Davis, Troy Jazser, Victoria Rutowski, Max Semchuk, Justin Mann, Aurel Smith, Tarek Rashwan, Lisa Spiers, Justin Willems, Katelyn Giesbrecht, Zack Gerbrandt, Stacey Archer, Dustin Schlag, Samantha Blanchette, Nicole Rosner, Sanna Kocay, Nicole Aubin, Alicia Hoffman, Ella Greer, Belinda Goertzen, Rachelle Garton, Natalie Hocking, Cassie Ralph, Renee Marion, Alana Ramnauth, Karl Enns, Haley Wiens, Caitlin Engel, Reily Mann, Kamini Ramnauth, Kyla Westra, Brooklyn Enrentraut, Nicole Rosner, Rob Woods, Carson Mauthe, Allison DeRuddere, Samantha Erickson, Desiree Waldner, Zona May, Alexis Cherniak, Aynsleigh Kerchak, Adam Benson, Levi Willems, Brittany Kelly, Michelle Claeys, Max Strickland, Stephanie Wallis, Alis Froehlich, Marvin Namaka, Claire Wheeler–

Mr. Speaker: Order. The member has gone quite a bit over the allotted two minutes.

The honourable member's asking for leave?

Ms. Brick: Leave.

Mr. Speaker: Is there leave for her to continue? *[Agreed]*

The honourable Member for St. Norbert, to continue.

Ms. Brick: Kerri Huff, Stuart Harris, Bonnie Dack, Sydney Barton, Caitlynn Taczynski, Breanne Nicole, Amber Lotz, Sawyer Marshall-Stanchuk, Curtis Erickson, Lynn Sumka, Breanna Corlett, Emilie Derksen-Poirier, Chantal Schlamp, Olivia Ballentyne, Kiera Dayholos, Ali Froehlich, Madelaine Crierie, Shamus Dack, Nykol Pishak, Gisele Smith, Eileen Dionne, Matthew Lagace, Logan Sali, Cheyenne Neufeld, Al Omichinski, Rene Ahrens, Andrea DeRuddere, Victoria Jenkins, Cody Smith, Deanna Smith and Suzanne Cormier.

I would also like to congratulate Director Bev Betz and the staff and parent volunteers who participated.

Mr. Speaker, I thoroughly enjoyed St. Norbert's production of *Urinetown*. The school has a long tradition of producing excellent theatre, and I'm so proud to have such talented young people in my constituency. Thank you.

YWCA Women of Distinction

Mrs. Myrna Driedger (Charleswood): I'm proud to rise today and congratulate the well-deserving women who were honoured last night at the YMCA-YWCA Women of Distinction Awards ceremony. This year marked the 33rd anniversary of the prestigious awards which are bestowed upon those women who have displayed exceptional leadership, achievement, imagination and innovation in how they have contributed to the development of others in their community.

The annual presentation of these awards continues to emphasize the importance of publicly recognizing the positive contributions that many different women from a multitude of backgrounds have made in our society.

I was pleased to attend this event last night, along with fellow Progressive Conservative MLAs from Morris, Portage la Prairie, Pembina, as well as our leader.

Nearly 60 women were nominated for the Women of Distinction Awards this year and all of them deserve to be congratulated for the positive spirit and dedication that they bring to their communities, and which merited a nomination for this award. This commitment that each of the nominees has shown deserves our respect, our admiration and our sincere thanks.

Of the 60 nominations, 10 exceptional women were chosen for a Women of Distinction award. Among them are, in the area of Health and Wellness, Leslie Galloway, a nurse at the Children's Hospital; for Community Volunteerism, Elaine Bishop, executive director of the North Point Douglas Women's Centre; for Education and Training, Wanda Wuttunee, director of the Aboriginal Business Education Program at the Asper School of Business and head of Native Studies in the Faculty of Arts; for Arts and Culture, Carmen Infante, founder of Sol de Espana folk dancers; for Business and Professions, Noelle De Pape, executive director of Immigrant and Refugee Community Organization of Manitoba; for

Research and Innovation, Elissavet Kardami, a doctor and principle investigator at the Institute of Cardiovascular Sciences at U of M; for Sport and Recreation, Jo-Anne Clark-Gillespie, a physical education teacher at Portage Collegiate Institute; for Creative Communications, Lisa Meeches, president of Eagle Vision Inc. and Meeches Video Production; for Young Woman of Distinction, Kim Le, a student and active volunteer; and for the Gerrie Hammond Memorial Award of Promise, Jacqueline Proctor, a student and president of her student council in Warren, Manitoba.

Mr. Speaker, I heartily congratulate all of these women on their significant achievements, and a particular acknowledgement to Pat Flaws for chairing an exceptionally wonderful evening and dinner. Thank you.

Youth Parliament of Manitoba

Mr. Bidhu Jha (Radisson): Mr. Speaker, it gives me great pleasure to rise in the House today to speak about a wonderful organization, Youth Parliament of Manitoba. Youth Parliament is a group that seeks to introduce young people to Manitoba and our legislative system by holding a mock parliament twice a year. It is one of the oldest model parliament organizations in the world and has held sessions continuously since 1922.

The organization is run for youth by youth. The board of directors are all members of our community between the ages of 18 to 25, who have been elected by their fellow parliamentarians. The executive appoints a 20-member cabinet who are responsible for the day to day running of the legislative session.

This organization is an institution in our province, an 88-year legacy we should be proud of. Youth Parliament alumni are scattered not only across Manitoba, but the world. Some are working on Parliament Hill; others are lawyers, Rhodes scholars, doctors, journalists, teachers, while some walk the halls of this very Legislature.

Mr. Speaker, it's with great pride that I share with all members about all my three children, Piyoosh Jha, Prabhat Jha and Reena Jha. They were all Manitoba Youth Parliament members and they are the alumni.

We know one member right here, the Member for Elmwood (Mr. Blaikie), ex-dean of the House of Commons in Ottawa, among distinguished alumni of Manitoba Youth Parliament.

Mr. Speaker, it's my view that the world would be much better tomorrow built on solid democratic principles and by participation by our youth from our society. Thank you very much.

ORDERS OF THE DAY (Continued)

GOVERNMENT BUSINESS

Hon. Steve Ashton (Deputy Government House Leader): Mr. Speaker, before resolving into Committee of Supply, I believe there's agreement to also continue Committee of Supply tomorrow. With that in mind, if you could resolve into Committee of Supply, please.

Mr. Speaker: Okay, orders of the day, to remind members that Committee of Supply will continue tomorrow.

COMMITTEE OF SUPPLY (Concurrent Sections)

FAMILY SERVICES AND HOUSING

***** (14:40)

Madam Chairperson (Marilyn Brick): Will the Committee of Supply please come to order. This section of the Committee of Supply will now resume consideration of the Estimates of the Department of Family Services and Housing. As had been previously agreed, questioning for this department will proceed in a global manner.

The floor is now open for questions.

Hon. Gord Mackintosh (Minister of Family Services and Housing): I know the department is rallying some answers to questions we were making best efforts to get back today. There was the boilerplate contribution agreement, and I'll leave that for the member.

The Manitoba Child Benefit changes from CRISP: The '08-09 numbers show 5,325 children. That's an increase of 219.2 percent over the previous year, and part of that–no, that's the right way to put it–and then the other one was the amount. I think that was the question. Wasn't it the number of children on the Manitoba Child Benefit? Yes. We had a 2.8, 35.5, and that's an increase of 305.9 percent.

Then, Madam Chairperson, there was a question around the SPAs: Agency Accountability and Support Unit, one; Children's Special Services, 21; Child Protection branch, 21; Employment Income Assistance, eight; Family Violence Prevention

Program, 27; a multi-division, in other words, involving several areas of the department, 23; Supported Living Program, 87; and Employment and Training Services, 11, for a total of 199. Those are active. There are two SPAs, one with B&L, and the other, essential living assistance services, that are under negotiation for renewals, but the current SPAs continue until such time as the renewals are completed, I understand.

So, if there's other information that we can provide, we will do so.

Mrs. Bonnie Mitchelson (River East): I just want to thank the minister for those very timely responses, and I'll read those in the record that he's put on the record and also take a look at that contribution agreement.

Can we move on, then, to–actually, I don't know whether you'll have this, but this is information that I got out of the last annual report and several annual reports previously. It's on child abuse investigations. It's on page 89 of the last 2007-2008 annual report and, under centralized provincial services, it says that the number of child abuse investigations that were done in that year were one thousand, five hundred and–no, pardon me–2,250. The year before it was 1,535.

I noticed as I went back into annual reports, I guess I went back as far as 2003-2004, and, you know, the number of investigations has gone up and down a little bit. I guess the lowest was 1,100 in '05-06 up to a high of 2,250 in '07-08.

The first question I would have is, as I looked at the annual reports earlier on, there were several agencies that didn't report. In '03-04, 10 of the agencies didn't report child abuse investigations. In '04-05, the Northern Child and Family Services authorities didn't report. In '05-06, there were four agencies that didn't report. I guess I was–in '06-07 and '07-08, there was no mention of agencies not reporting, and I guess I would just ask the question then: Did all agencies report, and that was why it wasn't referred to, or do we have any other information?

Mr. Mackintosh: Yes, I'm advised that in some years there are some agencies that may not get their information in by the time the deadline is in place for the compiling of the annual report's statistical information. I'm advised that with an enhanced emphasis on data collection–we talked about that yesterday in the area headed by Rhonda Warren that we anticipate that for the collection of this year's annual report, that there's going to be more timely reporting. But that has been a pattern that's been noticed over the years with that deadline.

Mrs. Mitchelson: Madam Chair, I'll be watching for that in the annual report, I guess, that comes out. By September, we should have that cleared up and we should have all the information.

It says in a footnote beside child abuse investigations, that this includes investigations completed by the provincial investigator. I guess I would just like to understand a little bit better of what we're talking about and what the difference is between the provincial investigator and whoever else does investigations.

***** (14:50)

Mr. Mackintosh: We someday will move to staff directly answering questions. You know, every hour or so, I wonder why we got into this, but it's about ministerial accountability, I understand that and that's very important. It also sometimes informs the minister of what goes on in the bowels of the department.

The provincial investigator role was set out in section 18.6 of the act. The provincial investigators versus the agency investigators take on those investigations that are in regard to complaints about residential facilities, No. 1, and No. 2, where it concerns usually staff of another child protection agency or organization; in other words, to avoid a conflict of an agency investigating itself. For example, there was that St. Amant example that is well known publicly, where the provincial investigators looked at that situation rather than relying on St. Amant to look at one of its group homes because their allegations were against a staffperson.

It's a province-wide service that's offered. I think that historically there were two investigators. Just last year, we doubled it to four investigators. There's one manager. There are over 200 investigations annually. Of course, they must work closely with police; often there are joint investigations.

Mrs. Mitchelson: So where do I find those positions on the–oh, don't tell me I didn't bring the–I know they were long pieces of paper that you gave me yesterday with the org charts.

Where do I find that increase in positions on the org chart?

Mr. Mackintosh: In the org chart that has Claudia's name at the top–Ash-Ponce. If you move over to Erickson, and under Erickson is Ms. Hanson. She's the manager, and she has a history of being one of the investigators. Then you'll see Ms. Schellenberg and Greeley, Fewster and Yager.

Mrs. Mitchelson: So if there are 200 investigations done by government, approximately, in a year, and there were 2,250 done provincially, that would mean then that the agencies or the authorities, I guess–who else does the investigation?

Mr. Mackintosh: If the investigations aren't done by the branch itself, they would be done by child welfare agencies across Manitoba; generally, the designated intake agencies.

Mrs. Mitchelson: Can the minister tell me how many designated intake agencies there are then across the province? I believe it's ANCR that–and I'll get into some questions around that later, but–does all of the Winnipeg intake, I understand?

Mr. Mackintosh: There are 14 DIAs, Madam Chair. ANCR has jurisdiction in Winnipeg, Headingley and St. Clements.

I am advised it's not all of St.–like I'm using that term generically, but it's part of St. Clements. We can provide a map, if the member seeks that.

Mrs. Mitchelson: Does the department keep statistics and do the agencies keep statistics on how many of those allegations were substantiated and how many were not?

Mr. Mackintosh: Yes.

Mrs. Mitchelson: I wonder whether the minister could tell me, over the last couple of years–and I know we don't have the annual report from last year and you may not have all of the information in from all the agencies because I know you said there was a bit of a backlog sometimes–but for the year 2007-2008 then, could the minister indicate to me by designated intake agency or authority, whatever it is, and the branch, how many of the allegations were substantiated?

Mr. Mackintosh: I am advised that certainly that information can be collated, but the numbers on substantiated allegations, of course, will only deal with investigations concluded in that fiscal year. So that will be the caveat on the information, but I think that's what the member is looking for.

Mrs. Mitchelson: Thanks. I'd just like some sort of general indication of–and can that be done then by category? How many children were in sort of their natural home versus foster care versus residential–all of the different categories that–I might not be thinking of something, but if you could do that breakdown for me and in the most current year, I guess. If they don't have the detail for this year, maybe from the year before, last year.

Mr. Mackintosh: I'm advised that that information is recorded and can be collated.

***** (15:00)

Mrs. Mitchelson: Thank you for that. I notice there's been a significant increase in the number of FTEs in the Child Protection branch and I see, by the org chart, I think the minister indicated to me already two new positions that were created and those would be in investigations, just in his previous answer. But could he just go through the department and indicate to me, because I believe staff has increased from 56 FTEs in 2006-2007 to, I believe it's 72 in this year's budget.

Mr. Mackintosh: The numbers I have are 56 in '07-08, 72 in '09-10.

Mrs. Mitchelson: Madam Chair, I thought I was waiting for an answer. My question was, where are the new positions? There were 56 to 72, and you did indicate that there were two new investigation specialists, but I was wondering where the other positions in the org chart are that would constitute the increase.

Mr. Mackintosh: Yes, '08-09, there was one position out to community service delivery, and the new positions to net out was one management secretary.

Mrs. Mitchelson: Where's that? If we could just have the org chart, if the minister has a copy of the org chart. I've got it in front of me, the one he gave me yesterday, so it would be, you know–I could just put a little mark beside the new positions. If you've got that, it would be helpful.

Mr. Mackintosh: They actually made a list here, so they'll cross-reference that to the org chart. I can go down the list. There's a management secretary, and there's one quality assurance, one admin support, the two provincial investigators we spoke of, one issues management specialist, two CFSIS business analysts and one CFSIS trainer.

Then, in '09-10, two were transferred out, and the new positions are the one authority relations specialist, two policy analysts, one project manager for the child victims centre, one admin assistant, one differential response co-ordinator, one co-ordinator for sexual exploitation, one quality assurance specialist, and the two new sexual exploitation strategy specialists under Tracia's Trust.

Mrs. Mitchelson: Can the minister tell me whether the positions–and I see a position, an acting manager of training, a C. Martinez, and then three trainers underneath in the boxes underneath that–are any of those new positions?

Mr. Mackintosh: One of the three advisers is a new position.

Mrs. Mitchelson: Just for clarification, is this training on the CFSIS system?

Mr. Mackintosh: Yes.

Mrs. Mitchelson: Is there any other training then within the department or any other positions that are responsible for training?

Mr. Mackintosh: The three in the branch, aside from CFSIS training, do an intake training in core competency training, Madam Chairperson. Core competency is supplemented by contractors who deliver training. In addition to that, the joint training unit is a standing committee. That's the organization comprised of the four authorities in the branch. Under the Changes for Children initiative, the Province has four positions there as well that are funded.

Mrs. Mitchelson: So there are four positions in the joint training unit. Where does the budget show for that?

Mr. Mackintosh: The JTU positions are funded under the authorities and maintenance of children line on page 77 of the Estimates–of the detailed supplementary Estimates, joint training unit.

Mrs. Mitchelson: When were those positions created?

Mr. Mackintosh: Those positions, I'm advised, were funded during '06-07 as part of the Changes for Children initiative.

***** (15:10)

Mrs. Mitchelson: Can the minister tell me what has happened? There are four positions funded in the joint training unit by the department.

So, are they part of the FTE component or–I guess I'll ask that question.

Mr. Mackintosh: Those are not FTE expenditures. They're not provincial civil service positions. Those are positions created as a result of a grant to the authorities for the provision of the joint training initiative.

Mrs. Mitchelson: So, are there only four training positions in the joint training unit?

Mr. Mackintosh: The grant to the authorities for the four positions is distributed on the basis of one for each of the authorities. Then the branch is represented at the JTU by Ms. Martinez, which is one of the FTEs in the branch for training.

As well, there is funding for an administrator, and that flowed to an authority for the JTU. I'm advised that, as well, there is funding available for contractors to provide services.

Mrs. Mitchelson: So, then, there are four staff positions in the joint training unit, with one administrative support for those positions, and that joint training unit falls under the standing committee, which is, I understand, the CEOs of the four authorities plus our director.

How often do they meet?

Mr. Mackintosh: They meet twice a month for one-and-a-half days.

Mrs. Mitchelson: I wonder if the minister could tell me what kinds of issues would be discussed at the standing committee.

Mr. Mackintosh: The standing committee is involved in work on, first, the funding model development that we spoke about yesterday that has been approved by our Treasury Board.

Standards development: one of the achievements there has been, 19?–thirty now, 30 new standards that have been developed; 19 I know that were approved and were out the door by summer.

Intersectoral work, which includes work with, for example, Healthy Child Manitoba, Manitoba Adolescent Treatment Centre, Health, FASD, suicide strategy, all of those initiatives that were important to the Changes for Children initiative.

There are regular meetings, formalized meetings now with the office of the Children's Advocate and the Ombudsman quarterly on issues of mutual interest, but as well, the Changes for Children, action on Changes for Children.

Quality assurance matters: budgeting, overall co-ordination of Changes for Children, province-wide shared resource development, the development of the differential response model for Manitoba and how family enhancement should roll out. They can deal with legal presentations from legal services from time to time, the development of common processes and forms.

Madam Chair, getting back to the original question from the member, joint training initiatives and the methodology of that operation. There is problem-solving from time to time, and the CFSIS redevelopment; it's an initiative called Information Matters. Finally, reviewing the work plans for the Changes for Children initiative.

Now, that information comes from both the ADM and the director, so I suspect that it's pretty comprehensive then. But I think there's a catch-all there; matters that arise from time to time as well are dealt with there, but it is the consensus building and co-ordinating part of the child welfare system today in this province.

Mrs. Mitchelson: Madam Chair, the minister talked about the new funding model that has been approved. I guess my question around that would be: Would the funding flow under this contribution agreement that was tabled for me?

That is in the function of this committee, I believe it would be the quality–yes, I'm just wondering, is it the same branch that develops service purchase agreements that would be negotiated with the authorities over this new funding model?

***** (15:20)

Mr. Mackintosh: Essentially, the answer is yes, but there are other complications. But, yes, the dollars do flow under the–they will flow under the auspices of the contribution agreement, and they will have to be amended accordingly to flow those dollars.

There are some conditions that attach. For example, each agency is to conclude a five-year business plan and that has to be approved then by the respective authority. So that will be part of the contribution agreement.

Mrs. Mitchelson: Are there contribution agreements signed now with the four authorities?

Mr. Mackintosh: Yes.

Mrs. Mitchelson: Are there any business plans? Are there five-year business plans presently?

Mr. Mackintosh: The next step in the funding formula's roll out is the agreement with the federal government, then, on the funding formula itself and its components. The next step, then, is to ensure that the dollars flow according to the contribution agreements and the plans of the agencies.

Mrs. Mitchelson: Madam Chair, are the negotiations complete with the federal government, and what commitment do we have from the federal government on funding?

Mr. Mackintosh: The framework is all the product of the ongoing work over the last, what, year and a half or more, of provincial and federal officials; in terms of federal officials, both from the region and from headquarters in Ottawa. As well, there's been discussions at the deputy level and political correspondence. It's our understanding that the federal officials, now that the Province has put in its budget–we had to make that commitment in our budget–and the next step, then, will be for the Cabinet memorandum to be concluded by the officials–or federal officials. Is it Cabinet or Treasury? Well, they call it a memorandum of Cabinet.

Mrs. Mitchelson: Has there been a change in the funding formula from the federal government?

Mr. Mackintosh: Yes. Well, that will be what to watch for, is that change in funding formula from Ottawa.

Mrs. Mitchelson: The minister mentioned new standards, and that that was a function that was discussed and worked on at the standing committee level, and that there were several new standards that were developed or have been developed and they have been implemented.

Can I ask, what is the process for training front-line staff for the new standards? I'm asking this because of a genuine concern that I have when we look at a lot of the reviews of child deaths that have been done. There are a lot of recommendations, but I believe, if more training had been done up front and workers knew what their roles were and what their jobs were, that maybe some of the tragedies that have occurred might have been prevented.

So, when I look at recommendations, I see training as the underlying thread of what's missing for many of the front-line workers, and if they don't have the resources or don't understand their roles and responsibility, that's where we run into trouble. I'm very interested in how much work is going on since the reviews have been tabled with government to ensure front-line workers understand their roles and responsibilities. That can only happen through good training and good training initiatives.

Mr. Mackintosh: The standing committee created a standards training package that provides the basis for all of the authorities to ensure that agency staff receive training on a consistent basis. Of course, the standards manual is available. It's based on the provincial legislation and policy.

There has been an enhanced focus now with the JTU on training. I'm advised that last year approximately 1,600 staff and some foster parents as well received training in core competency and CFSIS and practice approaches co-ordinated by the joint training unit as well. JTU is now working on several joint training initiatives in three prioritized areas: critical incident and stress management, suicide prevention and intervention, child abuse investigations. There's intensive work on a new orientation package for new workers. I've got new numbers here from April '08 to December '08, Madam Chair. Attendance at training sessions exceeded 6,200 participants.

Mrs. Mitchelson: I wonder if the minister could share with me the training packages that have been developed. I'd be really interested in seeing those if I could.

***** (15:30)

Mr. Mackintosh: Just to clarify, then, we don't have them available here, but we can provide them on a timely basis to the member, but just if you could indicate whether it is only with regard to standards or whether core competency as well. There may be other areas that are of interest to the member; in other words, would she like a full training package or just those related to standards training?

Mrs. Mitchelson: I think I'd like the whole training package and I think orientation is one piece that I'm very interested in, so if we could do the whole thing and I could just have a look at it and see what is happening because I feel it's a very critical component to what needs to happen.

Can the minister indicate for me how stable the work force is in the agencies? I do know, if we go back to looking at the Phoenix Sinclair review that was done–certainly in the agency that Phoenix Sinclair was associated with there was significant turnover in staff and there were very few workers on the front line that had any training or any experience. That is of great concern to me. Could we have statistics–maybe let's just start at the top, and could I have a history authority by authority on–now, what do we call them; do we call them CEOs of the authorities? Is that the head person? I just wasn't sure of the title. Could the minister indicate who the CEOs are now of the four authorities and how long they've been in place, and maybe since the authorities were created? What's the history of the CEOs? Who were the initial CEOs and then how has that changed over the years?

While we're getting that information–I understand it may take a few minutes–I wonder if the minister could indicate to me, since 1999-2000, could he just give me a history of the deputy ministers in the Department of Family Services and Housing, the ADMs in–I guess I'm mostly interested in the Child Protection branch, since 1999, if he could just give me the names and the dates that there have been changes in those positions.

Mr. Mackintosh: So far at the table here we're good with names, but the dates are not exact. But we can give time lines in terms of, first of all, the CEOs. The North CEO is Marie Lands, and she will be one year this summer. The southern authority CEO is Elsie Flette, and she's been in place since the authority was created. The general authority, Jay Rodgers is the CEO. He's been there about two years. The Métis, Leilani Buschau. Did I say how long Leilani has been there? One year, approximately, one year.

The deputy ministers, '99, Tannis Mindell–well, the member knows that–followed by Debra Woodgate and then Milton Sussman. I know Martin Billinkoff was appointed, I believe the same day that I was, in September of '06. So we don't have dates for the others, but we could provide those. *[interjection]* If there's no further question on that one, we won't search for the dates.

The ADMs for CFS, as the member knows, David Langtry, a fine person. Peter Dubienski, who was there when I first arrived–for Changes for Children, and then Carolyn Loeppky. Carolyn's been in office as ADM for about two and a half years and still standing.

Madam Chairperson: This is called corporate memory. We're all scared we're going to lose when people retire.

Mrs. Mitchelson: In the position that Carolyn Loeppky is in, I sometimes wonder how you can keep track of the days and years because it is a hectic position.

Could the minister just indicate to me who the directors of Child Welfare have been since '99?

Mr. Mackintosh: The director is Phil Goodman, who the member will know. I had the pleasure of meeting this summer, a northender, who described Alberta's approaches to DR and information management and sexual exploitation. It was very insightful.

I understand there's an interim–is that acting or interim–Bev Ann Murray. The next director was Dennis Schellenberg, who then went on to the general authority's leadership. Joy Cramer, who now heads up Housing. Jay Rodgers, now the general authority CEO. Josie Hill, as the member knows, was briefly director and Claudia Ash-Ponce now who, thankfully, has a life contract with the department.

***** (15:40)

Mrs. Mitchelson: I wonder if the minister could provide for me the–I guess it would be the executive directors of the agencies throughout the province. Do we have that information?

Mr. Mackintosh: We can compile the list of the agencies' directors.

Mrs. Mitchelson: I'm rather interested in both the CEO positions, and I know that besides Elsie Flett, who has been there since the beginning in the southern authority–if I could just have the history of the CEOs, then, and their length of stay in the other authority.

I don't need that today. I'm just saying if I could have that for looking at compiling information that I would appreciate having. That would be one thing. Then, also, the executive directors of the agencies, how long they have been there, and who may have preceded them.

Do both the authorities and the agencies have boards?

Mr. Mackintosh: Yes.

Mrs. Mitchelson: Could the minister tell me who's on the board of the authority? Again, this isn't information that I need right now, but if that could be provided to me, I would appreciate it.

Mr. Mackintosh: Yes, we can provide that very quickly.

Mrs. Mitchelson: Back in 2008, Bill 34 was passed, which was agreed to and supported unanimously in the Legislature, and one of the key standards that was enshrined in that legislation was protection and well-being of children, as the primary consideration. I appreciate that becoming the first and foremost priority.

Can the minister tell me what changed after that legislation was proclaimed? Was there any directive that went out to authorities and agencies in regard to implementing the new legislation?

Mr. Mackintosh: The chief work after the bill was passed was to enhance the standards in this regard, accompanied by the training that rolled out then beginning in that fall.

First of all, the legislation was, as the member knows, intended to make absolutely clear beyond any doubt in The Child and Family Services Act that safety was paramount, which was expressed in the authorities act, but not in The Child and Family Services Act.

As well, the legislation brought in a second emphasis, and that was that when a child is to be seen under the standards, the child must indeed be seen. "Every child seen every time" was the mantra that was developed, and standards, again, reflected that, the dissemination of those standards and the training that followed. That can't be a one-time operation. Know that there has been continued exploration on how and development of reminding front-line workers and everyone in the system about "every child seen every time." There'll be further work on that as well, but there was a comprehensive standard around that with the training component.

Mrs. Mitchelson: I guess I'm still hearing within the system that safety isn't necessarily always first and foremost within the system, so I guess my question is: Is the minister satisfied that the direction and the intent of the legislation is being followed, and what process would there be to ensure that every worker in the system understands and knows that?

Mr. Mackintosh: It was timely that, given a lot of public debate and, quite frankly, insights following tragedies, that all the system understand that while devolution was intended to enhance the importance of culture, it was never intended to diminish the importance of safety. Indeed, the authorities act, which is the devolution act, expressly said that as the first part of the bill. So that expression was made loud and clear, starting with the fundamental document of the system which was the act. The salience of the change depends always, of course, on, then, standards reflecting that and training, which I'm told is part and parcel of strengthening our responses.

Now we also know that every time a child welfare worker or social worker has to make determinations, they have to use professional judgment, and sometimes there is a balancing of many factors. In the balancing, safety underpins the reason why the system exists in the first place, so it's important for that reminder to be there, but there will, I'm sure, always be circumstances where people can argue that safety may not have been a paramount consideration, in which case I'd like to know of those situations, but professional judgment again will balance some often very difficult situations.

Now the development of a risk-assessment tool as well provides meat to the words and the intent of the legislative change. The risk-assessment tool is now being piloted, the new risk-assessment tool. There always have been risk-assessment tools, but there has been the development of one that is stronger, based on practices and experiences elsewhere, which, by the way, has proven not to be an exact science because, again, professional judgment and the human factor always plays a role in individual situations. But we now have, along with the development of DR, differential response, in the family enhancement stream, the new risk-assessment tool that's being piloted.

***** (15:50)

So that is one part of the answer. The other is the funding model will also fund a quality assurance position at each agency, not just at the authority level, to build capacity at the agency level, to monitor compliance with standards.

There was a recent analysis done that every state in the U.S. was failing to meet standards, child welfare standards, and you have to ask, well, what do we have to do to reduce the risk to children when there is that kind of finding? That is all about a multi-faceted response, which is not just strong legislation but the standards, the training, the funding model, quality assurance reviews, the provision of workload relief, which has been so important. We hear that so much from the front lines.

We've been able to put in place 103 new positions as a result of Changes for Children so far. At the same time, we have seen the growth in the number of children coming into care, so we realized that we had to continue this effort, at the same time bringing into place in Manitoba the differential response model, based in part on what Alberta's experience has been, Minnesota and other places. But you have to continue to provide that workload relief, and this budget allows for further workload relief as well as the introduction of differential response in Manitoba.

Mr. Doug Martindale, Acting Chairperson, in the Chair

The member well knows the workload issues in child welfare, not just here, of course, but this is Manitoba where we are elected to work on behalf of children. But it has been an experience all across North America and perhaps beyond that has not adequately, I think, been addressed in most jurisdictions. So here in Manitoba we have made some extraordinary investments now in providing workload relief.

By workload relief, too, I shouldn't just say that it's about more staff. Differential response is really important. When the family enhancement model began in Alberta, Phil Goodman, for example, told me about what a difference that was making to the protection cases. The numbers were going down. Then Alberta had a bit of a bump. It may have been a lot of migration issues at work there, but the numbers certainly are stabilizing in Alberta. The increases are not as great as they had been before their introduction of differential response. That has been the experience in Minnesota as well and I think in other jurisdictions that have been moving to differential response.

So that's one. The other, though, is just better management of agencies, ensuring that CFSIS is continually redeveloped and strengthened, because if CFSIS is inaccessible to workers, if it's too complex, if they're not trained in CFSIS, that's going to take away time from them. It's a matter of organizing activities, too, and getting social workers out of the coffee rooms and into the living rooms. That has been a reason why the workload relief wasn't only for social worker positions. The external review said they also needed relief with the administrative support because the social workers were doing so much paperwork around their files.

So all of these enhancements are expected now to work together to reduce the risk to children and to better ensure that those decisions that the member started her questions around are made by social workers in the best interests of children. So the question, I think, really begs an answer from a number of approaches.

I don't know if the member wants to go into any of those areas where there have been enhancements. I'm getting notes here on examples of the CFSIS enhancements. As well, I just will say maybe in conclusion that I'm seeing the authorities taking on their responsibilities very seriously. We're seeing the quality assurance reviews, the ongoing reviews that are happening not just in response to tragedies or concerns about financial problems as they arise, some very historic. We're going to continue to see that work because the authorities are seeing the impact of those reviews with agencies.

Mrs. Mitchelson: Mr. Acting Chair, I wonder if the minister could provide for me the standard that enshrines Bill 34 and the training document that might highlight Bill 34.

Mr. Mackintosh: We can highlight that with the package of printing materials. I had been carrying that around. Actually, that one for every child seen every time, but we can provide that for the member.

Mrs. Mitchelson: Mr. Acting Chair, the minister mentioned, in his response, 131 positions that have been added–*[interjection]* Oh, sorry, 103 positions. How many of those are front-line positions? And where might they be?

Mr. Mackintosh: We're going to have to provide that information for the member. There were some further numbers, some further positions beyond the statistics that we have here today. But–do we have an idea there?

We'll answer the member's question. We have 103–or 103.5 now? But when we had 99.5 positions, I have those numbers here. So that, I think, pretty well answers the question. Front line was 66; supervisors 10.7; service assistant 2.5; admin 20.3; for a total of 99.5.

Mrs. Mitchelson: Mr. Acting Chair, does the minister have any more detailed information on the 66 front-line positions, where they might be?

Mr. Mackintosh: We have a breakdown, but it's not in the room here. So we can provide that.

Mrs. Mitchelson: Does the minister or the department have any idea how many vacancies there are in the front-line positions, agency by agency, and whether it's an issue?

Mr. Mackintosh: I'm advised we would have to canvass the agencies, unless the authorities have something recent as well, but, of course, that will change, well, almost daily. But I will endeavour to collect that information.

***** (16:00)

Mrs. Mitchelson: Yes. It always will be a snapshot in time, depending on the circumstances. One of my concerns, again, is the number of staff that might have some longevity and some experience versus new staff members because I do know there were some recommendations that talked about mentorship, and ensuring that new staff weren't left on their own to make difficult decisions without some sort of mentorship or supervisory support.

So I'm interested in knowing whether we're retaining our staff at the agency level, or whether they're moving out to some other opportunity. I know it's a little bit or work and I know that it's–but I mean I think that's all about accountability. I'm sure that the authorities would be looking at that very carefully in their monitoring of the agencies and, you know, some red flags went up if there was an agency that seemed to be having difficulty, it would appear to me that either more support and whether that be–whatever kind of support to try to help that agency get on track or get on its feet might be really important.

So I would hope that kind of function is happening and I would hope those kinds of issues would be raised at the standing committee so that everyone can try to work to resolve the problem. I mean, God knows, we know there never will be a perfect child welfare system because we're dealing with human beings that are delivering service and having to make decisions, and we know we don't have a perfect health-care system and there are mistakes that happen. We will never have a perfect child welfare system, but, I guess, you know, all of our goals–and I believe it is the goal of everyone–is to try to ensure that we have the best we possibly can have and that the supports are put in place to try to make sure that the mistakes are minimal, if possible.

So I think that's important information for all of us to have. It's not necessarily information that would be looked for to be critical but to understand where the real issues are, and hopefully we can all work towards finding better solutions. So I think that is all about outcomes and accountability within the system. So I would hope that even if it does take a little bit of time that that information–and I know it would have to be a snapshot in time. I mean, it changes on a regular basis but if I could have that information it would be very helpful.

I do know that one of the things that was talked about in October of 2006 when the Changes for Children was launched, the strategy, there was a bullet in the news release that said foster parents will also see increased support through stronger protocols to build teamwork for social workers and their agencies to ensure a voice for foster parents and planning for children in their care.

I'd like to ask the minister how that's going and how that has happened.

Madam Chairperson in the Chair

Mr. Mackintosh: One of the priorities has been and must continue to be, to better embrace the value of the role of partnership between child welfare agencies and their workers and foster parents. The first piece of that was the development of better recognition of foster parents and their contribution to the lives of children, and there were several pieces to that.

***** (16:10)

The first was significant increase in the foster rates, as well, recognition that sometimes there are other special costs, for example, cribs, car seats, that had not been recognized as eligible for support. As well, it was building the Foster Family Network strength and recognizing them in ways that we hadn't in the past, enabling them to provide more supports and liaison, and working with the authorities in child welfare agencies. In that regard, as well, we've some very significant improvements where the Foster Family Network now is partnering with the authorities and agencies. We're seeing them up in the north doing tremendous work. We're seeing working groups where they are a vital piece of this. Those kinds of protocols make all the difference to remind workers in the child welfare system of the important contribution of foster parents and what they bring to a child's care.

A tangible outcome of that is the new development of a curriculum for fostering in Manitoba. This is developing as a result of the insights of the Foster Family Network and workers in the child welfare system. What is coming to the fore in Manitoba is a made-in-Manitoba approach that builds on some of the practices. There's a model called PRIDE, for example. There's another model in British–what's the other one, Safe, and what they have decided in Manitoba as a result of, I think, a new era of mutual respect, is a made-in-Manitoba model that is near conclusion and ready for being piloted. So this new emphasis on the role and value of fostering is a big part of what was intended with that bullet in that piece.

The other is the training that is ongoing and, of course, the standards, but there, as well, I think, as a result of this, has to be a renewed emphasis on engaging foster parents in the creation of plans, and as well, recognizing the grief that foster parents endure, not only when there is tragedy but when a child leaves the home. It's my view that that has been underestimated. The Children's Advocate, I think, has helped me to understand some of that, but I have heard from foster parents. I know some in my own neighbourhood. I know some that have come to my office as a result of challenges, some that the member knows about. I think that we have a lot of growth to do, and it's not just here, I understand. I understand that this is a challenge elsewhere, as well, where we have professional views of child welfare workers that sometimes don't respect, to the extent, I think, should be taken of the views and insights of the foster parents themselves.

So we now, as well, have foster parents being invited and taking part in the training that workers have been involved in. So those are some examples, and if the member has other ideas–I know I've had some correspondence from her that I think are some examples of the need to enhance those dynamics. But I'm bound and determined to do what is necessary to breathe new life into this respectful relationship that I'm beginning to see unfold now as a result of these changes. I look forward to the conclusion of the new fostering curriculum, and I think that empowering foster parents, as well, in how the system works. They have to have better information on aspects of it, whether it's, you know, like the rules of the system, and that is as well part of it. It's not only changing attitudes on the part of child welfare workers but empowering and helping to provide accessible information for foster parents.

So we'll be continuing to work on those kinds of initiatives, and there are some other initiatives that we have been noodling with that I would like to see develop. But if the member has other information on this one–I know she has a relationship with some foster parents in her community, and I think some of the best ideas come from the foster parents themselves when they get into difficult situations and disagreements about what may be the best interest of a child. Sometimes, there are hard decisions that do have to be made in the end and, often, it's the courts that actually make those decisions. I think we're starting to see the courts, as well, better respect the views of all the parties. I think even recently, I've seen the development of different approaches to reconciling differing views and more recently even the role of mediation, perhaps, was one I'm advised of that is current now that has been a challenging case for family and for others, so maybe when things are really difficult there are ways to remediate it by way of ways that we haven't thought of before. But I think the member has a very important issue. When we recruit this number of foster families, they have to know that they are going to be valued members of a team. I think historically we haven't done the job that's necessary, and that's why that bullet was there which has ushered in these changes that I've talked about, but there may be other ways as well.

Mrs. Mitchelson: That bullet was there three years ago, and we're still seeing significant problems. It's not just in my community, and I know the minister's heard of others, but there are others that I'm working with out in the community that have really felt that they're not recognized and appreciated within the child welfare system the way they should be, and that nothing is provided in writing to foster families. It's verbal, and it's fairly widespread, and I think it's an issue that needs to be looked at and addressed. I do know and I've got lots of issues, but I want to stick to one theme. I've got lots of issues around the recommendations from the reviews that have been done.

There was one recommendation, and you probably have heard it from me in correspondence or seen it in correspondence, and that is the recommendation of the 47 and the Gage Guimond report that indicates that foster families should have something in writing regarding the plan, that there should be an assessment of the circumstances surrounding the placement of children, that there should be a thorough assessment, including that child's relationship and bonding with the foster family that they're in and that that should be provided in writing. I know I asked the minister a question, I think it was back in December, and I know I didn't get an answer to the question. So I'm asking him here now whether he has moved in any way on that recommendation from the Gage Guimond report.

Mr. Mackintosh: I agree with the member that plain language information on processes for foster parents are critical, and that's why the curriculum which is being in large part designed by foster parents themselves is going to–the attention is to address that.

In terms of the situation that the member raised, I'm advised that there are some unique issues with regard to that placement. As we recall here, I understood that there was an agreement of a temporary placement of those children where that had been set out early on with a reunification objective, and then there was an involvement of the courts, I think, as well which played a role here. But I don't dispute that the recommendation is an important one, and that's why we accept that that should be in writing.

***** (16:20)

Mrs. Mitchelson: I did ask a question in question period, too, about foster family rates and a freeze on foster family rates. I think the minister indicated in his answer that there was no freeze and that foster family rates had been increased, and I heard him say that, I think, in his opening statement, again.

It is my understanding that, through the AJI initiative, that special rates were frozen for foster families, and that was back in, well, 2003-2004, possibly, and that those rates haven't changed. They are still frozen.

Will the minister confirm that or can he confirm that today?

Mr. Mackintosh: Yes, I think there may be some confusion on the rates here. The foster care rates increased; I think the real increase is about 23 percent when you compound it. I think there were two increases of 10 percent over two years, effective January 1, '07-08.

That was across the province, and if I recall, too, the member was talking about Anishinaabe Child and Family. That would affect Anishinaabe Child and Family.

There's been no freezing of any foster rates, to my understanding, Anishinaabe–it's across the board–and basic rates are always under review, and, as well, special-needs funding has increased.

The member now is talking about what is called the Winnipeg special rate, and it's my understanding that there was an arrangement entered into because the Winnipeg rate was disproportionately higher than the provincial rate. So, in other words, there was some top-up or some additional funding available at Winnipeg Child and Family that exceeded that anywhere else in the province. So that's what the member must be talking about now.

The other thing that happened, then, we had the external reviews take place, and one of the recommendations in the Changes for Children initiative was to ensure that there was a consistent foster rate across the province, that there were too many inconsistencies.

So, now that Winnipeg's special rate–which, by the way, has seen increases in expenditure. There was no freeze in the sense of there were exceptions. There are exceptions to that you can apply for. I think there's three of them. We can provide those to the member. But that is now under review to determine if that should be adjusted or not beyond what is in place today, but the member shouldn't confuse the foster rates and the Winnipeg special rate.

The review of the Winnipeg special rate is being launched this fiscal year.

Mrs. Mitchelson: But the minister kind of talked around, and I think talked around in circles, and I'm not sure he gave me a straight answer.

Can I ask a very basic question? I'll try to keep my questions very simple. The foster rates are standard at the basic rate, level 1, across the province today?

Mr. Mackintosh: Yes.

Mrs. Mitchelson: What is that basic foster rate?

***** (16:30)

Mr. Mackintosh: The foster care rates in effect, I'm advised, are–and this does not include what's called an agency allowance, which can be for gifts and other recreation. In the south, ages zero to 10, it's $21.57 per day. For ages 11 to 17 in the south, it's $26.78. For the north, ages zero to 10, it's $23.02, and in the north for ages 11 to 17 it's $28.57.

Mrs. Mitchelson: Now, can the minister explain to me what the special rate is for children? That's the rate that's been frozen.

Maybe if I could just read from the Auditor General's report on pre-devolution. The Auditor General says that the department wrote a letter in November, 2004, that stated the freeze of special rates in foster care at Winnipeg, rural and northern CFS is an issue connected with the AJI. As such, discussions have been held. No final decision has been made regarding exactly how or when the freeze will be lifted. That's out of the Auditor General's report in 2004.

I have heard today, and I believe the Foster Family Association has confirmed, that freeze is still in place. I would like to know what freeze we are talking about.

Mr. Mackintosh: In addition to the foster care rate and the numbers that I provided, there's an agency allowance that's available, that's for recreation and special gifts. Also, special needs is recognized for compensation or for clinical services, respite and then–

Mrs. Mitchelson: Before we move on, would that be–we're talking about respite or are we talking about child care and all of those things? Would that all be included in special needs, if there was a need for, you know, sort of one-on-one in a child-care facility? Is that part of the special needs? We're getting to the special rate. I just wanted some clarification around special needs.

Mr. Mackintosh: So in addition to the basic rate then, we're looking at possible remuneration. Basic rate, the agency allowance, then the special needs, which is really about compensating for costs and then special rate that agencies can negotiate with guidelines with foster families. That really is about a compensation for families for exceptional circumstances and needs.

***** (16:40)

When a child comes into care an allocation can be negotiated. In addition to what I've said, there are three exceptions for special rate amounts. Also, that if there are exceptional needs that are not getting recognized by way of special rate, case-by-case consideration is made by the branch on an application. So those, I'm advised, are the different kinds of forms of remuneration available for foster families.

Mrs. Mitchelson: So you're saying that the special rate has guidelines. Is special rate available to all agencies?

Mr. Mackintosh: I'm advised that that's the case.

Mrs. Mitchelson: Now, that special rate then, it's negotiated with guidelines. Do we have a copy of the guidelines?

Mr. Mackintosh: I'm advised that agencies have these guidelines, and we don't have them available here, but one of the problems that has been identified by the external reviews and by the department is the discrepancies between the guidelines across the agencies. That's why we have to move to a standardized approach, but we can get a compilation of those guidelines and provide them to the member.

Mrs. Mitchelson: How many children across the system would be getting a special rate?

Mr. Mackintosh: We can get that information for the member.

Mrs. Mitchelson: Thank you. Could I get a breakdown agency by agency and the cost for the last fiscal year?

Mr. Mackintosh: The cost of the special rate? The expenditure per agency?

Mrs. Mitchelson: I guess what I would like is a breakdown. I think there was a breakdown in the annual report of level 1 funding and then level 2 to 5 funding. There is that breakdown there already, but it doesn't break down.

I guess, is a special rate included in level 2 to 5 or is it over and above?

Mr. Mackintosh: Twelve could be in each one, each level.

Mrs. Mitchelson: So, if we're looking at level 2 to 5 funding, is the special need funding all inclusive in that and the special rate for children?

Mr. Mackintosh: The department advises that they will make best efforts to separate out that from special needs and we'll let the member know of the result of that.

Mrs. Mitchelson: So then the minister is indicating to me–will he confirm today that the special rate has been frozen in Winnipeg, rural, and northern CFS since the AJI initiative was undertaken?

Mr. Mackintosh: As I said earlier, I'm advised that the special rate need in Winnipeg was out of whack with the rates elsewhere, the expenditures. So there was a decision made, apparently, that with regard to Winnipeg there would be no ad hoc increases for family compensation but adjustments are available according to three exceptions and as well if the needs of the child changed. That was for Winnipeg.

Mrs. Mitchelson: So is the minister telling me that if a child remains in that same foster home and the needs of that child change, there is an adjustment and there is no freeze?

Mr. Mackintosh: Well, a couple of points there. When a child comes into the child welfare system, there is a negotiation with the family to recognize needs first of all. There are three exceptions, and as well where needs change, there can be an application to the Child Protection branch.

As well, the big picture here is that in accordance with the Changes for Children recommendation, on this one there is a review being launched so that there can be some more consistent approach across the province for a special rate because Winnipeg was out of whack.

***** (16:50)

Mrs. Mitchelson: I wouldn't be raising this issue if it hadn't come to my attention from foster parents that are hearing that there are other children that are getting special rates significantly higher than their special rates. It has become an issue. A lot of them are long-time foster families that have been providing, obviously, pretty adequate care or the children wouldn't remain in those foster families. So there is some concern that new foster families that are coming into the system are getting different treatment and that their rates have been frozen since 2004.

It's my understanding that this is a Treasury Board directive. There has been reference made in conversations that I've had that it's a Treasury Board directive that this should happen, and there seems to be some inconsistency and unfairness. Now, I heard the minister say that there might have been unfairness in the past, and that's why the rates were frozen. But it appears to have tipped the other way now. So I know that these comments will be on the record for those to see that have felt that there's an issue. So, hopefully, the minister can indicate to me whether there has been an application by the department to lift the freeze, and whether that's been stalled somewhere outside of the department.

Mr. Mackintosh: We thought it advisable that, given the discrepancies of the past and discrepancies that continue, and recognizing that we have to have a more consistent approach, the current approach is going to be maintained until the review is completed and then we can make an application for any adjustments to Treasury people; but that has to be preceded though by that analysis. But, in the meantime, the rates, the basic rates, we've seen historic adjustments now getting back to levels, and I think we're now finally getting back to–*[interjection]* Yes, so there are enhancements to recognize the importance of foster care across the board as a result of the foster rate adjustments.

Mrs. Mitchelson: When can we anticipate that review being completed? How long has it been ongoing?

Mr. Mackintosh: There are two components to that. One first is our review and I should say too, that there's been an analysis of what is taking place, how rates are being dealt with in other provinces and their systems. We've also had an analysis of American rates, which, by the way, place us very favourably and, in fact, very, very favourably. But drilling down in terms of a special rate that analysis has begun now. There will be necessary discussions with the federal government for on-reserve amounts as well so that we can marry the two rates. It's expected that over the next year or so that we can get this completed, and it could be ongoing discussions with our partners as this unfolds with the Foster Family Network, for example.

Mrs. Mitchelson: Are the amounts in the Estimates book purely provincial government support, or is it a combination of provincial and federal government support in the detailed Estimates?

Mr. Mackintosh: That just comprises provincial dollars.

Mrs. Mitchelson: I know we haven't got too much time left today, so I'll try to just ask a very quick question for some clarification. Under the southern authority, we have Animikii Ozoson child and family services–maybe I could just say Animikii. What's the mandate of this agency?

Mr. Mackintosh: Animikii, mandated by the southern authority–the client group served, I believe was the question from the member: First Nations children and families in the Winnipeg area who are members of Ontario First Nations. It doesn't provide direct service to any of the Ontario First Nations communities, but instead provides statutory services in a culturally appropriate manner. I think that answers the question.

Mrs. Mitchelson: So these are children from Ontario that are here in Winnipeg receiving support or services through the Child and Family Services system.

Mr. Mackintosh: Just to clarify, the group served is First Nations families who are resident in the Winnipeg area.

Madam Chairperson: The time being 5 o'clock, I am interrupting proceedings. The Committee of Supply will resume sitting tomorrow at 10 a.m. Thank you.

LABOUR AND IMMIGRATION

***** (14:40)

Mr. Chairperson (Rob Altemeyer): Will the Committee of Supply please come to order. This section of the Committee of Supply will now consider the Estimates of the Department of Labour and Immigration.

Does the honourable minister have an opening statement?

Hon. Nancy Allan (Minister of Labour and Immigration): Thank you very much. I'd like to take this opportunity to just say a few words about what an honour and a privilege it is to be the Minister of Labour and Immigration, and Multiculturalism. I believe that we have a pretty awesome department and an incredible team of people that really do a lot of work in this province in regard to providing a better place to work and live and enjoy this great province that we live in.

The highlights of our 2009-2010 budget, the total request is $51,379,000 and the total increase over last year's Adjusted Vote is 2.9 percent, which is 1.457 k's–I'm doing that because it's easier–so there is a pretty big increase in the transfer of federal funding from CIC, which is Citizenship, Immigration and Immigration Canada. Obviously, that is funding that is in our enabling vote, and that is funding to help us provide programs and services to settle our newest newcomers. There is a 62.8 increase there.

There is also a 293,000 increase, or 18.9 percent of the total increase reflects an increase in the amount that is going into Workplace Safety and Health for our new workplace safety and health officers. We have a net increase this year of 11 full-time equivalent positions: five of those positions will be used to help us with our workplace injury and illness prevention plan; three of those positions, those FTEs, are for the Employment Standards division; and two of those FTEs are for the Immigration division and that will help us implement the new legislation, WRAPA, The Worker Recruitment and Protection Act, which was proclaimed April 1, 2009; and one FTE is going to be used for ITS, it's a business analyst to provide additional information technology support for the immigration initiatives and other departmental programs.

I'm going to keep my comments short because I believe that it's a good opportunity to have lots of time to have question and answers from my critics, and both of them are here today, so I'd like to proceed.

Mr. Chairperson: We thank the minister very much for those comments.

Does the official opposition critic have an opening statement?

Mrs. Mavis Taillieu (Morris): Mr. Chair, I don't really have an opening statement. I have a lot of questions, so I think we'll probably have some dialogue as we go along, but I would just like to thank the staff that are here today and look forward to getting on to some questions.

Mr. Chairperson: We thank the honourable Member for Morris (Mrs. Taillieu) for that.

Under Manitoba practice, debate on the minister's salary is the last item considered for the department of Committee of Supply. Accordingly, we shall now defer consideration of line item 11.1.(a) contained in Resolution 11.1.

At this time we'll also invite the minister's staff to join us at the front table and once they're settled perhaps the minister could introduce the staff in attendance.

Ms. Allan: Thank you very much. I'd like to introduce the officials that are with me from the department. I'd like to introduce: Jeff Parr, the deputy minister of Labour and Immigration; and to his left is Ben Rempel, the assistant deputy minister of our Immigration branch; across the table from Jeff is Victor Minenko, who is the director of research, legislation and policy; and Ken Taylor, who is the director of financial services. We also have with us today: Melissa Whiteside, who is a senior analyst; and Sara Obaid, who is the executive assistant to the deputy minister; and Rebecca Blaikie, who is the assistant to the minister.

Mr. Chairperson: Thank you very much for that, minister.

A question for the committee, do you wish to proceed today through the Estimates of this department chronologically, or to have a global discussion?

Mrs. Taillieu: Mr. Chair, I will likely go through in a global fashion, if that's acceptable. I probably will refer to the Estimates book on certain pages as we go along. I'd like to get through a lot of questions, so I may jump over things today and come back to them tomorrow, if that's acceptable.

Ms. Allan: Agreed.

Mr. Chairperson: Okay. For the record, it is agreed that questioning for this department will proceed in a global manner, with all resolutions to be passed once questioning has concluded.

The floor is now open for questions.

Mrs. Taillieu: I think, in the minister's statement, she did indicate that there were some increases in her department, and indicated the funding and the positions–I may just start with some of the positions, though, just in reference to the org chart. I think that this year is fairly–it's spelled out who the directors of these departments are, so that's fine.

I'm wondering if there's a list of–if the minister can give me a list of the political staff that she has within her office.

Ms. Allan: In the Legislative Building there was one political person, and that is Rebecca Blaikie, who is the special assistant to the minister. In my constituency office there is Brenda Reeve-Deamal, who is my executive assistant, and then there's another staffperson, Jackie, who works with Brenda.

Mrs. Taillieu: In the constituency office, are those political? Is one of those a political staffer?

Ms. Allan: Well, I don't think they're political. They're just staffpeople that work in the constituency office and provide services to my constituents.

Mrs. Taillieu: Would those staff in the constituency office be then paid by member's allowance or paid by the Department of Labour?

Ms. Allan: They're paid through the LAMC budget. That's my understanding. That's what all political staff–or all staff in MLA's constituency offices are paid through that budget.

Mrs. Taillieu: Mr. Chair, the minister indicated that there was an increase in the number of staff. I'm just wanting to clarify if any of these staff–are they employed within her office or are they employed in–I think she said there was one other person. I wasn't quite sure where she said that person was employed. There was some in Workplace Safety and Health, some in Employment Standards.

Ms. Allan: All of them are employed in the department. The five that are employed in Workplace Safety and Health are individuals that we have hired as workplace safety and health officers to help us get our injury rates down. Then, in the Employment Standards branch we have hired three new people to help us roll out enforcement around the WRAP legislation. Also, we have two new people in our Immigration branch who are also helping out with that. Then, the one person you probably might be referring to is one person for computer program analyst to perform business analysis to address immigration initiatives. That individual is in the Immigration branch.

Mrs. Taillieu: Can the minister tell me how many new hires there have been in this last fiscal year?

Ms. Allan: Fourteen–oh, tab 14, oh sorry. Excusez-moi. *[Interjection]* That's better. I didn't think that was very many. That was pretty funny. Where do you see it? Okay. Got it.

That would be 45.

Mrs. Taillieu: Is that a net gain or how many people have left the department?

Ms. Allan: I'm going to ask my officials to figure that out, because they are going to have to look at the staff turnover that was involved in that. If we could go on–if you wouldn't mind with questions and then they'll kind of try to figure that out–the exact number for you.

Mrs. Taillieu: Of the 45 new hires in the last year, how many of these would have been through competition, or how many would have been appointed?

Ms. Allan: Of the 45 hires, 29 were hired through competition. Seven were hired by direct appointment and nine were hired under our employment equity initiatives. The direct appointments were for difficult to recruit positions or short-term positions.

Mrs. Taillieu: Could the minister elaborate on what that exactly means–short-term positions or difficult to fill positions, and where are these positions located?

Ms. Allan: In one department we hired two short-term appointments, actually, a business analyst and a policy analyst. Those two individuals were Kurtis Penner and Andrew Donachuk. In the Manitoba Labour Board we hired two short-term appointments to cover unexpected retirements. There were two administrative secretaries, Annalina Rosit and Monique Racine. In Workplace Safety and Health, we hired a short-term appointment, Jeffrey McCulloch. In the office of the Manitoba Fire– *[interjection]*–Manitoba Fairness Commissioner, a new acronym that I'm not used to yet, is Robert Millman, and it was a short-term appointment.

Mrs. Taillieu: So of those appointments, then, they were short term so they're not presently on staff?

Ms. Allan: They are still on staff.

Mrs. Taillieu: Can the minister indicate, then, what term they were hired for and if they've extended past the term that they were hired for?

Ms. Allan: We'll get that information to the member.

Mrs. Taillieu: I just want to clarify. You indicated seven that were difficult positions to fill by appointment and then you said nine. I just want to clarify what that nine were and whether you had covered those in the people that you mentioned.

Ms. Allan: Nine positions were hired under our employment equity initiative; it's the civil service Gateway program, which encourages people–the Gateway program is a civil service program that encourages people that are already bureaucrats in departments to come on programs to learn senior management. So it's a program where the Civil Service Commission runs competitions for visible minorities ,and then they hire them and they provide them to different departments so that they can get experience.

***** (14:50)

Mrs. Taillieu: It's unclear to me. There were nine people that the minister said were by appointment into the employee equity program. Then she said they were hired by the Civil Service and appointed to different departments for experience. So is this a training program, or are these people hired for a specific job, or is it a training program? Specifically, is there an individual that is in charge of who would hire them?

Ms. Allan: It's a program that is run through the Civil Service Commission, and what they do is they have lists of people, and they interview people, and they put them on a list. Then, if we're looking for certain skilled individuals, we can actually go to the Civil Service Commission and say this is what we're looking for; do you have anyone within the civil service that you have hired in the Gateway program? It helps us create a diverse government when we have more of those individuals that represent the communities that we serve.

Mrs. Taillieu: Where would I find a description of the Gateway program in the Estimates book?

Ms. Allan: In the Civil Service Commission, but it's probably on the Civil Service Commission Web site, as well. We can provide you with that information if you'd like.

Mrs. Taillieu: Yes, thank you. If you could provide that information, it'd be great.

I'm still–

Ms. Allan: I can go back to that again. So, 45 hires, 29 through competition, seven were hired by direct appointment, and those are those ones that I talked to you about in regard to short-term appointments, and then the nine individuals that we hired through the Gateway program where we went, okay, so we've got a retirement, we've got someone who's left, we need somebody in our department to be, you know, let's go to the Civil Service Commission; let's see if they've got someone there because we feel it's important in our department to reflect diversity.

So we did those nine hirings through the Civil Service Commission.

Mrs. Taillieu: Of the seven direct appointments, who hired those seven people?

Ms. Allan: The business analyst and policy analyst in–is the Management Services division which is the IT shop. So the person who was in charge of the IT shop would have hired them.

The Manitoba Labour Board is an arms length adjudicative labour board. So somebody in the labour board would have hired the two administrative secretaries.

The Workplace Safety and Health department, it would have been somebody in the Workplace Safety and Health department, probably our assistant deputy minister, Don Hurst or Jo-Anna Guerra.

The office of the Manitoba Fairness Commissioner, it probably would have been Ximena Munoz.

Then the one other position or appointment that was hired is Rebecca Blaikie, my special assistant.

Mrs. Taillieu: Just to clarify, then, those seven people are still on staff on a temporary basis, or are they hired into full time now?

Ms. Allan: We said we would get you that information. We'll do that for you.

Mrs. Taillieu: Can the minister indicate, of the last fiscal year, people that were appointed at that time, how many of those people are now employed full time? When they were appointed for a temporary or part-time position, how many of those actually gained full-time employment?

Ms. Allan: So you're not asking for the people that I just listed in the '09-2010 year if you want those individuals from the '08-09 year?

Mrs. Taillieu: Mr. Chair, I'm basically asking of last year's Estimates when–how many people would have been appointed on a short-term, temporary or difficult-to-fill position? And then, of those, how many of those would then have gained full-time employment and would still be on staff?

Ms. Allan: We'll get that information for you. This is '08-09 information that I'm giving you because that's the most recent hirings that we have. So we would have to pull the '07-08 information to have a look at that.

Mrs. Taillieu: Are there any positions that are vacant in the Department of Labour at the present time?

Ms. Allan: Mr. Chairperson, 18.3.

Mrs. Taillieu: Eighteen point three vacancies. That's a lot, isn't it? Where are those vacancies? In what specific areas are those vacancies?

Ms. Allan: In the Management Services Division, there is a half-time position which is a revenue clerk. In the Mechanical and Engineering, there is a gas inspector and a boiler inspector and the competitions are under way for the boiler inspector. The gas inspector will be filled by the fall. At the Manitoba Labour Board, there is a labour board position, labour board officer that is vacant. In the Workplace Safety and Health office, division, excuse me, there is a senior safety and health officer in Winnipeg and a mines inspector in Flin Flon. Both of those positions will be filled by September.

In the Employment Standards division, there is a 0.8 admin secretary position that was hired into another position so we will be looking at that position in the future. The administrative assistant position as well, we're going to fill that one by the fall. The Worker Advisor Office, a worker advisor position. Immigration, there are three program officers that are actually–one is working in an

Employment Standards position right now because he went over to the Employment Standards to help with the management training position. There's a PM3 program officer and he or she is actually currently acting in a different position right now. Then another program officer that is also currently acting in a different position. All three of those program officers, we're moving to competition right now.

Then the management of settlement support services, that's Ximena Munoz's position probably. Ximena went to the Fair Practices Office, so we're in the beginning of moving to filling that position. Then there are five other positions that are going to competition, a policy analyst, three program officers, a program co-ordinator and an admin assistant that are also going to competition as we speak.

***** (15:00)

Mr. Kevin Lamoureux (Inkster): I appreciate the answers from the minister, listening to the Member for Morris (Mrs. Taillieu). I did have a couple of very specific questions. One of the things I do respect is that as the minister you do have special assistants, executive assistants, and so forth, and you will have a direct hire. No doubt you would play a role, a personal role, in the individual that you choose. I guess I just look for the minister to provide comment on the other seven that the Member for Morris makes reference to. There's always this concern the public has in terms of ensuring that there's equal opportunity for people that are looking for employment or even from within the union, that they're not going to be overlooked because someone's going to be assigned a position.

What is done, not with respect to the minister's appointment, but to ensure that those other appointments are not short-circuiting or preventing the civil service from being able to hire into these full-time or even short-term spots? What can the minister just tell us just to give us assurance that these are done in an appropriate fashion?

Ms. Allan: Each one of these positions we've referred to in regard to the short-term hire, usually what happened was we didn't have a lot of lead time in regard to the fact that the position was going to be vacated, so what we did was, because we needed to fill them in a hurry, we would put a person, an individual, in that position. Then what would happen is we would, once we had everything lined up and the position was going to competition, they would be invited to apply.

So they could apply for the position just like anyone else can, but it goes to an open competition which is in line with all of the civil service guidelines in the Civil Service Commission, and the individual in the position could apply for it just like anyone else could in the civil service.

Mr. Lamoureux: Again, I'm not trying to imply anything in regard to that. I just want to highlight what I believe is a very important principle, and that is that, generally speaking, when we're hiring, it should be done through teams as opposed to an individual per se, and we should be going through the civil service. Whenever you hear, as the Member for Morris was able to pull out this afternoon, a large number, it does raise some concerns. I think we want to minimize that. So I just wanted to get on the record as saying that.

The question I had for the minister is, when did she hire Ms. Blaikie?

Ms. Allan: I beg to differ with the MLA for Inkster but I don't believe, out of 325 staff, that seven direct appointments, and one of them is political, is a lot of people. I think six direct appointments out of 325 people in a department is not an outrageous amount.

Every one of these people, every one of these positions, are short-term appointments and they're going to go to full competition. With those individuals that are in those spots, they will be allowed to apply for the position, but there is no guarantee they will get the position.

The special assistant that was hired in the minister's office was hired in my office last August after Sharon McLaughlin went to Ottawa.

Mr. Lamoureux: I guess I had misheard. I thought it was only 45 people that were actually hired this year, not 325.

Ms. Allan: We were talking about direct appointments and there were 45 hires; 29 of them were hired through competition, directly went to competition, and seven were hired by direct appointment. Of those seven, one was my special assistant. So there were only six people out of 325 staffpeople in my department that were hired by direct appointment. I read out every one of their names and read out every one of their positions in every place in my department, so you can check the *Hansard* and you'll have that information.

Mr. Lamoureux: But what we're referring to, and I don't want to spend much time on it, was the 45 people in the last year, and seven out of 45 is a significant percentage.

Ms. Allan: I have no comment.

Mr. Lamoureux: The last question is that I understand that the minister did employ–or I was told–did she employ at one point Niki Ashton as a special assistant or employed in some capacity? I don't know.

Ms. Allan: No.

Mrs. Taillieu: Can the minister indicate if there are any staff within the department that have been seconded to another department at the present time?

Ms. Allan: Sixteen–oh, sorry, tab 16. I did it again. You've got to say tab in front of those. Tab 16 everybody, tab 16. Oh, two.

Mrs. Taillieu: And these two people, where have they been seconded? What departments have they been seconded to and who are they and when were they seconded?

Ms. Allan: Sue Barnsley, who was with the Status of Women branch, was seconded to Family Services and Housing, and Betty Brand, who was a policy analyst, was seconded to Seniors and Healthy Aging. That was probably–Betty Brand was in the last couple of weeks and Sue Barnsley was about two years ago, approximately.

Mrs. Taillieu: Does the Department of Labour and Immigration have staff on staff right now that have been seconded from other departments?

Ms. Allan: Judy Fraser, who is the Youth Prevention Education co-ordinator, and she was seconded from the WCB; she's with Workplace Safety and Health. And then three staff in the Immigration branch: one is Pam McConnell, a program co-ordinator; Denise Hanning, director of–oh they've all expired and gone home. Oh, well then, so just got two.

Mrs. Taillieu: The person that's the youth prevention co-ordinator seconded from the WCB, is that person then paid for by WCB or Department of Labour?

Ms. Allan: Well, the individual is in the Workplace Safety and Health branch. As the member knows, monies are transferred from WCB to my department, but we pay for it.

Mrs. Taillieu: What are the duties of that person?

***** (15:10)

Ms. Allan: It's all about getting awareness and programs into the schools with young people, and she co-ordinates a lot of those programs. She works with schools, and she does some programming as well with Red River College.

Mrs. Taillieu: Just a bit more clarification on what she does in the schools. What is the curriculum? What's the mandate here? What exactly, I guess, is the mandate of this person?

Ms. Allan: Well, we know that we have a serious challenge in regard to young people and getting the message out to young people that we have to reduce injuries. So we have really had a concerted effort in regard to trying to develop programs, so that we can get the message out to young people that they have the right, for instance, to refuse unsafe work.

It's important for young people to understand that there are Workplace Safety and Health regs that were approved 18 months ago, that they need knowledge about those. Sometimes they move from employer to employer, and they're not always in a work environment where the employer is providing them with that knowledge in regard to exactly what their rights are.

If you would like her exact job description, we'd be more than happy to provide it to the MLA.

Mrs. Taillieu: Thank you very much. That would be helpful.

I'm just curious, though, the minister mentioned that she talked about the Workplace Safety regs, regulations, and, I guess, legislation and regulations, so I'm wondering if the message that this person is taking into the schools bears any political pamphlets, any political signage or any political message.

Ms. Allan: No, we actually worked with the Department of Education, with the curriculum folks, and we developed some curriculum materials that were age-appropriate for the schools and the age groups that she was going into. So it's certainly not political. It's curriculum-based and has gone through a pedagogical process.

Mrs. Taillieu: I'm just curious as to what particular class in school would be teaching workplace safety?

Ms. Allan: The health and life skills classes.

Mrs. Taillieu: Is this a program that is accepted into all the schools?

Ms. Allan: Teachers make the decision in regard to what they want to teach in those particular classes, and then we provide the resources to the teachers.

Mrs. Taillieu: I wonder if the minister could indicate what the resources are. Perhaps there's a package of information that we might be able to see?

Ms. Allan: Yes, we could put some information together.

Mrs. Taillieu: Thank you. How does this overlap, then, with SAFE Workers of Tomorrow? Are they not doing the same thing?

Ms. Allan: They are independent from–well, we fund them, and they do work in schools as well. We fund them directly, and the deputy minister meets with them on a regular basis to get information from them about what they're doing with schools and the programming that they're providing. But we believe that it complements what this individual is doing in our department.

Mrs. Taillieu: So am I to understand, then, that the department funds the SAFE Workers of Tomorrow to deliver messages into the school about safe work, and there's also another person that delivers the same message, or is it different messages?

Ms. Allan: It's two target audiences. The individual in our department that is providing the curriculum resource materials is working directly with the teachers who are providing the materials and developing the classroom materials and teaching students. The work that is done by SAFE Workers of Tomorrow is that they provide speakers to schools.

Mrs. Taillieu: The SAFE Workers of Tomorrow, they provide speakers. Are these speakers a mix of employer-employee, or are they of a–belong to a specific group, or how do you choose who the speakers are?

Ms. Allan: Well, we don't choose them. The SAFE Workers of Tomorrow chooses them. But I do know that one of them that is a very high profile speaker is Cindy Skanderberg, who lost her 19-year-old son when he was an electrician, working unsupervised and untrained, before we changed The Electricians' Licence Act and helpers were allowed to work on job sites. She also has speakers–I know that I've met one of them this year at the Leaders' Walk, who is a young man who was injured severely, burned on the job, who goes in and makes speeches to young people in schools. I think these are the kinds of speakers that can really make an impact in regard to talking to young people about making sure that they work in safe environments.

Mrs. Taillieu: Just for clarification, then, the Department of Labour funds the SAFE Workers of Tomorrow.

Ms. Allan: Yes, we provide a grant to SAFE Workers of Tomorrow. Yes. We have for years.

Mrs. Taillieu: Where are these SAFE Workers of Tomorrow offices located?

Ms. Allan: They are housed in the Manitoba Safety Council.

Mrs. Taillieu: And where is the Manitoba Safety Council?

Ms. Allan: I don't know. I think the address is probably in the phone book.

Mrs. Taillieu: Well, I just was, with interest, reading this publication called *Union*, and it says, SAFE Workers of Tomorrow moved to the main floor of the training centre on April 1. The training centre would be the training centre on Portage Avenue, the union centre?

Ms. Allan: Well, it may be. Is that the United Food & Commercial Workers magazine? Could be. Actually, a lot of the construction industry has also got programs that go into schools as well. The Winnipeg Construction Association that Ron Hambly is the director of, they have a very advanced program where they go into schools, as well, and talk to young people about keeping safe on the job. They're very involved in this as well. So I think this is a real priority area for those individuals that are interested in making sure that our young people stay safe at work, especially when we have so many people that are going to be going into our apprenticeship programs.

***** (15:20)

Mrs. Taillieu: Can the minister indicate, then, that the SAFE Workers of Tomorrow has just moved into the union training centre on Portage Avenue?

Ms. Allan: I don't know. I have no idea where they moved. We can certainly check that out and get back to you on that. It doesn't worry me where they're housed.

Mrs. Taillieu: Well, I guess the point would be, if the department is funding the SAFE Workers of Tomorrow and the SAFE Workers of Tomorrow have moved into the Union Centre and are paying rent to the Union Centre, then the department is actually paying the rent, and that might be quite a convenient arrangement.

I'm wondering where they were before. Do you know where they moved from?

Ms. Allan: We told you that we thought they were in the Manitoba Safety Council. We said we would check it out, but I don't think it's a big deal who they pay their rent to. I think this is everybody's responsibility in regard to getting injury rates down.

Our government gives money to employers too. We don't just give money to organizations that are interested in giving money to unions. This particular issue is everybody's responsibility, and, quite frankly, it doesn't matter to me who they pay their rent to.

Mrs. Taillieu: If the minister is going to provide me with the last location of the SAFE Workers of Tomorrow and the present location, perhaps she could at the same time provide me with the rent that was paid at the previous location and the rent that's paid at this location.

Ms. Allan: We don't have that information in our department about where the SAFE Workers of Tomorrow pays their rent, so if the MLA for Morris would like to know that, I would suggest she get in touch with Ellen Oldford and ask her who she pays her rent to.

Mrs. Taillieu: I'd just like to ask some questions in regard to Workplace Safety and Health. I'm looking on page 37 in the Estimates book. I'm just looking at where it says: Reducing the time-loss injury rate to 3.5 percent per 100 workers by the year 2012, and so on, and further to that: Continue to implement the joint 2008-2012 injury and illness prevention strategy with the Workers Compensation Board.

I'm wondering if the minister can indicate if she is considering any further expansion of coverage under WCB.

Ms. Allan: When we announced the expansion of coverage, we had good meetings with the employer stakeholders, and we said that what we would do is roll out a voluntary campaign. We had planned to roll out a voluntary campaign in consultation with employers, but what we did when there was a downturn in the economy was we decided to hold off on that campaign for some time until the economy bounced back.

So at this time there are no plans to expand coverage. The only plans I believe that we have is to roll out a voluntary campaign.

Mrs. Taillieu: I believe that that was the mandate originally, is to have a voluntary campaign before actually doing the expansion of coverage. I'm just curious–to my recollection, I didn't see much of a voluntary campaign rolled out from the WCB.

So I'm wondering if the minister can indicate when this voluntary campaign is coming, and what is the plan to do this voluntary campaign?

Ms. Allan: Well, it won't be my campaign; it will be the WCB's. So that is something that the WCB will determine. There's a tripartite board of directors that have employers–three employers, three special interest reps, and three labour reps. It will be them that will decide what that campaign looks like. I will bring to committee tomorrow the letter from Shannon Martin that I received from the head of the CFIB that congratulated me, as minister, and our government, in regard to how we proceeded with the expansion and coverage.

Mrs. Taillieu: I know that the expansion that was planned, Shannon Martin felt very good about it because the minister didn't go as far as she intended to go with that expansion of coverage. She had to pull back on that because the surveys done and sent into the WCB did not indicate that there was a large appetite for that to happen. So, even though she could have forced that expansion to go further, she didn't, and that is what Shannon was saying was a good thing.

I just wanted to also ask about the safety and health officers. Now I notice in the book here it says: hire five new safety and health officers as part of the 20 new FTEs announced on 2007. So, just to clarify then, there were 20 FTEs announced in April of 2007.

Are all of these new 20 people hired, or are we still not there yet?

Ms. Allan: We made a commitment that we would hire 20 new Workplace, Safety and Health officers; we made that commitment during the election campaign in 2007. We hired 10 last year and we're going to be hiring five this year.

Mrs. Taillieu: So of the election commitment of 20, two years later we have 10 with a commitment to go ahead with five more. Do we have those five more now then?

Ms. Allan: The first year after the election–because the promise was made in '07, but the budget year that you would be allowed to hire new staff in would be the '08-09 budget year. So that budget year, the first budget year after the election campaign, we hired 10. This is the second budget year, and we're hiring five more.

Mrs. Taillieu: Are the number of inspections, then, of the Workplace, Safety and Health people–are the number of inspections increased?

Ms. Allan: Yes. They've tripled.

Mrs. Taillieu: So the number of inspections has tripled. Does that mean that there are three times the number of workplaces investigated or that there are certain workplaces that are investigated more than once?

Ms. Allan: It's a bit of a mix.

Mrs. Taillieu: Are there, therefore, more workplace infractions then?

Ms. Allan: In 1999, when we were elected, the number of improvement orders were 1,697. In '08-09, the last full year that we have statistics for, there were 9,725 improvement orders.

***** (15:30)

Mrs. Taillieu: Over 9,000 workplace improvement orders, and yet we still have a time-loss injury of, I think, it's 3.7 per 100. Even with expansion of coverage which is going to, in effect, lower that number just by the simple fact that you're incorporating people that are in lower risk situations, why aren't we seeing an improvement?

Ms. Allan: Well, we have seen an improvement. We just haven't eliminated it yet. One of the concerns that we have, obviously, is the number of people going into the construction industry and the way the construction industry is growing, as well as the manufacturing industry. Then the other sector that is a challenge for us is the agriculture sector. We rolled the agricultural sector in when we did the expansion of coverage.

Mrs. Taillieu: On the following page it does say right at the top under activity identification, develop and distribute occupational safety and health publications. I'm wondering what these publications are and who do they go to?

Ms. Allan: We'll put a package of information together for you.

Mrs. Taillieu: Well, thank you then. Perhaps that could also include, if there is any difference, it says that, develop innovative methods of promoting safety and health in the workplace, establish partnerships to develop innovative methods of promoting.

If you could give me an example of what is an innovative method of promoting safety and health in the work force, and who does that?

Ms. Allan: The work that we do with industry around setting up industry safety associations. One of the really exciting events that we had just this week was the event at New Flyer. New Flyer is a company that is reputable in regard to getting their injury rate down. They were really excited this year to host the national NAOSH breakfast and kick-off to the NAOSH week. The Premier (Mr. Doer) actually went, and we believe it is the very first time in Canada that a premier has attended a national NAOSH event. It was a really exciting partnership where industry and the government were working together to raise awareness about injury prevention.

Mrs. Taillieu: I just want to clarify, then, the note at the bottom of the page does say the new hires in Workplace Safety and Health is going to have an impact on the number of inspections this year. Is it the intent then to do further inspections this year?

Ms. Allan: Well, yes, we want to do more inspections. In fact, that is something that employers have asked us to do. It is something that employer stakeholders have talked to me about. There are 40,000 workplaces in Manitoba, so more officers will help us to do more inspections.

Mrs. Taillieu: On the following page, it does talk about increased funding for prosecutions and that's in explanation note 1, just the very last sentence in there. So I'm wondering, when you're talking about prosecutions, what exactly are we talking about here?

Ms. Allan: The department can make the decision and the authority to prosecute a contravention of the act and that rests with the Attorney General of Manitoba. So Workplace Safety and Health forwards appropriate investigation reports to the Attorney General and then they decide whether or not a matter should be prosecuted. In 2007-2008, there were

11 prosecutions; in 2008-2009, our year-to-date prosecutions are 24.

Mrs. Taillieu: In the second note, it talks about increased legal fees for investigations, and I'm wondering what investigations that would refer to.

Ms. Allan: Sometimes when we do prosecutions, we will get Civil Legal Services involved, so we had more cost for our own lawyers. We have to make sure that we're getting involved appropriately, legally, so what we do is we get Civil Legal Services lawyers involved and those fees are up.

Mrs. Taillieu: I'm just kind of moving through the Estimates book here a bit, so under the Employment Standards on page 41, under activity identification, it says: Recover unpaid wages and fees illegally charged. I'm just curious as to what that exactly means: Recover unpaid wages and fees illegally charged, using statutory collection mechanisms.

Ms. Allan: The provisions in the Employment Standards Code allow for the branch to go after an employer for unpaid wages. These are situations–the Employment Standards branch works with individuals that are not covered by a collective agreement, so if someone was working with an employer and they didn't get paid wages that they should have been getting paid, they can make a complaint to the Employment Standards branch. The Employment Standards branch would investigate that complaint and then, if they believe that those wages were being withheld from the employee unlawfully, they can pursue the employer for those unpaid wages and get them on behalf of the worker.

The changes that we made in the Employment Standards Code, that an employee couldn’t be charged for their Hooters uniform–or whatever, right–if they're charged for those, anything that is not a benefit to them, then we can, if the worker makes a complaint to the department, we can pursue that on their behalf.

***** (15:40)

Mrs. Taillieu: I wanted to ask some questions about the Worker Advisor Office. Where is this office located?

Ms. Allan: In the Norquay Building in the Employment Standards branch.

Mrs. Taillieu: I'm just wondering, as my understanding is, that this would be the office where people that were unsuccessful or unsatisfied or dissatisfied, I guess, with Workers Compensation Board adjudications, they would go to this office for assistance?

Ms. Allan: That is correct, but with the changes that we made with The Workplace, Safety and Health Act, that service is also available to employers. So employers and workers can both go to the Worker Advisor Office and seek help.

Mrs. Taillieu: Mr. Chairperson, I notice in here that there were 600 individuals who were assisted regarding processes and decisions; 400 given advice, 100 resolved claims; 200 through Workers Compensation Board–actually what I'm getting to is there seemed to be about 1,300 people that used this office, so is this an increased amount over last year or is this an average amount, the number of complaints from unsatisfied people?

Ms. Allan: In 2008-2009, the Worker Advisor Office provided services to over 1,411 individuals, and that is about the same as what was done in the previous year.

Mrs. Taillieu: I wanted to ask a few questions in regard to immigration, and I note on page 51 that one of the priorities is improving Manitoba's performance in attracting, settling, and integrating immigrants and achieving in the range of 12,000 to 13,000 landings in 2009. I'm just wondering if the minister can indicate what the numbers are to date.

Ms. Allan: In 2008 it was 11,230.

Mrs. Taillieu: And how many to date in 2009?

Ms. Allan: We usually gather those statistics at the end of the year, so we'll try to track that number down and see if we've got it. We're trying to find it, but those statistics are usually gathered over the course of a year.

As of February 28, which is the most recent statistics that we have, in comparison to the February date in '08, we have received 1,514 landings, and that is an increase of 37.5 percent.

Mrs. Taillieu: Just so I know that we're talking apples to apples here, you said by February 28 this year, so from January 1 to February 28, you had 1,514 and compared to the same time frame last year is a 37 percent increase. Is that what you said?

Ms. Allan: It's a 37.5 percent increase, Mr. Chair. In February '08 we had 1,101 landings. So it's a 37.5 percent increase at February 28, '09 this year over February 28, '08.

Mrs. Taillieu: Is there a particular time of the year that more immigrants come? Is there sort of a peak season I guess, if you will?

Ms. Allan: No.

Mrs. Taillieu: Can the minister indicate if the Employer Direct stream is still suspended?

Ms. Allan: Well, no. It never was suspended. The Employer Direct stream has always been there.

Mr. Lamoureux: I wouldn't mind getting some clarification. The Employer Direct stream, from what I understand, was in fact frozen for applications back in December. Is that not the case?

Ms. Allan: Well, what we did with the Employer Direct stream and, what's really important is to make a distinction between the employer application process. It was the employer application process that we put on hold. What we were doing was getting ready for the WRAPA legislation to come in. What we wanted to do was review our application process to make sure that it was in line with the new WRAPA legislation. We revised the criteria to ensure that our criteria were consistent with the WRAPA regulations. We wanted to do this to respond to concerns that the employer applications were largely being recruiter driven and submitted by third-party recruiters rather than directly from employers. So we wanted to make sure, we wanted to have a look at that process and make sure that it was in line with our new legislation. Anybody coming to Manitoba could still come through Employer Direct.

Mr. Lamoureux: I understand the difference between the employer application and getting the approval prior to actually getting processed through the Employer Direct stream. From what I understand the minister is saying now is that the application itself process is what was on hold so that people that were applying for Employer Direct stream could still do so.

Ms. Allan: I'm being informed by the assistant deputy minister of Immigration in my department that workers could always apply.

Mr. Lamoureux: That's not necessarily the same understanding we would have had several months ago, but I'm pleased to see that we're moving forward, then, on the employer stream.

As of today, there is no freeze whether it's application process for the employer or the employee?

***** (15:50)

Ms. Allan: Workers could always apply, and when they applied, we could match them to employers, so there hasn't been a lot of change. I think what the confusion was–and you asked it in question period, and I tried to explain it to you–and so it really wasn't anybody in our department that ever, ever said that this stream had been cancelled, it was you that said it. What we said was we were reviewing our practices to make sure that they were legal and ethical in relationship to the WRAPA legislation.

Mrs. Taillieu: I have a letter dated November 19, 2008, from the Department of Labour, Promotion and Recruitment Branch, Immigration and Multicultural Division, which states, and I'm quoting: We are temporarily suspending the employer application process and will not be accepting any additional employer applications until further notice.

There also was mention of a review that was going to be taking place. Now, we actually asked for, through a Freedom of Information request, asked for a copy of the review that was done. First of all, we were informed that there was no review, and then we were provided with a summary of a review, but this review had no date on it, nothing to indicate who did the review or when the review was done.

I really would like to know again why this program was suspended and what is the review. What was found out through this review that was necessary to put this application process on hold?

Ms. Allan: I would really like the MLA for Morris and the MLA for Inkster to sit down with the assistant deputy minister of Immigration and walk through this piece. I'd like you to really understand this, and I really don't think I can explain it to you. I am being really honest with both of you. I really don't think that we could write you letters until the cows come home.

But this is very complicated and you're confusing the employer with the worker, the Employer Direct stream with a process and, for some reason, no matter how hard I try to explain it, I can't explain it. So I would love it if you would sit down with the wonderfully talented Ben Rempel, the assistant deputy minister of Immigration, who, I'm sure, would love to talk about this because he loves to talk about immigration, and I am sure he could explain it to you. He would be more than happy to talk to you about the one-page review that we did that doesn't have a date on it. We can put a date on it, if you'd like, and explain it to you.

But at the end of the day, I can tell you that what was done in my department is going to be better for employers and better for workers because we're going to have an ethical recruitment process for temporary foreign workers, and we're going to have the Provincial Nominee Program. The two programs are going to run side-by-side and they're going to work really, really well.

Mr. Lamoureux: Mr. Chair, I thank the minister. It's always a good experience when I get the opportunity to meet with Mr. Rempel. I look forward to our next meeting, and we'll try to set something up in the next couple of weeks.

The essence of my understanding–and this way, Mr. Rempel can reflect on these words, but we'll maybe even broaden the discussion to include some of the other questions that we might have that we could, not necessarily have to put forward today, but we'll be able to include those discussions about the Provincial Nominee Program, the different streams and so forth.

Just so he knows where I'm going with the Employer Direct stream, my understanding of it is today, effective today, is that the employer application portion was on hold. It was on hold because of legislation that was passed by the Legislature, and until we felt comfortable with the regulations and so forth, it seemed to be content within the department to leave it on hold, whereas the employee, on the other hand, could still process through the Employer Direct stream. That's my understanding of it as of right now.

So then the question–and I say I look forward to the dialogue–is: Has all of that then been cleared up? Because Mr. Rempel would know, as I'm sure the minister does, in order for the employee to apply through the Employer Direct stream they have to have the okay from the employer. So, if the employer cannot put in for the application, it, in essence, freezes the employer stream. But, now, the minister is right. It can be fairly complicated. I look forward to having that dialogue, and we'll try to set something up in the next couple of weeks. I thank the minister.

Ms. Allan: But I can tell you, to give you a comfort level, that all systems are go. We're up and running. It was a very, very short–that one particular process in the big picture–it was short and sweet and things are up and running again.

Mrs. Taillieu: Mr. Chairperson, I just have still some questions though in regard to the review, the summary of the review that was provided to us. I'm just wondering, it appears that the employers were to be involved in the direct recruitment of employees but there was an increasing use of recruiters, and it does say in here: it became evident that some recruiters and/or employers misused the MPNP employer pre-approval application for several reasons, and it goes on to state some of them. But it also says: workers were charged, not only for immigration services, but also for the job offer, which is illegal in Manitoba.

So, if there was illegal activity going on, were there any charges laid?

Ms. Allan: Well, no, because we had no legislative authority. What we discovered when we started looking at this was we had no legislative authority because The Employment Services Act was a very weak piece of legislation and had not been reviewed for over 20 years. So that's one reason why we brought in the WRAPA legislation.

The other piece of this is the temporary foreign workers were totally unregulated. We didn't know who the worker was. We didn't know who they were working for. So, because of that, a total unregulation of that whole movement, that's why it was really–one of the reasons that we've been very, very fortunate here in Manitoba to develop this legislation is for the simple reason that we have the Employment Standards branch and the Immigration branch both in the same department. So we were able to figure this out from the point of view of providing newcomers with the basic minimum rights in the code, just like any other domestic worker would have.

***** (16:00)

Mrs. Taillieu: Mr. Chair, I note that this method of recruitment with hiring third-party recruiters was increasing starting in 2004, soon after this Employer Direct stream was created, all the way up through to 2008, but it wasn't until then that the legislation was proposed. So, if there was illegal activity going on for four years, what took so long to bring in the legislation?

Ms. Allan: Well, we are leading the country in this legislation. I just explained that the whole temporary foreign worker area is completely and totally unregulated. We didn't know who the employer was, we didn't know who the worker was and the recruiters weren't licensed. So the only way that we could find out if there was a problem was if the nanny, who was living with someone, had the guts to pick up the phone and call the Employment Standards branch and say, I've got a problem. Imagine how difficult that would be for someone who is living in the home of their employer and also somebody who comes from another country. Sometimes, you know, getting in touch with the government isn't always a positive experience. So we had absolutely no ability to control it or manage it.

I just want you to know, that what we're doing here in Manitoba is going to change the Canadian landscape, and it's going to end modern-day slavery, Mr. Chairperson. Two days ago, in the House, the Honourable Jason Kenney, the Minister of Citizenship, Immigration and Multiculturalism, said in the House: Mr. Speaker, we have launched consultations with live-in caregivers and those interested in this issue to seek ways we can better enforce regulations to protect the rights of caregivers. I encourage provincial ministers of Labour to do likewise, to follow the excellent lead of the government of Manitoba in this respect. So every jurisdiction in Canada right now, including the federal Tory Minister of Immigration, is looking at us and saying, way to go Manitoba, what you did is incredible.

I'd like to thank the officials in my department for this piece of legislation because it really is phenomenal, and it's going to end modern-day slavery in Canada, hopefully, some day.

Mrs. Taillieu: Mr. Chair, but I am looking before the legislation. I'm wondering, when did the minister first become aware that there was illegal activity going on?

Mr. Chairperson: Honourable Minister.

Ms. Allan: Did you say my name? Sorry, I'm waiting for you to say my name.

Well, it's a complaint-driven process, and we didn't have any complaints, and so what we did was we started to think about it. We knew what really broke it for us was two Septembers ago–or was it three–two Septembers ago, when Maple Leaf hired 200 workers from China. Those 200 workers were brought here by a recruitment agency in B.C. and they were charged $10,000 apiece. They were charged that illegally by the B.C. recruitment company–and they can still do it–and when the workers got here to Maple Leaf, Maple Leaf found out that those workers were living in Brandon, trying to send money home to their families, trying to pay rent and trying to pay an unscrupulous recruitment agency in British Columbia money.

I just got so angry and I was so disgusted, and we started talking about this. That's when we started to work on this legislation, and I bet you we're going find out there's lots more of this going on. We've already had lots of phone calls in my office from individuals in this province who have been brought over by unscrupulous recruitment agencies. It's really something that as people learn more and more about it here in Manitoba, they're going to stand up for their rights.

Mrs. Taillieu: Can the minister tell me what show money is?

Ms. Allan: It's a requirement under the federal legislation. If they're immigrating through the federal immigration stream, they have to provide information to the federal government that they have a certain ability and a certain financial strength to move to Canada.

Mrs. Taillieu: I'm still concerned about the summary of this review. I know that there must be another review because this is a summary of the review. I'm wondering if we can have a copy of the review.

Ms. Allan: This is the review.

Mrs. Taillieu: Well, thank you very much. As I indicated before, there's no date or anything on this review to indicate who did it or when it was done. Perhaps the minister could indicate that.

Ms. Allan: It was an internal review that was done by and signed off on by the assistant deputy minister of Immigration.

Mrs. Taillieu: Exactly what is the illegal activity referred to in this?

Ms. Allan: That people were charging for job offers.

Mrs. Taillieu: How many people were charging for job offers, and if that was known to the minister, why were there no charges laid against these people?

Ms. Allan: It's obvious that we knew anecdotally when we heard what went on in Maple Leaf, that there were problems. We knew there were problems. I mean, all you have to do is read the *Toronto Star* and know what's going on in Ontario, and you know there are problems.

It wasn't that we had individuals coming to our department, and employers. We had no legislative authority to lay charges. We had no legislation. We do now. You can't prosecute somebody without legislative authority to do that and now we have legislative authority. We knew about it anecdotally, and what we had to do is set up a legislative framework so that we could manage this issue.

***** (16:10)

Mrs. Taillieu: Can the minister indicate, within the last two years, how many people have left the Immigration Department not of their own volition?

Ms. Allan: No one.

Mrs. Taillieu: Can the minister indicate, within the last year, how many people have left the Immigration Department?

Ms. Allan: We can provide that information to the member.

Mrs. Taillieu: Well, thank you. Is the minister saying that she does not know, then, if people have left the Immigration Department?

Ms. Allan: People come and go all the time, and I am saying that we'll get that information to the member.

Mrs. Taillieu: Thank you very much. We have the assistant deputy minister of Immigration here, and I'm wondering if he might be able to provide that information in regard to the management staff at Immigration.

Ms. Allan: Well, the assistant deputy minister of Immigration is looking through his book and trying to find that information. When we have it, we'll provide it to you.

Mrs. Taillieu: I'm not going to dispute the fact that there may have been some unscrupulous recruiters. However, I think that there have been some recruiters that have done a decent job of bringing people into the province and now find themselves in a position where they feel that they're going to have to take their business elsewhere.

I'm not sure whether they will or not; how this will really impact them. But I'm wondering if the department has decided that the recruitment will all be done now by the department, and they will be the de facto recruiters now.

Ms. Allan: Well, recruitment can be done by any organization or any company, recruitment agency, that is registered with CSIC. The only problem is they cannot charge the worker for a job. They cannot do that. That is, no domestic worker is charged for a job.

So we cannot have two standards, one for domestic workers and one for newcomers, new immigrants.

So, if a recruiter had a business and their business model was to make money by charging foreign workers for the privilege of coming to Manitoba and paying money for a job, they're going to have to redesign their business model.

We are totally supported by CSIC on this. We are totally supported by the Honourable Jason Kenney. We're totally supported by the Honourable Minister Diane Findlay, the former Minister of Immigration, and the Canada Migration Institute.

Mrs. Taillieu: Well, again, when did the minister become aware of this illegal activity going on?

Mr. Chairperson: Just before recognizing the honourable minister, I'll just remind all members that technically, we're dealing with Estimates from the department, so questions should be phrased in that context or in relation to a piece of the Estimates.

Ministers can choose to answer whatever question they want, but there is latitude given to ministers when a question is asked which does fall outside of the Estimates process.

Ms. Allan: Well, the answer is exactly the same as the last time I answered the question. It became apparent to me when I found out what happened with 200 Chinese workers that came in through a recruiter in British Columbia. They were unscrupulously charged $10,000 per person, and I went, you know, I don't want that to happen in Manitoba.

So we need to look at this and figure out what we can do to stop unscrupulous recruiters from charging newcomers for the privilege of a job in our province. So we consulted with the federal government and the Employment Standards CEO, executive director Dave Dyson. Assistant Deputy Minister Rempel started to consult with a bevy of stakeholders about this legislation including the Canadian Border Services and the RCMP, and this legislation is supported by them as well.

Mrs. Taillieu: I believe that the Estimates process–we agreed to go about this in a global manner. I was referring to a letter that came from the Department of Labour and Immigration, Immigration branch, and also a FIPPA about a summary and a review of the employer application process, and I was asking questions identified in that summary letter provided to me which there–it talks about illegal activity.

The minister has said there has been illegal activity. I want to know when she first found out about it. When did she first discover there was illegal activity going on? When was it?

Mr. Chairperson: Again, just to clarify, and I appreciate the Member for Morris's statements. Nothing of what I said was in relation to the documents that she says she has. A global discussion just means that we're not going one section of the Estimates book after the other. It means that it's open for any discussion on any particular line item in the Estimates book, but it is the Estimates book and budgetary matters which should be the focus of questions.

When questions fall–you know, questions can be asked outside of the purview of the Estimates book, but members should recognize that under parliamentary practice ministers have discretion on whether to answer those questions or not because it falls outside of the purview of Estimates.

So the discussion that's going on is fine. I was just making sure that people knew that we're getting a little bit close, and the clerks have advised me of this, we're getting close to the area where we're technically outside of the specific area. There's nothing wrong with the questions. There's nothing wrong with the answers. I'm just pointing out that the questions can continue and the answers might not, and that that is okay.

***** (16:20)

Ms. Allan: Well, you know, I guess I don't know what to say anymore because I don't have an answer that's making my critic happy. I don't have a new answer. I've answered the question twice, honestly, as I would any question that I was asked, and I'm sorry, but I don't have an answer, obviously, for your question that you want to hear.

Mrs. Taillieu: I think we'll come back to that, then, tomorrow.

I want to just go on to the–I believe last year I talked about service purchase agreements with all the settlement services agencies, there are a number of them under the Immigration Department. I notice this year in the Estimates book, it's something new, it says: Establish contribution agreements with 200 service providers so that the delivery of a wide range of settlement, Adult EAL, and enhanced services through Manitoba Immigration.

I'm wondering then–I had asked for a package of information in regard to contribution agreements. We got into the issue of personal information and protection of privacy. I said I did not need any personal names or anything; I was looking for copies of the service purchase agreements or contribution agreements, didn't receive any of those, and now I see they're going to be established.

So can the minister indicate if these are done or they're just in the process of being done, and why haven't they been done to date, if not?

Ms. Allan: Well, no, it's nothing new in our department. Every year we have contribution agreements. We're actually bound, I believe, by federal government rules–*[interjection]*–guidelines, thank you. Not rules, guidelines. So we have very in-depth contribution agreements with our stakeholders, Mr. Chairperson. What happens is every year we review those contribution agreements and consult with the stakeholders and renew those contribution agreements with them in regard to the services they're providing. That's done on a yearly basis.

Mrs. Taillieu: How many actual agencies are there, then, that provide immigrant settlement services at the present time in Manitoba?

Ms. Allan: While Ben counts them, I'll give you the information you asked for in regard to the staff that left the department of the Immigration branch. In 2008-2009, a total of six staff left. One of them was Michael Scott. One of them was Mely Buenaventura, and the other one was Marsha Share, and they retired. Deb Fehr Barkman and Sophia Vong, left for another department. One of them resigned to move out of province and her name, or her name, is Chris McInnis.

The number of settlement providers we will fund is 200.

Mrs. Taillieu: Are there contribution agreements with all 200 of those?

Ms. Allan: Yes, there will be contribution agreements with all of them.

Mrs. Taillieu: The minister, I think, said will be. So there are some that aren't done yet?

Ms. Allan: It's early in the fiscal year, so we walk through those and we develop them as we go along.

Mrs. Taillieu: Just for clarification, I'd like to know how many are completed and how many are in progress.

Ms. Allan: We're not sure at this time, but I can just guarantee you that within the next few weeks, all 200 will be done.

Mrs. Taillieu: Perhaps then, in the next couple of weeks, the minister can provide a letter saying they have been completed.

Ms. Allan: Certainly.

Mrs. Taillieu: Thank you very much. I think there's quite a large amount of money that flows from the federal government to the Province for settlement services. I think it's something like $10 million or $12 million, and then that is distributed amongst the settlement service providers.

Are there criteria that the service providers must meet to be eligible for some of this funding?

Ms. Allan: We have funding criteria. They are that the service providers must demonstrate an effective service delivery model that will assist Manitoba immigrants and refugees towards economic and social integration, participatory citizenship and long-term residency in Manitoba. The proposal must give evidence that the services are needed and wanted. Unless otherwise agreed upon, funded services must be provided free of charge.

Mrs. Taillieu: I'm just trying to clarify here, but I believe that one of the important criteria for new immigrants to be accepted through the PNP program is that they have some competence in the English language. Is that correct?

Ms. Allan: It's one of the factors, depending on which stream they come through.

Mrs. Taillieu: I notice that a lot of the settlement and community supports are around assisting with English as an additional language. I'm wondering how that's measured. How do we know that the settlement service money is actually improving the English skills of new Manitobans. Is there a measurement how that works?

Ms. Allan: We have staff in the department that do assessments and they work, as well, with the service providers in regard to making sure that the delivery of services is making a difference in regard to newcomers' language abilities. We also have programs in place with employers. One of the gentlemen that I met last night is the head of Bison Transport, and Bison Transport does language training on site. There is specific language training for employers; it's called Benchmark training, and that's how we assess their language capability.

Mrs. Taillieu: I'm looking through a list that I have here of settlement and community supports. Some of them, I understand, show that there are clients served and some of them do not. There's a very wide range of people that are recipients of monies made available for settlement services, so I just want to pick a few, maybe, and ask if the minister could indicate–just give me a minute here, I'm looking just to pick one. Okay, Rural Municipality of Bifrost. I'm only using this, picking it out as an example. They received $26,000.

What would be the reason that they would be considered a settlement and community support? Can you give me just an example of what that would be for? I have no idea, so I'm just asking the question.

***** (16:30)

Ms. Allan: Ben Rempel has said that what he will do is he would have to look at the agreement. Of the 200 agreements, he doesn't have all of them in his head in regard to what the services are that are provided by each one of them.

Mrs. Taillieu: Well, I do appreciate it might be difficult to sort of go individually like that, but I'm just wondering if a municipality, any municipality, was to apply for a settlement and community supports and, yet, didn't indicate over the last three years that they had served any clients, what would be the basis for them to receive funding?

Ms. Allan: Well, a perfect example is Winkler. We gave them $600,000 for settlement supports. Obviously, some of it might be in language training. Some of the training that we provide is orientation to the job market. Sometimes they need help with resumes. Family members might. We started an entry program that's been very successful. Sometimes they want to just learn more about Canadian culture and learn more about what our systems are in regard to our education system and our health-care system. Sometimes those kinds of supports are important, as well, for newcomers who come from different cultures.

Mrs. Taillieu: I also note that there's a radio station, I don't know which one this is, CKUW, 95.5 FM received some money from Manitoba Immigrant Integration Program for settlement and community supports. What would a radio station need money for settlement and community supports for? Can you give me an example?

Ms. Flor Marcelino, Acting Chairperson, in the Chair

Ms. Allan: We've done language training through the radio for new immigrants. We're not sure that that's exactly what this one is, but we're going to check into it, and we'll get back to you.

Mrs. Taillieu: I also noticed that there is a financial institution in here, Assiniboine Credit Union, who also received some money from Manitoba Immigrant Integration program. Would this be the only–it's the only one I noticed anyway. Oh, no, I'm sorry, there was TD Canada Trust, I see.

I'm just wondering what criteria would they have to meet, then, to get money through Manitoba Immigrant Integration program?

Ms. Allan: Well, this one is probably one of my favourites. It's one of the most exciting programs that we fund. It is a program that was started by Christina Semaniuk, who actually was on our Manitoba Immigration Council.

It's a program to train newcomers in how to become customer service reps. It has become such a success that now the Royal Bank came on board–or, sorry, Toronto-Dominion. It's very exciting because the credit union system identified that as Manitoba's demographics change, because we will depend solely on immigration for population growth by the year 2014, that we better have people behind the counters that can relate to the new demographics of Manitoba. So it was an exciting program that was started by Christina, and it's to train newcomers.

I remember it was one of the first events that I went to shortly after becoming minister, and I met these incredible women that had all just been trained–and I think they were all women, actually, I don't recall if there were any men or not–and they had lived in Manitoba for quite some time, some of them. One woman said she'd been in Manitoba for five years, and she had not been able to find employment. They enrolled her in this program and it was very, very exciting because now she was working and participating in the economy and gainfully employed. It's really a neat program.

Mrs. Taillieu: What I understand from that, then, anybody that–anybody–in any field that wanted to hire new Manitobans and train them would be eligible to apply for this?

Ms. Allan: Well, there's an application process that they would have to go through, and it would have to meet the strategic objectives of our settlement services and our immigration strategy. So if someone had an idea like this, and they wanted to sit down with my department and consult with them in regard to whether or not this is something that would be of benefit, that is something certainly that we would entertain.

You should know that the federal government applauds Manitoba's settlement services strategy. There are only three jurisdictions in Canada that deliver settlement services, and they consistently tell us how, when I'm at FPT meetings, in regard to what a remarkable job we do here in Manitoba in delivering settlement services that really make a difference for our newcomers.

Mrs. Taillieu: Madam Chair, can the minister indicate what are the current wait times for all of the streams in the Provincial Nominee Program?

Ms. Allan: Well, we have–I have told–I wrote the MLA a letter, and I told her what the wait times were in regard to the streams. I can't recall what I said in that letter, but I don't believe that much has changed in regard to that. I can tell you that we take a holistic approach in regard to our immigration program. We believe that, you know, the due diligence has to be done in regard to our applications, and that sometimes it varies in regard to exactly what those wait times are because, quite often, what will occur is not all of the information is there in regard to the application.

But we're certainly pleased with our immigration program in regard to–when you look the success of the program, 70 percent of all of the provincial nominees that come to Canada come to Manitoba. We're particularly pleased with the fact that 34 percent of those that come to Manitoba come to rural Manitoba, which is very, very, very exciting, you know, because we can't have an immigration strategy that just benefits our urban centres. We also have a retention rate that we're very proud of, around 84 percent. So we believe our immigration strategy is working for Manitoba.

***** (16:40)

Mrs. Taillieu: The minister indicated that 70 percent of all newcomers to Canada come to Manitoba, and then she indicated a retention number. I'd asked through a Freedom of Information the number of Manitobans that had left within two years of settling here all years from 2000 to 2008. I was told that that record didn't exist. Is there, in fact, a record that exists to track the number of people that leave or stay in Manitoba every year–of the ones that come in through the PNP?

Mr. Chairperson in the Chair

Ms. Allan: No, we're just not set up to track those kinds of statistics. The actual retention rate statistic is from an independent study that was done by an independent body.

Mrs. Taillieu: But, Mr. Chair, according to the Canada-Manitoba Immigration Agreement, section 7, in order to aid in the evaluation of the Provincial Nominee Program, the Province will track provincial nominees for a minimum of three years from their date of entry as a basis for assessing the retention of provincial nominees.

So in light of that, I'd like to again ask what the retention rate is of provincial nominees in Manitoba. If they don't have that information, are they not complying with the Canada-Manitoba Immigration Agreement?

Ms. Allan: We actually are working with the federal government on an information-sharing agreement because no jurisdiction in Canada can do this because of the simple fact that we're not able to share information with the federal government in regard to those landings. So we're actually working with the federal government. I actually had Monty Solberg here last year, and we announced that we were going to be working with the federal government on this in regard to how to implement that.

Mrs. Taillieu: But there's an agreement between Canada and Manitoba which says that the Province will track provincial nominees for a minimum of three years from their date of entry as a basis for assessing the retention of provincial nominees.

Is the minister saying they are not doing this and therefore breaking that agreement?

Ms. Allan: Our agreement with the federal government is a bilateral agreement, and it's signed off on by the federal minister and the provincial minister. We are in consultations with the federal government in regard to how we can comply with what is in that agreement.

Mrs. Taillieu: From that answer, I take it that you're in violation of the agreement because you're not doing what the agreement says. So if you don't have the information, how can you measure the success of the program if people are coming to Manitoba and then you don't know where they're going? You really don't have a handle on how many people are staying or where they're going to. How can you measure the success of the program?

Ms. Allan: Well, what we do, we are in compliance with it. I know you'd just love to find something I wasn't in compliance with, but it's not going to happen.

What happens is we are in compliance because what we do is we provide the federal government with the newcomer's health registration number, and then they cross-reference it with their tax information. They're able to draw aggregate information from those two sets of data, and then that way, they can determine. That is the mechanism that we're using right now until we have an official information agreement with the federal government. So this process is in place for now until we have a better one.

I have the information for the member in regard to the radio station that received funding. CKUW was funded in 2007-2008 for $2,500 to run a day camp for immigrant children to learn about the radio broadcast business.

Mrs. Taillieu: Well, if the minister is saying that they are tracking this information, perhaps she can tell me then, what is the retention rate of immigrant medical personnel, doctors and nurses, that are retained in Manitoba, or how many actually leave the province?

Ms. Allan: It's aggregate data. We can't pull that information from aggregate data.

Mrs. Taillieu: Again, I'm just quoting from the agreement. In order to aid in the evaluation of the PNP, the Province will track the nominees for a minimum of three years. That doesn't sound like aggregate data. That sounds like it will track the people that come through the PNP to see whether they stay in Manitoba or they leave Manitoba. That doesn't appear to have been done.

The next section in this Canada-Manitoba agreement says that every five years, this annex, the whole annex, the whole agreement, will be reviewed, and I'm wondering if the Province has had discussions with the federal government in regard to this.

Ms. Allan: Well, we're actually in the process of negotiating a new bilateral agreement with the federal government, and we will be having discussions with the federal government about how we can better work together in regard to our immigration strategy.

Mrs. Taillieu: What is the nature of the new bilateral agreement?

Ms. Allan: Well, the old bilateral agreement was a five-year agreement, and that agreement is going to be up soon. We have been in negotiations with the federal government for six months on a new bilateral agreement.

The new bilateral agreement we have–without a bilateral agreement with the federal government, immigration is a federal responsibility. So, it is a shared jurisdiction. So, we have to have a bilateral agreement with the federal government for our immigration program.

I have the answers to your other question, the list of settlement services. We provide information referrals for community–and this is the Bifrost rural municipality–provide information referrals for community and regional supports in the areas of housing, health care and services, education, recreational activities, adult and family learning and literacy programs, instruction programs, finances, employment supports, support labour market preparations and entry for immigrants, organize and promote five community events to help immigrants feel more welcome.

Mrs. Taillieu: Well, thank you for that.

I'm just wondering, then, Mr. Chair, is this new bilateral agreement, is that going to replace the Canada-Manitoba Immigration Agreement or is it just a renegotiation of the same thing?

Ms. Allan: It is a renegotiation of the agreement that you're looking at right now. It will be a new agreement, and I will sign off on it with the new Minister of Immigration, Jason Kenney, if that's who's the minister when we sign off on it.

***** (16:50)

Mrs. Taillieu: Does the Department of Immigration advertise abroad the Provincial Nominee Program?

Ms. Allan: Well, we don't have to. We have the most successful Web site of any Web site in government. It gets about 1.6 million hits a year.

Mr. Lamoureux: Toward the minister, in terms of just the wording, talk about the overall numbers with the Provincial Nominee Program, we have seen an increase. I know we have a target of 20,000. I suspect that it wouldn't take that much effort to really achieve the 20,000. I suspect that the demand has actually been growing within the Provincial Nominee Program and I'm wondering if the minister can give an indication–I think she said that we're at 3,000 in the first three months. When does she anticipate at this stage that we'll hit that 20,000?

Ms. Allan: Well, the commitment was to hit 20,000 by 2016, and we just take it year by year.

Mr. Lamoureux: Generally speaking, individuals that will qualify for the Provincial Nominee Program put in an application, and I'm just guesstimating here, but I suspect that the numbers of individuals and their families that are actually applying probably exceed 20,000 today in terms of the number of applications that are being put in. Is the minister aware, or is the department aware of what sort of numbers that were actually applying to come through the program?

Ms. Allan: Well, we're not really as concerned about numbers as the MLA for Inkster is. Our approach to our immigration strategy is holistic. We're concerned about them succeeding. We want them to participate in our economy. We want them to get here without being taken advantage of by unscrupulous recruiters. We want them to get here and have settlement services and support services and we want them to feel welcome, and it's a challenge.

We have newcomers that come to Manitoba, not just through the Provincial Nominee Program but from the refugee stream and the family support stream and it really is a balancing act in regard to getting those folks here and getting them into the right organizations and getting them jobs. So I know that the MLA for Inkster would just like to open up the doors and have them all arrive tomorrow and tally ho, they'll all do well, but, you know, I think slow but steady is our approach to immigration and make sure that, you know, we have a lot to be proud of here, and, once again, 70 percent of all of the provincial nominees that come to Canada come to Manitoba. It's a very, very successful program, but one of the things that you can do when you have success sometimes is grow too fast, and we want to make sure that we don't make that mistake with this program that is so valuable to Manitoba and also valuable to the newcomers that want to live here and become Manitoba's newest citizens.

Mr. Lamoureux: You see, I would ultimately argue this is one of the greatest programs that the Province has, even if you go through all the many different departments, and that's why I think that we have to be thinking ahead in terms of how we're going to be able to meet those demands.

Does the minister have a graph that would show the number of applications that are coming into the PNP office for the last four years?

Ms. Allan: Well, you know, I would really ask the MLA for Inkster–I'm going to give you this data for 2008, but I don't want this to turn into a make-work project for my departmental staff, because every make-work project that I pull immigration staff onto means that less people are processing immigration applications and are providing services. So I think what you're asking me, and we have the numbers for 2008, the Provincial Nominee Program receives 6,922 skilled worker applications, 5,608 were accepted for assessment, 20 percent were complete and ready for assessment, and 60 percent were initially incomplete, and 1,314, 20 percent were returned as ineligible or incomplete. Now I think that's what you were asking me. Does that help?

Mr. Lamoureux: Yes, Madam Minister, that does help a lot. But, you see, if we just look at that 6,900, because the details in how the breakdown I'm not as much concerned about, at least for this particular argument or discussion, as that overall number. Let me explain. If it's 6,900 for 2008 and it was 6,000 for 2007, I suspect that we've been seeing year over year an increase, and that increase year over year will likely have an impact in terms of the number of arrivals that we would be getting at any given point in time of the year, the overall number on arrivals.

So what I'm concerned about is that we have the capability to be able to potentially, to the best of our abilities, meet the demand, which I believe is going to be increasing over the next number of years. I guess that's kind of like what I'm looking for, and that's why I think that there's some benefits in terms of understanding the increases that have been coming over the last few years. The last thing I would want to do is to tax the resources of the department, you know, to get them to do something when they could be helping out on case files.

Ms. Allan: Well, I totally agree with the MLA for Inkster in regard to the fact that, you know, we cannot do this work. We cannot make the mistake the federal government has made and not resource the Immigration branch, because this is a people business. This is all about applications and people. So, since 1999, the funding to the Immigration branch has increased by more than 260 percent and that's the settlements or that's funding, and the staffing levels have more than doubled to 77 FTEs.

We have made a consistent effort in my department to make sure that there are people and funding there to process applications, to do the assessments that are required to make sure that we're getting people in training and get them into jobs.

Mr. Lamoureux: I know. I've already written a note here that I'll pass on to Mr. Rempel before I leave in terms of suggesting some meeting times, and we'll get more into the processing times and so forth at that particular meeting.

The question that I would ask the minister–having said that, is that typically, and we'll talk about a family stream where all the paperwork is filled out correctly, there is no need to require additional information from the applicant. Let's just say they did a thorough good job in providing the paperwork. What could they expect to have to wait in order to go through the system in that situation?

Mr. Chairperson: The hour being 5 o'clock, committee rise.

An Honourable Member: Committee recess.

Mr. Chairperson: Oh, sorry. Committee recess, right. Sorry about that.

The time being 5 o'clock, I'm interrupting proceedings. The Committee of Supply will resume sitting tomorrow at 10 a.m.

SCIENCE, TECHNOLOGY, ENERGY AND MINES

***** (14:30)

Madam Chairperson (Bonnie Korzeniowski): This section of the Committee of Supply has been dealing with the Estimates of the Department of Science, Technology, Energy and Mines.

Would the minister's staff please enter the Chamber.

We are on page 148 of the Estimates book. As previously agreed, questioning for this department will proceed in a global manner.

The floor is now open for questions.

Mr. Blaine Pedersen (Carman): Through you to the minister, we've had various discussions over the last two years about low-speed vehicles, making regulations for them. I've offered Carman, the town of Carman, as a test case to set up regulations.

Can the minister advise me as to where his department is right now in co-ordination with the Ministry of Infrastructure and Transportation in terms of how soon these regulations will be developed?

Hon. Jim Rondeau (Minister of Science, Technology, Energy and Mines): The status of the low-speed vehicles, as far as that's concerned, the regulation is the responsibility of Manitoba Infrastructure and Transportation. But we worked with them, we co-ordinate and discuss the issue with them. We understand the drafting instructions for the regulations are nearing completion, but the regulations will not be available for comment for several more weeks.

There are some concerns, and we are trying to deal with other provinces regarding safety concerns, how to integrate with regular traffic, et cetera, and the whole roll out of these vehicles in a safe and cautious manner.

We would like to ensure that there are no concerns on cold weather or integration in regular traffic flow issues. So we are working with MIT on (a) how to roll this out in a safe process, (b) talking to other provinces on how their rolling it out and looking at their experience, and (c) we want to do it in a plan that makes sense and can be communicated to the public.

Mr. Pedersen: In the next couple of weeks when these draft regulations are written up, and realizing that they are just draft, and there may be things that need to be tweaked in it, does the public have a chance for input on this or what is the procedure here as you develop the regulations?

Mr. Rondeau: We're trying to work with the industry to roll out these regulations. As the regulations are developed, there will be discussions with industry and other concerned partners on the roll out of this, which may involve different industry players, such as Westward Industries or the company that's in your community, as well as other stakeholders which might be municipalities or other groups that may want to do a pilot project.

***** (14:40)

Mr. Pedersen: So when you have your regulations, and I guess all I can do is ask: Will you, either through myself or directly to Northland Machinery, perhaps to the town of Carman, give us a copy of these regulations, draft regulations, so that we do have input? I would hate to see this opportunity pass and us not have any chance for input to them.

Mr. Rondeau: Madam Chair, we will meet with Northland, go through what we're planning to do with them and make sure the communications are open.

Mr. Pedersen: Mr. Nussey, at Northland Machinery, will certainly be waiting with bated breath for that.

Mr. Rondeau: If the member would give us the contact information of the people, phone number and stuff like that, we'll make sure that we contact the right person.

Mr. Pedersen: Madam Chair, that's good. I will do that. I will go down and get the pamphlet and I'll leave it with your staff here today so you have the contacts. Very much appreciated. Thank you.

Mr. Cliff Cullen (Turtle Mountain): Just on the vehicle side of things. I know under the previous legislation, the minister had to set up a committee to investigate climate change as it relates to motor vehicles and that committee has put forward some recommendations. But the recommendations, to me, look like it's kind of a wait-and-see kind of an attitude. It looks to me like everybody's kind of waiting on what happens in California.

Is that where we're at? What's the next stage in the process here? I know there's some other–what they call complementary measures that are being recommended, but what's the role of this board going to be going forward? And then, what steps is the Province going to take from here on in based on these recommendations?

Mr. Rondeau: Thank you very much for the question. It's a good question because the board had a very important role, and I'd have to thank the board for completing it because it was a very tough job. They had a lot of public input. They went and did a job. They completed their role and I have received the report.

The report's very thorough and it was interesting because when I met first with the board, they sort of said, what's our role? Do you have any expectations? I said, well, I want you to look at the mandate and just do what you believe is appropriate.

The report is very thorough, it's very good, and they had a number of recommendations because they took a broad look at the subject and they looked at, you know, transit and looking at transit and they looked at other forms of alternative transportation. They looked at hybrid rebates and talking about maybe looking at how we can renew the fleet.

But one of the major things that they said was this is not just a Manitoba issue, Madam Chair. We need to work with others. Although we're working in the province on the new hydrogen buses that Flyer's developing for the Olympics, we're looking at hybrid buses which are using less fuel, although we're looking at integration of alternate vehicles or more fuel-efficient vehicles–those are all things we need to do–but one of the things they did say was that California is a huge market and we have to learn to work together in order to push demand or pull demand.

California has more people than Canada. We have about 0.03–less than one-third of 1 percent of the market for cars in North America, so we won't be driving the demand for cars. We have to work with others, California, other states, to sort of say, okay, here are the new rules, here's the reality, and have one standard that's understandable, that's acceptable for all North America, and it's one thing that all manufacturers can work towards. They said this well, and so that they said that if we can move towards a standard that's comprehensive, that's adopted by the vast majority of North America, that makes it much easier. That was another statement that they made.

I like the report. We're working towards addressing the issues and concerns–the recommendation report–and there will be future developments and, as the U.S. has said, they're moving towards things like this and they want to continue to move forward in that regard.

Mr. Cullen: I guess, specifically, there's reference to pre-1995 vehicles, and there's talk about those vehicles, I guess, that have been taken in by MPI. One of the recommendations is to use those vehicles for parts only. Is that something the government is going to be looking at? The other option, too, was there was some discussion about not being able to import into the province vehicles manufactured before 1995. Is the Province thinking of moving ahead on that as well?

Mr. Rondeau: There are two parts to this. First, we will look at all the recommendations this board made. We'll see what we can do as far as retirement programs, and that's basically older vehicles that could consume more fuel and create more greenhouse gases. As I understand it, as a vehicle gets older, it generally uses more fuel, and pre-1995, in general, and not specific, pollute a little bit more–in general, not in every specific case. So we want to look at the recommendation from the committee on that regard, but there's also the part of legislation we've already added.

Part of the legislation we did in the climate change was that we were moving forward with preventing pre-1995 being imported into the province for resale. Now, that meant retailers couldn't bring in pre-1995 vehicles and resell them. Individuals could bring in vintage or collectible cars or vehicles. We weren't going to prevent people who are bringing in a 1935 car or a car that has very good value in here. We want to make sure people are allowed to import individual cars, especially if they're collectors, so the legislation has that provision. But we want to look at all the recommendations of the board and make sure that we see what we can implement to make change.

Mr. Cullen: Well, it sounds like things are still pretty vague. I guess there's going to be more to follow, I guess, and we'll just have to wait and see how that materializes.

The Province did have a rebate on hybrid vehicles. My understanding is that is no longer available. Is there anything the minister is considering on that side?

Mr. Rondeau: Currently, the hybrid rebate is in existence and is being paid.

Mr. Cullen: I'm sorry, you said the program is still in existence?

Mr. Rondeau: Yes, it's currently still in existence.

***** (14:50)

Mr. Cullen: In reference to Bill 15 here, there was the–and maybe what the minister could do, I guess, first of all, is indicate–or at least some time in the near future, let me know which parts of The Climate Change and Emissions Reductions Act have been proclaimed or if there's anything in there that has not been proclaimed.

Mr. Rondeau: Sure, we'll get that to you with the package of materials.

Mr. Cullen: In the legislation there was, under coal phase out: after December 31, Manitoba Hydro must not use coal to generate power except to support emergency operations. Is that still on line as far as you're concerned?

The second part to that is there's no definition of emergency operation. So has your department put together a definition of emergency operations in respect to Manitoba Hydro?

Mr. Rondeau: Madam Chair, I'd like to inform the member opposite the process is unfolding as anticipated on schedule. We've been working with Manitoba Hydro to develop the regulations, the definitions and move this whole project forward.

Mr. Cullen: Okay. I appreciate the minister's response there.

The other issue that was discussed in the legislation was a coal tax, a tax on coal to try to limit the use. Has the Province implemented that or can you tell me if there's a time line for that potential coal tax to come into effect, and how much that particular tax would be?

Mr. Rondeau: The coal tax is anticipated to be $10 a tonne. It will be effective in 2010-2011. It's part of that budget, and the Department of Finance will bring forward the regulations and all that in due course. So you could ask the Minister of Finance (Mr. Selinger) next year on this.

Now, the purpose–we announced a 2010-11 tax last year, or this year, was because we wanted to make sure that people understood what was happening, and wanted to move forward on alternatives. So I can let the member know my department is working with people who currently use coal to come up with use of biomass or other sources. So what we're trying to do is look for alternatives. So we're trying to use green fuels. An example would be taking straw or flax sheaves, compressing them and being able to burn them instead of coal, which is a green fuel, and which would displace coal.

Just for the record, the tax would be effective in 2011. But we announced it early, and we announced it early so that people could take advantage of some of the incentives Hydro has put out there and, also, some of the things that we're trying to do so that people would be able to move off. It's hopeful that we don't collect any money on this tax. We're, hopefully, looking at people coming up with biomass and other options. I know that we've been working with companies to bring densifiers to the province, and to do experiments with flax and other material that we could use–called biomass–to displace coal.

Mr. Cullen: So the tax, then, as you see it, would be a fee up front, like a point of sale. I guess the question I have–I know a lot of our coal is imported from Saskatchewan, so how is the minister going to be able to tax that?

Mr. Rondeau: Finance will determine the process as it goes on. It's going to be part of the 2011 budget. What we wanted to do is make sure that we were fair to people, to sort of say this is what's coming. We're going to provide incentives now to use more green alternatives so people can get into biomass or other sources. This is an interesting process because usually you announce a tax as it comes in and, then, it just comes in. What we wanted to do is say, listen, we want to help support people with alternatives now, to convert now. What we would do is put this tax in the future and, hopefully, by announcing a tax this year, for 2011, people can make the changes necessary and we don't have to collect the tax. But the details of the tax will be worked out through Finance and will be presented to this House.

Mr. Cullen: Another point in this legislation was the plan to mitigate landfill emissions. I know the City of Brandon is working with or has had tenders from a number of companies that were interested in capturing emissions from the landfill there. I think it certainly can be a very worthwhile project. I know a number of the American states are doing it, and they're generating electricity from their landfill and it's proven to be very effective.

Also, what a lot of companies are able to do, or cities are able to do, is generate carbon credits through that process. I'm wondering if the minister is aware if that particular process is going to be available here in Manitoba, where, say for instance, the City of Brandon, by working with a private company, if that private company or the City of Brandon would be able to participate in the carbon credit trading.

Mr. Rondeau: I can inform the member opposite that we've been working with Brandon, the City of Winnipeg and other major landfill centres to discuss the capture of landfill gases. Landfill gases have a huge effect on the greenhouse gases. They're 16 times more potent than regular. It has to do with the methane gas. So what we want to do is work with the municipalities to capture and make sure that we're not letting this methane gas, which is 16 times more powerful than CO_2, actually get out into the atmosphere because it does make a big difference.

So, Madam Chair, we're working with Brandon, City of Winnipeg and other large landfills to do this. We want to capture entire credits. Because it's legislated, that's where we're going to go; we're going to capture, retire and meet our targets. After we've reached our targets, some companies, some groups, may look at ways of mitigating greenhouse gases and selling them. There will be a market in the future for some enterprises. I can't predict the future. I do know that as part of our strategy in the climate change bill, we want to move forward on capturing the greenhouse gases, retiring them, putting it against our target of three megatonnes. If we do this with Brandon, the City of Winnipeg, et cetera, on some of the major landfills, that's a huge component to our greenhouse gas reduction strategy.

***** (15:00)

Mr. Cullen: My question was specific about carbon credits. My question is, does the legislation that you have in place now regarding greenhouse gas emissions on landfills, does that legislation preclude a company from now trading those carbon credits that have been captured from landfills?

Mr. Rondeau: It's our plan to capture and retire those credits against our greenhouse gas reduction targets, against the government's greenhouse gas targets.

Mr. Cullen: Well, I don't want to put words in the minister's mouth, but what I think he is saying is that this legislation now precludes companies from trading those credits. Is that what the minister's saying?

Mr. Rondeau: To achieve our targets, we would have to capture the greenhouse gases from these disposal sites and retire them and not trade them, put them on the market.

Mr. Cullen: So I am hearing you say that no, you can't trade those carbon credits on the market. Is that what the minister's telling me?

Mr. Rondeau: I'd offer the member a briefing on how you can capture and retire the credits. It's part of our plan to take these credits that are being decreased from the greenhouse gases from the refuse sites. It's our plan to take those, capture them and retire the credits so that they're not part of the open market.

We also have got a Web site up and running which was developed by my branch, the Canadian Standards Association and other partners which is talking about how individuals can take action, where they can actually capture, record and then eventually maybe trade on the open market. It is the government's intention to capture the greenhouse gases from these sites and retire them against the climate change actions in our plan. Right now it's part of our plan to capture and retire them and not sell them on the open market.

Mr. Cullen: I will follow up directly with the minister on that just for clarification, but I think what he's done, or what the department has done with this legislation has precluded any private company that wants to come and do business in Manitoba the opportunity to do what's environmentally right, and, secondly of all, to actually generate some income from that by doing what's right. So by doing what's publicly perceived as doing the right thing in legislation, may not, in fact, in big picture, be helping the environment because we haven't seen any move on Brady Landfill in terms of catching gas. But if the opportunity was there to look at recovering some dollars with carbon credits, we know the carbon credits are going to increase in value. That's certainly the suggestion once everything comes into place. So I'm just wondering why the minister would preclude the opportunity for entrepreneurs to make money.

Mr. Rondeau: Madam Chair, one of the things we have is, we have a plan that is moving forward to reduce about three megatonnes. The things that are in our plan–it's a public document, it's on the Web site–it has lots of opportunity to reduce greenhouse gases.

There's a difference between the greenhouse gases that we're going to take. We're going to help work with different groups and put them and retire the credits and actually move forward and take the credits out because you don't want to take the credits and double count them. One of the things we found out is the whole greenhouse gas exchanges, we wanted to make sure that we have a process where we legitimately take, capture and retire three megatonnes. We don't want them to be double counted.

There are huge opportunities for entrepreneurs to come in and work in areas that we haven't prescribed in legislation or regulations, Madam Chair. There's huge opportunities for entrepreneurs to work in sites that the government doesn't have in its specific plan. We want to have entrepreneurs come to us and look at options. We're very open to work a new partnership with people who have ideas on how to reduce greenhouse gases and make some money and create jobs, because, as we mentioned before, we believe that being environmentally green can create economic activity. So if an entrepreneur comes to us with an idea on (a) moving forward with a project and (b) making money on it and (c) cutting greenhouse gases, we would definitely listen to him or her and we would also try to work with them.

However, if we have as part of our plan or part of our legislation, that we're going to retire certain credits, because if we legislate it or regulate it, then we cannot sell it; we have to retire it. So that's part of the WCI, that's part of the agreements that are being developed nationally, that if we regulate it, then we own the credits and we retire the credits.

If, and there will be lots of areas for entrepreneurs to work in, they want to go in and do other areas that we haven't regulated or we haven't legislated, not only are we welcoming them to do that, we encourage them to do that. We will actually help facilitate some of their actions. So that's where we want to go.

An example of where we could go are wind farms. They're very, very green, and in the case of the wind farms, Hydro is open to use the credits in any way to allow the best deal on power.

***** (15:10)

Another example is geothermal heat pumps. If I wanted to go and get all those people–in some cases, if they've gotten subsidies, they've sold the credits. In other cases, people have an opportunity to sell my credits. So, if I wanted to take the four tonnes of credit that I have in my house because of my geothermal heat pump and sell them on the open market, I could do that and get my $16 this year.

But these are all opportunities in the future. I wanted to let the member know that we'd encourage third party entrepreneurs to come into areas that we haven't regulated or legislated.

Mr. Cullen: Well, this isn't a thing of the future; it's happening now. Just read one report here, the Chicago trading index traded 69.2 million metric tonnes of CO_2 emissions. That was in 2008. That's increased 363 percent from 2007.

Now, we've got people and companies involved in signing up agriculture producers for carbon credits. Quite frankly, it can be pretty substantial. I just read an article where one company paid $20 million on contracts to 2,100 farmers between 2003 and 2006. So obviously those figures last year would certainly be more significant than that. Some of these farmers are Manitoba producers, and there's people out there now trying to sign up these producers for aggregators to turn around and do some carbon trading.

So, I think we, as a province certainly have to move this forward. I know we're involved with the Western Climate Initiative. How soon are we, as a group, going to be organized so that we can actually say, here's the process, here's the way we think it's going to work and Manitobans have a crystal clear market to go to?

Mr. Rondeau: I agree with the member opposite fully. I think that there's a huge opportunity for not only ag and forestry, but ag and forestry are two huge areas that they could get credits. There's others: energy efficiency. There's other companies, manufacturing companies that also may have huge opportunities here to produce offsets and be able to acquire credits and sell them.

Now, we've done one thing that's very, very interesting is because we know that this is an evolving industry. We know that at times, people weren't sure whether the credits were real, whether they were sold one time or 10 times. So, what we did is we worked with the Canadian Standards Association and other partners to develop a green registry. What this green registry does is it's–and I'd encourage the member opposite to go to it because it basically gives the person who has got this idea or what they want to do, they then can go to the Web site, sort of put in what they've done and get an example of how many tonnes of greenhouse gases they actually have.

It's the first step of understanding what you can do to mitigate your greenhouse gases. It's the first step that actually counts greenhouse gas reductions, verifies them and sort of says, okay, this is your number. This is how many greenhouse gases you are eliminating. Then, when you sell them, you're actually selling something that's counted and verified. Then, hopefully, down the road people will be able to aggregate these and sell them and these will have real value because it's no longer the wild, wild west.

We actually work with the Canadian Standards Association to make sure that these are real credits, they're sold once, they're counted once and they're verified. So, we've actually got that Web site up and running. I'd encourage you to go. If you have suggestions about it, we'd be happy to work with you on some of your suggestions.

But, yes, there will be huge opportunities to trade. The how and where and what and when is evolving. With Obama being the President of the United States, things have been moving very quickly. As part of the Western Climate Initiative, we've worked with a number of people, former governors, et cetera, that are moving forward on this file. So we believe that the rules on trading–we've been at the table for a few years, about five years now, and what we want to do is, we want to be there to talk about how the rules are established, what's counted, what can be retired, how they're retired. We've been there and we dealt with this. So we're happy that we've been at the table. We think it's a huge opportunity and I fully agree with the member opposite that this is a huge economic opportunity for Manitobans, because they get it. The first step is the green registry which is up and running and is available now.

Mr. Cullen: Okay, just so I'm kind of clear on where the minister is headed here, Manitobans will be signing up on the registry and this way the Province can monitor how many greenhouse gases are saved. Ultimately we're going to be able to put a figure on that, tonnage-wise. So then the Province will use that figure in terms of reducing–this is the amount of greenhouse gas that we've reduced as a province, and then will the Province take those numbers, whatever value that is, and then sell that on the market? Is that how this is going to work?

Mr. Rondeau: The registry is not meant to count what government's doing. We actually have a plan where we're going to actually take actions ourselves, capture greenhouse gases, like from landfills, and retire them. That's part of the government plan.

Separate from that, individuals can take actions. So what this Web site's done is it's allowing individuals to register, verify and sell on their own, their greenhouse gas reductions. Of course, it does affect the amount of greenhouse gases Manitoba emits but what we are going to do is we're going to reduce our greenhouse gases by 3.1 megatonnes to get down to Kyoto, which is 6 percent below 1990 levels, which we legislated.

Mr. Cullen: Bill 30, the bill that says we're not paying down our debt, part 14 of the bill relates to The Waste Reduction and Prevention Act and the wording is pretty vague here but maybe the minister can try to explain to me how he thinks this amendment to The Waste Reduction and Prevention Act is going to work so I have an understanding of–I understand we're going to be taxing garbage, if you will.

Could the minister fill me in on the process, how this is going to work and how it's going to improve the recycling in the province? I know we've got a long way to go in terms of improving our recycling here in the province. So if the minister can tell me how the process works and how it's going to improve–how it's going to get less garbage in the landfill, and how it may improve our recycling here in the province?

***** (15:20)

Mr. Rondeau: This part of the bill is adding garbage tax of $10 a tonne, details of which are being worked out through Finance and IGA, et cetera. It's the intention of this part of the bill to collect the tax and utilize or enhance recycling activities in the province, enhance waste recovery by using this fund to improve what's happening as far as recycling.

So we're going to charge tax on the garbage. The municipalities will continue to work with our government and my department and IGA to enhance recoveries. And so it's meant to help provide financial assistance to municipalities, to fund recycling activities and increase our numbers. Examples that we've done in the past are we want to continue to work with our partners as far as the e-waste recovery, and we did a very good job of collecting almost a million kilograms of e-waste in the last couple of years, getting more deposits, longer hours, et cetera. We just worked with our partners to do a phone and small electronics pick-up, but what we want to do is take this revenue and work to enhance recovery and thus have less unwanted items go into the landfill.

Mr. Cullen: Who's going to be paying the tax? Is it municipal corporations that are going to be paying the tax for how much garbage goes into their landfill? Is that how the system's going to work? The Province is going to bill the municipality for it and then collect the money and then turn around and give it back to the municipalities for a recycling program?

Mr. Rondeau: The departments of Finance and Intergovernmental Affairs are going to be working through the details with the municipalities, et cetera, to make it an effective system. As far as the usage of the revenue, we want to enhance the recyclable system and the amount that's recycled. Although we pay 80 percent of the bill for the recycling, which is the highest, I understand, in Canada, so our share is 80 percent, municipalities 20 percent, we think it's really important to divert unwanted products into the landfills, so we've gone out and worked previously on things like composting programs with the City of Winnipeg and others. We've worked on e-waste collection and other things, and we want to continue to enhance the recoveries.

I know that Conservation's been working on other printed paper and packaging regulations. That's part of their efforts. We want to continue to work on diverting waste into landfills, and we think by having this revenue source and working with the municipal governments, we can actually increase the amounts that are diverted from landfills.

Mr. Cullen: Well, I'm certainly interested to see how this is going to work. I guess time will tell how that plays itself out.

Just changing gears here, there's been very little discussion lately about wind farms in Manitoba, wind energy production. It sounds like it's kind of fallen off the radar, and I know the Province has made a commitment to increase wind energy production here in Manitoba, and, clearly, as the price of hydroelectricity goes up, I think the economics of wind farm production started looking better and better all the time. It was our understanding that there was going to be a wind farm in St. Joseph, but we haven't heard anything about that for several months. I just wonder if the minister can advise us where that particular wind farm development's at.

Mr. Rondeau: Madam Chair, the issues between Babcock & Brown and Hydro have been moving forward, and we have got the St. Leon wind farm up and running, the 99 meg wind farm. We have announced that Babcock & Brown and Hydro are working together to finalize all the issues.

One of the issues is a financial issue; trying to borrow money, move projects forward, and this economic time has been complex. It has been a large issue. But, so far, the project is on track for 2011 in-service date.

However, there are issues, as far as trying to get the project financed, move forward and get a very complex and, I understand, one of the largest wind farms in North America, up and running is an interesting complex issue.

I'd like to let the member know that our government is committed to wind, and we are committed to green energy projects. We will continue to build dams. I know that we believe in building dams. We believe in expanding hydro. We believe in wind farms. In fact, we just announced, just a little while ago, assistance for solar walls, and we have assistance for geothermal programs.

So, we do believe energy has a huge benefit, and we will continue to work with partners to try to develop all green energy sources that we can because we believe that it is truly a feather in our cap and a huge potential in the future.

Mr. Cullen: I know Obama is certainly making waves in the United States in terms of some of the announcements he's been making, Madam Chair. He seems to be keen on alternative fuel sources. I know he mentioned here, the last couple weeks, that wind power can generate 20 percent of the country's electricity needs by 2030 and would add 250,000 jobs. So he's certainly keen on the prospect of that.

Are the Province and Manitoba Hydro committed to the St. Joseph's project, or is there potential for another RFP process, or is that kind of where we're at right now?

Mr. Rondeau: I'll try to answer your question and refer the member to the standing committee for Hydro, if you have further questions.

But, I understand Babcock & Brown and Hydro are committed to the project and are working very much toward the 2011 in-service date. We've also made a commitment, public commitment, as a party, to 1,000 megs of wind, which would be about 20 percent of our current capacity.

The other thing I'm pleased is that President Obama is talking about green, meaning environment creating green, which is jobs. It was interesting, in his second speech, he talked about demand-energy projects, which is energy savings, as being a huge driver; like getting energy efficiency, insulation and home renovations. It was a wonderful speech. I was at the Y and I was cheering for him because I thought it was great, because he talked about ethanol and biodiesel being used as economic drivers and green things. He talked about demand-side energy efficiency. Again, the same thing. He talked about new energy sources. He mentioned wind. I believe he also mentioned geothermal.

***** (15:30)

I think that what he's doing is saying that by changing the economics, by changing green, you can create economic activity, and this government has been saying exactly the same thing for five years. It's interesting to note that some of the major names in the field have said that it's important to be early adopters, because if you're early adopters of technology, of green manufacturing, et cetera, like geothermal, then we can sell that production to the world.

By the way, we have two manufacturing plants. We have a training course. We have all that nailed, and we are exporting geothermal technology through many countries in the world. So, that's a perfect example. Now, we have a head start in the U.S., and we're working very hard to move some of these initiatives forward. I believe that it's the right strategy, and I'm glad that Obama is following Manitoba's lead.

Mr. Cullen: Madam Chair, I don't know if the minister has had any discussion with Elton Energy, a group just outside of Brandon. They were certainly interested in the concept of having community wind. I know they're certainly interested. I imagine they've had a proposal to the minister. They're looking at wind production on a relatively smaller scale, where the community can get involved and some of the profits could go back to the community. I'd just like to get the minister's comment on Elton Energy, in particular, and, I guess, in general terms, some of the other opportunities that might be there to generate power on a smaller community base.

Mr. Rondeau: Madam Chair, we've been in regular contact with Elton Energy and a number of other organizations or people who are interested in wind energy. The member might know that we–during the expression of interest, there were multiple people that expressed interest in participating in the wind RFP.

Not only that, but we've had many, many people and organizations contact my branch. They've been very busy in responding to different inquiries, and I anticipate because this is a growing industry, the inquiries will continue. Our dialogue will continue, and we'll try to roll out further wind projects with Hydro in due course.

What's nice about it is that people are excited about this industry, as I am, as the member opposite is, and I think what we want to do is help facilitate that. I'd like to compliment the staff at the branch because, although it's a smaller part of the branch, they're very, very active and very responsive to the inquiries.

Mr. Cullen: I think we have to view this energy development in broad terms. I don't think we have to think narrowly that it has to be a wind necessarily. I think there are other opportunities out there. I've visited some hog barns where they're doing some innovative things where they can generate electricity from the gas and clean up the waste water, if you will. It's very effective, and I just think we should be doing more to try to get those types operations off the ground.

I think, you know, if there's a will by government to get the job done and there's a willingness by Hydro to purchase that electricity at a reasonable rate, I think we should be looking at that. It's a tremendous economic opportunity for rural Manitoba.

Mr. Rondeau: I agree with the member opposite. There are all sorts of opportunities in different sectors. An example was the solar air heating potential. We just announced the GTEC, which is basically a tax credit to have solar heat used in hog barns. There are other options, and what we want to do is, as more and more options come around, as the technology changes, we want to work with companies to utilize the technology and utilize things like tax credits.

An example was the GTEC applicable to geothermal–which is a good industry in Manitoba and very well adopted. So now, we have expanded just recently, we were talking about the solar air heating. I was at, I think it was Assiniboine Credit Union, and they had a great little solar wall and it worked great. We talked about the importance of the return on investment and the GTEC on that Manitoba technology, Manitoba utilized and manufactured. Parts of those components, they were in process and they are now utilized or can utilize the tax credit, the green energy tax credit.

So I agree with the member. There are lots of things coming down. We're going to continue to work with industries and individuals who come up with ideas and there are lots of opportunities. We'll try things. We'll try to work forward to save energy and save money and reduce greenhouse gases.

Mr. Cullen: I appreciate where the minister's going here and I do know there are some tax credits for different things out there, but I think if the private sector is going to get involved in this, they would like to see some incentive financially besides just a tax credit. Like if they knew that they were going to generate electricity–by whatever means it is–and they knew they were going to get paid so much a kilowatt at the end of the day, it's pretty straightforward, pretty neat and tidy and clean. You just put it through the meter and the meter tells you how much electricity you're generating and, at the end of the day, here's your cheque for generating. Manitoba Hydro can take that electricity, turn around and sell it and hopefully everybody makes a little bit of money at the end of the day.

Mr. Rondeau: Actually, Hydro has a reverse metering policy, which means that people can eliminate their whole Hydro bill and actually get paid from Hydro if they have some projects that create electricity. That's in place now. It's in policy now. If a person wants to get a windmill, put it up on their farm, first they can eliminate their entire energy bill and then they get paid from Hydro.

There are some rules on connectivity, et cetera, but that policy is in place now and I would encourage people–I hope my neighbour doesn't put in a big wind tower, but beyond that, people can put in–they have to follow normal municipal by-laws; they have to follow normal practices. We hope that they work with others and Hydro to make sure that the connectivity is appropriate. What we want to do is encourage people to talk to our department and we will help facilitate these things with Hydro to see how they can integrate to the grid and get free electricity or maybe make some money.

Mr. Cullen: Other jurisdictions have gone so far as to implement feed-in tariffs so that there's an actual structure of what an individual or a company would get paid based on however they're producing it, so solar would be a certain rate, methane recovery could be a certain rate, wind energy would be a certain rate. Just wondering if the minister or the department has considered going so far as to establish a feed-in tariff and structure such as that.

Mr. Rondeau: If the member opposite would like to suggest one that the Conservative Party would adopt and like to suggest that we implement, I'd be open to receiving a written copy of what your policy would be. Right now, we have a policy of net metering which means you pay off the bill and then sell at a specific prescribed price to Manitoba Hydro.

***** (15:40)

Mr. Cullen: Well, talking about electricity, how about nuclear energy? We know there's certainly a demand for energy in Ontario and a growing demand in Saskatchewan. Those provinces are all talking about nuclear energy. It certainly sounds like Saskatchewan is really gung-ho and having some very positive discussions, I understand, looking at a fairly sizable facility somewhere in Saskatchewan.

So I just want to get the view from the minister. Is that an opportunity for us here in Manitoba or does he see that as a bit of a threat to Manitoba?

Mr. Rondeau: The member might know, right now, we're working on Keeyask, Conawapa and other dams, Wuskwatim. What we want to do is we want to develop those dams. Dams are very cost-effective because you build them. If the member has ever been to Norway House, I had the opportunity to live in Norway House for three years. You notice that these dams are rock, made of granite; they're miles long and they're there for a long time. So you make the investment; you get a huge return. So we believe in the hydro dams. We have three planned which, again, will be utilized for export sales, which is great revenue, which is wonderful.

We also have one wind farm. We're working on the second wind farm and others are going to be proceeding as time goes on, Madam Chair. We also have demand-side energy efficiency programs. So we are exporting a lot of electricity. We continue to build dams. We continue to work on wind farms. We want to do this. So that's where we want to go right now.

Other jurisdictions might not have the hydro potential we have. We have a huge hydro potential. I know when I talk to the energy ministers in Alberta and Saskatchewan, often, they comment on our huge potential and what we have. We're already exporting tonnes of electricity. Well, I guess it's not measured in tonnes. We export lots of electricity.

We believe that's a positive step. Already we are working to put strategic investments in that are paid back by export sales, that are paid back by consumers, generally, in other states or provinces. We're working with other states and provinces to improve connectivity and improve transmission lines. What we want to do is actually have it so that we have opportunities in the future.

Now we have chosen to go solar and wind and energy efficiency. That's our choice. Other governments might choose to do other things. We believe that we have a very green energy plan, and it seems to be resonating with a lot of people because they're saying that our plan makes sense. So that's where we're headed right now.

Mr. Cullen: Well, the minister made reference to a grid. Obviously, Bipole III is certainly the next one on the radar. Where do we have to go next in terms of a grid, though? If we're going to be exporting, what has to happen next? Are we looking at a line south, east, west? From your department's perspective, what has to happen next?

Mr. Rondeau: Although that's a question for Hydro, I can say that we're always looking at export opportunities wherever we can get good money, I understand, from hydro.

Mr. Cullen: Okay, I see we're not going to get too far down the line on this one. Mr. Obama just announced some pretty major undertakings in the ethanol side of things. He's certainly hanging his hat on ethanol and possibly new ways to produce ethanol. Where are we at here in terms of our mandate, and is there room for expansion here in the province in terms of the ethanol industry?

Mr. Rondeau: Madam Chair, the ethanol mandate has been 8.5 percent of the pool average that's been implemented. So, right now, 8.5 percent of the pool average is ethanol.

We're working towards a biodiesel mandate. We have been very active on both files to (a) create economic activity, (b) greenhouse gases, and (c) to make sure that we actually have people employed in Manitoba here. So we have been working on those.

Of course, there are always opportunities for expansion, depending on people's cost benefit analysis, what they want to do to invest, et cetera. Again, the department has been very proactive and responsive to people's concerns and interests in this area. It's an area that does get good greenhouse gas reductions and does reduce the dependency on fossil fuels.

Mr. Cullen: So you're saying that we are meeting our mandate? If so, is there a report that the department puts out on an annual basis, just so we know the facts and figures and the production and all that?

Mr. Rondeau: Madam Chair, I'd like to let the member know that we've been on 8.5 percent pool average for a while now. At first, it was just a 5 percent pool average working with the companies to implement it. We can get all the details together and send him the information on this, if you wish. Basically, we worked with the industry to do an 8.5 percent pool average because then it's easier for them to work with the mandate. As we put in the mandate, we wanted to make sure that we were working with the companies to do an achievable target and implement it in a very effective manner.

I'm pleased to say that the work of the staff with working with the companies did a very good implementation. In fact, it was so smooth no one took any notice of it, except we do have the report on how much ethanol is being used and we do have the 8.5 percent pool average now.

Mr. David Faurschou (Portage la Prairie): Madam Chairperson, I appreciate the opportunity to ask the minister a couple of questions as it pertains to recycling.

I know it was mentioned by the honourable minister that when I brought forward a private member's resolution regarding a deposit return system in Manitoba, being that Manitoba is the only jurisdiction in Canada that does not have that type of regime in place for beverage containers outside of that of beer bottles, and the minister's response said that it was coming and to just be patient. I'm wondering when that program is going to be coming forward and how the minister envisions the program working.

***** (15:50)

Mr. Rondeau: I'd like to thank the member for the question. I'd like to let the member know, through you, Madam Chair, that the multimaterial product stewardship initiative is moving forward. The regulations have been approved and moving forward. It's taken from the current government-funded central system to an industry-led program that has targets for recovery rates and the government will continue to work with the industry to ensure that we are achieving these targets and moving forward on the whole recovery.

Letting the member know that this is an interesting topic because just yesterday or the day before the Minister for Conservation (Mr. Struthers) was talking about an industry-led initiative to recycle and dispose of cellphones and BlackBerrys and other hand-held devices. So this is coming where more and more the industry is leading the retirement and the appropriate disposal of these commodities, whether it's bottles or whether it's cellphones or whatever. The printed paper and packaging regulations have been approved. They're moving out and discussions are happening with industry as we speak.

Mr. Faurschou: Well, then, is it the fact that the government is going to provide for enabling legislation whereby the industry can make a surcharge collection, if I'm using the correct terminology? There's an environmental levy currently collected by the government already on pop bottles. Is this money that is collected by government currently, is it going over to the industry organization that you speak of so that they can use those resources in order to facilitate the program of which he speaks?

Mr. Rondeau: Within the next six months the industry is building a business plan looking at the regulations that have been developed and published and are public now. The Minister of Conservation (Mr. Struthers) will review the business plan, work with the industry-led consortium on how the industry will fund it. There are some programs currently that don't have a fee. I just mentioned that there is the cellphone and personal electronic device, BlackBerry, et cetera, that is totally industry funded, so they have taken it upon themselves to be good stewards of the environment.

So they actually even have it where you can go to the Web site, which I did, and print off an address label that's prepaid that you can actually mail in at no cost and then your old cellphone gets disposed of appropriately and isn't landfilled. So there are a lot of models, but right now the industry-led consortium in each case will look after it, will develop a business plan, and develop a plan on how to dispose and collect these items, and then move it forward. They all have targets, and the Minister of Conservation will be dealing with the industry so he can go into more details with you on that.

Mr. Faurschou: Where I was going with this is just to have the minister's assurance that the monies collected by government currently that go into the Manitoba Product Stewardship Corporation at the present time, are they then still going to be collected and made available to the new entity? It's something that is always questionable with change as to whether or not the government's going to still keep collecting the money and it won't pass the monies on. So I'm looking for the minister's assurance that whatever resources that are being paid into the government and currently passed on to the Manitoba Product Stewardship Corporation will continue to do so.

Mr. Rondeau: These regulations will be moving forward. They have moved forward as far as the printed paper and packaging. They will supersede what's currently there, and the business plan that the industry will come up with will have financial arrangements and suggestions and comments and then financial decisions will be made from there.

Again, it's not my purview to talk about the levy. We in Green Manitoba are responsible for trying to enhance the collection and diversion of items out of the waste stream, so we'd be involved in the electronic waste pickups; we'd be involved in other activities, but we really wouldn't be involved in the regulation of the industry. That's the Minister of Conservation (Mr. Struthers) and I'd have to respectfully say the business plan's approved by the Minister of Conservation, not this department, although we are in dialogue with them because Green Manitoba is trying to divert waste from landfills. So we have that as part of our mandate. The regulation is with the Minister of Conservation and the business plans are approved by the Minister of Conservation. I don't approve them.

Mr. Faurschou: Well for me it's confusing insofar as you're responsible for the regulation, then he's responsible for the implementation, a colleague of his, and you keep on going around this merry-go-round and ultimately nothing happens.

So, anyway, I do want to, as a–pardon the pun–wrap-up question on recycling: Is the department looking at contingency plans to be able to wrap up the operations that are currently under way in recycling? This current situation, and I'm sure the minister is appreciative of, is very grave. Much of what is being collected in the blue box, green box programs throughout the province is going directly into storage, and if the minister is not aware of that, he could call up any recycling corporation that is active in the province and he'll be well informed by that call. So if the minister is wanting this program to go over to industry, and right now the government is responsible for current activity, it is incumbent upon government to make sure that they're going to pick up the mess that is currently in building, and I would like to ask the minister to give that assurance to the corporations engaged in recycling here in the province of Manitoba currently.

***** (16:00)

Mr. Rondeau: Madam Chair, I'd like to thank the member for the question. Here's the transition. The current program is under the purview of the Minister of Conservation (Mr. Struthers) and the Conservation Department. The transition to the new program and writing the regulations, the discussion on the regulations, is the purview of the Minister of Conservation.

The current program and the new program are under the Minister of Conservation so that's that minister's area of responsibility. The plan, the new programs, as they're transferred from the current to the new system will now, and the implementation and some of that, now goes to the department, Green Manitoba, et cetera. The current program, Conservation, the transition, Conservation, when it goes to an industry-led model, which we're moving towards, it's going to go more to this department. It will be an industry-led operation. It will have specific targets. It will have specific collections, but that doesn't mean that things like the blue box system are automatically wiped out. They might add to the blue box. They might utilize the blue box in Winnipeg in other areas. The interesting part is that there's already a tire stewardship program, there's already an oil program collecting used oil, motor oil, there's printed packaging and paper regulations that are out now, and there's others.

I explained the member the telephones, et cetera, the electronic waste we have been running because it's a program that we believe that's important to divert from landfill. So, we're running it, and a million kilograms is a lot that we collected in the last two years. Last year, it was about 660,000, about 700,000 kilograms. I might be off by a little bit because I'm using my memory, but basically we're moving from the two-cent levy on pop bottles to a new industry-led model that will come up with a business plan to the Minister of Conservation, the transition to the Minister of Conservation and the industry-led model that we then become involved in.

Mr. Cullen: Madam Chair, I want to just take the opportunity to thank the minister and his staff for the last couple of days and thanks for attempting to answer most of the questions. Thank you very much.

Ready to go line by line, Madam Chairperson.

Madam Chairperson: Is the committee ready to starting passing resolutions? *[Agreed]*

Resolution 18.2: RESOLVED that there be granted to Her Majesty a sum not exceeding $5,971,000 for Science, Technology, Energy and Mines, Energy, Climate Change and Green Strategy Initiatives, for the fiscal year ending March 31, 2010.

Resolution agreed to.

Resolution 18.3: RESOLVED that there be granted to Her Majesty a sum not exceeding $21,932,000 for Science, Technology, Energy and Mines, Science, Innovation and Business Development, for the fiscal year ending March 31, 2010.

Resolution agreed to.

Resolution 18.4: RESOLVED that there be granted to Her Majesty a sum not exceeding $33,286,000 for Science, Technology, Energy and Mines, Manitoba Information and Communication Technologies, for the fiscal year ending March 31, 2010.

Resolution agreed to.

Resolution 18.5: RESOLVED that there be granted to Her Majesty a sum not exceeding $12,055,000 for Science, Technology, Energy and Mines, Mineral Resources, for the fiscal year ending March 31, 2010.

Resolution agreed to.

Resolution 18.6: RESOLVED that there be granted to Her Majesty a sum not exceeding $8,555,000 for Science, Technology, Energy and Mines, Costs Related to Capital Assets, for the fiscal year ending March 31, 2010.

Resolution agreed to.

Resolution 18.7: RESOLVED that there be granted to Her Majesty a sum not exceeding $5,225,000 for Science, Technology, Energy and Mines, capital investment, for the fiscal year ending March 31, 2010.

Resolution agreed to.

The last item to be considered for the Estimates of the Department is item 1.(a) Minister's Salary, contained in Resolution 18.1.

The staff having left the Chamber, the floor is open for questions.

Resolution 18.1: RESOLVED that there be granted to Her Majesty a sum not exceeding $761,000 for Science, Technology, Energy and Mines, Administration and Finance, for the fiscal year ending March 31, 2010.

Resolution agreed to.

This concludes the Estimates for this Department. The next set of Estimates that will be considered by this section of the committee are the Estimates of Intergovernmental Affairs.

Shall we recess briefly to allow the minister and critic the opportunity to prepare for the commencement of the next set of Estimates? *[Agreed]*

Committee is in recess.

The committee recessed at 4:07 p.m.

The committee resumed at 4:15 p.m.

INTERGOVERNMENTAL AFFAIRS

Madam Chairperson (Bonnie Korzeniowski): Will the Committee of Supply please come to order. This section of the Committee of Supply will be considering the Estimates of the Department of Intergovernmental Affairs.

Does the honourable minister have an opening statement?

Hon. Steve Ashton (Minister of Intergovernmental Affairs): First of all, I want to indicate that during the consideration of Estimates we will obviously be dealing with issues related to the department and also to EMO, and what I wanted to suggest for consideration is that, if in fact we are in the Chamber and it's a bit difficult to circulate staff in and out, it might be appropriate if we can get some sort of indication in advance and make sure that the appropriate staff are available for the different components.

I do want to indicate that, in terms of Intergovernmental Affairs, I'm very proud of being minister of a department that probably has far greater impact on the lives of average Manitobans than most people realize. I'm very proud to be working with 198 municipalities in the province, have a very good partnership with those municipalities and with the Assembly of Manitoba Municipalities representing them.

I've always said that we are leaders in the country in many ways, and that's something that I know is echoed by our municipal leaders. We certainly have had a significant support to municipalities over the years. I have the numbers available if the critic is interested. I think it's been very noticeable, the increase, for example, to the City of Winnipeg; it's increased 66 percent since we came into government in 1999. We had a further 5.2 percent increase this past year, which is very significant. The 2009 provincial funding support will increase $4.5 million for other municipalities; that's 5.6 percent over 2008 levels.

The key element, of course, is the Building Manitoba Fund, the degree to which we share in growth revenues. I think that's been one of the most significant elements going back to the 1970s, the degree to which in Manitoba we do share with municipalities. That has had a very significant impact.

I do want to note the significance this past year of what we've been building on the last number of years in terms of transit funding. We reinstated the 50 percent share for transit funding for Winnipeg, Brandon, Thompson and Flin Flon. We also applied that both in legislation and in a direct funding announcement to rapid transit here in the city of Winnipeg. We consider that to be very significant.

We provide support for public safety, and I want to note this year the very significant new increase in funding for the Winnipeg ambulance services. I think it's important to note, by the way, that we are working toward the city's goal of having its share of EMS, cost 10 percent. I want to credit, by the way, the City of Winnipeg, also the firefighters. I met both with the fire chief, Jim Brennan, and with the firefighter union president, Alex Forrest, fairly early on in this, and met with Mayor Katz. They made a very compelling argument. I think it's important to note, by the way, the success of the combined fire-paramedic approach, which is providing excellent service to the city, and we are responding accordingly.

I want to note, by the way, the renewal of the Municipal Recreation Fund. We've already made a number of announcements in terms of municipal recreation and library facilities. That is extremely important, and we've worked with communities like Thompson, The Pas, Portage, Brandon and Arborg through the BMF funding.

We continue to focus in on infrastructure working with the Minister responsible for Infrastructure in the Department of MIT. I really want to say that we consider our investment in terms of municipal support to infrastructure to be very significant. There's almost $40 million in capital support that will flow to Winnipeg and, in fact, flowed early part of this year. We've accelerated funding for roads and bridges, part of our five-year, $125-million investment in transportation. That is very significant. If you combine that with a historic announcement of investment in rapid transit, you're seeing a tremendous commitment to infrastructure, and that's a commitment that's echoed throughout the province.

***** (16:20)

We're very proud of our work with communities across the province through Neighbourhoods Alive! It was expanded recently to Flin Flon, The Pas, Dauphin, Portage la Prairie and Selkirk. I want to indicate that we are having a tremendous amount of success in those communities, and we're already seeing some significant community-driven projects adding to the communities in Winnipeg and also in Brandon and Thompson that have been part of Neighbourhoods Alive! since 2000. We have been very much part of working towards economic development through the Winnipeg Partnership Agreement. I want to particularly note the excellent work that's been done in terms of the Aboriginal component. We're working with Brandon in terms of Renaissance Brandon, an excellent project that I think is visionary and one again that we support directly.

We are there in terms of the funding side, but we provide many other services. We're also focussed, obviously, on the tax affordability side. I want to note that we have seen a significant reduction in the net effect of property tax across the province. We've moved on the public education side, which I know members of the House will be aware of. We've increased our education property tax levy to $650 this year, and we'll be continuing to do that to $700. Very significantly, home-owners no longer play the ESL. We increased the Farmland School Tax Rebate this year, and we strengthened the tax incentive grant for school divisions. That's all important because obviously property taxes go to both municipal governments and to school boards, and we believe it's important to have a balanced approach.

We work with governments on their capacity. I want to note the excellent work that's been done by municipalities in terms of compliance with the PSAB, and I think it's very important to note the degree to which we are now working with municipalities on a review of provincial land use planning. We've seen some very significant challenges, but we think some significant progress in land use planning.

One of the key elements that we will be putting forward is redivision, particularly in rural and northern areas. I want to put on the record as minister that I believe that we have to ensure that our land use planning is helping ensure continued growth because there is growth in a number of areas in terms of rural population, but also to not only stop but to turn around the decline in other areas. So we have to make sure our land use policies are consistent with that.

We also have to ensure a sustainable land use planning. I want to note that there's been some significant progress there.

I just want to focus also very briefly on an area, and I'm sure that there'll be a number of questions during Estimates on, but obviously very much on people's minds, and that is in the EMO side. We did face some significant challenges this past year, particularly with the flooding that we have seen–I want to say, have seen–it's still receding in many parts of the province. We had a flood that was equivalent to the second highest in the last 100 years south of Winnipeg and north of Winnipeg. It was very much the flood of the century. I think it's important to note, by the way, that in 1950 a lesser flood resulted in a 107,000 Manitobans being evacuated and 10,000 homes being damaged. This year, much less damage, and it shows the value of our flood protection. We're going to be continuing to work on the flood protection at the recovery stage with the FA over the next period of time, and I would certainly welcome questions on that when we proceed to the question part of Estimates. Thank you.

Madam Chairperson: We thank the minister for those comments.

Does the official opposition critic, the honourable Member for Ste. Rose (Mr. Briese), have any opening statements?

Mr. Stuart Briese (Ste. Rose): Thank you, Madam Chairperson. Just a few opening comments. Obviously, from my background with municipalities and with the Association of Manitoba Municipalities, I have some understanding of how land use planning and any large number of the things that affect municipalities enter into this. I probably should do it at the end of the session, but I know the calibre of the staff that this minister has in his department and how good they are to work with over the years and still are. Even though I'm the critic here, I get very good co-operation out of them.

I heard the minister suggest that he would like somewhat of an indication of where we're going at certain times in this, and I would probably like to ask him what the breakdown is. That you want a separation of the EMO staff from the actual planning and municipal side of the staff, I presume, is what you're talking about, so I'll defer then. I know we're not going to have a great deal of time today, but EMO staff, then, I won't go with any questions on that today. Maybe at the end of the session we can take a look at where we may go with them. I do have a number of questions in that category. But, as for today, we won't touch on them. In fact, I think we'll only probably get through our openings.

I think that's all I need to say as an opening, so turn it back.

Madam Chairperson: We thank the critic for his remarks and, under Manitoba practice, debate on the minister's salary is traditionally the last item considered for a department in the Committee of Supply. Accordingly, we shall defer consideration of line item 1.(a) and proceed with consideration of the remaining items referenced in Resolution 1.

At this time, we invite the minister's staff to join us in the Chamber, and once they are seated, we will ask the minister to introduce the staff in attendance.

Mr. Ashton: Madam Chair, if I could introduce globally both the staff at the table and the staff that are available in the gallery and will be part of the Estimates consideration over the next whatever period of days. They are Linda McFadyen, Deputy Minister; Laurie Davidson, Assistant Deputy Minister, Provincial Municipal Support Services; Claudette Toupin, Assistant Deputy Minister, Community Planning and Development Division; Denise Carlyle, Executive Director, Municipal Finance and Advisory Services; Brian Johnston, Chief of Financial Services; Beverly Kachanoski, Manager, Human Resource Management Services; and Lee Spencer, Director of Recovery, Emergency Measures Organization.

Madam Chairperson: Does the committee wish to proceed through these Estimates in a chronological manner, or have a global discussion?

Mr. Ashton: I'm quite open to whatever suggestion the critic has, but we're certainly assuming that it will be global, with perhaps some separation between EMO and the department, just in terms of make sure we have the right staff available.

Mr. Briese: Yes, that's suitable for me.

Madam Chairperson: It is agreed to go global. The floor is now open for questions.

Mr. Briese: The first number of questions I'm going to ask are strictly, I think, basically internal questions and ones that we ask most years, I believe.

First off, I'd like to know how many staff actually work in the department and then, secondly, what your absence level is, like, what's the percentage of positions not filled?

Mr. Ashton: Full-time positions are 286.13, and in terms of current vacancies, that's if I could provide the information as of March 31–so as of March 31, 2009, the total vacancies were 18.3 FTs, that's a vacancy rate of 6.4 percent. Once again, the total FTs as of April 1, 2009, were 286.13 FTs. That includes regular and term, and if the member wishes a comparison, this compares total vacancies at March 31, 2008, of 19.2 regular FTs for a vacancy rate of 6.8 percent. So the vacancy rate is slightly lower than last year.

***** (16:30)

Mr. Briese: Can you give me a description of any positions that have been reclassified in the past year?

Mr. Ashton: Just to indicate there were eight positions reclassified in 2008-2009. That's six existing positions and two new positions that were actually classified, and there was a senior policy adviser, an administrative secretary in the deputy minister's office. I don't think the member wants the specific recalculations, but I'll maybe provide just a description of positions, and I can explain any of the details. Director of Recovery and director of emergency operations, the EMO office; policy planner in the Provincial Planning Services; administrative officer in the Municipal Board, and two neighbourhood planning project officers–these are two new positions in urban development. So, once again, there were a total of eight positions that were reclassified to varying, different levels in 2008-2009.

Mr. Briese: Have there been any positions relocated in the last year, for instance, from rural or northern Manitoba into Winnipeg or relocated in other directions, and why were they relocated?

Mr. Ashton: No.

Mr. Briese: Next question and this is on the minister's out-of-province travel. Has the minister taken part in any out-of-province trips in the last year, and what are the details on such trips?

Mr. Ashton: I attended the FCM back in 2008; that's May 29 to May 30. I also have been to Ottawa. Actually, I initially went to Ottawa in March to meet with Minister Van Loan in advance of the spring flooding that took place. I have since then met with Minister Van Loan, Minister Toews, and also met with Minister Strahl in Ottawa as a–I shouldn't say post-flood because we were still dealing with some flooding, but on flood recovery. Those are the three names over the past year.

Mr. Briese: Does the Intergovernmental Affairs Department have an annual advertising budget, and, if so, what is it?

Mr. Ashton: There is not a specific item in terms of advertising. Obviously, there would be–there are on occasion advertisements that are done. I can maybe undertake to try and pull that together, but there's not a specific line item for an advertising budget. Perhaps maybe by tomorrow at 10 o'clock, I'll certainly get a bit of a summary.

We do have AMM publications, probably the main aspect that's consistent on the advertising side, but if the member wishes, I can try and pull something together tomorrow with a bit more detail.

Mr. Briese: I'm a little more interested in possibly similar campaigns that maybe kind of run by the department–something like the budget ads that were run by the Department of Finance. If you do any of that in your department, or specifically, what kind of advertising do you do? I was aware you did the AMM, but whether there's more that comes through your department.

Mr. Ashton: We have done some public education through EMO, which is consistent with EMO's role not only in terms of response to disasters, but also in terms of public education. Again, I'll get some of that detail for the member tomorrow. Outside of AMM, we really–other than the occasional ads maybe related to specific meetings and processes that we have–don't have a specific advertising line item budget for the department per se.

Mr. Briese: I think I'll move on here. It appears to me that, when I go through the Estimates book, the budget for your department is down somewhat. I come up with about 11 percent. Is there a specific block of funding that was moved to another department, or am I accurate with that?

Mr. Ashton: The simple explanation is the fact that we advanced money to the City of Winnipeg as part of our funding commitment to the City of Winnipeg in the previous fiscal year. Of course, the City of Winnipeg has its own fiscal year, so whether it's transferred to the City in the previous or current fiscal year, it has the same net impact to the City and funding is up for the City. That was essentially the difference on the print over print, the degree to which we advanced funding to the City in the last fiscal year which will, of course, allow them to finance their activities through their fiscal year, which, I believe, is a different basis than ours.

Mr. Briese: So is that capital grants that are advanced, or what are the advances? What specifically are the advances?

Mr. Ashton: It was a mixture. Part of it was the roads funding, which is capital. There were some unconditional grants as well that were advanced to the City as well. Rapid transit was the other one again, which is capital, but it reflects accounting treatment that's similar to our 50 percent operating cost share that we have with the municipalities. So it was a combination of capital and regular grants that were cash-flowed to them. Of course, it won't impact their fiscal year, they have a different fiscal year. But that's the reason for the difference print over print. There's no actual difference in programming or level of support. It's just the year in which the support was spent, so it was actually advanced to the City in the previous fiscal year. That explains the difference in the print over print in the Estimates this year.

Mr. Briese: So that would translate, then, into the–financial assistance to municipalities appears to be down, but it's because of advances, then. Is that what I'm hearing?

Mr. Ashton: The total of advances to Winnipeg was $45 million, and that included 25 million. I'll give the specific numbers here for the member: for roads capital, 15 million unconditional; and 5 million for rapid transit. So the member's quite correct.

There's no reduction of program, no reduction in funding. What this simply reflects is our fiscal year in which the money was transferred to the City, and again–the member knows this from his municipal background–that fiscal years don't necessarily coincide between the Province and the municipalities. So that's really all it is. It's a cash flow from on our budget side; not only no reduction for the City, but the City actually is going to be receiving additional funding support this year, as I mentioned earlier, of 5.2 percent. I mentioned some of the specific components where we've actually increased funding. But this is simply a reflection of the cash flow.

Mr. Briese: Another thing I thought I picked up in here, in the Estimates book, was there appeared to be less funding for Provincial Planning Services. Is that true, and, if so, what is the reduction?

***** (16:40)

Mr. Ashton: Only difference year over year was a vacant position that was eliminated. The operating funding is the same. So there is no difference in actual provision of services; it really reflects a move on our part to indicate that vacant position was basically taken out of the FTE component. So nobody was laid off. There was no reduction in service, but that explains the difference.

Mr. Briese: I think I'm going to have to put in the earpiece here. I missed part of that answer.

It's a vacant position that's been cut. Is that what I was told?

Mr. Ashton: The dollar equivalent amount was taken out. The position was vacant to begin with. So that explains the difference in actual budgeted funding. It's a reflection of that vacant position that was basically eliminated.

Mr. Briese: Thank you for that answer. I have quite a number of questions I want to get in on the planning side, and I guess we'll probably start into some of them right now.

One of the curiosities I have is, how many of the municipal governments have actually filed their livestock operation policies?

Mr. Ashton: There are 28 that have been completed, and that means that they have livestock operation policies adopted in force. Under review, there are 38, and in that case that applies to municipalities that have drafted livestock operation policies. Some progress in another 27, but where the actual operating policy has not been drafted by the board or council. That's for a total of 93.

Mr. Briese: So I'm to understand that there are 93 that have either implemented or partially implemented their livestock policies in their development plans?

Mr. Ashton: I will just add the qualification that that's correct in case of the first 28 and 38 that I mentioned. I would probably describe the situation, the other 27 part of the 93, is that they've made some progress. Either they don't have a formal policy drafted or adopted. So 93 have made some progress or full progress.

Mr. Briese: There were extensions to the deadlines several times on that process, and I'm wondering why it still seems to be dragging along rather than being completed.

Mr. Ashton: Well, first of all, I want to stress that we're talking about the planning authority. So there are 93 planning authorities. It puts in context the degree to which you have, out of that number, already 66 that have a policy either drafted or a policy drafted and implemented. We did have the authority through the act to extend the deadline, and most municipalities and planning districts have formally requested that we give an extension to either June 30 of 2009 or January 1, 2010. That was, I think, appropriate given some of the complexities and some of the recent developments the last couple years. I would say that we are seeing significant progress. I wouldn't classify the extension of the deadlines as indicating anything other than the fact that we do understand the complexities of what we're dealing with here and the degree to which this is a policy that can have long-term and far-reaching implications in terms of the overall municipal planning.

So I would say we're making significant progress, even though there have been some extensions on the deadlines. We've had progress in all of planning authorities, and I fully anticipate that we will soon be in position where all of the nine authorities have a livestock-operation policy adopted and in force.

Mr. Briese: I thank the minister for the answer. One of my concerns–it looks to me like there's some provision in the proposed new waste-water regulations for that to have to be implemented into municipal development plans. We also have the provincial land-use policies under review, which once again will probably require fairly major changes to municipal planning.

I was chair of a planning district for probably 12 or 14 years–I'm not sure exactly how long–and I don't recall us ever having a series of major changes like we're seeing coming down the line now. It's very, very costly for the municipalities to implement and to do all the things necessary. I was involved in putting the livestock policy in place in our planning district; it took a lot of time and a lot of hearings and a lot of expense to get it into place. It almost seems like we're going to be in that kind of state of flux for quite some time coming where every time we get it rewritten, we're going to be opening up again and immediately rewriting it.

I'm wondering if the department is thinking of lending a little more assistance to planning districts with the major changes you're doing with legislation and with the provincial land-use policies or how–what's the expectation going to be on completion of all these additional things that are going to go in?

Mr. Ashton: I think it's important to know that, first of all, we already are providing assistance and we certainly recognize the many issues that municipalities are dealing with. Of course, it's important to note that many of the things the member was talking about are captured on the next review of the municipal plans. I think that's important notice.

I would actually argue that we–and the member, you know, I defer to his knowledge at the ground level, he has significant experience with a planning authority and his role and he's certainly seen some of the changes that are out there–but my concern as minister, quite frankly, and our concern as government is to ensure that we're not only developing state-of-the-art waste-water regulations–I think that's something that is a part of the overall vision of sustainable land-use planning–that we're not only dealing with state-of-the-art livestock operation policies, but that we're also dealing with some of the broader issues. That's where the review of provincial land-use policies is coming into place.

***** (16:50)

One of the concerns that I have raised is there are many areas of the province–and the member knows this directly from his own constituency–where farms are now measured in sections, not quarter sections, that population–you know, on three, four sections of land, there might have been six, seven, eight farm families; you're down to one. I really believe that we need to make sure our land-use policies are providing opportunities for both urban and rural municipalities to, yes, create sustainability; yes, to protect the integrity of agricultural land and green space–all the various factors that go into planning.

We also have to make sure, I believe, that we have a plan that is geared to recognizing that we do not want planning perversely to be accelerating depopulation in areas of the province where we're seeing some significant population reductions. I'm a great believer by the way, and I come from northern Manitoba, I really believe that one thing that northern and rural areas have to offer is a quality of life. I also recognize that in a lot of cases our planning principles often, while they may have been appropriate at a certain period of time, don't necessarily reflect what's happening now.

I can't stress enough how important the provincial land-use policy review is. I know the AMM has been very supportive of the review, and I think that is fairly critical. Now having said that, that's the broader vision, and I appreciate the member's also asking about the specific impact on the ground.

Under the community planning assistance grant program we have provided $1,114,945 over the last 10 years to the various municipalities and planning districts. That is, I believe, been a significant part of why we have had significant development. We've got 20 new planning districts with 77 member municipalities and 12 municipalities which are preparing and adopting new development plans. There are 38 planning districts, and municipalities have received assistance to review and update their development plans and zoning by-laws, including livestock operation policies that the member talked about earlier.

We are not only putting forward the broader vision on the planning side, I believe. We are also providing real assistance on the ground because we recognize there is work involved, not the least of which is the significant amount of community consultation. I do want to say that one thing that I think is unique in Manitoba is the degree to which our municipalities and our planning districts do have a significant amount of public input. I know the member knows that from, certainly, his experience with his planning district. I think it's, quite frankly, it's money and time that's well invested.

Yes, significant changes, but we are there to help municipalities, as well. We do recognize some of the costs.

Mr. Briese: Thank you for that answer. That's one of the places I was going to go is the recognition of local knowledge out there. I know when we were doing the work on our development plan and implementing the livestock policy, we had a great deal of difficulty with–actually one of the departments in government. It caused us a lot of grief. They refused to recognize what we had on the ground out there. By the way, Mr. Minister, it was not your department. I find your planning department and your planning staff just excellent to work with, and I have for many years. They're very willing to listen to what's going on out in the country, and I just wish some of the people elsewhere were as willing.

Back to the waste-water regulations that I mentioned before. I don't want to go into a debate on the waste-water regulations or necessarily even on the provincial land-use policies. It certainly appears to be a case where there's somewhat of a, for lack of a better word, a download onto municipal planning to police what the province wants for the waste-water policies. I know that's not unique. I know that we do that in a lot of cases, but it might not be as easily recognized by local authorities that waste-water regulation is in their jurisdiction, and that's somewhat of what I think I'm seeing coming through this.

Mr. Ashton: Well, first of all, clearly the provision of water and waste-water services is one of the prime roles and responsibilities of municipal government. I think there's been significant progress there, by the way, not just in compliance with new regulations and updated regulations, which I think is something that is absolutely necessary. I point to the fact, for example, in the city of Winnipeg, it wasn't really until the City of Winnipeg waste-water facilities were referred to the Clean Environment Commission in 2002, I believe it was, that we actually saw licensing of the City of Winnipeg waste-water treatment plant. I was Minister of Conservation at the time that the report was received, and I think it was long overdue, that indeed not only was there licensing but there was a licence requirement to upgrade the waste-water treatment facilities. That is something that's happening across the province.

I do want to note, by the way, that both water and waste-water facilities received a high priority in the announcements under the Building Canada Fund Communities Component this last Friday. I look at the largest grant in the announcement was to the City of Selkirk, more than $9 million. I believe the second-largest grant was to the City of Flin Flon, and it ranges all the way through to some significant funding that was provided to Northern Affairs communities including Nelson House and the Island Lake community council and many others, all of them providing either water treatment or waste-water treatment. I do want to note, by the way, the additional funding support for the R.M. of Gimli, which has provided a real model in terms of regional facilities.

I want to stress that there is the funding side as well through Infrastructure and as well as funding through the Water Services Board. I'm no longer the Minister responsible for the Water Services Board, but I know the member's more than aware of some of the things that have been happening in that particular case.

I also think, by the way, what's important to note is the degree to which we're working on a regional vision for water and waste water. I really want to credit the municipalities that have been taking a leadership role. I mentioned the R.M. of Gimli, for example, but there are examples throughout the province of either water treatment or waste-water treatment where we see regional realities. I look at Portage as probably a good example in recent years, where you've seen a real extension of the kind of vision you have.

So I believe–and without getting into a long discussion, debate on this, I don't think that's the member's intent here–I think that we are not only moving forward, we are providing additional supports. I think there's not a single municipal elected official that doesn't realize, as we do, that it's something the public is demanding. Whether it's post-Walkerton on the drinking-water side or North Battleford, or in terms of the environmental pressures we're under, I find that Manitobans are expecting us to do exactly what we're doing, which is to improve water and waste water, but do it in partnership and that's very much our approach on the funding side.

Mr. Briese: Thank you once again for that answer, Mr. Minister.

Trying not to get into a debate, but in the case of the waste-water management–and I know it doesn't even totally fall into your department but–I realize there's probably some problems in certain areas, probably in the capital region and some of the cottage country and some of the Red River Valley where it's a flood plain, but putting a blanket regulation across the province, I think, is counter-productive.

In my municipality, we have 800 people. There's probably–and I did the math–there's about four people per section, so there's about one per quarter section. I don't think waste water is a big problem out where I am. Now, there are some places where it would be a concern, you know, close to waterways and stuff like that, but we already have those setbacks in our development plans and in our zoning by-laws, so they are covered. The exceptions out there probably should be zone by zone or case by case, and that's where I think they should be covered off.

I see the Chairperson's right in the–put the hammer down, and it's about five seconds to go, so I'll cut it off there.

Madam Chairperson: The hour being 5 p.m., this section of the Supply will now recess and reconvene at 10 a.m. tomorrow (Friday).

LEGISLATIVE ASSEMBLY OF MANITOBA

Tuesday, December 15, 2009

The House met at 1:30 p.m.

Mr. Speaker: O Eternal and Almighty God, from Whom all power and wisdom come, we are assembled here before Thee to frame such laws as may tend to the welfare and prosperity of our province. Grant, O merciful God, we pray Thee, that we may desire only that which is in accordance with Thy will, that we may seek it with wisdom, know it with certainty and accomplish it perfectly for the glory and honour of Thy name and for the welfare of all our people. Amen.

ROUTINE PROCEEDINGS

PETITIONS

PTH 15–Traffic Signals

Mr. Ron Schuler (Springfield): Mr, Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

In August 2008, the Minister of Transportation stated that traffic volumes at the intersection of PTH 15 and Highway 206 in Dugald exceeded those needed to warrant the installation of traffic signals.

Every school day, up to a thousand students travel through this intersection in Dugald where the lack of traffic signals puts their safety at risk.

Thousands of vehicles travel daily through this intersection in Dugald where the lack of traffic signals puts at risk the safety of these citizens.

In 2008, there was a 300 percent increase in accidents at this intersection.

We petition the Legislative Assembly of Manitoba as follows:

To request that the Minister of Transportation (Mr. Ashton) consider the immediate installation of traffic signals at the intersection of PTH 15 and Highway 206 in Dugald.

To request that the Minister of Transportation recognize the values of the lives and well-being of the students and citizens of Manitoba.

Signed by Doug Raynard, Louise Bass, Juergen Hartmann and many, many other Manitobans.

Mr. Speaker: In accordance with our rule 132(6), when petitions are read they are deemed to be received by the House.

Ophthalmology Services–Swan River

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, I wish to present the following petition to the Legislative Assembly.

These are the reasons for this petition:

The Swan Valley region has a high population of seniors and a very high incidence of diabetes. Every year, hundreds of patients from the Swan Valley region must travel to distant communities for cataract surgery and additional pre-operative and post-operative appointments.

These patients, many of whom are sent as far away as Saskatchewan, need to travel with an escort who must take time off work to drive the patient to his or her appointments without any compensation. Patients who cannot endure this expense and hardship are unable to have the necessary treatment

The community has located an ophthalmologist who would like to practise in Swan River. The local Lions Club has provided funds for the necessary equipment, and the Swan River Valley hospital has space to accommodate this service.

The Minister of Health (Ms. Oswald) has told the Town of Swan River that it has insufficient infrastructure and patient volumes to support a cataract surgery program; however, residents of the region strongly disagree.

We petition the Legislative Assembly of Manitoba as follows:

To urge the Minister of Health to consider rethinking her refusal to allow an ophthalmologist to practise in Swan River and to consider working with the community to provide this service without further delay.

And this is signed by Dori Driedger, Lily Grieger, Mary Ann Blythe and many, many others.

Manitoba Liquor Control Commission–Liquor Licences

Mr. Cliff Graydon (Emerson): Mr. Speaker, I wish to present the following petition to the Legislative Assembly and these are the reasons for this petition:

The Manitoba Liquor Control Commission has substantially raised the cost of annual liquor licences for restaurants, cocktail lounges and other Manitoba businesses.

The MLCC justifies this increase by stating that the cost of an annual licence is being increased to better reflect rising administration costs.

For some small business owners, the cost of annual liquor licences has more than doubled. These fee hikes are a significant burden for business owners.

The decision to increase the annual licence fee, while at the same time eliminating the 2 percent supplementary licence fee payable on the purchase of spirits, wine and coolers, has the effect of greatly disadvantaging smaller businesses. Small businesses which do not purchase liquor from the MLCC in large volumes will not receive the same benefit from the elimination of this supplementary fee. Instead, they are facing substantial increased costs simply to keep their doors open.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister responsible for the administration of The Liquor Control Act (Mr. Mackintosh) to consider working with MLCC to find alternate means of addressing rising administrative costs.

To request the Minister responsible for the administration of The Liquor Control Act to consider working with MLCC to revise the decision to implement a significant annual licence fee increase.

To urge the Minister responsible for the administration of The Liquor Control Act to consider ensuring that the unique challenges faced by small businesses are better taken into account in the future.

This petition is signed by Gord Hoffmann, Roxanne Greaves, Lindsay Kaartinen and many, many more fine Manitobans.

Education Funding

Mr. Rick Borotsik (Brandon West): I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

Historically, the Province of Manitoba has received funding for education by the assessment of property that generates taxes. This unfair tax is only applied to selected property owners in certain areas and confines, including, but not limited to, commercial property owners.

Property-based school tax is becoming an ever-increasing burden without acknowledging the commercial property owner's income or owner's ability to pay.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Education (Ms. Allan) consider removing education funding by school tax or education levies from all property in Manitoba, including commercial property.

To request that the Minister of Education consider finding a more equitable method of funding education, such as general revenue, following the constitutional funding of education by the Province of Manitoba.

This petition, Mr. Speaker, is signed by M. Malcolm, L. Brown, M. Harding and many, many other fine Manitobans.

Seven Oaks Hospital–Emergency Services

Mr. Kevin Lamoureux (Inkster): I wish to present the following petition to the Legislative Assembly of Manitoba.

The background to this petition is as follows:

The current Premier (Mr. Selinger) and NDP government are reducing emergency services at the Seven Oaks Hospital.

On October the 6th, 1995, the NDP introduced a matter of urgent public importance that stated that, quote, "the ordinary business of the House to be set aside to discuss a matter of urgent public importance, namely, the threat to the health-care system posed by this government's plans to limit emergency services in the city of Winnipeg community hospitals."

On December the 6th, 1995, when the then-PC government suggested it was going to reduce emergency services at the Seven Oaks Hospital, the NDP leader then asked Premier Gary Filmon to, quote, "reverse the horrible decisions of his government and his Minister of Health and reopen our community-based emergency wards."

The NDP gave Manitobans the impression that they supported Seven Oaks Hospital having full emergency services, seven days a week, 24 hours a day.

We petition the Legislative Assembly of Manitoba as follows:

To request the Premier of Manitoba to consider how important it is to have the Seven Oaks Hospital provide full emergency services, seven days a week, 24 hours a day.

Mr. Speaker, this is signed by A. Allard, V. Allard, L. Agapito and many, many other fine Manitobans. Thank you.

***** (13:40)

COMMITTEE REPORTS

Standing Committee on Public Accounts First Report

Mr. Leonard Derkach (Chairperson): Mr. Speaker, I wish to present the First Report of the Standing Committee on Public Accounts.

Madam Clerk (Patricia Chaychuk): Your Standing Committee on Public Accounts–

Some Honourable Members: Dispense.

Mr. Speaker: Dispense? Dispense.

Your Standing Committee on Public Accounts presents the following as its First Report.

Meetings

Your Committee met on December 14, 2009 in Room 255 of the Legislative Building.

Matters under Consideration

- *To consider the election of a new Vice-Chairperson*

Committee Membership

- *Mr. BOROTSIK*
- *Ms. BRAUN*
- *Ms. BRICK*
- *Mr. DERKACH (Chairperson)*
- *Mr. DEWAR*
- *Mr. JHA*
- *Mr. LAMOUREUX*
- *Mr. MAGUIRE*
- *Mr. MARTINDALE*
- *Mrs. STEFANSON*
- *Hon. Ms. WOWCHUK*

Your Committee elected Mr. DEWAR as the Vice-Chairperson.

Mr. Derkach: Mr. Speaker, I move, seconded by the honourable member for Springfield (Mr. Schuler), that the report of the committee be received.

Motion agreed to.

Standing Committee on Legislative Affairs First Report

Ms. Marilyn Brick (Vice-Chairperson): Mr. Speaker, on behalf of the honourable member for Kirkfield Park (Ms. Blady), I wish to present the First Report of the Standing Committee on Legislative Affairs.

Madam Clerk (Patricia Chaychuk): Your Standing Committee on Legislative Affairs presents the–

Some Honourable Members: Dispense.

Mr. Speaker: Dispense? Dispense.

Your Standing Committee on LEGISLATIVE AFFAIRS presents the following as its First Report.

Meetings

Your Committee met on December 14, 2009 at 4:00 p.m. in Room 255 of the Legislative Building.

Matters under Consideration

- *The appointment of the Conflict of Interest Commissioner*

Committee Membership

- *Ms. BLADY*
- *Ms. BRAUN*
- *Ms. BRICK*
- *Hon. Mr. CHOMIAK*
- *Mr. CULLEN*
- *Mr. GOERTZEN*
- *Mr. HAWRANIK*
- *Hon. Ms. HOWARD*
- *Mr. JENNISSEN*
- *Mr. PEDERSEN*
- *Mr. REID*

Your Committee elected Ms. BLADY as the Chairperson.

Your Committee elected Ms. BRICK as the Vice-Chairperson.

Motions

Your Committee agreed to the following motions:

- *THAT the Committee recommends to the Lieutenant-Governor-in-Council that Mr. Ron Perozzo be appointed as the Conflict of Interest Commissioner for a term not to exceed three years from date of commencement.*

Ms. Brick: Mr. Speaker, I move, seconded by the honourable member for Transcona (Mr. Reid), that the report of the committee be received.

Motion agreed to.

TABLING OF REPORTS

Hon. Diane McGifford (Minister of Advanced Education and Literacy): Mr. Speaker, I am pleased to table the following reports: Red River College's Annual Financial Report 2008-2009; and the Assiniboine Community College Annual Report 2008-2009. Thank you.

Introduction of Guests

Mr. Speaker: Order, please. Prior to oral questions, I'd like to draw the attention of honourable members to the public gallery where we have with us from River East Collegiate, we have 17 grade 10 to 12 students under the direction of Ms. Linda LaCoste. This school is located in the constituency of the honourable member for River East (Mrs. Mitchelson).

On behalf of all honourable members, I welcome you here today.

ORAL QUESTIONS

Provincial Debt Reduction Strategy

Mr. Hugh McFadyen (Leader of the Official Opposition): Mr. Speaker, since this is our last question period before the holidays, I think it's–I think it's important to acknowledge the remarkable generosity of Manitobans, as reported in today's *Free Press*, as the most generous people in Canada according to the Fraser Institute. That's something that we all–we're all proud of as Manitobans. It's one more reason why we have such a great province.

Mr. Speaker, one of the–one of the concerns that we have been raising in terms of the forecasts going forward in terms of the incomes and well-being of Manitobans is the rising level of public debt in the province of Manitoba. As the numbers show, Manitoba was the only province in western Canada that increased its debt over the last 10 years, at a time when other provinces were paying their debt down during good times.

Now, Mr. Speaker, this morning there are warnings coming from experts at both the Royal Bank and the Bank of Montreal predicting an increase–predicting an increase in interest rates starting as soon as July of 2010.

So as we see this record level of debt and predictions of rising interest rates, I wanna ask the minister: What is her plan to ensure that her government's NDP debt isn't gonna push down the incomes of Manitobans in the years to come?

Hon. Rosann Wowchuk (Minister of Finance): Mr. Speaker, indeed, the impacts of the recession are being felt around the world; Manitoba is not immune. However, Manitoba has ridden out the recession much better than many other provinces have and many other countries that have managed.

But, Mr. Speaker, the member opposite talks about the debt and debt repayment, and I can assure the member that our debt management strategy has many elements to it and we are committed to it. We have been paying down the debt. We have been paying down pension liabilities. We are funding our share of pensions, principal repayments and capital amortization, even though we are in difficult times. We have made a commitment that we will pay–make a payment on the debt this year, and I would say to the member–

Mr. Speaker: Order.

Mr. McFadyen: Well, Mr. Speaker, the patting of themselves in the back in terms of the economic performance is at odds with what her own–her own chairman of Manitoba Hydro wrote in June. Vic Schroeder wrote that, as the province established for 2007, we were last in dwelling starts; only two provinces have lower average weekly earnings; three have lower per capita retail sales and capital investment; and in none of the categories were we above average.

Mr. Schroeder, the chairman of Manitoba Hydro and former NDP Finance Minister, went on to say: To put it another way, assuming that we are in a race, even if we're moving faster than the others, when we are further back, running faster does not mean we're in the lead or even in the middle.

This is what–this is what her own Manitoba Hydro chairman, Mr. Schroeder, wrote in June, and I know that Manitobans are concerned with the rising level of public debt, now $21 billion, which represents $21,000 for every man, woman and child in Manitoba with the prospect of rising interest rates. What is she gonna do to protect the incomes of Manitoba families?

Ms. Wowchuk: Well, Mr. Speaker, as I said, we all recognize that we are in challenging times, and we have made a commitment to stand by the consumers and the people of this province. We will make a payment on the debt. We will invest in stimulus so that people continue to work, and we will continue to fund and support important services that our people rely on, whether that's health care, education or justice.

But, Mr. Speaker, the member talks about the net debt to GDP as a percentage, and I want to share with the member that since 1999 it has decreased from more than 25–it has decreased from 31.5 percent to 23 percent. The members opposite can't talk to us about how we should manage the debt. We have paid it down, but we are also very considerate of services important to people.

Mr. McFadyen: Well, we're well aware of the–of the profligate spending and their lack of regard for the impact of that spending on the next generation of Manitobans. The debt of the province has gone up from 13.5 billion to over 21 billion today under their watch at a time when other western provinces were paying the debt down during the good years. Mr. Speaker, when the sun is shining, this is the time to fix the roof and instead of fixing the roof they made the hole bigger in terms of Manitoba's debt.

Mr. Speaker, I wanna ask the minister if she will apologize for the mismanagement of the last 10 years and commit–commit today at a time when we're spending more than $2 million a day on debt servicing, a record high level: What is her plan to deal with Manitoba's debt? Rather than increasing it, what's she doing to protect the next generation?

Ms. Wowchuk: Well, I'm really pleased that the member opposite is interested in debt servicing because when he was chief of staff for the Conservatives when they were in power, the debt-servicing costs were much higher. They are down from 13.2 cents on a dollar to point–six cents on a dollar.

The member opposite refuses to accept that we are in a different accounting. He refuses to accept the fact that as well as having debt, we have much more assets, Mr. Speaker, because we have to account for those assets and we have made investments in assets, whether it be the Health science Centre, whether it be schools, whether it be hospitals.

I would stand beside our record of what we have invested into assets in this province anytime when they were in government.

***** (13:50)

**Provincial Debt
Servicing Costs**

Mr. Rick Borotsik (Brandon West): Mr. Speaker, I know that my warning about out-of-control debt has fallen on deaf ears.

The previous Finance Minister, now Premier (Mr. Selinger), and the current Finance Minister cannot control their credit card addiction. This fiscal year alone will mean an additional $1.8 billion of debt, taking us to an unheard of level of $23 billion.

Mr. Speaker, economists are now warning that higher interest rates and debt-servicing costs are just around the corner. They predict a 1 percent increase in rates in 2010, and they're predicting an additional 2 percent increase in rates in 2011.

Debt goes up; rates go up; debt-servicing costs go up: Program funding has to be affected.

What is the minister's long-term strategy for increased interest rates?

Hon. Rosann Wowchuk (Minister of Finance): Mr. Speaker, the member opposite is complaining about the amount of money we are spending on infrastructure.

Some Honourable Members: Oh, oh.

Ms. Wowchuk: Well, I–well, I wonder, Mr. Speaker, I wonder if he is complaining about the money we spent on the health–on the hospital in Brandon.

I'm wondering if he's complaining about the money that we spent on waste-water treatment–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Ms. Wowchuk: –in Brandon.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. Order.

Ms. Wowchuk: I wonder, Mr. Speaker–

Mr. Speaker: Order.

Ms. Wowchuk: I wonder, Mr. Speaker, if he's complaining about the bridges we spent in Brandon that he's trying to take credit for.

Mr. Speaker, you can't have it both ways. You can't ask for stimulus which we believe in and we have invested in because it keeps people working and then complain that there is money being spent.

Financial Statements
Tabling Request

Mr. Rick Borotsik (Brandon West): Well, Mr. Speaker, if the Finance Minister wants to play that game, I would suggest that I'm complaining about $640 million that's being wasted on the west-side hydro.

I'm gonna complain about $14 million that they're wasting on an enhanced ID.

I'm gonna complain, Mr. Speaker, about $250,000 that's been spent on advertising on *The Simpsons*. That's what I'm gonna complain about every day.

Every day, for the past two weeks, I have asked the Finance Minister for her to table the second-quarter financials. When I see her in the hall, Mr. Speaker, I ask her to table the financials.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Borotsik: Here in the Chamber, I ask her to table the financials. In question period, I ask her to table the financials, and what do I get? All I get is her thumbing her nose at me, Mr. Speaker.

I can tell by the number of pizza boxes outside the minister's office last night that she and her staff have been working on the NDP spin. Mr. Speaker, the pizza boxes were out. The lights were out. The minister wasn't home. Will she table the financials right now before we rise?

Hon. Rosann Wowchuk (Minister of Finance): Well, Mr. Speaker, the member–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. Order. Order. Order. The honourable minister.

Ms. Wowchuk: You know, Mr. Speaker, the member opposite just complained about the money that would–being spent on Bipole III. The member opposite–

Some Honourable Members: Oh, oh.

Ms. Wowchuk: The members opposite would–just can't get it through their heads that building a line on the east side will not fly, Mr. Speaker.

And I want to table for the House a report that came out today that says the boreal forest is the world's richest carbon storage, and a spot in Manitoba–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. Order.

Ms. Wowchuk: –a spot in Manitoba is the only place in the world that is identified as a pristine boreal forest, Mr. Speaker.

Mr. Speaker, I'll table this for the members opposite to see how far off target they are when they start talking about where the line should go.

Mr. Speaker: Order.

Manitoba Hydro
Bipole III West-Side Location

Mr. Cliff Cullen (Turtle Mountain): Well, Mr. Speaker, the minister already has a hydro line running through the boreal forest and now the NDP government's gonna build a road through the boreal forest.

Mr. Speaker, the Premier's (Mr. Selinger) been telling Manitobans that government must tighten its belt and reduce spending. Meanwhile he has instructed Manitoba Hydro to do exactly the opposite. Hundreds of millions of dollars will be wasted on their west-side route running over to the Saskatchewan border.

It's unfortunate that Manitoba Hydro employees won't speak up on the issue, but we know how this government treats whistle-blowers.

Mr. Speaker, one retired engineer from Manitoba Hydro with 30 years service did write to the NDP government, and he said: certainly a bad decision economically, technically and developmentally. He goes on to say that it will cost each of us as Manitobans $500 to $1,000 in addition to ongoing operating costs. Allowing politics to override sound and proven decision making is surely a mistake.

Will the minister now do the right thing for Manitobans, heed the advice of Bill Stephens and reverse this decision in the best interest of all Manitobans?

Hon. Rosann Wowchuk (Minister charged with the administration of The Manitoba Hydro Act): Mr. Speaker, as I said yesterday, I have a lot of respect for engineers. I have a brother who's an engineer, and I listen to him. But I would encourage the member also to look at what engineers do, and their job is to build lines. But I would ask him to–I'd ask those engineers to talk to the sales department, because it is the sales department that negotiates sales, and this government is not going to put at risk $20-billion worth of sales because of the members' opposite desire to have a shorter line. It may be shorter, but the price we pay will be much, much higher.

Mr. Speaker, it will never get built, and we will never get the benefits that are outlined for us by maintaining that boreal forest that benefits the whole world.

Mr. Cullen: Well, Mr. Speaker, Manitobans are looking for some leadership from government to stand up to the American environmentalists. What have we got from the NDP leadership? We've got hydro rates up 16 percent. We're looking at at least another 6 percent over the next two years. Manitoba Hydro's looking at 3.5 percent annually, long-term.

We no longer have the lowest rates in Canada, let alone the United States. Second-quarter reports show our export sales down 42 percent year-to-date. Long-range forecasts from Hydro show net income–net income dropping off dramatically. We've got independent consultants raising issues on this management at Hydro. We've got the Premier (Mr. Selinger) making jokes about it in public, and, meanwhile, Manitobans are on the financial hook from decisions made by this NDP government.

When will this government take the serious issues at Manitoba Hydro–when will they take those issues seriously?

Ms. Wowchuk: Mr. Speaker, we take all of these issues very seriously, and we take Manitoba Hydro's very seriously, very different from what the members opposite did. That was the mothball party with the– when the Conservatives were in power. We're building Manitoba Hydro. We're building dams and we have to–Hydro has to build a transmission line for reliability and also to ensure our sales.

Now, the member opposite talks about cost. He's willing–he's willing to take the chance on a–on a–on a line that will never be built but–and then give up $20-billion worth of sales, Mr. Speaker. That's an unacceptable position, and it's unacceptable for the member opposite to say we do not have the lowest rates in North America because we have the lowest rates.

Mr. Speaker: Order.

Court Orders Enforcement

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, today police charged an 18-year-old, high-risk, level 4 car thief with killing a 47-year-old father this past Friday. It is reported that this high-risk car thief had several court orders against him, which he clearly wasn't following.

Over and over, time and time again, car thieves and gang members and others who have court orders against them ignore those court orders and are responsible for violence and death in the city of Winnipeg. They are not being enforced. They take them as a joke because this minister takes them as a joke.

Why won't this minister acknowledge that his failure to enforce court orders is putting Winnipeggers and Manitobans at risk, Mr. Speaker?

Hon. Andrew Swan (Minister of Justice and Attorney General): Mr. Speaker, on behalf of all members of this House, I think we should congratulate the Winnipeg Police Service for making an arrest in this case. We're very pleased they've been able to do that.

I think the member opposite needs a little briefing and needs to understanding how criminal law works in this country, and at past federal-provincial meetings, my two predecessors have pushed strongly to make sure there are changes to the Youth Criminal Justice Act.

I don't believe the members opposite like the way the act works. We certainly don't and we have called upon the federal government to change the Youth Criminal Justice Act to make sure that deterrence is taken into account in sentencing. That hasn't happened yet. We hope to continue raising our voices, and I actually hope the member for Steinbach and his colleagues work with us to make changes to that act, because that would be a very good thing for safety in this country.

***** (14:00)

Mr. Goertzen: The minister either doesn't understand or chooses to ignore the fact that it's a provincial responsibility to enforce court orders when an individual is out, Mr. Speaker. It would save lives if those orders were enforced, yet this known car thief, this level 4 car thief, the worst of the worst, was out and clearly didn't have the enforcement of his orders, and a father died as a result.

These criminals know that those court orders are not going to be enforced under this NDP government. I will ask this minister: Mr. Minister, will you today finally do something to stand up for Manitobans, for the safety of Winnipeggers and Manitobans, and ensure that all of these court orders are strongly enforced so that there can be safety on the streets of Winnipeg, Mr. Speaker.

Mr. Swan: I'm not certain if the member opposite has heard of the Winnipeg Auto Theft Suppression Strategy. That strategy combines the efforts of our Winnipeg Police Service, who I know members on this side certainly respect. I thought the member for Steinbach did, but now I'm not so sure.

Certainly we work with Crown attorneys. We have excellent staff in Probations and Corrections to do their best to enforce those orders. And certainly we've been–we've been successful at reducing auto theft by some 70 percent since 2005. It's lower than it's been in any year since 1992 when auto theft became a major problem in this city and, frankly, there is more work to be done.

There are more tragedies that have happened and we will continue to work on that, but we are moving in the right direction, Mr. Speaker.

**Diagnostic Services of Manitoba
Review of Mismanagement Allegations**

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, under this Minister of Health's watch there is a crisis brewing at Diagnostic Services Manitoba, yet she is calling a whistle-blower, a doctor, a liar and, once again, as she has done with the death of Brian Sinclair, she's covering up the facts.

One of the whistle-blower's allegations is that there is unsafe care going on in the labs, and yet this Minister of Health has been saying, and I quote: ". . . no patient harm was done." And on Friday, here in question period she said, and I quote: "There was a specific case in the allegations that was very concerning. That case was investigated immediately. Indeed, it was determined that the allegations did not match the actual facts and that, in fact, there was no negative impact on that patient's outcome."

Can the Minister of Health then tell us, if that was the case, why was a critical incident called on that case?

Hon. Theresa Oswald (Minister of Health): I want to be explicitly clear that the member across the way is the one who's using words like "liar" and so forth. I want to be very clear with her and with all members of this House that we are taking the allegations of this doctor very seriously. That's why there is an internal review. That's why there is an external review being led by Dr. Macdonald, a very well-respected doctor.

She, in turn, has sought the expertise of a pathologist from out of the province. There was a very specific case in the document that the doctor wrote that was investigated. I reiterate to the member that the facts did not match the allegations but, in fact, the review continues.

Indeed, we are taking the allegations of this doctor very seriously. That's why there is a review. It's actually the opposite of not believing him.

Mrs. Driedger: Mr. Speaker, this Minister of Health is trying to talk out of both sides of her mouth.

A critical incident is called when a patient is harmed, and yet this minister keeps saying that no harm was done. And when a critical incident occurs, the Minister of Health must be notified about the incident. So the minister would have known about this particular situation for many, many months and yet she keeps saying that no harm was done.

So can the Minister of Health please explain her misleading comments and tell us: Why is she trying to cover up the facts about this situation?

Ms. Oswald: I will say very clearly that this review is being done after allegations were brought forward. Patient safety is at the forefront of this investigation. There are other allegations that have been made concerning issues of remuneration, issues of administrative discord, of infighting. All of those are going to be investigated, Mr. Speaker.

I can say to the member opposite that we're taking these allegations very seriously. We will make the findings of this review public. There's absolutely nothing about this that's being covered up. No matter how many times the member opposite tries to use this particular smear campaign against me, it's not going to work. We're being open and transparent, Mr. Speaker.

Mrs. Driedger: Mr. Speaker, a minister with the track record she has on cover-ups has no credibility with her answers in this House.

Mr. Speaker, pathologists, lab technologists are all saying that there is bullying, intimidation and abusive behaviour happening in Manitoba labs. Because of this toxic environment, many in the labs are too afraid to come forward and speak to the review committee. In fact, on Friday, the lawyer on the review committee told pathologists that he can't guarantee that there will be no consequences for pathologists who speak out.

So, Mr. Speaker, I would like to ask the Minister of Health today to commit to ensure that all pathologists, technologists and other lab personnel who speak to the review committee will be guaranteed total and absolute anonymity, or is it her intent to have this whole review a whitewash?

Ms. Oswald: Well, again, Mr. Speaker, I made it clear, on the first day that I was asked this question, that these individuals are protected under the whistle-blower legislation.

And on the subject, Mr. Speaker, of credibility, as raised by the member opposite, when we received these allegations we immediately sought to review them and protect patient safety. When the member opposite received this document, she phoned a reporter, begged to get her picture in the paper, but didn't do a thing to help patients. It's a classic tactic by the member opposite. We care about patients. She cares about publicity. It's the same old, same old.

Thomas Lake Water Levels Flooding Concerns

Mr. Leonard Derkach (Russell): Mr. Speaker, last spring I asked the Minister of Water Stewardship (Ms. Melnick) to come to the aid of cottagers and home-owners along the Thomas Lake shores to help to alleviate the flooding that was occurring and to allow them to open up an outlet that had been silted over. The summer went by and nothing happened.

Mr. Speaker, today those same home-owners and cottage owners are facing flooding next spring when the melt waters come down, and, indeed, some of those cottages will be unusable, as will an access road and a connecting road.

I want to ask the government whether or not they are prepared to come to the aid of these cottage owners between now and spring so that, indeed, their cottages and their property will not be valued useless once the high waters hit the area.

Hon. Stan Struthers (Acting Minister of Water Stewardship): Mr. Speaker, I know the questions that the member for Russell asked of my colleague. I know of the content and I know that my colleague has undertaken to make sure that everybody who needs to be heard on the issue will be heard and that there is work being done towards finding a solution to this–to this unfortunate situation.

Mr. Derkach: Mr. Speaker, time has literally run out. When the cottage owners wanted the department to intervene, they were told that they had to get permission from landowners downstream before the outlet could be opened. That happened last June.

Mr. Speaker, the First Nations people have said they understood the problem and they were prepared to have the water go through their property and through the creek–or a river that runs through their property, but the department would not allow the outlet to be opened.

Mr. Speaker, today those cottagers are facing a devaluation of their property and perhaps unusable cottages because water will flood them in the spring. In addition, the main road will be flooded in the spring, as will connecting roads between the developments.

I ask the minister whether or not he's prepared to meet with these people and ensure that a solution is found before these waters start to impede the use of their property, Mr. Speaker.

Mr. Struthers: Certainly, the Minister of Water Stewardship (Ms. Melnick) is–has been working with the R.M. of Strathclair. My understanding–my understanding is–my understanding is is that the R.M. of Strathclair has promised the minister some information that she has requested, and when she receives that information from the R.M., she will be in a position to deal on a–on an ongoing basis with an issue that I know is frustrating for the member for Russell's constituents.

So I believe when the minister gets that information, she will be moving forward with it.

***** (14:10)

Mr. Derkach: Well, Mr. Speaker, perhaps the minister better get a better briefing on the whole issue than he has because the only thing that they received from this minister was a request that the municipality do a $50,000 environmental study before any action can be taken.

Mr. Speaker, there has been no consultation with either cottagers or the municipality, except for that one request. Since then, cottagers have been appealing to the department to get something done and nothing has been done.

Mr. Struthers: Mr. Speaker, if there is a holdup anywhere in the system, I would assume that the member for Russell wants to work its–work his way through that. And I would assume the member for Russell would want to be helpful in making sure that all the information that is needed to make decisions and to move forward to help his constituents–he'd be more than co-operative in trying to get the information that I have.

The most information–the most up-to-date information is that the Minister of Water Stewardship (Ms. Melnick) is waiting for some information from the R.M. of Strathclair so they can make some decisions. If that's–if that is the case, I would assume the member for Russell would want to help and be co-operative to help his constituents out. I'm sure he would.

Harmonized Sales Tax
Government Strategy

Hon. Jon Gerrard (River Heights): Mr. Speaker, the Minister of Finance has done a rather poor job of releasing a report on the harmonized sales tax. First of all, she says it's on the Web and we've tried with various computers in different ways to downlade it–download it and must conclude that the site's nonfunctional. We've gone to the minister's staff in her office and they say they don't have a hard copy and they have no idea where to get one. I ask the minister–in her short summary she says that they won't put an HST on in–with the global recession.

I ask the minister: Does this mean that the minister will consider imposing an HST next year after the recession is over?

Hon. Rosann Wowchuk (Minister of Finance): Mr. Speaker, the HST report that the member is referring to was released today. If he hasn't been able to get one, I can–I can assure him that I will provide him with one.

But the report that was released today indicates–and the review that people have done indicate to us clearly that this is not the time to implement the HST, in a time of recession. We've looked very closely at the numbers and this would, indeed, be a burden for our lowest-income people, to have these additional kind of costs put on them–on these.

Mr. Speaker, the member opposite says: Will we implement it at another time? Now is not the time to do it. Is it–if it is a time to review it at another date, certainly we would look at it.

Budget
Deficit Prediction

Hon. Jon Gerrard (River Heights): Mr. Speaker, you know, we know that the Minister of Finance has difficulty getting things done well and releasing financial reports and so on, but last year we note that the new debt of the–the debt of the government went up by $800 million or $900 million. In this year's budget, the government has released its budget plans for an $88-million deficit in the core operating budget.

I ask the Minister of Finance: We're now three-quarters of the way through the year. She must know, hopefully, where she's going in this respect. Can the minister tell us now what her current projection is? Is the deficit going to be more than 88 million or is it gonna be less than 88 million?

Hon. Rosann Wowchuk (Minister of Finance): Mr. Speaker, related to the–to the previous question, what I said was that although the federal government was trying to convince us to move towards the harmonization of GS–to HST we've conducted the review and the report just says that there are too many risks for Manitoba to–and Manitoba families in this time of recession to implement HST.

Mr. Speaker, with regard to–and I would report to the member that the HST report that he is looking for is on the Internet. It's the Finance Web site. It's there, but if he can't find a copy, we would be prepared to provide him with one.

Mr. Speaker, in regard to spending and debt, the member opposite has to remember that we've gone to summary financing, and he also has to look at our assets.

Boreal Forest Protection

Mr. Kevin Lamoureux (Inkster): Mr. Speaker, as we all witnessed, the Deputy Premier got fairly excited this afternoon as she jumped to want to table the boreal forest and how the NDP are protecting the boreal forest, you know.

And as she's doing that, I'm looking at this picture of the boreal forest with this big tractor and it's clearcutting 19 kilometres of the boreal forest. There seems to be a little bit of inconsistency. On the one hand, she's glowing about how wonderful she is in protecting the boreal forest; on the other hand, I'm looking at a tractor that's orange–it probably could have the label NDP labelled across it–that's clearcutting the boreal forest.

My question is to the Deputy Premier: Will she be as passionate in going to Manitoba Hydro and ask them why are they clearcutting the boreal forest in order to accommodate a few cottage owners, Mr. Speaker? Will she make that commitment and have that discussion with Manitoba Hydro?

Hon. Rosann Wowchuk (Minister charged with the administration of The Manitoba Hydro Act): Well, Mr. Speaker, I'm really pleased the member opposite has looked at the map that I have provided with him and shown where the one last pristine boreal forest is in the world and how it–important it is to climate change.

But I'm really disappointed in the member opposite. He tries to have it both ways, you know. Put the line on the west side, put the line on the east side, but don't give power to put in a small line from a main line for some cottagers.

The member opposite doesn't want to accept that there are people who have cottages who are trying to reduce their use of propane and diesel fuel and convert to electricity, Mr. Speaker. It's a local project. It is not a major line like the line that would have to go for Bipole III on the east side if he got his way.

Boreal Forest Protection

Mr. Drew Caldwell (Brandon East): Mr. Speaker, there is no government in North America as green as the New Democratic government in Manitoba.

The–our record has been–our record on the environment has been recognized by no less–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. Order. Order.

Mr. Caldwell: –of an authority–

Mr. Speaker: Order.

Mr. Caldwell: –than Dr. David Suzuki, Mr. Speaker.

Mr. Speaker, while the Premier (Mr. Selinger) and Minister of Conservation (Mr. Blaikie) are in Copenhagen this week acting on Manitoba's clean energy advantage and promoting our boreal forest protection as action to curb climate change, could the Acting Minister of Conservation please inform the House today if any new information has been released regarding Manitoba's east-side boreal forest?

Mr. Struthers (Acting Minister of Conservation): You know, Mr. Speaker, I'm reminded of the Tory position in the 1980s where they didn't have the courage to make the big decisions that are good for Manitobans, when they opposed the construction of Limestone. I'm reminded of the 1990s, when they bungled the Conawapa deal, another big project that they could have been the heroes on that they totally screwed up.

In the 21st century now, they're asking us–the Tories across the way are asking us to forgo the market in Wisconsin and in Minnesota, other U.S. markets, because of their concerns over the bipole.

Mr. Speaker, we're gonna make the big decisions on this side of the House that are good for all Manitobans, and there are people around the world who are cheering us on, including, today, the Boreal institute who said and released data and maps that showed the uniqueness, the uniqueness, Mr. Speaker, of the area that we're going to protect, the area that members opposite would bungle like they did in the '80s and in the '90s.

Pension Regulations Amendment Consideration

Mr. Cliff Graydon (Emerson): Mr. Speaker, when the members opposite attempt to justify cutting back services or their inability to budget, they're quick to reference the economic challenges that the global economy is facing.

However, they're not taking enough steps to protect Manitoba workers from the downturn. As we know, many pension funds have taken a hit over the last year. Some provinces have taken steps to reflect the downturn by amending their pension regulations.

Mr. Speaker, can the Minister of Labour and Immigration tell us that the Province of Manitoba is considering amending Manitoba's pension regulations to reflect what has happened in the markets?

Hon. Jennifer Howard (Minister of Labour and Immigration): I'm pleased to let the House know that those regulations are being examined right now by the Pension Commission and by the capable staff in my department.

We are looking at changes that are going to make the pension system in Manitoba one of the most progressive and, certainly, one of the best systems of protecting pensions for all Manitobans.

***** (14:20)

Mr. Graydon: Mr. Speaker, as far back as 2008, other provinces were addressing the pension issues they knew were coming, but the NDP government was cruising full speed ahead with a $4-billion transfer of money and immune to the recession, they said, that type of strategy, steady-as-she-goes downhill.

Mr. Speaker, the First Minister failed to protect the Crocus investors. He made off with taxpayers' dollars through rebate-gate. He failed workers at Tembec, and now the NDP government is failing pensioners.

Other provinces have taken real steps–already taken real steps to protect their pensioners. Alberta changed the way that the pension values were calculated to reflect changes in the market. As a result, pensioners aren't seeing decreases to their pension cheques.

Mr. Speaker, will the Minister of Labour and Immigration today tell us when these changes will take place in Manitoba?

Ms. Howard: Mr. Speaker, on the topic of pensions, I'm certainly proud to be part of a government that for the first time actually funded the pension plan for the civil servants, and we'll continue to move forward to look at modernizing and making sure that pensions are protected.

On the topic of the situation in Pine Falls, Mr. Speaker, I would like to let the House know that today we made an announcement with the federal government to fund the Winnipeg River Learning Centre, committed $600,000 to that initiative to help the people in Pine Falls and in that area get the training and education that they will need to compete in today's economy. Thank you.

Parkland Regional Health Authority
Ambulance Services

Mr. Stuart Briese (Ste. Rose): Mr. Speaker, I've raised the matter of ambulance services for Eddystone, Bacon Ridge and Ebb and Flow First Nations in this House many times. People in this area of the province are being ignored by this NDP government. The closest ambulance service is 45 minutes to an hour away.

When is the Minister of Health going to do the right thing and provide more timely emergency services to this area?

Hon. Theresa Oswald (Minister of Health): As the member knows, we work with our regional health authorities to ensure that we continue to provide the best emergency medical services that we can to Manitobans. We know that our investment in the Medical Transportation Co-ordination Centre in Brandon has enabled us to capture, to collect data on response times as we've never been able to do before in Manitoba, and that data helps inform regional health authorities about prioritizing where it is that they need to put EMS stations, and we'll continue to work with this community and the region to provide the best service that we can.

Mr. Briese: Mr. Speaker, there are approximately 2,500 people in the area and there are over 200 emergency calls per year. There are trained EMS providers at the Ebb and Flow First Nation, but they need an ambulance to provide their services.

When is this minister going to listen to the people and correct this dangerous situation by placing an ambulance in the Eddystone, Bacon Ridge and Ebb and Flow First Nation area of the province?

Ms. Oswald: And again, the MTCC allows data to be captured about response times. Regional health authorities work with the communities in their region to ensure that the response times are as expeditious as they can be. They monitor safety as being paramount in these situations. And, again, they'll continue to work as a group to provide the most responsive time with the best educated paramedics and emergency medical professionals that are–that are available in the area.

I will continue to work with the member on this issue, and we'll continue to keep growing the emergency medical system as we have done since 1999.

Mr. Speaker: Time for oral questions has expired.

Order. Order. Order.

* * *

Mr. Speaker: I'd like to ask the House to assist me in thanking Jean Speers, who works in *Hansard*, who will be retiring. She has given 20 years' service to the Assembly and has done a wonderful job in her time with *Hansard*, and I would like to ask all members to assist me in saying thank you, Jean, for a job well done.

[Applause]

And also I would like to remind the members that we'll be recessing today until the new year, and particularly because we will have Youth Parliament–will be meeting here in the Chamber later this month, I'm asking that all members empty the contents of their desk before leaving today. And I encourage members–*[interjection]* Order, please. Order, please.

I encourage members to use the blue bins here in the Chamber to recycle their *Hansards* and copies of the bills. Any other material you have to recycle should be placed in the larger blue bins in the two message rooms, and I thank all members for their co-operation on this matter.

MEMBERS' STATEMENTS

Bill 208–Government Support

Mrs. Bonnie Mitchelson (River East): Mr. Speaker, I rise today to express profound disappointment that this government's lack of support for legislation that will protect and enhance the well-being of Manitoba's most vulnerable.

For those neediest of government support, a cheque-cashing fee is often an added burden to an already tight budget. A $13 fee on a $500 cheque may seem like pocket change to the Minister of Family Services (Mr. Mackintosh) and this government, but for our most vulnerable it's significant.

Mr. Speaker, Larry Updike, spokesperson for Siloam Mission, understands the differences small amounts such as this one can make in strained budgets, and he recognizes the value of this bill. In support of this bill, he said, and I quote: It is one small step the Province can take toward helping our city's most vulnerable.

This minister's inability to recognize the unwarranted hardship these fees represent on Manitobans–on Manitoba's most vulnerable, and his refusal to see the value of passing this bill is shameful. Yesterday when I asked the minister if he would consider passing Bill 208, he answered, and I quote: It's very important that we not put in place legislation that will stop retailers from honouring these cheques.

But the truth is that this legislation would not stop retailers from honouring these cheques, as similar legislation exists for cheques from the federal government. Banks cannot charge fees on federal government support cheques.

Mr. Speaker, I strongly urge the government and this minister to support and pass Bill 208. It would be extremely disappointing if this government missed this opportunity to help those who need it most. This bill is a small step that would remove an unwarranted and unnecessary burden on Manitoba's most vulnerable at no cost to Manitoba's Treasury.

Thank you, Mr. Speaker.

Abby Constant-Bercier

Mr. Frank Whitehead (The Pas): Mr. Speaker, today I rise to recognize an inspirational young woman from Opaskwayak Cree Nation, Abby Constant-Bercier. Abby is an outstanding athlete and young scholar who is being recognized nationally for her considerable athletic abilities.

A talented hockey player, 13-year-old Abby was the assistant captain of the OCN Flin Flon Female Pee Wee Blues during the 2008-2009 season and played as the only female on her team, Norman Pee Wee development team, that competed against all other regions in Manitoba.

For the current 2009-2010 season, she is playing for the Aboriginal Team Manitoba Midget Girls, competing in the National Aboriginal Championships. She is the youngest female to ever make this team. She is also playing for Team Norman Midget AA Midget Girls competing in Manitoba Winter Games.

Abby is very committed to her Aboriginal heritage. She competes as well in winter and summer events such as the Trappers' Festival, Opaskwayak Indian Days, where she participates in competitions such as fire-starting, bannock baking, snowshoe races and other events.

She trained every day this summer with her grandpa to prepare for tryouts for these events. She worked very hard to keep up with her 15- and 16-year-old male cousins who were also training, and this helped her to make Team Manitoba.

***** (14:30)

Not only is Abby a gifted athlete, she is also an exceptional student. She has received an honours award for the last two years in junior high and currently boasts a 91 percent average in school.

Mr. Speaker, given the challenges that many northern communities face, we are fortunate that they can look to the leadership of people like Abby. I want to congratulate her on her numerous achievements and wish her luck in her future endeavours. I also want to recognize her parents, family members and the community that supports her because without them her dreams will–may never become reality.

Thank you.

Dairy Farmers of Manitoba Awards Banquet

Mr. Blaine Pedersen (Carman): Mr. Speaker, the dairy industry is very important in both Manitoba and, particularly, my constituency. A number of my– a number of my constituents were recognized for their contributions to the dairy industry at an awards banquet that was put on by the Dairy Farmers of Manitoba on Thursday, December 3rd.

While most people associate the black-and-white Holstein cow with the dairy industry, many producers are using Jersey cows for an increased butterfat quality in the milk.

Isidore Jerseys, which is operated by Henry and Meredith Delichte of St. Alphonse, won the award for the Highest Classified Jersey Herd in Manitoba at the awards banquet. The Delichte family operates a century farm in the picturesque hills surrounding St. Alphonse.

In the 2009 Top 10 Milk Quality Awards category over–for over 500,000 litres marketed, Michael and Darlene Carels of Bruxelles placed first, Daniel and Joann Van Deynze of Holland placed third, and Lakeshore Holsteins of Bruxelles placed fifth. Under the category of Top 10 Milk Quality Awards for under 500,000 litres marketed, Gabriel Fifi of Bruxelles placed first, Sandtree Farms of Haywood placed fourth, Maurice and Henry Delichte of St. Alphonse placed fifth. It should be noted, also, that Gabriel Fifi was also named the overall champion of Milk Quality Awards.

The dairy industry remains an integral part of the Carman constituency. All of us need to be mindful of the contribution, the hard work and the adherence to quality from our dairy farmers in Manitoba. We often take it for granted when milk shows up on our grocery shelves.

Congratulations to these producers, and to all dairy farmers of Manitoba, for their dedication in producing a home-grown, quality product for all of us to enjoy.

Mining Industry Initiatives

Mr. Gerard Jennissen (Flin Flon): Mr. Speaker, mining is vital to Manitoba. The global economic downturn has had a significant dampening effect on the mining industry. However, I am pleased to inform the House about two promising initiatives in northern Manitoba: Victory Nickel near Grand Rapids, and HudBay Mineral's Lalor site near Snow Lake.

Victory Nickel is continuing exploratory work and has plans to develop an open-pit mine and concentrator at Minago. Should Victory Nickel proceed, the mine would be one of the largest industrial undertakings in the province for many years, requiring more than 600 people in its construction and more than 400 employees in its operation.

HudBay Minerals has restarted operations at its Chisel North mine and concentrator near Snow Lake, Manitoba, with full production expected in the second quarter of 2010. The very exciting Lalor deposits will be accessed via ramp from Chisel North. Apart from excellent copper and zinc indicators at Lalor, the value of gold is estimated at between three and four billion dollars; $450 million are committed to completing all three phases at Chisel North and Lalor. The benefit to the entire region will be substantial because HudBay expects to employ up to 100 people at Lalor, once full production is achieved. This will also provide economic opportunities for those employees impacted by the anticipated copper smelter closure in 2010.

Mr. Speaker, these exciting new initiatives, as so many other mining exploration initiatives in Manitoba, were supported by the Mineral

Exploration Assistance Program, MEAP, available through the department of innovation, technology and mines. MEAP increases and stimulates exploration activities, leading to the development of new mines and industrial mineral deposits. The program has–the program has been wildly successful. Since 1999, 539 projects have been completed and approximately $19 million of assistant funds–assistance funds have been issued.

Congratulations to the department and to the northern mining sector for the two current initiatives that I have mentioned earlier, which will not only improve the economy and quality of life in northern Manitoba, but will also have a significant positive economic impact on all of Manitoba.

Thank you, Mr. Speaker.

Elton Sabres Girls Volleyball Team

Mrs. Leanne Rowat (Minnedosa): Mr. Speaker, I rise in the House today to recognize a team of female athletes from my constituency.

I had the honour of witnessing the Elton Sabre girls' volleyball team bring home the AA provincial championship for the first time in history this November in Lac du Bonnet.

Under the competent leadership of head coach Jeff Maxwell, the Sabres entered the tournament ranked third. After falling to the–to the No. 1-ranked Killarney Raiders in round-robin play before beating both Rivers and Souris, the Elton girls finished the tournament with a hard-fought win over the Niverville Panthers to take the gold.

Sabres Jenna Moffat and Stephanie Penner were named to the all-star team, and Brooke Hucaluk was distinguished as the championship MVP. Congratulations to these young women.

High school athletes from my constituency have been a dominant force in the province. Both the Souris and Elton male and female volleyball teams have consistently ranked in the top four provincially for the past many years. Rivers, Minnedosa and Wawanesa teams also make frequent appearances at provincial championships in sports, including fastball, soccer and hockey. The fact that rural athletes have taken a crucial role amongst Manitoba's best and brightest is simply undeniable.

Next year, the Elton Sabres will host–play host to the Manitoba High School Athletic Association's AA provincial championships. I look forward to the opportunity to play spectator to Manitoba's top young athletes in my own backyard.

So, again, congratulations to Jeff Maxwell and the ladies of the Elton Sabres. They have shown that our rural communities and small schools do produce talented and devoted student athletes. To all student athletes across the province, keep up the good work.

Thank you, Mr. Speaker.

ORDERS OF THE DAY

GOVERNMENT BUSINESS

THRONE SPEECH
(Eighth Day of Debate)

Mr. Speaker: Resume adjourned debate on the proposed motion of the honourable Member for The Pas (Mr. Whitehead) that the following address be presented to His Honour the Lieutenant-Governor: We the members of the Legislative Assembly of Manitoba thank Your Honour for the gracious speech addressed to us at this Fourth Session of the Thirty-Ninth Legislature of Manitoba, and the debate remains open and it should be on this side.

Ms. Erna Braun (Rossmere): Mr. Speaker, it's a privilege to rise today to speak in support of the Speech from the Throne for the Fourth Session of the Thirty-Ninth Legislature. I'm very pleased to be speaking in response to our government's blueprint for Manitoba's future, especially since this fourth session marks a new chapter for this government with a new leader and Premier (Mr. Selinger) and new additions to the Cabinet.

I wish to congratulate our new Premier and wish him well as he continues to move Manitoba forward with a strong vision and purpose and that this was recognized by Manitobans in a recent poll in today's *Free Press*. I also want to congratulate two members from our class of 2007, my colleagues from Fort Rouge and Wellington, on their appointments to Cabinet. I know they will bring great skill and ability to their new positions, and I wish them very well.

And I can't forget the member from Elmwood, one of our most recently elected members. What an asset he is. He brings his commitment to the environment, to his role as Minister of Conservation (Mr. Blaikie), and I wish him well in Copenhagen this week as he represents our duty to the environment to the UN conference, and, of course, his many years of experience at the federal level, which, I think, make him a natural choice as House leader.

Congratulations and best wishes to all my colleagues in Cabinet and the back bench as you embrace your new roles with the enthusiasm and dedication that I have seen over the past two years. This enthusiasm and energy that I see with my colleagues is the fuel that will continue to move Manitoba forward, and I guess this is a good time and an opportunity that I would like to take to say a few more thank-yous.

I also wish to thank our table officers. Their hard work and diligence keeps our House focussed and running smoothly. They keep us on track with rules, points of order and points of privilege and especially their work on committee. I would like to acknowledge that in particular. Their patience and guidance through sometimes rough seas is very appreciated and helps us get the work done, and the committee work also includes that of the *Hansard* folks, and I certainly want to extend my thank-yous to the work of the Clerks as well as *Hansard* through the many meetings and travel that we had through the province of Manitoba for our work on the Special Committee on Senate Reform. So I thank you very much for that. Also, to the pages, and I'm always so impressed with their hard work and their ability to quickly respond to our needs and our requests. So, thank you for your hard work and keep it up.

Mr. Rob Altemeyer, Acting Speaker, in the Chair

I obviously can't overlook an opportunity to say thank you to my constituents in Rossmere. Rossmere is such a delightful community to work in, and especially since it is the community that I was raised and grew up in and have spent the better portion of my life. It's an energetic community. Its citizens are dynamic and forward-thinking and have taken on a variety of initiatives that are always wonderful to watch.

***** (14:40)

I think one of the groups that, in particularly, absolutely astonishes me, is the group that works on the Northeast Pioneer Greenway and their good work continues, and they continue to embrace the community and tie Elmwood, North Kildonan and East Kildonan together.

Our road map for the future, outlined in our Throne Speech, will resonate well with my constituents in Rossmere. The themes of the Throne Speech focus on investing in the health and well-being of Manitobans and also bringing a stronger Manitoba.

On many occasions, the constituents of Rossmere have expressed to me how pleased they are with the direction this government has taken Manitoba, especially that our programs and measures have helped our province weather the economic storms that have battered many around the country and the world. They feel confident that we have a steady and even approach that will serve us well into the future.

Our Throne Speech continues that model of a sure hand on the province's rudder. Our theme of investing in the health and well-being of Manitobans is one that all Manitobans will benefit from and that lets every citizen know that we are continuing to move forward with their health and well-being in mind. We are investing not only in the social health of our people, but also the economic and environmental health of our province.

In spite of the recent economic challenges, Manitoba has one of the strongest economies in Canada. We are building on our economic health of our province through a variety of commitments. We have committed to invest $545 million in roads and bridges in 2010 as part of the Province's plan to stimulate the economy and create public assets with long-term benefits. So far the Manitoba government has invested in 1,500 stimulus projects, creating more than 12,000 direct and 10,000 indirect jobs.

In my community, the infrastructure project most closely to their hearts is obviously the Disraeli Bridge. This bridge is of great importance to East and North Kildonan residents. It is our northeast link to downtown. I can still remember how the only route to North Kildonan, when we first moved there, was over the Redwood Bridge, and what a boon the Disraeli Bridge has been to us. And with our investment, it will continue to flow traffic during the construction but, more importantly, it will also be constructed for a lifespan well beyond the initial 40 years that the City of Winnipeg had planned for.

Building cranes and heavy equipment can now also be seen in the Rossmere community. In fact, I could almost say that there's a hive of activity in and around our furniture park that's happening in Rossmere. The government's investment, by building an MPI claim centre on Gateway, is creating jobs not only in its construction, but with the ongoing enterprise that it has built.

Our economic plan also will eliminate both the corporation capital tax and the small business tax in 2010. I know this will be well received in my community, which is sprinkled with many businesses and industry of various sizes. When I drive through my neighbourhood, whether on Henderson Highway, Springfield or Gateway Road, I see shops of a variety: automotive, masonry companies, cabinet-makers, furniture manufacturers. I often think of Rossmere as being a one-stop shop for almost any of your household and family needs. *[interjection]* True. All of these enterprises will see benefits from the initiatives of this government.

We will build on our economic health by ensuring that Manitoba remains one of the most affordable places in Canada to live, work and raise a family. The northeast corner of Winnipeg has a wonderful selection of homes, both older and newer homes, homes which fit a wide variety of budgets.

One of the things which I find that has added a wonderful dimension to our communities are the building of homes through Habitat for Humanity. Over the years, Rossmere has seen its share of Habitat homes. But, just over the last number of months, a project of grander scale has been built in my neighbouring constituency of Concordia. I had the privilege of attending the groundbreaking with the previous MLA for Concordia back in the springtime, and I was recently invited again to attend the blessing of two homes on a street of 12 Habitat homes.

The opportunity for home ownership is very special, and meeting the two families that will be moving into these homes was quite an emotional experience. The look on the faces of the parents and of their children when they were handed the keys to their home and held these keys in their hands tells me how important it is that we work hard to make our province a place where families can afford to live and raise their children.

It is also interesting to note that the affordability for which Manitoba is known is now also attracting people back to our province. Friends of mine have commented on how members of their family are returning to work in Manitoba after years of living in other provinces because they see a better future here in Manitoba for themselves and their families.

And in talking with former colleagues in the teaching profession, they have also noticed a number of teachers who have returned from places like B.C. and Alberta because not only do they see Manitoba as being far more ahead of things in terms of education, but also, again, as a better place to move to and raise their children.

And another example of affordability that I took note of was an article I read in the *Free Press* not too long ago about our Winnipeg Symphony music director and how in Winnipeg he and his wife have finally been able to purchase a home. Having worked in many places around the world, it is here in our fair province that they have been able to realize their dream of home ownership.

Health care is obviously something that's very important to the constituents of Rossmere, and health care is a key priority for this government. From H1N1 to emergency care in rural areas, to helping people live longer through healthy living, we are committed to improving the physical health of Manitobans. And I guess one example, and my compliments to the Minister of Health (Ms. Oswald) with the H1N1 clinics around the province and in the city of Winnipeg, I have to state that the efficiency with which the clinics were held was quite astounding, and as I went for my H1N1 shot two weeks ago, I was so impressed with the–with the patience and respectfulness that the staff and the volunteers at the–at the clinic dealt with everyone who was there. At first I thought that it would be hours to get through because the parking lot was filled with cars, but everything was done so well and so efficiently that, within 45 minutes, I was in and out of the door.

Other commitments that we have made are building a new women's hospital at the Health Science Centre and the other is providing access centres to St. James and northwest Winnipeg, and I know that these communities in both areas of Winnipeg will be very well served by the access centres.

Our River East Access Centre certainly provides a whole host of services all within one facility. Many of my constituents have remarked to me on numerous occasions of the good quality service they receive, as well as the range of services. One, in particular, stands out for me, and that is the midwifery unit located at the River East Access Centre. And I've had a couple of new mums who have let me know how pleased they were that they were able to have their children arrive in the world with the support of a midwife.

Building these centres in St. James and northwest Winnipeg will certainly enhance access to medical centres for–services for our citizens in these areas.

So I've touched on but just a few things that this government is ensuring for the long-term health of Manitobans. We are being fiscally prudent as we build our rural and urban areas, our health care, our infrastructure, as well as justice, and we will continue to build on our strengths to ensure a prosperous future for all our citizens.

Thank you, Mr. Deputy Speaker.

Mr. Rick Borotsik (Brandon West): Mr. Deputy Speaker, thank you very much for allowing me the opportunity to rise and respond to a Throne Speech, but, before I do that, I, like others, would simply like to thank a number of people. Obviously, the first ones I would like to thank are my constituents, the constituents of Brandon West, who have allowed me to stand in this Chamber, who have allowed me to walk into the front doors of this Legislature, who have allowed me to represent them for many years, the last few years here in this Legislature, and I don't think any one of us should ever, at any point in time, take for granted the responsibility that we have with not only our constituents, but, obviously, the constituents for the whole province of Manitoba.

***** (14:50)

And I know that all members in this Legislature are honourable members, and they do come into this House recognizing the responsibility that they have to make sure that we, as Manitobans, have a much better quality of life, a much better opportunity for ourselves and for our children. And I say that, obviously, very open and honest with respect to both sides of this Legislature, Mr. Speaker.

I would like to thank the table officers who perhaps don't get as much recognition as they should but who certainly keep us, as members of this Legislature, on the straight and narrow with respect to the rules and regulations that we do follow on a regular basis.

Mr. Deputy Speaker, I'd like to thank our caucus staff, the PC caucus, and I know that I would also–I suggest that the members opposite would like to give their own caucus staff their thanks for the energy, the effort, the time that they put into their jobs here in this Legislature on behalf of not only us as members but certainly the constituents in Manitoba.

Others we talk about, the Speaker, earlier today, had congratulated a member of the *Hansard*, and what we don't recognize and what we sometimes take for granted is the effort that *Hansard* members put into this Legislature. And if you haven't seen the *Hansard* office in the bowels of this building, I would ask that each member go down there and just have a look to see how *Hansard* is produced on a very timely basis; how our every word is being transcribed by people who are very dedicated to make sure that what we do say is placed in a record for posterity's sake.

Mr. Speaker, I would like to thank those people who keep our offices clean, the security and the maintenance that we have in this building 'cause sometimes we don't appreciate the job that they do to make sure that our job is so much easier to perform. And, being that it's Christmas, I would also wish them a very merry Christmas going forward.

As for the Throne Speech, the–one of the members of the government–and I won't mention any names–one of the members of the government, after the Throne Speech, did in fact indicated that the Throne Speech was perhaps a little thin gruel. I would say that that was the case. Not only was it thin gruel, but it was perhaps somewhat mediocre, although this government does embrace mediocrity in all that it does. It certainly embraced mediocrity in this Throne Speech as well when they put it forward.

The fact that we're here, Mr. Speaker, Mr. Deputy Speaker, the fact that we're here two days after the Throne Speech session was supposed to be completed speaks to the inability and the mismanagement of the government not only in being able to control the operations of this Legislature and this House but the–but the operations and the mediocrity that they bring forward in managing the affairs of the Province of Manitoba.

A member from opposite said, what about the bells ringing? Well, Mr. Deputy Speaker, when one knows the rules of the House, one does not call a Throne Speech specifically for the number of days it is necessary to debate a Throne Speech.

The member that just spoke congratulated the member from Elmwood, the new–the new House leader. Well, I should say that the member from Elmwood did not, and perhaps does not understand the rules as he should understand the rules; otherwise, Mr. Deputy Speaker, we would not be here today speaking to the Throne Speech. We would've had an extended sitting of this Legislature and then the embarrassment that falls on the NDP's mismanagement of the Legislature and this House would not have been necessary.

So I would not congratulate the member from Elmwood. I would suggest that he should probably sit down and in fact learn the rules of this Legislature. I know the table officers would be happy to explain to him the rules of this Legislature.

The Throne Speech, Mr. Speaker, when I was asked to respond to it after the Throne Speech–and I didn't say thin gruel. I didn't say mediocrity. I didn't say mediocre. What I said was it was the opportunity of a new Premier to set the direction of his government. It was the opportunity of a new Premier to give a vision and a direction as to how he wanted his government to operate over the next two years. I saw none of that.

What I wanted to see was a Premier to stand up and say, I've had it with the same old, same old, steady as she goes. I want Manitoba to be a have province. That's my vision for the province of Manitoba. That's what I wanted him to say. I wanted him to say that agriculture in Manitoba is the economic backbone of our–of our economy. I wanted him to say that no longer are we gonna depend on others, handouts from Ottawa, and I don't want to depend on other policies coming from other provinces. I wanna make sure that Manitoba puts its own agricultural policy forward that's gonna support agriculture. I heard none of that, Mr. Speaker.

I wanted a Premier, a new Premier, to stand in this House and say in his Throne Speech, I want opportunities for rural Manitoba. I want opportunities beyond the Perimeter Highway. I want to have rural Manitobans represented in our economic vision going forward. I heard none of that, Mr. Speaker, from this Throne Speech.

I wanted a Premier to stand up and say, we are going to change the direction of our fiscal policy. We are not going to borrow our children and grandchildren into bankruptcy. What we're going to do is we're going to have a plan set out where, in fact, we're gonna pay back all of that debt that we now have so that we're gonna leave a legacy for our children and our grandchildren of no debt, not debt that they can drown in. I wanted a fiscal policy where the Premier stood up and said, for the people of Manitoba, we're gonna be competitive with respect to tax regime in this province. No longer are we gonna tax the men and women, the hard workers of this province to the point where we're the highest taxed in the country. I wanted the Premier (Mr. Selinger) to stand up and say, we're gonna change that policy. We're gonna become better than what we are right now.

But you know what, Mr. Speaker? I heard absolutely nothing that would say that we would do that.

Right now, Mr. Speaker, and I've heard all of the accolades, all of the platitudes that come from the other side of the House, the fact of the matter is there is a reality. The reality is in Manitoba we have some very, very serious financial issues–not dressed–not addressed by the Throne Speech in any way.

We have–and I talk about a have province, Mr. Speaker. Our province right now is dependent for 40 percent of its total budget on the federal government. That's like each and every one, as members of this Legislature, if we had to depend on our parents or our aunts or our uncles or someone else to fund our lifestyle by 40 percent, we would be dependent on those people. We cannot afford to be dependent on the federal government for 40 percent of our lifeline. We have to be dependent on our own resources.

Ms. Marilyn Brick, Deputy Speaker, in the Chair

And no where in the Throne Speech does it say, let's become much more reliant on ourselves, self-reliant. No where does it say that. It says, in fact, quite the opposite. We're going to continue to go and beg the federal government for more money so that we can squander it on wasteful mismanagement.

No where in this budget did it talk about tax cuts. It's talked about it before, Madam Deputy Speaker. It's talked about 'em before in budgets that have been put down. It's talked about trying to become a little bit more competitive with respect to our basic personal exemptions, a little bit more competitive with our tax rates, a little bit more competitive with our brackets. But no where does it talk about that. It's gonna maybe talk about it in the budget, but I doubt it because we've already got the foreshadowing from the Finance Minister that we are in some challenging times, and we are. Make no mistake about that. But they're challenging financial times of their own making.

Madam Deputy Speaker, I talk about the debt. I said it today in question period, no where in this Throne Speech did it talk about becoming much more reasonable with the debt loads that we have. If you look at the first-quarter financials, because we can't have the second-quarter financials 'cause that–that's not gonna happen until December the 24th.

An Honourable Member: Everything's changing. You don't understand. Everything's changing.

Mr. Borotsik: Everything's changing, but, unfortunately, they keep the same schedule. You see, I asked the Finance Minister if she wouldn't mind tabling the second-quarter financials, and she said, oh, no, no. We're just gonna do it the same we's–we've always done it. And that'll be, oh, 1 o'clock on December 24th. Well, Madam Deputy Speaker, there was no need for that, but if we go back to the first-quarter financials, it says right here that this budget year there's going to be new cash requirements of $1.8 billion. Those new cash requirements are borrowing debt of another $1.8 billion. It's gonna take our debt to $23 billion in this province. It's gonna take the debt to an unbearable level. And there's no blue sky; there's no light at the end of the tunnel. It's just going up and will continue to go up. And I'm very concerned. And there was no speech–no speaking to that in the Throne Speech.

***** (15:00)

Fiscal constraint–restraint. It was talked about that they're going to have some programming looked at to ratchet it back on programming. We know that there was a letter that was sent to all ministers and deputy ministers that said that they were going to change their operations the way they spend our money.

Well, we know there's wasteful spending. We know there's $14 million that we could save right off the bat by these enhanced identification cards, which are not being accepted by residents of the province of Manitoba and, quite frankly, the opposite. The people that I talk to that come into my office and who have tried to go through the process of the enhanced ID say, this is absolutely the most ridiculous program I've ever seen in the province of Manitoba, and I will get a passport. So we could've saved $14 million.

Madam Deputy Speaker, 370-odd million dollars that they want to spend–waste on nitrogen coming out of the effluent in the city of Winnipeg, 640 million that they want to spend or waste on a west-side–a west-side Hydro line, Bipole III, which I find there's not a logical individual in this province that can understand why they would continue to want to waste $640 million of our money for absolutely no reason at all.

But the one that I really enjoy, if you want to talk about wasteful spending mismanagement, is the new Minister of Justice (Mr. Swan), who's just spent a quarter of a million dollars. Now it doesn't sound like a lot of money, but a quarter of a million dollars, ladies and gentlemen, is a lot of taxpayers' dollars, borrowed dollars, because you're going out and borrowing $1.8 billion. Madam Deputy Speaker, $250,000 has gone into an advertising campaign to keep people out of gangs.

Now, we heard yesterday that the advertising is being placed on wonderful programs like *Ellen DeGeneres*. I don't even know the soap operas. What is it, *The Young and the Restless*? I would suspect that they would be better off putting the advertising during *The Simpsons*, Madam Deputy Speaker. At least, at that point in time, when they have *The Simpsons* advertising, that Homer could actually look at it, and say, d'oh. Now for *Hansard*, for *Hansard* that's d-o-h. Okay, that's d-o-h. *Hansard*, you can report it as that, because Homer Simpson says d'oh, and I'm going to say, d'oh, to $250,000 wasted, absolutely wasted on a stupid advertising program that is going to accomplish nothing. But that wasn't in the Throne Speech. That wasn't in the Throne Speech, that we would just simply waste money, as we always have and will continue to waste money.

I'm going to talk about my constituency. I told you at the very beginning of this that I am very, very thankful and somewhat humbled by having my constituents send me to this august place. I looked at the Throne Speech and I read the editorials after the Throne Speech, and I found that actually Brandon was short shrift. And I know you can stand up and talk about all those wonderful capital projects that are ongoing in Brandon, but I should also say, first of all, that those capital projects should have been done within the first 10 years of your mandate. And, quite frankly–quite frankly, you cannot continually take credit for projects that were done 10 years ago.

You've reannounced and announced and reannounced and announced so many times, the bridge construction, the hospital construction, the CancerCare construction. I'm even confused as to when and should and could've been built. Too many of the projects have already been started or completed but reannounced in a Throne Speech, which I find very ludicrous, Madam Deputy Speaker.

We talked about the ACC trade building. Well, I drive by First Street all the time, and it's almost complete, but it was mentioned in the Throne

Speech. I drive–I drive in Brandon, and I see the BU physical plant, which is completed now, but it was mentioned in the Throne Speech.

I don't know if there was anything new that was mentioned in the Throne Speech. Actually, there wasn't anything new that was mentioned–ah, that's not true, that's not true. There was one thing new about Brandon in the Throne Speech, and they talked about TIF, which is the tax incremental financing program that's suggested by this government, which really is simply another revenue centre taking money out of schools and property tax owners to put into their own pet projects. So let's get things straight here.

They did mention TIF for the Strand Theatre project, but it was gonna be funded by the school divisions and the municipality. Oh, isn't that wonderful. But that was mentioned in the Throne Speech. It was the only thing that was mentioned for Brandon.

One thing they didn't mention in Brandon, Madam Deputy Speaker, in the Throne Speech, was their absolute abysmal record when it comes to crime and crime prevention. I travel across the country on a fairly regular basis and I have to admit I fly the Manitoba flag. I believe strongly in this province. I believe we have great opportunity in this province. I believe in this province. It's been very good to me and I would like to, and I believe I have put back into the province as much as I possibly could. But, when I go and I travel across the country, I hear, and I think if they opened their ears they would hear as well, the comments that come from other jurisdictions.

They're now coming from Saskatchewan, Alberta, British Columbia, Ontario. I hear them and, unfortunately, they say, what's happening in Manitoba? Why is it that you're the murder capital of the country? Why is it that you're–why is it that you're the auto theft capital in the country? Why is it that every time we turn on a television set in the evening we hear about another serious assault or a serious incident in Winnipeg, Manitoba? And that hurts. That hurts because I depend on the government to put in place proper policies to solve those problems and this government has no idea, has no desire to be able to fix those problems.

I also, in talking to people from Saskatchewan, who now look down their nose at Manitoba, which, I find, when I was growing up in Manitoba, it was quite the opposite. We always thought perhaps Saskatchewan was the poor cousin. We're now looking at Manitoba as that black hole, that poor cousin. See, you see, Saskatchewan has now got–has now got the strongest economy in the country.

Saskatchewan now has less debt than they had when the recession started. Saskatchewan–Saskatchewan now has–now has, Madam Deputy Speaker, a have province status and they throw it in my face constantly. And you know what? These people across the way saying, oh, how's that working, oh, so they're a have–they're a have province now. Isn't that just wonderful. We can depend on the federal government for money that we can waste. We don't have to be a have province. Well, I wanna be a have province and that should've been reflected in the Throne Speech.

Madam Deputy Speaker, I was very happy to hear the Throne Speech to know exactly where this government stands, which, in my opinion, is nowhere. Mediocrity is their mantra. It's what they scream from the opposite sides of the benches. And we will vote against this Throne Speech and we should vote against this Throne Speech because the direction that was put in this has nowhere to go.

In fact it's the first Throne Speech that I know of that the Premier will not speak to and the Premier will not vote for. And I've always said if you're not gonna vote for it, then I would just assume at that point that you're opposed to it. So I would say I'm really apologetic for the NDP, why their own Premier will not support his own Throne Speech. Thank you, Madam Deputy Speaker.

Hon. Steve Ashton (Minister of Infrastructure and Transportation): Madam Deputy Speaker, I want to start by saying how great it is to be able to speak on the Throne Speech once again. I always say the Throne Speech can bring out the best in debate in this House because it gives us all an opportunity to talk about our vision for this great province of ours.

And I must admit, by the way, I have been–I won't say I've been keeping notes. I'm not sure there was a lot of noteworthy comments from members of the opposition but, you know, whether it was the Leader of the Opposition (Mr. McFadyen), or the member for Brandon West, what struck me is really how out of touch they are with what's going on in this province.

I mean, the quote of the day was from the member for Brandon West. He said it's, you know, the sun isn't shining in Manitoba. There's no light at the end of the tunnel. I don't know if he stepped outside of this building, but it's a classic cold winter day in Manitoba. The kind of cold winter day that defines this province that we want to save from climate change. And it's a bright sunny day out there but, you know, it's not just a bright sunny day in terms of the climate. We have seen in this province, in this past year, some of the most incredible developments we've seen in a long time.

***** (15:10)

We have the highest increase in population in this province since 1971, Madam Deputy Speaker, 1971. No mention of that from members opposite. You know, I want to put it into context. The increase in population year over year is greater than the size of the city of Thompson. That's the third largest city, and it's a result of the growing diversity of this province, the growing Aboriginal population, the increased number of immigrants. Again, something that didn't just happen. We have 14,000 immigrants coming to this province because of the success we made of the Provincial Nominee Program. By the way, we're the second youngest population in the country. Other jurisdictions throughout Canada and throughout the world are looking at what will make them develop in the future and we've got it.

So I don't want to just start off with anything other than a clear statement about the real sense that's out there. I want to also remark on something else that's quite noticeable and that is that we've been in government for 10 years. You know, I think probably one of the reasons as I've seen it is certainly we've seen over the last couple of weeks that the opposition, you know, basically has tactics in search of a strategy. They still haven't, Madam Deputy Speaker, most of their approach in this House hasn't changed in 10 years. Now, I'm not going to give them too much advice, but, you know, I found from previous experience they don't listen anyway.

But, you know, if you look at what happens when members opposite–I mean they're running out of letters in the alphabet to, you know, to point negative things that at the government in their amendments to Throne Speeches. They got to Q this year. You know, it's very difficult for them, I think, to actually get up and say one clear thing, and that is one of the reasons why this government continues to have the support from the people of Manitoba is that in many ways, this province is far better off than it was 10 years ago, far better off. That's the reality.

Now, I want to give you one quick example, one that I have some direct experience with, and it's newly appointed Minister of Industry and Transportation. One of the first things I wanted to do was double check and reference 10 years ago with today in terms of transportation. Now, what's interesting, by the way, some things haven't changed. The Leader of the Opposition (Mr. McFadyen) November 20th in the *Carman Valley Leader* is once again trying to divide and conquer, saying that too much is going to northern Manitoba. Well, I want to put on the record, since we came to government, something is going to northern Manitoba. There was not much in the 1990s. In fact, a significant investment's taking place in northern Manitoba.

We're extending the all-weather road network which is a significant development for those communities, but there's not a region of this province where we're not spending more on infrastructure, rural, in and around the city of Winnipeg and I've–you know, the member for Brandon West (Mr. Borotsik), I would suggest by the way, he go to the 18th Street Bridge, and he may want to stop there. Park on the side and look at it because it's the NDP that, again, is redeveloping Brandon in terms of infrastructure. You know, there's no tunnels in Brandon; there's bridges. He just has to open his eyes. He'll see it.

Now the real problem with this approach, though, is you notice they had little code words that they like to throw out. They don't get up and say if they were elected to government there would be major cuts in spending, but let me tell you what they did when they were in government before with infrastructure. They didn't increase it. At one time, it was less than $100 million, and I remember–I'll never forget the year they got money from the federal government, they deducted it from how much they were spending. What we've done is we've taken the infrastructure opportunity with a federal government that is talking about developing infrastructure, and we've partnered and I've been the first one to give credit where credit is due. We've accessed $100 million this year on highways alone under infrastructure funding and whether it be in terms of highways or recreational facilities or sewer and water, we are building, but you know what the code word is?

You know, they talk about debt. You know, I think the Leader of the Opposition talked about debt. I think the member for Brandon West talked about debt. You know, it's kind of stereophonic over there, the two of them, debt, debt, debt, debt, debt. But you know, what does that debt represent? It represents investment in our highways, $310 million in terms of education infrastructure. Major construction that's taking place in terms of *[inaudible]* and by the way, including our Justice facilities. Major construction in terms of health. Wherever you go in the province, we are seeing at a time of economic slowdown that Manitoba's leading the way in investing in our infrastructure. That's what they don't tell you because the real code word when they talk about debt is if they get into government, God forbid what they would start cutting first, but one of the things they would most definitely cut is their investment in the public sector.

Now, what's the other theme of this session, this pre-New Year session we're seeing from members opposite? You know, again, we see the whole approach in terms of tactics and strategy here. Well, you know, with all the bell ringing and all the rest of–the other issue they keep raising is Manitoba Hydro. They have not said a good word about Manitoba Hydro since the beginning of this session.

Now that should come as no surprise because they also talk about debt again. Now, what is the debt being invested in, in Manitoba Hydro? Well, right now it's being invested in a hydro dam, the Wuskwatim Dam, in partnership with Nisichawayasihk Cree Nation. And if they took the time to come to northern Manitoba, they would find out that we're seeing significant partnership between the community, many people from northern Manitoba working. Of course, it could always be a greater amount, but, you know, that investment is part of the future of Manitoba Hydro.

You know, they talk about some of the recent trends with Manitoba Hydro. I want to put on the record that, yes, energy prices in the U.S. have dropped; our export markets have been affected. There's cheap natural gas. But the bottom line when it comes to Manitoba Hydro, it's got a strong future. It's a major asset, a public asset that is gonna develop this economy, and not the least of which is because we do have the lowest hydro rates in North America–*[interjection]*

You know, they can't even get up and ask a question without attacking a simple fact, that we have the most affordable hydro rates in this country. And dare I say, with the discussions taking place in terms of climate change, it's clean energy, and we have proven that we are leaders in terms of clean energy, in terms of climate change. Now, that's the–that's the second theme.

Now, the third theme you'll run into–they like to recycle things, by the way. I'm not talking about environmentally. I loved when the Leader of the Opposition got up and talked about cutting the payroll tax. You know, they were in government for 11 years. They promised they were gonna cut it in five years, and, as a former premier once said, they just didn't say which five years they were gonna cut it in. You know, they–they've recycled pretty well every theme they had from the 1990s. Now, does anybody really wanna go back to that era? I don't believe so.

But I don't–I don't want to assume anything with the members opposite. I've always said they're stuck in the '90s. My view is it's probably the 1890s, in terms of their political philosophy. But at a time when the–when the world has responded to the recession in terms of stimulus, they are attacking the investment. And yes, yes, in some cases it involves debt that is invested, just like when you buy a house and you invest in the mortgage for the house, that's invested in the future productivity of the province.

Well, I wanna paint a very different picture because I can say that one of the strengths of this government, by the way, is the strengths of our team and our support throughout the province. We are the only political party that has support from all areas of this province. And I can tell you–*[interjection]*

Well, the member opposite talks about, you know, support in his area perhaps for a different political party. You know, they don't even try in northern Manitoba. There's been more sightings of the Sasquatch than there have of Tory MLAs, Madam Deputy Speaker. So they make no effort when it comes to huge parts of this province.

But, you know what? I want to–*[interjection]*

An Honourable Member: You say that every Throne Speech.

Mr. Ashton: Well, I know. Members opposite knows that I do talk about the Sasquatch many, many times. Go to Norway House, they've seen a lot more sightings of the Sasquatch there.

But you know, the reality is we've also, I think, shown something that's important the last couple of months, and that is that we are very much a party and a government that is team-based. And I know something about that; we went through a lively period a couple of months back in a leadership–*[interjection]*

An Honourable Member: How'd you do?

Mr. Ashton: And for the member–well, member opposite says how I did. I went for the gold, got the silver. But, you know, I can tell you one thing: This New Democratic Party and this New Democratic government, we're not like Tories in another way, and that is we are united. We have a transition, I think, that's demonstrated that, and the fact that I'm here today speaking on this Throne Speech, and all members of our caucus speaking support of this Throne Speech is indicative of the fact that we are a party that does work together, unlike members opposite.

And I wanna just conclude with this. You've got, really, two clear choices in terms of vision in this province. The members opposite are the dark cloud party, you know, nothing good is going on. In fact, I went through the Leader of the Opposition's speech, and I found maybe one paragraph that was positive. You know, the member for Brandon West (Mr. Borotsik), and member after member after member got up with negative comments. And I realize they've been in opposition for 10 years, and opposition is honourable, and I realize they may be getting somewhat downcast about their continuing ability to be an opposition party not ready for government.

***** (15:20)

These–you know, it's interesting, they talk about daytime TV. This–if they–if you're ever at a party that's not ready for prime time, it's the PC Party. I mean, you know, their Finance critic giving impressions of Homer Simpson, you know, obviously, he studied the part very well.

But, you know, we are a government, on the other hand, that has a positive vision for this province. We have dealt with some very difficult economic circumstances, but still are doing better than many areas of the country.

We're investing in our infrastructure, we're investing in our public services, and we represent all of Manitoba–by the way, an increasing Manitoba. And, in the end, I say to members opposite, and I say to the people of Manitoba, one of the reasons that I am supporting this Throne Speech is because it is an optimistic document that reflects what I always say is the quote of a great Manitoban that sums up where we are after 10 years in government; that is we've accomplished a lot. But, to quote Randy Bachman, you want to look at the future, Madam Deputy Speaker, you ain't seen nothin' yet.

Mr. Kelvin Goertzen (Steinbach): It's always a pleasure to follow my friend from Thompson with his Throne Speech who got a rousing support here in the House, but wasn't able to garner the same sort of support two months ago, Mr. Speaker, when he was entering the leadership race for the NDP.

And I know he quoted some statistics, and statistics can sometimes be deceiving, and 10 different people can quote him 10 different ways. I think he said he finished second in the race. Some would say he finished last in the race 'cause there was only two people who wanted to actually run for the leadership of the NDP. But we know that his position as the former future leader of the NDP is solid and entrenched in that party, Mr. Speaker.

It's always difficult to–it's always difficult to be one of the last speakers on the Throne Speech because, you know, you want to welcome everybody back and welcome everybody back for a new session, but it's been such a short session that's it's almost over. And so welcoming people back wouldn't make a lot of sense.

So, I will, though, say to the–to the Speaker and to the table officers and to those in *Hansard* and those working in the Legislature, I wanna wish you all a Merry Christmas, best of the season, a Happy Hanukkah as you celebrate with your–with your families in the days ahead.

But we still have some work to do and it was difficult to get this government to come back to work. You know, there was many who were trying to have the Legislature recalled earlier so we could debate the issues of the day and ensure that Manitobans were able to have their voice heard here. But over and over the government stalled and decided that they didn't want to come back to the Legislature. And I know that that probably left a number of Manitobans puzzled and wondering why the government was running from the democratic responsibility that all of us who were elected to uphold from our constituents.

And then we realized why when they came back, as they stumbled around trying to organize the House, and they made their mistakes. And the new House leader, the member for Elmwood (Mr. Blaikie), hadn't read the rule book or he read the wrong rule book, and they continued to get things wrong day after day and has led us to this point where we now are in the extended session. I don't ever remember a time when I've been called back three times to the Legislature within three weeks. But that's what's happened because of how badly the government has managed the House–*[interjection]*

Well, and I hear the new member for, I think Entrepreneurship, the new member–Minister for Entrepreneurship (Mr. Bjornson) trying to read the paper and talk at the same time. I know he had a difficult time doing even one thing right in his former portfolio. He needs to try to at least to hone in and to focus either to listen or to do something else and not to try to do too many things at the same time.

And I know, Madam Acting Speaker, that when we talk about the government wanting to stay out of the Legislature, try to avoid this place of democracy; we saw the reasons why. We hope that when we come back in the spring and maybe it'll be earlier–you know, there's–just because there's a rule or an agreement that we're gonna come back in the third week of March or something along those lines doesn't mean we couldn't come back earlier, you know. All of a sudden, if the Premier (Mr. Selinger) decides that he wants to work a little bit more here in the Legislature, he could call it back sooner. We could have a good, democratic debate. I would encourage him to do that. If his House leader gets through the rule book and feels that he has a grip and understanding of what's going on here, he absolutely should call it back sooner. We're always ready to come back here and to talk about the issues that are important to Manitobans and important to our constituents.

I noticed in the–in the Throne Speech, Mr. Speaker, that there was a number of things that just simply weren't mentioned. Even the member for Thompson (Mr. Ashton) refused to talk about crime in his–in his address to the Throne Speech, and that's the same member, when he was running for leadership, I remember him saying that crime was out of control, that it was skyrocketing. That's what he said when he was running for leadership, you know, so it was interesting. He talked about team and how there wasn't that division, that, finally, when the chains are off of some of those members who are trying to seek the leadership, we finally heard some of what they actually feel, and we heard it from the member for Thompson. He said crime was out of control, it was skyrocketing.

We heard for the now Minister of Justice (Mr. Swan) who said that we should look at building the Bipole III along the east side of the province instead of the west side of the province. Suddenly, everybody was unshackled, and they were saying what they actually felt and what they knew and what they know that Manitobans have been saying to them. But now they've sort of clustered back in and are trying again to toe the party line and put all of those concerns that Manitobans have brought to them aside and they don't want to have them addressed.

But I wish that they would've spoken more, that the member for Thompson would've spoken more about his feeling about how crime has got out of control, both in the city of Winnipeg and throughout Manitoba. He would've been wise to continue on his path during the leadership in recognizing that crime is out of control under this NDP government. Successive ministers, whether it was the member for St. Johns (Mr. Mackintosh) or whether it was the member for Kildonan (Mr. Chomiak) or now the member for Minto (Mr. Swan), have taken the approach that we're gonna be soft on crime and try to convince individuals that things are gonna get better, and the member for Thompson wanted to compare, you know, how things were in 1999 compared to how they are in 2009.

I wish you would've talked about crime and made that comparison, you know, and looked at how the growth of gangs has occurred in the city of Winnipeg, street-level gangs. We suspect that there are probably six to seven thousand known gang members in the city of Winnipeg in the province of Manitoba, but it's hard to quantify. It's hard to quantify, Madam Deputy Speaker, because of the fact–because of the fact that they unplugged the gang data base. You know, we had a system in place in the 1990s where there was about 1,500 known gang members and we were tracking them and we were using that information to try to see if things were getting better or things were getting worse when it came to crime, and what did the NDP do when they saw that their approach was causing gang activity to increase? Well, somebody ran into the back office and unplugged the database and said, we can't track it anymore. We're not gonna look at it anymore. Let's put our heads in the sand. Let's close our eyes and let's pretend the problem isn't there and maybe it'll go away.

And I know the member for Transcona (Mr. Reid)–I hear him making a couple of comments. I know that his constituents would be concerned. I've spoken to some of his constituents concerned about the level of crime in Winnipeg, and they might wonder why he is not standing up and saying what the member for Thompson (Mr. Ashton) did, that, under the NDP, crime has been skyrocketing. Maybe he'll have that opportunity in March or sooner if the Legislature comes back sooner. I'd encourage him to go to the Premier (Mr. Selinger) and say, we want to be here a little earlier to deal with some of these issues–if he has that influence. I can't remember which horse he backed in the race, so that may be difficult to have that influence, but I think that he should go–*[interjection]*

What's that? *[interjection]*

Well, you know, and I hear the member for Transcona making disparaging remarks when we talked about crime, when we talk about the concerns of his constituents, and I think that, ultimately, in the long run, that's an approach that will not serve him well as he goes back to them for support. But the issue of crime in unplugging the database is only one thing.

But, you know, we had–in fact, the new Minister of Justice (Mr. Swan) was making an issue about how he wasn't able to use a gang courthouse, and somehow he thought that that made him strengthen his hand; that Manitobans would somehow rally around him because he wasn't able to use a gang courthouse. Well, the reason he wasn't able to use the gang courthouse was he hasn't been able to get the gangs off the street, Madam Deputy Speaker. That's the reason he hasn't been able to use their courthouse. You don't need it if you're not going after the gangs. So, over and over we see these different failures when it comes to the issue of crime.

You know, it was sad. I think it was maybe not the saddest moment that I've seen in the Legislature, but one of the sadder moments when the Minister of Justice stood and said that–yesterday, when we were talking about the 47-year-old father who was killed as a result of a stolen vehicle on Friday–when he said that they were busy celebrating their achievements. You know, at a time when I think all of us should have our hearts going out to the family and redoubling our efforts and looking at what more could be done, he said that it was a time for celebration, and he was glad to be with the member for Kirkfield Park (Ms. Blady) to pat themselves on the back when it comes to auto theft.

***** (15:30)

And yet today we have the president of the Winnipeg Police Association, Mr. Mike Sutherland, saying that what's gonna be happening now, what they've already seen to some extent is, because of the immobilizer program, because of the focus of the government to put all of the onus on the victims, and instead of going after the criminal intent of those young people who are trying to steal cars, now there's going to be more carjackings because and, you know, this would be common sense and you don't have to be a lawyer, you don't have to be a criminologist, I think, to understand this, that if you don't go after the–if you don't go after the criminal intention of a person trying to steal a vehicle or commit some other crime, they're just gonna commit some other crime. And, if every car has an immobilizer, they may look at carjacking. They might be doing breaking and enters. There might be violent crime. And so you don't actually have less victims, you have just different kinds of crime.

And that's what this government has never understood. I mean, years ago they looked at a–at a seniors program and said, well, let's hand out deadbolts to the seniors 'cause they're concerned about crime–*[interjection]*

Well what–well, you know, I mean the member for Transcona (Mr. Reid) asked if one of the professors who's involved with the–with the program is wrong.

You know, I'm happy to stand by the police. If he wants to stand by every professor in the province of Manitoba, I'll stand beside every police officer in the province of Manitoba, and we'll have that debate. If he wants to ignore the police–if he wants to ignore what the police are saying on this issue, I'm more than happy to rent a hall, we'll bring in the police officers, he can bring in academia and we can have that debate about how to make our province safer.

But, you know, I think that most individuals would recognize that if you don't go after the criminal intention of an individual who wants to commit a crime, if you just put all of the onus on the victim, you know what's gonna happen. So they went to the seniors and they said, well, here are some deadbolts. Lock yourself in your homes. While the criminals are running outside, you lock yourself as a prisoner in your home, and that'll keep you safe.

Well what approach–what approach to crime is that, Madam Deputy Speaker? And what's the result gonna be? Well, it's clear what the result's gonna be. You're gonna have an increase of crime because individuals know that the government's gonna focus on the victims instead of focussing on them, and that's what happened. And we saw it, unfortunately, with the accused individual, who now has been charged with manslaughter, the 18-year-old individual, as a result of the death on Friday.

Here's an individual who was a level 4 car thief, and I think most members would know that that's the worst of the worst. That's the–you've been identified–if you're identified as a level 4 car thief, that means they know you're a repeat offender, you're likely to offend again and you have to have intense supervision. Well, you know, according to the initial reports, this individual obviously wasn't following his court orders that he had placed upon him. He didn't have electronic monitoring, he didn't have that supervision and we saw the deadly results, Madam Deputy Speaker. We didn't have that kind of intense supervision.

This wasn't somebody who never had a previous record, who you wouldn't expect would be committing a crime. This was a level 4 car thief who had already been identified as somebody who was likely to reoffend. But because this government refuses to crack down on those court orders, something that's fully in their ability to do, fully in their jurisdiction, in their purview, because they have decided that they're not going to enforce those court orders, we're gonna continue to have this type of violent crime where there's auto theft, gang activity or other kinds of crime and they know, you know.

And, you know, it's so sad because every time you hear of a horrific incident, whether it's a gang incident or some sort of other violent incident, you know that when the perpetrator is caught and charged, you know it's gonna be somebody who is breaching a court order. It's inevitable. We know that it's gonna be somebody who should've had some sort of a court order in force but this government refuses to enforce those court orders and we're gonna continue to have victims as a result.

So, look at their approach. You know the first thing–the first thing that the new Minister of Justice (Mr. Swan) did when he assumed office–and I had some hope, you know, I'd like to think that I'm a person who has hope and I believe I have an optimism, that things could change, Madam Deputy Speaker, so when the new Minister of Justice was sworn into office I said, well, let's give him the opportunity. Let's hope that this'll be different than the member for St. Johns (Mr. Mackintosh) was, and the member for Kildonan (Mr. Chomiak) was, the two individuals who announced eight gang strategies in 10 years. Let's hope that this would be something different.

But on one of the first days of office, the Minister of Justice announced his new strategy to take gangs off the streets, to wipe them away, to clean up the streets of Winnipeg was to launch an ad campaign on shows like *Ellen DeGeneres* and on soap operas like *The Young and the Restless*, and on *Canada AM* at seven in the morning, and hope that those gang members, instead of being addicted to selling drugs on the streets, were addicted to soap operas. That was his approach to trying to get gangs off of the streets of Winnipeg.

And you know we talk about the carrot and the stick approach, and I've heard the–I've heard the members opposite talk about how you need to have both the carrot and the stick approach. Well, you know, we don't disagree but, you know, there's more carrots over there than Bugs Bunny has and at some point, at some point, Madam Deputy Speaker, you have to bring out the stick, because there comes a point in time where these individual gang members are so entrenched and so hardened in that gang lifestyle, that there's going to be some consequences. You know, and it's not like there's no hope.

I've talked to individuals across North America about gang activity and how to–how to have an impact, and I met with some officials in the office of the mayor of Minneapolis recently. And, you know, Minneapolis is an interesting comparison, because they used to be called Murderapolis in the mid-1990s. That might ring a bell, of course, because of the challenges that we have in Winnipeg.

But they were able to go from one of the most violent cities in North America to one of the safest cities, not just because they extended a bunch of carrots, as the government would do, extended a bunch of carrots and hoped, and hoped that they would get them off the street because somebody was watching *Desperate Housewives*, or was watching a soap opera and decided, oh, look, apparently gangs are a dangerous lifestyle. Well, I've got news for you, you know, some of these young people actually know that gangs are a dangerous lifestyle.

But, when you talk to, you know, 14- or 15-year olds who are at risk or have been lured into that gang lifestyle, they'll tell you, on the one hand they're presented with a gang recruiter, with a gang recruiter who's saying, if you come into this gang, we're going to give you clothes, electronics, money. And, on the other hand, is a counterbalance, you have an ad running on *Ellen DeGeneres* that's saying, well, it's a dangerous lifestyle, maybe you shouldn't do it. Well, you know, if there's a young person who's watching *Canada AM* at seven in the morning, I suspect he's not at risk. I suspect that he's probably, you know, doing pretty well.

But this is what the government doesn't understand is you've got these gang recruiters out there offering all of these different things for these young people to get involved in gangs, and as a counterbalance, they throw out ads–and look, I mean, we all know why they did it. It was just to try to get those individuals who are watching the ads to try to believe, oh, maybe the government is trying to do something about gangs.

And I think it backfired. And I think it really backfired on the government because everybody that I've talked to about the ads, they've said, well, this is ridiculous. We know this isn't going to work. And I expect the member from Transcona and others, when they go back to their constituency, if they talk to those in their riding, they're probably getting the same comments. They're probably getting people who–*[interjection]* Well, the member for Transcona (Mr. Reid) says no. He's either living in a bubble or, you know, he's limiting his conversations to those who live within his household, and he needs to go a little bit beyond that, because people are saying this simply is not going to work because they're frustrated, they're frustrated, Madam Deputy Speaker, and I understand why they're frustrated.

Winnipeggers have had it. They're saying enough is enough. It's time that we take some serious action to try to bring order back to the streets of Winnipeg, because it's not that Winnipeg or that Manitoba that any of us remember growing up in. And yet what–you know, and so when the ads came on TV, the people that I've spoken to, from a variety of different ridings, have said this is ridiculous. This isn't going to keep gang members or get gang members out of gangs, and that's before they learnt, when they were running the ads during daytime talk shows and during soap operas. But that's the approach this government has always taken.

One of the first things the member for St. Johns (Mr. Mackintosh) did when this government was elected in 1999, actually, I think it was the second thing, first they took the safer communities act that the Filmon government had passed prior to the election and they copied that, put it on the photocopier, copied all the pages, re-introduced it and then claimed it as their own, and that worked. And so, you know, kudos to Gary Filmon and to Vic Toews.

So the second thing that the member for St. Johns did was to announce that they were going to have a Project Gang-Proof to drive gangs off of the street. And that was essentially pamphlets that were made up and distributed to parents and to youth.

But doesn't that sound familiar? Doesn't that sound familiar, Madam Deputy Speaker? Ten years later we've gone from distributing pamphlets and having ads on Project Gang-Proof to having ads on this new gang initiative. After a decade, we've come full circle. And all it is, is a media strategy by this government to try to convince people that they're going to get tough on gangs. And I think that most Manitobans recognize that this is not, this is not a party who really is going to ever ensure that there are tough measures placed on gang members. And I think that that's unfortunate, because as we continue along this path, there's going to be more and more crimes and more and more victims and more and more families who are mourning the loss of a loved one.

***** (15:40)

The one thing that was mentioned–*[interjection]*. Oh. I know, Mr.–Madam Acting–Madam Deputy Speaker, that my time is running short. My House leader, who I would like to commend for doing a tremendous job this session–I wouldn't want to say that my House leader could beat up their House leader, but certainly in a mind war, certainly in an intellectual debate, I'll put the member for Lac du Bonnet (Mr. Hawranik) up against the member for Elmwood (Mr. Blaikie) any time, and I think we saw that–we saw that this session.

But I would like to thank the residents of Steinbach, which include the town of Niverville, the R.M. of Hanover and the city of Steinbach, again, for their continuous support. Many of them have wished their good wishes to me and my wife and my son during this holiday season, and we have always appreciated the opportunity to represent I think one of the greatest constituencies in the province, and I look forward to continuing to serve them during the duration of this term.

Thank you very much, Madam Deputy Speaker.

Mr. Mohinder Saran (The Maples): Madam Deputy Speaker, I am pleased to stand in the House today and speak in support of this Speech from the Throne.

The Throne Speech shows that Manitobans have elected themselves the right government for these unsettling economic times. Just think back to what happened when a cold economic wind blew Manitoba's way in the 1990s. Yikes, the Tories said, and slashed funding for our universities, cancelled the bursary program, fired 1,000 nurses and cut medical post spots. Contrast those rash decisions with the steady performance of our government in education and health that the Throne Speech has described. My colleagues have already elaborated on our investments in these areas.

I would only like to add, as a footnote, about recent improvements in emergency services at our local Seven Oaks Hospital that benefit my constituents in particular. Recently, a $14-million expansion and redevelopment of the ER at Seven Oaks increased its capacity by 50 percent. Now, as part of budget 2009's province-wide improvements in emergency care, the ER will be staffed by additional nurses overnight. In addition, Seven Oaks has been part of a pilot project to add a new category of professionals to the ER team: physician assistants. They are qualified to perform a wide range of duties, including conducting physical exams, ordering diagnostics tests and prescribing medications and other treatment. This is yet another step towards strengthening the emergency team at Seven Oaks.

Manitoba was the first province to institute a children's fitness tax credit paralleling the federal credit introduced in 2007. Now Manitoba is showing the way for other provinces by phasing in a similar fitness tax credit for adults. This incentive to engage in physical activity is something that I have been advocating during my two years as an MLA. The health benefits of keeping fit are well known. Fit individuals are more likely to lead happier, healthier and longer lives. There is also a benefit to society as a whole. A fit population makes fewer demands on our health-care system. A report commissioned by the Fitness Industry Council of Canada estimated that Canadians would have saved $2.5 billion over the next 21 years if the federal fitness tax credit were extended to adults. The council claims that the foregone tax revenue would be matched by the health-care savings in only three years. The Canadian Diabetes Association estimates that, 2020 are nearly one in 10 Canadians will be living with the diabetes, at a cost of nearly $16.9 billion annually. Ninety percent of diabetics have type 2 diabetes, which is brought on by obesity, inactivity, poor diet and aging. Consider what an adult fitness tax credit might do to help Manitobans ward off the disease or keep it in check.

Madam Deputy Speaker, the Throne Speech commits the Province to working with the municipalities to encourage the construction of more secondary or granny suites, as they are called. These self-sufficient suites are added to or created within a single-family residence and provide the basic facilities for living, sleeping, cooking, and sanitation. At the urging of a number of my constituents, I met with the previous minister responsible for housing to propose this move.

Granny suites make good sense socially and economically. First of all, they are an excellent means of expanding the stock of affordable housing. The costs are minimal. Property owners who build granny suites to accommodate low-income seniors or adults with a disability are even eligible for forgivable loans from the Canada Mortgage and Housing Corporation in the range of $24,000 to $36,000.

Granny suites are also a plus environmentally. They create no sprawl and take less energy to heat and cool than independent residences. Best of all, they enable children, parents and grandparents to be mutually supportive while still affording an appropriate amount of independence and privacy. The older generation benefits from the companionship of their kids and grandkids. They receive assistance with the chores that would be beyond their capacity. There is always someone around to keep an eye on their health and well-being. And the younger generation benefits greatly from the presence of grandparents, particularly if both parents are working. Kids have someone to greet them when they come home from school. They have someone to monitor their activities and ensure that they don't fall in with a bad crowd.

The Throne Speech spoke of our government's desire to make Manitoba the most age-friendly province in Canada. By looking at how municipal planning and zoning regulations could make granny suites an option for more Manitobans, we are taking a step in the right direction.

My constituency, The Maples, is renowned for having the highest proportion of new Canadians in Manitoba. These newcomers in turn help attract more skilled workers to our province. They can also take a great deal of credit for encouraging these new workers to stay in Manitoba once they immigrate to Canada. In the last year for which we have statistics, over 84 percent of Manitoba's provincial applicants in the economic class who were over the age of 25 had post-secondary education in professional and technical fields; 84 percent. The comparable figure for Manitobans as a whole is around 57 percent. The 71,000 immigrants we have welcomed to our province over the last decade have been increasing our education edge as will the thousands more that will be coming each year as part of our immigration strategy.

I welcome the announcement in the Throne Speech that applications to our Provincial Nominee Program will be speeded up so that would-be immigrants will know within six months whether they have been accepted. Manitoba is also working with Ottawa to fast track the recognition of the credentials of foreign-trained professionals, and it is also good news that our government will be enabling successful applicants to start making work and living arrangements before they arrive in Manitoba.

Our government's continuing support for the smooth integration of newcomers from diverse nationalities into the Manitoban scene is key to their success. The recent budget provides for a respectable increase in funding for multiculturalism. Outreach to Manitoba's ethnocultural communities is not just about cultural diversity and the many benefits that such diversity brings to the fabric of our province. It is also about enabling newcomers who are keen to contribute their skills, knowledge, and experience to our economy to feel that they are included in and respected by mainstream society.

***** (15:50)

I would like, Madam Deputy Speaker, to tell a personal anecdote which illustrates this point. Back when I first came to Canada, I was desperately looking for employment. I was not having any luck. Time and again, however, I was told that it was next to impossible to get a job if you wore your hair in a turban as I did in accordance with my tradition. And so one day, I went into the bathroom with a pair of scissors. I cut my hair short, and I wept for betraying my Sikh culture by doing so. Then I composed myself, put on a brave smile and asked my roommates, how do you like my new look? Decades later, the recollection of this incident is still painful to me. But that was long ago. Now, thanks to the government's promotion of ethnocultural communities and educational campaigns, newcomers are much less likely to feel isolated and much less likely to feel pressure to conform in a way that violates their core beliefs.

Thank you, Madam Deputy Speaker.

Mr. Leonard Derkach (Russell): Madam Deputy Speaker, I rise today to put a few comments on the record with regard to the Throne Speech, and I begin by first of all congratulating the new Premier (Mr. Selinger) on being elected as the leader of his party and also the Premier of our province, and I want to wish him well. And I also want to say to the two runners-up, first of all the member from Thompson who I sat with in this House for a long time who came into the Chamber in 1981, I believe, and who has always been a very outspoken individual, who is charismatic and who is–I think carried the torch for the NDP over the years, and in fine fashion.

I only regret that throughout the campaign for leadership, the minister, in my view, did the honourable thing in trying to ensure that everybody had equal access and equal opportunity in the NDP party, but that was not so from the other candidates who were running for leadership. But that's sort of the history of the NDP party, and it's not surprising that they would conduct themselves in that manner.

And we also had the minister–current Minister of Justice (Mr. Swan) who got the second prize, but even though he quit. And I think we'll probably see more of him down the road, and we'll probably see more quitting down the road from his–from his side.

But, Madam Deputy Speaker, nevertheless we have a new face in the–in the form of the Premier of our province. We also have a new Minister of Finance (Ms. Wowchuk) in our province, but there is much more of the old style of governance from this government that we saw even under the leadership of Gary Doer.

Madam Deputy Speaker, I also want to take the opportunity today to comment and to thank the services that we are provided in this Chamber by the table officers, the staff in the Chamber and also the pages. And I want to say thank you to them for all of their efforts and for ensuring that our jobs are made as comfortable and as easy as possibly can be done in the Chamber. I know that they provide a great service to our Chamber, and I'm never one to complain about the cost of running this Chamber for a day, unlike the NDP, of course.

Madam Deputy Speaker, I also want to say thank you to the *Hansard* staff who record all of the transactions that occur in this House, because I know they work tirelessly and they work long hours and, to them, we wish them the very best. And I want to extend to all of the staff that serve us an extremely happy holiday season, a merry Christmas and also the best in the coming new year.

Madam Deputy Speaker, before I get into the meat of the–of the Throne Speech, I also want to send to my constituents the greetings of the Christmas season. May their Christmas be blessed and also wish them a happy new year and thank them for the support that they have given me over the last number of years. I think this is my 23rd year in the Chamber, and certainly I want to thank them for the support that they've given me over the years.

Madam Deputy Speaker, the Throne Speech that was delivered to us on November the 30th by His Honour the Lieutenant-Governor spoke about some of the things that the government would be doing, but there wasn't anything new in this Throne Speech. The Premier's (Mr. Selinger) comments were flat is now the order of the day, and expectations should be lowered by all Manitobans because we were–this province was starting to face its downturn in the economy. Well, if the NDP had protected what this province was blessed with over the course of the last 10 years, today we would be in a much better position to respond to the needs of Manitobans and to stimulate the economy in a much more positive way.

But, over the course of the last 10 years, Madam Deputy Speaker, we have seen an abundance of wasteful spending by this government, and I say wasteful because, if you look around and where the government's priorities have been, they weren't too concerned about ensuring that Manitoba's debt was maintained. They weren't too concerned about paying down that debt, and they weren't too concerned about the fact that two-thirds of our budgets were being supported by transfer payments from Ottawa.

And, you know, all of those signals out there should have said to them that in–when the sun is shining, let's, as my leader said, let's repair the roof, so that in times of rain we are protected, and that's not the attitude of this government, that's not what they did.

Madam Deputy Speaker, if you look at the sectors of the economy of this province that have generated the wealth of this province, we see that they have done very well in spite of our government because, if we compare ourselves to other jurisdictions, you will find that our tax rates are higher than they are in other jurisdictions. A family of four in Manitoba pays far more in taxes than they do in other parts of this province, almost in every part of this province and, yet, the government continues to spend money as though it were growing on trees.

Madam Deputy Speaker, when we have the tax regime that we have in our jurisdiction and we have the kind of transfer payments that we're receiving from Ottawa and a government that–it's got a spending habit, we have, indeed, a course for disaster down the road. And that's exactly what Manitoba is going to be facing over the course of the next few years, and we're seeing that the slide is starting to happen again.

You know, Madam Deputy Speaker, I go back to when Howard Pawley was the premier of this province, and when I went back that far, I was sitting in this Chamber at the time when the deficits of this province were roaring out of control and our debt-servicing costs–our debt-servicing costs during lean those years, were about a half a million dollars a day, increasing up to a million dollars a day towards the end of that regime.

And, Madam Deputy Speaker, when you look at where we are today, the Minister of Finance (Ms. Wowchuk) today was trying to defend this, but she couldn't, because today Manitoba's debt-servicing costs are 2 billion–or $2 million day. Now, that is very, very significant. It's very startling to begin with and I don't know where we're going to be down the road if we continue to support this kind of administration.

Madam Deputy Speaker, there's always somebody who comes up to clean up the mess that the NDP create. And I was told by one of the ministers of this government that it's okay, we know that sometimes we're going to have to lose government and the Tories will come in, and they'll clean up shop and then–and then we'll–they'll get booted out because they tend to focus on debt relief and on paying down their debts and then, all of a sudden, they–we can come back in and we can start spending money again. And that was told to me by one of the ministers of this current government.

An Honourable Member: Yeah, right.

Mr. Derkach: Yeah, that's right, and I don't want to name him, Madam Deputy Speaker but, indeed, he's a prominent member of the–of the current government and the NDP.

Madam Deputy Speaker, we talk about where we should be spending our money and the priorities that we should have. Today, I look at promises that were made to Manitobans, and I go specifically back to my own community of Russell where, since 1999, 1998 as a matter of fact, was when the first commitment was made for a dialysis unit in the Russell Hospital. At that time–and at that time, there was also another commitment made for a physical rehab clinic to be set up in the Russell Hospital as well.

Well, Mr.–well, Madam Deputy Speaker, we have been waiting for the dialysis now for the last 10 years and it hasn't happened. Four times now in throne speech and budget Addresses I have heard that Russell was going to be receiving a dialysis unit. It was also–it was also announced in this latest Throne Speech.

***** (16:00)

Madam Deputy Speaker, at AMM, the mayor of Russell asked the Minister of Health (Ms. Oswald) when this was going to happen. She said, imminently. I am awaiting that announcement, first of all but, secondly, the construction of it, because the people in that part of the province–it's not just what they want, it's what they need.

Madam Deputy Speaker, I have to say that the rehab unit was set up in Russell in 1999 while we were still in government. Two years after the NDP took over that was cancelled. Their excuse was that there weren't sufficient trained staff to be able to have that unit operating there. Well, the reality was the three people who worked in that lab had to go and find work elsewhere because they were dismissed as a result of that unit being cancelled in that community.

So, Madam Deputy Speaker, one has to ask where the priorities are. Are they just in NDP-held ridings? And that's the way that this government has been conducting itself. You know, my leader has been asking for a school in Fort Whyte for a long time. Not because he wants to see the government spend money, but the government is supposed to provide services where they are needed, and when you have a population the size of Fort Whyte that doesn't have a high school in it, then you have to question whether or not the government is really interested in serving all of Manitobans.

Well, Madam Deputy Speaker, just last week I heard an announcement that I could not believe. When we have–when we have people dying in hallways, dying in waiting rooms, dying in emergency wards, lying on a gurney for seven hours before they can be treated and then, unfortunately, because of complications, they die, and the minister and the government can't address those priorities, but they make announcements like a $31-million polar bear compound at the zoo. They make an announcement at Gordon Bell High School for a green area, which is fine, but don't–but don't go ahead and cancel projects that are needed in this province and make announcements because it's gonna look good in Copenhagen, or it's going to appease some people in the inner city or close to your–close to your election base, and that's how the NDP conduct their affairs as a government, and we have watched this over and over and over again.

Madam Deputy Speaker, all Manitobans deserve services, but I do have to credit the Minister of Health (Ms. Oswald) about some things, because she is somebody who I think has had a broader view of things, and I single her out because I've gone to her on several occasions with constituent issues that needed to be addressed and I have to say she has responded in a very forthright way, Not every demand that goes her way can be accomplished and can be satisfied, but at least, I have to say, to her credit, that she addressed the issue immediately and it was dealt with either positively or less positively. It didn't matter, for that matter, as long as there was good rationale and as long as somebody looked at the issue, and that's what I have to credit her with because she has been very open in that regard and she's been very approachable. That's not–that's not the norm for this government, unfortunately, and I wish that some of the members on that side of the House, some who've been sitting in their chairs for a long time perhaps could take a lesson from the way that this minister has been conducting herself.

Madam Deputy Speaker, the government has also talked a lot about the environmental issues. We have a Minister of Conservation past who now takes over the reins of the Department of Agriculture and, you know, when I heard that, I just about had to go to the washroom because I said to myself, now, that's about tantamount to appointing somebody off the street as the Minister of Justice for the province, because here is a guy who–what did he do for agriculture in the last 12 months? Well, I can recite a couple of things. Number 1, he killed the hog industry. He destroyed the hog industry in our province as Minister of Conservation. He said, he said this was good for farmers. He said what he was doing was good for farmers. It was putting a nail in the coffin of the hog producers of this province and he had the–and he had the audacity to say that this was good for farmers.

What else did he do? Well, let's take a look at the BSE issue. Together with the former minister of Agriculture they were going to build this elaborate killing plant in Dauphin. They went to the United States, bought a bunch of equipment, they were gonna set up a killing plant in Dauphin. Well, Madam Deputy Speaker, right in the minister's own backyard, that was fine; I didn't–we didn't care where it was as long as there was one there. But what happened, they left this equipment on a pile in Dauphin and today it sits rusting somewhere because it's not used. We don't have a cattle processing facility in Dauphin, and that's six years after BSE. What an embarrassment. What a let down to the producers of this province. Today we are seeing the cattle–the mother cow herd–in this province declining at a faster rate than it is anywhere else in Canada.

And why? Because this government has chosen to kill that industry as well. So the minister, now of Agriculture can put up on the wall that he helped to kill the hog industry in this province and, secondly, he's working towards that in the cattle industry as well. What other industry is he going to attack under his leadership as Minister of Agriculture?

I'm sure farmers in this province are going to be very confident in having him sit down at a negotiating table with the federal minister and other provincial ministers because he knows absolutely squat about what's happening in the field of agriculture.

Madam Deputy Speaker, I hate to be so unkind to him, but, really, one has to learn from the mistakes that he's made in the past, and I don't think he has.

What did he do with rural farm families with regard to effluent disposal in Manitoba? Twenty years ago or 22 years ago, I went to the Department of Agriculture and said we were putting in a new effluent system in our–in our–on our farm, and we wanted to know what the best system was so that it would be environmentally sustainable. We were told at the time, do not go to a field because a field will create a lock for all pathogens that cannot escape, and then you will contaminate whatever vegetation you have or whatever ground water you may have in that area. So they recommended that we put in one of two systems. One is a mound system. The other one was an ejector system for effluent, not for sewage, as this minister said. Madam Deputy Speaker, the sewage is hauled away with a–with a sewage truck to a lagoon. So the minister needs to, again, educate himself on what he is talking about.

Well, Madam Deputy Speaker, what did this minister do? He went and banned sewage ejectors. The very kinds of facilities that were promoted by the Department of Agriculture now were banned under his watch. Did he do any science? Did he do–did he apply any scientific facts to this? He did not.

Madam Deputy Speaker, so the minister doesn't have a very good track record when it comes to dealing with rural Manitobans and the issues that they face.

And I can go one step further. What did he do with the fishery in the Dauphin area? Finally, after the pressure from this side of the House, and the fact that we were going up there and visiting with the fishermen in the Dauphin area, he was dragged kicking and screaming to the table and offered some pathetic solutions to them, Madam Deputy Speaker. But the people of Dauphin know it–the people of Dauphin know it and they'll reward him accordingly down the road.

Madam Deputy Speaker, the Throne Speech in general sets a very low level or a low standard for this province. While other provinces are looking towards coming out of the recession, building their provinces, lowering their tax rates, improving the quality of life for their–for their inhabitants and their residents, this province is looking at our province slipping back from the growth that we should be projecting.

Our unemployment rates are starting to soar. Madam Deputy Speaker, when we take a look at what's happening with Tembec, when we look at what's happened with the call centre here in this province, those jobs are leaving. And why? Because this government doesn't have any creative insight in what it should do to assist Manitobans in not only long-term jobs, but keeping the jobs that are already here, and somebody has to stand up for 'em. A hundred days after the strike at Tembec, the Premier (Mr. Selinger) nor the minister who's responsible for it had ventured out there to talk to the workers and to see what solutions could be found. Instead, at the 11th hour, this government puts forward a million dollars and says, go play. Here's a million dollars, go play. In other words, shut down the industry. Find a new job. The town with a million dollars can find out what its destiny is going to be. Well, nobody is a fool, and a million dollars is never going to find a solution for a community that is losing its major industry like they did at Tembec. This Minister of Finance (Ms. Wowchuk) should be ashamed of what her government has done in this regard, and the lack of attention that they have paid to this very important industry in this province.

***** (16:10)

But, Madam Deputy Speaker, they talk with forked tongue. They talk about jobs and the importance of preserving them but at the same time they're losing them. They offer a million dollars for the community to go find a new destiny. It's the same thing that they're doing with the hydro line. They're talking about not cutting any of the boreal forest for the–for the hydro line, yet they're the same government that's gonna punch a road through the east side of the–of the lakes. They're the same government that's going to put in a road that they're slashing and burning boreal forest right now to a cottage development site. They're–and yet they–they're saying that they can't put a hydro line down that same corridor. It doesn't make any sense.

Yet on the west side of the province, where nobody wants the line, they're deciding that they're gonna spend another $650 million more for that project. Well, Madam Deputy Speaker, that, once again, is an example of what this government's lack of focus on priorities is. They have lost their focus in terms of where they should be but down the road Manitobans will reward them accordingly.

So, Madam Deputy Speaker, I know my time is up and I know the Minister of Finance wants to respond to some of the things I've said and I welcome that, but let me say that the amendment that was put forward by our leader was one that I was looking forward to perhaps the government even supporting, partially at least, but no, that wasn't to be. And it's unfortunate that we will not be able to support this Throne Speech because it lacks direction and it lacks any positive initiative for the good of this province. Thank you, Madam Deputy Speaker.

Hon. Rosann Wowchuk (Minister of Finance): Madam Deputy Speaker, I'm very, very pleased to have the opportunity to speak today on the Throne Speech, and I want to definitely comment on some of the comments made by the member for Russell.

But, Madam Deputy Speaker, when we–when we put this budget together under our new leader we looked at some very important issues. We looked at this budget, Throne Speech, I should say, to–with a couple of themes. One of them is investing in the health and well-being of Manitobans and then building a stronger Manitoba. Both of those themes are covered off very well and describe what it is we intend to do.

Madam Deputy Speaker, we know that we are facing challenging economical times. We're having a downturn in the economy but this government has made a commitment. This government has made a commitment that we will keep the economy going. We will invest in stimulus. We will invest, ensure that the services that are important to people of Manitoba, services like health care, education, safety, all of those issues and services to protect the most vulnerable people in our society. We will be there for those–for those people and we outlined our plan–we've outlined the plan that we have in our Throne Speech.

It's unfortunate that the members opposite want to take advantage and, in fact, make announcements about some of the infrastructure that we're proposing, and they lobby every day to have additional infrastructure in their constituency, but when the time comes to vote to support these they're nowhere to be seen. In fact, Madam Deputy Speaker, they vote against them. They vote against a commitment of $745 million in roads, investment in bridges, projects that will stimulate about 1,500 jobs, creating more than 1,500 stimulus projects that we have been in partnership with the national government, the national government. Their brothers and sisters recognize the importance of stimulus and they're prepared to put money in and the members opposite vote against it. And we New Democrats are working with the national government to stimulate our economy so that people will work, so that we have an infrastructure that will be there for many years to come. And through these 1,500 stimulus projects we are creating more than 12,000 direct jobs and 10,000 indirect jobs, but the members opposite don't seem to recognize that.

I heard the members opposite–the member opposite just talking about how bad things are in Manitoba and how the employment–unemployment is up and how the deficit is up and the economy is just not doing anything.

Well, let me quote a few. What did the Royal Bank say about the–Manitoba. The Royal Bank is forecasting that Manitoba's economy will lead Canada this year at 0.2 percent. In 2010, and it's forecasted that Manitoba's growth will be at 3 percent–third highest in Canada.

And so, despite what the members opposite are saying, although we are facing challenges, Mr. Speaker, our economy is growing and the vice-president and chief economic officer of the Royal Bank said, and I quote: Most of the indicators suggest Manitoba has endured the worst part of the economic storm while achieving a positive growth rate of 0.2 percent in 2009. Increased capital spending, agriculture activity and demands for provincial reproduced products and natural resources will result in a more significant economic growth going forward.

It's too bad the members opposite can't say something positive about the economy in this province. He also said, overall, the positive forces in the economy are expected to dominate the recent weakness in manufacturing and produce a positive growth in Manitoba–the only province to achieve this feat in 2009.

The member opposite also talked about our jobs. What does the Royal Bank say about Manitoba? It says, the province of Manitoba is one of only three projected to show an overall job gain in 2009. Manitoba's positive growth is 0.2 percent; New Brunswick, 0.1 percent; Saskatchewan, 1.5 percent.

So, Mr. Speaker, I wish, again, that the members opposite would just think a little bit more positively about what's happening in this province, because, indeed, we should be proud of our province. We are having a Homecoming next year. We should be encouraging people to come back home, and I can tell you that many people–many people that left this province, when the Tories were in power, are now recognizing the growth and the positive things in this province and they are coming back.

Madam Deputy Speaker, the members opposite, I want to–I just have to stray a little bit here. The member from Ste. Rose talked about Ranchers Choice. The member from Ste. Rose said the Province bought equipment, and I want to remind the member that it was not the Province that bought the equipment, it was producers who went out and bought the equipment. Real farmers went out and bought that equipment because they believed–*[interjection]*–that the real farmers bought the equipment. They came to–

Some Honourable Members: Oh, oh.

Madam Deputy Speaker: Order. Order. Order. Order. Order. Order. Order.

I'd like to remind all members that there are loges if they wish to have private conversations.

Ms. Wowchuk: Thank you, Madam Deputy Speaker.

You know, the members opposite said that the Province bought equipment. Well, Madam Deputy Speaker, that's wrong. I want them to know that it was producers that went and bought the equipment because they believed that they could add value and build a facility in Dauphin.

Unfortunately, we had members opposite–and I want to talk about the former member from Emerson who is on the record saying we didn't need slaughter capacity in this province, that we had enough slaughter capacity. I have to give credit to the present member from Emerson, because the present member from Emerson was one of the people who talked in a positive way about Ranchers Choice, one of the few Tories who thought that this could work.

But, you know, there–had there been a little bit more support, had they not been out there talking about how negative this would be, and had they not been trying to kill it, maybe it would have succeeded, maybe it would have. Maybe it wouldn't have, but the members opposite can–I just want to correct the record–it was we stood by the producers on that facility, and we will continue to stand by the producers who want to increase slaughter capacity and processing in this province, Mr. Speaker.

***** (16:20)

Mr. Speaker in the Chair

Because, Mr. Speaker, if we can add value to an agriculture product and create jobs, we should be very proud, and I would ask the member to look at the records of where, since this government has taken office, where value-added process was under their administration and where it is today. It has more than quadrupled, more than quadrupled in the food-processing area as to where they were and where we have taken the industry. Again, I've touched a sensitive nerve here, but the members opposite are wrong when they talk, as usual.

I should take a few minutes, Mr. Speaker, to talk about Hydro. You know, the members opposite just hate Hydro. And I honestly believe, if they had a chance, they would sell it, because if they aren't gonna sell it, they're gonna mothball it, just as they mothballed it in the past, and they just don't like the idea of having economic development in the north and having Aboriginal people part of the economic development, and they don't like the idea of clean energy. I really think they would much rather develop the tar sands and have Alberta make money on the tar sands despite the fact that it's the dirtiest energy that's there. They will not speak in a positive way about electricity and they will not talk about, in a positive way, about the sales, you know, and why we need another bipole.

The members opposite don't recognize that we need Bipole III for reliability. We need Bipole III to complete the sales that we–that we have. And the members opposite are bound and determined, despite the fact that on the east side of the province we have one of the jewels of the world, Mr. Speaker. We have, as I tabled in the House today, and many have seen on a world map, there's only one spot in the world where there is a pristine boreal forest, no place else in the world. We are taking steps to protect it, to try to get a UNESCO heritage designation for it, because the boreal forest is known for its ability to capture carbon and it's very important.

And as we are at–our Premier (Mr. Selinger) is in Kyoto–Copenhagen, pardon me, wrong, wrong agreement, continuation of Kyoto. But, of course, the members opposite hated Kyoto, Mr. Speaker, and they really don't want Canada to be in Copenhagen either to ensure that Canada can clean up their reputation. Right now, Manitoba–Canada does not have a very good reputation as it comes to addressing climate change. Our record here in Manitoba is something that we should be very proud of, and I'm very proud that our Premier and our Minister of Conservation (Mr. Blaikie) were invited to be part of the Canadian delegation to help influence–to help influence Canada's position and maybe help clean up Canada's reputation a little bit.

But, Mr. Speaker, the west-side line is very important to our sales and for our economic development and I wish that the members opposite would recognize that this will help us to–they talk about wanting to improve the economy of Manitoba, to have growth in this province, but they are very opposed to electrical clean energy which will help our economy, but, most importantly, is done in a new way, it's done in partnership with First Nations. The members opposite were critical of spending money to bring the Aboriginal community into the discussions, but we will see–we will see that project through.

And I, very much, am looking forward to seeing those dams built and our sales to the U.S. become a reality. And I'm very much hoping that we will, indeed, get a UNESCO designation for eastern Manitoba, and the members opposite should know that Ontario very much wants this designation as well because it is in their jurisdiction.

But I just had to talk about Hydro and how important it is–it is to our economy, Mr. Speaker, but I also want to talk about, as I said, what we have done, and the members opposite, in their, in their condemnation of Manitoba, talking about how negative it is, talk about how we haven't managed well, how we haven't saved. Well, I would remind the members opposite how much was in the rainy day fund when they were in power, and where is it now? They say we haven't managed, but, there is over $800 million in the rainy day fund.

Mr. Speaker, we have taken steps during some good years to put away funds to help us to ensure that we can provide services that are important to people, and, for me, that's one of the most important things we can think about as we go through this challenging time of a recession that is affecting the whole world. Challenging times, a recession that's affecting other provinces much more than Manitoba is being affected.

Manitoba is one of those provinces that is able to–may not have as many peaks, but they–we don't dip as low either, Mr. Speaker–and we've been able to ride this out well, and I want to give credit to where credit is due. I want to give credit to our Premier–previous premier and Cabinet. I want to give credit to the present Premier (Mr. Selinger) and Cabinet for–and I want to give credit to all of the staff in the departments who work with us on these important issues. And I want to give credit to the farmers because the farmers in this economy in this province do play a very important in the economy.

But, Mr. Speaker, I want to say that as challenging as these times are, we've committed in this budget that in 2009, business tax cuts will be in place and we will–in this business tax, we are going to save Manitoba companies $41 million a year. This is including the corporate tax rates of reducing from 13 to 12 percent and the reduction of small business tax from 12 percent to 1 percent. This the lowest–this is the lowest small business tax in Canada. We have to–we have to look at ways that we can address business issues, and I'm very proud of the steps that we have taken in reducing tax. I have to say that I'm very proud of the steps that we've taken to reduce education tax on farmland.

I'm very proud of the steps that we have been able to take to improve opportunities for our young people, whether it be in creating jobs or in training. It is my view that training is one of the key tools to help people get out of a recession, to get out of a downturn in the economy, and there's no doubt that steps we are taking to invest in education and training, whether it, whether it be in the north, whether it be here in the city, or whether it's working with immigrants, new immigrants who have come to this country, this province, Mr. Speaker, we are working with all of them.

And, Mr. Speaker, we will continue to work with the national government. We will continue to make investment in stimulus because it keeps people working and it provides the kind of, I guess, the legacy that you could have for working in the province during a time of downturn.

But, Mr. Speaker, we aren't through these challenges. They're–I'm hoping that we can come out of this very quickly, but the whole world is coming out of the recession much slower than they anticipated they would, so there's more to do, and that's why we, in 2010, in the Throne Speech, we announced that we will do an economic summit and it will be led by the business community, by the Premier, by labour, by Aboriginal people, and by local government leaders. These are real people that we will bring together and people who are working in the trades and look at ways that we can further stimulate the economy based on what we have started.

But, ultimately, Mr. Speaker, our goal to invest in education is important. Our goal to ensure that we maintain the health-care services that are very important are all what we are going to do. We will continue to build. We will continue to build a stronger, a healthier Manitoba, a strong–and one where people can work, one where we can provide services, whether it is in facilities in Russell like a dialysis unit or whether we can provide services in the Women's Health Centre or in Swan River or in Dauphin. This government has a record of investing across the province and bringing services closer to people.

This government–the opposition will not recognize the investments that we have made—

***** (16:30)

Mr. Speaker: Order. The hour being 4:30 p.m., pursuant to rule 45(5), I am interrupting proceedings in order to put the question on the motion of the honourable member for The Pas (Mr. Whitehead), that is, the motion for an address in reply to the Speech from the Throne.

Is it the pleasure of the House to adopt the motion?

Some Honourable Members: Agreed.

Some Honourable Members: No.

Voice Vote

Mr. Speaker: All those in favour of the motion, say aye.

Some Honourable Members: Aye.

Mr. Speaker: All those opposed to the motion, say nay.

Some Honourable Members: Nay.

Mr. Speaker: In my opinion the Ayes have it.

Formal Vote

Mr. Gerald Hawranik (Official Opposition House Leader): A recorded vote, Mr. Speaker.

Mr. Speaker: A recorded vote having been requested, call in the members.

Order. The question before the House is the motion of the honourable member for The Pas (Mr. Whitehead), that is, the motion for an address in reply to the Speech from the Throne.

Division

A RECORDED VOTE *was taken, the result being as follows:*

Yeas

Allan, Altemeyer, Ashton, Bjornson, Blady, Braun, Brick, Caldwell, Chomiak, Dewar, Howard, Irvin-Ross, Jennissen, Jha, Korzeniowski, Lemieux, Mackintosh, Marcelino, Martindale, McGifford, *Nevakshonoff, Oswald, Reid, Rondeau, Saran, Selby, Struthers, Swan, Whitehead, Wowchuk.*

Nays

Borotsik, Briese, Cullen, Derkach, Driedger, Eichler, Faurschou, Gerrard, Goertzen, Graydon, Hawranik, Lamoureux, Maguire, McFadyen, Mitchelson, Pedersen, Schuler, Stefanson.

Madam Clerk (Patricia Chaychuk): Yeas 30, Nays 18.

Mr. Speaker: I declare the motion carried.

* * *

Hon. Dave Chomiak (Deputy Government House Leader): I often wonder if all of us, because of our sometimes getting a little bit boaster should be–should be forced to do that roll call ourselves, and good job. I want to commend the good job done every time, and all of the people who make this place work, despite all of us and our best efforts. I mean, people work really hard. I want to congratulate them, and, on that note, wish everyone a very festive holiday season, sincerely to everyone, and perhaps might notice that the clock is 5 o'clock?

Mr. Speaker: Is it the will of the House to call it 5 o'clock? *[Agreed]*

Okay. The hour now being 5 p.m., this House is adjourned and stands adjourned until March 23, 2010, or at the call of the Speaker.

And I wish everyone a very merry Christmas and all the best in the New Years.

Bipole III route best for Hydro's future

BR.S PpAD

AUG 13 2010

The NDP's commitment to providing clean, reliable and affordable power to Manitobans while building export relationships and protecting intact boreal forest is being met by the development of the transmission line Bipole III on the west side of Lake Manitoba.

Today, 75 per cent of our power is carried through the Interlake by Bipoles I and II; the probability of a power outage due to a tornado hitting Bipoles I and II is one in 16 years.

A western-routed Bipole III improves the probability of a three bipole outage to one in 3,650 years.

Bipole III is a financially sound project that will increase opportunities for hydro export sales, covering the cost of the project. With Bipole III and new generating stations operational, revenues from hydro exports are projected to exceed $20 billion over the next two decades.

After two years of consultations with west-side communities and residents, Manitoba Hydro has announced a preliminary preferred route for Bipole III.

The route runs closest to Lake Winnipegosis and Lake Manitoba, avoids all parks and has the least impact on agricultural lands. Manitoba Hydro will now begin a fourth round of consultations with local stakeholders and landowners along the preliminary route.

Hugh McFadyen and the provincial Conservatives play a dangerous game by pledging to reverse work on Bipole III and attempt to force it through the intact boreal forest on the east side of Lake Winnipeg.

Such a move would face local and international opposition that would delay and stall the critical project and damage Manitoba Hydro's reputation in export markets. The provincial government has received 40,000 emails and letters opposing projects like Bipole on the east side.

McFadyen has also been misleading the public by inflating the cost of a western-routed Bipole III. His figures are based on his reckless plan to cancel the converter stations at the start and the end of the line.

Manitoba Hydro has been clear; new converter stations are required, regardless of the route taken, to enhance reliability and to add capacity to carry power from new generating stations. McFadyen's approach would effectively cancel any future development of our hydro resources.

We will not roll the dice on Manitoba's future in this way. Our government is committed to moving Manitoba forward, and that includes investing in Bipole III to ensure clean energy and reliable hydro for generations to come.

Project must proceed

BR.S

1 p. A6

FEB 01 2010

I read with interest your editorial on Jan. 24, with the headline Tenuous Logic In Bipole.

It's important for all Manitobans to understand the urgent need to get Bipole III built, and built on time as Manitoba Hydro needs to secure the reliability of Manitoba's power system.

Stalling or delaying the project in any way, as the leader of the opposition has demanded, would put $20 billion in power exports at risk.

Our government is committed to supporting east side first nations seeking to establish a UNESCO World Heritage Site on the east side of Lake Winnipeg. Recent events in Newfoundland and Labrador underscore that a hydro transmission line is incompatible with a UNESCO site.

Last September, Newfoundland's Conservative Premier Danny Williams announced he was scrapping a shorter, cheaper transmission route because it would threaten the Gros Morne UNESCO World Heritage Site. Instead he opted for a longer route around the UNESCO site even though it would cost at least $100 million more.

Work on Bipole III is already well underway, with three rounds of consultations with communities on the west side of Lake Winnipeg nearly complete. Following licensing approvals, construction of Bipole III will begin in 2012.

When complete in 2017, Manitoba will begin to benefit from billions of dollars in lucrative export sales. Reversing this work and delaying this project until 2020, as Conservative Leader Hugh McFadyen wants, would put the entire project and Hydro's exports at risk.

We will not roll the dice on Manitoba's future in this way.

ROSANN WOWCHUK
Minister Responsible for Hydro

Tab 141

McFadyen misses mark with Hydro comments

BR.S

VPpAll

SEP 23 2010

I would like to correct the misinformation that Mr. Hugh McFadyen and his Progressive Conservatives have been stating as fact.

Mr. McFadyen claims that Manitobans are paying three times as much as Americans for the same power. That is simply not true. Mr. McFadyen chose to compare Manitoba residential retail rates to some of the wholesale, bulk rates in the U.S.

The fact is, according to the U.S. Energy Information Administration, Wisconsin residential customers currently pay almost twice what Manitobans pay for the same power. The rate here is 6.38 cents/kWh. In Wisconsin, the rate varies from 9.6 to 13 cents. There's not a single state that pays below 7.58 cents.

Hydro sells its surplus power to the U.S. to generate profit. Much of that power is sold through long-term fixed rate contracts, and any extra power is sold based on short-term availability to generate additional profit.

There are two options for the extra power: sell the power for a profit or let the water flow through the dam and waste it. We sold it for profit; McFadyen wants to waste it.

These wholesale, bulk sales to the U.S. subsidize the low rates Manitobans pay, which continue to be one of lowest in the country.

The average Manitoba home pays $837 annually; families in Toronto paid $1,559, and in Regina, they paid $1,434.

Unfortunately, Hugh McFadyen has also misled Manitobans when talking about Hydro's future development. Every time he mentions Hydro's Bipole III line, he has a higher dollar figure for the cost. It's interesting how Mr. McFadyen continues to inflate the cost, despite the fact it has been corrected publicly and repeatedly (including in this paper) by the CEO of Hydro, Bob Brennan.

Mr. McFadyen ignores the fact that Bipole III built on the west side of the province will greatly increase opportunities for hydro export sales. With Bipole III and new generating stations operational, revenues from hydro exports are projected to exceed $22 billion over the next two decades. These export revenues show Bipole III is clearly a worthwhile investment as Manitoba Hydro estimates the cost of Bipole III to be $2.2 billion.

Our government is committed to developing a clean energy future to ensure that Manitoba families have reliable access to the energy they need and to power Manitoba's growing economy while maintaining the pristine boreal forest for generations to come.

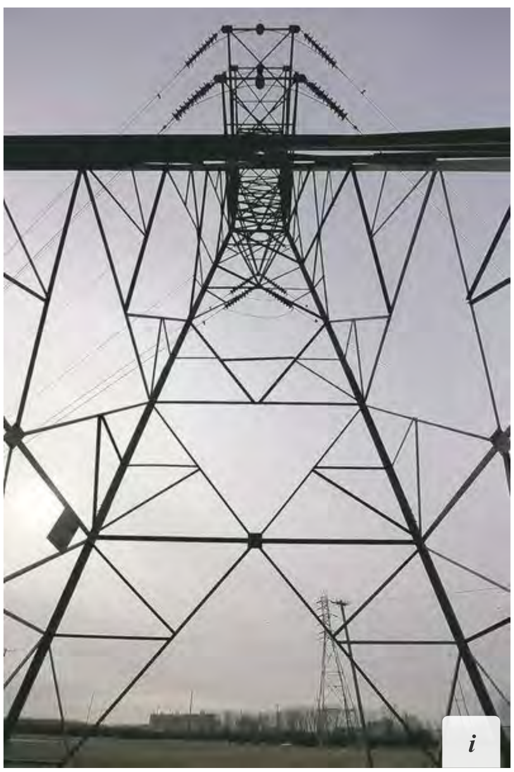
Hydro, gas hikes get go-ahead

BOARD APPROVES INCREASES TO HELP COVER CAPITAL COSTS

By: Bruce Owen
Posted: **04/27/2013 6:38 AM** | Last Modified: 04/27/2013 12:13 PM

Manitoba's Public Utilities Board brought some fresh pain to Manitobans Friday when it boosted hydro and natural gas rates -- the same day the Selinger New Democrats voted to boost the provincial sales tax to eight per cent July 1.

The NDP said despite the 3.5 per cent rate hike awarded to Manitoba Hydro -- and the prospect of similar hikes during the next few years -- Manitobans will stay pay less than their provincial neighbours.



TREVOR HAGAN / WINNIPEG FREE PRESS
Hydro must use 1.5 per cent of the rate increase to mitigate future increases when Bipole III comes into service in five years.

That's also despite the fact consumers will pay eight per cent more in electricity -- starting May 1 -- than they did a year ago, because of earlier interim rate increases.

"We'll still be the lowest, if not the second-lowest, in the country," Energy Minister Dave Chomiak said. "Everyone's rates are going up -- Saskatchewan's rates went up 4.9 per cent and Ontario's rates are higher.

"It's not a great time to be raising anything, but at the end of the day with Hydro, we've already signalled we will be asking for regular increases. We are guaranteeing that we will be the lowest and we will be held to that."

The PUB also awarded Centra Gas, a subsidiary of Hydro, an increase in natural gas rates -- the projected hit for a typical residential customer is approximately 5.6 per cent or $42 per year -- due to rising supply prices.

The Progressive Conservatives said the increases in energy rates are a symptom of a government that's going after a shrinking piece of the pie to pay for its spending and Hydro projects.

13054

"There's a little less money on the table for Manitobans and it adds up," PC Leader Brian Pallister said.

The PUB order for the Hydro rate increase outlines the challenges the Crown corporation faces due to a weak market for its surplus export power and the risk it faces under its 20-year, $33-billion development plan.

"The board is concerned about the deteriorating financial condition of Manitoba Hydro in the face of pending significant major capital expenditure," the PUB said.

The risk comes on several fronts, including a $6-billion decrease in forecast export revenues during the next 20 years and the steadily increasing cost of fixing and replacing aging Hydro generation and transmission systems, including the Pointe du Bois dam on the Winnipeg River that went into service in 1926. Hydro forecasts it will spend $2.4 billion on Pointe du Bois alone.

To soften that risk, the PUB told Hydro to use 1.5 per cent of the new rate increase to mitigate future increases when Bipole III comes into service in four or five years. The increase will generate $48 million in 2013-14.

Hydro's development plan includes building the Keeyask and Conawapa generating stations in Manitoba's north. The two mega-dams come with a combined price tag of $16.4 billion -- a cost that, in part, will see electricity rates more than double during the next 20 years at approximately twice the forecast level of inflation, the PUB said.

"Just because you have low prices now doesn't mean you should squander a Manitoba advantage by doing something that doesn't make sense in the longer term," Pallister said. "Clearly, at best, it will double our prices for Hydro."

Chomiak said Manitoba will continue to enjoy lower energy prices compared with the rest of the country as the two new generating stations will pay for themselves.

"We have (export) contacts that are firm, valued at $7 billion," he said. "We probably have another $20 billion that we're negotiating. We feel really confident about the future."

The board also said since a portion of the granted increase is to be dedicated to major capital, Hydro has to do more to control its operational, maintenance and administrative costs.

"Manitoba Hydro's cost-containment measures appear to be modest at best, and despite a hiring freeze, the utility's current projections still reflect a growth in staffing of 243 equivalent full-time positions from 2011-12 levels," the board said. "Since the economic downturn in 2007-08, levels have increased by 771, with total payroll increasing by $197 million, or 41 per cent, since that time."

It also said Hydro has to increase energy-conservation targets.

Hydro should expand its Lower Income Energy Efficiency Program as increasing energy prices will hurt low-income earners, the board said.

Interest rates are also a concern. The PUB said Hydro's long-term debt is expected to grow to $29 billion by 2027, from $9.4 billion in 2013, which will lead to a finance expense exceeding $1.6 billion in 2028; three times the current level. "The board sees a genuine risk that the capital cost for the major capital projects will escalate further and that interest rates will be higher than forecast," the PUB said.

bruce.owen@freepress.mb.ca

Ready to dig deeper?

WHAT the Public Utilities Board decision means to you:

It approved a 3.5 per cent increase in Manitoba Hydro customers' billed rates effective May 1;

The Crown utility was already granted a two per cent hike last April and another 2.5 per cent increase in September;

Hydro says the monthly cost of the latest increase for the typical residential customer, without electric space heat, using approximately 1,000 kilowatt-hours per month will be $2.60 or 3.4 per cent. A residential customer with electric space heat, consuming an average of 2,000 kilowatt-hours per month, will see an increase of $5.20 per month or 3.6 per cent;

The PUB granted Centra Gas, a subsidiary of Hydro, a hike, too. The approximate 5.6 per cent increase, or $42 per year to the average homeowner, is somewhat cushioned after almost five years of decreases due to low market supply prices for natural gas.

Halting hydro projects puts long-term prosperity at risk

Brian Pallister's recent letter asserting that Manitoba Hydro should halt the development of new generating and transmission projects is short-sighted at best. At worst, it's a dangerous gamble that would kill jobs while risking Manitoba's long-term economic prosperity and energy security.

Manitoba is growing and our demand for power is rising. In his letter, Mr. Pallister admits domestic demand is climbing at a pace that will require new power generation within a decade. What he fails to mention is that it takes well over a decade to plan and build a new generating station. We know this from our last project, Wuskwatim.

Cancelling our next hydro generation project now would not only leave us unable to meet our own energy needs in the coming years, it would also make it impossible to meet our export obligations. These signed contracts with customers beyond our borders are projected to generate $29 billion in export revenue over the next 30 years, which will help keep rates low for Manitoba families and businesses.

If we don't build now, we can't simply flip a switch when demand outstrips supply. The infrastructure must be there and that infrastructure takes time to plan and build.

But Mr. Pallister has stated he wouldn't stop at cancelling our new hydro generating projects; he also wants to cancel the next bipole transmission line. Even if we halted all hydro development as the Opposition has clearly stated they would do, a third bipole line is critical for the reliability of our system. Continuing to rely solely on the existing lines running through the Interlake is akin to keeping all our eggs in one basket.

To back his policy of cancelling the hydro capacity we are now building, Mr. Pallister claims the extensive review process for these projects is inadequate. Nothing could be further from the truth. Each project goes through extensive reviews where all information and detail is presented in a fully transparent manner to the public. Opportunities for Manitobans to raise questions and concerns exist throughout theses reviews which take several years to complete. Changes and amendments are made to ensure the best possible results for our province, as was the case with Wuskwatim.

Similarly, we have held extensive consultations and public hearings on the route of Bipole III. We have engaged in substantial public debate, had two provincial elections, and are currently consulting landowners and other stakeholders on the final route.

Manitobans know that hydro is our oil, only cleaner and greener. Mr. Pallister says we shouldn't develop our hydro power. That's like telling Alberta not to develop their oil.

Manitobans have told us they want a responsible long-term approach to hydro that keeps their rates affordable, not short-sighted proposals that ignore the realities of our growing province and increasing demand for energy.

Building Hydro for today and tomorrow will ensure we can meet our own energy needs while keeping our rates among the lowest in North America through export revenues.

DAVE CHOMIAK,
Minister responsible for Manitoba Hydro

Note: In addition to the average rate increases projected for electric customers, General Consumers' Revenue also includes provisions for the new Energy Intensive Industrial Rate re-submitted to the Public Utilities Board in September, 2008.

1.0 OVERVIEW

1.1 INTRODUCTION

This Consolidated Integrated Financial Forecast (IFF08-1) projects Manitoba Hydro's financial results over the period 2008/09 to 2018/19 based on 2008 planning cycle assumptions regarding future energy demand and supply. Segmented forecasts prepared for the electricity (MH08-1) and natural gas (CGM08-1) operations are included. This forecast reflects the actual hydraulic conditions in the fall of 2008, new long term export sales agreements and the addition of the 630 MW Keeyask generating station for a targeted 2018/19 in-service date.

1.2 HIGHLIGHTS

- **Electricity Rates:** The base forecast includes the PUB-approved 5% rate increase effective July 1, 2008 and a further 4% conditional increase effective April 1, 2009 followed by projections of average rate increases of 2.9% per year beginning April 1, 2010 and every April 1 thereafter. Actual future rate applications to the PUB will be dependent upon the conditions of the day and subject to approval by the Board of Manitoba Hydro prior to filing.

- **Gas Rates:** The gas forecast includes the PUB-approved 1% average rate increase effective May 1, 2008, and general rate increases sufficient to generate net income of approximately $3 million in each of 2009/10 and 2010/11 (currently assumed to be 1% but will be dependent upon the cost of gas at the time of application). Thereafter, the forecast assumes 1% general rate increases effective April 1, of 2011, 2012, 2014 and 2018. The general rate increases projected for gas customers are intended to recover the distribution-related, non-commodity costs of operating the gas utility. As with electricity rate increases, these estimates are subject to future approvals.

- **Consolidated Net Income:** Consolidated net income is forecasted to reach $314 million in 2008/09, up $154 million from the $160 million forecasted in IFF07-1. The increase in net income is mainly attributable to higher export volumes due to current favourable water flow conditions and reductions to finance expense resulting from higher revenues and lower interest rates. Over the forecast period, net income is sufficiently improved to enable the debt/equity ratio to stay close to target even with substantial new capital investment.

- **Export Sales:** The forecast assumes new long term firm contracts with Minnesota Power and Wisconsin Public Service as well as a contract extension with Northern States Power.

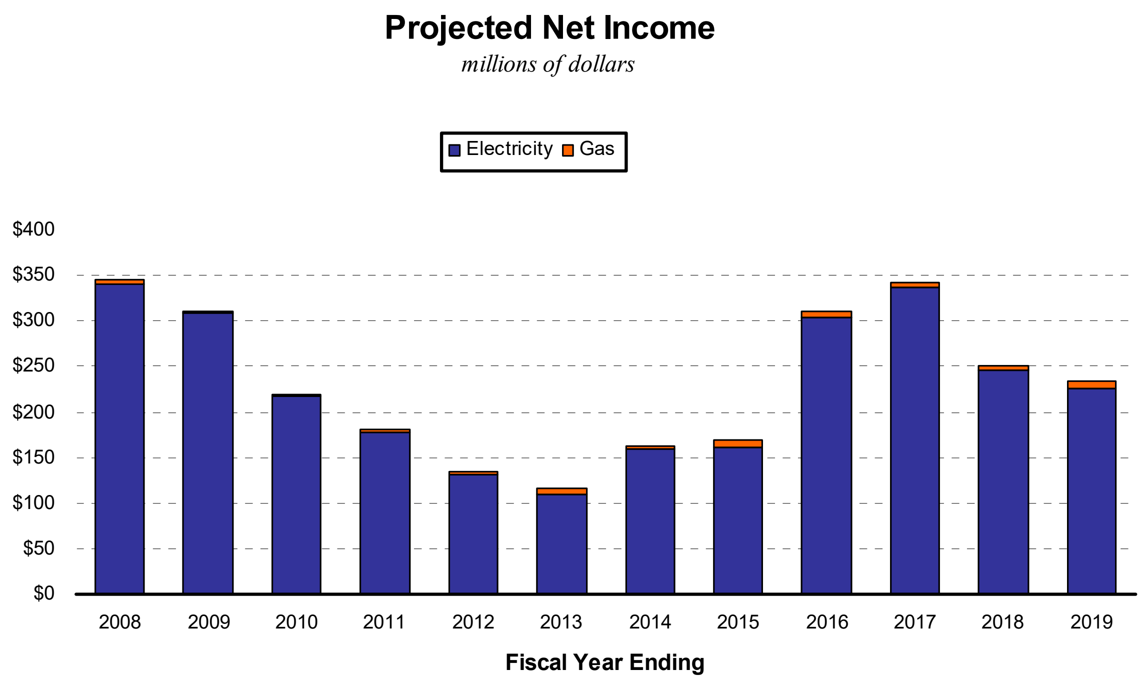
- **New Generation:** The Keeyask generating station (630 MW) is planned to come into service in 2018/19 in order to meet new export demands and domestic load growth. A draft partnership agreement, including equity ownership arrangements, has been submitted to the Tataskweyak, War Lake, Fox Lake and York Factory Cree Nations for community ratification over the next few months. Construction of the Wuskwatim generating station (200 MW) is proceeding, with the first unit planned to come into service in September, 2011. This forecast assumes that Nisichawayasihk Cree Nation will invest to acquire the maximum available 33% ownership interest in the generating station. Other assumptions related to hydraulic generation include the Conawapa generating station (1300 MW) first unit in-service in 2022/23 and the modernization of Pointe du Bois (from current 74 MW to 120 MW) by 2016/17.

- **New Major Transmission:** IFF08-1 assumes that the Bipole III HVDC line along with 2000 MW of converter capability at both north and south locations will be in service by 2017/18 for system reliability purposes and will accommodate future northern generation. A new 500 kV interconnection from Dorsey to the US border is planned for June, 2018 in order to meet the obligations of the new firm export sales.

- **The Capital Expenditure Forecast (CEF08-1):** The 2008 capital forecast, totalling $16.4 billion to 2018/19, is comprised of $11.5 billion of new major generation and transmission projects and $4.9

billion for other capital requirements including necessary system refurbishment and upgrades.

- **Projected net income for electricity and gas operations**: The following graph indicates projected levels of net earnings for Manitoba Hydro and the relative contributions made by each of the gas and electricity operations:



2.0 ASSUMPTIONS

2.1 ECONOMIC VARIABLES

The economic assumptions used in the forecast are based upon Manitoba Hydro's Spring 2008 Economic Outlook. Projected rates for key economic indicators are listed below with the previous projected rates in brackets.

	Manitoba Consumer Price Index	MH CDN New Short Term Debt Rate *	MH CDN New Long Term Debt Rate *	$US/$CDN Exchange Rate
2008/09	2.0% (2.0%)	3.50% (4.70%)	4.90% (5.60%)	1.02 (1.08)
2009/10	2.0% (2.0%)	4.05% (4.60%)	5.30% (5.75%)	1.06 (1.11)
2010/11	2.0% (2.0%)	4.60% (4.60%)	5.85% (5.95%)	1.06 (1.11)
2011/12	2.0% (2.0%)	4.60% (4.60%)	5.95% (6.10%)	1.07 (1.11)
2018/19	2.0% (2.0%)	4.60% (4.60%)	6.45% (6.45%)	1.10 (1.16)

*Excluding Provincial Guarantee Fee of 1.0%

Manitoba Hydro will be monitoring the global credit market crisis and how it may affect future interest rates, foreign exchange, load growth, capital and operating costs, and export market conditions.

2.2 IFRS - INTERNATIONAL FINANCIAL REPORTING STANDARDS

Manitoba Hydro will be required to produce IFRS compliant statements beginning with the 2011/12 fiscal year and provide comparative information for the 2010/11 fiscal year. While many aspects of IFRS are similar to Canadian Generally Accepted Accounting Principles, there are some areas that differ such as the capitalisation of overhead and the treatments of rate regulated assets. It is expected that the revised treatments will reduce the levels of expenditures that are deferred into future periods and will, therefore, cause an increase in current period costs which will, in turn, reduce net income and retained earnings over the short term. Manitoba Hydro is currently reviewing the accounting policy revisions necessary for the transition to these new standards and will be developing an implementation strategy over the next year. The forecast includes a provision for the adoption of the revised treatment of internally developed intangible assets, such as planning studies and DSM expenditures, effective April 1, 2009 as required under Canadian GAAP. For the years 2011/12 on, IFF08-1 includes provision for the more certain aspects of the conversion to IFRS in the amount of $25 million less offsets due to the corresponding reductions in depreciation and amortization expense. Areas which will require more detailed study will be reflected in subsequent forecasts.

2.3 US EXCHANGE EXPOSURE MANAGEMENT

Manitoba Hydro's Foreign Currency Exposure Management Program establishes an effective hedge between $US-denominated revenues and $US-denominated debt. Remaining $US inflows and outflows are valued at the market exchange rate. The exchange rate at year end is used for the balance sheet presentation of $US-denominated debt and investment instruments.

2.4 ELECTRICITY DEMAND AND SUPPLY

2.4.1 Manitoba Electricity Load Forecast

Relative to last year's forecast, the May 2008 Electric Load Forecast projects Manitoba electrical requirements to be 35 GW.h lower by 2017/18. Net total peak is forecast to be 1 MW higher. Significant growth is projected in the residential sector due to a higher population forecast and increased usage but this is largely offset by lower projected growth for general service customers.

Projected load growth in the general service class, (which represents 67% of all sales by volume) is lower even with higher growth in the primary metal sector. The reduction in overall growth is due to lower projected use in the chemical classifications and a reduced provision for potential large industrial loads.

General consumers' revenue includes the estimated impact of the proposed new marginal cost-based rate structure designed to encourage efficient use by new energy-intensive industrial loads which displace higher priced export sales. As this rate structure is related to actual marginal costs which change from time to time, it is not subject to projected general rate increases.

2.4.2 Extraprovincial Sales and Production Costs

Three new long term firm contracts have been included in this forecast (contracts under negotiation):

- Northern States Power contract extension (2015/16 to 2025/26) of 375 MW at 47.6% capacity factor, ramping up to 500 MW in 2022/23.
- Wisconsin Public Service (2018/19 to 2032/33) 66% capacity factor sale with capacity varying from 150 MW to 500 MW for various time periods.
- Minnesota Power (2022/23 to 2035/36) 250 MW at 66% capacity factor.

When combined with projected domestic load growth and existing export commitments, these new export agreements, which mostly occur outside of the IFF08-1 forecast period, necessitate the construction of the Keeyask and Conawapa generating stations and a 500 kV interconnection to the US.

Over the period to 2017/18, there is a projected increase in net export revenues of $508 million compared to the previous forecast. $242 million of this increase occurs in 2008/09 and 2009/10 and reflects current reservoir conditions and favourable market prices. The coal-fired Brandon unit #5 generation facility will be restricted in its operation throughout the forecast except during emergency conditions.

2.4.3 Demand Side Management

IFF08-1 includes DSM projections from the 2007 Power Smart Plan. Combined with savings achieved to date, the target for electrical savings is 807 MW / 2,759 GW.h by 2017/18. There is also a plan to achieve natural gas savings of 152 million cubic meters.

2.4.4 Electricity Supply

Manitoba Hydro's 2008 Power Resource Plan describes the Corporation's current expectations for new or enhanced major sources of electricity generation and HVDC transmission. The Power Resource Plan also provides projections of near-term retirement dates for existing facilities.

Major resource assumptions are shown in the table below. Keeyask is included in this forecast but was not in the plan for IFF07-1, while Conawapa is planned for one year later than in the previous forecast.

2008 Power Resource Plan			
	MW	**Dependable GW.h**	**In-Service Date**
Brandon #5 License Review	105	837	Restricted operation to 2018/19
Pointe du Bois	120	620	Rebuild by 2016/17
Wuskwatim	200	1,250	First power 2011
Keeyask	630	2,900	First power 2018
Conawapa	1300	4,550	First power 2022
Kelsey Re-runnering	77	-	All 7 units by 2011/12
Enhancements of Winnipeg River Plants	30	30	
HVDC Bipole III Line & 2000 MW of Converter Capability	89	243	2017/18
Northern AC Enhancements	45	-	
Demand Side Management Program			
Planned Additional	180	837	By 2017/18

2.4.5 Wuskwatim Partnership

The Wuskwatim Limited Partnership was established between Manitoba Hydro and Nisichawayasihk Cree Nation (NCN) to develop the Wuskwatim generating station. Construction of the infrastructure began in August 2006. The stage 1 cofferdam has been completed and significant progress has been made on excavation for the principal structures and channels. A number of major contracts have been awarded including the recent selection of a general civil contractor. Based on this bid, work is proceeding to achieve a nine month advancement of the first unit in-service to September, 2011. NCN may invest to acquire up to a 33% partnership interest in the generating station and finance up to 22% of project equity through loans from Manitoba Hydro.

Manitoba Hydro will purchase the output from the partnership under a power purchase agreement, and will construct, maintain and operate the Wuskwatim generating station and associated transmission. Manitoba Hydro's projected financial statements consolidate the partnership results, utilizing the non-controlling interest method of accounting for purposes of recording NCN's share of partnership net income. The partnership's net assets on the consolidated balance sheet are offset by an amount for NCN's non-controlling equity interest in the liability section of Manitoba Hydro's consolidated balance sheet. Manitoba Hydro's income statement reflects all of the revenues and costs related to the Wuskwatim partnership with NCN's share of the project net income shown as a deduction before net income.

3.0 NATURAL GAS DEMAND AND SUPPLY

The Corporation sells primary gas to Manitobans in a market which also includes a small number of brokers and marketers, and is the gas distribution utility for all customers in Manitoba. Currently, approximately 80% of customers representing approximately 60% of volumes purchase their primary gas requirements from Manitoba Hydro, with the balance using brokers and marketers through the Western Transportation Service.

The 2009 Natural Gas Volume Forecast is slightly higher than last year's forecast. The total natural gas sales volume forecast is up 13 million cubic meters (0.6%) in 2008/09 and up 20 million cubic meters (1.0%) in 2009/10. By 2017/18, the forecast is up 23 million cubic meters (1.1%). The Large General Service and Special Contract volume forecasts are expected to increase due to a combination of the increased usage experienced in 2007/08 and the use of a higher weather-adjusted base. The volume forecast increase is offset by lower consumption expectations of various manufacturing facilities in the Industrial sector.

The forecast incorporates the transportation and supplementary gas requirements, not only for Manitoba Hydro's customers but also for those consumers who purchase their primary gas from brokers and marketers.

There is no mark-up on primary gas but gas rates are structured to recover a portion of fixed costs through volume-based charges.

4.0 OPERATING & ADMINISTRATIVE EXPENSE

The operating forecast includes the necessary expenditures to provide for the safe and reliable operation and maintenance of the generation, transmission and gas and electric distribution systems.

Operating, Maintenance & Administrative (OM&A) Expenses in IFF08-1 are projected in total to be similar to those in the previous forecast with the addition of operating costs for the Keeyask generating station beginning in 2018/19. Overall, OM&A expenses are projected to increase by an average of 2.5% per year over the forecast period after including the projected requirements of both Wuskwatim and Keeyask. This rate of increase is lower than the combined total of projected inflation and customer load growth and will be achieved through continued productivity improvements.

5.0 CAPITAL EXPENDITURE FORECAST (CEF08-1)

CAPITAL EXPENDITURE FORECAST (CEF08-1) ($ in Millions)												
	2009	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**	**Total**
Electric	1,013	1,201	1,086	851	818	1,159	1,827	2,227	2,146	1,753	1,900	15,981
Gas	43	47	41	41	41	37	36	36	36	37	38	433
Total	**1,056**	**1,248**	**1,127**	**891**	**858**	**1,196**	**1,864**	**2,263**	**2,183**	**1,790**	**1,938**	**16,414**

Projected capital expenditures for the period 2008/09 to 2018/19 total $16.4 billion. Over the first 10 years of the forecast, this is $3.6 billion higher than in CEF07-1 of which $2.9 billion relates to increases for major generation and transmission projects as referenced in the table below.

	10 Year Change in Forecast $ Millions	Total Project Cost $ Millions
Keeyask Generating Station	2,701	3,700*
Dorsey - US Border 500 kV T/L	201	205
Riel 230/500 kV Station	160	268

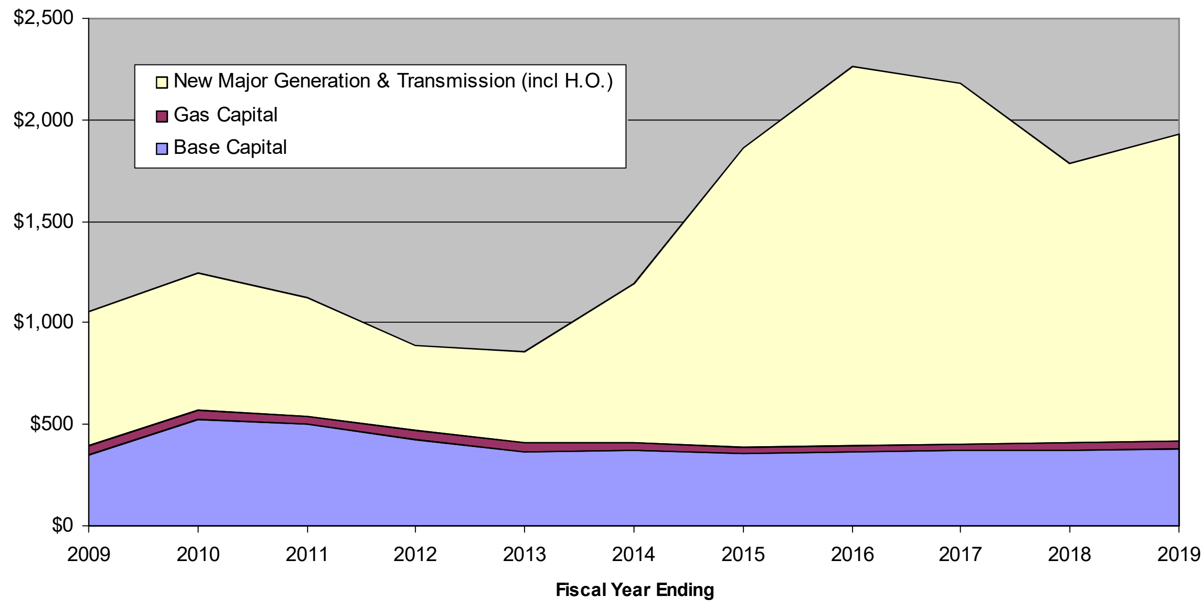
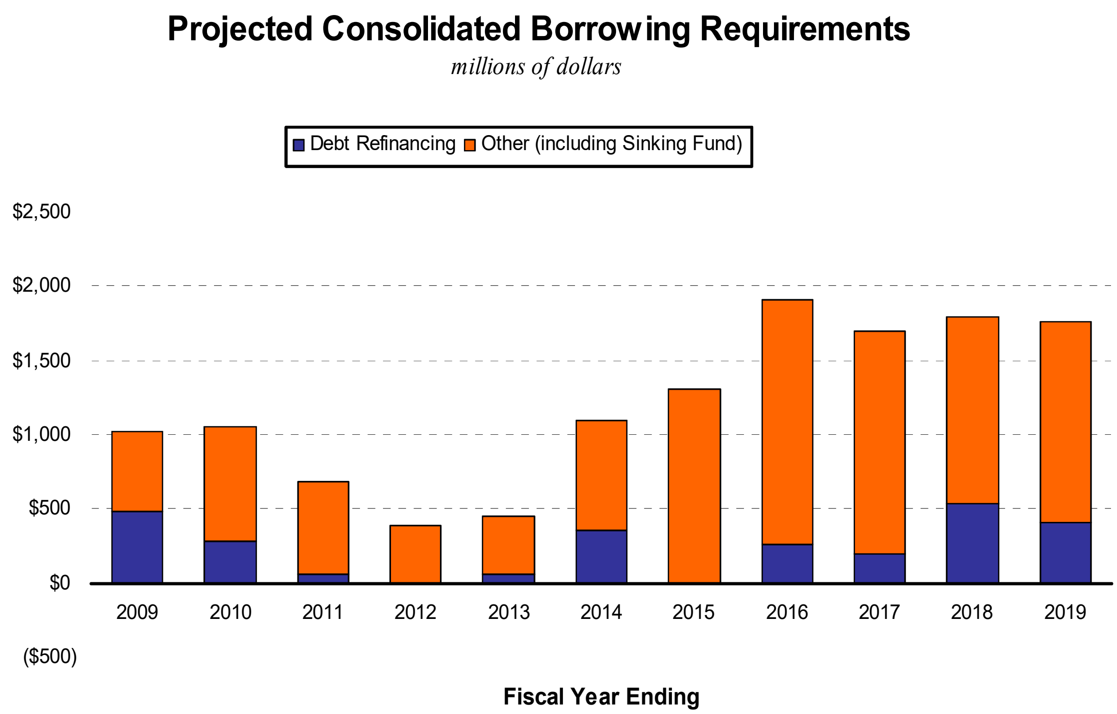
Projected Capital Expenditures
Major Categories

millions of dollars



6.0 BORROWING REQUIREMENTS

Manitoba Hydro's forecast borrowing requirements are portrayed in the following graph:



The Province of Manitoba issues long term debt directly on behalf of Manitoba Hydro. Both long and short-term borrowings are guaranteed by the Province. 15% to 25% of Manitoba Hydro's debt is held in floating rate instruments in order to minimize debt costs without undue interest rate exposure. Currently, about 21% of Manitoba Hydro's debt is in floating rate instruments.

7.0 FINANCIAL RATIOS

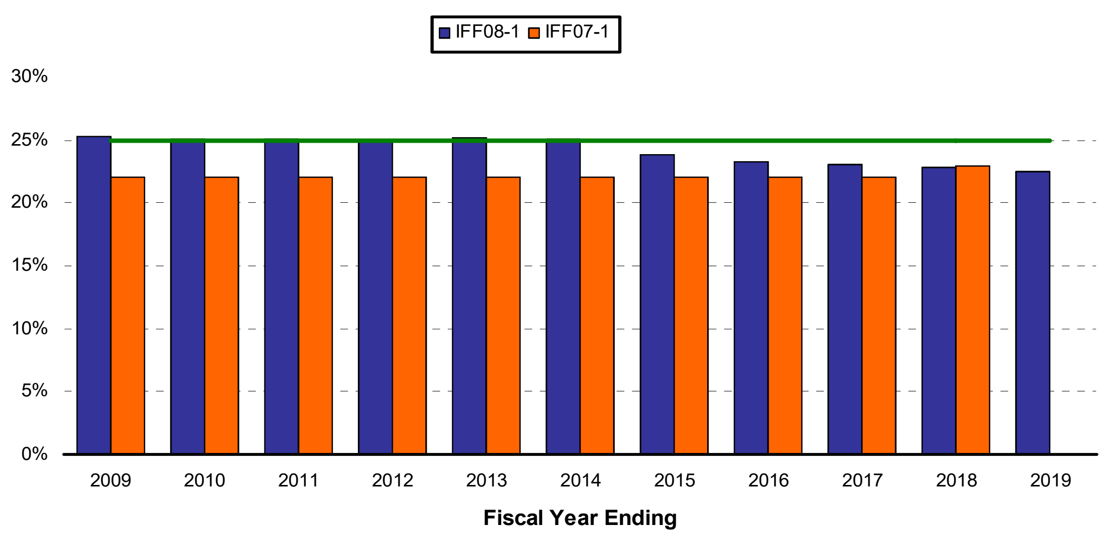
The following graphs depict the impact of IFF08-1, compared to IFF07-1, on Manitoba Hydro's financial targets.

Financial Targets	
Debt/Equity	Achieve a debt/equity ratio of 75:25 by 2011/12
Interest Coverage	Maintain a gross interest coverage ratio of at least 1.2
Capital Coverage	Maintain a capital coverage ratio greater than 1.0 (excluding new major generation and transmission & new head office building)

7.1 EQUITY RATIO

The equity ratio indicates the portion of Manitoba Hydro's capital structure that has been financed internally and not through debt financing. The current favourable water flow conditions are projected to result in the achievement of the Corporation's 75/25 debt equity ratio target by the end of 2008/09. Net income levels are projected to be sufficient to maintain this ratio at the target level until 2014/15 when capital expenditure levels begin to grow as a result of the construction of Keeyask, Conawapa and Bipole III.

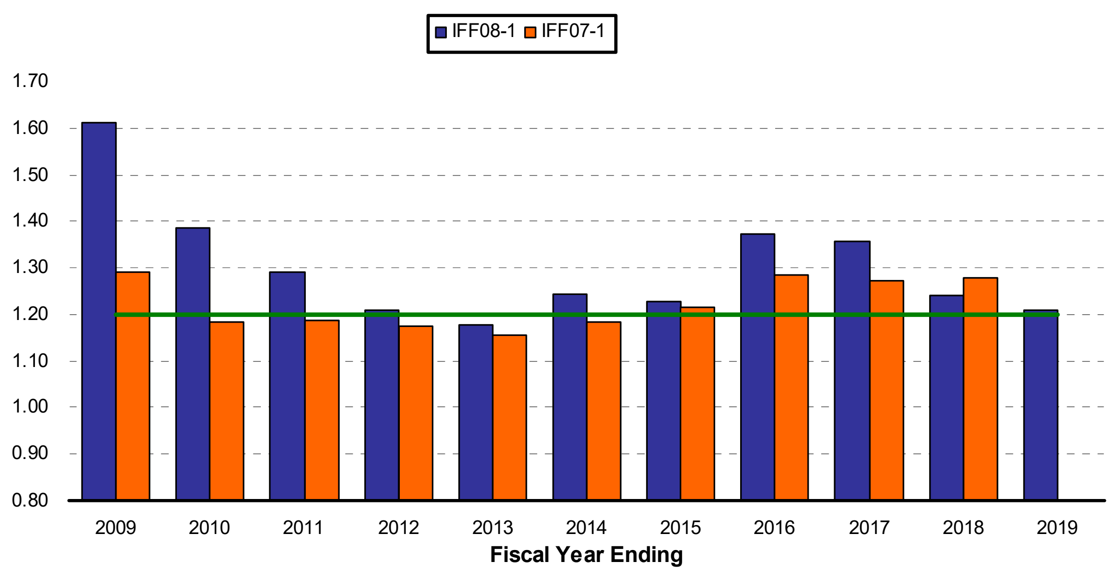
Projected Consolidated Equity Ratio



7.2 INTEREST COVERAGE RATIO

Interest coverage is measured by the ratio of the sum of gross finance expense plus net income to gross finance expense and provides an indication of the ability of the Corporation to meet interest payment obligations without the need for further borrowing. The effects of the current water flow conditions can be clearly seen in the level of interest coverage projected for 2008/09 with carryover effects into 2009/10. With the exception of a slight shortfall in 2012/13, the target level of 1.20 is projected to be met in all years of the forecast under assumed water flow conditions.

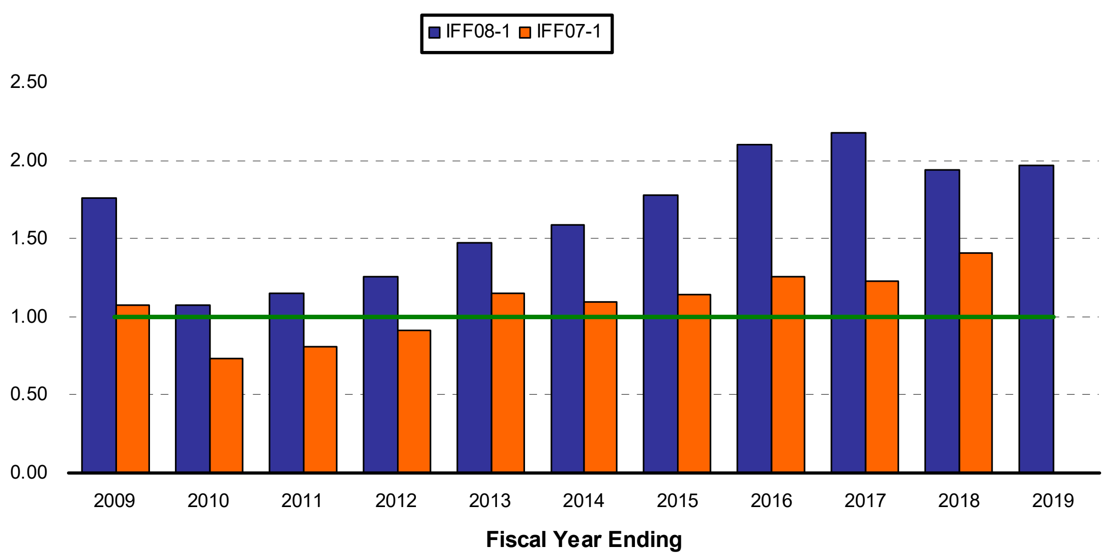
Projected Consolidated Interest Coverage Ratio



7.3 CAPITAL COVERAGE RATIO

Capital coverage measures the ability of current period internally generated funds to finance capital expenditures with the exception of major new generation, related transmission and the new head office. Projected net income levels are sufficient to enable this target to be met throughout the forecast period.

Projected Consolidated Capital Coverage Ratio



8.0 RISK ANALYSIS

Drought continues to be a risk of high significance in terms of both likelihood and consequence of occurrence. Manitoba Hydro typically derives over one third of its revenue from export sales and the potential loss of export revenue due to the adverse effects of a drought and/or other factors such as price declines, changes in regulation and increased domestic requirements is significant. Revenue losses are compounded by the additional costs to import power and operate thermal generation.

The impacts of export market and drought sensitivities, along with a number of other quantifiable risks and sensitivities, are shown in the table below. The table quantifies the resulting changes in retained earnings of the consolidated operations (IFF08-1) by the end of the forecast period 2018/19 assuming no change to rate increases from those in the base case and the annual rate increases/decreases relative to IFF08-1 necessary to offset the risks. Descriptions of the basis for the sensitivities follow.

	2010/11	2014/15	2018/19	Incremental Annual Rate Increase/(Decrease) *	
	Incremental Increase/(Decrease) in Retained Earnings (in millions of dollars)			Electric	Gas
IFF08-1 Baseline	**2,493**	**3,037**	**4,198**	**-**	**-**
+1% Interest Rates	32	27	(115)	0.18%	0.04%
-1% Interest Rates	(26)	13	214	-0.17%	-0.04%
Cdn $ down $0.10 US	53	126	258	-0.20%	N/A
Cdn $ up $0.10 US	(48)	(86)	(144)	0.20%	N/A
Low Export Prices	(64)	(408)	(936)	0.90%	N/A
High Export Prices	55	369	1,026	-1.18%	N/A
5 Year Drought	(485)	(2,651)	(3,488)	3.81%	N/A
+$100M & +$10M Capital Expenditures	(3)	(122)	(448)	0.54%	0.11%
Medium High Electric Load Forecast	(23)	(14)	(58)	0.13%	N/A

***NOTE** - the rate increases represent the additional identical annual percentage (incremental to the base case annual rate increases) required to achieve the same level of retained earnings in 2018/19 as in the base MH08-1 and CGM08-1.

Interest rates and foreign exchange

For the foreign exchange rate sensitivities, rates were adjusted beginning in fiscal year 2008/09. For the +/- 1% interest rate case and increase in capital spending scenarios, adjustments begin in 2009/10. In the +/- 1% interest rate case, the changes in rates were applied to all new long and short-term debt issues and to new sinking fund instruments For all other sensitivities, changes from MH08-1 and CGM08-1 begin in fiscal year 20010/11.

Export prices

Manitoba Hydro has developed an 'Expected' forecast of power prices for export which is assumed in the MH08-1 electricity forecast. In order to establish a reasonable set of bounds to cover the likely range of export prices, Low and High price forecasts have been developed based on industry research. Over the nine year period between 2010/11 and 2018/19, net export revenue would decline $746 million under the Low price forecast and increase $794 million under the High price forecast , before interest effects, compared to the Expected price forecast.

Manitoba load growth

The base load forecast used in MH08-1 represents the most likely future electricity requirements within the Province of Manitoba. Recent events suggest that load growth could be lower than forecast, but higher domestic load growth scenarios generally pose a greater financial risk to Manitoba Hydro. This is due to the reduction in high value export sales which are used to keep rates low, as well as the need to ensure that sufficient resources are available to meet the additional load requirements.

Increase in Capital Expenditures

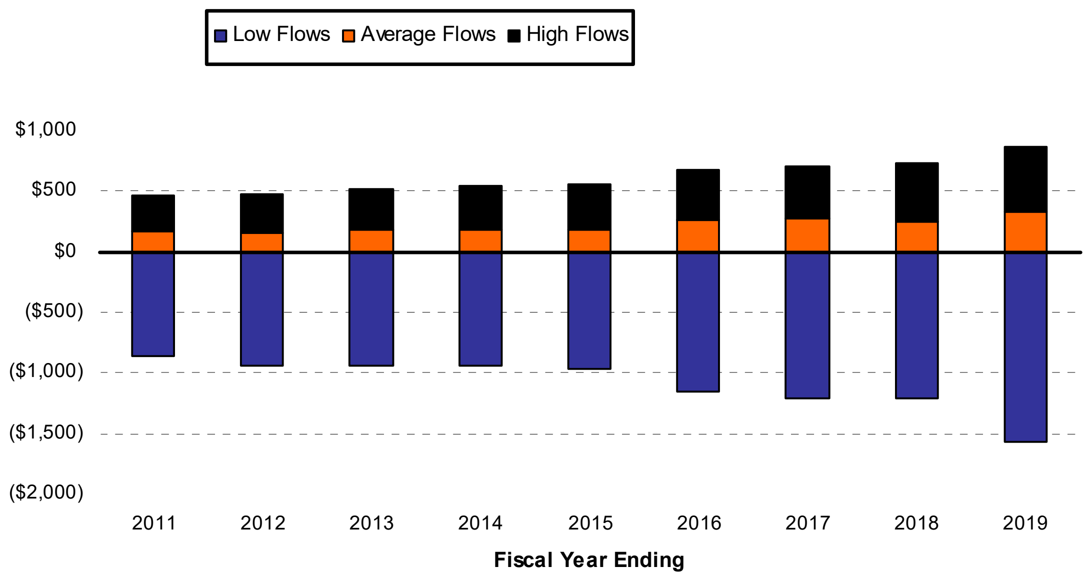
Sensitivities have been performed on capital spending for both gas and electricity operations to reflect the increased financial risk faced by the Corporation in the area of continued upward pressure on capital project construction costs, and/or additional expenditures to meet reliability, safety, regulatory or customer requirements. Increases in general infrastructure requirements of $100 million per year for electricity operations and $10 million per year for gas operations have been assumed for this sensitivity.

Water conditions

Historically, droughts of varying degrees of severity have occurred about once every ten years. The onsets of droughts are very unpredictable and their range in impact can vary significantly. A drought sensitivity has been prepared based on an assumed recurrence of the worst five year drought on record. This drought sensitivity replicates the water flows of the historic five year drought period between April 1987 and March 1992 beginning in the forecast year 2010/11 and extending to 2014/2015. The impacts of the drought on export revenues and thermal and import costs, assume expected market conditions. Over the five year drought period, net export revenue would be reduced by $2.2 billion compared to IFF08-1. The impact could be greater due to financing costs and will be dependent upon the timing and magnitude of the rate increases implemented to address the drought impacts. If a drought of this magnitude (or the even larger 1936 - 1943 drought) were to coincide with a period of high prices for thermal and import purchases the impact would be even greater.

The graph below shows the variability in net export revenues on an annual basis due to fluctuations in water flows. The asymmetry between the benefits of high flows and the costs of low flows is due to the fact that in high years, water is spilled as a result of system design constraints and to the requirements for thermally generated and imported energy under low water years.

Variability in Net Export Revenue
millions of dollars



From a financial perspective, Manitoba Hydro's best risk protection is achieved through adequate levels of equity (retained earnings). Equity provides a buffer to absorb adverse events so that compensating rate increases can be smoothed out over a period of time. The Corporation is exposed to a number of other uncertainties which must be managed including risks related to reliability of service, infrastructure loss, environmental, and regulatory/legal issues. The magnitude of their impact and relative probability of occurrence are outlined in Manitoba Hydro's Corporate Risk Management report.

ELECTRIC OPERATIONS
COMPARISON OF MH08-1 TO MH07-1
INCREASE / (DECREASE)
(In millions of Dollars)

ACCOUNT	2009	CUMULATIVE 2009-2011	CUMULATIVE 2009-2018	VARIANCE EXPLANATION
REVENUES				
General Consumers Revenue Including Projected Rate Increases	(7)	21	205	5.0% July 1, 2008 and 4% April 1, 2009 rate increases, versus 2.9% April 1, 2008 & 2009 in previous forecast. Load growth lower in early years, higher in mid years. Lower projected Energy Intensive Industrial rate revenue.
Extraprovincial	151	329	169	Improved water flows in first two years. Higher export prices partially offset by strengthened Canadian dollar. Removal of 300 MW of new wind generation from forecast due to economic reasons.
Other	(7)	(37)	(153)	Revenue from subsidiaries now only included in consolidated operations. Increase in Joint Use revenue from MTS. Reduction in tenant revenue related to the new head office due to a reduction in downtown real estate lease rates.
Total Revenue	**136**	**313**	**221**	

ELECTRIC OPERATIONS
COMPARISON OF MH08-1 TO MH07-1
INCREASE / (DECREASE)
(In millions of Dollars)

ACCOUNT	2009	CUMULATIVE 2009-2011	CUMULATIVE 2009-2018	VARIANCE EXPLANATION
EXPENSES				
Finance Expense	(26)	(65)	(279)	Higher net income, lower interest rates in the early years of the forecast and strengthening of the Canadian dollar all reduce finance expense. Higher capital spending begins to offset finance expense in later years.
Operating & Administrative	(11)	(34)	(119)	O&A related to subsidiaries now reflected in consolidated operations
Depreciation & Amortization	4	39	310	DSM now amortized over 10 years rather than 15. Higher capital forecast. Inclusion of minimum IFRS provision.
Water Rentals & Assessments	9	13	6	Up in early years due to increased water flows.
Fuel & Power Purchased	7	23	(345)	Higher prices for thermal and import power purchases in early years. Reduction in power purchases due to the removal of 300 MW of wind from the forecast.
Capital & Other Taxes	2	11	66	Higher capital taxes and property tax assessments.
Total Expenses	**(15)**	**(13)**	**(362)**	
Non-controlling Interest	0	0	(46)	Higher export prices increase Wuskwatim net income and hence NCN's share.
Change in Net Income	**152**	**325**	**535**

20 YEAR FINANCIAL OUTLOOK

2009/10 – 2028/29

FINANCIAL PLANNING
CONTROLLER DIVISION
FINANCE & ADMINISTRATION

January, 2010

OVERVIEW

The 20 Year Financial Outlook is an extension to the Integrated Financial Forecast IFF09-1 which was approved by the Manitoba Hydro-Electric Board on November 19, 2009. The 20 Year Financial Outlook depicts the long-term financial direction of Manitoba Hydro based on current assumptions of future events.

The first decade of the 20 Year Financial Outlook (the decade of investment) shows the financial impacts of major investments in new generation and transmission. Financial ratios are projected to weaken slightly in the first decade but rebound strongly in the second decade (the decade of returns). Domestic rate increases are projected to range from 2.9% to 3.5% per year in the first decade, then drop to 2.0% per year for the entire second decade. Equity (retained earnings) is projected to remain strong throughout the period, rising from $2.2 billion at March 31, 2010 to $11.2 billion at the end of 20 years. Drought remains one of the major risks with a repeat of the worst 5 year drought on record projected to cost $2.4 billion (assuming drought commencing in 2011/12).

KEY ASSUMPTIONS

The key assumptions included in the 20 Year Financial Outlook reflect similar assumption as the 11 year IFF and include the following:

1) Domestic Load Growth

   Domestic electricity load will grow at an average of 1.5% per year for net firm energy to 2019/20 and then 1.3% per year to 2028/29. Net total peak demand grows at an average of 1.3% per year over the 20 Year Financial Outlook to 2028/29.

   Natural gas volumes are projected to decline approximately 0.2% per year over the 20 Year Financial Outlook to 2028/29.

2) Domestic Rate Increases

   Average electricity rate increases of 2.9% per year are projected in 2010/11 and 2011/12 followed by 3.5% per year to 2019/20. Average electricity rate increases then drop to 2%, consistent with long-term projected inflation, for the last 9 years of the 20 Year Financial Outlook.

   Natural gas rate increases are projected to be only the rates necessary to generate net income of approximately $3 to $6 million per year (rate increases average less than 1% per year).

3) Inflation

The Manitoba Consumers Price Index is projected to increase at an average 2% per year commencing in 2011/12.

4) Interest Rates

The very low current short and long-term interest rates are projected to rise over the next 12 to 18 months with long-term rates reaching 6.10% by 2013/14 (excluding the debt guarantee fee of 1.0%) and then remain constant to 2028/29.

5) Foreign Exchange Rates

The US-Canadian exchange rate is projected to rise from the current level of 1.03 ($1.00 US = $0.97 Cdn) to 1.07 in 2012/13, 1.14 in 2016/17 and 1.15 by 2023/24.

6) Export Sales Contracts

The term sheets negotiated for the 15 year 500 MW Wisconsin Public Service sale (commencing in 2018) and the 14 year 250 MW Minnesota Power sale (commencing in 2022) will be finalized into long-term contracts. The 10 year Northern States Power contract extension of 375MW to 500MW (commencing in 2015) will also be finalized.

7) Carbon Pricing

Electricity export prices reflect anticipated greenhouse gas legislation and regulation which will likely impose significant constraints on emissions and will result in upward pressures on future market prices for electricity.

8) Capital Expenditures

Investments in new property, plant and equipment are projected to be significant during the first decade with major expenditures on Wuskwatim, Keeyask, Conawapa and Bipole 3 (total capital expenditures to 2019/20 projected to be $16.5 billion). The second decade will see the completion of Conawapa in 2022/23 plus the addition of new transmission to the US. No other new major generation and transmission projects are forecast in the second decade of the forecast. Figure 1 illustrates projected capital expenditures by major categories including new major generation & transmission, gas and other electric capital requirements including system refurbishment and upgrades necessitated by aging infrastructure.

ALTERNATIVE SCENARIOS

IFF09 includes a section demonstrating the sensitivity of key assumptions in the base forecast. Scenarios with the greatest sensitivity, such as the Low and High Export Prices and Five Year Drought, have been developed under the 20 year timeframe to demonstrate the longer-term impacts. The drought scenario has been supplemented to include other flow related scenarios including median flows and periodic low flows. Additionally, an alternative development sequence required for Manitoba demand has been developed. These scenarios are further described below. Figures 6 to 9 show the impacts on the equity ratio for each scenario compared to the 20 Year Financial Outlook.

Low and High Export Prices

The 20 Year Financial Outlook assumes expected export prices. The Low Export Price scenario reflects the long-term impact on future energy prices due to a number of potential factors including low economic growth, aggressive energy conservation policies, low growth in energy demand, loss in momentum in the development of competitive electricity markets, lower natural gas and coal prices and lower premiums related to emissions costs. The High Export Price scenario is characterized by high economic and energy demand growth, higher capital costs, a move to fully competitive markets, higher natural gas and coal prices, stringent US environmental policies and higher environmental premiums relative to expected prices in the 20 Year Financial Outlook. Figure 6 below compares equity ratios under the Low and High Export Price scenarios and the 20 Year Financial Outlook.

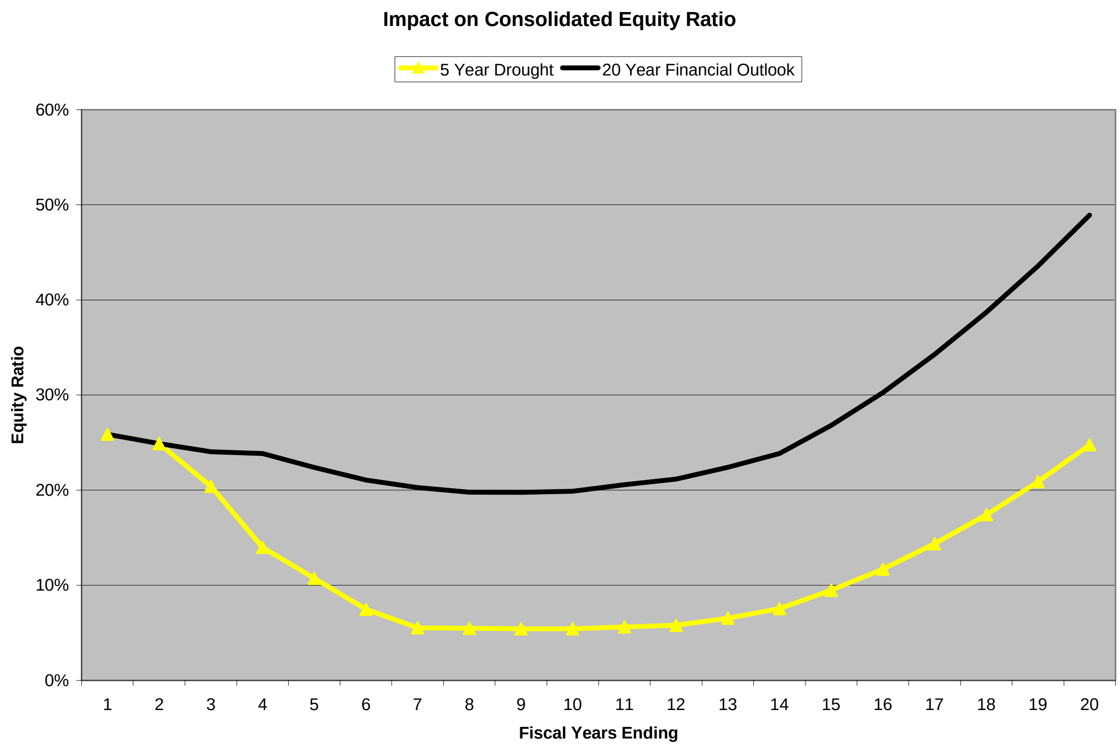
Five Year Drought

The five year drought scenario shown is identical to the scenario shown in IFF09-1 and assumes a recurrence of the worst five year drought on record commencing in 2011/12. Actual impacts could be smaller or return to normal sooner due to management actions that would mitigate the financial effects of extended low water flow conditions. Figure 7 below compares equity ratios under the 5 Year Drought scenario and the 20 Year Financial Outlook.

Figure 7



Median Flow Revenue Scenario

The base export revenue forecast assumed in IFF09-1 inherently incorporates the effects of drought and high water flows. The revenue forecast is developed by averaging the revenues corresponding to all 94 years of historic flow conditions on record in each year of the forecast. This method captures the asymmetric relationship between higher costs of low flows which are greater than the benefits of high flows. This produces a revenue forecast that is lower than would otherwise be calculated if the historic flows were simply averaged to then calculate revenue or was based on median flow conditions.

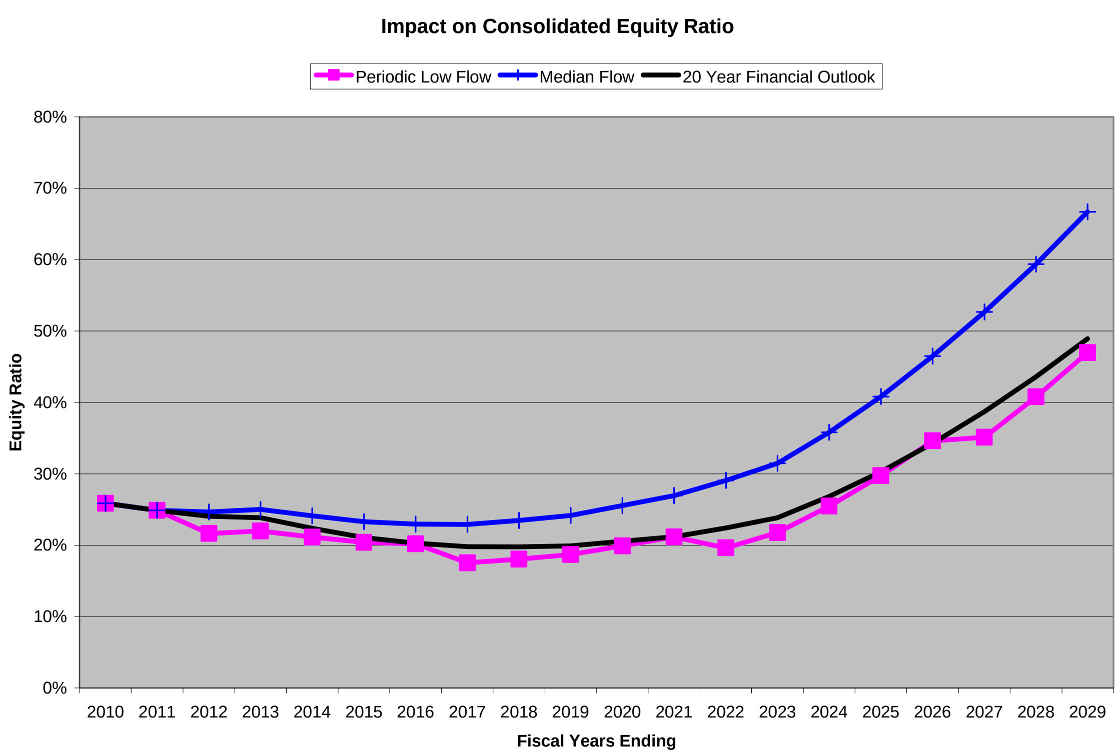
To remove the effects of low and high flows on the revenue forecast, a median flow scenario has been developed. An average of three median flow years (1921, 1926 and 1982) is used as the best representation of median flow conditions. Over the period to 2028/29, net export revenues, assuming median flows, are on average $145 million higher per year compared to the 20 Year Financial Outlook. However, it is more prudent planning to assume that low water flows (as well as high) are going to occur in the future and Manitoba Hydro employs a weighted average methodology for forecasting net export revenues as a result.

Periodic Low Water Flows

Low flow revenues are substituted one in every five years of the median flow forecast reflecting low flow conditions likely to occur in four out of twenty years. The median forecast is the base for the scenario (rather than the 20 Year Financial Outlook) in order to eliminate the duplication of low flows inherent in the 20 Year Financial Outlook. When compared to the IFF09, the Periodic Low Water Flow scenario shows no impact over the longer term compared to the 20 Year Financial Outlook demonstrating the effectiveness of the weighted average forecasting methodology for export revenues.

Figure 8 shows the equity ratios corresponding with the Median and Periodic Low Flow scenarios compared to the 20 Year Financial Outlook.

Figure 8



Alternative Development Sequence

The alternative power resource development plan for major infrastructure and resources to meet Manitoba requirements includes Conawapa in 2021/22 and a combined cycle gas turbine in 2033/34. This sequence excludes the sales related to the Wisconsin Public Service and Minnesota Power term sheets, the construction of Keeyask and the planned interconnection to the US. Although the equity ratio is slightly higher in the Alternative Development Sequence, the equity ratio under the 20 Year Financial Outlook crosses over by 2033/34 as the benefits of hydro development and additional tie-line capability are realized. Thereafter, the benefits are substantially positive for the entire life of the generation and transmission facilities. With respect to transmission, another benefit of the sale scenario is that counterparties in the US will be making large investments in new transmission which will enhance reliability and provide additional export sale opportunities. Figure 9 below compares the equity ratios under the Alternative Development Sequence and 20 Year Financial Outlook.

Hydro board slams handling of Bipole III, Keeyask dam projects — but says it's too late

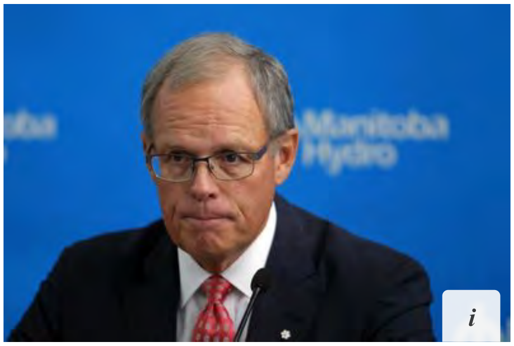
By: Nick Martin
Posted: **09/21/2016 2:16 PM**

The west side Bipole III line and the Keeyask dam projects are politically motivated mistakes that the NDP should not have built, Manitoba Hydro chair H. Sanford Riley charged Wednesday — but they're much too far along to pull the plug.

"This was an absolute no-brainer," Riley told a news conference in the atrium of the gleaming Hydro tower Wednesday morning.

Hydro's board said that 95 per cent of the initial cost of Bipole III has already been constructed or committed, and that Bipole III must be completed within the next couple of years to start generating revenue from the Keeyask dam project.

But as badly as the NDP mishandled those megaprojects, Riley said, they're a 'sideshow' to the enormous debt problems Manitoba faces — Hydro's debt will almost double to $25 billion within four years. And that will hit consumers on their monthly hydro bill.



BORIS MINKEVICH / WINNIPEG FREE PRESS
Manitoba Hydro-Electric Board Chairman H. Sanford Riley.

Previously predicted rate increases for consumers of four per cent a year for the next 20 years will only be the starting point, Riley said.

The review by American-based Boston Consulting Group told the new board — appointed this spring by Premier Brian Pallister — that Bipole III should have been built on the east side of Lake Winnipeg, and that Keeyask will not be needed for up to 15 years later than the NDP forecast, Riley said.

"If we had been the board at that time, we would not have proceeded," Riley said.

Both projects are behind schedule and will run close to $2 billion over budget, he said.

But so much work has been done and contracts signed and purchases made, he said, that cancelling the west side Bipole III and starting over on the east side would cost Manitobans more than $7 billion, Riley said.

Hydro plans a series of town hall meetings across Manitoba to explain its difficulties and challenges, and to hear from the public.

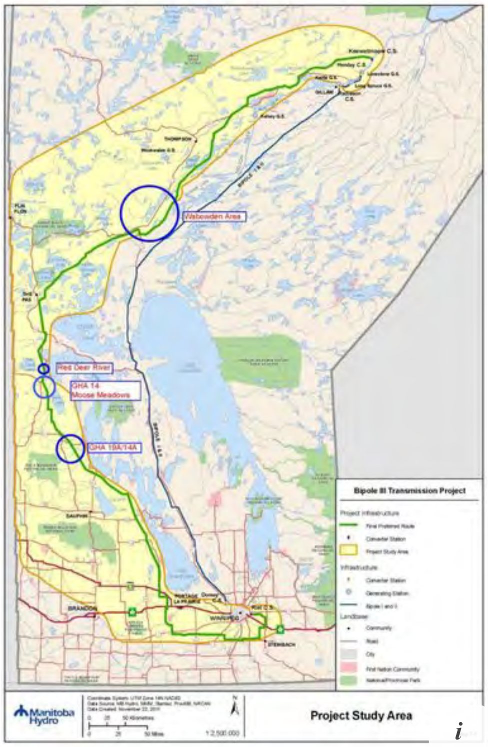
Finance Minister Cameron Friesen later told reporters that Manitoba could face a further downgrade to its credit rating, which means money intended for public services would have to go to servicing the debt.

"We know the NDP spent beyond their means," Friesen said. "The debt of Manitoba Hydro is the debt of all Manitobans."

But NDP crown services critic Ted Marcelino declared that finishing the west side line is the only logical choice. It's the most secure and reliable route, he said, and he challenged reporters to say why the cost matters if it saves the boreal forest on the east side. "History will judge us," Marcelino said.

BIPOLE III:

It cost $900 million more to build Bipole III down the considerably longer west side of Lake Winnipeg instead of the east side, Riley said. "It appears to be almost a $1 billion mistake."



Bipole III revised route 2012.

Hydro favoured the east side, but the NDP government was issuing the orders in 2007 without bothering to do any real analysis of the east side, Riley said, adding it was an imprudent decision.

Riley said Bipoles I and II now carry 70 per cent of the power Manitoba needs. Bipole III is for redundancy in case of catastrophe, and to carry power meant for export.

"The risk is some catastrophic event — I leave that to your imagination," Riley said, though the most likely is a weather event. The review refers to ice storms, a tornado, anything that could bring down a transmission line.

Hydro President and CEO Kelvin Shepherd said Bipole III is 12 to 15 months behind schedule, and its $4.65-billion price tag will likely hit $5 billion.

Pallister has been talking about scrapping the west side and starting from scratch on the east side, but, said Crown Services Minister Ron Schuler, "The Bipole III project is much further along than we were initially led to believe.

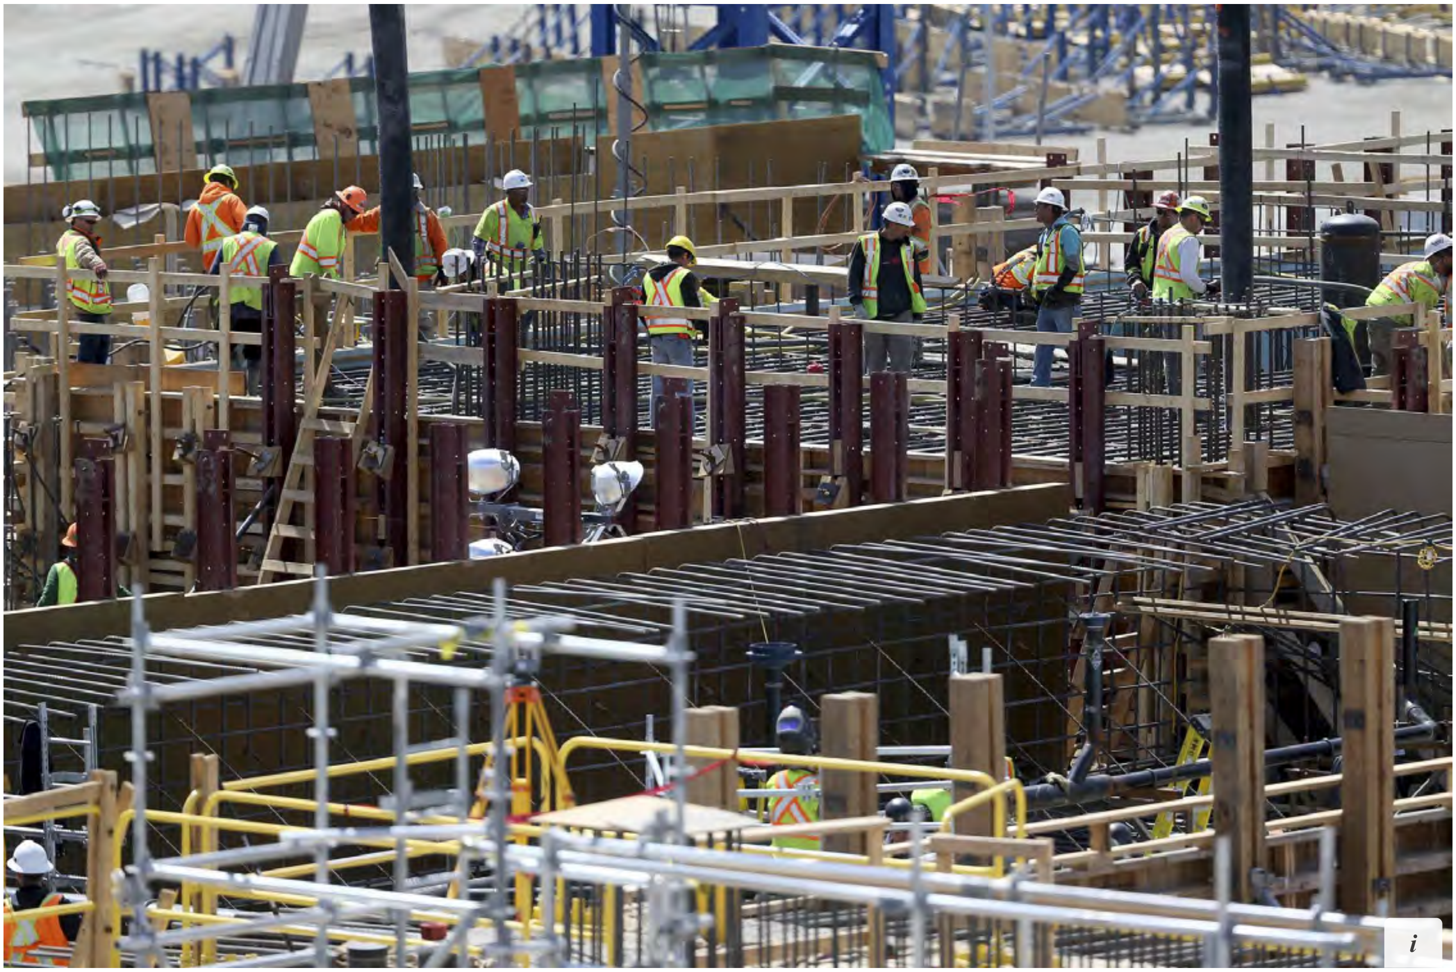
"Transformers are leaving Europe, four of them, as we speak, bought and paid for," Schuler said.

Schuler said it's all been mismanaged, but wouldn't say if the NDP or previous Hydro board had misled or outright lied about how far along the project had come — he'd just say the point of no return was before the April 19 election, but the Tories were unaware of that at the time.

Retorted Marcelino: "It will save our future."

13127

KEEYASK:



TREVOR HAGAN / WINNIPEG FREE PRESS
The Keeyask Dam project site near Gillam, Man.

Shepherd said the dam project is 21 to 31 months behind schedule, and will be as much as $1.3 billion over budget. "There were flaws in some of the strategic decision-making," he said.

Riley said Keeyask is too far along to stop now, an overall waste of $7 billion if scrapped, but the review indicated the NDP could have waited another 15 years to build it instead of adding to Hydro's debt load now before it's needed. "We all question why the decision was made to proceed with Keeyask when they did."

But if Hydro were to leave Keeyask uncompleted while starting over with a new Bipole III on the east side, "In effect, you'll have a white elephant up there," Riley said.

Under the former administration and NDP government, Riley said, "Hydro had a culture of building dams."

Big ones, he said.

In retrospect, Schuler said, it's obvious that the NDP inextricably linked Bipole III and Keeyask as one project, although the New Democrats passed them off as separate and distinct megaprojects.

Marcelino said the NDP were acting responsibly, knowing we lacked the oil that Alberta and Saskatchewan have. "It was a necessity on our part. The only resource we have is the development of our hydro," Marcelino said.

DEBT

NDP mismanagement on Bipole III and Keeyask leave Manitoba's finances in jeopardy, our debt rapidly approaching levels never seen here before, Riley warned. "That is an untenable risk for our utility."

Within four years, Manitoba Hydro's debt will almost double to $25 billion, he said, and that will further hurt the province's credit rating. The utility's debt to equity ratio is falling far below acceptable levels, he said, while public debt in Manitoba soars as a percentage of gross domestic product.

Meanwhile, the market price for exported surplus power is dropping.

"What can go wrong is water," Riley cautioned. "What we can't control is Mother Nature."

In 2004, Manitoba Hydro went from a $200 million profit to a $500 million loss because there wasn't enough water in the north to generate the power needed.

Friesen said that debt drives up the cost of borrowing and can lead to a downgrade in credit ratings, thus making it more expensive to borrow already higher amounts of money.

"While that threatens the bottom line of the province of Manitoba," he was not prepared to discuss Wednesday what could happen to provincial spending. Nevertheless, money going to servicing the debt is money not available for frontline services, said the finance minister.

WHAT IT MEANS TO YOU

It may be hard to get your head around billions of dollars — but your monthly hydro bill will be hard to ignore.

Riley said that getting Hydro's finances under control are the responsibility of the crown corporation and the province, and consumers. "There's no secret right now, ratepayers are going to be part of the solution. We have to fix Manitoba Hydro."

Under the NDP, expectations were that hydro rates would go up four per cent a year for 20 years, acknowledged Riley, who wouldn't speculate on numbers, but said, "That's a starting point.

"We have the lowest hydroelectric rates in North America, with the possible exception of Hydro Quebec. Probably, they've been maintained at too low a level."

And he took a shot at the public utilities board; interested only in getting rates as low as possible, the PUB "didn't pay a lot of attention to the overall health of Hydro," Riley charged.

Financial Profile Summary

- With Retained Earnings of $2.6 billion, Manitoba Hydro is in the strongest financial position in its history.
- The Export Revenues associated with Manitoba Hydro's predominantly hydro system has been a key contributor to the Corporation's financial strength and affordable rates for customers.
- Manitoba Hydro is well positioned to make the necessary investments to meet the future energy needs of the Province.

Manitoba Hydro
Financial Outlook Update

(IFF13 February 2014)

Major Changes since IFF12 Approved in November 2012

- Load Forecast lower due to lower forecasted population growth. Gross firm energy is projected to be down 717 GW.h in 2022/23 and 1 159 GW.h in 2031/32 compared to IFF12.
- Conawapa in-service date deferred 1 year to 2026/27.
- Increased capital costs $1.6B due to Conawapa deferral, reinstatement of DSM costs into Capital Forecast and project estimate updates.
- 2013 Electric Export Price forecast projects on-peak prices to decrease on average 3% over the period 2014/15 to 2032/33.
- IFRS Implementation deferred 1 year to 2015/16 and assumption that rate-regulated accounting will continue over the forecast period.
- Forecast operating cost growth has been further constrained to 1% inflationary growth between 2016 and 2021.

Comparison of IFF13 to IFF12 Consolidated Net Income ($ Millions)

Increases (Decreases)

Debt/Equity:

Maintain minimum debt/equity ratio of 75:25

Interest Coverage:

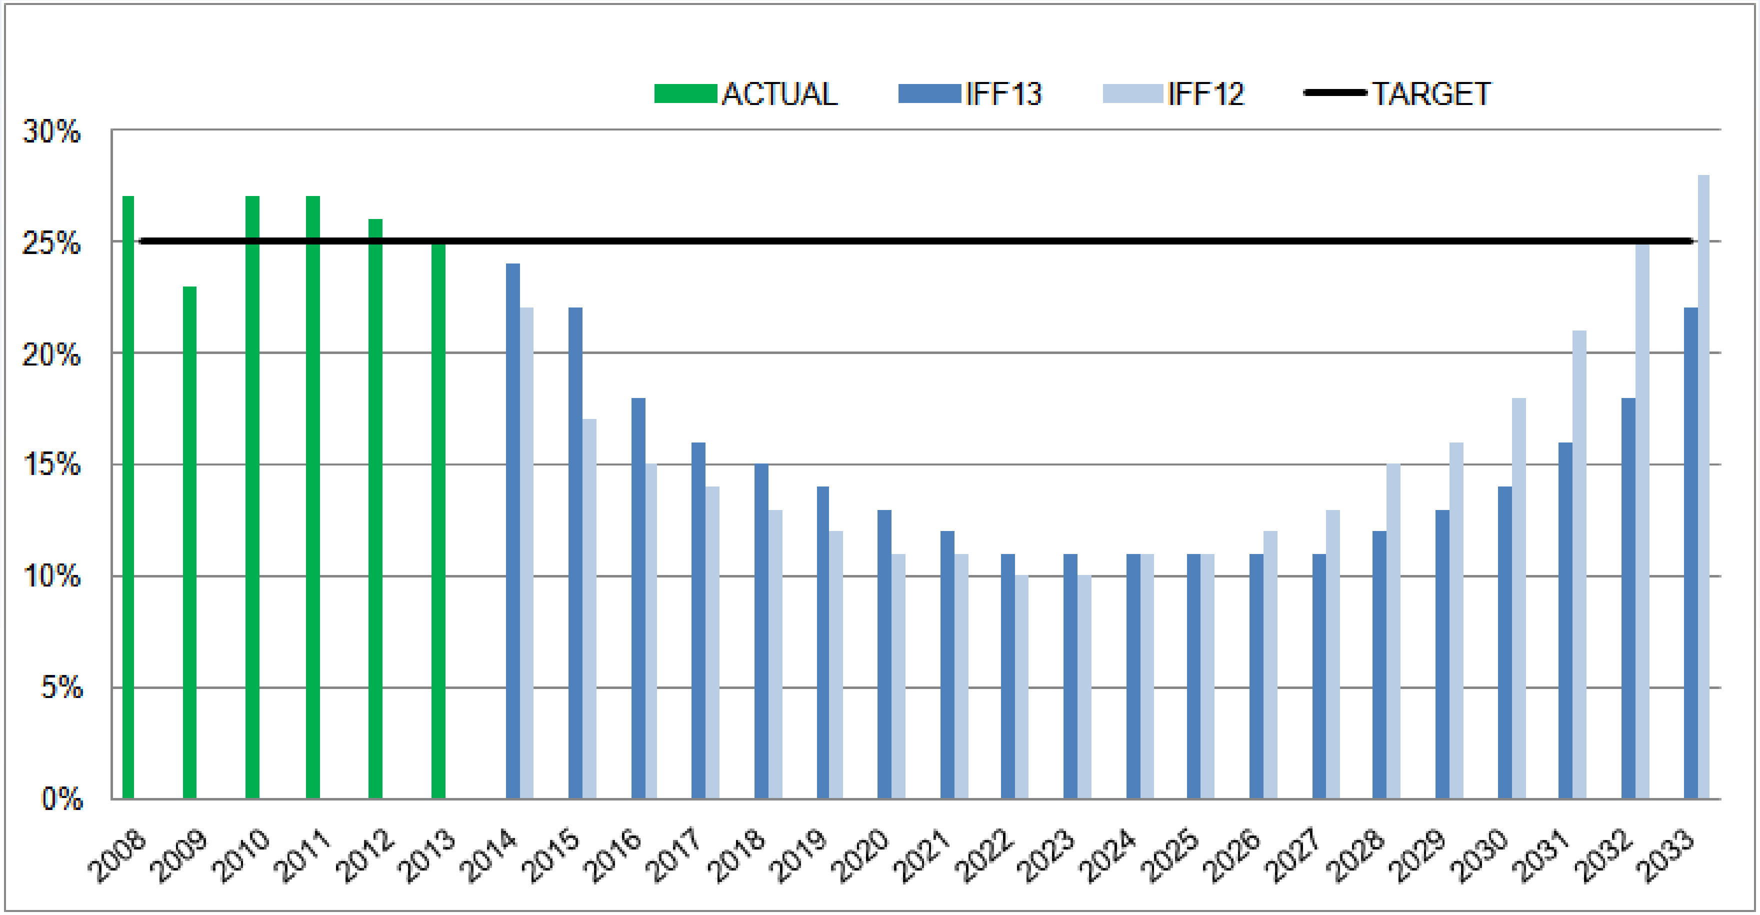
Maintain interest coverage ratio of > 1.20

Capital Coverage:

Maintain capital coverage ratio of >1.20

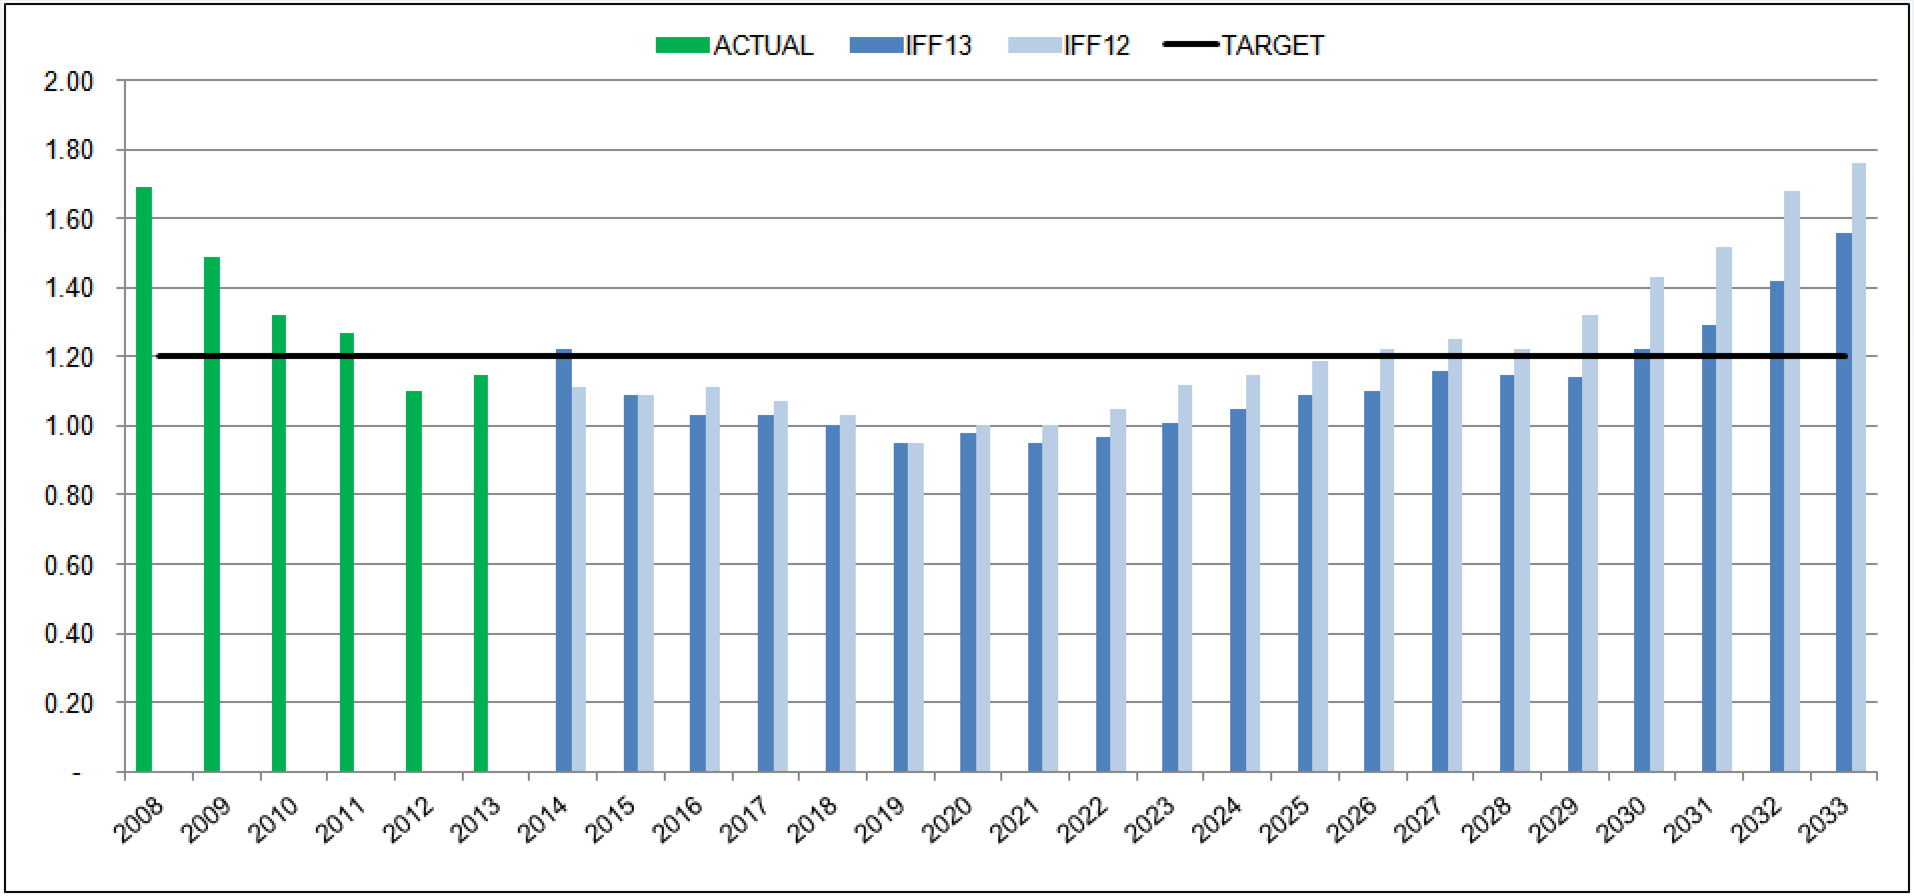
Note: Financial targets may not be maintained during years of major investment in the generation and transmission system.

Equity Ratio

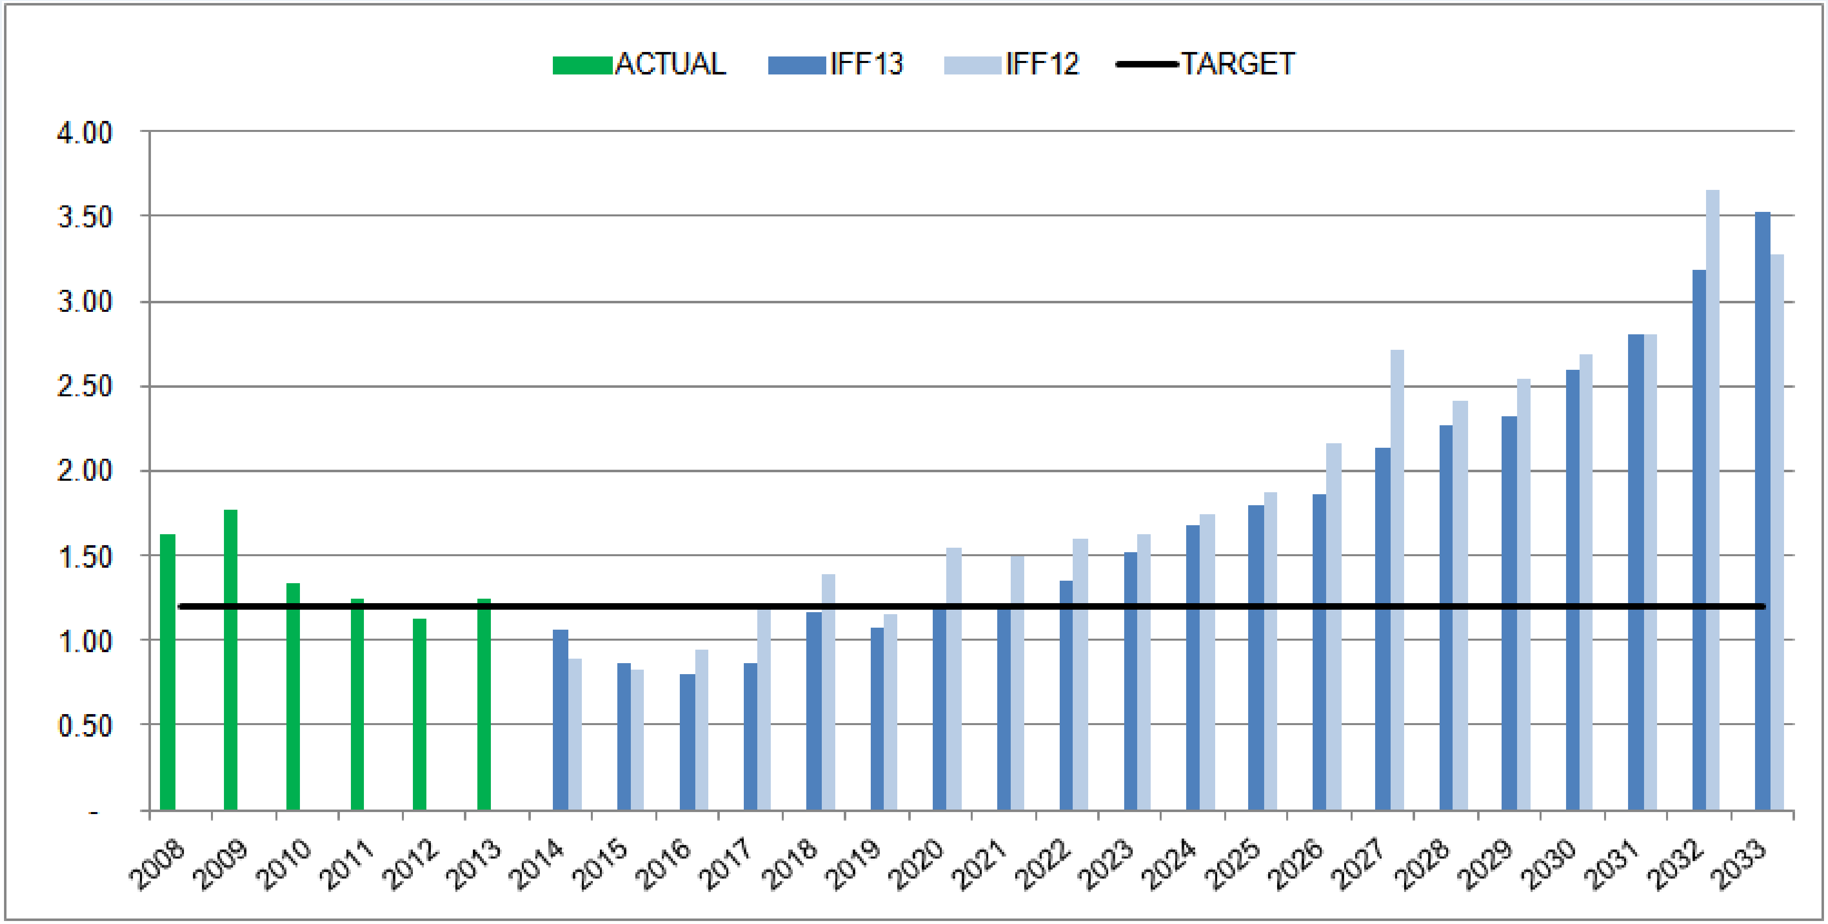


Note: 25% equity target attained in 2034 in IFF13

Interest Coverage Ratio

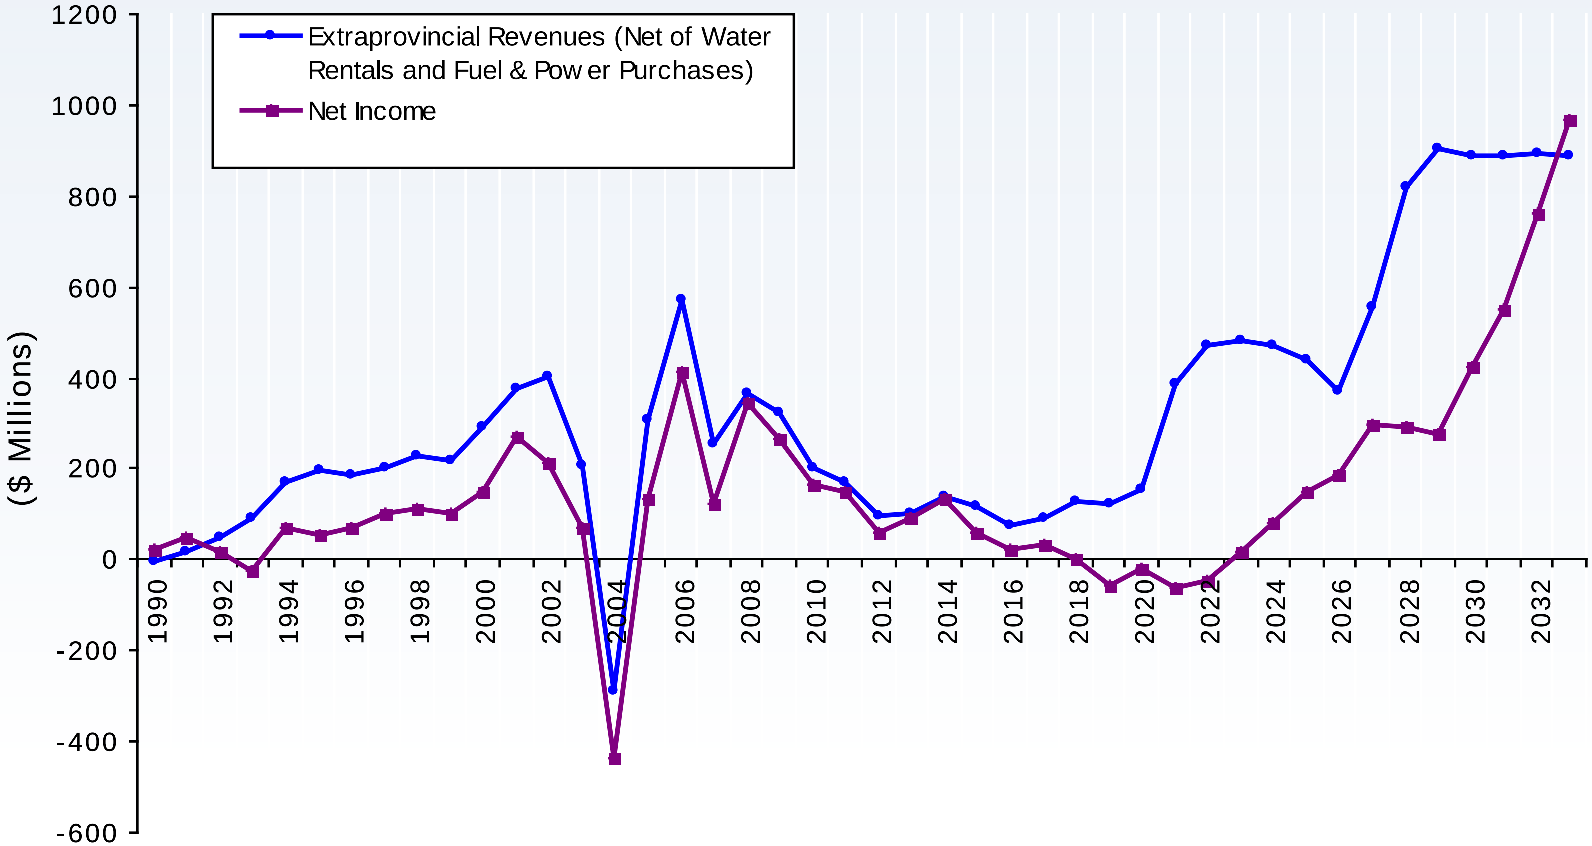


Capital Coverage Ratio



13150

Consolidated Income Statement –
Comparison of Net Extraprovincial Revenues to Net Income



13151

Financial Outlook Summary

- The required investments in existing infrastructure and new generation are expected to place pressure on Manitoba Hydro's key financial ratios in the next decade.
- Significantly higher rate increases than 3.95% would be required to maintain financial targets during the investment period.
- In setting financial targets, it has always been recognized that the targets may not be attained during periods major investments in the generation and transmission system.
- Credit rating agencies and other stakeholders are prepared to accept short-term weakness in financial ratios, as long as Manitoba Hydro can demonstrate progress to attaining the targets over the long-term.
- Financial ratios are expected to recover after the in-service of Keeyask and Conawapa generating stations and reach target levels within a forecast horizon of approximately 20 years.
- Export revenues will continue to play an important role in improving the Corporation's financial strength and keeping rates affordable for customers in the future.

Recent Rate Increase Requests – Other Provinces

SaskPower seeks 15.5 per cent rate hike

CTV Regina
Published Friday, October 25, 2013 12:05PM CST

SaskPower has applied for a 15.5 per cent rate increase over three years.

The Crown corporation is asking for rate increases of 5.5 per cent next year, five per cent in 2015 and five per cent in 2016.

SaskPower says it needs to raise rates because demand for electricity is growing in Saskatchewan, while generation, transmission and distribution infrastructure is aging.

Ontario hydro bills to rise 42% in 5 years

604

BY ANTONELLA ARTUSO ,QUEEN'S PARK BUREAU CHIEF

FIRST POSTED: MONDAY, DECEMBER 02, 2013 01:43 PM EST | UPDATED: MONDAY, DECEMBER 02, 2013 03:47 PM EST

TORONTO - Ontario hydro bills are headed up, up, up.

The Liberal government's new long-term energy plan shows that the average monthly residential bill of $125 will rise to $178 within five years — a 42% increase.

Hydro bills are expected to dip slightly in 2019 to $177 a month, and then rise again until 2022 when they'll hit $193 a month.

A second decrease in prices is forecast for 2023-24 and then the trend for prices is onward and upward for the foreseeable future.

BC Hydro rates to increase 28 per cent over 5 years

"Our rates are still among the lowest in North America," says BC Hydro CEO Charles Reid

CBC News Posted: Nov 26, 2013 10:53 AM PT | Last Updated: Nov 26, 2013 7:54 PM PT

Energy Minister Bill Bennett and BC Hydro CEO Charles Reid announced a 28 per cent electricity rate hike over five years, with a nine per cent jump coming April 1, 2014.

In a press conference in Victoria this morning, Bennett and Reid said the rate hikes were part of a 10-year plan to keep rates as low as possible, while still allowing BC Hydro to invest in infrastructure and future power projects.

Hydro-Québec rates to rise by 4.3 per cent as of April 1

The 4.3 per cent increase is the biggest hike in the last 10 years

CBC News Posted: Mar 06, 2014 7:12 PM ET | Last Updated: Mar 06, 2014 7:12 PM ET

Quebecers will be paying more for electricity starting April 1.

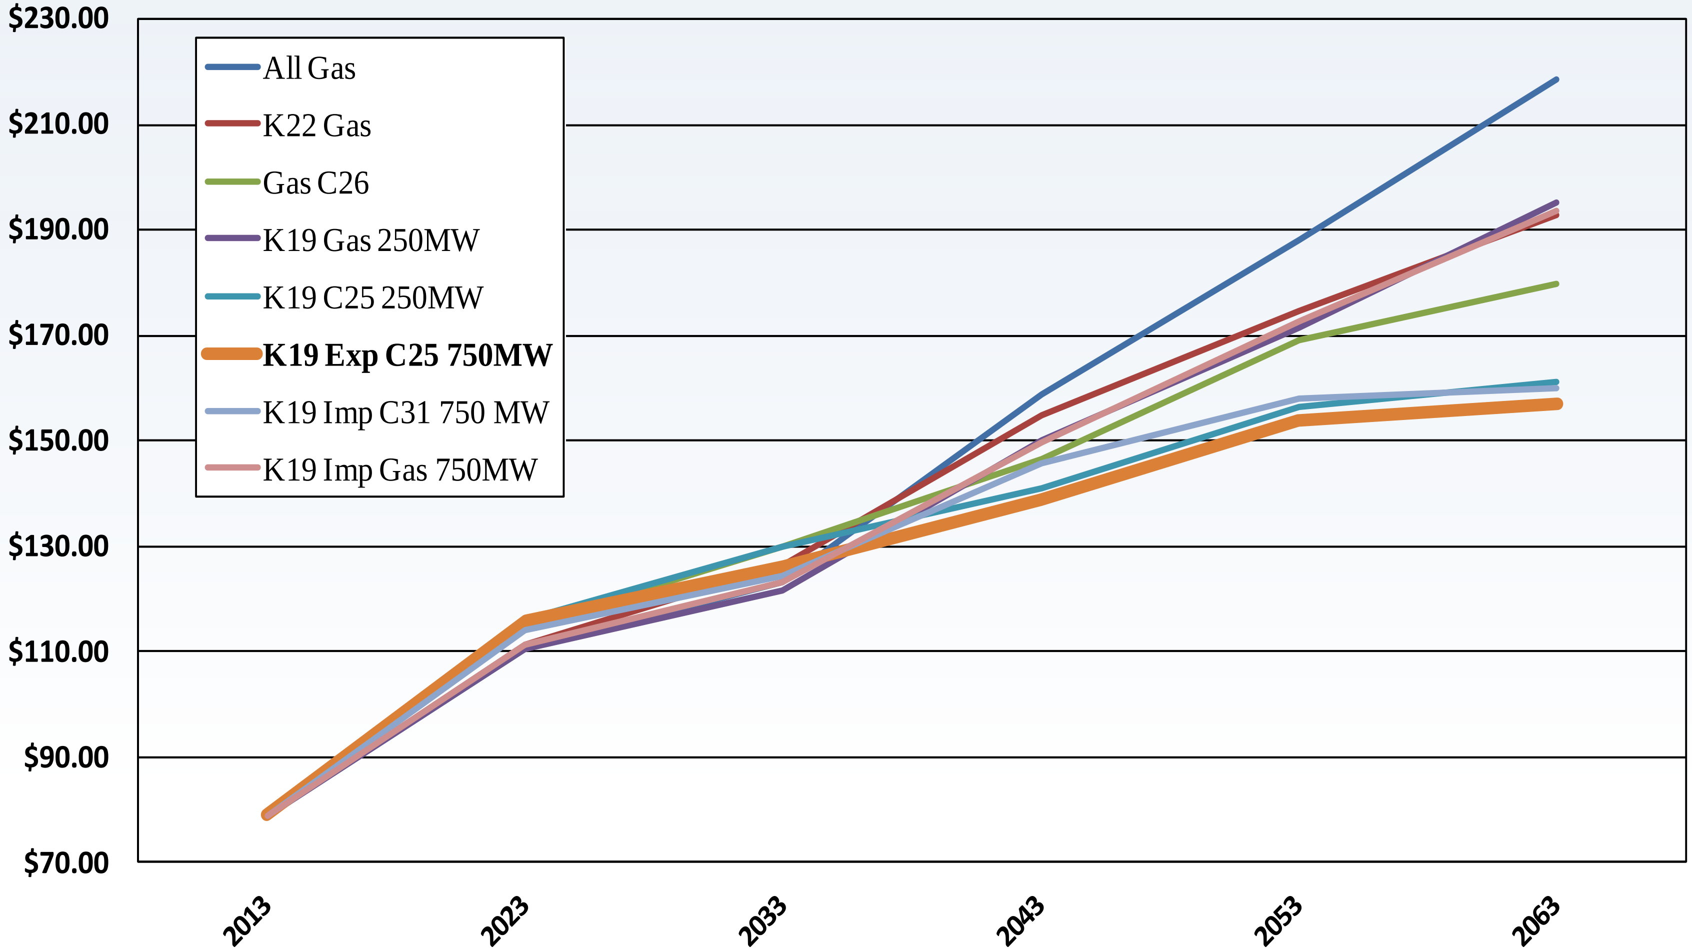
Quebec's energy board has approved a rate increase of 4.3 per cent.

This marks the highest increase since 2004.

Hydro-Quebec had requested a 5.8 per cent increase this year, but the energy board decided that was too high.

Last year, rates went up 2.4 per cent.

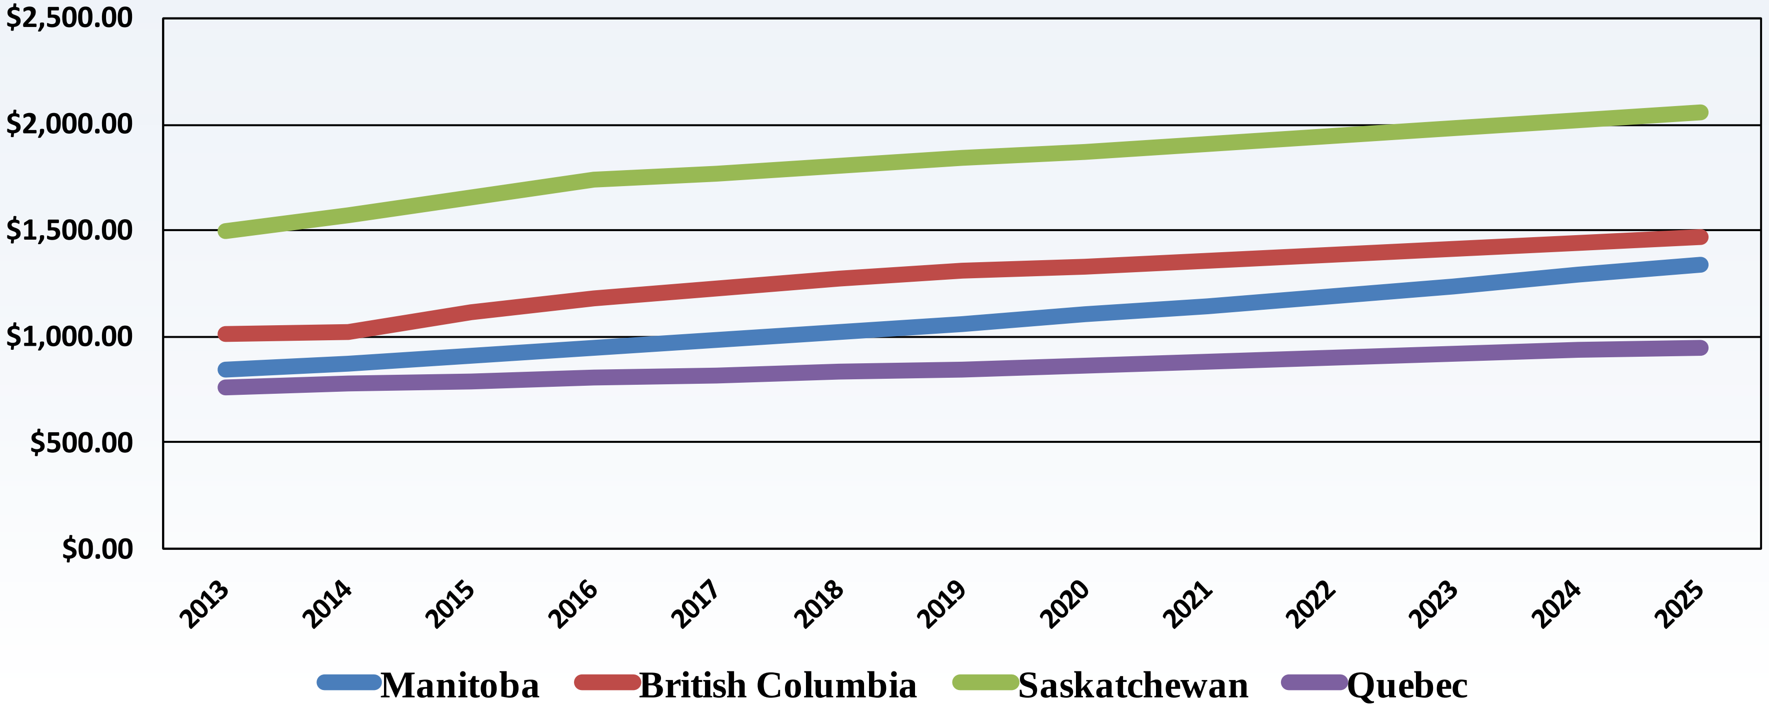
Projected Monthly Residential Bills
Based on 1000 kWh
CAC/MH I-140



13161

Residential Annual Bill Comparisons

CAC/MH II-134b (Assuming MH projected rate increases and BC, SK & PQ approved or proposed rate increases with GDP deflator* thereafter)



*The GDP deflator is considerably less than the average rate increases proposed in these jurisdictions and may not reflect the trend in future rates.

Rate Comparison Summary

- Manitoba Hydro electricity rates are among the lowest in North America.
- Electric utilities in other jurisdictions are facing the same increased costs of maintaining existing infrastructure and developing new resources.
- Electric utilities in other jurisdictions are requesting or implementing rate increases much higher than the rate of inflation and higher than Manitoba Hydro projected rate increases.
- Manitoba Hydro electricity rates will continue to be affordable and competitive with other jurisdictions.

NFAT Financial and Rate Analysis

Impact on Manitoba Hydro’s Customer Rates

Financial Evaluation Assumptions & Methodology

- Financial evaluation compares the year-by-year impacts of each of the development plans on Manitoba Hydro's projected financial statements and customer rates.
- Overlays development plan assumptions on the revenue and cost, balance sheet and cash flow projections for the entire electric operations, including existing infrastructure.
- Development plans are evaluated by extending IFF12 and modifying for preliminary 2013 forecast of electricity export prices
- IFF12 (adjusted) is modified for the generation costs and transmission associated with the type of facility and timing for each development plan

Financial Evaluation Assumptions & Methodology

- Capital costs are reflected in the balance sheet
  - Construction in progress until in-service
  - Property, plant & equipment following in-service
- Once in-service, capital costs are reflected on the income statement in depreciation on a straight-line basis over the useful life of the asset:
  - Hydro generation 20-125 years
  - Gas generation 30 years
  - Transmission substations 35 years
  - Transmission lines 50 years
- Incorporates the flow-related production costs and revenues associated with the facilities for each development plan
  - Production costs include import purchases, wind purchases, thermal fuel and direct operating costs of the facilities
  - Surplus energy, after serving domestic and firm exports, is assumed to be sold as firm (if available from dependable energy) and as opportunity (for any additional in excess of dependable).

Financial Evaluation Assumptions & Methodology

- Uses the same assumptions from economic evaluations converted from real to nominal dollars.
- General consumers revenue reflects sales to Manitoba customers, including load growth, at rates approved by the PUB
  - Does not change under differing development plans
- Annual borrowing requirements are calculated based on the cash flow surplus or deficit for each development plan based on both existing infrastructure and new generation and transmission associated with the specific development plan.
- Annual finance expense is calculated based on the existing debt portfolio plus the projected annual borrowing requirements.

Financial Evaluation Assumptions & Methodology

- General consumers revenue additional reflects the incremental revenue required to recover costs for both existing infrastructure and the development plan.

- Manitoba Hydro has a long-standing strategy of gradualism in its approach to developing rate proposals.

- Under cost of service regulation, cost recovery is smoothed out over time by absorbing some of the cost into retained earnings on a temporary basis, if prudent, allowing sufficient time for export revenue benefits to accrue.

- Due to the volume of projections evaluated, Manitoba Hydro applied a mechanical approach using a set of fixed parameters consistent with the Corporations financial targets to derive the annual rate adjustments – removes judgment and subjectivity.

- Given that a timely return to the targeted 75:25 debt/equity ratio is prudent, the financial analysis assumes even-annual rate increases in order to achieve the targeted debt/equity ratio by the end of 2031/32, similar to the approach used in IFF12.

Financial Evaluation Assumptions & Methodology

- Once the debt/equity target is reached, the projected comparative annual rates for the remainder of the 50-year financial forecast period are derived based on the corporation's interest coverage ratio target of 1.20.
- Strictly adhering to the financial targets results in projected rate increases that are at times well above the rate of inflation and at other times result in rate reductions – in practice, these would be smoothed over a period of time.
- Rate increases are indicative for comparability purposes between plans
- Actual rate increases will vary from those projected in this analysis and will be dependent upon future revenue requirements
- Numerous factors, other than the choice of development plan, may influence the revenue requirement, such as changing water flow conditions, weather, costs to maintain the system, and economic variables.
- Future rate proposals will be subject to full justification as part of General Rate Applications before the Public Utilities Board.

Financial Evaluation Assumptions & Methodology

- Approximately $1.2 and $0.4 billion is projected to be incurred to June/14 in nominal dollars to protect the early in-service dates of Keeyask and Conawapa, respectively.
- For NFAT financial evaluation purposes, a simplifying assumption was made to expense all sunk costs over an 18-year amortization period.
- If CEC or NFAT regulatory approvals are not received or the Corporation defers one or both plants, costs deemed to no longer provide future benefit must be expensed.
- Manitoba Hydro would periodically analyze the nature of the costs to determine their future benefit – some costs have longer expected future benefits while others have shorter.

All Gas Development Plan (1)

Customer Rates Summary

- Rate increases above the rate of inflation are required under all scenarios due to investments in existing infrastructure and reliability and reductions in non-firm export prices compared to those of a few years ago.
- Rate increases in the period to 2032 are moderately higher under the PDP than All Gas and Keeyask/Gas/750.
- Under the reference scenario, the PDP rates are lower than All Gas and Keeyask/Gas/750 by 2035.
- On a present value basis, the PDP consumers revenue is lower than All Gas by 2046 and lower than Keeyask/Gas/750 by 2050.
- Costs of the Preferred Development Plan do not directly affect Manitoba Hydro's electricity rates today.
  - Costs are deferred until in-service at which time they are included in net income and revenue requirement and amortized over the lives of the associated assets.
- Once in operation, the Preferred Development Plan is anticipated to assist in maintaining affordable and competitive Manitoba Hydro rates.
  - Costs are spread over a very long time matching when customers receive the benefits,
  - Carrying costs decline over time, and
  - Exports offset costs passed on to ratepayers.

Financial Position Summary

- Net income, interest coverage ratio and debt/equity ratio weaken initially and then improve gradually to 2032 under all development plans.
- Net assets and retained earnings are highest under the PDP.
- Net assets under the All Gas grow steadily over the study period and are only $5 billion or 13% lower than the PDP by 2062 due to continuous investment in gas turbines over the study period.
- The PDP has the highest level of net debt throughout the study period but declines following hydro generation ISD’s.
- The All Gas has the lowest level of net debt initially but increases throughout the study period converging with the PDP net debt by 2062.
- The PDP results in the strongest projected balance sheet with the highest level of assets and retained earnings over the entire study period.
- The impact of drought is greater under the PDP; however, due to the higher net assets and retained earnings, the PDP is in a stronger financial position to absorb the adverse financial impacts of drought.

Financial Risk Management

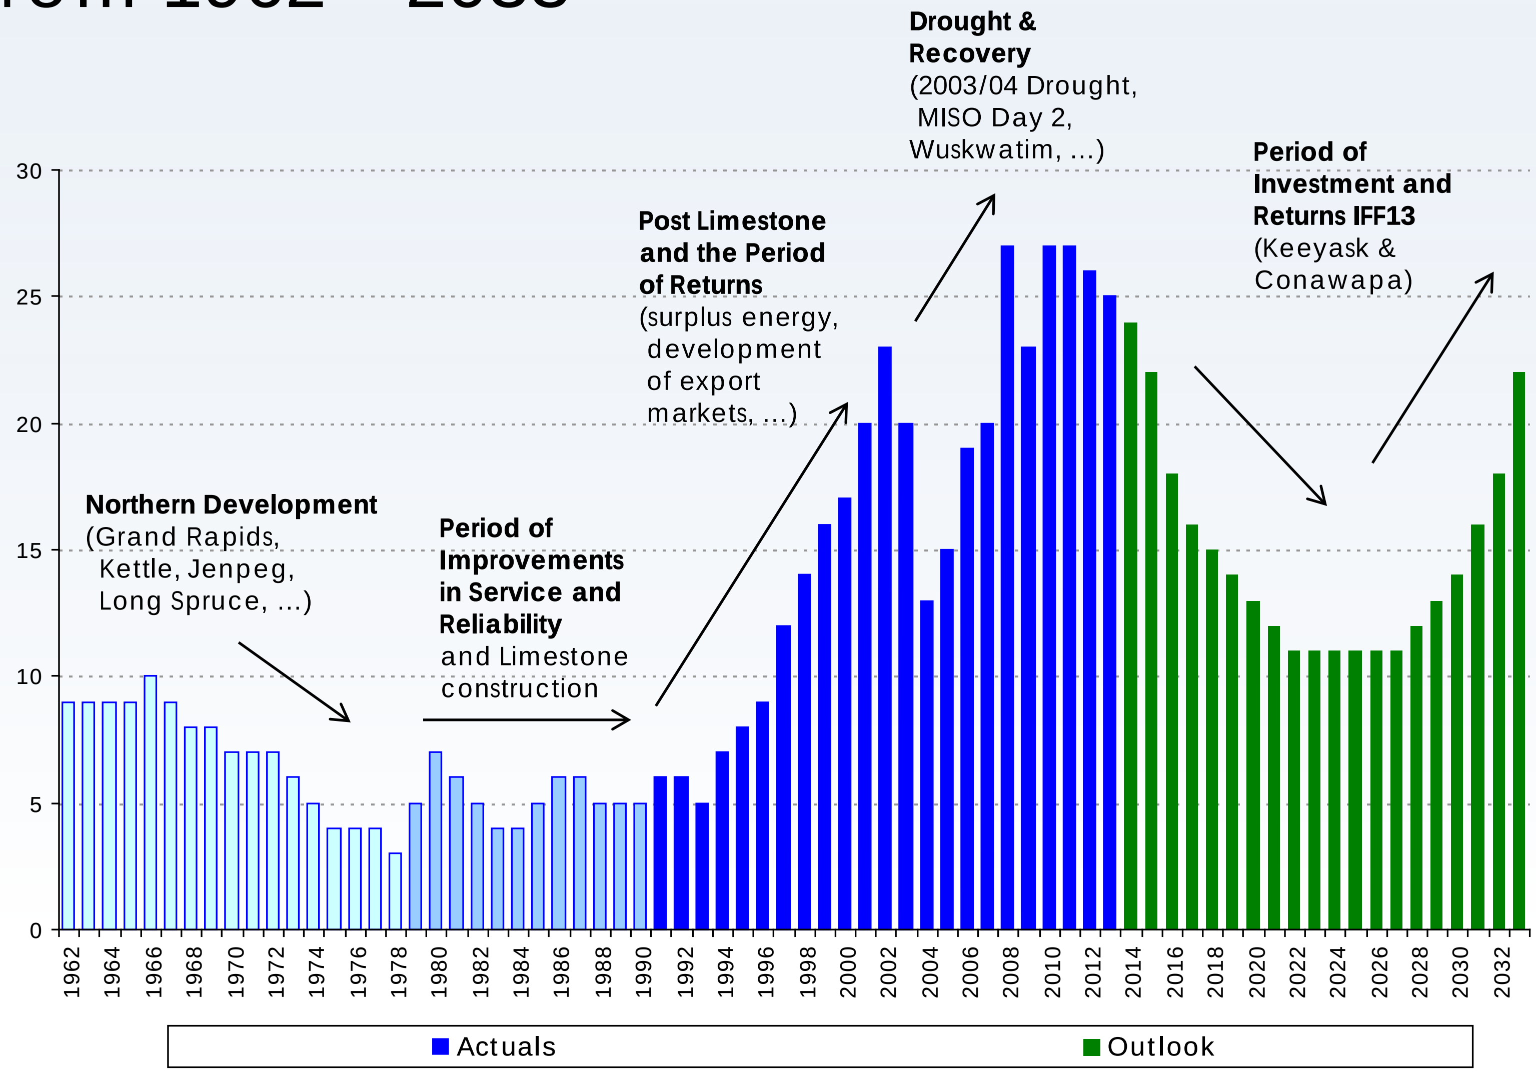
Risk Management is Integral to the NFAT Submission

- Manitoba Hydro considers **business risk as an integral aspect of its plans and operations**.
- Manitoba Hydro's financial risks, forecasts, ratios and evaluations have been extensively examined (eg. Chapter 11 and Appendix 11.4 with 216 distinct sets of pro-forma financial statements).
- The financial volatility of severe drought was also examined in the NFAT filing (eg. Section 11.4).
- The submission also includes flexible pathways to manage through future uncertainties.

Financial Risk is Manageable and Debt Self-Supporting

- Manitoba Hydro is embarking upon its development plans from a position of strength.
- As measured by the equity ratio, the Corporation is well situated to move forward with its upcoming capital investments.

Manitoba Hydro's Equity Ratio
from 1962 – 2033



13204

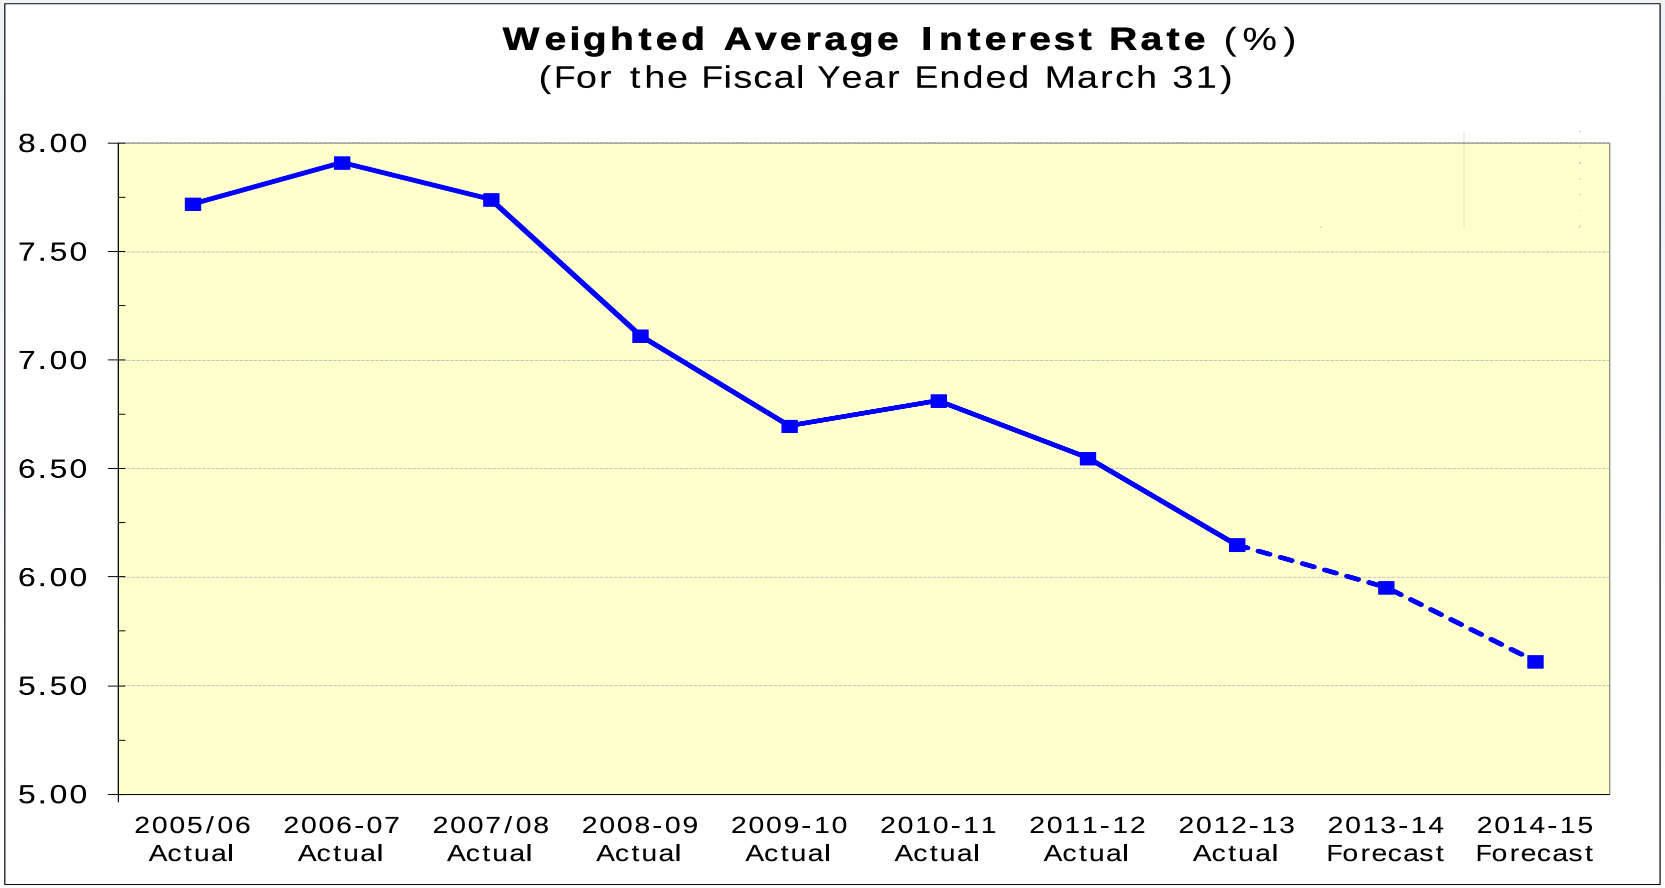
Financial Risk is Manageable and Debt Self-Supporting

- With respect to Manitoba Hydro's borrowings, the Corporation receives a flow through credit from the Province of Manitoba.
- In exchange for this flow through borrowing capability, Manitoba Hydro pays a provincial debt guarantee fee to the Province of Manitoba.
- As Manitoba Hydro makes interest and principal payments to bondholders on an uninterrupted basis, the debt is considered by the credit rating agencies to be self-supporting.
- Therefore, to the extent that Manitoba Hydro prudently manages its debt and maintains its self-supporting status, Manitoba Hydro's capital investment plans should have no significant impact on the Province of Manitoba's credit rating.

Debt Management Strategy

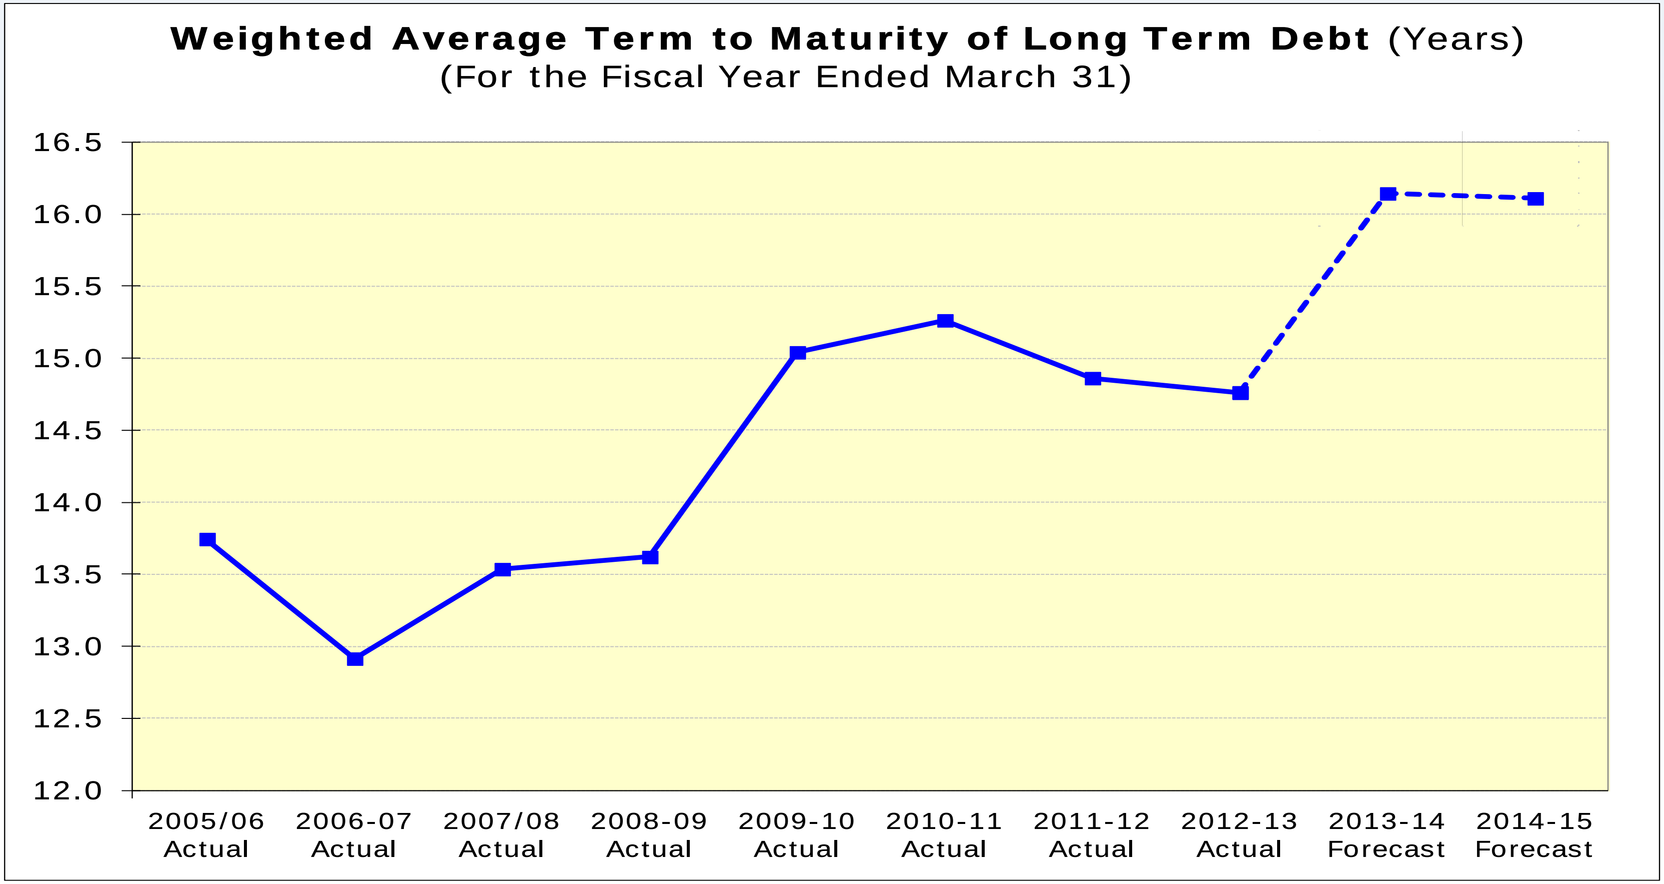
- Manitoba Hydro's fundamental debt management objective is to provide stable, low cost funding to meet the financial obligations and liquidity needs of the Corporation.
- Manitoba Hydro's actual long term financing includes debt issuance in various terms to maturity.
- In order to mitigate refinancing risk, Manitoba Hydro will:
  - Match long-lived assets with long term debt, and
  - Continue to favour long term fixed rate financings with maturities of 10 years+.

Debt Management Strategy – Low Cost



13207

Debt Management Strategy – Stability



13208

Foreign Currency Exchange Risk

- Manitoba Hydro's net income is largely inoculated from fluctuations in the movement of the USD/CAD exchange rate.
- Manitoba Hydro has significant export revenues and cash inflows denominated in US dollars.
- However, in order to manage the currency exchange risk on these revenues, Manitoba Hydro maintains a natural hedge with offsetting US dollar cash outflows, including finance expense on US denominated debt.

Liquidity Risk

- Liquidity risk refers to the risk that Manitoba Hydro will not have sufficient cash or cash equivalents to meet its financial obligations as they come due.
- Manitoba Hydro will meet its financial obligations when due through cash generated from operations, short term borrowings, long term borrowings, and where applicable, sinking fund withdrawals.
- Manitoba Hydro can issue short term borrowings in the name of the Manitoba Hydro-Electric Board up to a limit of $500 million.

Liquidity Risk

- During a severe prolonged drought Manitoba Hydro would provide sufficient cash flows for the continuity of business operations and Manitoba Hydro's self-supporting status.
- Liquidity measures include:

1. Cash conservation. Manitoba Hydro would curtail or delay operating and capital expenditures as required and appropriate. In severe circumstances, this may include exercising the optionality available within the development plan pathways.
2. Bridge financing. Manitoba Hydro could draw upon its $500 million short term borrowing program and/or access the capital markets for shorter dated debt financings that could be retired upon the resumption of positive cash flow from operations.
3. Increase cash inflows through rate increases. Should circumstances warrant, Manitoba Hydro could apply for higher rate increases in order to generate additional cash inflows.

View from the Credit Rating Agencies

(2) **Low-cost hydro-based generation.** Low-cost hydroelectric-based generating capacity results in one of the lowest variable cost structures in North America, which has enabled Manitoba Hydro to provide electricity to its domestic customers at one of the lowest rates on the continent. This gives the Utility the flexibility to increase rates in the future, especially in light of the substantially heightened future capital expenditure requirements.

From the **Dominion Bond Rating Service (DBRS)** credit rating report on the Manitoba Hydro-Electric Board dated September 16, 2013; page 2 (highlighting added). For the full report see PUB/MH I-85(b), Attachment 1]

View from the Credit Rating Agencies

Significant Borrowing for Manitoba Hydro, but Self-Supported

Roughly one third of the province's total direct and indirect debt is attributed to Manitoba Hydro (issued and on-lent by the province) and is considered to be self-supporting. This Crown Corporation's ability to meet its own financial obligations without recourse to provincial subsidies is a positive credit attribute for the province. In our view, the likelihood that the contingent liability represented by Manitoba Hydro's debt would materialize remains relatively remote.

[From the **Moody's** Investors Service credit rating report on the Province of Manitoba dated July 23, 2013; page 3 (highlighting added). For the full report, see PUB/MH I-85(b), Attachment 4].

View from the Credit Rating Agencies

FINANCIAL TARGETS TO BE CHALLENGED BY HIGHER CAPEX

As part of its debt management strategy, Manitoba Hydro targets certain financial metrics such as an interest coverage ratio greater than 1.2 and equity-to-capitalization greater than 25%. With new generation and transmission projects underway, such as Bipole III, Keeyask and Conawapa, total capital expenditures are forecasted to be $20.7 billion, or on average $2 billion per year from FY2014 to FY2023. About one third of the total planned capex will be funded by internally generated cash from operations, leaving the rest to debt financing. New debt financing will ramp up in FY2014 and peak in FY2018 and FY2022, at an annual average of approximately $1.7 billion. Given the uptick in capex and corresponding debt, financial metrics are predicted to fall below targets in the next three fiscal years. The equity ratio, in particular, will be challenged and not likely to return to target until FY2032. The weakening financial profile restricts financial flexibility and adds risk in case of unexpected events such as low water levels, cost overruns and construction delays, given the nature of a hydroelectric plant's long construction cycle before cash generating begins. However, we view Manitoba Hydro as being capable of prudently managing debt and mitigating such risks by seeking rate increases and curtailing capital spending to continue as a self-supporting corporation.

[From the **Moody's** Investors Service credit rating report on the Manitoba Hydro-Electric Board dated September 23, 2013; page 2 (highlighting added). For the full report, see PUB/MH I-85(b), Attachment 3].

Financial Risk Summary

1. Manitoba Hydro considers business risk as an integral aspect of its plans and operations.
2. Manitoba Hydro's financial risk is manageable.
3. Manitoba Hydro will continue to take appropriate actions to ensure its debt remains self-supporting.

Tab 148

2017/18 & 2018/19 ELECTRIC GENERAL RATE APPLICATION

Follow-Up Questions to Manitoba Hydro Undertaking Nos. 7 & 8 from Counsel for MIPUG (email dated December 21, 2017)

On December 21, 2017, MIPUG requested the following:

1. Please provide the data values, by year, used to generate Undertaking 8.

2. Add a line (scenario) to Undertaking 8 (the 1990 base scenario) that is based on an IFF as follows (please provide the underlying IFF 6 page financial forecast scenario as well):
   a) IFF16 Update with Interim assumptions, except where noted.
   b) 12 year WATM
   c) Overhead accruals at $20M continue throughout, amortized at 30 year rate (consistent with PUB/MH-I-1(e))
   d) Depreciation at ASL throughout, no amortization of difference with ELG.
   e) Rate increases as necessary consistent with the approach in Coalition-MH-II-19 (i.e., equal annual increases to target 75:25 by 2035/36)
   f) Make sure the graph goes out to 2035/36.
   g) Please also provide the summary data for this scenario as per Undertaking #9 page 2 (i.e., max net debt, etc.)

Response:

Notwithstanding the concerns outlined below, Manitoba Hydro is providing the data values included in Undertaking No. 8 and the projected financial statements, including data values, reflecting the December 21, 2017 MIPUG Scenario.

As noted in the responses to PUB/MH II-21 and PUB/MH II-28, Manitoba Hydro's financial plan reflects a goal to return to its target 25% equity to capitalization ratio in 10 years and believes limited value should be ascribed to forecasts a decade or more in the future. The potential for volatility in key assumptions, many of which are beyond Manitoba Hydro's ability to control, reduces the second half of a 20 year forecast to little more than a hypothetical modeling exercise.

Manitoba Hydro maintains all the same concerns outlined in PUB/MHI-1d) and e) related to items c) and d) of MIPUG's request. Furthermore, the 12 Year WATM in Manitoba Hydro's debt management strategy is justifiable only if there is a reasonable expectation of sufficient cash flow to retire the repositioned debt. The sufficient cash flow stems from the path of higher rate increases in MH16 Update with Interim and not from the rate path included in the scenario requested by MIPUG and presented below.

The table below outlines the accounting treatment in MH16 Update with Interim, and the assumptions in part c) and d), of the MIPUG scenario.

	MH16 Update with Interim	**MIPUG Scenario Dec 21/17**
Ineligible Overhead		
Ineligible Overhead Annual Provision	$20 million	$20 million
Ineligible Overhead Amortization Period	20 years	30 years
Ineligible Overhead Deferral Until	2022/23	Indefinite
Equal Life Group (ELG)/Average Service Life (ASL)		
ELG/ASL Amortization Period	20 years	None
ELG/ASL Deferred Until	2022/23	Indefinite

** Includes Water Rentals & Assessments and Fuel and Power Purchased
***2017 includes $20 million non-recurring gain

To note, in Appendix 1.6 in Manitoba Hydro's Rebuttal Evidence, 3.95% rate increases to 2035/36 results in a 27% equity ratio in that year. Targeting a 25% equity ratio in 2035/36 would yield even annual rate increases of 3.88%. The table below breaks down the impacts of MIPUG's accounting and debt terming assumptions to arrive at 3.57%.

Assumption	**Scenario**	**Even Annual Rate Impact from 2018/19 - 2035/36**	**Even Annual Rate Increase from 2018/19 - 2035/36**
Targeting 25% Equity in 2035/36	MH16 Update with Interim with 20 Year Debt		3.88%
MIPUG's Accounting Changes	MH16 Update with Interim with 20 Year Debt and MIPUG Scenario Ineligible Overhead and ELG/ASL Assumptions	- (0.16%)	3.72%
Debt Terming	MH16 Update with Interim with 12 Year Debt and MIPUG Scenario Ineligible Overhead and ELG/ASL Assumptions	- (0.15%)	3.57%

As requested, the summary data for the December 21, 2017 MIPUG Scenario has been added to the table shown on page 2 of Undertaking #9. The updated table is provided below.

	Long Term Rate Increase	25% Equity Ratio	Maximum Long-Term Debt	Minimum Equity	Negative Net Income	Retained Earnings at 2033/34	Maximum Net Debt
NFAT Plan 5 - High Keeyask Level 2 DSM	3.95% in 2014/15; 3.99% 2015/16 to 2031/32	2031/32	$22.490 B in 2023/24	8% in 2021/22 - 2023/24	Total of $638 M in 8 years during 2015/16 - 2022/23	$6.659 B	$21.606 B in 2022/23

MANITOBA HYDRO
2019/20 ELECTRIC RATE APPLICATION

INDEX

Appendices

MANITOBA HYDRO
2019/20 ELECTRIC RATE APPLICATION

1.0 OVERVIEW AND REASONS FOR THE REQUESTED RATE INCREASE

On May 5, 2017, Manitoba Hydro filed a comprehensive 2017/18 & 2018/19 General Rate Application ("GRA") with the Public Utilities Board of Manitoba ("PUB") and a lengthy and extensive review of Manitoba Hydro's operations, forecasts, financial plans, capital expenditures, and operating expenses was conducted over the course of nine months. Following its review, the PUB issued Order 59/18, dated May 1, 2018, which approved a 3.6% average electric rate increase effective June 1, 2018. Order 59/18 also contained a number of directives and recommendations requiring work to be undertaken and completed by Manitoba Hydro prior to filing its next GRA.

With the appointment of a new Manitoba Hydro-Electric Board ("MHEB"), a comprehensive review of Manitoba Hydro's operations, forecasts and financial plans is currently being undertaken to allow the MHEB to establish a long-term financial plan for the Corporation. As a result of the foregoing, and further to Manitoba Hydro's correspondence of November 12, 2018 and the PUB's correspondence of November 21, 2018, Manitoba Hydro is submitting to the PUB a one-year rate increase application for the 2019/20 fiscal year which is based on financial information currently approved by the MHEB for the 2018/19 and 2019/20 fiscal years as set forth in its letter of November 12, 2018. Upon the MHEB's development and approval of a long-term financial plan, Manitoba Hydro will submit a full GRA to the PUB, anticipated to be filed in late 2019. A fulsome review of Manitoba Hydro's responses to those directives contained in Order 59/18 which the PUB indicated in its November 21, 2018 correspondence would be deferred, will also be addressed as part of the next GRA.

In this Application, Manitoba Hydro is requesting an Order pursuant to section 25(1) of *The Crown Corporations Governance and Accountability Act* for final approval of a 3.5% rate increase for all customer classes to be effective April 1, 2019. As shown in Appendix 1, page 1, this increase is projected to generate additional revenues of $59 million and would result in a modest contribution to financial reserves (net income) of $31 million in 2019/20. Absent the proposed rate increase for 2019/20, Manitoba Hydro is projecting a net loss of $28 million from Electric operations based on current assumptions.

As noted by the PUB in Order 59/18 (page 173):

> *The Integrated Financial Forecast filed in the proceeding as Manitoba Hydro Exhibit 93 supports the Board's decision on the level of the overall rate increase. This financial scenario included: continued deferral of $20 million in ineligible overheads, amortized at a 30-year rate; Average Service Life depreciation methodology, without amortization of the difference with the Equal Life Group methodology; achievement of a 25% equity level over a longer period of time, specifically by 2035/36; and debt management based on a weighted average term to maturity of 12 years. In many respects, and as a departure from Manitoba Hydro's plan and Integrated Financial Forecast assumptions, Manitoba Hydro Exhibit 93 is therefore reflective of many of the Board's decisions in this Order.*

Considering the MHEB is undertaking a comprehensive review of Manitoba Hydro's operations, forecasts and financial plans to allow for the establishment of a long-term financial plan for the Corporation, for purposes of its rate request for the 2019/20 fiscal year, Manitoba Hydro has noted the PUB's comment regarding Manitoba Hydro Exhibit 93 from the 2017/18 & 2018/19 GRA ("Exhibit 93") and prepared the current Application utilizing a comparison to Exhibit 93.

Since Order 59/18 was issued, Manitoba Hydro's cumulative earnings (actual and projected) over the three year period 2017/18 to 2019/20 have deteriorated by nearly $200 million compared to Exhibit 93 as shown in the following Figure 1.1.

Figure 1.1: Comparison of Actual and Projected Net Income to Exhibit 93
(In Millions of Dollars)

[3] 2019/20 Interim Budget including 3.5% proposed rate increase (Section 2.4)
[4] Includes a projected 3.57% rate increase

Actual net income results for 2017/18 were lower than anticipated in Exhibit 93 mainly due to lower export prices, the impact of U.S. transmission outages which led to lower volumes and a higher proportion of off peak sales at lower prices, as well as higher net finance costs.

The outlook for 2018/19 net income is also much lower compared to Exhibit 93 which is primarily attributable to lower net export revenues as a result of below average water conditions impacting generation, as well as increases in depreciation and financing costs arising from the earlier than planned in-service of Bipole III, which went into service July 4, 2018 compared to a budgeted in-service date of July 31, 2018.

Exhibit 93 projected net income of $61 million for electric operations for the 2019/20 fiscal year. In comparison, the 2019/20 Interim Budget, which includes the proposed 3.5% rate increase requested in this application, projects net income of $31 million. The deterioration in projected net income for electric operations is mainly attributable to higher net financing costs. Exhibit 93 had assumed that Manitoba Hydro could take advantage of lower interest costs on debt issues with shorter terms to maturity. Since the 2017/18 & 2018/19 GRA, the interest rate yield curve has continued to flatten and the savings expected from shorter term borrowings are no longer available.

In the absence of the proposed 3.5% rate increase, a net loss of $28 million would be projected in 2019/20 under the same forecast assumptions, increasing the cumulative deterioration in earnings to approximately $260 million over the three year period from 2017/18 to 2019/20.

Exhibit 93, which assumed more favourable financial results and annual 3.57% rate increases, projected over $400 million in cumulative net financial losses over the six year period from 2022/23 to 2027/28 following the planned Keeyask in-service. Although Manitoba Hydro has not yet updated its longer term forecast, the lower than expected financial results in 2017/18 to 2019/20 compared to Exhibit 93 will exacerbate the losses projected in Exhibit 93. It follows that without the proposed 3.5% rate increase, the cumulative losses projected in Exhibit 93 following the Keeyask in-service will be even more significant.

Manitoba Hydro's net income has historically been extremely variable. Key drivers of net income such as water flow conditions, weather, interest rates and export prices are unpredictable and outside of Manitoba Hydro's control. Section 2.4.4 of this Application presents an analysis of the sensitivity of projected net income or losses for 2019/20 to key assumptions in the Interim Budget. Water flow conditions can vary projected net income for 2019/20 by as much as $360 million between the 10th and 90th percentile of net revenues under the 102 years of historic flow conditions. Colder or warmer winter weather can vary projected net income for 2019/20 by more than $60 million. With interest rates 1% above or below that forecasted, net income for the 2019/20 Interim Budget could vary by approximately $30 million. Export prices higher or lower than the reference forecast used in the 2019/20 Interim Budget can produce a variation of up to $50 million.

Without the proposed 3.5% rate increase, the likelihood of financial losses is greater given the variability of factors such as water, weather, interest rates and export prices. This potential annual variation in financial results and the deterioration in the Corporation's financial position relative to Exhibit 93 in the period leading up to the Keeyask in-service date also underscores the need for a reasonable rate increase in the 2019/20 fiscal year.

The requested 3.5% rate increase effective April 1, 2019 generates a modest level of net income under average water flow conditions that will assist in gradually building the revenue base and reduce the risk of the Corporation incurring a loss in 2019/20. The 3.5% requested rate increase is aligned with PUB-approved rate increases since 2015 and keeps Manitoba's customer rates and estimated bill impacts among the lowest in North America.

Section 2.0 of Manitoba Hydro's 2019/20 Electric Rate Application provides a summary of Manitoba Hydro's actual financial results for the 2017/18 fiscal year, its current financial position and financial outlook for 2018/19, as well as its Interim Budget and Planning Assumptions for the 2019/20 Test Year. Included in this discussion is an overview of Manitoba Hydro's current capital expenditure forecast and an update on the status of its Major New Generation and Transmission projects.

Section 3.0 provides updated rate schedules and customer bill impacts for the proposed rate increase, as well as a comparison of Manitoba Hydro's electricity rates to neighbouring jurisdictions. If approved, the April 1, 2019 rate increase would result in a \$3.30 increase in the monthly bill of a residential customer without electric space heat using 1,000 kilowatt-hours ("kWh") per month, and a \$6.30 increase in the monthly bill for a residential customer with electric space heat using 2,000 kWh per month.

Throughout this Application, Manitoba Hydro has also provided a brief update on certain directives and recommendations of the PUB as outlined in its Order 59/18. As noted above, further review of PUB directives will be addressed at the next full GRA filed by Manitoba Hydro.

2.0 MANITOBA HYDRO'S FINANCIAL POSITION AND OUTLOOK

Section 2.0 provides analyses of the actual and forecast revenues and expenses related to Manitoba Hydro's electric operations for 2017/18 to 2019/20.

Manitoba Hydro's Financial Outlook for 2018/19 and the 2019/20 Interim Budget form the basis of the current one-year rate application for a 3.5% average revenue increase effective April 1, 2019. Manitoba Hydro's financial results are prepared in accordance with International Financial Reporting Standards (IFRS).

2.1 2017/18 Actual Financial Results from Electric Operations

Section 2.1 compares 2017/18 actual financial results with Manitoba Hydro's 2017/18 Approved Budget. The 2017/18 Approved Budget, filed with the 2017/18 & 2018/19 GRA, was approved by the MHEB in March 2017 with MH16 for the purposes of financial reporting comparisons throughout the fiscal year and reflected a budgeted net income of $111 million.

Figure 2.1 below compares Manitoba Hydro's actual net income from Electric operations for the 2017/18 fiscal year of $18 million to the approved MH16 budget.

Figure 2.1: 2017/18 Actual Financial Results from Electric Operations Compared to the Approved Budget (MH16)

MANITOBA HYDRO
STATEMENT OF INCOME
For the Year Ended March 31, 2018
(In Millions of Dollars)

	ACTUAL	BUDGET	INCREASE (DECREASE)

Capital and other taxes	130	132	2
Other expenses	501	115	(386)
Corporate allocations	8	8	-
	2 393	1 987	(405)
Net income (loss) before net movement in regulatory balances	(462)	35	(496)
Net movement in regulatory balances	472	68	404
Net Income	**$10**	**$102**	**($92)**
Net income (loss) attributable to:			
Manitoba Hydro	**$18**	**$111**	**($93)**
Non-controlling interests	(8)	(9)	1
	$10	**$102**	**($92)**

Actual net income in 2017/18 was $93 million lower than budget primarily due to a 3.36% interim electric rate increase effective August 1, 2017 being granted as opposed to the 7.9% requested by Manitoba Hydro in its 2017/18 & 2018/19 GRA. The PUB directed that all revenues flowing from the 3.36% rate increase be added to the previously established Bipole III deferral account, to be recognized when Bipole III comes into service. Additionally, a continuation of weaker than forecast opportunity prices in the export market and higher financing costs also contributed to the lower than budgeted net income for 2017/18.

In addition to the impact of the lower than requested rate increase, actual domestic revenue was lower than budget as a result of the cooler summer weather which reduced air conditioning load, partially offset by higher customer usage (excluding weather impacts).

Actual extraprovincial revenues were lower than budget as export prices in the opportunity market did not reach forecasted levels. In addition, export volumes were lower than budget as a result of U.S. transmission outages leading to a higher proportion of off peak sales at lower prices.

The higher net finance expense reflects earlier than planned borrowings to take advantage of favourable market conditions, lower capitalized interest due to delayed capital spending as well as higher foreign exchange losses on U.S. cash balances resulting from the strengthening Canadian dollar. This was partially offset by higher interest income on pre-funded cash balances.

Actual other expenses were higher than budget primarily due to the transfer of the $379 million construction in progress balance related to the discontinuance of the Conawapa Generating Station project to a regulatory asset. The increase in other expenses, to a large degree, is offset in the net movement in regulatory balances (removed from the statement of income, deferred and subsequently amortized through net movement in regulatory balances). The regulatory asset will be amortized over 30 years as directed by the PUB in Order 59/18.

Exhibit 93 was filed as an update to MH16 for information purposes. Compared to the $111 million approved budget, the projected income for 2017/18 under Exhibit 93 was $94 million or $17 million lower due to the PUB's interim approval of the 3.36% rate increase compared to the 7.9% requested which was largely offset by a forecasted improvement in water flow conditions and weakening of the Canadian dollar resulting in higher forecast export revenues.

On an actual basis, 2017/18 net income was $75 million lower than forecast in Exhibit 93 as shown in Figure 2.2 below. The reduction in net income compared to Exhibit 93 was due to lower than forecast water flow conditions, as well as lower export prices and U.S. transmission outages described above, resulting in lower net export revenues.

The 67th Annual Report of the MHEB for the year ending March 31, 2018 can be found in Appendix 3.

Page 56 of the Annual Report provides Manitoba Hydro's Consolidated Statement of Cash Flows. As explained in Note 3(s) to the Financial Statements for the year ended March 31, 2018, the Corporation elected to present cash flows from operating activities using the indirect method as compared to the direct method used for the year ended March 31, 2017, which is consistent with other utilities in the electric industry and Manitoba Public Insurance. In addition, cash flows related to capitalized interest were reclassified from investing activities to operating activities. Both the indirect and direct cash flow methods and the reclassification of capitalized interest are acceptable under IFRS. In their Audit Findings report for the year ended March 31, 2018, Manitoba Hydro's independent external auditors (KPMG) concurred with the changes in presentation as noted above.

To assist with the comparison of the Consolidated Statement of Cash Flows for the year ended March 31, 2017, included in the 66th Annual Report of the MHEB filed as part of the 2017/18 & 2018/19 GRA, Manitoba Hydro has restated its Consolidated Statement of Cash Flows for the year ended March 31, 2018 under the Direct Method, and included it as Appendix 2 to this Application. As can be seen, regardless of whether the Indirect Method or Direct Method is used, the cash and cash equivalents at year end will remain the same.

2.2 2018/19 Actual Results to September 30, 2018 - Electric Operations

Manitoba Hydro's net loss from Electric operations for the first six months of the 2018/19 fiscal year was $32 million compared to a budgeted net loss of $37 million (which incorporated the 3.6% rate increase and accounting changes approved by the PUB effective June 1, 2018), as shown in the following Figure 2.3.

Figure 2.3: 2018/19 Actual Results to September 30, 2018 from Electric Operations

Net loss attributable to:			
Manitoba Hydro	**($32)**	**($37)**	**$5**
Non-controlling interests	(2)	(4)	2
	($34)	**($41)**	**$7**

The net loss in the first six months of the 2018/19 fiscal year was lower than projected primarily due to favourable weather impacts partially offset by increased financing costs and depreciation expense associated with the earlier in-service date for Bipole III.

Actual domestic revenue was higher than budget primarily due to the impacts of weather, specifically warmer summer weather which increased air conditioning load and a cooler April and September which increased heating load. In addition, the earlier in-service date of Bipole III resulted in an increase in domestic revenue associated with the correspondingly earlier draw-down of the Bipole III deferral account into revenues.

Actual finance expense was higher than budget due to higher net interest on debt primarily as a result of Bipole III going into service earlier than projected as well as lower overall capital spending on the Bipole III project. In addition, there were unfavourable foreign exchange impacts resulting from the weakening Canadian dollar.

Actual depreciation and amortization expense reflect the impact of the earlier in-service date for Bipole III and therefore are higher than budget.

Actual fuel and power purchased was higher than budget due to a write off of coal inventory as a result of the Brandon Thermal Generating Station no longer being operational as a coal powered generator. This is partially offset by lower transmission charges due to redirecting transmission to lower cost nodes as well as lower purchased volumes.

Appendices 4 and 5 provide the MHEB Quarterly Reports for the three months ended June 30, 2018 and the six months ended September 30, 2018 respectively.

2.3 2018/19 Financial Outlook

As shown in Figure 2.4 below, Manitoba Hydro is projecting annual net income for Electric Operations of $51 million in the 2018/19 Financial Outlook compared to net income of $143 million projected in Exhibit 93. The 2018/19 Outlook incorporates actual financial results and water flow conditions to September 30, 2018 and assumes average water flow conditions and normal winter weather for the remainder of the year. The 2018/19 Outlook was reviewed and approved by the MHEB in late October for inclusion in this Application.

Net Income	**$45**	**$142**	**($98)**
Net income (loss) attributable to:			
Manitoba Hydro	**$51**	**$143**	**($93)**
Non-controlling interests	(6)	(1)	(5)
	$45	**$142**	**($98)**

The net income in the 2018/19 Outlook is $93 million lower compared to the net income from Exhibit 93 primarily due to lower net export revenues as well as an increase in financing costs partially offset by higher domestic revenue.

Domestic Revenue is $26 million higher than Exhibit 93 due to weather impacts (warmer summer weather which increased air conditioning load and a cooler April and September which increased heating load) as well as increased revenues associated with the earlier in-service date of Bipole III.

The decrease in Extraprovincial Revenue is primarily a result of below average water conditions impacting generation.

The increase of $52 million in Net Finance Expense is primarily attributable to higher forecasted interest rates. Subsequent to the filing of Exhibit 93 and during the course of the 2017/18 & 2018/19 GRA, the Bank of Canada interest rates rose such that the cost advantage to borrowing more shorter term maturities did not materialize. The yield curve continued to flatten such that there is now only a minimal difference between the all-in borrowing cost for a 5 year Province of Manitoba bond and a 30 year Province of Manitoba bond. As such, Manitoba Hydro reverted to a longer term borrowing strategy of targeting a 20 year weighted average term to maturity ("WATM") for new borrowings as opposed to the 12 year assumption in Exhibit 93. In addition, financing costs are higher due to the impacts of Bipole III going into service earlier than planned.

The Outlook for Other Expenses is $31 million lower compared to Exhibit 93, which is offset in net movement (the majority of other expenses are removed from the statement of income, deferred and subsequently amortized through net movement in regulatory balances). The remaining variance in net movement is primarily due to the annual amortization of the Conawapa deferral account which was not reflected in Exhibit 93 but was endorsed by the PUB in Order 59/18.

2.3.1 Water Conditions as of September 30, 2018

The total volume of water in reservoir storage was approximately 10% below average at the end of September. The water level on Lake Winnipeg, Manitoba Hydro's largest reservoir, was about one foot below historic average for the end of September period; this is approximately a 1 in 10 year low. This is in contrast to September 2017 when the water level on Lake Winnipeg was close to the historic average.

Following nine consecutive months of below average precipitation, water conditions began to improve in September particularly over the Winnipeg River and Lake Winnipeg local basins which were especially dry.

Manitoba Hydro expects water flows to be below average through the winter and overall hydraulic generation to be below average. In addition to inflow uncertainty, factors such as weather, export market prices and ice restrictions are drivers of revenue uncertainty for the remainder of the year.

Additional information on hydraulic generation, water conditions and extra-provincial energy exchange data is provided in Appendix 9.

2.3.2 Business Operations Capital – Recommendations of the PUB

At pages 110 and 111 of Order 59/18, the PUB concluded:

> *The Board finds that Business Operations Capital spending can be safely decreased by $160 million, based on Manitoba Hydro's evidence that it can defer $160 million of spending in the Test Year.*
>
> *…*
>
> *The Board recognizes that Order in Council 92/2017 does not give the Board authority to direct Manitoba Hydro to amend its planned Business Operations Capital spending. Rather the Board has factored into its rate decision the reduction in Business Operations Capital of $160 million. Manitoba Hydro can decide whether to accept the Board's findings and reduce its Test Year Business Operations Capital spending, or to incur additional debt in order to maintain spending at the proposed levels in CEF16.*
>
> *The reduction in spending on Business Operations Capital in no way diminishes Manitoba Hydro's responsibility and obligation to provide for an ongoing safe and reliable supply of energy to its customers in the most efficient and environmentally sensitive manner. The Board expects that Manitoba Hydro will appropriately assess, plan and prioritize Business Operations Capital spending in order to meet its obligations in this regard.*

The 2018/19 Financial Outlook includes the investment of $515 million for Business Operations Capital and represents the Corporation's best estimate of the expenses necessary to support the safe, sustainable and reliable operations in this period. To ensure sustainable, safe and reliable operation of the Manitoba Hydro system to the benefit of its customers, the projects identified in the 2018/19 Financial Outlook are projects which are active and cannot be cancelled without a cost to the safe and reliable services being provided. Manitoba Hydro will continue to assess active projects on an on-going basis which may impact timing, investments may be reduced accordingly.

2.3.3 Demand Side Management Deferral ("DSM") Account

In accordance with the PUB's direction in Orders 43/13 and 73/15, Manitoba Hydro established DSM deferral accounts for the years 2012/13 through to 2016/17 to capture the differences between planned and actual electric DSM spending. In Directive 23 of Order 59/18, the PUB directed Manitoba Hydro to discontinue the accounting practice of recognizing a DSM Deferral Account. As Order 59/18 was issued in advance of Manitoba Hydro finalizing its financial statements for the year ended March 31, 2018, for consistency with the PUB's direction in Order 59/18, Manitoba Hydro did not record the difference between its planned and actual DSM spending for the 2017/18 fiscal year to the deferral account.

As of March 31, 2018, $48.8 million had accrued to the DSM deferral account. Manitoba Hydro's 2018/19 Outlook assumes that the DSM deferred regulatory asset and corresponding credit will be written-off as of March 31, 2019. There will be no impact to net income as a result of the write-off as the deferred debit and credit accounts will completely offset each other. Manitoba Hydro has made a similar assumption with respect to its natural gas DSM Deferral Account, which will be reviewed by the PUB at Centra Gas Manitoba Inc.'s 2019/20 General Rate Application.

2.3.4 Regulatory Deferrals and Amortizations

Order 59/18 set out a number of directives for the following regulatory deferral accounts and related amortization periods: :

- Directive 17 - Manitoba Hydro continue to use its existing Average Service Life methodology for calculating depreciation rates for rate-setting purposes, without reversion to Equal Life Group in the financial forecast and not amortize the difference between Average Service Life and Equal Life Group for rate setting.

- Directive 19 - Manitoba Hydro to recognize the costs pertaining to the construction of the Conawapa Generating Station as a regulatory asset and amortize over a 30 year period.
- Directive 21 - Manitoba Hydro continue the annual deferral of $20 million in ineligible overhead. The regulatory account balance is to be amortized over 34 years.
- Directive 22 - Manitoba Hydro to begin recognizing the Bipole III Deferral Account in domestic revenues following the in-service date of Bipole III, amortized over a five-year period.

Manitoba Hydro has reflected the above-noted directives in the 2018/19 Financial Outlook and in the planning assumptions underlying the 2019/20 Interim Budget.

2.3.5 Demand Side Management Spending

Order 59/18 recommended that Manitoba Hydro reduce its demand side management programming and review it for cost effectiveness and cease or modify spending on programs that are no longer cost effective, except for programming targeted at lower-income and First Nations on-reserve customers.

In 2017, the Province of Manitoba tabled legislation, *The Efficiency Manitoba Act* ("The Efficiency Act") to create a new Crown Corporation to be known as Efficiency Manitoba which has a mandate to provide Demand Side Management programming. On January 24, 2018, excepting a few sections, The Efficiency Act was proclaimed and is now in effect. While Efficiency Manitoba is still in its formative stage, Manitoba Hydro continues to deliver Demand Side Management programs to meet the needs of Manitoba customers until the full transition occurs to Efficiency Manitoba. Until such time as the transition occurs and *The Energy Savings Act* has been repealed, the obligations of Manitoba Hydro to consult with the Minister to prepare a yearly energy efficiency plan remain in effect.

Manitoba Hydro's 2017/18 DSM plan filed with the PUB in response to PUB MFR 61 during the 2017/18 & 2018/19 GRA was the plan that Manitoba Hydro prepared in consultation with the Minister appointed to administer *The Energy Savings Act*. As the targets, programming and spending on energy efficiency and demand side management detailed in the reports filed with the PUB are set in consultation with the Government, these targets and spending cannot be unilaterally adjusted by Manitoba Hydro. As the 2018/19 Financial Outlook incorporates targets and spending assumptions set in consultation with Government, the PUB's recommendation to reduce DSM spending from its revenue requirement as a result of the new, lower marginal value has not been incorporated into the 2018/19 Financial Outlook.

2.4 2019/20 Interim Budget and Planning Assumptions

Manitoba Hydro's projected financial results and key financial and economic inputs underlying the 2019/20 Interim Budget are discussed in the following Sections.

2.4.1 2019/20 Interim Budget

Manitoba Hydro is projecting an annual net income for Electric Operations of $31 million for the 2019/20 fiscal year, inclusive of the 3.5% proposed rate increase, compared to net income of $61 million in Exhibit 93, as shown in the following Figure. The 2019/20 Interim Budget shown below in Figure 2.5 assumes average revenues and costs based on Manitoba Hydro's long term record of water and normal weather for the year.

Figure 2.5: Comparison of 2019/20 Interim Budget to Exhibit 93

	ELECTRIC OPERATIONS PROJECTED OPERATING STATEMENT (In Millions of Dollars)		
	Interim Budget	**Exhibit 93**	**Increase/ (Decrease)**
For the year ended March 31		**2020**	
REVENUES			
Domestic Revenue	1 737	1 720	17
BPIII Reserve Account	78	79	(1)
Extraprovincial	411	420	(9)
Other	29	31	(3)
	2 255	2 251	4
EXPENSES			
Operating and Administrative	511	511	(0)
Net Finance Expense	765	721	44
Depreciation and Amortization	508	515	(7)
Water Rentals and Assessments	111	110	1
Fuel and Power Purchased	160	158	2
Capital and Other Taxes	150	154	(4)
Other Expenses	111	481	(371)
Corporate Allocation	8	8	(0)
	2 325	2 660	(335)
Net Income before Net Movement in Reg. Deferral	(70)	(409)	339
Net Movement in Regulatory Deferral	103	473	(370)
Net Income	33	64	(30)
Net Income Attributable to:			
Manitoba Hydro	**31**	**61**	**(30)**
Non-controlling Interest	2	2	(1)
	33	64	(30)
Percent Increase	3.50%	3.57%	

The decrease in net income of $30 million is primarily attributable to higher finance expense partially offset by an increase in domestic revenue.

The increase in domestic revenue of $17 million reflects higher than anticipated load requirements in response to the PUB-approved 3.36% electricity rate increase in 2017/18 and lower forecast savings arising from program based DSM initiatives.

The increase of $44 million in net finance expense is primarily attributable to higher than forecasted interest rates. Exhibit 93 filed in the 2017/18 & 2018/19 GRA included savings of approximately $500 million due to lowering the WATM of new debt issuance from 20 years to 12 years in order to take advantage of borrowing rates in the short end of the yield curve. As discussed in Section 2.3, since Exhibit 93 was filed, the Bank of Canada has continued to raise interest rates. While yields have risen across all terms since the last forecasts were filed, the yield curve continued to flatten throughout 2018 and remains exceptionally flat. While the shape of the yield curve and interest rates themselves are subject to further change, the savings opportunity associated with shorter term borrowings continues to be substantially compromised.

The significant reduction in other expenses is offset in net movement and reflects the March 31, 2018 transfer of the $379 million construction in progress balance for the Conawapa Generating Station project compared to the planning assumption of April 1, 2019 in Exhibit 93.

2.4.2 2019/20 Planning Assumptions

The following provides a summary of the key financial and economic inputs underlying the 2019/20 Interim Budget including the Electric load forecast, forecast interest and foreign exchange rates, export prices and water flow conditions as well as assumptions with respect to Regulatory Deferrals.

<u>2019/20 General Consumer Sales (GW.h)</u>

General Consumer Sales includes the energy supplied to all of Manitoba Hydro's domestic customers. General Consumer Sales in the 2019/20 Interim Budget reflects the 2017 Electric Load Forecast adjusted for actual consumption experienced in 2017/18 and is compared to the 2017 Electric Load Forecast assumed in Exhibit 93. Manitoba Hydro is presently preparing the 2018 Electric Load Forecast which will be used in the preparation of MH19 and will be filed at the next General Rate

Application in late 2019. Planned additional savings are incorporated in the forecast of domestic revenue separately from the Load Forecast.

The future program based DSM savings incorporated in the 2019/20 Interim Budget are based on the 15-Year DSM Plan Supplement Report filed in Appendix 7.2 of the 2017/18 & 2018/19 GRA adjusted for actual DSM savings achieved in 2017/18 and the carry-forward effects of the changes made to the 2018/19 one-year DSM plan prepared in consultation with the Manitoba government. Manitoba Hydro is presently working in consultation with the Manitoba government to prepare the 2019/20 one-year DSM plan which will be incorporated into MH19 and filed as part of the next General Rate Application in late 2019. The 2019/20 DSM plan will incorporate the direction provided by Government.

Figure 2.6 below compares the forecast of General Consumer Sales between the Interim Budget and Exhibit 93.

Figure 2.6: Comparison of General Consumer Sales Volumes (GW.h)

GW.h	2019/20 Interim Budget	Exhibit 93	Increase/ (Decrease)
Residential	7,875	7,835	40
General Service	15,074	14,984	90
Area & Roadway Lighting	92	92	0
Sub-Total	**23,041**	**22,911**	**130**
Planned DSM Savings	(834)	(933)	99
Total	**22,207**	**21,977**	**230**

The actual domestic electric rate increase of 3.36% effective August 1, 2017 as opposed to the planned rate increase of 7.9%, which underpins the load forecast assumed in Exhibit 93, impacts the elasticity effect of prices such that load is expected to increase in 2019/20 for electricity in the residential sector by 40 GW.h and in the general service sector by 90 GW.h. The 99 GW.h decrease to the planned DSM savings are due to delays to the implementation of customer sited self-generation systems and the removal of the Fuel Choice initiative and Conservation Rates from the DSM plan.

2019/20 Interest Rates & Exchange Rates

Figure 2.7 below compares the interest rate and exchange rate assumptions underpinning the 2019/20 Interim Budget and Exhibit 93. The forecasted 20-year average interest rate listed under Exhibit 93 has been included for comparison purposes only as the 12-year average rate was used to derive the finance expense related to the issuances of new Canadian debt and is no longer being used in the 2019/20 Interim Budget.

Figure 2.7: Comparison of Interest Rates & Exchange Rates

	2019/20 Interim Budget Winter 2017	**Exhibit 93 Spring 2017**
MH Short Term Interest Rate*	2.20%	1.55%
MH Long Term Interest Rate*		
12 Year WATM	N/A	3.45%
20 Year WATM	4.00%	3.90%
U.S. – Cdn Exchange Rate	1.26	1.29

* Not including the 1% Provincial Guarantee Fee

Forecast interest rates are trending at about the same level as shown in Figure 2.7 . Section 2.4.4 provides a sensitivity analysis of the 2019/20 Interim Budget assuming interest rates at 1% higher or lower than the rates reflected in Figure 2.7 .

Although Figure 2.7 shows a slight strengthening of the Canadian dollar since Manitoba Hydro's 2017/18 & 2018/19 GRA, net income is generally not sensitive to changes in the U.S. exchange rate due to Manitoba Hydro's hedging policies and practices.

2019/20 Net Interchange Revenues and Generation Costs

The 2019/20 Interim Budget reflects Manitoba Hydro's reference electricity export price forecast and a simulation of the full historic flow record to derive the average net interchange revenues and generation costs. The reference electricity export prices from the 2017 Energy Price Forecast (Fall Update) for 2019/20 were approximately 6% to 7% lower than the prices from the 2017 Energy Price Forecast (Spring) assumed in Exhibit 93 and filed in the 2017/18 & 2018/19 GRA.

Hydraulic generation in 2019/20 is primarily driven by future precipitation which is impossible to forecast accurately beyond a one week period. As such, Manitoba Hydro uses its full historic flow record to project future net interchange revenues and generation costs beyond the 2018/19 fiscal year. Section 2.4.4 provides an analysis of the sensitivity of the 2019/20 Interim Budget to both electricity export prices and water flow conditions.

Manitoba Hydro has relatively small levels of unsold dependable energy and capacity in 2019/20. In forecasting the net interchange revenues and generation for both the 2019/20 Interim Budget and Exhibit 93, the Corporation has not projected incremental revenues associated with surplus dependable capacity. This is consistent with the PUB's finding on page 128 of Order 59/18:

> *Manitoba Hydro's change of methodology - to remove capacity values and dependability premiums from the substantial surplus dependable energy - **is reasonable in the near term**, but is not reasonable in the long term as it biases the export forecast to be low and is not consistent with third party forecasters nor with the needs in the Midcontinent Independent System Operator and Minnesota markets. (**emphasis added**)*

Regulatory Deferral Accounts and Accounting Assumptions

Manitoba Hydro's 2019/20 Interim Budget incorporates the PUB's direction in Order 59/18 for the regulatory deferral accounts listed in Figure 2.8, compared to Exhibit 93.

Figure 2.8: Accounting Treatment for Regulatory Deferral Accounts

	2019/20 Interim Budget	**Exhibit 93**
Ineligible Overhead		
Annual Provision	$20 million	$20 million
Amortization Period	34 years	30 years
Deferral	Indefinite	Indefinite
Equal Life Group (ELG)/Average Service Life (ASL)		
Amortization Period	None	None
Deferral	Indefinite	Indefinite
Costs Related to Conawapa		
Deferral Amount	$379 million	$379 million
Recorded in the Regulatory Deferral Account	Mar 31/18	Apr 1/19
Amortization Period	30 year	30 year

2.4.3 2019/20 Interim Budget with and without 3.5% Revenue Increase

Manitoba Hydro is requesting approval of a 3.5% rate increase to be effective April 1, 2019. This increase is projected to generate additional revenues of approximately $59 million and would result in a modest net income of $31 million in 2019/20. Absent the proposed rate increase for 2019/20, Manitoba Hydro is projecting a net loss of $28 million from Electric operations. Figure 2.9 compares the 2019/20 Interim Budget with and without the 3.5% revenue increase.

2.4.4 2019/20 Sensitivity Analysis

This section provides an indication of the impact of changes in water flow conditions, weather, interest rates and export prices on the 2019/20 Interim Budget net income of $31 million.

The net income or loss resulting under each of the key changes in assumptions is shown below in Figure 2.10. Figure 2.10 also shows that the likelihood of a financial loss is greater without the proposed 3.5% rate increase under the range of sensitivities considered.

Figure 2.10: Key Variable Sensitivity Impacts on 2019/20 Interim Budget Net Income/ (Loss) With and Without the 3.5% Proposed Rate Increase

	Projected Net Income/(Loss)	
	3.5% Proposed Rate Increase	**No Rate Increase**
Interim 2019/20 Budget	$31 M	($28) M
Low Water Flow (10th percentile net interchange revenues and generation costs)	($169) M	($229) M
High Water Flow (90th percentile net interchange revenues and generation costs)	$194 M	$134 M
Colder than normal winter weather	$63 M	$4 M
Warmer than normal winter weather	($0) M	($60) M
+ 1% Interest Rates	$16 M	($43) M
- 1% Interest Rates	$45 M	($14) M
Low Export Price Case	($2) M	($61) M
High Export Price Case	$49 M	($10) M

The 2019/20 Interim Budget assumes average net interchange revenues and generation costs for the historic water flow record. The historic water flow record has a great deal of variability from the highest to the lowest flow which creates a dramatic range of the possible net interchange revenues and generation costs that could occur in a given year. The impact of low flows are greater than high flows due to the requirements for thermally generated and imported energy in low flow years and spilling of water beyond system constraints in high flow years. Due to this asymmetry, the average revenues and costs of the historic water flow record is the equivalent to approximately the 40th percentile or P40 and not the median or P50. To demonstrate the range of possible net interchange revenues and generation costs, the P10 and P90 sensitivities have been provided. Figure 2.10 shows that the projected income or loss for 2019/20 can vary by more than $360 million due to water flow conditions.

The 2019/20 Interim Budget assumes a weather adjusted forecast for General Consumer Sales. A record cold or warm winter will increase or decrease Manitoba's 2019/20 energy consumption by approximately 4%. An increase or decrease to domestic revenue due to a colder or warmer than normal winter will be partially offset by an associated decrease or increase to net interchange revenues and generation costs. Figure 2.10 shows that projected net income for 2019/20 can vary by more than $60 million due to colder or warmer winter weather.

Manitoba Hydro is planning to raise approximately $2.4 billion in new debt issuances in 2019/20. The interest rates affixed to new debt issuances have a lasting effect due to the perpetual nature of long-term debt (20-year WATM) which makes this a different risk than drought. The interest rate sensitivity demonstrates the financial impacts of interest rates one percent higher or lower than forecast on short-term, long-term and floating rate debt, as well as sinking funds. Figure 2.10 shows that the 2019/20 Interim Budget net income could vary by approximately $30 million with interest rates 1% above or below that forecasted.

The 2019/20 Interim Budget reflects Manitoba Hydro's reference electricity export price forecast derived from several independent price forecasts for the MISO region. There is uncertainty in each of these pricing factors, and particular uncertainty as to how future legislative and regulatory requirements may evolve. As such, Manitoba Hydro has developed high and low electricity export price forecasts as sensitivities around the reference case using information prepared by the U.S. Energy Information Administration (EIA). Figure 2.10 shows that projected net income from 2019/20 can vary by $50 million if export prices vary from the forecast reference export prices assumed in 2019/20 Interim Budget.

2.4.5 Information on Other Cash Payments

Directive 10 of Order 59/18 requested Manitoba Hydro to provide information about the Other Cash Payments included in its Cash Flow Statement. Manitoba Hydro has provided additional details on the Cash Flow Statement included in

Appendix 1. In addition to the further line item breakdown provided on the Cash Flow Statement, the “Other” category balance of $11 million in 2017/18 under Financing Activities represents the advance to Centra which is eliminated upon consolidation. The “Other” category of $3 million under Investing Activities is primarily investments in assets held for sale as well as payments associated with various obligations.

2.4.6 Operating & Administrative Costs

Consistent with Exhibit 93, Manitoba Hydro’s preliminary O&A target included in the 2019/20 Interim Budget is $511 million reflecting an inflationary increase of 2% over the $501 million of O&A expenses included in the 2018/19 Financial Outlook. The 2% increase is aligned with Manitoba CPI. Manitoba Hydro is committed to achieving this level of O&A expenditure and is in the process of developing detailed budgets for 2019/20 to support this commitment.

As discussed in the 2017/18 & 2018/19 GRA, the implementation of a significant work force reduction strategy resulted in cost reductions in both 2017/18 and 2018/19. As shown in Figure 2.11, O&A costs were $19 million lower in 2017/18 than the prior year and are projected to be further reduced by $16 million in 2018/19.

Figure 2.11: Year over Year Comparison of O&A Costs

(in millions of dollars)	2016/17 Actual	2017/18 Actual	2018/19 Budget	2019/20 Forecast
O&A Expenditures	$536	$517	$501	$511
Year over Year Inc / (Dec)		-3.5%	-3.1%	2.0%

The year over year decreases in 2017/18 and 2018/19 are primarily due to the impact of the Voluntary Departure Program (“VDP”) which was launched in April 2017 as a means to accomplish the Corporation’s workforce reduction target of 900 employees over a 3 year period ending March 31, 2020. A total of 821 employees were approved under the VDP with the majority of staff departing by March 2018. Manitoba Hydro’s headcount as of April 2017, excluding summer students and seasonal workers, was approximately 6150. The Corporation's projected headcount to March 2020 is approximately 5250.

Appendix 8 provides Manitoba Hydro's O&A Expenses Quarterly Report for the year ending March 31, 2018 as well as the quarters ending June 30th and September 30th 2018, filed in response to Directive 14 of Order 73/15. O&A performance to the end of September 2018 is closely aligned with budget. The September 30, 2018 report provides information for the 2018/19 annual budget by cost element.

2.4.7 Impacts of VDP on Pension

At March 31, 2018 Manitoba Hydro recognized a $30 million actuarial loss in Other Comprehensive Income (OCI) related to the VDP departures based on a December 2017 valuation of the pension liability. The loss is primarily a result of deviations in pension valuation assumptions. The pension valuation assumes age 59 as the average age of retirement and that pensioners will take a monthly pension payment. Individuals retiring as part of the VDP who were 55-58 years of age at retirement had a negative impact on the pension valuation as did individuals who withdrew the commuted value of their pension. Manitoba Hydro's actuary (Ellement Consulting) estimates that annual pension payments will increase by approximately $1 million per year once all the VDP individuals have retired and the current service rate is expected to decrease by 5% by 2019. Additional actuarial losses on the pension obligation of approximately $30 million and $7 million are projected for March 2019 and March 2020 respectively using fiscal 2017/18 VDP valuation impacts as a proxy.

2.5 Capital Expenditure Forecast (CEF18)

Appendix 6 contains a copy of Manitoba Hydro's Capital Expenditure Forecast (CEF18) from 2018/19 to 2027/28. CEF18 identifies all projects greater than $1 million in response to Directive 15 of Order 73/15. Projects greater than $15 million appear in the body of the report and projects less than $15 million are summarized in Appendix II of the report.

Figure 2.12 provides a comparison of CEF18 to CEF16 for Electric operations, which shows a decrease of $303.6 million over the 10 year period to 2027/28.

Figure 2.12: Comparison of CEF18 to CEF16

	2019	2020	2021	2022	2023	2019-2013 5 Year Total	2019-2028 10 Year Total
CEF16	$ 2,742.1	$ 1,884.2	$ 1,666.5	$ 1,332.5	$ 945.2	$ 8,570.5	$ 12,122.4
Inc (Dec)	(72.1)	(65.1)	(97.3)	64.2	(4.4)	(174.8)	(303.6)
CEF18	$ 2,670.0	$ 1,819.1	$ 1,569.2	$ 1,396.7	$ 940.8	$ 8,395.7	$ 11,818.8

Figure 2.13 provides a summary of the changes of $303.6 million over the 10 year period ending 2027/28.

Figure 2.13: Summary of CEF18 Forecast Changes

($ Millions)	10 Year Increase (Decrease)
MAJOR NEW GENERATION & TRANSMISSION	**(266.9)**
Keeyask - Generation	(133.8)
Bipole III Reliability	21.9
Manitoba-Minnesota Transmission Project	53.6
Birtle Transmission	4.4
Other Major New Generation & Transmission	(212.9)
Electric Business Operations Capital	**0.2**
Generation System	(65.3)
Transmission System	(123.7)
Distribution System	175.5
Corporate Infrastructure	6.4
Unallocated Target Adjustment	7.2
Electric DSM Program	**(36.9)**
ELECTRIC CAPITAL EXPENDITURE & DSM FORECAST TOTAL	**(303.6)**

Major New Generation and Transmission ("MNGT") capital expenditures over the 10-year period are forecast to be $5,391.2 million. Compared to CEF16, this is a reduction of $266.9 million primarily associated with Other MNGT projects included in CEF16. Several of these projects were completed in 2017/18 including: Wuskwatim–Generation, Pointe du Bois Spillway Replacement, Kelsey Improvements & Upgrades, Riel 230/500kV Station, Kettle Improvements & Upgrades and Pointe du Bois Transmission. The Grand Rapids Fish Hatchery Upgrade & Expansion project has been reclassified to Business Operations Capital and all future investment requirements related to the Gillam Redevelopment and Expansion Project will also be included as Business Operations Capital items. In addition, the Keeyask – Generation project cash flow reduced by $134 million over the 10 year period, however, the total project forecast remains unchanged at $8.7 billion. The Business Operations Capital (BOC) forecast did not materially change compared to CEF16.

2.5.1 Summary of MNGT Projects

A summary of capital expenditure requirements for each project within MNGT can be found in CEF18 on pages 10 through 12. Figure 2.14 summarizes by investment category the total project cost and forecast cash flow for each of the 4 projects.

Figure 2.14: Total Project Costs for Major New Generation & Transmission

MAJOR NEW GENERATION & TRANSMISSION ($ Millions)	Total Project Cost	2019	2020	2021	2022	2023	2019-2023 5 Year Total	2019-2028 10 Year Total
Capacity & Growth								
New Energy

Directives 15 and 16 of Order 59/18 directed Manitoba Hydro to consider implementing recommendations made by the IEC's with respect to Keeyask, MMTP and GNTL, as well as filing detailed quarterly reports for all Major New Generation and Transmission projects currently under development. An update with respect to each of these directives is provided below.

<u>Directive 15 of Order 59/18</u>

Manitoba Hydro has implemented certain recommendations, and is in the process of considering implementation of other recommendations made by the IECs in the 2017/18 & 2018/19 GRA for those projects that are within its control in order to properly assess any projected cost savings and schedule impacts.

With respect to the Manitoba Minnesota Transmission Project, recommendations were mainly focused on schedule modifications such as breaking apart long duration activities and removing constraints. These recommendations have been addressed and a basis of estimate will be prepared when details of contractor pricing are received. Currently however, it does not appear that these changes have had a measurable impact to the project budget.

With respect to the Keeyask project, the recommendations proposed by MGF Project Services were primarily focused on improving outcomes of the General Civil Works Contractor ("GCC") with the goal of achieving the control budget of $8.7 billion and the control schedule first unit In-Service Date of August 2021.

In January 2018, during the 2017/18 & 2018/19 GRA, Manitoba Hydro laid out its approach on the closer collaboration between Manitoba Hydro and the GCC to improve performance and achieve the plan for the 2018 construction season and ultimately deliver the project within the revised control budget of $8.7B and related schedule. The intended approach aligned with the closer collaboration on execution planning and oversight of the GCC recommended by MGF as well as working with the GCC to develop an achievable plan in 2018 based on production experienced to date. Manitoba Hydro has increased the pressure on the GCC to perform, and has collaborated wherever possible to stimulate greater productivity.

By the end of November 2018, the GCC exceeded the concrete production goal of 105,000 m3 for the year representing a year-over-year improvement of more than 20% over last year's production. In total, more than 83% of the required volume of concrete to build the Keeyask Generating Station has now been placed. The GCC also met the planned quantities for earthworks for the year, achieving roughly double the volumes of production from last year. In addition to improving production rates, the work completed in 2018 was also completed more efficiently. Though significant project risks remain, the progress to date has been positive and the necessary improvements to achieve the control budget of $8.7B are being realized and the first unit In-Service Date (ISD) is currently trending ahead of the control schedule.

Directive 16 of Order 59/18

Manitoba Hydro has provided detailed quarterly reports on the following MNGT capital projects:

- Keeyask Generating Station – a 7 unit, 695-megawatt hydroelectric generating station under construction at Gull Rapids on the low Nelson River in northern Manitoba.
- Bipole III Transmission Reliability Project – a high voltage direct current transmission line that delivers renewable energy to southern Manitoba. Bipole III was brought into service on July 4, 2018.
- Manitoba–Minnesota Transmission Project – a new 500kV AC Transmission Line between Winnipeg and Duluth, Minnesota which will connect to the Minnesota Power's proposed Great Northern Transmission Line.
- Birtle Transmission Project – a new 230kV Transmission Line between Birtle, Manitoba and Tantallon, Saskatchewan.

Please see Appendix 7 for copies of Manitoba Hydro's Public MNGT Capital Reports for the quarter ended March 31, 2018, and the quarters ended June 30, 2018 and September 30, 2018.

3.0 PROPOSED RATE CHANGES & CUSTOMER IMPACTS BY CLASS

Manitoba Hydro's electric rates were last adjusted effective June 1, 2018 to reflect the 3.6% rate increase approved by the PUB in Order 59/18. Pursuant to Order 59/18, the rates that came into effect on June 1, 2018 reflected the following rate design considerations:

- the creation of a First Nation On Reserve Residential customer class, with no increase from August 1, 2017 rates;
- the application of no rate increase from August 1, 2017 rates to Residential Diesel class customers, and,
- the adjustment of class revenues to commence migration of customer classes toward the Zone of Reasonableness ("ZOR") of 95% to 105% over a ten year period.

Manitoba Hydro filed an Application to Review and Vary some of the directives in Order 59/18 including the directives related to the creation of a First Nation on Reserve Residential Customer Class. In its Order 90/18, dated July 13, 2018, the PUB denied Manitoba Hydro's application to Review and Vary these directives. On August 10, 2018, Manitoba Hydro filed a Motion with the Court of Appeal seeking Leave to Appeal portions of PUB Orders 59/18 and 90/18 with respect to the creation of a new customer class for First Nation on Reserve Customers. As of the filing of this Application, these issues remain before the Court of Appeal.

As part of its 2019/20 one-year electric rate application, Manitoba Hydro is requesting approval of a 3.5% rate increase, effective April 1, 2019, to be applied equally, across all customer classes.

In Order 59/18 the PUB directed for the 2018/19 test year rate, that Manitoba Hydro is to assume a 10-year timeframe to move all classes within the zone of reasonableness. The PUB further stated at page 199 of Order 59/18 that it would *"…examine the Revenue to Cost Coverage ratios arising from the Prospective Cost of Service Study filed with the next GRA and will consider adjustment to the differentiation of rates as necessary, including to consider the impact of Bipole III entering service".*

Manitoba Hydro intends to continue the migration of customer classes into the ZOR in its next full General Rate Application, anticipated to be filed in late 2019, based on the results of its next Prospective Cost of Service Study ("PCOSS") to be developed following approval by the MHEB of a new Integrated Financial Forecast. The next PCOSS will reflect Bipole III coming into service. As this is anticipated to have a significant impact on customer class costs, pausing further differentiation until Manitoba Hydro can assess which classes may remain outside the ZOR once the impacts of Bipole III have been reflected will limit potential over-corrections that may be unnecessary following Bipole III coming into service. The across-the-board increase proposed as part of this Application will not negatively impact the migration of class revenues that has been achieved to date following the implementation of differentiated rates approved by the PUB in Order 59/18.

In consideration of this one-year electric rate application and in absence of an updated PCOSS, Manitoba Hydro is proposing to apply the increase to all components of the rates (monthly basic charges, energy charges and demand charges) on an across-the-board basis for all customer classes, with the exception of Diesel General Service. For Diesel General Service customers Manitoba Hydro is proposing to increase the grid portion of the rate (Basic Charge and first 2,000 kWh per month for non-government customers) by 3.5% with the non-grid portion of the rate remaining unchanged.

Until the Court of Appeal rules on the issue of the creation of a First Nations On-Reserve Residential customer class, Manitoba Hydro proposes to apply the same rate increase to all residential customers (including the First Nations On-Reserve Residential and Diesel Residential customers) for the 2019/20 fiscal year.

The proposed 3.5% rate increase applied on an across-the-board basis generates additional revenue of $59 million for fiscal 2019/20.

On a class by class basis, the proposed increase in revenues is shown in Figure 3.1 below.

Figure 3.1: Additional Revenues by Customer Class

Customer Class	2019/20 Additional $(000s)
Residential	24,800
General Service (GS) Small*	11,900
GS Medium	7,400
GS Large	13,600
Area & Roadway Lighting	800
Miscellaneous	200
Total General Consumers Revenue	58,800

*includes revenues from General Service customers in Diesel Communities

A Proof of Revenue for the 2019/20 test year depicting the total revenue increase by customer class is provided in Appendix 10. Rate Schedules for proposed rates effective April 1, 2019 are provided in Appendix 11 and Bill Comparisons between current June 1, 2018 rates and proposed April 1, 2019 rates are provided in Appendix 12.

3.1 Rate Design and Cost of Service Directives

Order 59/18 set out a number of directives related to Manitoba Hydro's cost of service study and rate structures.

Directives 24 to 27

Manitoba Hydro has completed the modifications to the cost allocation model that will be used for future Cost of Service Studies to reflect these directives which direct non-tariffable transmission costs be excluded from the allocation of export revenues, the addition of a new subfuction to allocate the specified customer services costs to all classes other than GSL 30-100kV and GSL >100kV and export revenues be treated as a reduction to cost in the calculation of Revenue to Cost Coverage ratios. Manitoba Hydro is continuing to study the Service Drop allocator and Common Costs and intends to have the review completed in time for the next Prospective Cost of Service Study to be filed with the next full GRA.

Directive 28

Directive 28 requested information regarding the rationale for the declining block rate structure for the General Service customer classes and an evaluation of the block thresholds and charges. The declining block rate structure for the General Service Small, General Service Small Demand and General Service Medium customers is on account of class consolidation that began with rates implemented on July 1, 2008 and was necessary to recover the demand costs related to General Service Small customers that are not demand metered and to reflect the higher load factors of the General Service Small Demand and General Service Medium customers. There are no changes currently proposed to these customer classes as Manitoba Hydro intends to study whether consolidation of these classes continues to be appropriate.

<u>Directive 29</u>

Directive 29 directed filing of a time-of-use rate design proposal for general service large customers. Manitoba Hydro has invited customers in the General Service Large >100 class and representatives of the Manitoba Industrial Power Users Group to a kick off meeting on December 4, 2018 which will mark the beginning of the customer consultation phase. The consultation phase, originally anticipated to begin by the end of October 2018, was delayed to allow for additional internal review to analyze and study the key inputs and considerations underlying a time-of-use rates proposal in order to provide customers with updates that will allow for meaningful participation at the outset of the consultation process. Over the next several months, through group and individual consultations, Manitoba Hydro intends to solicit feedback and gather information from customers for the purposes of developing the new rate structure.

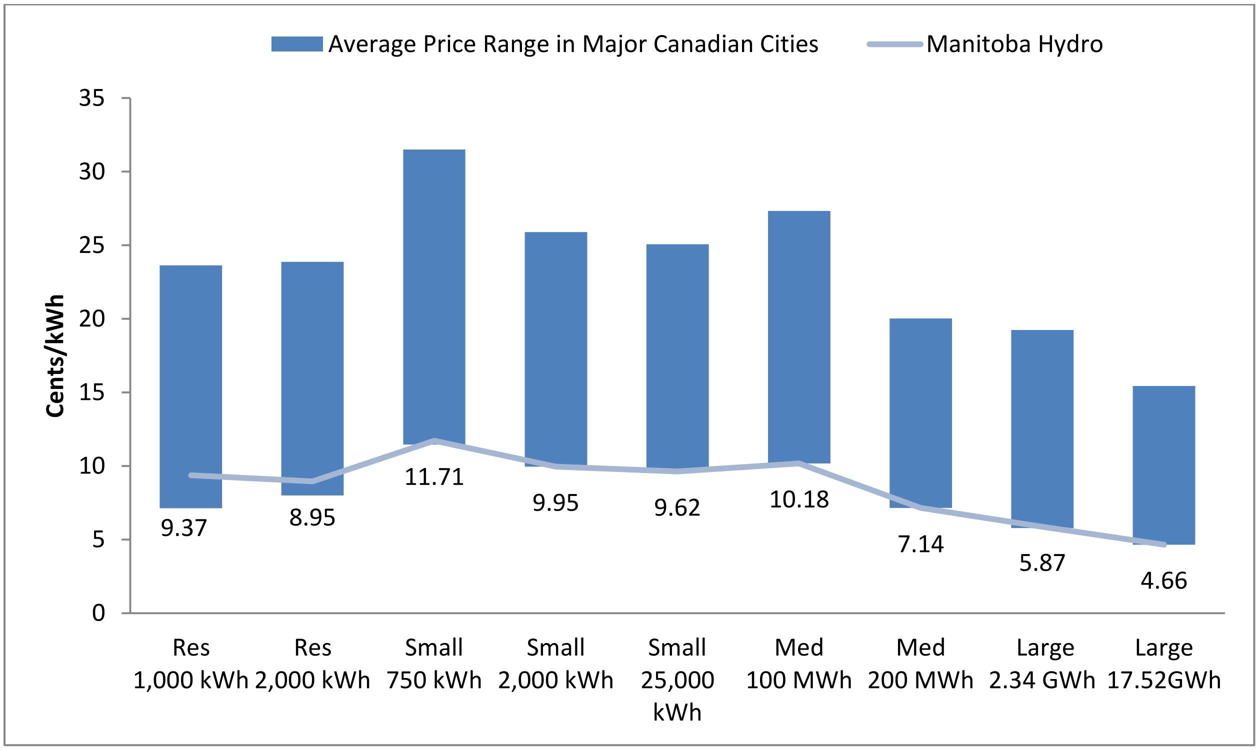
3.2 Comparison of Manitoba Hydro's Electricity rates to Neighbouring Jurisdictions

Manitoba Hydro has used Hydro Quebec's annual *"Comparison of Electricity Prices in Major North American Cities"*[1], to compare average rates for all major rate classes paid by Manitoba customers with those of other major Canadian utilities, as shown in Figure 3.2.

[1]http://www.hydroquebec.com/data/documents-donnees/pdf/comparison-electricity-prices.pdf

Figure 3.2: Comparison of Average Electricity Prices in Major Canadian Cities

Rates in effect April 1, 2018 (Price per kWh)



The 2018 Hydro Quebec survey demonstrates that the average price per kWh paid by Manitobans is amongst the lowest in large Canadian cities.

A summary of rate changes from utilities across Canada from 2007 to 2019 is provided in Figure 3.3 below.

1 **Figure 3.3: Utility Rate Changes 2007 to 2019**

Utility Rate Changes (%)															
	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019*	Cumulative	Current Rate Index***
Manitoba Hydro	2.2	5.00	2.90	2.80	2.00	4.40	3.50	2.75	3.95	3.36	3.36	3.60	3.50	53.1	100
Hydro Quebec	1.90	2.90	1.20	0.35	-0.40	-0.50	2.41	4.30	2.90	0.70	0.70	0.30	0.80**	18.9	109

* Where published information on proposed increases is not available, Manitoba Hydro has assumed a 2% inflationary increase

** Hydro Quebec is proposing an overall 0.8% increase in 2019, but only 0.2% for industrial customers.

*** This index is based on the Edison Electric Institute Survey and compares the average price per kWh for the various utilities. Manitoba Hydro's average price is $0.0649/kWh in Canadian dollars based on 12 months data ending December 2017.

In addition to average prices, a comparison of monthly bills aids in providing context for what customers in each jurisdiction are paying on a monthly basis. The charts provided in Figures 3.4 to 3.8 compare projected monthly bills for major Canadian cities in 2019/20. Consistent with calculations in Figure 3.4, where published information on projected increases is not available, a simplifying and conservative assumption has been made that annual rate increases will be in line with inflation at 2% each year. Where information is available, projected rate increases have been reflected in the bill calculations.

Figure 3.4: Residential Monthly Bill Comparisons in 2019/20

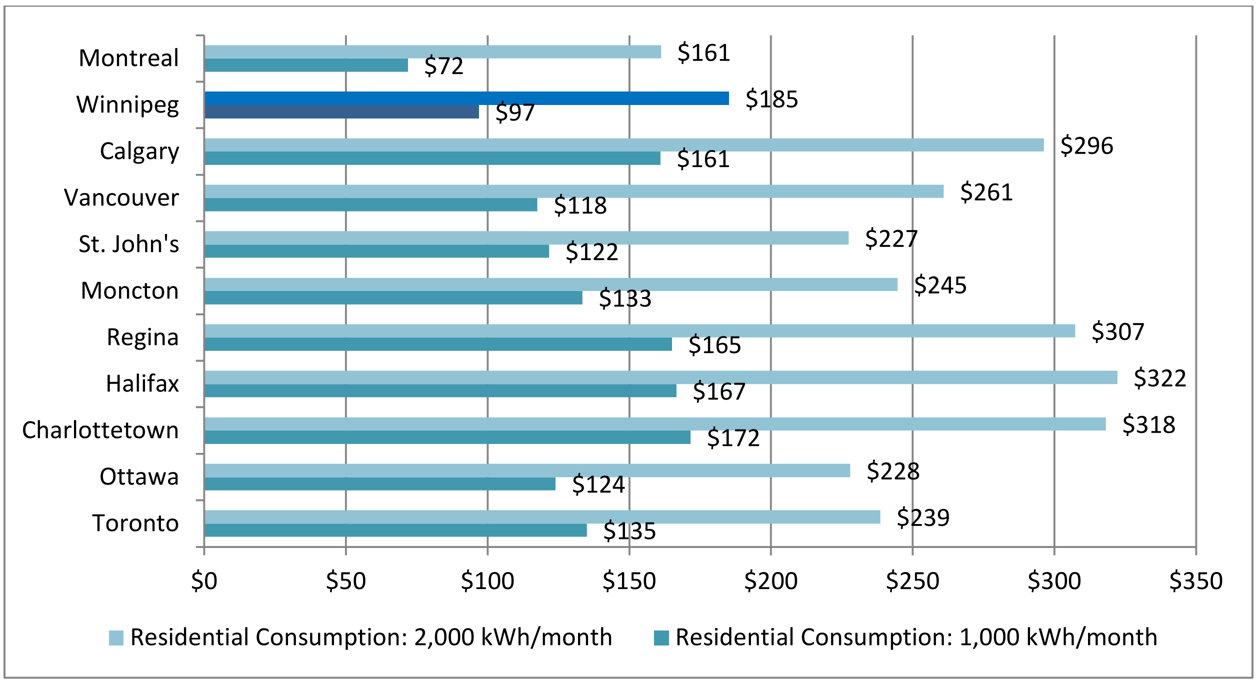

Figure 3.5: Small Power (10,000 kWh) Monthly Bill Comparisons in 2019/20

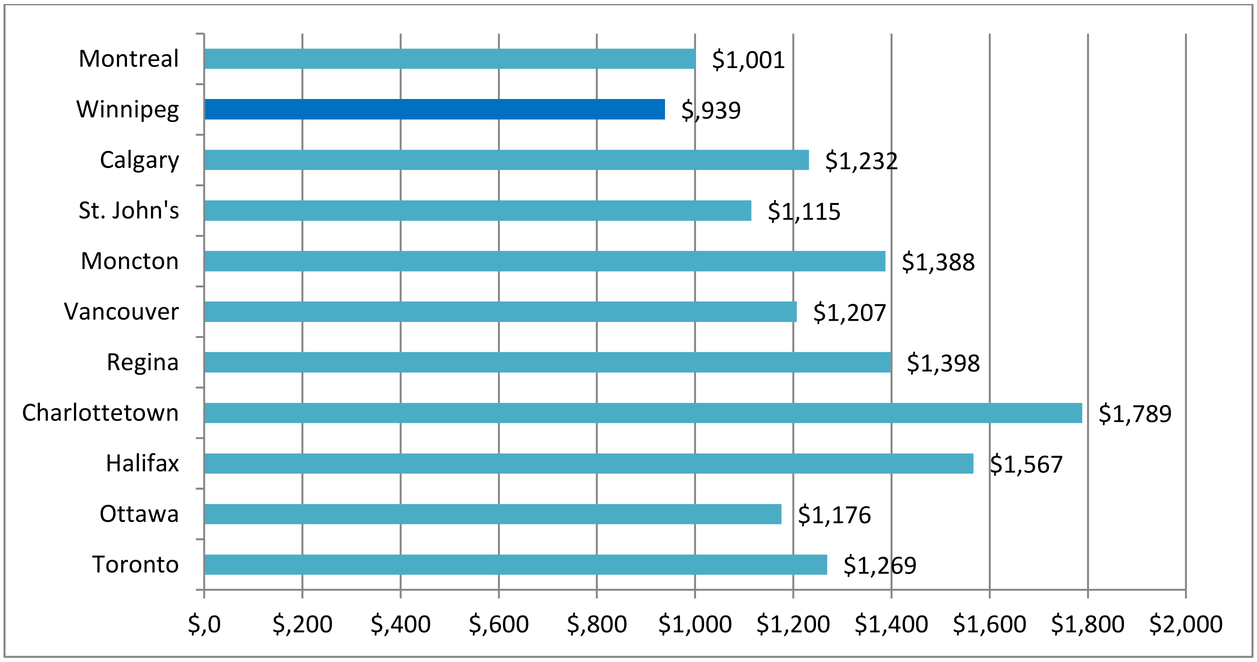

Figure 3.6: Medium Power (1,000 kW) Monthly Bill Comparisons in 2019/20

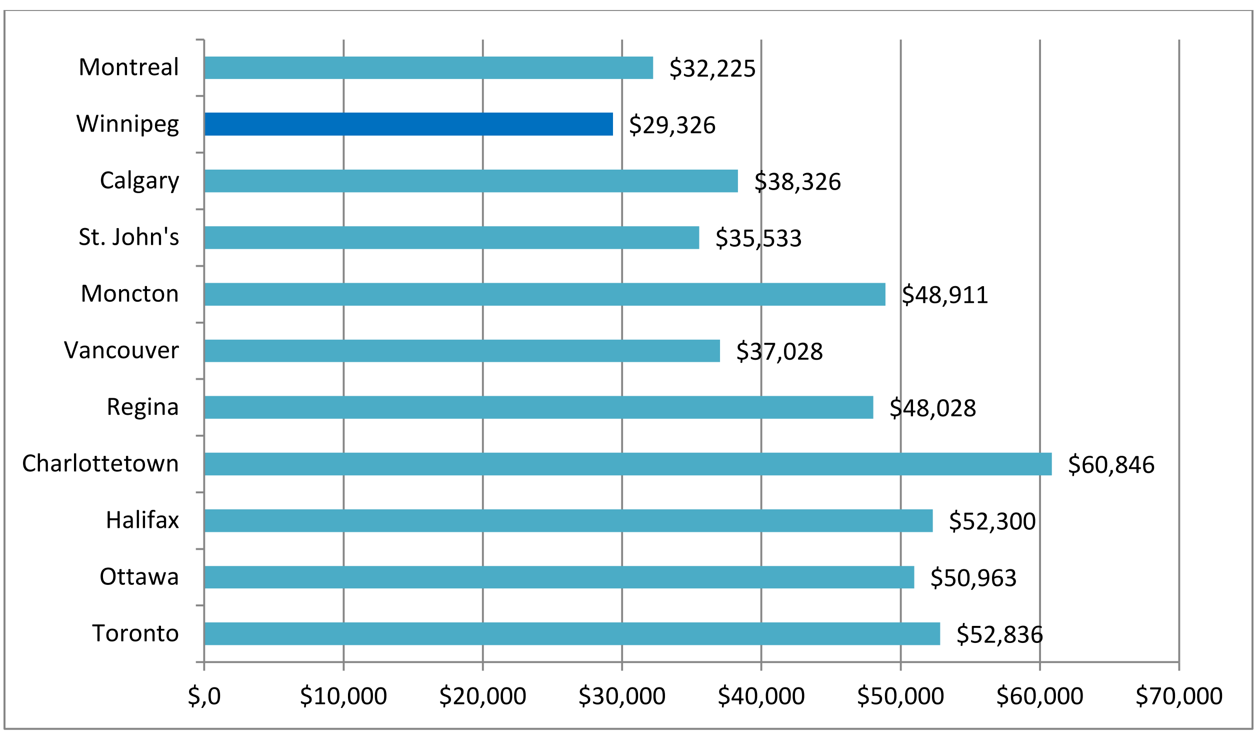

Figure 3.7: Large Power (5,000kW) Monthly Bill Comparisons in 2019/20

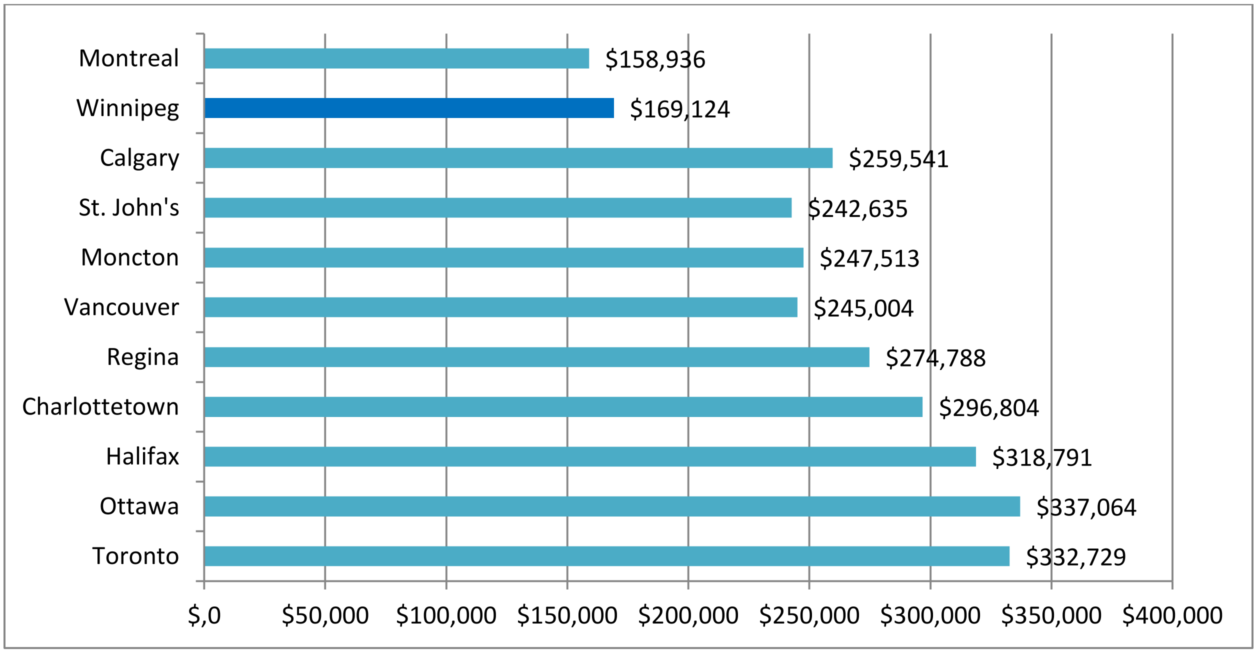

Figure 3.8: Large Power (50,000kW) Monthly Bill Comparisons in 2019/20

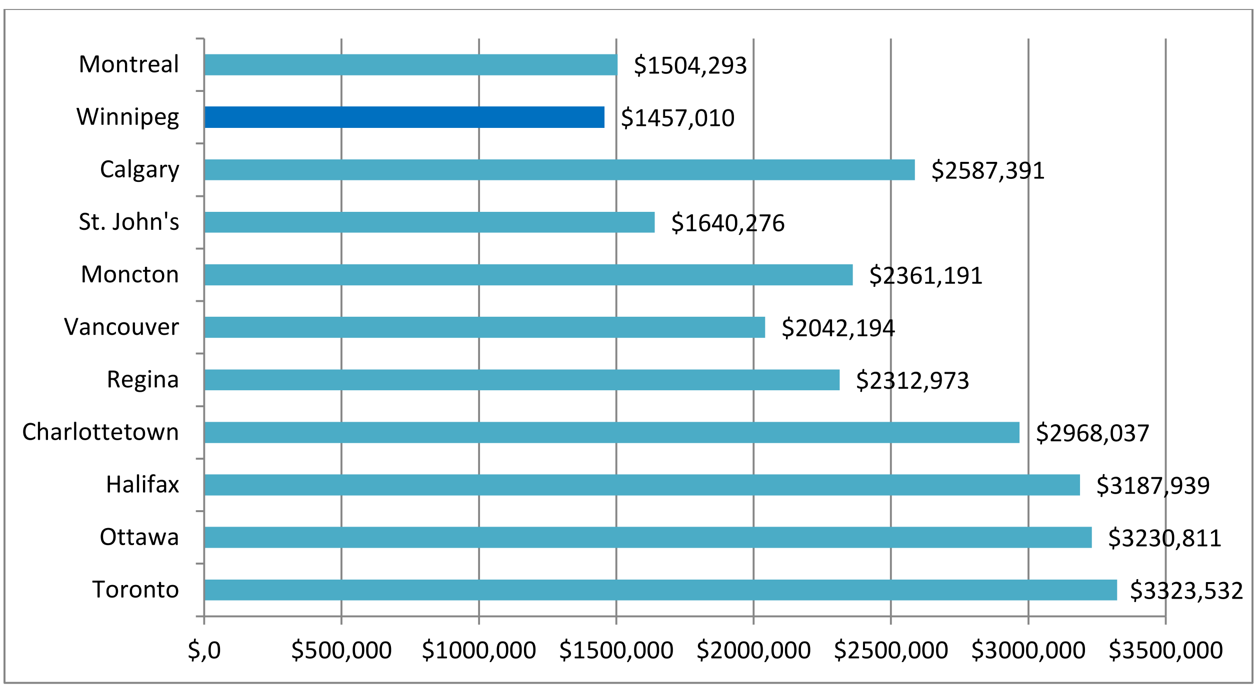

To measure its performance in the overall North American context, Manitoba Hydro uses the results of both the Edison Electric Institute ("EEI") survey as well as monthly statistics obtained from the United States Department of Energy ("DOE"). Unlike the EEI data that provides investor-owned utility comparisons, the DOE data provides comparisons by State which includes numerous utilities within each state. Figure 3.9 below provides the Total Retail Average Rate compared to other low-cost jurisdictions and neighboring utilities, including primary Mid-continent Independent System Operator states, based on the July 2018 DOE data and July 1, 2018 EEI data, using an exchange rate of 1 US $ =1.32154 Canadian as of July 3, 2018. The Average Retail Rate was determined by dividing the combined total revenue billed by the combined total kilowatt hours billed for the 12-month period ending June 30, 2018 for all customer classes (residential, commercial and industrial).

Figure 3.9: Average Retail Price

State / Province	Average Retail Price Cents per kWh
Manitoba Hydro	6.49*
Hydro Quebec	6.97
BC Hydro	9.22
SaskPower	10.67
North Dakota	11.00
South Dakota	13.09
Minnesota	12.36
Wisconsin	14.06

*Total revenue used in the calculation includes PUB-approved rate increases of 3.36% effective August 1, 2017 and the portion of 3.6% effective June 1 to June 30, 2018.

As demonstrated in the Figures above, Manitoba continues to maintain an advantage over most North American jurisdictions with respect to the average monthly customer bills and average prices for all customer classes.

Report to the Manitoba PUB

Review of Manitoba Hydro Financial Targets and the 2017/18 and 2018/19 GRA

Prepared by
MPA Morrison Park Advisors Inc.

October 31, 2017

Contents

Appendices

Executive Summary

On May 5, 2017, Manitoba Hydro applied to the Manitoba Public Utilities Board for electricity rate increases of 7.9% for both 2017/18 and 2018/19.

In support of this application, Manitoba Hydro provided a substantial body of information on the company's financial performance, forecasts, and financial targets and goals. In particular, the application referenced that the Manitoba Hydro Electric Board has set a goal to achieve a target Debt to Equity Ratio of 75:25 by March 31, 2027. In order to achieve this goal, a series of substantial rate increases would be required over the coming years.

This Report addresses three critical issues:

- Why are financial targets relevant to rate-setting for Manitoba Hydro?
- Should the Debt : Equity Ratio be the primary financial target that is taken into account when setting rates for the future?
- Assuming the Debt : Equity Ratio is the primary target, should rates be set so as to achieve that target by March 31, 2027?

Manitoba Hydro's governing legislation does not specify a capital structure for the company. It is organized as a non-share capital corporation, to be operated at cost. However, the maintenance of reserves for various purposes are allowed, which gives the company flexibility in determining its capital structure. The Manitoba Public Utilities Board is free to take into account the need for reserves in its deliberations on rates, but is not required to approve of any specific level of reserves.

Manitoba Hydro is fairly unique as a government-owned, pure cost recovery electricity utility which is mandated to produce and sell electricity for export as well as for domestic purposes. This sets it apart from its peers in North America, none of whom have that exact combination of characteristics. While the experience of other utilities may be used as a guide, the particular nature of Manitoba Hydro means that there is no pattern that can simply be followed in determining how best to address the issues raised in the application. Regardless, government-owned utilities across North America exhibit a wide variety of financial profiles, lending support to the proposition that Manitoba has the flexibility to pursue its own course.

One of the principal reasons to carefully track and manage financial performance is to ensure continued access to the capital markets. Manitoba Hydro is a capital intensive business, and it is in the midst of a massive building program, for which it requires a significant amount of debt. While the company's debt is issued by the Province of Manitoba and on-lent to Manitoba Hydro, nonetheless the company must address itself to the capital markets to ensure that it does not weaken or harm the credit-worthiness of the Province of Manitoba.

The primary concern of lenders is the risk that a borrower will default on a loan. In order to gauge this risk, capital markets participants closely examine the financial history and circumstances of potential borrowers to determine their credit-worthiness. Manitoba Hydro, and the Province of Manitoba, are each regularly scrutinized and reported on by various credit rating agencies, and of course bond investors themselves monitor the behaviour and results of both the company and the Province in real time, as news and events instantly affect the bond trading market. It is apparent from reading various financial market reports that a primary focus is on the expected sufficiency of cash flows to satisfy debt obligations. While the capital structure of a prospective borrower like Manitoba Hydro is important, it appears to be a secondary issue for the capital markets. This raises questions about the centrality of the Debt to Equity Ratio in Manitoba Hydro's application: if the capital markets are focused on other financial metrics, then why not make those metrics central to rates, instead of the Debt to Equity Ratio?

Rates must be set prospectively, at a level that is expected to cover the costs of the utility. However, Manitoba Hydro's revenues depend very much on unpredictable water inflows to the hydroelectric facilities that the utility owns and operates. Other uncertainties include interest rates on the utility's outstanding debts, export prices for the power sold abroad, and the ultimate cost of the various construction projects currently underway. These risks mean that Manitoba Hydro must take a sophisticated approach to managing its finances. In addition, the variability of all of these factors raises questions about how the PUB should be setting Manitoba Hydro rates, and the degree of flexibility there should be in changing the level of those rates over time.

The Manitoba PUB must not only operate within the confines of its governing legislation and that of Manitoba Hydro, but it can and should call on the enormous body of practice and jurisprudence concerning regulated utilities that has been developed across North America over the past hundred years or more. A number of principles have emerged over the years which seek to clarify what may be considered "just and reasonable" in the setting of utility rates. An over-arching concern is to balance the needs of customers and the utilities themselves, so that services can be provided in a manner, and at a price, that is fair, economically efficient, prudent, predictable and stable.

Considering Manitoba Hydro's rate application in the light of regulatory principles, it becomes apparent that the urgency with which the utility wishes to achieve its targeted Debt to Equity Ratio makes it difficult to maintain a fair distribution of burden on ratepayers over time. The sharp increase in rates, designed ostensibly to protect ratepayers from undue financial risks and burdens in the future, instead appears to create significant burdens for ratepayers in the short term, with uncertain utility to ratepayers later. Alternative, more modest rate increases may be sufficient to satisfy the needs of the capital markets, while spreading burdens more equally across ratepayers over time. In the event that financial distress arises from the actualization of a risk, then rates could be increased further.

In short, the answers to the three questions posed above can be summarized in the following way:

- Financial targets are important for rate-setting, both because they indicate the general health of the utility, which must be a factor in rate-setting, and because they are critical to having access to capital markets.

- There appears to be significant doubt as to whether rate-setting should be driven by the Debt to Equity Ratio. This particular financial measure is of secondary importance to the capital markets, and the emphasis placed on it does not appear to lead to balanced, fair results for ratepayers.

- A goal to reach a financial target by a fixed date does not appear to take into account the ever-changing risks faced by the utility, and the need to balance those risks against the interests of ratepayers over time. It may be more advisable to focus on different financial metrics, and seek to achieve and maintain them on some form of rolling-forward basis, which might provide the Public Utilities Board with the flexibility it needs to find a fair and reasonable balance in the setting of rates.

Morrison Park Advisors

MPA is an independent, partner owned investment banking advisory firm. We primarily advise clients on mergers and acquisitions, equity and debt capital raises, divestitures and restructurings. In addition, we provide formal valuations, fairness opinions, contract negotiation services, advice to special committees of boards of directors, advice on initial credit ratings, expert testimony before courts and regulatory bodies, policy development, and market analysis. Our ability to deliver top tier financial advisory services is based on decades of combined experience and expertise developed at some of Canada's leading investment banks, while serving many of Canada's largest and most sophisticated corporate clients as well as federal, provincial and municipal governments and quasi-government entities.

Our areas of specialty include utilities, infrastructure and power; mining; real estate and technology. In the electricity sector, MPA has direct and recent experience on a number of transactions and other advisory assignments involving electricity assets and has detailed knowledge and experience with this market, its participants and how they operate.

Information on the team members contributing to this report, as well as the scope of our assignment is attached in Appendices F through J.

For more information on MPA, please visit our website at www.morrisonpark.com.

1. Manitoba Hydro Request

A. Original Request (May 5, 2017)

By way of formal application for electricity rates, Manitoba Hydro requested that the Manitoba Public Utilities Board ("PUB") approve:

- An across-the-board rate increase of 7.9% to be effective on August 1, 2017;
- An across-the-board rate increase of 7.9% to be effective on April 1, 2018; and
- A number of approvals relating to adjustment of specific rate classes, recovery of regulatory deferral accounts, amortization periods, and other technical matters.

Based on these requests, it could be expected that Manitoba Hydro would return to the PUB sometime in mid-to late-2018 with a request for new rates as of April 1, 2019.

B. Implicit Requests Inherent to the Application – Financial Targets and Goals

The request for rate increases reflects current assumptions about a range of expected revenue and cost drivers. Forecasts for domestic demand, export prices, operating expenses, interest costs and required capital expenditures were included in the application, as required, and are subject to scrutiny by the PUB to support the need for the requested rate increases.

Beyond forecasts of future operating and economic variables, however, the application provides substantial information about Manitoba Hydro's financial targets. Moreover, the application contends that the need to meet these targets within a specific period of time helps to justify the requested rate increases.

Manitoba Hydro focuses on three main tests for financial health:

- Debt to Equity Ratio, with a target level of 75:25;
- Interest Coverage Ratio, with a target level of 1.8x;[1] and
- Capital Coverage Ratio, with a target level of 1.2x.

[1] Note that historically Manitoba Hydro calculated its "interest coverage" using an EBIT-based formula. In 2015 Manitoba Hydro changed the formula, and began using a calculation that employs "EBITDA", instead of "EBIT". In its materials, the new ratio is sometimes referred to simply as the "Interest Coverage Ratio", and sometimes as the "EBITDA to Interest Coverage Ratio" in order to differentiate the new formula from the old formula (in documents from previous rate hearings, "interest coverage ratio" always referred to the "EBIT"-based calculation, hence the possible source of confusion). Please note that in this Report, all references to "Interest Coverage Ratio" refer to the new, post-2015 formulation. The older calculation is a different metric, and is not employed anywhere in this Report.

Debt to Equity Ratio

Manitoba Hydro calculates its Debt to Equity Ratio as follows:

$$\frac{\text{(Total Net Debt = Long-term Debt - Sinking Fund Balances + Short-term Debt - Short-Term Investments)}}{\text{(Retained Earnings + Unamortized Customer Contributions + Accumulated Other Comprehensive Income + Non-controlling Interest + Total Debt)}}$$

While most of the elements in the calculation are familiar, two notable elements are “Unamortized Customer Contributions” and “Accumulated Other Comprehensive Income”.

The former refers to contributions in aid of construction that were received from customers for capital projects, and that are being amortized in parallel to the depreciation of the capital items that they helped to pay for. In some jurisdictions, utilities remove contributions in aid of construction from the value of assets, and therefore also exclude these amounts from the liabilities/equities side of the balance sheet. Since Manitoba Hydro does not exclude contributions from the value of their assets, then there must be corresponding liabilities which are amortized over time, and Manitoba Hydro has reflected this in the Debt to Equity Ratio.

“Accumulated Other Comprehensive Income” has taken a more prominent role since Manitoba Hydro adopted the IFRS accounting standard in its fiscal year ending March 31, 2015. This balance sheet item includes transactions which are not part of the normal operations of the company, and often relate to unrealized gains or losses on such things as foreign exchange transactions, hedging arrangements and pension plans. Typically, such gains or losses are recorded because the fair value of a financial instrument has changed since it was first arranged, however that instrument is still outstanding as of the end of the financial year (hence the gains or losses are “unrealized”). Significantly, for Manitoba Hydro, the amounts in this item grew substantially (and became an accumulated loss instead of a gain) upon adoption of IFRS accounting standards, and have mounted since. The result is that the calculation of the Debt to Equity Ratio would be different if Manitoba Hydro were using CGAAP or USGAAP accounting standards, as opposed to IFRS. In any case, Manitoba Hydro has predicated all of its calculations and scenario-building on the continued use of IFRS accounting, so this treatment will be used.

The Manitoba Hydro Electric Board has taken the position that the company should strive to achieve the Debt to Equity Ratio target of 75-25 by the end of the fiscal year ending March 31, 2027. Based on the provided analysis and forecasts, and assuming the accuracy of all assumptions made in the application, the original application states that there is a 50% probability of achieving this goal, if domestic rates are increased by 7.9% per year for three additional years beyond the two increases for which Manitoba Hydro formally applied, followed by five years of 2% domestic rate increases.

This ten-year rate path, and its relationship to the Debt to Equity Ratio target, is critical to the application as a whole. If the Debt to Equity Ratio target were not 75-25, or if the goal was to achieve that target over a longer timeframe, then rate increases of 7.9% likely would not have been requested.

In addition, a ten-year rate path of 7.9% increases for five years followed by 2% increases for five years is not the only possible rate path that would result in the achievement of 75% debt target by March 31, 2027. Manitoba Hydro could have requested even annual rate increases over the entire period, or could have suggested more modest increases for the first several years of the period, followed by larger increases later, or any combination of various mathematical possibilities.

In the broader context facing Manitoba Hydro (which will be discussed further in Section 3), what does it mean to achieve a ratio of 75:25? In a literal sense, it means that the book value of the assets in the company are significantly greater than its outstanding debt. Manitoba Hydro has indicated that it believes this to be a sign of ample “financial strength”, and that if it has achieved that goal, it will have enhanced flexibility to issue more debt, if circumstances arise where that might be necessary.

Interest Coverage Ratio

Manitoba Hydro calculates its Interest Coverage Ratio as follows:

$$\frac{\text{Net Income + Depreciation Expense + Finance Expense + Capitalized Interest}}{\text{Finance Expense + Capitalized Interest}}$$

Manitoba Hydro sometimes refers to this calculation as an “EBITDA : Interest Coverage Ratio”, in order to distinguish it from an older calculation that was also called “Interest Coverage Ratio”, but which was calculated differently. The exact formulation that Manitoba Hydro is using now, described above, is not identical to what is commonly considered an EBITDA : Interest calculation (Earnings Before Interest, Depreciation and Amortization, as compared to Interest). In Manitoba Hydro’s formulation, it is important to note that Net Income includes a number of special items (such as recognition of deferred revenues and net movement of regulatory balances) which are not always included in the more common EBITDA calculation. This technicality can be ignored in practice, however.

The Interest Coverage Ratio, as calculated by Manitoba Hydro, is often considered an important metric when assessing the credit-worthiness of an enterprise, because it provides information about the sufficiency of cash flow to cover interest costs. However, it should be noted that customer revenue (and many other items) is recognized on an accrual basis (i.e., when billed) as opposed to on a cash basis (when payment is actually received). As a result, while this ratio serves as an indicator of the sufficiency of cash flow, it is an “accounting” measure and not a true “cash flow” measure of the results of the period for which the calculation is being made.

Capitalized interest represents the amount of interest accrued during the year which will ultimately be transferred to asset accounts associated with capital goods currently in construction.[2] When new capital goods take more than one year to construct, they must be financed through debt issuance (or equity contributions, in the case of utilities which have an equity provider who contributes capital). Since the costs associated with such construction projects should not be passed on to ratepayers until such time as they are in use (“used and useful”), the interest associated with that debt should not form part of the annual expenses of the regulated business.

Notably, according to the IFRS accounting rules that Manitoba Hydro relies on, the amount of capitalized interest is calculated not on the basis of the actual cash interest costs associated with the construction project (which might be the case if a project were undertaken by a special purpose entity that arranged construction financing, for example), but instead based on the average cost of debt for the corporation and the average cost of the construction projects outstanding for the year. Since the average cost of Manitoba Hydro debt is influenced by all of the debt issued in the past, and past debt issues were more expensive than debt incurred today, the average cost of debt for Manitoba Hydro is actually higher than the real cash cost of construction debt that would be required for projects currently in

[2] On the Consolidate Statement of Cash Flows, the amount of capitalized interest is buried in the Additions to Property, Plant and Equipment, and does not appear in the Cash Flow from Operating Activities line item.

progress. This means that more debt interest is being capitalized than was actually “caused by” the construction projects underway, strictly speaking. This serves to reduce finance expense in the current year, which increases net income now, while deferring more interest to be recovered from ratepayers in the future. Note, however, that if interest rates were to increase, such that past rates were lower than current rates, the opposite situation would obtain, so the relationship between current finance expense and capitalized interest is at least somewhat based on happenstance.

Despite the subtleties associated with capitalized interest, for the purposes of the Interest Coverage Ratio, the addition of finance expense and capitalized interest can be understood to approximate the net cash cost of debt interest for the year (note that Finance Expense is not just interest paid on long and short-term debt, but also includes offsets from interest income received from short-term investments, hence this is a “net” total).

What does it mean that the target is 1.8x? In this case, operating cash flows before interest charges would be greater than interest charges. The remaining 0.8x of funds after paying interest charges could be used to invest in new capital equipment, or to pay down debt principle (bonds that may be coming due). This measure alone does not clarify whether the company’s debt is increasing, since there is no information captured in this metric about the size of capital expenditures (if capital expenditures are greater than 0.8x Net Finance expense, then Manitoba Hydro will have to borrow additional funds, but if capital expenditures are less than 0.8x Net Finance Expense, then the corporation could actually retire some debt principal). By the same token, this ratio provides no information on whether the Debt : Equity Ratio is rising or falling. It would be necessary to know both the size of the annual capital investment and the size of depreciation in order to calculate the impact on the debt ratio. Nevertheless, if this ratio were at a 1.8x level, creditors would be comfortable that the business is producing enough cash flow to service outstanding debts.

It may also be instructive to note the limitations of this calculation with respect to cash flow. There are many possible measures of cash flow, and this is only a variant of one of them. Some measures, such as “Free Cash Flow” are focused on understanding more about the actual cash funds available from a company after all of its expenditures have been taken into account (including capital expenditures and non-cash items such as net working capital). Others, like “Discretionary Free Cash Flow” make some distinctions about which planned expenditures are absolutely required, versus those which are optional. Depending on the specific objective of an analysis, each different cash flow measure may be useful.

In the application, Manitoba Hydro does not emphasize this cash flow metric as much as it does the Debt : Equity Ratio, and does not address other variants of cash flow metrics and their uses.

Capital Coverage Ratio

Manitoba Hydro defines its Capital Coverage Ratio as follows:

$$\frac{\text{Cash Funds From Operations}}{\text{Capital Expenditures (excluding Major New Generation and Transmission Projects)}}$$

Notably, when calculated on a retrospective basis, “Cash Funds From Operations” is an actual measure of real cash flows, and not an approximation including non-cash items such as non-cash working capital, deferral accounts, regulatory accounts, accruals, etc. On a prospective basis, however, for the purposes of modeling, most such nuanced differences between cash and non-cash accounts are generally ignored, since modeling them would be an unnecessary and time consuming complication.

Excluding "Major New Generation and Transmission Projects" is an extremely important element of the calculation. In effect, this measure is indicating the sufficiency of actual cash flows from operations to pay for maintenance capital expenditures, and expenditures required to manage "normal" as opposed to "major" or "strategic" growth in the system. This distinction makes the calculation somewhat arbitrary, since Manitoba Hydro can redefine at any time, by an internal policy change, whether a given project is sufficiently "major" to be excluded.

This metric is not a typical part of financial analysis, and its value is somewhat obscure. Certain typical financial measures do take into account capital expenditures (such as "Free Cash Flow"), but determining whether funds from operations are sufficient to pay for capital expenditures does not in itself indicate much about the company. Knowing the amount of Cash Funds from Operations generated by a company is often useful when compared to interest charges or debt (in which case it becomes a cash flow metric), since debt providers often wish to understand whether a company has sufficient cash to make good on debt obligations. Since interest charges are paid before new capital expenditures, it is not clear what purpose is served by aiming for cash flows to be 0.2 times in excess of planned capital expenditures? Unless debt interest charges are very small, they will in all likelihood be greater than 0.2 times capital expenditures (especially in a large, capital intensive electricity business like Manitoba Hydro). Moreover, knowing that cash flows are slightly larger than planned capital expenditures does not provide any insight into the direction of the Debt : Equity Ratio or the Interest Coverage Ratio, because too many other values are missing from the calculation of the Capital Coverage Ratio. In short, this metric qualifies as information, but its usefulness is somewhat questionable.

In the application, Manitoba Hydro does not emphasize the Capital Coverage Ratio as a financial measure related to rate-making as much as it does the Debt : Equity ratio.

C. Revised Materials Based on the Interim Rate Decision

By Order 80/17, the PUB granted an interim rate increase of 3.36% to Manitoba Hydro, commencing on August 1, 2017. The PUB denied Manitoba Hydro's request for an increase of 7.9%.

As a result of this decision, Manitoba Hydro has now revised its application materials pertaining to its financial targets and its future rate path. In keeping with its apparently primary objective of achieving a Debt to Equity Ratio of 75-25 by March 31, 2027, it now asserts that an even more aggressive 10-year rate path will be required, as described in the chart below. It is notable that in making this adjustment to its forecast of the future, Manitoba Hydro does not reference its other two measures of financial health, but instead focuses almost exclusively on the need to meet its Debt : Equity target.

	Original Application	Revised Materials
1 August 2017 to 31 March 2018	7.9%	3.36%
1 April 2018 to 31 March 2019	7.9%	7.9%
1 April 2019 to 31 March 2020	7.9%	7.9%
1 April 2020 to 31 March 2021	7.9%	7.9%
1 April 2021 to 31 March 2022	7.9%	7.9%
1 April 2022 to 31 March 2023	2.0%	7.9%
1 April 2023 to 31 March 2024	2.0%	7.9%
1 April 2024 to 31 March 2025	2.0%	4.54%
1 April 2025 to 31 March 2026	2.0%	2.0%
1 April 2026 to 31 March 2027	2.0%	2.0%

Formal request: Interim Decision: Revised Projection:

It is important to note that despite the change in forward projections based on Manitoba Hydro's target Debt : Equity Ratio and timing goal, Manitoba Hydro has not requested that the PUB formally endorse or otherwise agree with either the target level or the timing goal. Nor is any certainty with respect to future rate increases actually being requested. In effect, the 10-year rate path is provided for illustrative purposes only, to support arguments justifying the formal rate request. Presumably, Manitoba Hydro will be returning to the PUB for new rates as of April 1, 2019, and such new application will be based on two additional years of operating history and a new set of assumptions (domestic demand, export prices, operating costs, etc., etc.). As a result, that future rate request and forward projections for rates could be entirely different, even if still based on a Debt : Equity Ratio target of 75:25, with a goal of March 31, 2027.

2. Issues Addressed in this Report

This report will attempt to shed light on a number of topics arising from Manitoba's Hydro's rate application, and in particular the reliance on financial targets and goals to support the particular level of the rate increase requested.

Manitoba Hydro's focus on financial targets, and in particular on the Debt : Equity Ratio, raises a number of questions.

- Why are financial targets relevant to rate-setting for Manitoba Hydro?
- Should the Debt : Equity Ratio be the primary financial target that is taken into account when setting rates for the future?
- Assuming the Debt : Equity Ratio is the primary target, should rates be set so as to achieve that target by March 31, 2027?

Section 3 of the report will examine the context for Manitoba Hydro's financial targets, in terms of the nature of the targets, the levels Manitoba has chosen to aim for, and the timeframe over which the targets will be achieved. The section will consider questions related to whether Manitoba Hydro's self-defined financial targets are appropriate targets to help guide ratemaking.

Section 3(a) will address the legislative framework under which Manitoba Hydro operates, and which supports the PUB's consideration of rate requests. Since the legislation requires Manitoba Hydro to apply to a utility regulator for rates, section 3(b) will summarize the general statements of the PUB with respect to the principles guiding its decisions. In addition to Manitoba legislation, the PUB is also guided by the body of regulatory principles and good practice that have been developed over the past hundred years across North America. As a result, this body of principles and practice will be outlined in section 3(c).

Manitoba Hydro is a public enterprise, in that it does not have private sector shareholders but is instead created by statute on behalf of the people of Manitoba. This places the company outside of the worldwide norm for utility companies, but is by no means a unique or exclusive condition. Section 3(d) will examine some of the ways in which Manitoba Hydro's circumstances differ from those of the traditional regulated utility model, particularly as they pertain to financial targets and performance.

There are many other utilities structured as public enterprises, even though a majority are not, and section 3(e) will provide information on a number of public enterprise electricity utilities from Canada and the United States for the purpose of comparison and contrast with Manitoba Hydro, particularly from the perspective of financial performance and targets.

Finally, in terms of context, the views and practices of the capital markets with respect to financial targets at public enterprise utilities like Manitoba Hydro will be addressed in section 3(f). This will provide some indication of the range of possible targets, levels and timing goals that the PUB may consider within its ratemaking deliberations while ensuring that Manitoba Hydro continues to have access to the capital markets.

In the application, Manitoba Hydro contends that robust financial targets are required in order to better manage risks that potentially threaten Manitoba ratepayers. As a result, section 4 attempts to assess the risks facing Manitoba

Hydro, understand how these risks might affect financial performance, and hence how the PUB may wish to address risk issues within its deliberation on Manitoba Hydro's application.

Section 4(a) outlines the risks faced by Manitoba Hydro in broad terms, and attempts to provide some boundaries on the frequency, severity and duration that should be expected for certain risk issues. Section 4(b) considers the mechanisms which could be used to financially manage these risks from a regulated utility perspective. In addition, the practical limitations on such mechanisms will be addressed so as to eliminate from consideration those that are not likely to be applicable in the future.

Section 4(c) focuses on the relationship between risks, financial targets, financial mechanisms to manage those risks, and the regulatory principles that should guide ratemaking decisions.

Section 5 addresses some of the practical issues that fall out of a determination about financial targets in a ratemaking context. In particular, section 5(a) considers the future ratemaking impact of a decision based on a particular set of financial targets and goals. Section 5(b) considers the regulator's ability, through its ratemaking decision, to affect the capital market's perception of Manitoba Hydro and its financial targets and behaviour. Finally, section 5(c) examines how a regulatory decision on financial targets and goals will affect the debt management strategy of Manitoba Hydro.

Section 6 summarizes the key observations on Manitoba Hydro's financial targets made in this report, and suggests possible paths forward for the PUB to pursue on these matters.

3. Context for Manitoba Hydro Financial Targets and Goals

The ultimate goal of regulatory rate-making is "just and reasonable rates", as well as ensuring "fair" and "equitable" treatment of all of the parties involved. However, these goals can only be met by reference to some set of principles and models which guide deliberation and decisions, as they are applied to specific circumstances. Without context and principles, "just", "reasonable", "fair" and "equitable" are just empty words.

A. Manitoba Hydro's Legislative Framework

[*Please see Appendix A for the text of the legislation referred to in this section of this report*]

Manitoba Hydro is a corporation created by statute of the Province of Manitoba, through the *Manitoba Hydro Act*. The *Act* specifies that the company is the sole provider of electricity to retail customers in Manitoba (s. 15.2), and has the power to require any electricity produced by anyone in the province to be supplied to Manitoba Hydro (s. 16(1)(c)). In effect, the Province of Manitoba is the exclusive territory of the utility from the perspective of electricity supply.

The corporation has two main purposes:

- To supply power "adequate for the needs of the province", and
- "to supply power to persons outside the province" (s. 2).

The Board of Directors of the corporation has the power to make most decisions about the conduct of the business of the corporation, and has the responsibility to ensure it is meeting its purposes (ss. 14 and 15). However, like most government-owned enterprises, the company may not sell its businesses or major assets without express government approval (s. 15.1).

From a financial perspective, four provisions are critical:

- The price of power must reflect the full cost of operating the electricity system (s. 39(1));
- The corporation has limited powers to raise debt for short-term purposes (up to $500 million);
- The corporation's long term debt may be supplied by the government of Manitoba
- The province will guarantee all outstanding debt of Manitoba Hydro (ss. 30 to 35)

Despite the broad powers of the corporation to manage the supply and delivery of power in the Province of Manitoba, the company does not have the right to set its own rates. The *Crown Corporations Governance and Accountability Act* requires that Manitoba Hydro apply to the Public Utilities Board of Manitoba for any change in rates (s. 25). The PUB has the authority to review Manitoba Hydro applications, and to set rates that are consistent with the provisions of the *Manitoba Hydro Act*. The *Public Utilities Board Act* specifies all of the procedural rules that the PUB follows in reviewing applications, which are brought into play by s. 25(3) of the CCGAA. However, much of the *PUB Act* is not applicable to Manitoba Hydro (according to s. 2(5)).

The *Manitoba Hydro Act* specifies what Manitoba Hydro can include in its calculation of the price of power (s. 39(1)):

a) the necessary operating expenses of the corporation, including the cost of generating, purchasing, distributing, and supplying power and of operating, maintaining, repairing, and insuring the property and works of the corporation, and its costs of administration;

> b) *all interest and debt service charges payable by the corporation upon, or in respect of, money advanced to or borrowed by, and all obligations assumed by, or the responsibility for the performance or implementation of which is an obligation of the corporation and used in or for the construction, purchase, acquisition, or operation, of the property and works of the corporation, including its working capital, less however the amount of any interest that it may collect on moneys owing to it;*
>
> c) *the sum that, in the opinion of the board, should be provided in each year for the reserves or funds to be established and maintained pursuant to subsection 40(1).*

The concept of "reserves" is critical to the finances of the corporation, since it provides the enterprise with a degree of flexibility in managing its finances, which might not otherwise be possible. Section 40(1) and s. 40(2) provide additional detail with respect to reserves:

> *40(1) The board shall establish and maintain, and may adjust as required, such reserves or funds of the corporation as are sufficient, in the opinion of the board, to provide*
>
> a) *for the amortization of the cost to the corporation of the property and works, (whether as a whole or in its component parts), of the corporation during the period, or remaining period, of the useful life thereof;*
> b) *insurance, for which provision is not otherwise made, against loss or damage to any property of the corporation, or to the persons or property of others, caused by or arising out of the works or operations of the corporation;*
> c) *for the stabilization by the board of rates or prices for power sold by the corporation, the meeting of extraordinary contingencies, and such other requirements or purposes as in the opinion of the board are proper.*
>
> *40(2) The reserves created pursuant to subsection (1) may be used or employed by the board*
>
> a) *towards the reservation and setting aside of the sinking fund established under section 41;*
> b) *towards the renewal, reconstruction, or replacement, or depreciated, damaged, or obsolescent property and works;*
> c) *towards restoration of any property lost or damaged, or the payment of any claims, in respect of which a reserve as insurance has been established;*
> d) *in such manner towards the stabilization of rates or prices for power, the meeting of extraordinary contingencies, and for such other requirements or purposes, as the board in its discretion deems proper; and*
> e) *subject to the approval of the Lieutenant Governor in Council, towards the cost of construction of new works and extensions, improvements, or additions, to any property and works of the corporation.*

Somewhat confusingly, however, the *Crown Corporations Governance and Accountability Act* provides a different description of what should be included in the PUB's consideration of proposed Manitoba Hydro rates:

> *25(4) In reaching a decision pursuant to this Part, The Public Utilities Board may*
>
> a) *take into consideration*
>
> (i) *the amount required to provide sufficient funds to cover operating, maintenance and administration expenses of the corporation,*

(ii) interest and expenses on debt incurred for the purposes of the corporation by the government,
(iii) interest on debt incurred by the corporation,
(iv) reserves for replacement, renewal and obsolescence of works of the corporation,
(v) any other reserves that are necessary for the maintenance, operation, and replacement of works of the corporation,
(vi) liabilities of the corporation for pension benefits and other employee benefit programs,
(vii) any other payments that are required to be made out of the revenue of the corporation,
(viii) any compelling policy considerations that the board considers relevant to the matter, and
(ix) any other factors that the Board considers relevant to the matter; and

b) hear submissions from any persons or groups or classes of persons or groups who, in the opinion of the Board, have an interest in the matter.

While the formulations of the requirements are somewhat different between the two Acts, it is clear that both Acts provide flexibility to include some amount of "reserves" in the calculation of rates charged by Manitoba Hydro. Moreover, both Acts make clear that recovery of all of Manitoba Hydro's necessary costs is required over time.

One notable issue is that while both Acts specifically allow for "reserves" to be maintained at Manitoba Hydro, and for the calculation of rates to take reserves into account, neither the legislation nor attendant regulations specify the size of those reserves, nor any other characteristics about them. Unlike in many other jurisdictions, where the capital structure of government-created utilities are specified by government, in Manitoba this matter has been left open.

B. Regulatory Principles and the Regulatory Model

While legislation spells out the broad outlines of what can and should be included in rates, the details and nuances of rate-setting are found in regulatory principles, policies and decisions. Over more than 100 years, a body of regulatory precedents and practice has developed which can be called upon to help make determinations about utility rate issues. This regulatory practice extends beyond Manitoba to the rest of Canada, the United States, the United Kingdom, and other countries with similar legal and government systems with respect to utilities.

In addition, there is also a substantial body of academic analysis from the perspective of economics and law which sheds light on regulated utility rates, and regulatory issues more broadly.

Manitoba PUB Regulatory Principles

The PUB has described its regulatory principles in the following way[3]:

> *There is no single authority that sets regulatory principles, and these principles may conflict or overlap, but it is the goal of the PUB to effectively balance the following principles and consistently take them into consideration when setting utility rates.*

[3] Please see Appendix B for the full text of the PUB's statement about regulatory principles, as drawn from the PUB's website.

- *Cost of service standard*
- *Intergenerational equity*
- *Matching Principle*
- *Rate stability and predictability*
- *Used or required to be used*
- *Prudence standard*
- *Why we do it*

Specifically with respect to its consideration of rate applications, in Board Order 98/14 the PUB summarized its duty as:[4]

- *Ensuring that forecasts are reasonably reliable;*
- *Ensuring that actual and projected costs incurred are necessary and prudent;*
- *Assessing the reasonable revenue needs of an applicant in the context of its overall general health;*
- *Determining an appropriate allocation of costs between classes; and*
- *Setting just and reasonable rates in accordance with statutory objective*

This summary reflects many of the concepts included in the PUB's principles, as described above.

Broader Regulatory Principles and Practice

As noted above, the PUB does not exist as a regulator in isolation, nor did it develop its principles and practices on its own. The PUB's principles and practices are drawn from, and broadly consistent with those of many other jurisdictions, with appropriate adjustments for the needs of Manitoba.

An enormous body of academic literature concerning utility regulation exists, which summarizes, analyses and critiques a multitude of the issues which may arise in any jurisdiction. One of the foundational texts for modern regulatory rate-making is James C. Bonbright's *Principles of Public Utility Rates* (1961), source of the famous "Bonbright Criteria" for regulatory rate-making.[5] Important additional texts include, for example, Alfred E. Khan, *The Economics of Regulation* (1970), and Charles F. Phillips, *The Regulation of Public Utilities* (1984). From these and many similar works, a summary list of general principles can be formed which capture what most regulators focus on.

Monopoly Utility Customer Service: Regulated rates should be set for services which can only be efficiently provided by a monopoly. If a service is amenable to market competition, then it should not be regulated, but rather should be opened to competition, to the benefit of customers. Assuming a territorial monopoly is the only reasonable arrangement for a service, then ensuring the actual delivery of high quality service to customers should be a priority of regulation.

Economic Efficiency, both Static and Dynamic: A monopoly utility should be regulated in such a way that its services are delivered as efficiently as possible, making best possible use of available resources, both at any given time and over time. Given that the potential for efficiency changes over time depending on labour markets,

[4] Board Order 98/14, page 28. Note that this was a Board Order in respect of the Manitoba Public Insurance Corporation. However, a substantially similar list appears in Board Order 5/12, pages 26 – 27, which was in respect of Manitoba Hydro.
[5] Please see Appendix C for the full text of the Bonbright Criteria.

available technology and economic conditions, regulators should ensure that utilities are not only delivering services using the most efficient tools and practices available at any given time, but are also appropriately planning and investing to perform their functions more efficiently in the future.

Cost Causality, both Between Customers and Over Time: Customers should pay the costs associated with the services they use, and rates should reflect that. This is a critical concept in allocating current costs between customer classes, but also with respect to allocating the cost of long-lived assets over time. This principle rests on the recognition that all customers are equally important, so fairness demands that no customers be forced to pay for costs caused by others.

Stability and Predictability: Customers' ability to properly plan their usage of the utility's products and services depends on knowledge about how much those services will cost or are likely to cost, and when and in what form they will be available. By the same token, the utility itself can only operate efficiently if it has appropriate foreknowledge of the standards and business practices that are going to be required of it.

Prudence: Utilities should operate in a manner which reasonably reflects the common understanding of risks applicable in their industry, and seek to appropriately manage those risks. This principle is both a standard for utility behaviour, and a defense for utilities against after-the-fact criticism of their decisions and behaviour in challenging circumstances.

Public Interest: Utilities should be required to operate in a manner that is cognizant of the externalities associated with their products and services, and as much as possible supports the economic and social development of their communities. As a matter of course, utilities should meet all public requirements and standards with respect to labour, environmental, health and safety practices.

Access to the Capital Markets: Utilities are capital intensive businesses, and as such should be regulated, organized and operated in a way which will be attractive to the capital markets as an investment opportunity. This will both facilitate ongoing investment, and ensure that the cost of capital applicable to the investment is as low as possible.

It is important to note that these principles cannot always be simultaneously accommodated in every regulatory situation. The essence of "fairness" or a "just and reasonable" determination is in fact typically associated with balancing and applying these principles to specific cases. For example, "cost causality" might imply that costs should be allocated on an individual customer basis, but concern with administrative efficiency demands customers be grouped into reasonably large classes to prevent undue administrative burden and keep costs down. Similarly, fixing prices for 10 years at a time might benefit customers by providing predictability, but the capital markets would object that limiting financial flexibility would create significant risks that would result in much higher costs of capital. Despite the impossibility of simultaneously satisfying all of the principles in every situation, it is still critical that the relationship between every regulatory decision and the principles upon which it rests are made clear.

The Typical Economic Model for Regulated Utilities

The broad regulatory principles outlined above were formulated in relation to an economic model for utilities. This model both expresses the application of these principles, and highlights their limitations.

Investor-owned: In the United States, where there has been the most development of both the economic literature and jurisprudence of regulated utilities, approximately 70% of electricity customers today are served by investor-owned utilities. While the remainder are served by a combination of rural electric cooperatives and government-owned utilities ("Public Power Utilities", as they are called in the United States), the starting point for utility analysis has traditionally been the investor-owned model. In an investor-owned utility, equity investors bear the primary risk of financial uncertainty and loss, in exchange for receiving a regulated return on the equity they contributed to the utility.

Ratebase Model: The capital base of the utility consists of the Property, Plant and Equipment (including "intangibles" that are necessary for the operation of the utility) that is currently in use ("used and useful"), plus some amount of Working Capital (the exact definition and calculation of which differs from jurisdiction to jurisdiction) necessary for the daily operation of the business.

Capital Structure Determined by the Regulator: Typically, regulators determine a maximum allowable amount of debt in the capital structure, with the remainder consisting of equity contributed by shareholders. The choice of the debt-equity ratio must balance efficiency, risk management and access to capital. A very significant literature exists specifically on the point of the restrictions regulators should put on equity providers to manipulate the capital structure for their own benefit.

Revenue Requirement Formula: Opex + Depreciation + Debt Interest + Return on Equity + Taxes
where:

- Operating Expenses (Opex) are consistent with prudent and efficient utility operations, and will be expected to be sufficient to deliver on customer requirements, while meeting all public interest standards;
- Depreciation is based on the total pool of depreciable assets employed in the business (as long as they are "used and useful"), and is typically calculated on a straight line basis (whether individual or group), in order to allocate the burden of the use of assets equally across time to the ratepayers that benefit from them;
- Debt Interest and Return on Equity are calculated based on the deemed Ratebase of the utility;
- Debt Interest is typically calculated using interest rates actually faced by the utility, to ensure that the cost of capital is both as efficient as possible, and reflective of the real cost of operating the utility;
- Return on Equity is based on a Rate of Return on Equity set by the regulator, at a level that is high enough to attract sufficient capital from the market, but not higher than necessary, so as to ensure that cost of capital for the utility is as efficient as possible;
- Taxes at prevailing rates, and calculated based on the expected Return on Equity.

Prospective Rates: The Revenue Requirement is calculated prospectively for a coming year, based on forecasts and assumptions. The Equity Provider is at risk for any variation between the forecasts and assumptions and reality as it may occur, within limits set by the regulator. If the utility is operated poorly, and earns less than the expected return on equity during the coming period, then investors will suffer. If weather events (such as heat waves or cold snaps) cause customers to use more than usual amounts of power, then investors may earn higher than normal returns. However, regulators sometimes provide full or partial relief against certain unusual risks, and/or may limit the allowed return on equity above a certain level (which reduces the financial risk associated with the equity while possibly also limiting the upside available to investors, and may make the total cost of the utility more efficient in the long run).

Capital Plans Approved by the Regulator: Since investors' return on equity is ultimately dependant on the capital used in the business, a primary concern of regulators is ensuring that capital equipment is only purchased if it is reasonably and prudently necessary for the proper operation of the utility (regulated utilities are one of the few classes of companies in the world where spending more money on capital equipment is a positive temptation).

This model, as refined over decades of experience, has been optimized to balance the various regulatory principles described above. Under theoretically ideal conditions (for example, stable inflation and interest rates, zero customer growth and equal amounts of capital expenditures required annually), customers would face a stable cost of power on an inflation-adjusted basis, which would represent a perfectly "fair" allocation of costs over time. However, since "ideal" conditions do not happen in reality, any number of challenging decisions are required to try and ensure "just and reasonable" rates. The widespread use of this model across North America means that most of these issues have been addressed many times in the past, and different solutions have been attempted, which provides all regulators with a rich body of experience upon which to draw.

C. Manitoba Hydro Differs from the Traditional Regulated Utility Model

Manitoba Hydro is not structured according to the typical regulated utility model, and differs in a number of important ways.

Non-share Capital Corporation: As noted above, Manitoba Hydro was created by statute, is an agent of the Government of Manitoba, has no equity investors at risk for its performance, and makes no payments to any equity investors (the government is not an equity investor itself). Theoretically, this means that 100% of the utility's capital could be debt. In addition, since there are no equity investors, and no equity capital at risk in the company, then any capital in the company other than debt is not really "equity" in the normal meaning of the word.[6]

Exports are an Objective: Unlike a typical monopoly utility whose obligation is to serve the customers in its territory as efficiently as possible, Manitoba Hydro is explicitly allowed by its governing legislation to seek to export power. This is a critical distinction, because the business model and risks associated with exports are fundamentally different from the business model and risks associated with a domestic monopoly utility business.

Debt Provided and Guaranteed by Government: The Government of Manitoba is the sole provider of long-term debt to Manitoba Hydro. In turn, the government raises debt capital from the capital markets, and on-lends the funds to Manitoba Hydro, with the addition of a debt guarantee fee. This means that Manitoba Hydro is not directly exposed to the capital markets. However, the regulatory principle of "Access to Capital" is still important, since Manitoba Hydro's performance could have important impacts on the government's access to capital. The relationship to capital markets is less direct than normal, but still relevant.

No Ratebase Model: Manitoba Hydro does not have a ratebase consisting of property and working capital, no deemed capital structure for ratemaking purposes, and no rate of return on equity. Instead, only actual costs of

[6] Note that some government-owned enterprises use various names for "non-debt" capital, while others share Manitoba Hydro's use of the term "equity". Please see the next section for a sampling of the terminology used.

debt incurred by the company are included in rates, effectively minimizing the cash cost of capital for the corporation.[7]

All Costs Are Recovered Over Time: Since no equity investors are at risk, there are no parties available to bear the risk of Manitoba Hydro's actual financial performance. Domestic ratepayers are ultimately responsible for all of the costs of the utility, <u>however and whenever incurred</u>. While rates are still set prospectively based on forecasts and assumptions, any divergence between those forecasts and reality as it ultimately occurs are simply captured in future rates.

Reserves are Required: Since Manitoba Hydro has no equity investors or equity capital at risk, and the corporation applies for rates based on estimates and forecasts of its expenses and cost of debt (rather than the larger deemed cost of debt and equity that would be calculated in a typical investor-owned utility model, which is based on a ratebase that includes some amount of working capital in addition to used and useful assets), the corporation must maintain reserves which allow it to manage divergences between forecasted and actual revenues and costs. This is an issue which will be examined in greater depth below.

Revenue Requirement Formula: Given the many differences from the typical regulated utility model, a different revenue requirement formula could be understood to apply to Manitoba Hydro, namely:
Opex + Depreciation + Debt Interest + Taxes +/- Planned Changes in Reserves
where:

- Opex, Depreciation, Debt Interest and Taxes have the same meaning as the typical regulatory model;
- Return on equity is conspicuously absent from the formula; and
- Planned changes in reserves can be positive or negative in any given year, depending on whether the corporation's reserves are more or less than required.

Government Approves Major Capital Spending: In the past, the Government of Manitoba has made decisions about major capital spending plans at Manitoba Hydro, and those plans were not contestable before the PUB. While "normal" capital spending could be reviewed as part of rate applications, very significant decisions related to the capital plan have been exempted from review. In the current rate application, the PUB has been directed by the government to review all capital spending plans as part of its determination of rates.[8]

Taken together, these various differences mean that Manitoba Hydro operates dramatically differently than a typical regulated utility, particularly in a financial sense.

The corporation's <u>cash</u> cost of capital is significantly lower than that of a typical utility, because Manitoba Hydro has access to government guaranteed debt, because it pays no returns on equity, and it charges customers only for its expected cash cost of debt interest rather than a deemed amount of debt interest based on a deemed ratebase. However, it is important to note that the <u>actual</u> cost of capital must include some accounting for the necessity and existence of reserves. The reserves represent a financial burden on the ratepayers that contributed the funds through their rates, and hence the capital cost of the reserves should be calculated at a discount rate appropriate for the full

[7] Note that there is an exception to "actual" costs of debt, which is the "deemed debt" that is capitalized in assets under construction, and which is calculated based on the average cost of debt in the utility, rather than an actual cost of "construction debt".
[8] Manitoba Order-in-Council 92/2017, issued on April 5, 2017.

body of Manitoba Hydro domestic customers.[9] Unlike equity providers in a typical regulated utility who freely choose to contribute capital based on expected returns, Manitoba Hydro customers involuntarily make contributions to reserves through their rates. The effectively hidden nature of this capital cost should increase the burden on Manitoba Hydro to demonstrate that its reserves are both required and properly managed.

This is complicated by the fact that the corporation's mission to pursue export opportunities creates strikingly different incentives, pressures and risks as compared to a typical regulated utility. There is no doubt that the existence within Manitoba of natural hydroelectric resources represents a significant opportunity for social and economic development on a provincial scale. However, developing those resources for export purposes rather than domestic consumption casts Manitoba Hydro in an entrepreneurial role, rather than the usual role of a regulated monopoly utility. Entrepreneurs fundamentally make a "risk/reward" decision when they choose to invest in a project: if their hopes bear out, they will make money, but if the project results are poor, they ultimately could lose their entire investment.

At Manitoba Hydro, investment decisions on export projects are made by the government based on analysis provided by Manitoba Hydro, yet the financial consequences of the decision are largely borne by domestic ratepayers, for good or ill. This disconnect in financial incentives is highly problematic, and not really amenable to analysis through the regulatory principles that arise from the typical regulated utility model. Regardless, the existence of these pressures in Manitoba Hydro means that the need for reserves are strongly impacted by the existence of export projects at any given time. Therefore, any consideration of the size and nature of reserves must take into account the risks inherent in export activities.

D. The Manitoba Hydro Peer Group

Manitoba Hydro is not a typical regulated utility, for all of the reasons described above. The primary difference is that it is an entity created by government statute, without equity investors. However, while this is not the way a majority of electricity utilities are structured, it is not a unique characteristic, as there are a number of government-created electricity utilities across North America, some of which share various characteristics with Manitoba Hydro.

Information on a number of such utilities has been gathered below.[10] A primary distinction between the two groups listed below is national identity: the first group consists of Canadian utilities, and the second consists of utilities from the United States.

A few observations may be considered notable:

Export Focus is Rare: Manitoba Hydro shares a mandate to pursue exports only with Hydro Quebec and Nalcor. BC Hydro conducts and profits from active trading with nearby jurisdictions, but that function depends more on the flexibility of that province's electricity system, rather than net exports (in many years the BC Hydro is a net importer of power, yet still profits handsomely from its trading activity). All other government-created utilities are

---

[9] Note that reserves always are attributable to domestic ratepayers, even if Manitoba Hydro's exports happen to be profitable at any given time. The profits from exports in a cost-recovery entity like Manitoba Hydro should be used to reduce rates on domestic customers. If rates are not reduced because the export profits are necessary to increase reserves, then customers are making the contribution. Customers are in the same position as equity providers in a typical regulated utility, and bear the financial risk of the corporation.

[10] Please see Appendix D for additional information on these utilities.

mandated to seek to deliver low cost power to customers in their territories, and may engage in exports as an incidental by-product of having temporary excesses of supply.

Pure Cost Recovery Model More Common in the United States: Manitoba Hydro does not pay dividends to the Province of Manitoba.[11] This contrasts with most government-created utilities in Canada, which are required to pay dividends to provincial or municipal governments when financially feasible.[12] In several provinces, including in British Columbia, for example, the deemed debt to equity ratio is specified in legislation, and the regulator is required to include in rates a specific return on that equity. Comparison of financial targets between Manitoba and these provinces is therefore of limited use. In the United States, by contrast, a number of power authorities are explicitly structured as pure cost recovery enterprises, and pay no dividends to any government or other entity.

Use of the Term "Equity": Manitoba Hydro shares the use of the term "equity" with all other Canadian utilities. Given that virtually all Canadian utilities either do or have regularly paid dividends to their equity owner, this usage in cases other than Manitoba appears logical. However, in the United States where pure cost recovery models are more prevalent, a variety of different terms are used by utilities instead of the word "equity", which often provide a better description of the source of the capital in question. For example, the Bonneville Power Administration refers to "Accumulated Net Revenues", the New York Power Authority, Long Island Power Authority and Santee Cooper all refer to "Net Investment in Capital Assets", and the Tennessee Valley Authority uses the term "Proprietary Capital".

Debt to PPE Varies Dramatically: In the tables presented, recent information on long-term debt and on Property, Plant and Equipment is provided.[13] These two balance sheet line items were chosen deliberately because they tend to have stable definitions, even across various accounting standards and regulatory approaches. Calculating a ratio between these two figures provides insight into the degree of indebtedness of the entity.[14] In Canada, the range is from 27% for OPG to 102% for NB Power. In the United States, the range is from 22% for the New York Power Authority to 102% for the Long Island Power Authority. These dramatic differences depend both on policy choices, as well as coincidental characteristics of each utility.[15] Note that for comparison purposes, Manitoba Hydro's Debt : PPE ratio as of March 31, 2017 would be approximately 82%.

---

[11] Note that special dividends have been paid in the past.

[12] Note that Nalcor, NB Power and SaskPower have not paid dividends in several years due to various financial challenges. Hydro Quebec and BC Hydro are required to make regular payments, while OPG's payments depend on performance. The municipal utilities all pay regular distributions to their owners.

[13] Note that for entities using IFRS accounting, "intangibles" were added to PPE. Also, the current portion of long-term debt has been added to reported long-term debt.

[14] Note that Debt/PPE is not a typical financial metric used by credit rating agencies or other analysts. Instead, an analyst will typically undertake a substantial process of "adjusting" reported financial results to standardize them and compare them to peers. For example, standard metrics for capitalization include Debt : Total Capital, and Debt : Equity. However, the use of GAAP vs. IFRS accounting affects the calculation of Total Capital, and some utilities use each of these accounting methods. Moreover, again depending on accounting standards and regulatory policy, non-cash items such as pension liabilities, post-retirement benefits liabilities and regulatory assets and liabilities may affect total capital in different ways. Focusing on the assets actually used in the utility business and verifiable long-term debt simplifies comparison and reduces the need for extensive explanations and caveats.

[15] For example, OPG has a massive non-debt liability on its balance sheet for nuclear retirement, which strongly affects its capital structure, and Santee Cooper has recently been forced to accept that it will have to write off several billion dollars of investment in a failed nuclear build, which has greatly increased its indebtedness.

Most But Not All Are Exclusive Monopolies in Their Territory: No other electricity company is allowed to operate in Manitoba. This is also true in most of the peer group jurisdictions, and it is a financial strength for all of the companies that share that characteristic. Some, like Ontario Power Generation, are not exclusive suppliers in their territory, and are subject to various forms of competition, making them less useful as a comparator for Manitoba Hydro.

Economic Model: BC Hydro, Nalcor, OPG and the three Canadian municipal utilities examined above explicitly use the traditional "ratebase" utility model to produce rate applications, again making comparison with Manitoba difficult and of limited use. Many of the US utilities examined set their own rates for all or part of their services. The Tennessee Valley Authority, which sets its own rates for power, describes its model as a "Debt-Service Coverage Methodology", which specifically focuses on the need to "cover its operating costs and to satisfy its obligations to pay principal and interest on debt".[16] The Bonneville Power Administration uses a cost recovery model to calculate its revenue requirement, but explicitly focuses on measurements of reserves, risk and liquidity in its calculations to ensure that it continues to be attractive to debt providers.[17] SaskPower, Santee Cooper, the Los Angeles Department of Water and Power and others target specific annual payments to their government parent entities, so their rates include their projected full costs, plus a payment to equity, which allows a financial "cushion" in rates in the event that forecasts prove to be inaccurate.

Investment Grade Debt: All of the utilities examined which have their own credit ratings (i.e., Canadian municipal utilities and all of the US utilities) boast investment grade debt (at least BBB+), regardless of their current levels of indebtedness (which in some cases are higher than Manitoba Hydro's). Every Canadian provincial utility is supported by provincial debt guarantees, or receives their debt funding directly through their provincial government, and all provincial governments in Canada are above investment grade.

This survey of government-created electricity utilities across North America serves to highlight that Manitoba Hydro is unique in important ways. It is the only utility which combines a full cost recovery model with an explicit mission to develop electricity resources for export purposes. Nalcor and Hydro Quebec both pursue exports, but neither operates based on a pure cost recovery model. Hydro Quebec shields its domestic ratepayers from the entrepreneurial risk associated with exports by designating a "heritage pool" of 165 TWh of energy for domestic use at fixed costs (rising annually by inflation). On the other hand, the results of export activities directly impact the government through the rise and fall of net income and dividends paid to the province. In essence, the government is taking the entrepreneurial risk associated with exports, not the ratepayer. Nalcor is pursuing a major export project (the Muskrat Falls generating station, and associated transmission infrastructure), but the government is directly contributing equity to that endeavour, and domestic rates continue to be based on a typical ratebase utility model. Similarly to Quebec, the Government of Newfoundland is at risk for its investment in export activities, while it earns a typical utility return on the portion of the investment serving domestic needs. In both of these cases, the risks facing domestic ratepayers are very different than in Manitoba, and the companies in question do not appear to be useful points of comparison with respect to financial targets for Manitoba Hydro.

---

[16] Please see Tennessee Valley Authority, Form 10 K for 2016, page 12.

[17] Please see Bonneville Power Administration Overview for Investors, August 28, 2017, page 15, available at https://www.bpa.gov/news/Investor/Pages/default.aspx. In particular, please note the "Reserves Available for Risk" methodology and calculation, as well as "Days of Liquidity on Hand", which includes access to a short-term credit line.

Several major utilities in the United States operate on a pure cost recovery basis, but do not pursue exports out of their system, except as a means to manage temporarily surplus power. Again, a direct comparison with respect to Debt : Equity Ratio or other metrics may not be particularly useful. Having said that, their focus with respect to financial targets generally is not a specific capital structure, but rather on measures of cash flow sufficiency and interest coverage. As noted above, the Tennessee Valley Authority goes so far as to label their economic model a “debt service coverage” scheme. Bonneville Power Administration focuses on cash flow sufficiency, and the maintenance of liquidity sufficient to manage potential needs between rate reviews (which are every two years, in their case). Both utilities make clear that their ultimate recourse to ensure economic viability is to rate increases (in the case of TVA, they set their own rates, while for BPA they apply to FERC).

E. Capital Markets Environment

Manitoba Hydro has limited direct exposure to the Canadian capital markets, given that it receives almost all of its long-term debt resources through the Government of Manitoba. Nevertheless, the capital markets are the ultimate funders of Manitoba Hydro’s debt, so understanding market perspectives on Manitoba Hydro’s economic performance is extremely important.

Market for Manitoba Debt, and Manitoba Hydro’s Role

Manitoba Hydro does not issue long-term bonds to raise money.[18] Instead, the Province of Manitoba issues Manitoba bonds, and then on-lends the proceeds to Manitoba Hydro at identical terms (maturity date, interest rate, etc.). In addition, the Province adds a debt guarantee fee on all outstanding bonds, currently set at 1%.

From an investor’s point of view, they are never buying Manitoba Hydro debt, but rather are buying Province of Manitoba debt, which may be used to fund Manitoba Hydro projects, the projects of other Manitoba crown corporations, or the general obligations of the provincial government. Nevertheless, given the size of the Manitoba Hydro debt portfolio relative to the rest of the Government of Manitoba debt portfolio, information about Manitoba Hydro is critical to any potential bond buyer’s view of Manitoba bonds.

Issuance of provincial bonds or debt notes is typically an auction process. In grossly simplified terms:

- The issuer determines how much debt they are seeking, of what type (fixed rate, floating rate, etc.), and for what term;
- Potential investors are contacted by the banks acting as intermediaries for the bond sale and apprised of the details;
- On the day and time of the transaction, potential bond purchasers submit bids for the amount of bonds they are interested in purchasing, and at what price (sometimes investors are limited to a maximum bid, in order to ensure that bond issues are not overly concentrated into the hands of a small number of investors);

[18] In the past, Manitoba Hydro did issue “Hydrobonds”, but no longer does so. Outstanding bonds form a very small part of the existing pool of debt. In addition, Manitoba Hydro can issue short term debt in its own name. However, this source of capital is also dwarfed by outstanding long-term bonds.

- Bids are ranked from lowest to highest, and bids are accepted from the bottom up until the total desired amount of the bond issue is reached;
- The price of the highest bid to be accepted becomes the price of the entire debt issuance.

In order for potential investors to determine what interest rate they are willing to bid into the auction process, they must have an opinion on the risks associated with the transaction. All available information about the bond issuer and broader economic conditions factor into that understanding. Three layers of analysis are required, which are common to all financial investments:

- What currently is the risk associated with bonds vs. other types of available financial assets such as stocks, futures, options, or real estate? (i.e., asset class selection)
- What is the risk of the national jurisdiction of the issuer vs. other countries? (i.e., market selection)
- What is the relative risk of this particular issuer as compared to other issuers of that type of security in that country? (asset selection)

In concrete terms, the answers to the first two questions largely determine the interest rate associated with Government of Canada bonds. The global capital market determines the overall price of bonds versus stocks or other types of securities at any given time. The global capital market also determines the spread in bond prices between national governments, depending on real time collective global opinions about the expected performance of each national economy and government. Finally, information specific to Manitoba determines the spread between Manitoba bonds and Canada bonds.

Given that Manitoba Hydro debt represents such a large fraction of total Manitoba debt, information about Manitoba Hydro and its ability to make good on the terms and conditions of its bonds forms a very significant part of the story for all Manitoba bond issuances.

Who Buys the Bonds, and What Is the Role of Credit Rating Agencies?

For a typical Canadian dollar bond offering by a Canadian province, the list of potential buyers may consist of 150 to 200 institutions. Typically, these include pension funds, insurance companies, banks and other large financial institutions. Most are based in Canada, but some international institutions purchase Canadian dollar bonds as well. If a province chooses to issue bonds in a foreign currency, then the number and nature of likely players will very much depend on the currency chosen for the bond issue, and the terms of the offering.

Some institutions have large portfolios of government bond holdings. For example, according to its 2017 Annual Report, the Canadian Pension Plan Investment Board held over $80 billion in government bonds, from across Canada and globally. With over 1000 employees in its Toronto head office alone, and an entire group dedicated to the analysis and management of its bond portfolio, the fund can be considered an extremely sophisticated investor. Other potential investors are within the same class, while “smaller” institutional investors will still have large teams and significant research and analytical capabilities as they manage portfolios of government bonds measured in the billions of dollars.

All of these institutions make real time decisions about their bond purchases, trades and the management of their portfolios. There are numerous bond issues that occur every month, and furthermore government bonds are often traded after they are issued, as institutions constantly seek to adjust the size and duration of their bond portfolios, based on their own financial needs and priorities.

Conspicuously absent from this picture are credit rating agencies. These companies are independent analysts who review available information about debt issuers, and provide an opinion as to their credit-worthiness in exchange for fees. Agencies do not participate in the debt market themselves. There is no direct relationship between the opinions of credit rating agencies and the actions of bond purchasers or traders. Bond purchasers participating in the bond market make decisions in real time, and cannot wait for the opinions of external advisors.[19] Credit rating agency opinions are one more data point in an ongoing stream of information that is critical to debt market decision-making.

In fact, it is notable that the opinions of credit rating agencies are often inconsistent with each other, as each agency determines its views independently, according to its own criteria. Moreover, since credit rating agency reviews often follow from significant events and developments affecting a debt issuer (in the context of governments, that could be annual budgets, announcements of major new policies, or significant events in the local economy), it is often the case that the bond market reacts before credit rating agencies do. Changes in bond prices often will precede announcements of new opinions by credit rating agencies, rather than follow them.

Nevertheless, credit rating agency reports are useful:

- They consist of well written, high quality, thorough and sophisticated financial analysis that will mirror the kinds of analysis that institutional bond buyers will likely also pursue in-house;
- They are updated from time to time, to take into account recent conditions and expectations about the future for a particular issuer; and
- They are <u>publicly available</u> (usually for a price), unlike the views of actual bond market participants, who are naturally reticent to share their analyses and opinions lest their competitive position be affected.

As a result, reviewing the opinions of credit rating agencies should provide insight into the thinking process of the bond market as a whole, which is extremely useful when considering the broader context for Manitoba Hydro financial targets.

Credit Rating Agencies, Manitoba, and Manitoba Hydro

The key issue for a bond buyer is the risk that the debt issuer will not fulfill the terms of the bond: either by failing to make interest payments that are required periodically, or by failing to redeem the bond when it comes due. The greater this risk of default, the higher the interest rate that will be required to entice a bond buyer to purchase a particular bond. At some point, bond buyers will simply refuse to purchase the bonds at any price, if too much risk of default is perceived.

National governments have the ability to print money, and so, as long as they issued bonds in their own currency, they have an almost unlimited ability to avoid technical default. However, if a national government resorts to printing

[19] Note that if an issuer is issuing bonds for the first time, or if they are commencing a new series of bonds, they may contract with one or more credit rating agencies to issue reports in advance of an issue, as a service to investors who may not be fully familiar with the issuer. Principally, this is a means to give potential bond investors a starting point for their own analysis; it is not a substitute for bond buyers doing their own work to analyze opportunities.

money to fulfill its outstanding obligations, thereby debasing its currency, it will quickly find that investors will no longer buy any new issues of that country's debt securities, inevitably leading to financial crisis.

Sub-sovereign governments, like provinces in Canada, do not have the ability to print money. Nevertheless, provinces in Canada do have substantial capacity to raise funds through various forms of taxation. Their ability to actually do so, in sufficient quantity to fulfil financial obligations and potentially in the face of domestic political objections and resistance, is a critical part of the determination of credit-worthiness.

Manitoba is a special case among provinces, in that such a significant part of its debt is associated with its electricity crown corporation.[20] As a result, cash flows from electricity sales represent a significant part of its ability to service its debt, rather than just taxes.

Three credit rating agencies – DBRS, Moody's and S&P – provide opinions on the credit worthiness of Manitoba debt, and by extension also the credit-worthiness of Manitoba Hydro. Unfortunately, these agencies do not agree with each other on some important issues and conclusions. However, that very disagreement highlights the fact that credit rating agency opinions are independent conclusions of competing groups of analysts, each selling their analyses to purchasers in the capital markets. Each of the opinions is an important data point that may be useful to bond investors, but none of them appear to be directly determinative of capital markets behaviour.

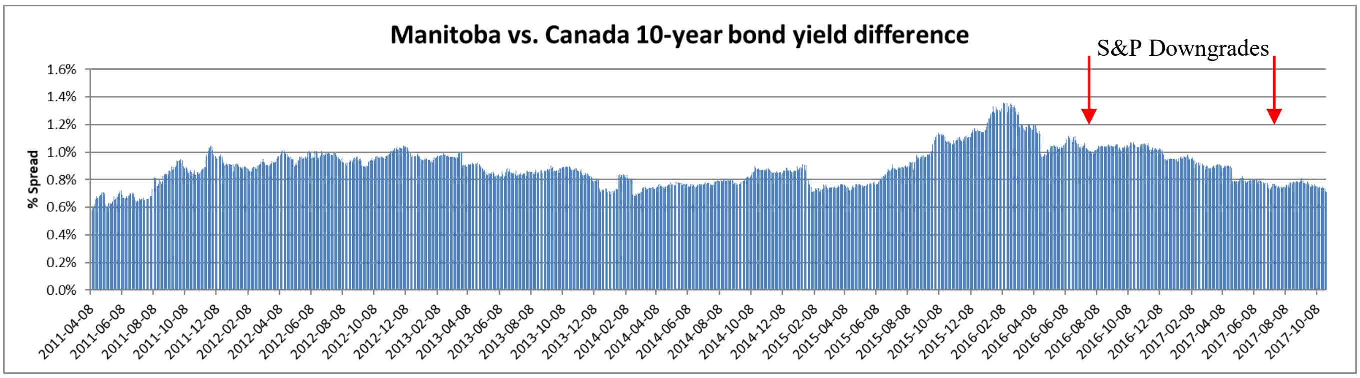
	DBRS	**Moody's**	**S&P**
Manitoba Credit Rating	A high	Aa2	A+
Relative Ranking	BC SK ON ***MB***, NB, QC NF	BC, SK ***MB***, NB, ON, QC NF	BC SK QC ***MB***, NB, ON NF
Manitoba Hydro is "self-supporting"	Yes	Yes	No

A critical issue in the three agencies' analysis of Manitoba finances is whether they consider Manitoba Hydro to be financially "self-supporting". Both DBRS and Moody's maintain that because Manitoba Hydro is expected to continue to service all of its debt through electricity revenues, Manitoba Hydro debt should not be included in the calculation of the provincial government's "tax-supported" indebtedness, and therefore does not affect consideration of the province's credit metrics and credit rating. S&P, on the other hand, has taken the position – only since July 2016 – that all of Manitoba Hydro's debt should be considered "tax supported". Simultaneously with it's release of an opinion reflecting this change, S&P also downgraded the province's credit rating from AA to AA-. A year later, in July 2017,

[20] As reported on page 57 of Appendix 4.5 by KPMG, Manitoba Hydro's net debt was the largest proportion of provincial net debt out of the provinces surveyed, including British Columbia, Quebec, New Brunswick and Newfoundland. Given Nalcor's planned expenditures on the Muskrat Falls hydroelectric project and BC Hydro's planned expenditures on the Site C hydroelectric facility, however, this status may change over the coming years.

S&P downgraded the province's rating further, from AA- to A+. Over this period, the other two agencies did not amend their credit ratings for Manitoba.

One way to shed some light on the relationship between credit ratings and the behaviour of actual bond investors is to examine the record of the spread in yields for Manitoba vs. Canada bonds. This spread represents the difference in perceived risk as between the Government of Canada (rated at the highest possible level by all three credit rating agencies) and the Government of Manitoba. Below is a chart showing the difference in yields for Manitoba 10-year bonds versus Canada 10-year bonds from April 2011 to October 2017. It is clear from even a cursory glance at this chart that the spread is constantly changing, due to a whole range of factors, but that rating actions do not appear to have much of an impact. The spread was actually lower in late 2016, after the S&P downgrade, than it was in early in 2016, when S&P still labeled Manitoba with a higher rating. Similarly, during July 2017 the spread was actually declining when S&P delivered its most recent downgrade. Canada's rating was stable throughout his period.



Source: Bloomberg

Nevertheless, the question of whether the debt of Manitoba Hydro is a financial burden to the Government of Manitoba is an extremely important one, and regardless of their conclusion on the matter, all three of the agencies do address this issue.

Under what circumstances would Manitoba Hydro be a financial burden to the Province of Manitoba? DBRS provided a clear explanation in its recent report on the Province of Manitoba: "DBRS fully expects the utility to recover its costs from the electricity rate base. As such, DBRS will continue to exclude the hydro-related debt from the calculation of tax-supported debt."[21] This recent statement reiterates a more comprehensive statement made in a November 2016 Rating Report on Manitoba Hydro:

> *DBRS continues to view Manitoba Hydro as self-supporting, as its earnings and cash flows continue to be sufficient to cover its operating expenses and to service its outstanding debt. However, DBRS could consider reclassifying a portion of the Utility's debt to be tax-supported should the financial health of the Utility deteriorate to the point where its expenses cannot be recovered through rates. If this were to occur, it could potentially put downward pressure on the Province's credit rating. Similarly, a large equity injection by the Province that materially increases tax-supported debt could also put downward pressure on the Province's credit profile. At this time, however, DBRS expects the Province's ratings to remain stable.*[22]

[21] DBRS, Province of Manitoba Rating Report, 12 July 2017, page 6.
[22] DBRS, Manitoba Hydro Electric Board Rating Report, 25 November 2016, page 2.

If DBRS were to come to the conclusion that Manitoba Hydro was not able to recover its costs from the electricity rate base for any extended period of time, then they would be forced to reconsider their exclusion of Manitoba Hydro debt from the Province's credit metrics.

Moody's echoes the position of DBRS: "Given its revenue stream that generates sufficient cash flow to support operations including interest payments, we view Manitoba Hydro as a self-supporting entity and therefore exclude the related debt from our debt metrics of the province."[23] However, Moody's goes on to clarify that "The anticipated increase in debt has put growing pressure on the province's rating since it raises the contingent liability of the province (anticipated to exceed 40% of the province's total debt by 2017-18) and has increased the risk that Manitoba Hydro could require a capital injection or other support from the province." Were Manitoba Hydro cash flows insufficient to satisfy its needs, or if Manitoba Hydro were to require some form of extraordinary support from the Province, then Moody's would reconsider its position.

In the case of both DBRS and Moody's, the determination of whether Manitoba Hydro's debt is a financial burden for the province is focused on cash flow. This emphasis on cash flow is consistent with typical definitions of insolvency (the inability to satisfy financial obligations), which is what bond investors are ultimately most worried about. Manitoba Hydro must continue to cover its costs, and in particular including its debt interest costs, without any external support from the Province. Failure to do so would call into question Manitoba Hydro's viability as a standalone entity, and result in at least some portion of its debt being determined to be "supported by the Province", to the potential detriment of the Province's credit rating.

S&P recently has taken a different position. In its December 21, 2015 rating report, S&P stated that "The province also borrows and on-lends to Manitoba Hydro, which we view as self-supporting."[24] No additional commentary was provided at that time clarifying why Manitoba Hydro was regarded as self-supporting, but this position had been consistent for many years. In its rating action six months later, however, S&P makes a statement about the "significant debt on-lent to the MHEB, which we no longer consider self-supporting mainly due to its high and rising leverage."[25] Apart from this statement, which is reiterated elsewhere in the report, there is no explanation given for the significant change in the S&P's position on the matter. One additional clue may be the statement that Manitoba Hydro "could produce considerable liabilities for the province. In our view, the government would be likely to support the utility in the event of financial distress. We believe that any such support would be limited to less than 10% of the province's consolidated operating revenues."[26] This statement points to the possibility that the *__risk__* of cash flow distress at Manitoba Hydro has caused S&P to reconsider its position on Manitoba Hydro being self-supporting, particularly given that increasing debt may increase the potential for financial distress. One additional consideration in the comparison of the two positions is that the "Primary Credit Analyst" for the Manitoba credit rating changed between the older and more recent reports. While S&P states that it follows a "committee" approach to making credit decisions, the possibility remains that a change in key personnel had some involvement in the changed position with respect to Manitoba Hydro's debt.

In any case, S&P's emphasis on "high and rising leverage" as a primary driver of a change of position with respect to self-supporting status is surprising, because it runs counter to S&P's own basic criteria for credit ratings. S&P emphasizes cash flow metrics as the basic determinant of financial risk, as opposed to capital structure metrics,

[23] Moody's, Province of Manitoba Update, 24 February 2017, page 4.
[24] S&P, Province of Manitoba, 21 December 2015, page 4.
[25] S&P, Province of Manitoba, Research Update, 14 July 2016, page 2.
[26] Ibid., page 4.

which are considered only as one factor among several which are used to refine ratings. This priority is clearly set out in the following excerpt from S&P's "General Corporate Methodology":[27]

> *11. The corporate analytical methodology organizes the analytical process according to a common framework, and it divides the task into several factors so that Standard & Poor's considers all salient issues. First we analyze the company's business risk profile, then evaluate its financial risk profile, then combine those to determine an issuer's anchor. We then analyze six factors that could potentially modify our anchor conclusion.*

> *12. To determine the assessment for a corporate issuer's business risk profile, the criteria combine our assessments of industry risk, country risk, and competitive position. <u>Cash flow/leverage analysis determines a company's financial risk profile assessment</u>. The analysis then combines the corporate issuer's business risk profile assessment and its financial risk profile assessment to determine its anchor. In general, the analysis weighs the business risk profile more heavily for investment-grade anchors, while the financial risk profile carries more weight for speculative-grade anchors.* [Note: <u>emphasis added</u>]

> *13. <u>After we determine the anchor, we use additional factors to modify the anchor</u>. These factors are: diversification/portfolio effect, <u>capital structure</u>, <u>financial policy</u>, <u>liquidity</u>, and management and governance. The assessment of each factor can raise or lower the anchor by one or more notches--or have no effect. These conclusions take the form of assessments and descriptors for each factor that determine the number of notches to apply to the anchor.* [Note: <u>emphasis added</u>]

> *14. The last analytical factor the criteria call for is comparable ratings analysis, which may raise or lower the anchor by one notch based on a holistic view of the company's credit characteristics.*

S&P further defines seven metrics that it focuses on with respect to cash flow (Note: the first two are the primary metrics, and the other five are secondary), the sheer number of which provides an illustration of the level of focus on cash flow in S&P's typical financial risk analysis. These are:[28]

- Funds From Operations (FFO) : Debt
- Debt : EBITDA
- Cash Flow From Operations (CFO) : Debt
- Free Operating Cash Flow (FOCF) : Debt
- Discretionary Cash Flow (DCF) : Debt
- FFO + Interest : Cash Interest
- EBITDA : Interest

Some of these measures rely on accrual accounting (from the Income Statement), and some are based in cash accounting (from the Cash Flow Statement), but all of them are designed to reveal whether an enterprise has the capacity to continue to meet its obligations.

[27] S&P, Criteria: General Corporate Methodology, published 19 November 2013.
[28] Ibid., paragraphs 101 to 103.

The emphasis that S&P normally places on cash flow metrics is consistent with the positions taken by Moody's and DBRS with respect to Manitoba Hydro's self-supporting status: Manitoba Hydro is self-supporting as long as its cash flows continue to be sufficient to covers its costs, including its debt costs.

Comparison to Other Pure Cost Recovery Electricity Providers

Manitoba Hydro's Canadian peer group does not include any utilities which are operated on a pure cost recovery basis. Each of them has shareholder equity and makes dividend payments to a parent, if financially feasible. Dividend payments represent a financial cushion which could be reduced or eliminated in times of financial distress (and in some cases this has occurred in the recent past). Manitoba Hydro does not share this ability.

Three of the United States utilities described above do share Manitoba Hydro's economic model of pure cost recovery, and each of these has an independent investment grade credit rating, despite the fact that two have Debt : PPE ratios which are higher than Manitoba Hydro's.[29] There are obviously many factors which contribute to the assessment of the credit worthiness of these companies, however a critical characteristic in all cases is a focus, both internally to them and among the rating agencies that review their credit-worthiness, on the sufficiency of cash flows to cover credit costs (i.e., Cash Flow : Interest metrics, or Debt : Cash Flow metrics), the ability to adjust cash flows in the face of financial distress, and the availability of sufficient liquidity to manage short term financial distress should it arise. Debt : Capital ratios are always included in ratings analysis, but they are not primary in the analysis, since the focus is always on cash flow sufficiency.

Appendix E contains copies of the following documents, which provide an illustration of these positions:

- Fitch credit rating criteria for US public power companies (highlights that cash flow sufficiency, and the ability to adjust customer rates to maintain that sufficiency, is critical to ratings)
- Fitch ratings summaries for Tennesee Valley Authority and Long Island Power Authority Bonds
- Moody's full credit rating report for Bonneville Power Administration
- Moody's rating summary for Tennesee Valley Authority
- S&P full credit rating report for Bonneville Power Administration

Priority of Capital Structure Ratio for Manitoba Hydro

This review of credit rating agency comments, both on Manitoba Hydro and on other pure cost recovery entities, raises questions about Manitoba Hydro's focus on Debt : Equity as the primary ratio of concern with respect to financial health. Throughout its application for new rates, Manitoba Hydro emphasizes the importance of ensuring the financial strength of the enterprise, principally as represented through the Debt : Equity ratio. However, this emphasis does not appear to be shared by analysts serving the capital markets, who appear to place a higher priority on cash flow metrics and the ability to adjust rates as required to match operational requirements. Certainly, the capital structure of a utility is important, and all analysts do recognize that, but few if any appear to make capital structure a centerpiece of their analysis in the way Manitoba Hydro does. This divergence between the narrative emphasized by

[29] Manitoba Hydro has a Debt:PPE ratio of 82%. For the Bonneville Power Administration, the ratio is 93%; for the Long Island Power Authority it is 102%, while for the Tennessee Valley Authority it is only 65%.

Manitoba Hydro and the narrative typically pursued by capital markets analysts is potentially troubling. If the Debt : Equity Ratio should not be the primary financial target of concern, then the setting of a goal for achieving a 75% ratio in 2027, and building rate proposals around that goal, is also cast into doubt.

4. Risks, Rates and Financial Plans

In its forecasts and plans, Manitoba Hydro has included "base case" or "reference" assumptions for all required variables. Under those assumptions, different rate paths will lead to specific financial outcomes. Conversely, defining a desired outcome (such as a 75:25 debt to equity ratio in 2027) allows for the calculation of the rate path required to achieve the outcome under base case assumptions.

However, since the world never operates according to forecasts, it is important to consider what might happen to financial outcomes as variables deviate from their base cases. How likely is it that the variables will deviate from the base case? How far might they deviate, in what time frame? Will financial outcomes that result from those deviations still be acceptable? If not, what can be done about it? Is it necessary to make provision in advance for these potential outcomes, or can they be addressed if or when they arise? Can regulatory principles help to guide these choices?

Potential deviation from a base case is, of course, just another way to describe a risk.

A. Nature, Magnitude and Expected Frequency of Manitoba Hydro Risks

As an electricity utility, the risks that Manitoba Hydro faces can be grouped into five broad categories:

Fuel Risk: The vast majority of electricity produced and delivered by Manitoba Hydro is hydroelectric in nature. The "fuel" for this output is water, and hence the primary fuel risk faced by Manitoba Hydro is the risk of persistent drought conditions. Even ignoring prolonged or severe droughts, the "normal" variability in water inflows into the Manitoba hydroelectric systems causes significant fluctuations in the corporation's annual financial results. Water is not the only fuel used in Manitoba, but all other resources, including wind, natural gas and imports, are minimal in comparison.

Operating Risk: This category encompasses the multitude of potential failures that could occur as part of the operation of an electric utility. Everything from storms damaging transmission infrastructure, to turbine or generator failure at major generation faculties, to labour disruption across the enterprise can be categorized as an operational risk.

Construction Risk: Manitoba Hydro is in the process of building two major projects (Keeyask and Bipole III) and a multitude of smaller undertakings. As has already occurred, construction projects face a range of possible ways in which their schedule or budget or both may be derailed, to the detriment to the corporation.

Market Risk: Manitoba Hydro must make forecasts and projections about its customers in order to understand and plan for delivery of its products and services in the future. In its particular case, Manitoba Hydro is heavily exposed to the growth rate in domestic demand for electricity, as well as both the demand and market price for exports. Manitoba Hydro does not face price risk in its domestic market, since rates are regulated on a full cost recovery basis.

Monetary Risk: As an enterprise which buys and constructs expensive equipment which will be operated over very long periods of time, Manitoba Hydro is particularly exposed to purely monetary variables, such as interest rates, inflation rates, and exchange rates.

Fuel Risk

Manitoba Hydro now has 104 years of data on water flows into the province's river systems. Using this data, the corporation can plot the likely physical output of its electricity generation facilities under a wide variety of conditions, and the financial consequences of each flow condition in a variety of different scenarios.

Water flows can vary enormously from year to year, with swings of up to 40%, as measured from the greater volume year. At the same time, flows can persist at above average or below average levels for significant periods. If a "severe drought" is defined as a period in which average water inflows for a five-year period are 85% of the historical average annual inflow, then such periods have occurred approximately 10% of the time over the past century. Put differently, and assuming both that water inflows are truly random on an annual basis and that the past 104 years is a representative sample of what will occur in the future,[30] then at the beginning of any given year, there is approximately a 10% chance that Manitoba is embarking on a five-year drought. This is a non-negligible risk.

The effects of water inflows are not financially symmetrical: in other words, high flows do not improve financial performance as much as low inflows harm it. This is because in times of exceptionally high inflows, water must be literally spilled out of reservoirs for a variety of safety and operational reasons. As a result, the mean financial case is actually associated with water inflows that are below the median. Manitoba Hydro has provided example scenarios for one specific year, 2017/18, for the operating income that results from the 104 water inflow cases under reference assumptions for domestic demand, interest rates, export prices, etc.[31] These illustrate the range of results that are possible, solely on the basis of alternative water flows. The chart on the next page is a graphical representation of the information provided.

The level of water inflows affects only three line items on the Manitoba Hydro Income Statement: Export Revenues, Water Rentals and Assessments Expenses, and Fuel and Purchased Power Expenses. Netting the three hydraulic line items provides a sense of the range of the impact that water availability can have on Manitoba Hydro's financial results (i.e., for each of the 104 water scenarios, the calculation Export Revenues – Water Rentals – Fuel and Purchased Power was completed. The result of each of those 104 calculations is a bar on the chart, which were then sorted in order from lowest to highest).

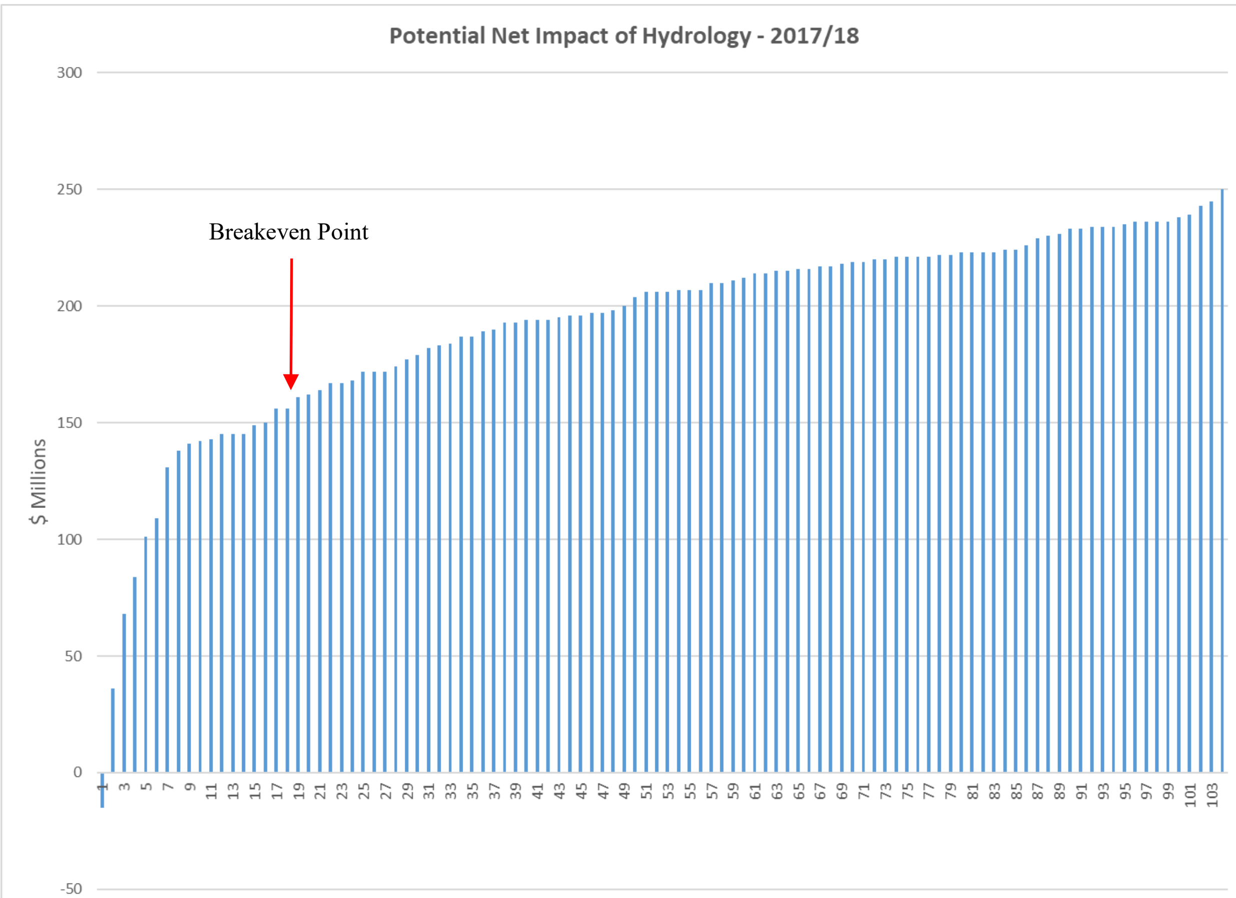
The mean of the financial results is $192 million of net revenue from these three line items. The best result is $250 million, but the worst result is a loss of $15 million. Bad water scenarios are very, very bad, but there are not many of them within the sample of 104 years. Only 6 water scenarios out of 104 result in net revenues of less than $130 million.

In each of the 104 scenarios, all of the line items on the financial statement are the same, except for the three water-related line items already identified. Keeping those three line items aside, if all of the remaining revenue and expense lines are netted out, the result is a net operating income of $795 million. However, Depreciation and Finance Expense are together $954 million. This means that before taking into account the three water-related line items (Export Revenues, Water Rentals, and Fuel), Manitoba Hydro would be suffering a net loss of $159 million.

[30] Note that these are VERY significant assumptions. For example, if water inflows are being affected by long-term changes in climactic conditions, such as climate change, then the past 104 years may not be a good sample of what will happen in the future.
[31] Please see the response to Coalition Round 2 IR-3(b) Attachment 1. This provides operating statement results for 104 different water scenarios for the 2017/18 financial year.

Of course, the three line items do need to be taken into account. Of the 104 water cases, only 18 result in net hydraulic revenues below $160 million, which means in only those 18 cases will Manitoba Hydro's net income be negative. Approximately 79% of the time, Manitoba Hydro will have a positive net income (before regulatory deferrals, non-controlling interests, etc.), at least in this example.

From the perspective of cash flows to cover interest costs, it is worthwhile to make two points. In this example, net operating finance expense is $558 million, and so it appears that EBITDA : Interest is always greater than 1, regardless of hydraulic outcomes. However, not included in finance expense information provided in the table is capitalized interest (which should be added to net operating finance expense), so cash flow metrics would be somewhat worse than they appear.



Recall that this chart is just an example of <u>one year</u>, the estimate for 2017/18, and that in this particular year, Manitoba Hydro has begun its analysis from the position of high water in reservoirs at the start of the year (because water levels were extremely high in 2016/17). If the assumption had been made that reservoirs were at historically average levels, then all figures would be lower, and the breakeven point would move to the right.

Unquestionably, fuel risk should be considered the most significant risk for Manitoba Hydro. In very low water years, operating income will fall significantly, which will result in poor cash flow ratios, potentially negative net income, and hence a deteriorating debt to equity ratio.

This inference is borne out by the analysis provided by Manitoba Hydro in Figure 4.4. of the Application, where a five-year drought has a more significant impact on retained earnings than any other variable examined, even though most other variables were examined over a ten-year period rather than just five.

Having said that, it is also true that over longer periods of time, a sustained water inflow below 85% of the average becomes less and less likely. While the financial consequences of drought can be intense, water inflows tend to revert to the mean over the longer term.

Operating Risk

All utilities rely on systems of built infrastructure to deliver goods and services. This makes them very susceptible to disruptions based on equipment not performing as intended, whether caused by weather events, operator error, or deliberate disruption. This can range from the normal randomized failure of equipment based on wear and tear, all the way up to province-wide ice storms that can wreck entire systems of overhead wires.

Operation and maintenance costs are a relatively small part of Manitoba Hydro's revenue requirement. In the year ending March 31, 2017, they amounted to slightly more than 25% of total expenses. Assuming that most operating risks, if they were to materialize, might affect the operating and maintenance costs in one year only, then the magnitude of these risks in terms of potential impacts on financial outcomes is not very large. For example, even if an ice storm caused significant damage to overhead distribution lines, requiring a substantially increased expenditure on repairs, the entire episode would be complete with one year, having few ongoing effects.

Manitoba Hydro did not examine the potential financial outcomes of this class of risk in its application, and given the typical magnitude of operating risks, this is reasonable. However, there is an exceptional case. One of the primary reasons that the Bipole III transmission line is being built at a cost of multiple billions of dollars is exactly to mitigate an operating risk of enormous magnitude. Without Bipole III, Manitoba is exposed to the risk of massive system failure in the event that an ice storm, tornado or other weather event destroys existing north-south high voltage transmission lines in the province. In this scenario, Manitoba Hydro's ability to serve its customer base is significantly impaired, potentially for a substantial period of time. However, assuming that Bipole III enters into service as scheduled, the most significant possible operational failure for Manitoba Hydro will have been mitigated, and all other potential events that fall into this category are likely to be less severe, both in terms of the extent of possible damage, and the speed of recovery that would be possible.

Construction Risk

Manitoba Hydro has already absorbed the news that both Keeyask and Bipole III are substantially behind schedule and over budget. These are two of the largest projects that Manitoba Hydro has ever undertaken (certainly in terms of current costs, if not physical size), and there are no plans to undertake anything remotely comparable for at least the next 15 years. The risk remains, however, that these projects, and in particular Keeyask, may not be completed according to the new schedule and timing included in the application as a base case assumption.

The financial consequences of being behind schedule or over budget can be significant. If the projects are over budget, then Manitoba Hydro will require additional debt above the assumed base case. This would in turn entail more debt interest, putting pressure on cash flow ratios, and would also put downward pressure on debt to equity ratios. If Keeyask were to be behind schedule, then construction interest costs would continue to accumulate, and the new revenues associated with Keeyask would be delayed further into the future. Again, cash flow ratios would deteriorate, as would debt to equity ratios.

Manitoba Hydro provided one sensitivity analysis in its application showing the impact of a $1 billion cost overrun above the current base case for the Keeyask plant. While the financial impact of this outcome would be significant, it would not be as damaging to Manitoba Hydro's financial outcomes as would be some other risks, and so additional information was not provided.

In response to PUB Round 2 IR 25, Manitoba Hydro provided financial analysis of a 32-month delay of the Keeyask Project. However, because of confidentiality concerns, this information was redacted. It is not clear whether the consequences of such a delay would be worse than, better than or equal to a $1 billion cost overrun.

Market Risk

Manitoba Hydro produces and sells electricity. This is a valuable business to be in only if there are customers who wish to buy that electricity, at prices high enough to cover the costs of production and delivery. Domestic customers have no choice with respect to the price of electricity, given its regulated nature. However, the volume of domestic demand can and does change over time. Other reports in this regulatory process examine the validity of the base case domestic demand forecast provided by Manitoba Hydro, and the appropriate magnitude of the upside and downside alternatives. For the purposes of financial risk, however, it is sufficient to point out that the low-growth case as Manitoba Hydro modelled it has very limited impact on financial outcomes, even with a fixed rate path. Domestic demand would have to be dramatically lower than the base case assumption in order to have a significantly negative impact on cash flow or capital structure ratios. This is theoretically conceivable over the longer term, especially given increasing technological change making conservation and demand management easier to implement, but the magnitude of the decline in domestic demand would have to be extremely significant before financial outcomes were strongly affected.

Manitoba Hydro exports its excess power, principally into the MISO market. That market is over ten times larger than the Manitoba electricity system, both in terms of instantaneous capacity requirement, and energy consumed per year. Manitoba Hydro is therefore a small player that should not be assumed to significantly affect that market. It is fair to assume that if Manitoba Hydro is willing to simply be a price taker in the MISO market (including $0 for power on some occasions), then Manitoba Hydro will be able to sell all of its surplus output. Effectively, there is no demand risk for Manitoba Hydro exports into the MISO market. However, from a price perspective, Manitoba Hydro is completely at risk.

In Manitoba Hydro's financial model, export prices are directly related to cash flow and net income. As a result, any deterioration in export prices below the base case causes cash flow and capital structure ratios to decline.

Other experts are commenting on Manitoba Hydro's base case export price forecast, and on the reasonableness of the high and low alternative forecasts. From a financial performance point of view, however, it is notable that Manitoba Hydro's own low alternative forecast caused significant deterioration in financial outcomes. Export prices are one of the three variables to which the financial model is most sensitive (along with drought risk and interest rate risk). If other experts conclude that export prices could be even lower than projected by Manitoba Hydro, then financial outcomes could suffer further.

Monetary Risk

Numerous monetary variables must be included in any modeling or forecasting exercise. The most obvious are interest rates, general inflation rates, and currency exchange rates. Greater refinement is possible by considering rates for specific subsectors of the economy (e.g., industrial goods inflation vs. consumer inflation, long-term vs. medium term vs. short-term interest rates, etc.).

Some of these rates are interlinked: for example, inflation rates and interest rates typically move together (though not always), and as a result if a scenario includes rising interest rates, some of that risk might also be reflected in higher inflation-based costs for labour, equipment and suppliers.

For Manitoba Hydro, inflation rates higher or lower than the base case would affect operating and maintenance costs (principally through higher labour costs), and the cost of capital goods. Manitoba Hydro did not provide any analysis of the financial impact of alternative inflation rates in the Application. This may be reasonable, because inflation rates have been relatively stable for the past decade, and the Bank of Canada remains committed to managing national monetary policy in such a way as to keep inflation rates stable within a target band.

Exchange rates varying from the base case would directly affect the value of electricity exports, but would also have an impact on the cost of equipment, supplies and capital goods, since many of these are purchased from abroad. These two pressures would be contradictory: a lower Canadian dollar would increase the value of exports, but would make supplies and capital goods more expensive, slightly mitigating the overall impact. Manitoba Hydro modeled a swing of CDN$0.10 above and below the base case assumption, and while the impact was measurable, it was substantially smaller than many other variables tested.

Interest rates are critical to Manitoba Hydro because of the overall debt burden that is resulting from the Keeyask and Bipole III projects. Historically, Canadian interest rates have been variable, changing with economic conditions, but for the past decade they have remained low and stable to an unprecedented degree. However, since Manitoba Hydro filed is application in May of this year, the Bank of Canada has increased its policy rate two times (for a total increase of 0.50%). This development was not anticipated in Manitoba Hydro's base case interest rate forecast, and raises the possibility that rates could move faster and higher than anticipated. Manitoba Hydro did examine the consequences of interest rates being 1% higher than anticipated in the base case, and this had a significant impact on financial outcomes, both for cash flows and capital structure.

Risk Modeling

Based on its sensitivity analysis, Manitoba Hydro selected three risks for further investigation: water risk, interest rate risk, and export price risk. Most other risks were much less significant from the perspective of affecting financial outcomes, as described above, and so justifiably were not examined further. However, construction risks associated with Keeyask were also significant, but unfortunately were not investigated.[32]

In Tab 4 of the application, Manitoba Hydro provided the results of 918 modeling runs for each of two rate paths. 102 water inflow scenarios were tested for each of three interest rate scenarios and each of three export price scenarios (102 * 3 * 3 = 918). The financial outcomes, in terms of financial results like net income and retained earnings, or ratios such as cash flow and debt to equity, for these modeling runs were recorded, and then summarized in the manner of "box and whisper" plots.

This method of presentation provides the range of annual outcomes for each metric that was examined (e.g., debt to equity ratio, interest coverage ratio, net income, etc.), but does not provide any information on how each of the 918 runs link from year to year. For example, in one year a run may produce the worst outcome in terms of a metric (e.g., net income), but in the next year the same run may have a much improved net income which is no longer at the bottom of the list. While it is valuable to know what the range of outcomes might be for a given variable in any given year, it would also be valuable to better understand the multi-year performance of Manitoba Hydro under different conditions.[33] Doing this type of analysis would require access to the full output of the 918 modeling runs, not just box and whisper plots. Unfortunately, the full output from these modeling runs could not be made available by Manitoba Hydro, so there was no opportunity to examine financial outcomes in detail.[34]

Some observations are nevertheless possible, based on the information made available by Manitoba Hydro.

Analysis Based on Original Application: The 918 modeling runs were based on the rate path and assumptions of the original application in May, and not the updated rate path presented after the PUB decision on interim rates in August. Nevertheless, the analysis is still useful in providing directional indications about risks and financial outcomes.

Only Two Rate Paths Contrasted: The 918 modeling runs were repeated twice, once with 7.9% rate increases, and once with 3.95% increases. It was assumed that no deviation from these paths was possible, regardless of the consequences. This assumption is clearly not realistic, but does help to simplify insights that can be made.

Interest Coverage Ratio and Capital Coverage Ratio: These box and whisper plots were not provided in Tab 4, however they were provided in response to IRs.[35] Given the importance of cash flow coverage ratios to credit rating agencies and the capital markets, these plots provide valuable information about the risks facing Manitoba Hydro.

Interest Coverage Remains Above Critical Throughout on the 3.95% Rate Path: At the P01 position of the EBITDA to Interest plot on the 3.95% rate path, the ratio is never below 1. It should be noted that a ratio of 1

[32] Assuming a linear relationship between cost overrun and impact on Manitoba Hydro financial outcomes, a $2 billion cost overrun from the base case budget of Keeyask would be approximately equivalent to a 1% across the board increase in interest rates. It may have been useful to investigate further this possibility, or the possibility of an additional delay in project completion.

[33] Another type of analysis which could usefully be performed given access to the raw data is to determine whether any single variable drives a majority of the worst outcomes. For example, in the worst water inflow years, does it matter what export prices or interest rates are? If the 9 worst outcomes are all the result of a particularly bad water year, then interest rates and export prices are simply much less important variables. This is particularly relevant to the question of what types of risks deserve to protected through "reserves".

[34] Please see the response to Coalition Round 2 IR-2.

[35] Please see the response to Coalition Round 2 IR-1.

means that operating income is just sufficient to cover finance expense costs. In the parlance of the Moody's and DBRS, as long as Manitoba Hydro is able to continue to cover all of its costs – including operating costs and interest – it will continue to be regarded as "self-supporting", and not a burden to the Province. Admittedly, the P01 position in the plot means that 9 model runs are actually below the numbers listed for each year, and it is not possible to know from the data if any runs actually resulted in interest coverage ratios below 1. However, it should be noted that it is unlikely that any given run remains at the low position for very long, and so the average capital coverage ratio for any single run (in other words, for any single future) should actually be comfortably higher. At the P50 position, the 1.8x target is exceeded in more than half of the years of the model, but not generally until later in the 2020s.

Interest Coverage is Very High on the 7.9% Rate Path: It is notable that on the 7.9% rate path the interest coverage ratio is comfortably above the 1.8x target for virtually the whole period at the P20 position. Even at the P01 position the 1.8x target is met in the later years of the model. At the P50 position, the 1.8x target is met and exceeded almost immediately, and is substantially exceeded in most years.

The 3.95% Rate Path Cannot Be Followed by 2% Increases: In the modeling presented, the 3.95% rate path includes increases at that level from 2017/18 until 2028/29, and then 2% per year thereafter. However, reducing the rate increases to 2% per year results in significant risk to the corporation after 2030. While the interest coverage ratio remains above critical levels throughout, net income actually becomes negative at the P20 position for more than half of the years of the model. The equity ratio becomes negative at the P01 position in 2030, and in the P05 position in it reaches 1% in 2032. It is not clear why annual rate increases were not kept at 3.95% for additional years beyond 2028/29, but based on this modeling, it would definitely be necessary.

On the 7.9% Path Rates Would Likely Fall After 2030: At the P50 position on the 7.9% rate path, the target equity ratio of 25% is reached as of March 2027. After that year, the equity ratio continues to rise at the P50 position, despite only 2% rate increases. This suggests that rates would either have to be frozen or reduced, to prevent an unnecessary build-up of equity.

The true value of the scenario modeling is to highlight what kind of situations could be problematic, in order to prepare for them. The limited nature of the data provided prevents a more thorough analysis of the individual runs that show the most significant downside risks for Manitoba Hydro financial outcomes, but even the limited data provided by Manitoba Hydro allows for the drawing of some useful inferences.

Assuming the downside cases of the examined variables are reasonable, the analysis shows that the 3.95% rate path is reasonably robust from a cash flow perspective for the first 10 years of the modeling period. After 2030, however, reducing the rate path down to 2% increases exposes the corporation to too much risk.

If a reasonably cautious standard to use is to choose an option which is feasible 95% of the time (which is the Bonneville Power Administration criteria), then the 3.95% percent option appears to qualify. There is no question that situations could arise which require further action beyond a 3.95% rate path, but they will be rare.

B. Options to Financially Manage Risks

The previous section demonstrated that combinations of factors can arise which undermine the best laid plans. Even in the 7.9% rate path, there are scenarios where interest coverage is insufficient. At 3.95% rate increases, more of this would be evident. However, in many scenarios distress does not arise. As noted above, cash flow is many times higher than necessary in a majority of the scenarios with the 7.9% rate path, and is adequate in most scenarios under the 3.95% rate path.

What are the available responses, knowing that such distress situations could arise? Several options appear to be available to Manitoba Hydro:

Build Up Cash Reserves in Advance: This is the "preventative medicine" approach. In effect, Manitoba Hydro would be building up its liquidity reserves in order to protect against relatively low likelihood combinations of challenges. Normally, liquidity reserves are limited and only intended to help manage the inevitable disconnect between accounts payable and accounts receivable, and other short term accounts, but Manitoba Hydro could choose to build up a "drought fund", for example, which could be called up on in the case of distress.

Pay Down Debt: Another form of preventative medicine, similar to the building of cash reserves. In this case, debt principle is repaid faster than the amortization of utility assets. This means that ratepayers must be charged rates that are higher than necessary for cost recovery purposes, but in the event of financially stressful situations, the corporation could simply borrow to cover its exceptional requirements. This is essentially the strategy being recommended by Manitoba Hydro in seeking a 7.9% rate increase to facilitate the goal of achieving a 25% Debt : Equity Ratio by 2027.

Cost-cutting: In the event of distress, be prepared to reduce costs significantly, in order to increase net cash flow from available revenues. A "wait and see" strategy, that depends on the willingness of the company to act decisively in the event of distress.

Increase Rates: If a significant risk materializes, then be prepared to raise rates on domestic customers to increase cash flows. Also a wait and see strategy.

Essentially, these are two strategies with two variants each. Practically speaking, one of each pair can be eliminated from consideration.

In the first pair, building up a cash reserve vs. paying down debt, the former represents a much more significant opportunity cost than the latter. All businesses require some amount of liquidity to manage unpredictable cash flows in the short term. However, maintaining liquidity is expensive because cash or "near cash" financial instruments earn very little return. Paying down debt, on the other hand, has the benefit of reducing interest payments, and therefore serves to improve cash flow metrics, as well as improving the debt to equity ratio of a company. Paying down debt is not a substitute for necessary liquidity, because issuing large amounts of debt takes time, and the essence of liquidity is the ability to respond to financial needs quickly. But liquid assets are not required to respond to a deeper challenge such as a multi-year drought: debt can serve that purpose well, and at less cost.

Cost-cutting and increasing rates are both initiatives that can be taken in response to distress, at the time the distress occurs. However, practically speaking, cost-cutting is limited by the need to continue to deliver utility services to customers: only so many costs can be cut while remaining in business. Moreover, utilities are under a general obligation to operate as efficiently as is reasonably possible. To assume that there is sufficient "fat" in a utility that would allow it to painlessly cut costs in the face of financial distress is equivalent to making the assumption that it is permanently inefficient, except when a crisis arises. Even if some amount of cost-cutting is feasible (as we see in the recently announced cost-cutting program from Manitoba Hydro), it is unlikely that cost-cutting alone would suffice to address the kinds of "P01" situations that were highlighted in the previous section, when multiple factors act simultaneously to create financial distress for a utility.

The four options to manage risk essentially collapse into two: paying down debt to create reserves that may be accessed when financial distress conditions rise, or responding to financial distress with rate increases. The next section will explore the pros and cons of managing risk in these two ways, through the lens of regulatory principles.

C. Regulatory Principles and Risk Management

As was described in the previous section, one version of a summary list of regulatory principles would be the following:

- Monopoly Utility Customer Service
- Economic Efficiency
- Cost Causality
- Stability and Predictability
- Prudence
- Public Interest
- Access to Capital Markets

Of these principles, the Customer Service and Prudence principles have the least bearing on the question at hand. Whether rates are raised now to generate funds to pay down debt, or rates are raised in the future if a financial distress situation arises, customer service is not affected either way. Admittedly, if severe cost-cutting were to be considered as an option, then the Customer Service principle would need to be considered, but for the reasons described above, cost-cutting is not considered relevant.

Prudence is often a catch-all term which is used ambiguously. However, in this case it is understood to have a procedural meaning, rather than a substantive meaning. The prudence principle requires that utilities consciously exercise good judgement through careful review and consideration of applicable risks before making decisions. In this case, a careful and deliberate choice between two methods of responding to potential future challenges is being considered, which is the essence of prudence. Prudence does not dictate the pros and cons of a choice, it only demands that the pros and cons be fairly and thoroughly considered.

The remaining five principles are all very much relevant to the choice of strategy to prepare for and potentially respond to future financial distress, and each will be considered in turn.

Economic Efficiency

Manitoba Hydro is proposing a rate path based on 7.9% rate increases, versus other options. This does not affect internal operations in any way, and so does not affect efficiency in an engineering or physical sense. However, Manitoba Hydro has claimed that paying down debt is an efficient use of ratepayer money, because it reduces interest costs in the long run, and protects against financial distress. In essence, the use of ratepayer capital beyond what is strictly required for the immediate operation of the utility in real time is an efficiency question.

The primary reason Manitoba is proposing an aggressive series of rate increases is to build up the reserves of the corporation (by paying down debt), and therefore reduce the likelihood that dramatic rate increases will be required in the future in response to a financial distress situation. This creates two possibilities that should be examined: a future where financial distress does not occur, and one where financial distress does test the company.

If reference assumptions were to actually persist for the next 19 years, then the financial outcomes for Manitoba Hydro might be consistent with the model presented in response to Coalition Round 2 IR 6 and IR 7. Manitoba Hydro calculated a future 7.9% rate path where a 75% debt ratio was achieved in 2027, and then domestic rates were adjusted annually to keep the debt ratio at 75% permanently. As a comparison, a different rate path was calculated under the same assumptions, with annual increases of 3.95% per year until a 75% debt ratio was achieved by March 2034, after which time rates were adjusted to maintain the 75% debt ratio.

These two financial projections highlight how differently rates and customer costs can turn out under a single set of financial assumptions, but maintaining all other things equal. Resulting rates are set in the tables on the next page.

If rates are increased by 7.9%, then by the end of 10 years, when the target 75:25 Debt : Equity Ratio is achieved, rates will have increased by approximately 77% in nominal dollar terms. In inflation-adjusted terms (assuming annual inflation of 2%), they will have increased by approximately 46%. If a ratepayer had purchased the same amount of power every year (1000 units), then the consumer will have spent 14,412 over that time period. In inflation-adjusted terms, the cumulative cost would be 12,816. However, in the next year, because the debt to equity ratio target had already been reached, rates could come down significantly, and in the 2030s price increases would be either modest or negative. By 2036, the last year of the model, nominal prices would be 44% higher than today, and would actually have fallen in inflation-adjusted terms.

Alternatively, if a 3.95% rate path were followed for the next ten years, rates would be lower, and cumulative costs would be lower, both in nominal dollar and inflation-adjusted dollars. However, the debt to equity ratio of the company would not be 75:25. In fact, rates would peak at 92% higher than today in 2034, when the debt target is achieved, and only then would rates come down somewhat. By 2036, prices in the two rate paths will have almost equalized, both in nominal and inflation-adjusted terms. However, the cumulative cost of power in the 3.95% rate path is actually slightly higher than for the 7.9% rate path, over the total 19-year period covered. In inflation-adjusted terms, the 3.95% rate path has lower cumulative costs until 2034, but then becomes slightly more expensive.

This comparison suggests that over a long period of time, under reference assumptions, the 7.9% rate path will actually be more economically efficient, in inflation-adjusted terms. This is the benefit that results from paying down debt early, rather than paying compounding interest costs over a long period of time.

This is far from a complete story, however. Nowhere in Manitoba Hydro's application has it considered the cost of capital that is applicable to its ratepayers. In the 7.9% rate path, ratepayers are paying more than in the 3.95% rate path for the same amount of electricity in years 2 through 10, and less in the next 9 years. In both cases the same amount of electricity is received, the only thing that changes is nominal price. This is a classic present value problem.

Rate path based on applied for 7.9% rate increase

Mathematical calculations on these scenarios give the result that a discount rate of 4.93% equalizes the discounted cumulative cost of power to ratepayers by 2036. However, customers in the 3.95% rate path will be paying less in cumulative discounted dollars throughout the entire period, until the final year. At discount rates lower than 4.93%, ratepayers in the 3.95% rate path will be better off for most of the period, but ratepayers in the 7.95% path will be better off towards the end. If the discount rate for customers is any higher than 4.93%, then ratepayers will always be better off in the 3.95% rate path.

This result makes sense, because there is a cost of capital (or time value of money) for everyone, ratepayers included. If a ratepayer pays less for their power today, then they will have more money available to pay down their own mortgage, or invest in a new business, or just buy something that they want. Manitoba Hydro cannot calculate the economic efficiency of proposed rate paths without taking into account the cost of capital to its ratepayers.

Some Manitoba Hydro ratepayers will have a higher cost of capital, while for others it will be lower. Given that Manitoba Hydro's ratepayers encompass almost all of the people in the province, it is arguable that a "social discount rate" should be used in this sort of calculation. There is an abundant academic literature around this subject, given its use in assessing long-term government programs (and conceptual problems like the cost of climate change). In Canada, recent government studies have landed on using a 3% real discount rate for many uses, consistent with recent decisions of the US government.[36] In the case of Manitoba Hydro, this would be a ratepayer cost of capital of 5%, given the assumed 2% inflation rate.

Applying a discount rate to the rate paths does not complete the review of economic efficiency issues, however. Manitoba Hydro's main purpose in applying for a 7.9% rate path is to strengthen the company's ability to withstand financial distress, without subsequently raising rates beyond the intended path. For example, as was suggested above in the review of hydrological risk, a severe drought could cause a series of years where cash flows are constrained, and all of the company's financial metrics deteriorate. If this were to occur in the context of the 7.9% rate path, the presumption would be that Manitoba Hydro would not ask for rate increases higher than already planned (debt would presumably no longer fall to 75% in 2027, but would instead only fall to 75% later, after the drought was over and financial results recovered). On the other hand, if the 3.95% rate path were pursued, then rates might have to be increased in the face of a severe drought. In this case, the 3.95% rate path would morph into something new, with different financial outcomes, and costs to ratepayers.

Suppose the drought began on April 1, 2024 (the year ending March 31, 2025, or year 8 in the tables above). At that point, rates in the 7.9% rate path would already be 71% higher than today, and Manitoba Hydro would have reached an equity ratio 19% (with an Interest Coverage ratio in the year ending March 31, 2024 of more than 2.0x). A ratepayer may have paid 9,194 for power over the previous seven years, which discounted at 5% would be 7,488. Alternatively, the same position on the 3.95% rate path would be rates that are 36% higher than today, with seven years of power purchases amounting to 8,151, discounted at 5% to 6,687. Manitoba Hydro would be at a 13% equity ratio (with a 1.55x Interest Coverage Ratio in the previous year).

In that situation, Manitoba Hydro ratepayers would be unequivocally economically better off in the 3.95% rate path when the drought begins. They will have paid lower prices over seven years, and used their own money as they saw fit. If, because of the drought, Manitoba Hydro's rates needed to be adjusted upwards, there would be room to do so.

[36] Please see the Technical Update to Environment and Climate Change Canada's Social Cost of Greenhouse Gas Estimates (March 2016), available at http://ec.gc.ca/cc/default.asp?lang=En&n=BE705779-1 This document also provides references to recent work from the United States, as well as academic literature.

However, without knowing the severity and longevity of the drought, it would not be possible to calculate the point at which customers would no longer be better off. A whole range of scenario calculations would have to be done based on the probability associated with droughts, versus the discounted dollar impacts of the alternative rate paths, in order to calculate an optimal probability-weighted break even point. Manitoba Hydro did not address this issue in its application.

In effect, from an economic efficiency point of view, Manitoba Hydro assumed that ratepayers do not have a cost of capital, and considered financial issues only from the perspective of the corporation, not its ratepayers. Given the regulatory principle of economic efficiency, however, it may be valuable to consider ratepayer costs of capital in the formulation of rates.

Cost Causality

The principle of cost causality holds that ratepayers should pay only the cost of the services that they have received from a utility, and should not be required to pay costs that are attributable to others. This principle is important because it affirms that all ratepayers are equally valid and important, and should be treated equally well.

Given the long-lived and shared-use nature of utility assets, appropriately allocating the cost of developing and operating a utility system is necessarily approximate, both in terms of allocation between current customers, and allocating costs to customers over time. From a time perspective, depreciation is the critically important method of allocation, and straight line depreciation is a compromise that addresses the unknowability of exact wear and tear on long-lived assets over time. Appropriately allocating the cost of risks over time is conceptually challenging. As noted above, the frequency, duration and magnitude of negative outcomes is ultimately unknowable until they actually occur. Nevertheless, the utility must be prepared to meet these challenges should they occur, and ratepayers must pay for them. But which ratepayers?

Consider the example of a five-year drought. The historical record demonstrates that such droughts have occurred, and might do so again at any time. When they occur, droughts reduce revenues and raise costs, and the net impact must then be passed on to ratepayers, since Manitoba Hydro has no investors who are taking on any of that risk. When they occur, the costs of a drought could be charged to the ratepayers of the day through an immediate and severe rate increase, or could be spread forward in time to ratepayers of the future by delaying recovery of some of the costs until the drought is over and the utility financially recovers. Importantly, the costs of a drought cannot be spread backwards in time, to ratepayers of the utility before the drought occurrence, for obvious reasons

However, droughts are not “caused” by any ratepayers: neither the ratepayers of the day they occur, nor those before or afterward. There is no reason why any particular ratepayers across time should be required to bear the burden of drought, since all ratepayers are valued and respected equally. However, the creation of a “drought relief reserve”, to which all ratepayers must equally (in a real sense, adjusted for inflation) contribute over time, would be one way of notionally spreading costs “forward” from any future drought event, and “backward” at least to the point that the payments into the reserve were begun. This is essentially a form of insurance, with all of the pitfalls normally applicable to insurance, in terms of accurately estimating all of the probabilities and outcomes involved. Insurance schemes, for the purposes considered here, amount to a mechanism to fairly distribute the costs of infrequent negative occurrences over time, fulfilling the principle of cost causality (in the same way that straight line depreciation attempts to fairly distribute the costs of capital goods over time).

Another name for a "drought relief reserve fund" could be "equity". If all ratepayers were contributing the same amount (on an inflation- or discount rate-adjusted basis) to equity over time, then all ratepayers would be contributing equally to the management of infrequent but extremely negative events such as drought.[37]

There are a variety of practical problems associated with calculating a "contribution to reserve" that would be relatively stable and appropriate for all ratepayers over time. However, a primary issue concerns what types of events should be included in the list of occurrences that should be covered by the notional reserve. Certainly, droughts would qualify, as would significant operational challenges like major storm damage. However, two of the chief risks identified by Manitoba Hydro are interest rates and export prices. Arguably, these are not risks that should be subject to notional insurance or reserves. In normal ratemaking, regulators do not typically attempt to smooth the cost of interest over time. Instead, ratepayers are required to pay the interest cost at whatever level is extant at the time of ratemaking. Manitoba Hydro is consistent with this practice, since only the actual costs of debt are passed on to ratepayers, and Manitoba Hydro does not attempt to hedge or smooth its interest costs against some notional long-term estimate of what interest rates "should be".

Manitoba Hydro has not proposed that all ratepayers over time pay a certain amount above otherwise required rates in order to contribute to equity. Instead, they have proposed that ratepayers for a specific period of time pay much higher rates, in order to create a reserve fund to be used later, in the event of a drought, or other negative event. This proposed distribution of the burden is called into question by the principle of cost causality.

Stability and Predictability

Stability and predictability are important attributes that contribute to customer service, economic efficiency, capital market acceptance, and the public interest. Customers could make better decisions about their intended use of electricity if they knew that rates would remain stable, or at least knew that rates would follow a predetermined path for a reasonable period of time. Governments could better design policies relating to climate change, energy conservation, fuel switching, and other programs, and capital markets could make better decisions about credit-worthiness and provide interest rates at efficient levels.

According to the *Crown Corporations Governance and Accountability Act*, Manitoba Hydro is only allowed to apply for rates for up to a three-year period. This limits the absolute length of time over which there can be true predictability of rates. In fact, Manitoba Hydro has historically returned for rates more often than every three years.

As noted in Section 1 of this Report, Manitoba Hydro originally applied for two years of 7.9% rate increases. However, they emphasized a 10-year rate path in their application. The premise was that they would actually seek five years of 7.9% increases over time, before rate requests would be reduced to 2% per year. The theory presented was that these increases would have a 50% probability of resulting in a 75:25 Debt : Equity Ratio by March 31, 2027. However, when the PUB allowed an interim rate increase of only 3.36% instead of 7.9%, Manitoba Hydro returned with a revised application highlighting that the 10-year rate path would have to altered in order to maintain the 50% probability of achieving the Debt : Equity Ratio.

---

[37] An explicit "contribution to reserves" could be included in the revenue requirement formula. The calculation of what this contribution should be over time would depend on the probability of negative events occurring, and their expected severity.

In other words, it appears that what is stable from the perspective of Manitoba Hydro is the need to aim for the targeted Debt : Equity Ratio by a specific date. If, over the next two years, economic and performance variables do not conform to reference assumptions, would Manitoba Hydro still return with a request for a rate increase of 7.9%, or would that figure be altered so that there continues to be a 50% probability of achieving the targeted Debt : Equity Ratio by the specified date?

From a ratepayer perspective, it is stable and predictable rates that are of value. From a capital markets perspective, it is apparent from the comments surveyed in Section 3 of this Report that stable and predictable cash flows are most helpful in achieving a higher rating. But stability and predictability in the capital structure does not necessarily assist in providing either of these things, since both rates and cash flows would have to be adjusted dramatically to hew closely to a specific Debt : Equity Ratio target on an annual basis.[38]

Public Interest

The public interest principle requires that the regulator of a utility take into account the broader impact of rates and utility operations on the economy and society in which it is situated.

On the question at hand, whether to pursue higher rates to build up equity or not, three public interest issues are apparent:

- The broader economic impact associated with higher rates;
- The risk to the Government of Manitoba credit rates arising from Manitoba Hydro financial outcomes; and
- Total payments to the Government of Manitoba under the two scenarios.

The first issue is addressed by economic experts in this process, and is outside the scope of this Report. Should it be found that raising rates to the 7.9% level will have a drag on the Manitoba economy, or should it be found that the competitiveness of certain economic sectors in the province will suffer, then this should be cause to carefully consider alternative options to the rate request. The second issue was addressed above in Section 3. It is evident that the capital markets would be very concerned if cash flows at Manitoba Hydro were insufficient to cover all costs, including interest on debt. Whatever rate path is ultimately chosen, protecting and preserving the credit of the Province must be a priority.

Total payments to the government by Manitoba Hydro consist of property taxes (or their equivalent), water rentals and assessments, the debt guarantee fee, and capital taxes. As noted in Appendix 4.5 of the application (page 60), these charges amounted to approximately $400 million, or 17% of Manitoba Hydro's total revenues in 2016/17. For the Province of Manitoba, which budgeted approximately $15.5 billion in total revenues in 2016/17, this amount represents approximately 2.5% of total annual budget revenues.

In considering two possible rate paths of 7.9% or 3.95%, it should be apparent that property taxes and water rental charges would not change in either case, since these charges are independent of rates. However, the debt guarantee fee is directly related to outstanding debt during each year, and the capital tax depends on the total of the

[38] As noted above in the examination of 7.9% rate path, in 2027/28 there could be a decline in rates of as much as 20%, with concomitant effects on cash flows.

debt and equity in the business. By following a 7.9% rate path and reducing debt more quickly than otherwise, Manitoba Hydro would actually be reducing its payments to the Government of Manitoba.

Given the very small portion of budget revenues represented by payments from Manitoba Hydro, and the fact that water rental charges and property taxes would not change in any case, the difference in total payments to the Province will be modest and have limited impact. However, it is a somewhat surprising result that under the 7.9% rate path, ratepayers would be paying more for their power, while the Government of Manitoba would actually be receiving less revenue from Manitoba Hydro.

Access to Capital Markets

Access to the capital markets is a critical requirement for regulated utilities, and must be a priority concern in the setting of rates.

The particular circumstances of Manitoba Hydro's access to capital were addressed in Section 3, above, and need not be repeated here in detail. The need to ensure that cash flows remain sufficient for Manitoba Hydro purposes is clear, in order to prevent indirect impacts on the Province's access to and cost of capital. However, Manitoba Hydro itself has automatic access to capital given its privileged relationship with the Province.

5. Practical Consequences of Financial Targets

A. Precedent for Future Ratemaking

The PUB, like all regulators, is not bound by precedent with respect to its ratemaking decisions. However, Manitoba Hydro's current application, given its focus on 10-year rate paths and longer term financial targets, presents an opportunity to set the agenda for a period of time into the future, which may be of benefit to all stakeholders.

Manitoba Hydro has not formally requested that the PUB adopt or endorse the financial targets that the Manitoba Hydro Electric Board has adopted. Nor is the PUB bound to do so in its duties as a regulator. The PUB is free to make its own determination about the amount of "any other reserves that are necessary for the maintenance, operation, and replacement of works of the corporation," per s. 25(4)(v) of the *Crown Corporations Governance and Accountability Act.* However, if the PUB chooses to clarify how it will approach the issue of reserves and rate stability in the future, it will simplify the process of ratemaking, both for Manitoba Hydro and for intervenors. With the settlement of these issues, and the adoption of a standardized methodology, the question of reserves and planned addition to reserves could become focused on mathematical and probabilistic calculation, rather than debate over principles and potential impacts.

B. Signals to the Capital Markets

A critical audience for PUB comments on reserves and rate stability in the future will be the capital markets. As discussed in Section 3, above, capital markets participants are very focused on cash flows at Manitoba Hydro, and the sufficiency of the same to meet all expenses, especially debt interest. They are quite aware of the potential for financial distress in the case of droughts, as well as the challenges potentially faced by Manitoba Hydro in the future with respect to interest rates, export prices, and the ongoing potential for budget or schedule slippage in the Keeyask project.

Explicit endorsement by the PUB of policies around reserves, cash flows, and rate increases will help all market participants understand what to expect. The lack of clarity about whether Manitoba Hydro is "self-supporting" could be at least partly addressed by a statement from the PUB about how it might consider approaching a hypothetical financial distress situation in the future. For example, adoption of a "debt service coverage" ratemaking formula in the style of the Tennessee Valley Authority would signal that rates will be adjusted above all to ensure sufficiency of cash flows (perhaps over some medium-term timeframe, such as a rolling five-year forward period, to aid in the smoothing of rates). Alternatively, use of some fixed or inflation-adjusted level of annual contribution to reserves, built into rates on an ongoing basis, would provide a means for observers to estimate the cash flows and financial resources of Manitoba Hydro under different circumstances.

Of course, endorsement of Manitoba Hydro's target for Debt : Equity of 75% would also be a strong signal, but this would then raise issues about how Manitoba Hydro and the PUB will each separately react to changing financial and operational conditions which will undermine the achievement or maintenance of that target. In many senses, Manitoba Hydro's preferred target and timing goal provides the least certainty to the markets about how rates will be managed in the future. Would rates continue to increase at 7.9% per year, regardless of outcomes, or would rates be adjusted, however dramatically might be necessary, in order to achieve that goal in 2027? Having achieved the goal, would it be strictly enforced thereafter, even if that meant rate decreases and increases from year to year?

Unambiguous signals to the capital markets are not without their potential pitfalls, however. If the PUB adopts policies around reserves and rates, then these will be understood as a new "baseline" by observers and analysts. Failure to be consistent with those policies in the future would undermine the credibility of the PUB and the financial soundness of Manitoba Hydro both. Given the very significant role of Manitoba Hydro debt in the finances of the Province, it is necessary to ensure that at no time there be any circumstance where financial stress at Manitoba Hydro becomes a "contagion" for the Province.

C. Manitoba Hydro Debt Management

In its original application, Manitoba Hydro stated that it had changed its internal treasury policies, and was now targeting an average term to maturity of 12 years for new debt. The meaning and import of this change was somewhat ambiguous. There appeared to be a suggestion that this policy was an argument in favour of adopting the 7.9% rate path, since it would facilitate the successful continuation of the debt maturity program.

In response to PUB Round 1 IR-28(c), Manitoba Hydro stated:

> *Should underlying forecast assumptions (including rate increases, cost savings, export prices, interest rates, in-service dates) not materialize as planned, Manitoba Hydro will re-evaluate and adjust its debt management strategy and the targeted weighted average term to maturity of new debt issuance as it deems necessary.*

This clarifies that the treasury function within Manitoba Hydro is creative and responsive to prevailing conditions, and is not in fact a driver of decision-making with respect to rates, reserves and other financial targets. In essence, treasury policies such as target term-to-maturity should be the result of ratemaking decisions, and not a cause.

6. Summary Observations

Why are financial targets relevant to rate-setting for Manitoba Hydro?

Financial targets are important in rate-setting because they help to define one aspect of the "overall general health" of Manitoba Hydro, which the PUB has said that it will take into account in its rate-setting. Ultimately, financial targets cannot be determinative of PUB decisions, and the PUB must balance a variety of principles of regulatory rate-making as it pursues each unique choice. However, many stakeholders, including especially the capital markets, are very focused on financial targets, both in historical terms, and with respect to intentions for the future.

The PUB may wish to give consideration to clarifying which financial measures it believes are important to rate-making, and how those measures will be incorporated into decisions, now and in the future. Doing so will provide clarity to the capital markets, reduce some of the ambiguity that currently clouds credit rating discussions about the Province of Manitoba, and set the stage for more efficient rate hearings in the future.

Should the Debt : Equity Ratio be the primary financial target that is taken into account when setting rates for the future?

Manitoba Hydro's application gives the Debt : Equity Ratio pride of place among financial measures, and implies that pursuit of the 75:25 target level by March 31, 2027 should drive rate-setting to an unprecedented degree. The revision of the proposed 10-year rate path after the PUB's decision on interim rates speaks volumes about the subsidiarity of all other considerations in the arguments of Manitoba Hydro.

This emphasis on capital structure does not appear to be shared by capital markets observers, who instead are more focused on measures of cash flow sufficiency to meet debt obligations, in keeping with their primary interest of protecting their debt investments. While capital structure is an important consideration, it is nevertheless secondary in credit analysis, and only indirectly sheds light on financial risk. This suggests that if preventing negative impacts on the credit rating of the Province of Manitoba is a concern, then pursuing a Debt : Equity Ratio is a secondary way of doing so. Instead, a more direct focus on ensuring cash flow sufficiency through rate-setting would be more likely to provide that support. However, lest the importance of stability and predictability be forgotten, the need to ensure the support of the capital markets for Manitoba Hydro should be balanced against the need to avoid wildly swinging rates. Cash flow sufficiency need not be an annual condition, but can rather be ensured on a rolling forward basis, which will help to manage both the predictability of rates, and the sufficiency of cash flows.

As a pure cost recovery, government-owned utility, it is not clear why "equity" should be a priority per se. From the perspective of the ratepayers who are the ultimate funders of all of the utility's operations, "equity" is essentially "dead money": it earns no return, but nevertheless has been taken out of the hands of the ratepayers who could otherwise use it. A review of rate paths through the lens of discounting at the social discount rate helps to stress the importance of making use of ratepayer funds in the most economical way.

If, per the language of the *Manitoba Hydro Act*, "equity" represents the reserves to be set aside "for the stabilization by the board of rates or prices for power sold by the corporation, the meeting of extraordinary contingencies, and such other requirements or purposes," then the term may be more effectively relabeled to better communicate its intentions to all concerned. In addition, if "equity" is properly to be understood as "reserves", then it should be clearly specified what those reserves are for, when they should be called upon (or not), and how exactly <u>all</u> ratepayers should be called upon to contribute equally to the reserves. Fairness as between ratepayers demands no less than an effort to apportion the costs of reserves over time and across customer classes. Estimating the necessary size of reserves should be founded upon an understanding of the risks faced by the corporation that should be borne by all ratepayers across time (as opposed to those risks that should be borne in real time, as they may or may not occur), and some form of careful calculation about the least size of reserves that will satisfy the need for the general financial health of the utility. This careful delineation does not appear to have been done; rather, all risks appear to have been accepted as included in the coverage by equity reserves, and no care taken to ensure that ratepayers over time are contributing an appropriate amount.

Assuming the Debt : Equity Ratio is the primary target, should rates be set so as to achieve that target by March 31, 2027, all other things being equal?

Given the observation that Debt : Equity Ratio should not be the primary financial focus for rate-making, this question is somewhat sidelined. However, if it is determined that Debt : Equity Ratio should be a primary focus, then the question arises whether the goal of meeting the target in 2027 is appropriate.

A glaring issue with this goal, even in a scenario where all reference assumptions were to prove miraculously accurate, is that in the year following the achievement of the target a very significant rate decrease would be warranted, otherwise the target would be substantially exceeded in short order. This casts into doubt the value of this timing goal from the perspective of rate stability and predictability, and also from the perspective of cash flow stability and predictability.

Manitoba Hydro stated in the risk assessment included in the original application that a 7.9% rate path would have a 50% probability of achieving the Debt target by 2027, in the face of a variety of uncertain variables. In the revised application, post interim rate decision, a revised and even more aggressive rate path was provided, which presumably continues to have approximately a 50% chance of successfully reaching that target by the same date. No clarity was provided about which variables would be allowed to undermine the reaching of that goal, and how they would relate to rate-making. For example, interest rates have already risen somewhat, presumably reducing the probability of reaching the goal: what should be the rate response, if any? Export prices between now and the next rate application for 2019 rates may be higher or lower than currently forecast; will that mean that the rates applied for will still be 7.9%, or will Manitoba Hydro simply accept that the probability of meeting the goal has changed? A fixed target for a specific date, which does not take into account changing variables and contexts, and is not adjustable and related to real drivers of rate-making policy, does not appear credible.

Appendix A – Relevant Manitoba Legislation

Manitoba Hydro Act

Purposes and objects of Act

2 The purposes and objects of this Act are to provide for the continuance of a supply of power adequate for the needs of the province, and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power and, in addition, are

(a) to provide and market products, services and expertise related to the development, generation, transmission, distribution, supply and end-use of power, within and outside the province; and

(b) to market and supply power to persons outside the province on terms and conditions acceptable to the board.

General powers of board

14 The board on behalf of the corporation may perform, execute, and carry out, all the duties, powers, and functions imposed or conferred upon it or upon the corporation by this Act; and for that purpose the board may do all and any acts and things that are necessary for or incidental to the performance, execution, or carrying out, of any such duty, power, or function, including the passing of such by-laws and resolutions as the board may deem advisable.

Powers of board

15(1) The board, on behalf of the corporation, may

(a) make such by-laws, not contrary to law or this Act, as it deems necessary or advisable for the conduct of the affairs of the corporation, and, without limiting the generality of the foregoing, with respect to the time and place of the calling and holding of all meetings of the board, procedure in all things to be followed at such meetings, and generally with respect to the conduct in all other particulars of the affairs of the corporation, and may repeal, amend, or re-enact them;

(b) appoint and employ such officers and employees of the corporation as the board deems necessary for the transaction of the business of the corporation and prescribe the duties of any such officers and employees and fix their remuneration;

(c) obtain the services of such engineers, accountants, and other professional persons as the board deems necessary for the proper and convenient transaction of the business of the corporation, and fix their remuneration;

(d) make such inquiries and investigations into all or any matters, relating to the development, generation, transmission, distribution, supply, purchase, or use of power, actual or potential, at such times and places and in such manner as seems advisable to the board.

Corporation has powers of a natural person

15(1.1) In addition to the other powers set forth in this Act and subject to the limitations set forth in this Act, the corporation has the capacity, rights, powers and privileges of a natural person to carry out its purposes and objects and to carry on related business ventures, on such terms and conditions as the board deems proper.

Power to carry out purposes and objects of Act

15(1.2) Subject to subsection (1.3) and section 15.1, the corporation, or any subsidiary, may

(a) carry out the purposes and objects of this Act; or

(b) carry on related business ventures;

on behalf of the corporation, or the subsidiary, or, by way of a partnership, joint venture or any similar arrangement, with any other person, or by way of a company in which the corporation or a subsidiary owns shares or securities.

Approval of L.G. in C. required where aggregate value exceeds $5,000,000

15(1.3) The corporation or any subsidiary shall not, without the approval of the Lieutenant Governor in Council,

(a) carry out the purposes and objects of the Act; or

(b) carry on a related business venture;

by way of a partnership, joint venture or any similar arrangement, with any other person, or by way of a company in which the corporation or a subsidiary owns shares or securities, wherein the aggregate value of the investments of the corporation and any subsidiary in, and the obligations of the corporation and any subsidiary to, such partnership, joint venture, company or similar arrangement, with any other person, exceeds $5,000,000.

Powers of corporation

15(2) The corporation may, for temporary purposes, and with or without the consent of the owner, enter, remain upon, take possession of, and use, any property, real or personal, and erect, make, or place thereon any structure, installation, or excavation, and flood and overflow any land, and accumulate and store water thereon.

Compensation

15(3) Where the corporation exercises the powers conferred under subsection (2), if it causes damage to the property of, or loss to, any person, it shall pay compensation therefor as in a case to which subsection 24(2) applies.

Transmission access

15(4) The corporation may enter into agreements, or issue a tariff prescribing terms and conditions and a rate schedule, under which the corporation may provide access to the transmission facilities of the corporation to any person entitled under section 21 to purchase power for resale in Manitoba or to any person for sale or use outside Manitoba.

Definitions

15.1(1) In this section,

"joint enterprise" means

(a) a partnership, joint venture or similar arrangement, or

(b) a company, other than the corporation or a subsidiary,

in which the corporation or a subsidiary has an interest and which owns or operates a major facility or business; (« coentreprise »)

"major facility or business" means

(a) a major facility in Manitoba for generating, transmitting or distributing power, and

(b) the business of generating, transmitting or distributing power in Manitoba or of supplying fuel in Manitoba. (« installation ou entreprise importante »)

No sale by corporation or subsidiary

15.1(2) Neither the corporation nor a subsidiary shall

(a) sell, lease or otherwise dispose of, except to the corporation or a subsidiary, all or any part of its interest in a major facility or business;

(b) sell or otherwise dispose of, except to the corporation or a subsidiary, any of its shares of a subsidiary that owns or operates a major facility or business or has acquired an interest in a joint enterprise pursuant to subsection 15(1.2); or

(c) sell or otherwise dispose of all or a substantial part of an interest acquired in a joint enterprise pursuant to subsection 15(1.2).

No issue of shares by subsidiary

15.1(3) No subsidiary that owns or operates a major facility or business or has acquired an interest in a joint enterprise pursuant to subsection 15(1.2) shall issue, except to the corporation or another subsidiary, any shares of its capital stock.

No sale of major facility or business acquired under 1997 amendments

15.1(4) No joint enterprise in which the corporation or a subsidiary has acquired an interest pursuant to subsection 15(1.2) shall sell, lease or otherwise dispose of, except to the corporation or a subsidiary, all or a substantial part of its interest in a major facility or business.

No guarantee by corporation or subsidiary

15.1(5) Neither the corporation nor a subsidiary shall guarantee the borrowings or obligations of any person, except that the corporation or a subsidiary may, with the approval of the Lieutenant Governor in Council, guarantee the borrowings or obligations of a subsidiary.

Retail supply of power

15.2 No person other than the corporation shall engage in the retail supply of power in Manitoba.

No privatization without referendum

15.3(1) The government shall not present to the Legislative Assembly a bill to authorize or effect a privatization of the corporation unless the government first puts the question of the advisability of the privatization to the voters of Manitoba in a referendum, and the privatization is approved by a majority of the votes cast in the referendum.

Procedures for referendum

15.3(2) A referendum under this section shall be conducted and managed by the Chief Electoral Officer in the same manner, to the extent possible, as a general election under *The Elections Act*, and the provisions of that Act apply with necessary modifications to such a referendum.

Question to be put to voters

15.3(3) The question to be put to voters in a referendum under this section shall be determined by order of the Lieutenant Governor in Council at the commencement of the referendum process.

Regulations re procedures

15.3(4) The Lieutenant Governor in Council may make any regulations that the Lieutenant Governor in Council considers necessary respecting the referendum process to give effect to this section, including, without limitation, regulations

(a) governing the preparation of a voters list;

(b) governing the expenses that may be incurred and the contributions that may be made, and by whom, in connection with a referendum, including placing limits on such expenses and contributions and establishing registration and reporting requirements for persons or organizations who make such contributions or incur such expenses;

(c) where greater certainty is required, modifying to the extent necessary the provisions of *The Elections Act* to make them applicable to the requirements of a referendum.

Costs of referendum

15.3(5) The costs of conducting a referendum under this section shall be paid from the Consolidated Fund.

Capitalization of balance owing to City of Winnipeg

15.3.1 If the Legislative Assembly enacts a bill to authorize or effect a privatization of the corporation, the stream of annual payments comprising the unpaid balance of the purchase price for Winnipeg Hydro shall be capitalized and paid in the manner set out in the purchase agreement between The City of Winnipeg and the corporation dated June 26, 2002, or in any other manner agreed to by them and approved by the Lieutenant Governor in Council.

Amendment or repeal

15.4(1) Any bill introduced in the Legislative Assembly to amend, repeal, override or suspend the operation of this section or section 15.1 or 15.3 shall be referred at the committee stage to a standing committee of the Legislative Assembly which provides the opportunity for representations by members of the public.

Requirements re hearings

15.4(2) The standing committee referred to in subsection (1) shall not meet to review the bill until seven days after the later of

(a) the day the bill is distributed in the Legislative Assembly; and

(b) the day the public is given notice of the date, time and place of the meeting.

Powers of corporation with approval of L.G. in C.

16(1) With the approval of the Lieutenant Governor in Council the corporation may

(a) acquire by purchase, lease, licence, or otherwise

(i) any power project, power site, and power plant;

(ii) that part of the undertaking, property, and assets (including works) of any person, relating to, or used in, the generation, distribution, or supply of power;

(b) without the consent of the owner or persons interested therein, acquire, take, and expropriate land, including the right of entry to install, maintain and protect works and the right to impose restrictions on the use of any land, notwithstanding that the land which is subject to the restriction is not, or may not be, appurtenant or annexed to any land of the corporation;

(c) require any person generating, transmitting, distributing, or supplying power, to supply such power to the corporation as the board may from time to time require or designate;

(d) within such territorial or other limits as the Lieutenant Governor in Council may from time to time prescribe, control and regulate the development, generation, transmission, distribution, and supply, of power in Manitoba, and, for any of those purposes, control and regulate the flow of, and right to use for the generation of power, or any purpose connected therewith, the water in any lake, river, or watercourse, or other body of water in Manitoba, and the taking, diversion, storage, or pondage of any such water;

(e) acquire by purchase, lease, licence or otherwise

(i) any real property outside Manitoba and erect, construct, maintain and operate, upon the real property so acquired, any works, or

(ii) interconnection works and maintain and operate the interconnection works so acquired;

(f) enter into an agreement with Her Majesty in right of Canada or of any province, or with any commission or minister of the Government of Canada, or of any province, or with any state of the United States or any officer or representative thereof, or with any person interested in or affected by any interconnection works, as to the terms and conditions upon which the interconnection works and the works carried out thereon shall be carried on or exercised;

(g) acquire for use in Manitoba power generated outside Manitoba by the government of any other province, or of any state of the United States, or by any person in that other province or state;

(h) supply power generated in Manitoba to any other province or any state of the United States, or to any person in that other province or state;

(i) sell, lease or otherwise dispose of any property of the corporation to a subsidiary or make any other investment in, or incur any obligation to, a subsidiary, where the aggregate value of the property, investments and obligations to the subsidiary exceeds $5,000,000.;

(i.1) develop new power generation stations;

(j) enter into agreements and do all things proper or necessary for the due exercise of the powers mentioned in this section.

No approval required if less that $5,000,000

16(2) Notwithstanding subclause (1)(e)(i), the corporation shall not require the approval of the Lieutenant Governor in Council to acquire real property outside Manitoba if the purchase price of the real property is less than $5,000,000.

Subsidiaries

16.1(1) A subsidiary has the capacity, and subject to this Act and to the applicable laws of the jurisdictions in which the subsidiary carries on business, the rights, powers and privileges of a natural person.

L. G. in C. may limit rights, powers and obligations of subsidiaries

16.1(2) In the case of a subsidiary that carries on business outside Manitoba, the Lieutenant Governor in Council may, for the purposes of enabling the subsidiary to comply with the regulatory requirements of the jurisdiction in which it carries on business, specify the rights, powers and obligations of the corporation or a subsidiary set out in this Act which shall not apply to the subsidiary.

L.G. in C. to approve loans

16.1(3) A subsidiary shall not raise money by way of loan, on the credit of the subsidiary or otherwise, from any person other than the corporation, without the approval of the Lieutenant Governor in Council.

L.G. in C. approval required

16.1(4) A subsidiary shall not carry on an activity for which the corporation is required to obtain the approval of the Lieutenant Governor in Council without obtaining the approval of the Lieutenant Governor in Council.

Rights of board re subsidiaries

16.1(5) The board shall exercise all of the rights of a holder of shares or securities with respect to any subsidiary or any company of which it holds shares or securities, including the right to elect directors, as it deems proper.

Separation of functions

16.2 Any rules and procedures for the separation of functions which the board has established for the purposes of pursuing opportunities to purchase and sell power within and outside Manitoba may be adopted, by regulation, by the Lieutenant Governor in Council, and upon such adoption such rules and procedures shall have the force of law.

Adoption of codes and standards

16.3(1) For the purposes of pursuing opportunities to purchase and sell power within and outside Manitoba, the board may, subject to the approval of the Lieutenant Governor in Council,

(a) adopt, in whole or in part, any standards, rules, terms, conditions, guidelines or schedules, which are related to the planning, design or operation of generation or transmission facilities within an integrated regional power grid, established by an industry organization, regional transmission group, regulatory body or other association or group or any other person;

(b) prescribe variations in, additions to or deletions from any standards, rules, terms, conditions, guidelines or schedules adopted under clause (a);

notwithstanding that the adoption of such standards, rules, terms, conditions, guidelines or schedules may constitute the delegation of powers or duties of the corporation to carry out or carry on certain functions to any other person.

Effect of adoption

16.3(2) The adoption of any standards, rules, terms, conditions, guidelines or schedules under clause (1)(a), in whole or in part and either in existing form or as altered under clause (1)(b), is deemed, on the approval of the board, to be an adoption of

(a) any subsequent amendment made to the standards, rules, terms, conditions, guidelines or schedules; and

(b) any new standards, rules, terms, conditions, guidelines or schedules subsequently substituted by an industry organization, regional transmission group, regulatory body or other association or group or any other person, for the standards, rules, terms, conditions, guidelines or schedules, and any new standards, rules, terms, conditions, guidelines or schedules so substituted are deemed to be subject to such alterations, with such modifications as the circumstances require, as may have been made in the adopted standards, rules, terms, conditions, guidelines or schedules under clause (1)(b).

Authority for temporary borrowing

30(1) With the approval of the Lieutenant Governor in Council, the corporation may, from time to time, borrow or raise money for temporary purposes by way of overdraft, line of credit, or loan, or otherwise upon the credit of the corporation in such amounts, not exceeding in the aggregate the sum of $500,000,000. of principal outstanding at any one time, upon such terms, for such periods, and upon such other conditions, as the corporation may determine.

Guarantee

30(2) The government may, on such terms as may be approved by the Lieutenant Governor in Council, guarantee the payment of the principal and interest on any borrowings of the corporation under this section.

Minister of Finance's approval

30(3) Where the corporation borrows or raises money under this section, otherwise than

(a) by way of overdraft with a bank; or

(b) by sale of its short term notes to a bank in lieu of borrowing by overdraft;

it shall do so only with the prior approval of the Minister of Finance, who, at the request of the corporation, may act as its agent in that behalf.

Temporary advances by government

31 To the extent permitted by any Act of the Legislature the Lieutenant Governor in Council, on the recommendation of the Minister of Finance, may authorize the Minister of Finance to advance moneys to the corporation for its temporary purposes out of the Consolidated Fund; and every such advance shall be repaid by the corporation to the Minister of Finance at such times, and on such terms, as the Lieutenant Governor in Council may direct, together with interest thereon at such rate per annum as may be approved by the Lieutenant Governor in Council at the time of the making of the advance and from time to time.

Loans by government

32(1) To the extent permitted by any Act of the Legislature the Lieutenant Governor in Council may authorize the raising by way of loan, in the manner provided in *The Financial Administration Act* and *The Loans Act*, of such sums as the Lieutenant Governor in Council may deem requisite for any of the purposes of the corporation under this Act; and any such sums may be advanced to, and paid over by the Minister of Finance to, the corporation, and shall be repaid by it to the Minister of Finance at such times and on such terms as the Lieutenant Governor in Council may direct, together with interest thereon as provided in subsection (2).

Fixing of rate of interest

32(2) Where an advance is made to the corporation under subsection (1), the Lieutenant Governor in Council shall, by order in council at the time of making the advance, fix the rate of interest that shall be paid by the corporation on the sums so advanced, or on the balance thereof remaining from time to time outstanding and not repaid, during such period as is stated in the order; and after the expiry of that period the Minister of Finance shall, by an order in writing, fix, and alter from time to time, as may be required, the rate of interest that shall be paid by the corporation on the sums so advanced, or on the balance thereof as aforesaid, during any one or more subsequent periods that may be stated in any such order.

Power of corporation to borrow and to issue securities

33(1) Subject to the approval of the Lieutenant Governor in Council, and to subsection (2), the corporation may

(a) raise money by way of loan on the credit of the corporation;

(b) limit or increase the amount to be raised;

(c) issue notes, bonds, debentures, or other securities of the corporation;

for the purposes of the corporation or for any related business venture; and, through the Minister of Finance, who shall be its agent in that behalf, it may

(d) sell or otherwise dispose of the notes, bonds, debentures, or securities, for such sums, and at such prices, as are deemed expedient;

(e) raise money by way of loan on any such securities;

(f) pledge or hypothecate any such securities as collateral security; and

(g) do any of those things.

Limitation on borrowing powers

33(2) The powers conferred on the corporation under subsection (1) may be exercised only

(a) for the repayment of any expenditure made, or that may be made, by the government for the purposes provided for in this Act or for any related business venture, or for the repayment, refunding, or renewal, of the whole or part of any loan or advance made by the government to the corporation or of notes, bonds, debentures, or other securities issued by the corporation; or

(b) in cases to which clause (a) does not apply, only to the extent permitted by this Act or any other Act of the Legislature.

Reissue of pledged securities

33(3) Where securities have been pledged or hypothecated by the corporation as security for a loan and the loan has been paid off, the securities are not thereby extinguished, but are still alive, and may be reissued and sold or pledged as if the former pledging had not taken place.

Form of securities

33(4) The notes, bonds, debentures, and other securities the issue of which is authorized by subsection (1) shall be in such form, and shall bear such rates of interest, and shall be payable as to principal, interest, and premium, if any, at such times and places, in the currencies of such countries, in such amounts, and in such manner in all respects, as the Lieutenant Governor in Council may determine.

Form of securities

33(5) The notes, bonds, debentures, and other securities authorized by subsection (1) shall bear the seal of the corporation which may be impressed thereon or may be engraved, lithographed, printed, or otherwise mechanically reproduced thereon, and, together with any coupons attached thereto, shall bear the manual, engraved, lithographed, printed, or otherwise mechanically reproduced signatures of the chairman and of any one officer of the corporation appointed by the board for that purpose; and any such mechanically reproduced seal and signatures are, for all purposes, valid and binding upon the corporation if the note, bond, debenture, or other security bearing it, or to which the coupon bearing it is attached, is countersigned by an officer appointed by the corporation for that purpose, notwithstanding that the person whose signature is so reproduced may not have held office at the date of the notes, bonds, debentures, or other securities or at the date of the delivery thereof and notwithstanding that the person who holds any such office at the time when any such signature is affixed is not the person who holds that office at the date of the notes, bonds, debentures, or other securities or at the date of the delivery thereof.

Proof that issue of securities is necessary

33(6) A recital or declaration, in the resolution or minutes of the board authorizing the issue or sale of notes, bonds, debentures, or other securities, to the effect that the amount of notes, bonds, debentures, or other securities so authorized is necessary to realize the net sum authorized or required to be raised by way of loan, is conclusive evidence of that fact.

Power of government to guarantee

34(1) The government may, on such terms as may be approved by the Lieutenant Governor in Council, guarantee the payment of the principal, interest, and premium, if any, of any notes, bonds, debentures, and other securities issued by the corporation; and the form and manner of any such guarantee shall be such as the Lieutenant Governor in Council may approve.

Signing of guarantees

34(2) The guarantee shall be signed by the Minister of Finance, or such other officer or officers as may be designated by the Lieutenant Governor in Council; and, upon being signed, the government is liable for the payment of the principal, interest, and premium, if any, of the notes, bonds, debentures, and securities guaranteed, according to the tenor thereof.

Discharge of liability under guarantee

34(3) In a case to which subsections (1) and (2) apply, the Lieutenant Governor in Council may discharge the liability resulting from the guarantee out of the Consolidated Fund, or out of the proceeds of securities of the government issued and sold for the purpose; and, in the hands of a holder of any such notes, bonds, debentures, or securities of the corporation, a guarantee so signed is conclusive evidence that compliance has been made with this section.

Signature of Minister of Finance, etc.

34(4) The signature of the Minister of Finance or of any such officer or officers for which provision is made in subsection (2) may be engraved, lithographed, printed, or otherwise mechanically reproduced, and the mechanically reproduced signature of any such person shall be conclusively deemed, for all purposes, the signature of that person and is binding upon the Government of Manitoba notwithstanding that the person whose signature is so reproduced may not have held office at the date of the notes, bonds, debentures, or other securities or at the date of the delivery thereof and notwithstanding that the person who holds any such office at the time when any such signature is affixed is not the person who holds that office at the date of the notes, bonds, debentures, or other securities or at the date of the delivery thereof.

Authority to raise loans in other currencies or in units of monetary value

35 Where this Act, or any other Act, authorizes the corporation to borrow or raise by way of loan a specific or maximum number of dollars by the issue and sale of notes, bonds, debentures, or other securities, it authorizes the borrowing, or raising by way of loan in whole or in part, of the same number of dollars of the currency of the United States; and if the amount of the loan is raised, in whole or in part, by the issue and sale of notes, bonds, debentures, or other securities payable in the currency of any country other than Canada or the United States or in units of monetary value, the Act authorizes the raising of an equivalent amount in that other currency or in units of monetary value calculated in accordance with the nominal rate of exchange between the Canadian dollar or the unit of monetary value, as the case may be, and the currency concerned on the business day next preceding the day on which the corporation authorizes the issue of the notes, bonds, debentures, or other securities, as that nominal rate is determined by any bank in Canada.

Price of power requisitioned

38(1) The price to be paid by the corporation for power supplied to it on its requisition pursuant to clause 16(c) shall be computed by the board at the amount of the actual cost of producing it, including a reasonable allowance for employed capital; and the prices so paid shall not necessarily be the same as between different suppliers.

Review by P. U. Board

38(2) Any person required by the board to supply power to the corporation may apply to The Public Utilities Board to review the price computed under subsection (1) for power supplied to the corporation.

Price of power sold by corporation

39(1) The prices payable for power supplied by the corporation shall be such as to return to it in full the cost to the corporation, of supplying the power, including

(a) the necessary operating expenses of the corporation, including the cost of generating, purchasing, distributing, and supplying power and of operating, maintaining, repairing, and insuring the property and works of the corporation, and its costs of administration;

(b) all interest and debt service charges payable by the corporation upon, or in respect of, money advanced to or borrowed by, and all obligations assumed by, or the responsibility for the performance or implementation of which is an obligation of the corporation and used in or for the construction, purchase, acquisition, or operation, of the property and works of the corporation, including its working capital, less however the amount of any interest that it may collect on moneys owing to it;

(c) the sum that, in the opinion of the board, should be provided in each year for the reserves or funds to be established and maintained pursuant to subsection 40(1).

Fixing of price by corporation

39(2) Subject to Part 4 of *The Crown Corporations Governance and Accountability Act* and to subsection (2.1), the corporation may fix the prices to be charged for power supplied by the corporation.

Equalization of rates

39(2.1) The rates charged for power supplied to a class of grid customers within the province shall be the same throughout the province.

Interpretation

39(2.2) For the purpose of subsection (2.1),

(a) grid customers are those who obtain power from the corporation's main interconnected system for transmitting and distributing power in Manitoba; and

(b) customers shall not be classified based solely on the region of the province in which they are located or on the population density of the area in which they are located.

39(3) to (7) [Repealed] S.M. 1988-89, c. 23, s. 34.

Confining hearing

39(8) In any public hearing held under this section, The Public Utilities Board may define the status and rights of any intervener to the application and it may confine the public hearing by refusing to admit evidence or permit a submission that does not relate to matters that come within the scope of the public hearing as determined and prescribed by The Public Utilities Board.

39(9) [Repealed] S.M. 1988-89, c. 23, s. 34.

Material supplied by corporation

39(10) Where an application is made to The Public Utilities Board under this Act, the corporation, upon request of The Public Utilities Board, shall provide The Public Utilities Board with

(a) a statement showing the prices fixed or proposed to be fixed and the prices which were or are in effect prior to the new prices being fixed;

(b) a statement of the reasons for any changes in the prices fixed or proposed to be fixed including a statement of the facts supporting those reasons;

(c) a statement of the manner in which and a time at which the changes in the prices were or are proposed to be implemented; and

(d) such further information incidental thereto as The Public Utilities Board may reasonably require.

Recommendations by P. U. Board

39(11) After hearing evidence and submissions in respect of any application made to it under this Act, The Public Utilities Board shall make a report to the minister which shall include its recommendations as to the prices that should be charged for power supplied by the corporation or paid for power requisitioned by the corporation, as the case may be, and the reasons for its recommendations.

Action by L.G. in C.

39(12) Upon receiving the report of The Public Utilities Board under subsection (11), the minister shall refer the report for consideration to the Lieutenant Governor in Council, who shall thereafter direct the corporation as to the prices to be charged for power supplied by the corporation or paid for power requisitioned by the corporation, as the case may be, together with such other orders or directions incidental thereto as he deems appropriate, and the corporation shall comply with the orders and directions given by the Lieutenant Governor in Council for such period as may be prescribed by the Lieutenant Governor in Council.

Applications made under subsec. 38(2) or 50(4)

39(13) Where an application is made to The Public Utilities Board under subsection 38(2) to review a price computed under subsection 38(1) or an application is made to The Public Utilities Board under subsection 50(4) to review an assessment or apportionment made under subsection 50(3), subsections (8), (10), (11) and (12) apply with such modifications as the circumstances require to the application.

Establishment of reserves

40(1) The board shall establish and maintain, and may adjust as required, such reserves or funds of the corporation as are sufficient, in the opinion of the board, to provide

(a) for the amortization of the cost to the corporation of the property and works, (whether as a whole or in its component parts), of the corporation during the period, or remaining period, of the useful life thereof;

(b) insurance, for which provision is not otherwise made, against loss or damage to any property of the corporation, or to the persons or property of others, caused by or arising out of the works or operations of the corporation;

(c) for the stabilization by the board of rates or prices for power sold by the corporation, the meeting of extraordinary contingencies, and such other requirements or purposes as in the opinion of the board are proper.

Use of reserves

40(2) The reserves created pursuant to subsection (1) may be used or employed by the board

(a) towards the reservation and setting aside of the sinking fund established under section 41;

(b) towards the renewal, reconstruction, or replacement, or depreciated, damaged, or obsolescent property and works;

(c) towards restoration of any property lost or damaged, or the payment of any claims, in respect of which a reserve as insurance has been established;

(d) in such manner towards the stabilization of rates or prices for power, the meeting of extraordinary contingencies, and for such other requirements or purposes, as the board in its discretion deems proper; and

(e) subject to the approval of the Lieutenant Governor in Council, towards the cost of construction of new works and extensions, improvements, or additions, to any property and works of the corporation.

SINKING FUND

Establishment of sinking fund

41(1) The board shall reserve and set aside, out of the reserves or funds of the corporation established and maintained under section 40 and out of such other revenues and funds of the corporation as may be available for such purposes,

(a) such annual or other periodic amounts as may be required to be reserved and set aside as a sinking fund under any agreement or undertaking entered into, or assumed, by the corporation or the responsibility for the performance or implementation of which is an obligation of the corporation, relative to the repayment of moneys borrowed by the corporation and

(b) such additional annual or other periodic amounts as the Lieutenant Governor in Council may from time to time direct to be reserved and set aside as a sinking fund for the repayment of any other moneys borrowed by, or advanced to, the corporation and applied to the cost of acquisition or construction of property and works of the corporation, or indebtedness assumed by the corporation or the liability for the repayment of which is an obligation of the corporation, in respect of the cost of any property or works of the corporation, or otherwise.

Minimum annual amount for sinking fund

41(2) Subject to subsection (7), the aggregate of the amounts so reserved and set aside as a sinking fund in each fiscal year under subsection (1) shall not be less than

(a) 1% of the advances, borrowings, and assumptions of indebtedness or indebtedness for which the corporation is liable, mentioned in subsection (1) that are outstanding as at March 31 of the fiscal year next preceding the fiscal year in which the sinking fund payment is made; and

(b) an amount in each fiscal year equal to interest at the rate of 4% per annum on the total sinking fund balances as at March 31 in the next preceding fiscal year.

Payment to Minister of Finance

41(3) The moneys reserved and set aside in each fiscal year for sinking fund purposes under subsections (1) and (2) shall be paid to the Minister of Finance as trustee for the corporation before the end of that fiscal year.

Sinking fund trust account

41(4) The Minister of Finance shall continue to maintain appropriate sinking fund trust accounts, in which shall be included

(a) the moneys and investments made from the moneys reserved and set aside by the corporation, and from interest earnings thereon, held by the Minister of Finance at the time this Act comes into force; and

(b) the moneys paid to the Minister of Finance under subsection (3).

Investment by Minister of Finance

41(5) The Minister of Finance shall invest and keep invested the moneys and investments so held by the Minister of Finance, in securities authorized by *The Financial Administration Act* for the investment of funds, and shall apply them towards the repayment of advances made to, and moneys borrowed or assumed by, the corporation or liability for the repayment of which is an obligation of the corporation and to which reference is made in subsection (1), as they fall due; and the Minister of Finance shall pay to the corporation all interest earned from the investment of the moneys so reserved and set aside and paid to and held by the Minister of Finance.

Repayments to the government

41(6) The corporation in addition to the payments provided for under subsections (1) and (2), may pay to the Minister of Finance such money as it may have available for application on advances made by the government to the corporation or assumed by the corporation or liability for the repayment of which is an obligation of the corporation.

Authorization of omission or deferment of commencement of sinking fund payments

41(7) Subject to subsection (1) and notwithstanding subsection (2), the Lieutenant Governor in Council may direct that

(a) in respect of any moneys advanced to or borrowed by the corporation pursuant to sections 31 or 32, no amounts need be reserved or set aside as a sinking fund; and

(b) in respect of any moneys advanced to, or borrowed or assumed by, the corporation, or liability for the repayment of which is an obligation of the corporation, and that are applied to the cost of newly constructed works of the corporation, the payments to which reference is made in clauses (2)(a) and (b), shall begin with such fiscal year of the corporation as, in each case, the Lieutenant Governor in Council may direct.

Limitation respecting fiscal year that is to be fixed

41(8) The fiscal year to be directed by the Lieutenant Governor in Council under clause (7)(b) shall not be later than five years after the making of the respective advances to or borrowings by the corporation or, in the case of moneys assumed by the corporation or liability for the repayment of which is an obligation of the corporation, shall not be later than five years after the making of the respective advances or borrowings liability for repayment of which is an obligation of the corporation.

"Works" defined for purposes of subsection (7)

41(9) For the purposes of subsection (7), the expression **"works"**, in addition to the meaning given it in section 1, includes preliminary reports, surveys, investigations, engineering, accounting, or organization work or service, or any other work or service in connection with, or incidental to, any proposed development or construction.

APPLICATION OF REVENUES

Application of revenues of the corporation

42(1) The corporation shall apply its revenues toward payment of the operating expenses, interest, and other charges, to which reference is made in clauses 39(1)(a) and (b), and the establishment and maintenance of the reserves and funds established under section 40, and to the reservation and setting aside of the sinking fund established under section 41, and towards all other obligations of the corporation; and the corporation may pay the Minister of Finance, for investment for the corporation, such additional moneys as are available for that purpose and as are not immediately required for the purposes and objects of the corporation.

Funds to be held in trust

42(2) Additional moneys paid to the Minister of Finance for investment under subsection (1) shall form part of the Consolidated Fund; and interest earnings thereon shall be credited to the account of the corporation in the Consolidated Fund or shall be paid over to the corporation by the Minister of Finance.

Right of corporation to use of funds and securities

42(3) The moneys referred to in subsection (2), and any investment therefrom held for the corporation, may be used as required by the board for the purposes of the corporation.

TAXATION, CHARGES AND DISTRIBUTIONS

43(1) [Repealed] S.M. 1989-90, c. 24, s. 85.

Grant in lieu of cost of municipal and school services

43(2) The corporation, as an operating expense, shall make annually to any municipality in which land or personal property of the corporation are situated, or in which the corporation carries on business, such grant towards the cost of municipal and school services as the Lieutenant Governor in Council may approve.

Grants by subsidiaries

43(2.1) A subsidiary, as an operating expense, shall make annually to any municipality in which land or personal property of the subsidiary is situated, or in which the subsidiary carries on business, such grant towards the cost of municipal and school services as the Lieutenant Governor in Council may approve.

Exemption from municipal taxation

43(2.2) For greater certainty, and without limiting any exemption from municipal taxation under *The Municipal Assessment Act*, the corporation and its subsidiaries are exempt from all taxes levied by a municipality on the following property:

(a) conduits, poles, pipes, wires, transmission lines, plant, equipment and any similar property owned by the corporation or any of its subsidiaries or occupied or used by any of them in the generation, transformation, transmission or distribution of power; and

(b) any land on or under which such property is situated.

Limitation

43(2.3) Subsection (2.2) does not exempt the corporation or any of its subsidiaries from local improvement taxes levied against land used for an electric substation or an office building.

Funds of government and corporation not to be mixed

43(3) Except as specifically provided in this Act, the funds of the corporation shall not be employed for the purposes of the government or any agency of the government as that expression is defined in *The Civil Service Act*, other than the corporation, and the funds of the government shall not be employed for the purposes of the corporation except as advances to the corporation by the government by way of loan or as a result of a guarantee by the government of indebtedness of, or assumed by, the corporation or liability for the repayment of which is an obligation of the corporation.

Application of subsection (3)

43(4) Subsection (3) does not

(a) exempt the corporation from paying any tax that may be payable to the government under an Act of the Legislature; or

(b) apply to moneys that may be payable by the corporation

(i) under *The Water Power Act* in respect of water power leases, licences, or permits; or

(ii) as rentals or fees in respect of leases, licences, or permits, of transmission line rights-of-way; or

(iii) in respect of moneys advanced by the government to the corporation, or assumed by it or liability for the repayment of which is an obligation of the corporation, or guaranteed by the government, and interest thereon and any charge made in respect thereof; or

(iv) as a payment under subsection (5); or

(c) apply to moneys payable by the government or any agency of the government for power supplied to the government or the agency, as the case may be, by the corporation.

Distributions from retained earnings

43(5) The corporation shall pay a portion of its retained earnings to the government for its general purposes as follows:

(a) as soon as practicable after this subsection comes into force, an amount equal to the lesser of

(i) $150,000,000., and

(ii) 75% of the corporation's net income for the fiscal year that ended on March 31, 2002;

(b) in accordance with subsection (6), 75% of the corporation's net income for the year ending on March 31, 2003, or any lesser amount determined by the Lieutenant Governor in Council; and

(c) in accordance with subsection (6), 75% of the corporation's net income for the year ending on March 31, 2004, or any lesser amount determined by the Lieutenant Governor in Council.

But the total of the amounts paid under this subsection shall not exceed $288,000,000.

Timing of distributions

43(6) Amounts payable under clauses (5)(b) and (c) shall be estimated and remitted to the government before the end of the fiscal year to which they relate. As soon as practicable after the amount payable for the year is determined, the government shall refund any excess to the corporation and the corporation shall remit any shortfall to the government.

Order for interconnection of electrical systems

50(2) If authorized by the Lieutenant Governor in Council, the board may order any person engaged in Manitoba in the generation, transmission or distribution of power to make an interconnection of two or more electrical systems, or parts thereof, on such terms and conditions, including the provision of transmission access to the corporation or to any other person, and with such apportionment of costs, as the board may deem proper.

Enforcement of order

50(3) In default of such an order being carried out in the manner, and within the period therein specified, and without limiting any other remedy of the corporation, the corporation may carry out the order, or cause it to be carried out; and for that purpose the corporation may enter upon the property of any such person and do whatever is necessary to effect the interconnection ordered, and may assess to, and collect from, that person the cost of so doing or such portion thereof as the board may deem fit.

Review by P. U. Board

50(4) Any person against whom an assessment is made under subsection (3) may apply to The Public Utilities Board to review the assessment or the apportionment thereof.

Crown Corporations Governance and Accountability Act

PUBLIC UTILITIES BOARD REVIEW OF RATES

Hydro and MPIC rates review

25(1) Despite any other Act or law, rates for services provided by Manitoba Hydro and the Manitoba Public Insurance Corporation shall be reviewed by The Public Utilities Board under *The Public Utilities Board Act* and no change in rates for services shall be made and no new rates for services shall be introduced without the approval of The Public Utilities Board.

Definition: "rates for services"

25(2) For the purposes of this Part, **"rates for services"** means

(a) in the case of Manitoba Hydro, prices charged by that corporation with respect to the provision of power as defined in *The Manitoba Hydro Act*; and

(b) in the case of The Manitoba Public Insurance Corporation, rate bases and premiums charged with respect to compulsory driver and vehicle insurance provided by that corporation.

Application of Public Utilities Board Act

25(3) *The Public Utilities Board Act* applies with any necessary changes to a review pursuant to this Part of rates for services.

Factors to be considered, hearings

25(4) In reaching a decision pursuant to this Part, The Public Utilities Board may

(a) take into consideration

(i) the amount required to provide sufficient funds to cover operating, maintenance and administration expenses of the corporation,

(ii) interest and expenses on debt incurred for the purposes of the corporation by the government,

(iii) interest on debt incurred by the corporation,

(iv) reserves for replacement, renewal and obsolescence of works of the corporation,

(v) any other reserves that are necessary for the maintenance, operation, and replacement of works of the corporation,

(vi) liabilities of the corporation for pension benefits and other employee benefit programs,

(vii) any other payments that are required to be made out of the revenue of the corporation,

(viii) any compelling policy considerations that the board considers relevant to the matter, and

(ix) any other factors that the Board considers relevant to the matter; and

(b) hear submissions from any persons or groups or classes of persons or groups who, in the opinion of the Board, have an interest in the matter.

MPIC

25(5) In the case of a review pursuant to this Part of rates for services of the Manitoba Public Insurance Corporation, The Public Utilities Board may take into consideration, in addition to factors described in subsection (4), all elements of insurance coverage affecting insurance rates.

25(6) [Not yet proclaimed]

Multi-year approvals

26(1) A corporation may submit for the approval of The Public Utilities Board pursuant to this Part proposals regarding rates for services relating to a period of not more than three years and the Board shall identify in its order the change approved, if any, with respect to each year.

Increases not cumulative

26(2) No corporation shall increase rates for services by an amount in any year that exceeds the amount approved for that year by The Public Utilities Board or introduce new rates for services in any year other than new rates for services approved for introduction in that year by The Public Utilities Board.

Changed circumstances

26(3) Where The Public Utilities Board is satisfied that the circumstances of a corporation have changed substantially, The Public Utilities Board may, of its own motion or on the application of the corporation or an interested person, review an order made pursuant to this section and modify the order in any manner that The Public Utilities Board considers reasonable and justified in the circumstances.

Compensation or refunds

27 When a new rate for services or an increased rate is allowed pursuant to an interim order and a final order does not allow any changes or allows changes other than those permitted in the interim order, The Public Utilities Board may make any order to compensate for or to refund any excess amounts collected by the corporation that it considers necessary and appropriate in the circumstances.

Public Utilities Board Act

Application to Manitoba Hydro

2(5) Subject to Part 4 of *The Crown Corporations Governance and Accountability Act* and except for the purposes of conducting a public hearing in respect of an application made to the board under subsection 38(2) or 50(4) of *The Manitoba Hydro Act*, this Act, other than subsection 83(4) and the regulations under that subsection, does not apply to Manitoba Hydro and the board has no jurisdiction or authority over Manitoba Hydro.

Regulations respecting construction standards

83(4) The board may make and enforce regulations, not inconsistent with this Act, prescribing standards for the construction and erection of telephone, telegraph, and power transmission lines; and every such regulation made under and in accordance with the authority granted by this section, has the force of law; and any owner of a public utility who has constructed or erected such lines in accordance with such regulations, is relieved from all liability for damage arising out of the construction or erection of the lines.

Appendix B – Manitoba PUB Regulatory Principles

The following information was retrieved from the website of the Manitoba PUB, at http://www.pubmanitoba.ca/v1/about-pub/regulatoryprinciples.html.

Regulatory Principles

When considering a rate application, the Board must weigh all the available evidence. As such, the PUB operates on the basis of sound, established regulatory principles in order to come to decisions. There is no single authority that sets regulatory principles, and these principles may conflict or overlap, but it is the goal of the PUB to effectively balance the following principles and consistently take them into consideration when setting utility rates.

Cost of service standard

This principle is at the heart of rate regulation. Under this principle, a utility is permitted to set rates that allow it to recover its costs for regulated operations, including a fair rate of return on its investment devoted to those regulated operations—no more and no less. In most cases, rates are set in anticipation of future costs. If the regulated entity over-recovers those costs, it keeps the excess. If it under-recovers, it bears the cost of the deficiency of its projections.

Intergenerational Equity

Under this principle, customers in a given period should only pay the costs that are necessary to provide them with services in that period. They should not have to pay any costs incurred to provide services to customers in any other period. This principle is consistent with setting rates that are just and reasonable. For example, a regulated entity is usually not allowed to earn a return on projects under construction because any costs incurred are incurred in order to provide services to future customers. Instead, the costs are capitalized and recovered through depreciation over the period that the assets are used to provide the service.

Matching Principle

This principle requires that a regulated entity's costs be matched to the period that benefits from the costs being incurred, and should be recovered from customers in that period. In other words, the customers in each period should pay for the costs of providing them with service in that period. The matching principle follows from the cost of service standard and the principle of intergenerational equity. Consistent with the cost of service standard, all of a regulated entity's costs should be recovered from customers. Consistent with the principle of inter-generational equity, only customers in the period that benefit from the cost being incurred should pay for the cost.

Rate stability and predictability

This principle requires rates to remain stable and predictable, at least to the extent practical. Therefore, the principle may justify smoothing out increases to avoid any sharp rate climbs.
The principle of rate stability and predictability may require costs to be collected from customers in periods other than those for which the costs were incurred. Therefore, the principle is inconsistent with the principle of inter-generational equity. Despite that, it is justified because it recognizes the problems customers can face in adjusting to significant short-term rate fluctuations.

Used or required to be used

Under this principle, customers should only pay for the cost of those assets that are either used or required to be used to provide them with the service. An application of this principle is in the case of a diversified company with both regulated and non-regulated operations. The customers of the regulated operations should not be required to pay for assets used to supply non-regulated services.

Prudence standard
Under this principle, customers should be charged only for prudently incurred costs. This recognizes the fact that regulated entities have a responsibility to manage themselves in a prudent manner. This principle is central to the PUB hearing process and the wealth of evidence collected and examined by the Board in its proceedings.

Why we do it
Due to the capital intensive nature of the business, and the inherent difficulty of competition in such a closed market, utilities naturally tend toward monopoly formation, meaning the complete absence of market competition. The PUB regulates public utilities precisely because they constitute a so-called natural monopoly in the marketplace.
The industry demonstrates so-called "economies of scale," meaning that the costs for the utility in distribution and production decrease as demand increases. In short, the more customers, the cheaper it becomes to serve them. This means that one large firm can provide utility service at a lower cost than two or more firms.

In the absence of a competitive market, prices are not set based on supply and demand pressures but rather on a self-determined reasonable rate of return for the utility, coupled with some outside evidence of what consumers will reasonably pay. Without market competition there is a risk that consumers will pay exorbitant prices for utility service.

In Manitoba, these natural utility monopolies are largely controlled by the government, or the Crown, as state-owned enterprises or Crown Corporations Manitoba Hydro (which includes natural gas subsidiary Centra Gas) and Manitoba Public Insurance. These state-owned enterprises seek only to break-even in their operations.

But while state-owned monopolies do not seek to generate a profit, they may charge unfair or unjust rates in the absence of oversight. Regulation and rate setting is intended to ensure that rates are prudent, just and reasonable, that utility service is reliable and safe, and that a balance is achieved between customer needs and the revenue requirements of the utility and its creditors.

Appendix C – The Bonbright Criteria

This version is drawn from James C. Bonbright, *Principles of Public Utility Rates*, Second Edition, 1988.

1. Effectiveness in yielding total revenue requirements under the fair-return standard without any socially undesirable expansion of the rate base or socially undesirable level of product quality and safety
2. Revenue stability and predictability, with a minimum of unexpected changes that are seriously adverse to utility companies
3. Stability and predictability of the rates themselves, with a minimum of unexpected changes that are seriously adverse to utility customers and that are intended to provide historical continuity
4. Static efficiency, i.e., discouraging wasteful use of electricity in the aggregate as well as by time of use
5. Reflect all present and future private and social costs in the provision of electricity (i.e., the internalization of all externalities)
6. Fairness in the allocation of costs among customers so that equals are treated equally
7. Avoidance of undue discrimination in rate relationships so as to be, if possible, compensatory (free of subsidies)
8. Dynamic efficiency in promoting innovation and responding to changing demand-supply patterns
9. Simplicity, certainty, convenience of payment, economy in collection, understandability, public acceptability, and feasibility of application
10. Freedom from controversies as to proper interpretation

Hydro Quebec

Jurisdiction	Quebec; also wholesale markets in northeastern regions in North America (e.g. Ontario, New England)
Ownership	Government of Quebec
Org. Type	Crown Corporation Pays dividends
Markets	Electricity generation, transmission and distribution
Mandate (in addition to primary purpose of providing listed services to customers)	From the *Hydro-Quebec Act:* "The objects of the Company are to supply power and to pursue endeavours in energy-related research and promotion, energy conversion and conservation, and any field connected with or related to power or energy"
Regulation	- Régie de l'énergie du Québec
Customers	Total customer accounts: 4,244,541 - Residential: 3,924,992 - Commercial, institutional and small industrial: 314,816 - Large industrial: 183 - Other: 4,550
Lines	- Distribution lines: 116,794 km - Transmission lines: 34,292 km
Sources of Production	- Hydroelectric and thermal
Energy produced	Total: 36,908 MW installed capacity - Hydroelectric: 36,366 MW (including Churchill fall) - Thermal: 542 MW Total electricity sales in 2016: 202 TWh Energy Purchased: $1.866 billion worth of energy and fuel purchases
Imported Energy	
Exported Energy	Net export of $1.568 billion for 32.6 TWh in electricity sales representing 16% of sales

Scope

This criteria report details Fitch Ratings' approach to rating U.S. public power utilities. It is a sector-specific extension of Fitch's global master criteria report, *Revenue-Supported Rating Criteria*. More specifically, the report elaborates on five key areas of operational and financial importance to the credit quality of municipal and cooperative power entities: governance and management strategy; assets and operations; cost and rate structure; customer profile and service area; and financial performance and legal provisions.

These key elements of Fitch's public power rating criteria remain largely consistent with its prior criteria reports. However, the importance of individual credit factors sometimes change as the industry evolves, particularly in response to new regulatory initiatives or as new market dynamics emerge. In addition, not all rating factors outlined in this report apply to each rating or rating action. Each specific rating action commentary or rating report discusses those factors most relevant to the individual rating decisions.

Key Rating Drivers

Rate Sufficiency and Flexibility: A public power utility's ability and willingness to maintain rates sufficient to meet all its financial obligations is of paramount importance. Fitch considers how a utility's rate structure affects its capacity for the full and timely recovery of costs, as well as its flexibility to raise additional revenue. Ratemaking autonomy and the process for adjusting rates factor into this analysis.

Comprehensive Strategic Planning and Risk Management: The extent of strategic planning and risk management performed by a utility is a key indicator of management's preparedness and sophistication, and an important rating factor. Fitch typically reviews prior strategic and financial plans versus actual outcomes, as well as newly adopted strategies, to gauge management effectiveness.

Resource Adequacy and Performance: Ensuring the adequacy of resources to meet current and projected demand is a fundamental planning requirement of public power utilities. Together with demonstrated operating efficiency, it is an important factor in providing low-cost, reliable energy supply. Fitch measures resource adequacy and performance against industry standards for cost and reliability.

Service Area Composition and Depth: Service area characteristics demonstrate the breadth, depth and stability of a utility's constituents, as well as their financial wherewithal. Fitch considers customer composition and concentration; income levels; and employment, population and sales growth trends in this assessment.

Financial Strength and Forecasting: The strength and stability of a utility's financial metrics reveal its ability to meet all financial obligations, and detailed financial forecasting provides an indication of future performance. Fitch reviews a broad array of historical and projected financial metrics in an assessment of a utility's financial strength, as well as a utility's adherence to adopted financial policies. Financial metrics focus principally on three core areas: cash flow, liquidity and capital structure.

Governance and Management Strategy

The strength of a utility's senior management and governing body is a key credit consideration in Fitch's analytical process and largely evaluated with qualitative observations. Interaction with utility management is key to this analysis.

Management's experience and ability to design and implement a comprehensive strategic plan is important to an issuer's rating, as is its ability to respond to unforeseen circumstances. A high degree of organizational understanding and support of a utility's business strategy and the issues facing the sector is also important.

Achieving Strategic Goals

Fitch typically reviews prior strategic and financial plans versus actual outcomes in an assessment of management and governance effectiveness. A stronger management team consistently meets or exceeds financial projections, and deals well with unexpected developments. Moreover, Fitch takes into account the reasonableness of key financial and operational planning assumptions relative to prevailing economic conditions and industry trends.

Comprehensive Resource Planning

Fitch analyzes a utility's integrated resource plan and its long-term strategies to provide reliable, high-quality, and low-cost service to its customers to determine if they are adequate and reasonable. Fitch monitors the implementation of those strategies and a utility's financial flexibility for responding to changing market conditions.

Major Components of a Comprehensive Strategic Plan
Forecasts of customer and load growth.
New generation, transmission or distribution requirements.
Plans to meet capital needs, including debt-financing forecasts.
Plans for rate increases.
Financial projections, including stress scenarios.
Risk management procedures and analysis.

Fitch discusses with management the purpose, amount and structure of planned debt issuances, and any debt-management policies in assessing a utility's capital needs and their effect on its future debt profile and financial performance. Fitch assesses the willingness and ability of a utility's management and governing body to increase rates to ensure the measured, timely and adequate recovery of total costs. Fitch also evaluates the likely effect of rate increases on a utility's financial performance relative to its peer group.

Attributes: Governance and Management

Stronger	
	Tenured management team with extensive experience.
	An objective, engaged and independent board of directors.
	Transparency and strong communication between management, the board of directors and customers.
	Strong coordinated efforts among utility system membership and the governing body.
	Frequent analysis and updating of financial forecasts and resource-management plans.
	Success meeting results from prior financial forecasts.
	Well-developed and documented risk management policies and procedures.
	Documented succession planning.
Midrange	
	Generally stable and capable management team.
	A board of directors exhibiting solid local governance and modest turnover.
	Comprehensive strategic and resource plans, demand forecasts and risk management policies that generally reflect current economic, system and political conditions.
Weaker	
	Management team characterized by inexperience or frequent turnover.
	A detached, politically-appointed board of directors.
	Significant political pressure and influence observed throughout municipality or service area.
	Failure to maintain open communication between the utility and the board of directors, which may reveal itself in unexpected, significant rate increases.
	Poor history of meeting financial forecasts and/or limited financial forecasting and rate planning.
	Lack of adequate risk management policies and procedures.

Preparing for Uncertainties

The extent of risk management performed by a utility is a key indicator of management's sophistication. Fitch views favorably a management team that is able to recognize and discuss risks (and mitigating factors) that could affect a system, and in turn, bondholder security. Such risks include participation in the fuel and energy commodity markets; plans for managing a large generation unit or transmission outage; reliance on off-system counterparty credit quality; and the effect of regulatory or legislative changes.

Fitch believes the ability to manage unforeseen circumstances without causing material changes to a utility's financial or operating position is a good indication of management planning and preparedness.

Assets and Operations

Fitch analyzes the generation, transmission and distribution assets of public power and electric cooperative systems to determine if a utility's power supply mix and asset operating performance adequately meet existing and future demand requirements. This analysis may be informed through site visits, which are an important part of Fitch's review process, as well as quantitative measures.

Resource Portfolio Benchmarking

Fitch benchmarks a utility's resource portfolio to that of industry standards, the regional market in which the utility operates, and other utilities in the rating category. This allows for a comparative analysis of a utility's relative strengths and weaknesses. Fitch considers the following areas in its assessment of resources:

- Fuel mix;
- Plant availability and capacity factors;
- Load factor;

- Heat rate; and
- Environmental mandates or goals.

Integrated Resource Planning

Fitch analyzes how a utility's customer or load growth, expiring purchase power contracts, aging generation fleet and renewable mandates influence the demand for future power resources. Fitch considers the following areas in its assessment of a utility's integrated resource plan:

- The type of generation chosen and alternatives considered;
- The relative maturity of the proposed technology;
- The size and cost of the resource;
- The positioning of the resource within the utility's existing portfolio (baseload, intermediate or peaking);
- The availability of transmission and distribution resources; and
- Environmental factors.

Fitch does not have a systematic rating preference for owning assets versus purchasing power. On the contrary, Fitch's analysis considers the costs and benefits to individual utilities of both approaches.

Fuel Cost and Supply Management

The ability to manage fuel costs is a key credit concern, because fuel is often a utility's largest budgetary expense. Factors related to fuel cost and supply that Fitch considers include:

- Fuel mix diversity;
- Fuel agreement flexibility;
- Fuel transportation arrangements; and
- Alternative fuels, if primary sources are not available.

Fitch also reviews a utility's hedging techniques as part of its risk management assessment. The use of financial and physical forward markets can help mitigate the risk of price volatility or a longer term trend of increasing prices. Fitch views prudent and conservative fuel hedging programs favorably. However, these initiatives may expose a utility to counterparty risk or collateral posting requirements as fuel prices rise or fall.

Fitch considers all aspects of a utility's hedging program in its analysis, including the relevant terms of hedging agreements, counterparty credit quality and available liquidity to support rising prices or collateral requirements. Although the optimal fuel cost and supply strategy varies by utility and is driven by the diversity of generating resources, sufficiency of fuel sources and the ability to mitigate associated risks, Fitch views a power supply portfolio that exhibits a broadly diversified fuel mix as most supportive of long-term credit quality.

Environmental Considerations

Fitch conducts a review of a utility's compliance with current and proposed environmental standards to fully understand a system's future capital needs and operating expenses. Environmental retrofits can be costly on a capital basis and from an operating perspective, as increased captive consumption often results in lower plant output. Moreover, the cost to retrofit or improve older, smaller generating facilities may be high, rendering the generating facility uneconomic and subject to premature retirement. As such, the effect of more restrictive federal and state environmental policies can have significant operating and financial repercussions for a utility that require careful, advanced planning

Renewable Resources

Fitch reviews a utility's strategy for developing renewable or alternative power generation to gauge how a utility's resource mix will change, particularly when it must comply with a state renewable portfolio standard. Fitch also evaluates the capital and operational costs of the projects, and how they will ultimately affect financial metrics and customer rates.

Renewable energy projects are expected to have long-term environmental benefits. However, the intermittent nature of their generation and higher operating costs relative to traditional generating resources can pressure a utility's financial operations without adequate cost recovery. Fitch evaluates the availability and types of renewable resources, as well as transmission capacity, which vary by region.

Distribution and Transmission

Fitch's review of transmission and distribution assets includes an assessment of reliability, as measured by the frequency of outages, line losses, etc., and the extent and timeliness of necessary capital improvements. Fitch evaluates the level of historical and planned system investment to determine if customer growth will affect the operations of the existing utility relative to a peer group. Fitch also reviews a utility's business strategy regarding its transmission connection with a regional operator or other transmission system. Membership in a regional transmission organization can be the optimal method of providing reliable access to market power.

Cost and Rate Structure

Fitch analyzes a utility's cost structure and methods of adjusting rates to determine its rate-raising flexibility for the timely funding of financial operations and capital needs. The analysis is conducted bottom up, by looking at the costs to supply electricity to customers, and top down, by examining the structure of rates charged to users. A utility with overall rates below neighboring systems or systems with similar fuel mixes is generally viewed as having greater flexibility to use rates as a tool for funding. Strong service territory income measures typically enhance this flexibility.

Local Rate-Setting Authority

Fitch views the flexibility most municipal systems and electric cooperatives have to independently adjust rates as a positive credit factor and distinguishing characteristic from comparable investor-owned utilities. Most public power systems are not subject to regulation by state public service commissions. Instead, public power systems typically maintain local authority to adjust rates as needed, which contributes to the timely recovery of costs. This provides management with the ability to raise rates to maintain financial stability, build liquidity or pay for portions of a capital improvement plan. Conversely, rate regulation generally limits financial flexibility and may delay the timing or amount of necessary rate increases.

Attributes: Cost and Rate Structure

Stronger	
	Sole authority by an independent board to set rates and a demonstrated willingness to do so.
	Service rates that are typically below those of neighboring utilities and regionally competitive.
	Use of an automatic monthly fuel or purchased power adjustment for timely recovery of variable energy and fuel costs.
	Timely and measured rate increases implemented in anticipation of multiyear capital spending.
Midrange	
	Authority to set customer or member rates, subject to the approval of an elected city council.
	Comparable rates to neighboring utilities, and within range of regional averages.
	Use of a fuel or purchased power adjustment that requires board approval or adjusts less frequently than monthly.
	Well documented rate strategy for servicing capital spending and related debt obligations.
Weaker	
	Outside regulatory approval required for rate increases.
	Political pressure that might limit or postpone needed rate increases, which could ultimately affect a utility's financial metrics.
	Above average rates relative to a peer group, which reduces flexibility for managing unforeseen operating or other capital expenses.
	Lack of any fuel or purchased power adjustment factor.

Fitch also considers the use of automatic or interim rate adjustments, which further ensure timely cost recovery, in its assessment of a utility's rate structure. Interim adjustments that may be implemented by a utility's management team — without the involvement of a governing board — can help ensure the overall stability of financial operations.

Rate Competitiveness and Affordability

Fitch analyzes rate affordability with a mixture of qualitative and quantitative factors. Fitch's perception of high or volatile rates, lack of future rate flexibility or difficulty in obtaining timely rate relief may influence a utility's rating.

Fitch believes credit is due to those systems that consistently raise rates to preserve financial strength. However, Fitch believes these activities will be more sustainable when rate affordability is a focus of policymakers and cost containment is regularly employed. Fitch reviews a utility's rates relative to neighboring and comparable systems, and against service area income levels to gauge rate competitiveness and affordability.

Customer Profile and Service Area

Service area characteristics provide an indication of the stability of a constituency's load, and ultimately its ability to pay electric bills. Stronger electric utilities typically serve growing, well-diversified areas. However, the essential nature of electric service and the remedies available to most public power providers (e.g. shutoffs and liens) make payment delinquencies in the sector extremely low, regardless of wealth and other economic indicators.

Service Area Considerations

A utility's ability to maintain a sound operating position, despite changing service area characteristics, is an important rating consideration. Some of the factors Fitch considers in its assessment of a service area are shown in the table on page 7.

Fitch performs a more detailed analysis of an electric system's customer base to further evaluate the stability of the revenue source when there is industry or customer concentration. The latter is defined as one or a few large customers accounting for a material proportion of revenues (see table on page 7). Fitch conducts an analysis of all relevant member information

Key Service Area Metrics

Indicator	Source	Significance
Economic Factors	U.S. Bureau of Labor Statistics and U.S. Bureau of Economic Analysis	A diversified economy is typically better positioned to absorb cyclical changes than an economy concentrated in a certain sector, providing for greater stability of revenues.
Customer Profile (Breakdown of Residential, Commercial and Industrial Customers)	Utility or consultant	A higher percentage of residential energy sales (more than 40%) typically provides for greater financial stability. Residential customers each account for very small percentages of total sales. As such, the loss of any single customer does not disrupt a utility's revenue stream.
Top 10 Customers	Utility or consultant	As a percentage of the total, 5% of sales to the largest customer or 25% of sales to the 10 largest customers reveals concentration in the revenue base, which can be disruptive if a large customer(s) leaves the area.
Population	U.S. Census	A growing service area typically leads to additional energy sales, in support of revenues.
kWh Sales (Breakdown of Residential, Commercial and Industrial Sales)	Utility or consultant	The trend of kWh sales provides an indication of the health of the local economy, with steady annual increases demonstrating sound economic and population growth.
Unemployment Rate	U.S. Bureau of Labor Statistics	Provides an indication of the relative depth of a local employment base.
Income Levels	U.S. Census and U.S. Bureau of Economic Analysis	Provides an indication of the relative ability to pay.

when reviewing wholesale public power suppliers, as necessary, to the extent that information is available.

Financial Performance and Legal Provisions

The assessment of a utility's financial performance and policies, and the legal provisions underpinning specific debt issuances, are important considerations in Fitch's rating process. Fitch reviews five years of audited financial statements for an established utility to understand its historical trends and competitive position relative to a peer group. A utility's operating results, liquidity levels and capital structure are evaluated. Financial projections, including planning assumptions for load growth, rate increases and expenses, are likewise critical to the rating process.

Financial Performance

Fitch's analysis of financial metrics focuses principally on three core areas: cash flow, liquidity, and capital structure. No single financial ratio stands apart from the rest. On the contrary, the ratios are examined together, providing a context for a utility's financial position that informs a complete analysis.

Cash Flow

Cash flow indicators, particularly as they pertain to debt service coverage, provide a measure of financial cushion to meet obligations to bondholders. Fitch primarily considers two measures of debt service coverage to compare utilities that own generation versus purchase power. The standard debt service coverage ratio measuring funds available for debt service to total debt service applies to all utilities.

An adjusted measure of debt service coverage — coverage of full obligations — is primarily for systems that own little or no generation. This ratio treats a percentage (30%) of purchased power costs as a debt-like obligation. Thirty percent is an approximation based on historical experience for that portion of off-balance sheet obligations that might otherwise be a fixed expense. The ratio provides a more conservative estimate of financial margin and facilitates comparison with systems that own capital-intensive generating assets. This adjustment is particularly important for those arrangements where a wholesaler supplier has issued debt on behalf of obligated retail entities. See Appendices A and B.

Liquidity

Liquidity measures, such as days cash on hand and days liquidity on hand, provide an estimate of an issuer's ability to meet unplanned operating or other capital expenses. For the purpose of ratio calculation, cash typically includes unrestricted cash, cash equivalents and investments that can be converted to cash within a reasonable period of time. In some cases, restricted cash and investments may also be included if available for general system purposes, including the payment of debt service.

Key Financial Ratios

Ratio	Calculation	Significance
Cash Flow		
FADS ($)	Operating Revenues – Operating Expenses + Depreciation + Interest Income[a]	Provides a measure of cash flow from operations.
Debt Service Coverage (x)	FADS/Total Annual Debt Service	Indicates the margin available to meet current debt service requirements.
Coverage of Full Obligations (x)	(FADS + Fixed Charge – General Fund Transfer and/or PILOT)/ (Total Annual Debt Service + Fixed Charge)[b]	Indicates the margin available to meet all debt service and other fixed obligations.
Debt/FADS (x)	Total Debt/FADS	Indicates the size of debt compared to the margin available for debt service.
Liquidity		
Days Cash on Hand	Unrestricted Cash/(Operating Expenses – Depreciation) x 365	Indicates financial flexibility, specifically cash, cash equivalents and investments, relative to expenses.
Days Liquidity on Hand	(Unrestricted Cash + Available Lines of Credit and Commercial Paper Capacity)/(Operating Expenses – Depreciation) x 365	Indicates financial flexibility, including all available sources of cash and liquidity, relative to expenses.
Capital Structure		
Equity/Capitalization (%)	Total Equity/Capitalization	Provides a measure of cost recovery, leverage and additional debt capacity.
Debt Service/Cash Operating Expenses (%)	Total Annual Debt Service/(Operating Expenses + Total Annual Debt Service – Depreciation)	Provides an indication of debt burden relative to cash operating expenses.
Debt/Customer ($)	Total Debt/Total Customers	Provides a measure for relative comparison of leverage.
Variable-Rate Debt/Total Debt (%)	Variable-Rate Debt/Total Debt	Provides context for an issuer's short-term obligations.
Other		
Operating Margin (%)	Operating Margin/Operating Revenues	Provides a measure of operating stability and capacity to manage an increase in debt service.
Capex/Depreciation and Amortization (%)	Capex/(Depreciation + Amortization)	Indicates whether annual capital spending keeps pace with depreciation.
FCF/Capex ($)	(FADS – Total Annual Debt Service – General Fund Transfer and/or PILOT)/Capex	Indicates a utility's ability to internally fund capex.
Net Debt/Net Capital Assets (x)	(Total Debt – Cash and Reserve Funds)/Net Utility Plant	Provides a measure of leverage relative to the book value of physical assets.
General Fund Transfer/ Operating Revenues (%)	(General Fund Transfer + PILOT)/Operating Revenues	Indicates the degree to which a utility provides city or county general fund support.

[a]Operating revenues exclude deferrals to and transfers from a rate stabilization fund. [b]Fixed charge – 30% of purchased power expense, which is an approximation of the associated fixed expense. Note: Includes unrestricted cash, cash equivalents and investments plus restricted cash and investments (if available for general system purposes). FADS – Funds available for debt service. PILOT – Payment in lieu of taxes.

Certain utilities, including many cooperatives, rely heavily on committed bank revolvers or lines of credit and commercial paper programs for access to short-term capital. As such, days liquidity on hand, reflecting undrawn short-term borrowing arrangements and unused commercial paper capacity, is also an important measure of financial flexibility. Fitch assesses the diversity and credit quality of liquidity providers, the ability to extend and replace bank agreements, the adequacy and terms of the liquidity support, and a borrower's short-term market access.

Capital Structure

A utility's capital structure, which encompasses the strength of its balance sheet, presents another indication of financial flexibility. More specifically, the equity-to-capitalization ratio measures a utility's ability to grow equity over time.

A rising equity ratio is viewed favorably, as it typically suggests adequate cost recovery in rates, load growth and a component of internal funding of capital investments. In addition, a robust level of system equity can indicate a heightened capacity for issuing additional debt to fund future capital needs.

Debt Profile

Fitch's assessment of a utility's debt profile considers the purpose, amount and structure of its existing debt. Fitch also considers any off-balance sheet obligations such as take-or-pay contracts or interest rate swap agreements for a complete assessment of fixed-expense obligations. Future financing plans, including the funding of a long-term capital program, and the renewal and replacement of any bank liquidity facilities, are also important considerations, particularly as they affect financial metrics.

The amount of hedged or unhedged variable-rate debt an issuer can manage is a function of its operating risk profile; the strength, predictability and amount of its cash flows; the level of available funds; and its management of interest rate exposure and maturities. Fitch assesses the resiliency of an issuer's financial metrics relative to a peer group when evaluating its ability to manage variable-rate and short-term debt exposure. Issuers with robust cash balances, broad rate-setting authority, and widespread access to the capital markets are typically better able to take on a greater percentage of variable-rate debt, as compared with issuers lacking these characteristics.

Legal Provisions

Aspects of the Bond Indenture

The legal provisions of a bond indenture or resolution provide a framework for the establishment of funds and, ultimately, the repayment of a debt obligation. Consequently, Fitch analyzes indenture provisions, including security, revenue pledge, lien position, rate covenant, additional bonds test, debt service reserve fund and flow of funds to determine the relative strength of the security.

Bond covenants are important to overall bondholder protection, though the degree to which they influence a rating varies. These restrictive provisions take on greater importance the weaker the credit quality, as they are more likely to be tested.

Municipally Owned Systems

Pledge of Revenues

Fitch does not distinguish between a pledge of gross and net revenues for municipally owned systems, as all systems must fully cover annual operating expenses and debt service from total revenues. A weaker revenue pledge may allow for the inclusion of other available funds in the calculation of revenues.

Rate Covenant

The rate covenant provides a minimum level of protection and ensures a system reliably covers debt service by a certain margin. Fitch views it as an element of financial cushion. Rate covenants with only a 1.0x (sum sufficient) debt service coverage requirement, or those that allow inclusion of other funds in the calculation, are viewed as being weaker.

Additional Bonds Test

The terms of the additional bonds test often mimic the rate covenant. The strongest tests include both a historical and projected debt service coverage test and limit the period for calculating historical net revenues to the 12 months immediately preceding the issuance of additional debt.

Attributes: Select Indenture Provisions — Municipal Systems

Rate Covenant	Additional Bonds Test
Stronger	
Greater than 1.25x coverage of ADS by net revenues alone.	More than 1.25x coverage of MADS from net revenues. Typically, the test includes both a historical and projected revenue period; the test is met over a consecutive number of months.
Midrange	
Coverage of ADS between 1.10x and 1.25x by net revenues alone.	Coverage of MADS from net revenues of between 1.10x and 1.25x. Might only include a historical or projected net revenue coverage test; might allow inclusion of other available fund balances to meet the test.
Weaker	
Less than 1.10x coverage of ADS by net revenues plus available funds.	Less than 1.10x coverage of ADS from net revenues plus additional funds. Typically, a historical or projected test, with a looser interpretation of the revenue period (i.e. 12 consecutive months of the 24 months preceding the issuance of additional bonds).

ADS – Annual debt service. MADS – Maximum annual debt service.

Debt Service Reserve Fund

The incidence of relying on a debt service reserve fund to pay debt obligations is low, given the limited number of public power entities that Fitch rates below investment grade. However, maintaining additional legally restricted, cash-funded reserves is looked upon favorably, particularly for weaker credits. Fitch evaluates those instances where reserve funds have been funded with a surety from a financial guarantor on a case-by-case basis.

Flow of Funds

The flow of funds is fairly standardized for municipal utilities, providing for regular deposits to the debt service fund after the payment of operations and maintenance. As such, the flow of funds usually has little bearing on the rating, except in the uncommon instances when it deviates from the typical arrangement.

Cooperatively Owned Systems

Security

Unlike municipally owned utilities, cooperatives typically issue debt secured by a first lien on owned tangible and certain intangible assets, not net revenues. Pledged security for generation and transmission (G&T) cooperatives is also expected to include the power sales contracts with distribution members, which Fitch views as important.

Although Fitch believes a mortgage interest provides valuable bondholder support, it does not distinguish the ratings of a cooperative's senior secured and unsecured obligations. Fitch's public finance ratings consider an obligation's relative vulnerability to default; they do not consider the prospect of recovery post default. Therefore, the fact that an obligation may benefit from a higher recovery is not a basis for a higher rating.

Rate Covenant

Rate covenants provide a minimum level of protection and ensure a system reliably covers debt service by a certain margin. Cooperative rate covenants typically require cash flows sufficient to recover all costs and expenses, and to generate a minimum times interest earned or margins for interest ratio (e.g. 1.10x) for some measure of additional cushion.

Other than establishing minimum operating thresholds, these ratios provide marginal value in Fitch's analysis and are a limited rating factor, as most Fitch-rated cooperatives operate with stronger cash flows.

Limitations on Patronage Capital

Distributions of patronage capital — returns of excess capital — to member owners are typically limited under cooperative indentures until a specified ratio of equity to capitalization (generally 20%) has been achieved. These limitations provide a measure of balance sheet resource adequacy and some protection for bondholders vis-à-vis member owners.

Effects of Litigation

Fitch considers any litigation that might result in financial payments in its review of an issuer's legal framework. Any such payments that materially affect an issuer's balance sheet could result in a negative rating action.

Key Analytical Considerations

Governance and Management Strategy

- Type of governing body
- Management's experience and depth of industry knowledge
- Management's track record at achieving financial and strategic goals
- Business strategy and planning
- Extent of risk management

Assets and Operations

- Review of generation mix and comparison to the region
- Historical operating performance of generation facilities
- Relative load balance or shortfall, and plans for meeting additional power needs
- Fuel supply and hedging contracts
- Compliance with environmental and renewable mandates
- Distribution and transmission issues

Cost and Rate Structure

- State or federal regulatory oversight
- Process of adjusting rates to ensure timely and adequate cost recovery
- Structure and use of fuel or purchased power adjustment mechanism
- Rate-raising flexibility
- Cost and rate competitiveness

Customer Profile and Service Area

- Economic and demographic makeup and trends
- Customer composition, including a breakout of kWh sales and revenues
- Customer revenue or business sector concentration
- Service area profiles of member systems, for joint action agencies and cooperatives

Financial Performance and Legal Provisions

- Management's financial policies
- Historical five-year analysis of key cash flow, liquidity and leverage ratios
- Financial projections and reasonableness of key assumptions
- Existing debt characteristics and future financing needs
- Financial analyses of the largest member distribution systems, for joint action agencies and cooperatives
- Review of indenture provisions and bond security features
- Type, length and renewal terms of wholesale power contracts
- Any material pending litigation

Variations from Criteria

Fitch's criteria are designed to be used in conjunction with experienced analytical judgment exercised through a committee process. The combination of transparent criteria, analytical judgment applied on a transaction-by-transaction or issuer-by-issuer basis, and full disclosure via rating commentary strengthens Fitch's rating process while assisting market participants in understanding the analysis behind our ratings.

A rating committee may adjust the application of these criteria to reflect the risks of a specific transaction or entity. Such adjustments are called variations. All variations will be disclosed in the respective rating action commentaries, including their impact on the rating where appropriate.

A variation can be approved by a ratings committee where the risk, feature, or other factor relevant to the assignment of a rating and the methodology applied to it are both included within the scope of the criteria, but where the analysis described in the criteria requires modification to address factors specific to the particular transaction or entity.

Appendix A — Wholesale Public Power Suppliers

This criteria appendix provides additional guidelines for rating wholesale public power suppliers, a subset of the U.S. Public Power sector. Most of the key factors considered in rating public power entities are the same. However, different functional characteristics of the sector's participants sometimes result in credit considerations that are unique and financial metrics that are less comparable for a given rating level. This appendix will elaborate on those characteristics and how they influence Fitch's approach to rating wholesale suppliers.

Key Highlights

Power Supply Requirements Vary

Wholesale public power suppliers typically supply power to retail electric utilities. Most wholesale systems are organized by municipally owned retail power systems as joint action agencies (JAAs) or by cooperatively owned systems as G&T cooperatives to exclusively provide all or a portion of their members' power requirements. Other wholesale suppliers include state or federally owned entities.

Typically Member Governed

Most wholesale suppliers are governed by all or a subset of the members they serve, aligning the incentives of the contractual parties and strengthening the related obligations. All operating and financial decision making, including wholesale rate setting, typically resides with the representative board of directors.

Wholesale Contracts Dictate Obligations

Wholesale power system revenues are primarily derived from power sales contracts with participant or member retail systems. The terms, tenor and nature of the contract obligations (i.e. take-and-pay, take-or-pay) are a key factor when rating wholesale systems. Without such contracts, these wholesale suppliers are unlikely to be rated investment grade.

Purchaser Credit Quality Supports Rating

The credit quality of the purchasing utilities is an important rating factor for wholesale systems, as the corresponding payments enable issuers to meet their obligations on a timely basis. The degree to which the rating of a wholesale supplier is influenced by the credit quality of any individual purchaser (or subset of purchasers) is generally determined by the specific terms of the contract and the nature of the obligation.

Exceptional Operating Characteristics Could Enhance Rating

Exceptionally strong operating performance and/or resource economics could potentially enhance a wholesale power supplier's rating, particularly for single resource projects, above the level that the credit quality of the purchasers would otherwise indicate. However, such instances are rare.

Wholesale Metrics Comparably Weaker

Wholesale suppliers typically exhibit comparably weaker financial metrics to retail power systems. However, weaker debt service coverage, higher leverage and lower cash on hand are generally acceptable given the credit quality, liquidity and strong contractual obligations of the member systems.

Wholesale Public Power Ratings in Context

U.S. wholesale public power utilities are generally owned by the customers they serve and operate with a mission to provide essential, reliable and relatively low-cost power supply. Wholesale suppliers do not typically provide retail electric service. Fitch's average rating for wholesale public power systems in the sector is higher than the Issuer Default Ratings (IDRs) for independent power producers (IPPs).

Key credit characteristics supporting higher ratings for public wholesale utilities include their strong wholesale power supply contracts, self-rate regulating authority and lower consolidated enterprise risk relative to IPPs. Comprehensive supply contracts protect suppliers from operating risk and market price volatility, while self-rate regulating authority allows for the more timely recovery of costs through wholesale electric rates. These two factors provide for more stable energy sales and, in turn, more predictable financial operations. Efforts to diversify operations or compete in the competitive marketplace are rare in the public power sector.

Power Supply

The supply requirements of wholesale power entities typically vary and are generally characterized as all-requirements or partial-requirements. All-requirements arrangements obligate both the supplier to supply all of the purchasing entities energy and capacity needs, and the purchaser to purchase all of their requirements from the supplier. Partial requirements arrangements typically obligate the supplier to supply only a portion of a purchaser's needs. The amount supplied may be limited to the capacity and energy available from identified resources, or requirements in excess of other resources available to the purchaser.

Resources used to meet wholesale supply obligations also vary, ranging from broad, sizable asset portfolios to single-asset power projects. Fitch evaluates all power supply resources based in accordance with the criteria outlined in this report.

Governance

Most wholesale suppliers are governed by a board of directors composed of representatives from all or a subset of the members they serve. While it may not always ensure the adoption of robust financial policies and strong credit quality, Fitch believes member-governance aligns the incentives of the supplier and purchaser, thereby strengthening their related obligations. Wholesale suppliers governed by politically appointed boards of directors, including many state and federally owned suppliers, may be subject to greater political influence.

Fitch seeks to understand the dynamics among wholesale suppliers and their members, as well as those among the members, to determine whether the strategies and vision adopted by these entities are widely consistent and shared. Although occasional disagreement among members is anticipated by Fitch, organizational discord that detracts from strategic and financial planning is a concern.

Power Supply Contracts

Wholesale power systems derive most of their revenues from power sales contracts with their participants or member retail systems. These power contracts and the nature of the related obligations are significant drivers of wholesale public power supplier credit ratings. Absent acceptable long-term contracts — many of which are court validated to provide assurances they are enforceable — a wholesale supplier would be unlikely to obtain an investment-grade rating.

Fitch reviews relevant power sales contracts to understand the nature of the related obligations and to assess the terms. Contract obligations are typically characterized as take-and-pay or take-or-pay. The details of each contract and its implications are discussed below.

Although suppliers may sell excess power and energy to nonmembers or into organized markets to maximize operating margins and reduce net energy costs, a heavy reliance on off-system sales is viewed as a negative credit factor, as revenues tend to be more volatile.

Take-and-Pay Contracts

Under take-and-pay contracts, a purchaser's payment obligation is not unconditional, but contingent upon the delivery of electricity. Take-and-pay obligations are most often associated with all-requirements contracts, where participating retail electric systems are required to purchase all energy and capacity needs from the wholesale supplier. Power requirements are largely met through supplier-owned generation or long-term power purchase agreements. However, contract provisions typically provide that suppliers may procure power supply from alternative resources as necessary, mitigating operational and performance risk, as well as the risk of the take-and-pay obligation.

Fitch expects all requirements suppliers will be required to set rates sufficient to meet debt service requirements. Rates must therefore be adjusted to account for nonpayment by a member system or the failure of a major generating unit. This provides an implicit (or explicit) unlimited step-up requirement for participating systems, which Fitch views as strongly supportive of supplier credit quality.

Take-or-Pay Contracts

Take-or-pay contracts are typically used to finance individual power projects, which are expected to provide only a portion of the purchaser's power requirements. Under these contracts, purchasers are obligated to make specified payments to the supplier, whether or not energy is delivered by the project, thereby eliminating operating risk. Mandatory payment obligations are usually sized to adequately cover the supplier's debt service requirements.

Take-or-pay project participants are typically obligated to pay a fixed percentage of the project's costs, including debt service, which corresponds to their allocated ownership interest or percentage of output. A supplier's ability to meet its obligations, including debt service, therefore depends on each participant meeting its required payment.

As a means of mitigating nonpayment by weaker and smaller participants, most take-or-pay contracts include step-up provisions, which require participants to increase their payments by a specified percentage in the event of another participant default. Step-up requirements can range from 20% to more than 100% of a participant's initial obligation.

Although participant defaults are rare, the inclusion and size of required step-up provisions in power sales contracts provide meaningful bondholder protection and are an important rating factor.

In reviewing wholesale suppliers, Fitch also evaluates the expiration and renewal terms of power sales contracts relative to the final maturity of an issuer's outstanding bonds. Debt maturities beyond the terms of the agreements are considered a negative rating factor, given the uncertainty of sufficient revenue to meet debt service post expiration. In these cases, Fitch will evaluate the likelihood of contract renewal, as well as the viability of the assets or enterprise to generate alternative revenue sufficient to meet debt service. Resource economics and flexibility, and prevailing market conditions are important factors in this determination.

Purchaser Credit Quality

The credit quality of the purchasing utilities is an important consideration when rating wholesale power systems, because the corresponding payments enable the systems to meet their obligations on a full and timely basis. The ability and willingness of purchasers to make their required payments must therefore be considered.

The degree to which a supplier's rating is influenced by the credit quality of any individual purchaser (or subset of purchasers) is determined by the specific terms of the contract and the nature of the obligation. Ratings for all-requirements wholesale suppliers are generally less sensitive to the credit quality of individual purchasers. Instead, the ratings broadly reflect the credit quality of the pool, or its largest purchasers, given the default protection provided by unlimited step-up provisions.

By comparison, ratings for suppliers subject to take-or-pay contracts with limited step-up provisions are more sensitive to individual purchaser credit quality. Fitch evaluates structural and step-up provisions to determine the extent to which payments from each purchaser are required to meet a supplier's debt service. The rating for a take-or-pay supplier will generally reflect the credit quality of the weakest purchaser after factoring the applicable step-up provision.

Where a step-up provision is insufficient to cover an individual purchaser's obligations if it were to default, the supplier's rating may be capped by the credit quality of that purchaser. For example, if a supplier's step-up is limited to 25%, then that supplier's ability to meet debt service obligations would be highly reliant on payments from any purchaser with an allocated share higher than 20%. Stepping up the required payments from the remaining systems responsible for less than 80% of the project costs by 25% would likely result in a shortfall in revenue.

If a supplier is highly reliant on more than one purchaser (i.e. each purchaser has an allocated share of more than 20% in the case above), then the supplier's rating may be capped by the credit quality of the weakest of those purchasers.

Although reserve funds or funds received from the sale of output from a defaulting participant's share could be used to avert an immediate default on the supplier's debt obligations, the long-term rating reflects the likelihood of payment through final maturity.

Assessing Purchaser Credit Quality

Fitch seeks to assess the credit quality of purchasing or member utilities using all available information, including public and private disclosure. In the absence of a Fitch public rating of a purchasing system, Fitch may assign its own credit opinion, consider ratings of the local government or other related enterprises, refer to ratings from other nationally recognized credit rating agencies, or rely on comparative peer metric reviews in determining credit quality.

Project Operating Characteristics

In addition to the contract and purchaser evaluations described, Fitch evaluates project operating characteristics in accordance with the criteria outlined in this report when rating take-or-pay power projects. Although rare, exceptionally strong project operating performance and/or economics could potentially enhance the rating of a project above the level the purchaser evaluation would otherwise suggest. Any rating enhancement would likely be limited and would reflect Fitch's determination that the obligations of the weakest purchaser would likely be assumed upon a default, given the inherent value of the resource and the incentive of the remaining purchasers to preserve the project's credit quality.

Conversely, poor operating characteristics would not necessarily result in a project rating lower than purchaser credit quality would suggest. Fitch's analysis assumes valid and binding take-or-pay obligations will be paid as required and any financial strain related to a poor-performing project would be separately reflected in the credit quality of the purchasers.

Financial Metrics — Wholesale Systems

Wholesale suppliers exhibit financial metrics that are comparably weaker to retail power systems for a given rating level, particularly take-or-pay projects where debt service coverage averages 1.0x–1.1x and cash balances held by the issuer are very limited. Overall weaker debt service coverage, higher leverage, and lower cash on hand reflect the higher asset concentration and related leverage characteristic of wholesale suppliers and are generally acceptable, given the credit quality and strong contractual obligations of the member systems.

Fitch also considers a wholesale system's cost structure, rate adjustment and billing processes to assess the timeliness of cost recovery as part of its metric review. Wholesale suppliers typically pass through costs to members on a monthly basis, which enhances cash flow stability and further supports system metrics.

Attributes: Select Financial Metrics — Wholesale Systems

Debt Service Coverage (x)	Debt/FADS (x)	Days Cash on Hand	Equity/Capitalization (%)
Stronger			
Coverage of consistently more than 1.5x provides solid cash flow and bondholder protection.	Less than 7x debt to FADS indicates a favorable level of leverage relative to cash flow.	More than 120 days cash on hand indicates solid financial flexibility to meet unforeseen spending needs.	Strong equity levels of more than 30% indicate adequate cost recovery and ample debt capacity for future capital needs.
Midrange			
Many utilities target coverage in the 1.2x–1.4x range.	Ratios in the 7.0x–9.0x range indicate a generally balanced level of debt relative to cash flow.	Many wholesale systems target approximately 60–90 days operating cash.	Most wholesale systems maintain 20%–30% equity levels.
Weaker			
Consistently less than 1.1x coverage provides limited cushion for unexpected revenue shortfalls.	Greater than 10x debt without a suitable rationale can indicate a deficient rate structure.	Less than 60 days cash indicates less financial flexibility, but can be adequate if a system is subject to less cash flow volatility.	Less than 10% equity is relatively low for wholesale systems and may suggest limited capacity for additional debt.

FADS – Funds available for debt service. Note: Excludes take-or-pay projects. The debt and equity ratios above do not reflect off-balance sheet obligations. Fitch reviews adjusted financial ratios to take into account such obligations.

Appendix B — Retail Public Power Systems

This criteria appendix provides additional guidelines for rating municipally and cooperatively owned retail power systems, a subset of the U.S. Public Power sector. Most of the key factors considered in rating public power entities are the same. However, different functional characteristics of the sector's participants sometimes result in unique credit considerations and financial metrics that are less comparable for a given rating level. This appendix will elaborate on those characteristics and how they influence Fitch's approach to rating retail power systems.

Key Highlights

Retail Electric Services Provided

Retail public power systems provide electric supply and distribution services to end-user customers, and include both municipally and cooperatively owned systems.

Local Governance

Most retail systems are locally governed by an independent board of directors appointed or elected from among its end-user customers or member owners. All operating and financial decision making, including retail rate setting, typically resides with the representative board of directors.

Local Government Influence Assessed

Municipal systems sometimes operate as a component of the local government and may be governed by politically appointed boards or elected city councils. As part of its analysis, Fitch seeks to identify and assess the degree of political influence on utility operations and the degree to which utility credit quality could be influenced by local government decision making.

Power Supply Arrangements Vary

Retail systems meet their power supply requirements through a variety of arrangements. Some systems, typically larger entities, own and operate generating facilities to meet system power demands, while others receive all-requirements contractual power supply through membership in municipal JAAs or G&T cooperatives. Still others actively manage their power supplies through a combination of owned assets, take-or-pay projects, and bilateral contracts.

Financial Metrics Diverge with Asset Ownership

Financial metrics diverge widely with asset ownership and related borrowings. Fully integrated systems that generate their own power supply and have financed production facilities on-balance sheet typically report lower debt service coverage and higher leverage metrics than systems that contract for power supply.

Metrics Adjusted for Contractual Obligations

When rating retail public power systems, Fitch factors contractual debt obligations in its analysis, particularly those issued by JAAs and G&Ts on behalf of its member systems. Financial metrics are adjusted for off-balance sheet obligations as appropriate to facilitate peer comparison.

Retail Public Power Ratings in Context

U.S. retail public power systems include municipally or cooperatively owned enterprises that operate with a mission to provide essential, reliable and relatively low-cost electric service to end users. Fitch's ratings for retail public power systems are typically higher than the IDRs of investor-owned utilities.

Key credit characteristics supporting higher ratings for public systems include their self-rate regulating authority, predominantly residential customer bases and lower consolidated enterprise risk. Self-regulating authority allows for the more timely recovery of costs through electric rates, while higher proportions of residential customers provide for more stable energy sales and, in turn, more predictable financial operations. Efforts to diversify operations in the public power sector are rare.

Retail Services

Retail public power systems are distinguished by the transmission and delivery of electricity to end users, including residential, commercial and industrial customers. Municipal power systems are typically owned by the municipality the utility serves, and may operate as a stand-alone entity or as an enterprise fund of the local government. Moreover, municipal electric systems may be operated as part of a combined utility system providing other services, including natural gas, water and wastewater on a retail basis.

Electric distribution cooperatives provide electric distribution services to their end-user customers or owner members, typically within prescribed and largely rural territories. Alternative services may also be provided by distribution cooperatives, but instances are rare.

Fitch views the distribution function largely as a monopoly-type, stable business with limited business risk. Combined utility systems are viewed favorably — provided the individual systems are self-sustaining — given the diversity of revenue and economies of scale. However, retail systems that provide services subject to competitive pressures, including telecommunications and propane, may be exposed to a higher degree of operating and financial risk.

Governance

Most retail systems are locally governed by an independent board of directors appointed or elected from among its end-user customers or member owners. All operating and financial decision making, including retail rate setting, typically resides with the representative board of directors. Governing boards that include highly engaged directors with diverse and relevant professional experience, and operate free from political influence are viewed more favorably by Fitch.

Fitch seeks to identify and assess the degree of political influence on municipal utility operations and the degree to which utility credit quality could be influenced by local government decision making. Municipal systems governed by politically appointed boards or elected city councils that are unfamiliar with the utility sector introduce political interference into decision making or rate-setting policies are generally of greater concern to Fitch. The involvement of influential consumer councils in rate setting can further limit financial flexibility. Conversely, local governments with ambitious and well-funded economic development programs could be highly supportive of retail power systems.

Fitch reviews transfers by a utility to a corresponding municipality's general fund and other means of financial support, including in-kind services and borrowing arrangements, as part of its analysis. Transfer policies that are formulaic or subject to limitation are viewed positively; whereas subjective, open-ended policies that allow a local government to affect the liquidity levels of a utility generally increase credit risk. For electric cooperatives, policies related to the repatriation (or return) of patronage capital to members have similar importance.

Power Supply Arrangements

Some retail systems, typically larger entities, own and operate generating facilities to meet system power demands. Fitch's analysis of these vertically integrated systems includes an evaluation of all power supply resources and the related business risks in accordance with the criteria outlined in this report.

Most retail power systems receive all-requirements contractual power supply through membership in a JAA or G&T cooperative. Membership in these organizations is generally viewed positively by Fitch, particularly for smaller systems, as they provide greater economies of scale and diversification of resources vis-à-vis asset ownership.

Other retail systems choose to actively manage their power supplies through portfolios that may include owned assets, take-or-pay power supply arrangements and bilateral contracts. An organization's ability and sophistication to manage and effectively hedge the risks related to this strategy, either alone or with third-party experts, is a rating factor.

Financial Metrics — Retail Systems

Financial metrics diverge widely with asset ownership and associated borrowings. Fully integrated systems that generate their own power supply and have financed production facilities on-balance sheet will typically report lower debt service coverage and higher leverage metrics than systems that contract for power supply.

When rating retail public power systems, Fitch factors contractual debt obligations in its analysis, particularly those issued by JAAs and G&Ts on behalf of its member systems and supported by power sales contracts. Fitch reviews all relevant power sales contracts to understand the nature of the related obligations and to assess the terms.

Contract obligations are typically characterized as take-and-pay or take-or-pay. Although a purchaser's payment obligation is not unconditional under a take-and-pay contract, as it is under a take-or-pay contract, Fitch does not generally distinguish between the obligations, as take-and-pay contract provisions typically mitigate performance risk. See the *Power Supply Contracts* section in Appendix A.

In addition to calculating standard financial ratios for retail systems, adjusted ratios that take into account off-balance sheet obligations, including those related to purchased power, are also calculated to facilitate peer comparison between retail systems that own generation versus purchase power. Further adjustments are made to measure coverage of charges Fitch deems as fixed for retail systems, including general fund transfers. These adjusted ratios include coverage of full obligations and are discussed in greater detail on page 8 of this report.

FitchRatings Public Finance

Attributes: Select Financial Metrics — Retail Systems

Debt Service Coverage (x)	Coverage of Full Obligations (x)	Debt/FADS (x)	Days Cash on Hand	Equity/Capitalization (%)
Stronger				
Coverage of consistently more than 2.0x provides solid cash flow and bondholder protection.	Coverage of consistently more than 1.5x provides solid cash flow and bondholder protection.	Less than 6x debt to FADS indicates a favorable level of leverage relative to cash flow.	More than 120 days cash on hand indicates solid financial flexibility to meet unforeseen spending needs.	Strong equity levels of more than 50% indicate adequate cost recovery and ample debt capacity for future capital needs.
Midrange				
Many utilities target coverage in the 1.5x–2.0x range.	Many utilities target coverage in the 1.2x–1.5x range.	Ratios in the 6.0x–8.0x range indicate a generally balanced level of debt relative to cash flow.	Many retail systems target approximately 60–120 days operating cash.	Most retail systems maintain 30%–50% equity levels.
Weaker				
Consistently less than 1.5x coverage provides limited cushion for unexpected revenue shortfalls.	Consistently less than 1.2x coverage provides limited cushion for unexpected revenue shortfalls.	Greater than 8x debt without a suitable rationale can indicate a deficient rate structure.	Less than 60 days cash indicates less financial flexibility, but can be adequate if a system is subject to less cash flow volatility.	Less than 30% equity is relatively low for retail systems and may suggest limited capacity for additional debt.

FADS – Funds available for debt service. Note: The debt and equity ratios above do not reflect off-balance sheet obligations. Fitch reviews adjusted financial ratios including coverage of full obligations to take into account such obligations.

Fitch Rates Tennessee Valley Authority's Global Power Bonds 'AAA'; Outlook Stable

September 21, 2015 11:41 AM Eastern Daylight Time

NEW YORK--(BUSINESS WIRE)--Fitch Ratings has assigned an 'AAA' rating to the following Tennessee Valley Authority's (TVA) bonds:

--Approximately $1 billion global power bonds 2015 series A.

The 2015 series A bonds are expected to price on September 21. Proceeds will be used to refinance outstanding TVA debt and provide funds for ongoing capital investments.

The Rating Outlook is Stable.

SECURITY:

TVA's global power bonds are secured by net revenues of TVA's power system.

KEY RATING DRIVERS:

IMPLICIT GOVERNMENTAL SUPPORT: The 'AAA' rating assigned to TVA's outstanding global power bonds reflects its status as a wholly owned corporation of the U.S. Government and Fitch's expectation that repayment of the power bonds would ultimately receive the support of the U.S. Government in the event of fiscal distress.

COMPETITIVE WHOLESALE ELECTRIC SUPPLIER: TVA has an increasingly diverse resource portfolio, which provides competitively priced wholesale electricity to a population of more than nine million spanning an exceptionally large and diverse region.

RING-FENCED SERVICE TERRITORY: The Federal Energy Regulatory Commission (FERC) is prevented, pursuant to the Federal Power Act's anti-cherry-picking provision, from requiring TVA to provide open-access to its transmission lines for the purpose of serving TVA customers. This provision in essence significantly reduces TVA's risk of customer loss.

TIMELY COST RECOVERY: TVA is required, pursuant to the TVA Act of 1933 (the Act), to set rates sufficient to cover operating and maintenance costs and all other obligations, including debt service and payments to the U.S. Treasury. An automatic fuel cost adjustment made each month ensures the timely recapture of fuel costs.

SUBJECT TO DEBT LIMIT: Given the authority's sizeable capital needs, long-term borrowing capacity remains a credit concern as TVA continues to approach a $30 billion debt ceiling imposed by the Act. However, this concern continues to be partially mitigated by TVA's access to, and past use of, alternate financing that does not count against the limit.

RATING SENSITIVITIES

CHANGE IN U.S. SOVEREIGN RATING: Any change in the credit rating of the U.S. sovereign would likely result in a comparable change in the rating on Tennessee Valley's power revenue bonds.

CREDIT PROFILE:

LARGE REGIONAL WHOLESALE SYSTEM

TVA operates the nation's largest public power system, selling power on a wholesale basis to 155 municipal and cooperative distribution systems spanning an exceptionally large and diverse service area that includes portions of Tennessee, Alabama, Mississippi, Kentucky, Georgia, North Carolina and Virginia. TVA operates as a fully self-supporting enterprise fund supported entirely from the sale of electricity and power system financings.

SATISFACTORY FINANCIAL RESULTS

Energy sales decreased again in fiscal 2014, although the 2.4% decline was less pronounced than the nearly 5% decrease incorporated into TVA's originally adopted budget. The positive variance in sales relative to the budget coupled with a modest rate increase prompted a favorable increase in funds available for debt service (FADS). The stronger cash flow, together with significantly lower annual debt service costs, resulted in Fitch-calculated debt service coverage of 2.62x.

Available cash reserves remain low for the rating category, but the inclusion of multiple lines of credit provides sufficient resources relative to TVA's operating needs. Unrestricted cash and investments at fiscal year-end 2014 together with a $150 million credit facility with the U.S. Treasury and three long-term revolving credit facilities totaling $2.5 billion provide a robust 166 days liquidity on hand.

Year-to-date results through the first nine months of the current fiscal year are positive compared to the same period in the prior year. Operating income is reported as up $454 million, driven primarily by a 2.6% rate increase adopted at the outset of the current fiscal year and continued progress towards an initiative to reduce O&M costs by $500 million.

DEBT LIMITATION CURTAILS FLEXIBILITY

With nearly $24 billion of debt outstanding at the close of fiscal 2014, TVA remains close to its $30 billion debt limitation imposed under the Act. Consequently, various lease financings have been employed as a way to circumvent the current debt limitation while still continuing to finance the authority's ongoing capital program. Lease-purchase transactions are not subject to the Act's debt limitation.

The limitation placed on TVA's borrowing capacity remains a concern given its long-term capital needs exceed the remaining capacity under the debt limitation. Capital costs covering fiscals 2015-2017 are estimated at $7.5 billion, the majority of which could be financed with long-term borrowings.

WATTS BAR UNIT 2 CONSTRUCTION PROGRESSING

Fitch believes the near completion of TVA's Watts Bar Nuclear Plant's Unit 2 reactor remains a positive development. Project completion is slated for the latter part of 2015 with commercial operation expected in June 2016. The final cost remains unchanged, estimated to be within a range of $4 billion-$4.5 billion. Unit 2 appears likely to be granted an operating license in the near term by the Nuclear Regulatory Commission (NRC) following a recommendation by an advisory group to the NRC earlier this year. When online, the Unit will further diversify TVA's resource portfolio and provide 1,150 megawatts of carbon-free generating capacity.

Date of Relevant Committee: 22 April 2015

Fitch Rates Long Island Power Authority Series 2016A/B Electric System Gen Revs 'A-'; Outlook Stable

August 24, 2016 11:22 AM Eastern Daylight Time

NEW YORK--(BUSINESS WIRE)--Fitch Ratings has assigned an 'A-' rating to the Long Island Power Authority's (LIPA) issuance of the following electric system general revenue bonds:

--$175 million, series 2016A (MMD FRN Rate);

--$414 million, series 2016B, fixed rate.

The series 2016A bonds are expected to be privately placed the week of Aug. 29, and proceeds will be used to repay the authority's outstanding series 2012C variable rate bonds. The series 2016B bonds are expected to be sold in September, and proceeds will be used primarily to fund capital improvements and refund certain fixed rate bonds.

Fitch has also affirmed the 'A-' ratings on the following LIPA debt and commercial paper bank notes:

--$4 billion, senior lien electric system revenue and refunding bonds;

--implied electric system revenue subordinate obligations;

--$200 million series 2014 CP-1A (federally taxable) and 1B;

--$100 million series 2014 CP-2A (federally taxable) and 2B.

The Rating Outlook is Stable.

SECURITY

The electric system general revenue bonds are senior lien obligations of LIPA secured by the net revenues of the electric system, after payment of operating and maintenance expenses. LIPA's subordinate lien general revenue obligations are also secured by the net revenues of the electric system, but are subordinate to payments on LIPA's outstanding senior lien electric revenue bonds and floating rate notes.

KEY RATING DRIVERS

SOLID UTILITY FUNDAMENTALS: LIPA is one of the nation's largest municipal electric distribution systems, serving 1.1 million retail customers. The authority benefits from sound utility fundamentals, including a flexible power supply mix, an affluent and well-diversified customer base and cost recovery mechanisms that stabilize cash flow. A series of comprehensive operating agreements with capable external service providers further support operations.

BUSINESS MODEL TRANSITION: The 2013 LIPA Reform Act, enacted in response to operating challenges following Superstorm Sandy, broadened the responsibilities of the utility's system operator (PSEGLI) and expanded the state's (Department of Public Service [DPS]) regulatory oversight of LIPA. Fitch views many of the legislated provisions as supportive of credit quality. However, added regulatory oversight could affect LIPA's financial and rate flexibility over time.

CONSTRUCTIVE REGULATORY RECOMMENDATIONS: The constructive recommendations submitted by the DPS following its initial review of LIPA's three-year rate plan, and adopted by the LIPA board, support LIPA's Stable Outlook. The authority implemented the first phase of a three-year rate increase on Jan. 1, 2016.

RATE PRESSURES PERSIST: Despite electric rates that have become more competitive regionally, political and consumer rate pressures persist as LIPA's average residential revenue per kilowatt hour (kwh) remains among the highest in the nation at approximately 19.4 cents/kwh.

HIGH DEBT LEVELS: LIPA's debt levels remain high, totaling $10.2 billion at Dec. 31, 2015 including capital lease and securitization obligations, or $9,337 per retail customer, well above the peer utility median of $3,318. Although Fitch recognizes the benefits of the separately secured $4.1 billion in securitized debt, the repayment profile remains an obligation and burden of current ratepayers. Positively, LIPA's three-year rate plan aims to reduce debt

financing of future capex to less than 64%, which should moderate future borrowings

SOUND LIQUIDITY: LIPA's liquidity was solid at 103 days of operating cash, and 202 days including available short-term notes and external bank facility at Dec. 31, 2015. Weaker metrics reported in recent years were affected by significant storm costs, but federal reimbursement of roughly 90% of the costs incurred is now complete.

RATING SENSITIVITIES

IMPROVED OPERATING STABILITY: Evidence of improved operating stability and financial performance at the Long Island Power Authority sufficient to offset persistent political and consumer-driven rate pressures could result in consideration of a positive rating action.

CREDIT PROFILE

LIPA owns one of the largest municipal electric distribution systems in the U.S., serving a population of about 3 million people located throughout Nassau and Suffolk counties, and the Rockaways section of New York City. The service area economy continues to exhibit well above average wealth and income levels. Unemployment in Nassau and Suffolk Counties (general obligations debt rated 'A'/Outlook Stable and 'A-'/Outlook Stable, respectively) is below that of the state and nation.

Operations and management services related to the LIPA transmission and distribution system, which had been provided by a subsidiary of National Grid plc, shifted to PSEG-LI, a subsidiary of Public Service Enterprise Group ([PSEG] Issuer Default Rating 'BBB+'/Stable) as of Jan. 1, 2014, for a 12-year term, pursuant to the operating services agreement (OSA). PSEG is paid a management fee and can earn performance incentives.

Effective Jan. 1, 2015, fuel management services shifted to an affiliate of PSEG - PSEG Energy Resources and Trade, LLC. The power supply and fuel management services are also provided pursuant to the OSA, which expires Dec. 31, 2025.

The power supply agreement remains with National Grid, plc, to provide capacity and energy from its oil and gas-fired generating units on Long Island. This agreement is in place through May 2028.

NEW ISSUE DETAILS

The series 2016A proceeds will be used to refinance LIPA's outstanding series 2012C variable rate demand bonds and should not expose LIPA or its bondholders to any meaningful new risks. The series 2016A bonds will initially bear interest at a variable rate based on prevailing AAA Municipal Market Data General Obligation Yield Curve plus an applicable spread and will have a final maturity of May 1, 2033

In addition to the bond issuance, LIPA is also expected to enter into a five year basis swap that will effectively convert the cost of the series 2016A bonds to 69.4% of one-month LIBOR plus an applicable spread. There is an additional requirement at the end of the basis swap agreement for LIPA to pay the counterparty 100% of any decrease in the market value of the series 2016A bond. However LIPA reserves the right to call or remarket the bond after five years, in which case the value of the basis swap would be $0.

The authority will continue to bear the interest rate risk associated with the series 2016A debt, but LIPA's overall variable rate exposure remained reasonable at 3.7% of total debt at year end 2015.

The series 2016 B bonds will bear interest at a fixed rate and have an expected final maturity of May 1, 2046.

For additional information on LIPA's long term ratings see the recent full rating report dated Feb. 18, 2016. The report and press release are available at 'www.fitchratings.com'.

Energy Northwest, WA

New Issue: Moody's assigns Aa1 to Energy NW's(WA) CGS, Project 1 and Project 3 bonds. BPA's Aa1 affirmed. Outlook stable

Summary Rating Rationale

Moody's Investors Service has assigned Aa1 ratings to Energy Northwest's (ENW) $242 million of Project 1 Electric Revenue Refunding Bonds, Series 2017-A; $194.4 million of Columbia Generating Station (CGS) Electric Revenue and Refunding Bonds, Series 2017-A; $159.7 million of Project 3 Electric Revenue Refunding Bonds, Series 2017-A; $525 thousand of Project 1 Electric Revenue Refunding Bonds, Series 2017-B (Taxable); $3.3 million of Columbia Generating Station Electric Revenue and Refunding Bonds, Series 2017-B (Taxable); and $905 thousand of Project 3 Electric Revenue Refunding Bonds, Series 2017-B (Taxable). These bonds are supported by net billing agreements with Bonneville Power Administration (BPA, Aa1/stable) and thus are rated the same as BPA's other supported obligations. Moody's also affirmed BPA's Aa1 issuer rating and BPA supported debt obligations. The rating outlook is stable.

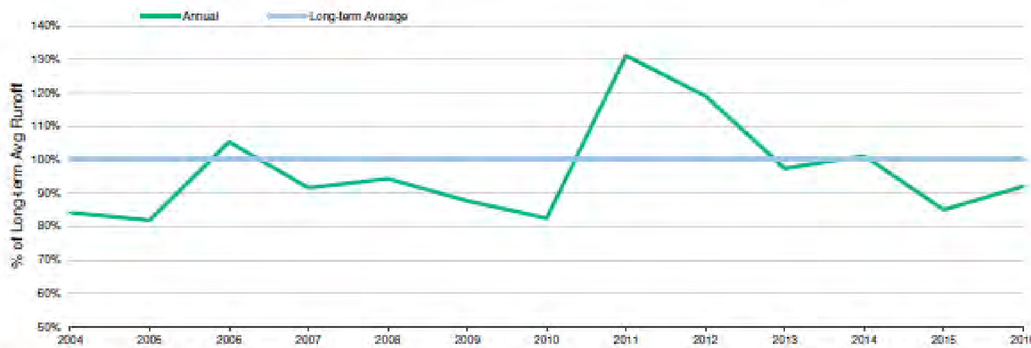
The Aa1 rating on Energy Northwest's (ENW) CGS, Project 1, and Project 3's revenue bonds reflect BPA's contractual obligation to pay including debt service under each project's net billing agreement, BPA's long history of meeting its contractual obligations, and BPA's Aa1 issuer rating.

BPA's Aa1 issuer rating reflects its credit strengths comprising of US Government (Aaa stable) support features, strong underlying hydro and transmission assets, very competitive power costs, and long-term power supply contracts with customers through 2028. Explicit US Government support features include borrowing authority with the US Treasury ($2.9 billion available as of September 30, 2016) and the legal ability to defer its annual US Treasury debt repayment if necessary. BPA's importance to the US Northwest region and its role as a US government agency represent drivers of implicit support. US federal government's strong explicit and implicit support features are key credit strengths that support BPA's Aa1 rating even though BPA faces weaknesses outlined below.

BPA's rating also considers long-term credit challenges such as hydrology and wholesale market price risk, 'regulated utility' like ratemaking process, environmental burdens, and forward-looking consolidated financial metrics that range in the 'Ba' to 'A' category per Moody's U.S. Public Power Electric Utilities with Generation Ownership Exposure methodology. Hydrology and wholesale market prices are the greatest volatility drivers of BPA's financial performance and have been the main driver of BPA's declining internal liquidity over the last ten years. These factors are likely to persist owing to the volatility associated with hydro resources along with the weak wholesale power that exists in the

Pacific Northwest. Additionally, BPA's accelerated repayment of federal appropriations debt and declining availability under the US Treasury line are continuing factors that diminish the US government's explicit support features over time and weakens BPA's positioning within its Aa1 rating. After the FY2018-2019 rate period, the combination of declining US Treasury line availability, declining internal reserves for risk, sustained weak wholesale power market and a reduction in the degree of federal debt subordination could lead to negative rating action.

Exhibit 1
Columbia River Runoff at Dalles



Source: Moody's Investors Service, BPA

Credit Strengths

- U.S. government support through US Treasury borrowing line and federal debt service deferral ability
- Regional importance as indirect power provider for 14 million people
- Access to 22 GW of low cost, federally owned hydro system
- Dominant electric transmission provider in the Pacific Northwest
- Highly competitive rates
- Long-term power sales contracts with creditworthy public power entities

Credit Challenges

- 'Regulated utility' like ratemaking process
- Significant exposure to hydrology risk and wholesale power markets
- 'Ba' to 'A' category forecasted financial metrics
- Federal debt subordination weakening
- Declining reserves for risk and availability under US Treasury Line
- Significant fish and wildlife environmental costs

Rating Outlook

The stable outlook on the CGS, Project 1, and Project 3 revenue bonds reflects BPA's stable outlook. BPA's stable outlook considers BPA's FY 2018-19 proposed rates and BPA's plan to maintain sufficient availability under the US Treasury line through FY2019.

Factors that Could Lead to an Upgrade

» Ratings on the CGS, Project 1 and Project 3 revenue bonds could be upgraded if BPA is upgraded.

» BPA's rating could improve over the long term if BPA is able to substantially mitigate hydrology and wholesale price risk and if BPA implements policies to ensure strong internal reserves for risk resulting in at least 250 days cash on hand on a sustainable basis.

Factors that Could Lead to a Downgrade

» Ratings on the CGS, Project 1 and Project 3 revenue bonds could be downgraded if BPA is downgraded or if the underlying net billing agreement is violated or weakened.

» BPA's ratings could be lowered if the US government's credit rating is downgraded, if we expect internal liquidity to fall below 60 days or availability under the US Treasury line declines below $1.5 billion on a sustained basis, or BPA experiences regulatory delays in receiving full recovery of costs. Other factors that could lead to a downgrade include any sign of waning federal government support or decline in the proportion of subordinated, deferrable debt owed to the US Treasury beyond actions currently planned.

Key Indicators

Source: Moody's Investors Service, BPA

Recent Developments

In November 2016, BPA proposed rates for FY2018-2019, which would increase power rates by an average of 3.5% and transmission rates by 1.1% for the two year period. The BPA administrator will finalize the rates in July 2017 and final rates will go into effect on October 1st, 2017 subject to FERC approval.

As part of FY2018-2019 rates, BPA has proposed a reserves policy which targets 90 days cash on hand (based on reserves for risk) for each line of business with a minimum of 60 days cash on hand. If liquidity is below the minimum at the start of the year, a surcharge would trigger subject to a 3% cap. Liquidity above 120 days cash on hand would be credited back to customers, used to reduce debt or fund capex. Implementation of a reserve policy would be credit positive since BPA's reserves for risk have served as BPA's frontline cushion against underperformance and has dropped steeply since 2008. That said, we see the proposed policy as primarily seeking to maintain current reserve levels since BPA had around 100 days cash on hand at FY2016.

For FY 2016, BPA faced another year of below average hydrology conditions at around 92% of average. This was exacerbated by the need to refill reservoirs at the Canadian hydro dams in FY 2016. BPA previously drew down on available reservoir storage in FY2015 to offset low hydrology conditions. BPA's 'reserves for risk' serves as the primary buffer against any underperformance and it dropped to $602 million in FY 2016 ($845 million in FY 2015). For FY 2017, BPA reported in its Q1 quarterly business review that reserves for risk are forecasted to further drop to $395 million primarily due to lower power and transmission sales and higher than expected operating costs. BPA's rapid decline in its reserves for risk is a credit negative and an inability to ensure internal reserves at or near current levels could lead to a negative rating action.

Detailed Rating Considerations

Revenue Generating Base

Major Power and Transmission Provider to the Pacific Northwest

BPA derives its revenues from the sale of power and transmission services from its dominant hydroelectric generation and electric transmission assets in the Pacific Northwest. BPA has roughly 75% of the Pacific Northwest's bulk electric transmission consisting of 15,000 miles of high voltage transmission lines and 260 substations and other facilities located in BPA's service area. Additionally, BPA's power supply represents roughly one third of the total regional power supply and consists of 22 GW of mostly federally owned hydro plants, the 1.1 GW CGS nuclear plant, and market and contract purchases. The federal hydro projects also serve numerous purposes, including irrigation, navigation, recreation, municipal and industrial water supply, and fish and wildlife protection.

Power sales represent the largest portion at typically 75% of total revenue and the majority of these sales are made under long-term power sales contracts (Preference Contracts) maturing in 2028 with 133 municipally owned utilities, cooperatively owned utilities, and federal agencies. Sales to these customers totaled approximately $2 billion in FY 2016 and represent BPA's largest revenue segment at nearly 60% of total revenues. Snohomish County P.U.D. 1, WA Electric Ent. (Aa3/stable) is BPA's largest preference customer at 10% of power sales in FY 2016. Power rates charged by BPA are highly competitive and BPA's average tier 1 rate for FY 2016 was $35.63/MWh.

Electric transmission sales are BPA's second largest revenue source at $947 million in revenues in FY 2016. BPA's top transmission customer is Puget Sound Energy Inc (Baa1 stable) at 12% each of transmission revenue in FY 2016.

Exhibit 3

Power Customer Name	Type	Rating	% of Power Sales	Transmission Customer Name	Rating	% of Transmission Sales
Snohomish County P.U.D. 1, WA Electric Ent.	Preference	Aa3	10%	Puget Sound Energy, Inc.	Baa1	12%

Source: Moody's Investors Service, BPA

'Regulated Utility' Like Rate Making Process Could Delay Timely Recovery

Unlike a traditional public power utility, BPA's ratemaking procedure for power and transmission rates charged to its customers involves an extensive process that shares similarities with a rate regulated utility that often create complications and delays in timely and full recovery of BPA's costs. The Northwest Power Act contains specific ratemaking procedures for BPA, mandates justification and reasons in support of such rates, and requires a hearing. The BPA Administrator ultimately decides the power and transmission rates based on the hearing record including all information submitted. Rates established by BPA are subject to approval by FERC. Currently, BPA has rate cases every two years. In a stress situation, BPA could file an expedited rate with FERC and the whole process could take several months for an interim rate approval. We see BPA's rate setting process as materially weaker than peers such as Tennessee Valley Authority (Aaa stable) that have unfettered, self-regulated rate setting.

Notwithstanding the 'regulated utility' like ratemaking process that BPA operates under, we recognize that BPA has raised rates in difficult situations such as the power crisis of 2000-2001 when BPA raised rates by 46%. Additionally, within a rate period, BPA is able to charge up to an additional $300 million per year starting at the beginning of the fiscal year under the Cost Recovery Adjustment Clause (CRAC) if Power Service's accumulated net revenue is below a set level that is equivalent to reserves for risk at zero balance. A separate NFB Adjustment for certain environmental costs can raise the $300 million CRAC limit. While the CRAC mechanism adds some flexibility to BPA's two-year rate periods, the annual basis of the test and low trigger point limit the benefit of the CRAC mechanism.

A credit supportive rate setting tool is BPA's use of its treasury payment probability tool whereby BPA proposes rates at levels that it can meet its US Treasury payments at a 95% confidence level based on its cash flows and reserves. BPA's approach should ensure a high probability of near-term payments to the US Treasury and an extremely high probability of near-term timely payments on non-federal debt service, which is effectively senior to the debt owed to the US Treasury.

Regional Hydrology and Wholesale Price Risk Are BPA's Biggest Volatility Drivers

BPA's financial results can be materially impacted by hydrology in the Columbia River Basin and wholesale power prices since market based power sales can represent roughly 10-15% of total revenues. Since 2001, hydrology has been very volatile with high and low around 130% and 60%, respectively, of the long-term average. Similarly, power prices have also been volatile with a recent peak nearing $60/MWh in 2008 and a low below $20/MWh in 2012. These factors, which are outside of BPA's control, have contributed heavily to periods of underperformance and represent BPA's biggest driver of cash flow volatility since power sales under long-term contracts and transmission sales are much more stable and predictable. Moreover, wholesale power revenues have, in the past, provided a source of cash flow for funding capital expenditures at BPA. In light of the sustained weak power markets, BPA has been more reliant on the borrowing authority with the US Treasury (currently at $2.9 billion). The volatility of wholesale revenues emphasizes the importance of maintaining significant internal liquidity especially at BPA's rating level.

Operational and Financial Performance

Environmental Costs Are Material

BPA faces conflicting uses of the Columbia River and environmental regulations, such as the Endangered Species Act (ESA), that contributes significantly to BPA's costs and weighs heavily on BPA's cash flows. Biological opinions prepared by National Oceanic and Atmospheric Administration Fisheries Service and the US Fish and Wildlife Service mandate actions to protect fish species resulting in direct costs such as hatcheries and indirect loss of revenue from hydro dam operational changes. For FY2016, BPA estimates total fish and wildlife costs at approximately $622 million consisting of $495 million in direct costs and $127 million of indirect costs. BPA was able to recover the non-power related environmental costs totaling $77 million from the US Treasury in FY 2016. While BPA's fish and wildlife mitigation costs are considerable, BPA's federally and non-federally owned generation are emissions free since they consist of hydro and nuclear generation. As such, BPA remains insulated against new federal regulations including those for greenhouse gases and BPA could benefit if new emissions regulations increase the market price of power.

Financial Metrics Are Low for the Rating

On a fully consolidated basis including federal debt, BPA's financial metrics are commensurate with Ba to A category scoring on a historic basis. Total DSCR has averaged around 1.0x over the last three years, which is commensurate with a 'Ba' scoring, while BPA's debt ratio is high at an average of 95% which is commensurate with a 'Ba' scoring. Looking forward, BPA's sets rates to achieve around 1.0x DSCR; however, actual performance can deviate especially if hydrology and market prices are different than expectations. Separately, non-federal DSCR have risen to almost 3.8x since principal payments for CGS, Project 1, and Project 3 have been pushed out to the future resulting in an interest only coverage ratio for non-federal DSCR.

LIQUIDITY

For FY 2016, BPA had reserves for risk, a measure of internal liquidity, totaling $602 million (103 days cash on hand) , which is commensurate with the low end of the 'A' scoring. Below average hydrology, the need to replenish reservoirs, and lower than expected power prices were major drivers of the liquidity drop versus the $845 million (152 days cash on hand) at year-end FY 2015. For FY 2017, BPA expects its reserves for risk to decline to $395 million mainly due to lower power and transmission sales and higher operating costs.

As part of its current rate case, BPA proposed a reserve policy that targets 90 day cash on hand with a surcharge if reserves for risk drop below 60 days cash on hand. Implementation of a reserve policy would be credit positive since BPA's reserves for risk have served as BPA's frontline cushion when underperformance occurs and has dropped steeply since 2008. That said, we see the proposed policy as primarily seeking to maintain current reserve levels since BPA had little over 100 days cash on hand at FY2016.

Supplementing BPA's internal liquidity is a $750 million borrowing sublimit under the US Treasury line that can be used to fund operating expenses. This line of credit is renewed on an ongoing basis and any draw needs to be repaid within one year.

Debt and Other Liabilities

DEBT STRUCTURE

BPA's $15.6 billion in total debt consists of $8.5 billion of non-federal debt and $7.2 billion of federal debt, which is debt owed by BPA to the federal government. BPA's non-federal debt are debt like contractual obligations such as BPA's obligation to CGS, Project 1, and Project 3 under the net billing agreements. In addition to the net billing agreements, BPA has non-federal debt through leases, power prepay, and other take-or-pay contractual obligations. Since these obligations are treated as an operating expense of BPA, they have priority over BPA's direct debt obligation to the US Treasury and BPA can defer payments to US Treasury, if necessary. This deferral ability provides BPA a major source of financial flexibility under extreme situations though BPA has not deferred such payments since 1983 and any deferral is likely to have significant negative political ramifications. The significantly higher non-federal DSCR previously described above also highlights the substantial benefits of the federal debt's effective subordination to non-federal debt and these benefits are supportive of the Aa1 rating on CGS, Project 1, and Project 3.

We see BPA's Regional Cooperation Debt (RCD) program as undermining the benefits of the federal debt's subordination, since the program results in a substantial extension of non-federal debt in exchange for the accelerated repayment of federal appropriations debt. While we recognizes the cost savings benefits for this strategy, Energy Northwest's debt funding of interest and O&M expenses to accelerate repayment of federal appropriations debt further undermines the subordination and is credit negative.

DEBT-RELATED DERIVATIVES

BPA indirectly has interest rate derivative like exposure of around $1 billion mostly tied to its lease financed transmission assets. We understand there are no collateral posting requirements under any conditions for these derivatives.

PENSIONS AND OPEB

BPA employees are part of the US government's post-retirement benefit programs for all federal civil employees. The post-retirement benefits are overseen by the United States Office of Personnel Management (OPM), an independent agency that manages the civil service of the federal government. As such, BPA does not record any accumulated plan assets or liabilities related to the administration of a retirement plan.

Management and Governance

US Government Support is a Major Strength

While BPA's obligations do not benefit from the full faith and credit of the United States Government, BPA benefits from significant explicit and implicit support elements from the US Government. The key support elements consist of BPA's borrowing line ($2.9 billion available) with the US Treasury and ability to defer payments to the US Treasury. That said, BPA forecasts the US Treasury line availability shrinking over time which we see as weakening a key support element and could become a driver of future negative rating action.

A strong qualitative consideration for implicit support include BPA's role as a line agency of the US Department of Energy. As a line agency of the US DOE, the BPA Administrator reports to the US Secretary of Energy and BPA has numerous linkages with other federal agencies. For example, the US Army Corp of Engineers and the US Bureau of Reclamation own and operate the federal dams while BPA markets the power output and pays for all of the associated operating and capital costs.

Importance to the US Northwest region is another key qualitative factor. BPA is responsible for certain treaty responsibilities with Canada regarding the federally owned dams, significant regional environmental protection programs, and coordination of river operations. Northwest US representation on key US House and Senate committees that deal with energy legislation is a credit strength.

Overall, we see these explicit and implicit US support as providing a multi-notch lift to BPA's standalone credit quality and represent key considerations for BPA's Aa1 rating. In a major stress scenario, Moody's expects any US Government support to BPA is likely to be provided through the established US Treasury credit line or deferral of payments to the US Treasury.

Legal Security

CGS, Project 1, and Project 3's bonds are secured by a pledge of specific project revenues primarily sourced under substantially similar tri-party net billing agreements with BPA and project participants for each project. The Project 3's pledge is subordinate to $29.2 million of prior lien bonds. The revenues for each project are not cross collateralized. There are no debt service reserves.

The net billing agreements obligate the project participants, consisting of numerous municipal and cooperative electric utilities, to pay ENW their proportionate share of the project's annual costs, including debt service, irrespective of whether the project is operable or terminated. BPA, in turn, is obligated to pay (or credit) the participants identical amounts by reducing the amounts the participants owe for power and service purchased from BPA under their power-sales agreements. BPA has also agreed, in the event of any insufficient payment by a participant, to pay the amount due in cash directly to the project. In 2007, Energy Northwest and BPA adopted a new direct pay agreement whereby Energy Northwest participants directly pay all costs to BPA rather than through Energy Northwest. BPA has made a clear and tested commitment to support the payment under the net billing through more than more than 30 years of stressful circumstances including legal challenges in the early 1980s.

Use of Proceeds

Approximately $97 million of CGS's bond proceeds will be used to fund capital spending. Remaining funds for CGS, Project 1, and Project 3 will be used primarily to extend bond maturities per its Regional Cooperation Debt program. As part of the Regional Cooperation Debt program, BPA expects to accelerate repayment of defacto subordinated federal appropriations debt in conjunction with the CGS, Project 1, and Project 3 debt maturity extensions.

Obligor Profile

BPA was created in 1937 by an act of the US Congress and is one of four regional power marketing agencies within the US Department of Energy. BPA is primarily responsible for federally owned generation and electric transmission assets in the Pacific Northwest spanning all or parts of eight states. The Army Corps of Engineers and the Bureau of Reclamation own and operate the hydro projects. Many of the statutory authorities of BPA are vested with the Secretary of Energy, who appoints and acts through the BPA administrator. BPA's obligations are not backed by the full faith and credit of the US government and its cash payments are limited to funds available in the Bonneville Fund.

Other Considerations: Mapping to The Grid

Moody's evaluates BPA's issuer rating under the US Public Power Electric Utilities with Generation Ownership Exposure methodology, and the grid indicated rating is Aa2, which is lower than its Aa1 assigned rating. BPA's close linkages with the federal government as a federal agency are the supportive considerations for the Aa1 assigned rating as compared to the Aa2 indicated rating under the US Public Power with Generation Ownership methodology.

Moody's also evaluates CGS, Project 1, and Project 3 ratings under the US Municipal Joint Action Agencies methodology, and the grid indicated rating is Aa1 for CGS and Baa1 for Project 1 and Project 3. The Aa1 rating assigned to all three projects reflects BPA's contractual obligation to pay including debt service under each project's net billing agreement, BPA's long history of meeting its contractual obligations, and BPA's Aa1 issuer rating.

The grid is a reference tool that can be used to approximate credit profiles in the US public power industry in most cases. However, the grid is a summary that does not include every rating consideration. Please see U.S. Public Power Electric Utilities with Generation Ownership Exposure and US Municipal Joint Action Agencies for more information about the limitations inherent to grids.

Rating Action: Moody's assigns Aaa rating to TVA's $1 billion bond offering; stable outlook

Global Credit Research - 21 Sep 2015

New York, September 21, 2015 -- Moody's Investors Service today assigned an Aaa rating to Tennessee Valley Authority's (TVA) $1 billion Global Power Bonds 2015 Series A Due 2065. TVA's outlook is stable.

Proceeds from the bond offering will be used to pay down short-term debt and for general corporate purposes. TVA had approximately $2.6 billion in short-term debt outstanding as of June 30, 2015.

RATINGS RATIONALE

"TVA's Aaa senior unsecured rating considers several attributes unique to TVA, including federal ownership, legislation that provides protection from competition and the statutory authority of TVA's Board to set rates", said Scott Solomon, Moody's Senior Credit Officer. "These attributes, combined with TVA's size, scale, and economic importance within the Tennessee Valley, translate into a more predictable and stable financial profile relative to all other public power and investor owned utilities" added Solomon.

Challenges confronting TVA include a decline in electric demand and a significant capital spending program driven by the replacement of coal-fired generating capacity in an effort to increase the company's power supply from reduced emitting resources.

To that end, TVA's Board approved the retirement of coal units at three plant sites with more than 3,000 megawatts of combined generating capacity. In addition, TVA is constructing two new combined-cycle gas plants: the 1,000 megawatt Paradise plant, which is expected to achieve commercial operation in 2017 and the 1,046 megawatt Allen Plant (2018), at an estimated cost of $2.0 billion.

Combined with the anticipated commercial operation of Watts Bar Unit 2, a nuclear plant, in late 2015, TVA anticipates reducing the reliance on coal-fired generation from approximately 32% of total generation currently to approximately 22% by 2020 while increasing generation from gas-fired and nuclear generating assets to approximately 23% and 41% , respectively, from 19% and 35%, currently.

TVA's near-term projected capital expenditures is expected to exceed historical levels, which has averaged approximately $2.2 billion annually over the past three periods. Specifically, expenditures are anticipated at approximately $3.4 billion in fiscal year 2015 and $2.4 billion in each of 2016 and 2017, and require a modest amount of external funding.

TVA's Aaa credit rating could be downgraded if there are any limitations placed on the independence of TVA including its ability or willingness to set rates at sufficient levels to cover operating expenses and debt service requirements, or if there are any changes in law that negatively affect TVA's protected position in its service territory including permitting outside access through TVA's transmission lines. Also, the credit rating could be downgraded if TVA debt approaches its $30 billion debt ceiling. Moreover, pressure on the U.S. government's credit rating or a reduction or reconfiguration of federal ties could also place pressure on TVA's rating.

For additional information on TVA, refer to the Credit Opinion dated August 11, 2015 which can be found on moodys.com.

The principal methodology used in this rating was U.S. Public Power Electric Utilities with Generation Ownership Exposure published in November 2011. Please see the Credit Policy page on www.moodys.com for a copy of this methodology.

TVA is a wholly owned corporate agency and instrumentality of the United States, originally established by Congress in 1933 to develop the Tennessee Valley region. TVA is the largest public power system in the country, selling wholesale power to distributor customers including municipalities, cooperatives, and industrial customers in an 80,000 square mile region that covers most of the state of Tennessee, as well as parts of six other states.

REGULATORY DISCLOSURES

For ratings issued on a program, series or category/class of debt, this announcement provides certain regulatory disclosures in relation to each rating of a subsequently issued bond or note of the same series or category/class of debt or pursuant to a program for which the ratings are derived exclusively from existing ratings in accordance with Moody's rating practices. For ratings issued on a support provider, this announcement provides certain regulatory disclosures in relation to the rating action on the support provider and in relation to each particular rating action for securities that derive their credit ratings from the support provider's credit rating. For provisional ratings, this announcement provides certain regulatory disclosures in relation to the provisional rating assigned, and in relation to a definitive rating that may be assigned subsequent to the final issuance of the debt, in each case where the transaction structure and terms have not changed prior to the assignment of the definitive rating in a manner that would have affected the rating. For further information please see the ratings tab on the issuer/entity page for the respective issuer on www.moodys.com.

For any affected securities or rated entities receiving direct credit support from the primary entity(ies) of this rating action, and whose ratings may change as a result of this rating action, the associated regulatory disclosures will be those of the guarantor entity. Exceptions to this approach exist for the following disclosures, if applicable to jurisdiction: Ancillary Services, Disclosure to rated entity, Disclosure from rated entity.

Regulatory disclosures contained in this press release apply to the credit rating and, if applicable, the related rating outlook or rating review.

Please see www.moodys.com for any updates on changes to the lead rating analyst and to the Moody's legal entity that has issued the rating.

Please see the ratings tab on the issuer/entity page on www.moodys.com for additional regulatory disclosures for each credit rating.

Rationale

S&P Global Ratings has assigned its 'AA-' rating to six series of $592 million of proposed Energy Northwest (ENW), Wash., bonds. Bonneville Power Administration (BPA), Ore., will pay the bonds' debt service as operating expenses of its electric system.

The bonds include the following series:

- Project 1 electric revenue refunding bonds, series 2017-A;
- Columbia Generating Station (CGS) electric revenue and refunding bonds, series 2017-A;
- Project 3 electric revenue refunding bonds, series 2017-A;
- Project 1 electric revenue refunding bonds, series 2017-B (taxable);
- CGS electric revenue and refunding bonds, series 2017-B taxable) ; and
- Project 3 electric revenue refunding bonds, series 2017-B (taxable).

At the same time, S&P Global Ratings affirmed its 'AA-' ratings on existing parity and prior-lien ENW debt and additional nonfederal obligations that BPA pays as an operating expense of its electric system. The outlook is stable. S&P Global Ratings also affirmed its 'aa-' stand-alone credit profile on BPA.

Although the series project 3 bonds are subordinate ENW obligations, the utility covenanted to close its prior liens. The $29 million of project 3 prior-lien debt represents less than 1% of the $8 billion of nonfederal debt that BPA supports. In light of the modest amount of project 3 bonds, we do not view the subordinate-lien position as an additional exposure. ENW has retired its prior-lien CGS and project 1 debt.

CGS is ENW's only completed and operating nuclear unit. The incomplete nuclear units 1 and 3 have $1.9 billion of debt and the operating CGS nuclear unit has $3.4 billion.

ENW and BPA will use the bonds' proceeds to refund portions of ENW's existing debt and finance a portion of CGS's capital improvement needs. Bonneville has been using ENW refunding transactions to capture debt service savings and to defer portions of its ENW debt to free up funds to retire portions of higher interest federal appropriation debt more quickly and preserve Treasury borrowing capacity, which is subject to a cap.

At fiscal year-end 2016 (Sept. 30), Bonneville had $15.6 billion of debt obligations, consisting of $2.9 billion of federal appropriations, $4.8 billion of bonds issued to the U.S. Treasury, and $8.0 billion of nonfederal debt that the utility supports. BPA's financial statements include $2.1 billion of lease obligations and $285 million of customer power prepayments in its nonfederal debt. It pays nonfederal debt from net revenues before it services federal Treasury debt and appropriations.

Accelerating portions of high interest rate federal appropriations debt by using the cash flow that re-amortizing ENW debt through refunding transactions frees up should reduce interest expense. As federal debt is retired, funds that would have been applied to its principal will then be available to further accelerate portions of BPA's Treasury debt, which is critical to funding Bonneville's capital program. The utility operates under a congressionally imposed $7.7 billion ceiling on its Treasury borrowings. Although as of fiscal year-end 2016, $4.8 billion of Treasury bonds were outstanding, the utility's reports that capital spending needs could exhaust the remaining Treasury borrowing capacity by as soon as 2019. Debt extensions have reduced federal appropriations debt to $2.9 billion in 2016 from $4.3 billion in 2013 and Treasury debt rose modestly to $4.8 billion in 2016 up from $3.9 billion in 2013.

BPA expects that managing Treasury debt balances with the savings from ENW debt deferrals will alleviate its borrowing constraints and add years to its Treasury borrowing capacity. Bonneville labels its use of ENW debt extensions to reduce appropriations and Treasury debt, "Regional Cooperation Debt Refinancings." To further these plans, it expects more than $2 billion of additional transactions to extend debt beyond the approximately $1.2 billion of debt extensions since 2014.

The 'AA-' ratings on ENW's debt and the other nonfederal debt that BPA supports reflect Bonneville's contractual obligations to support the debt and the application of our government-related entities (GRE) criteria. We assess Bonneville's stand-alone credit profile to be 'aa-' and believe there is a moderately high likelihood that the U.S. government would provide extraordinary support to it in financial distress. We base the latter on our opinion of the strong link between the BPA and the federal government, as well as the important federal role the agency plays in the Pacific Northwest. However, after downgrading the U.S. to 'AA+' from 'AAA' in August 2011, we no longer view the U.S. government's sovereign credit profile as lifting the ratings of the nonfederal obligations that BPA supports above the utility's stand-alone credit profile.

The GRE rating reflects our view of:

- Bonneville's status as a federal agency;
- The ongoing financial support the federal government provides to the agency through long-term loans and credit lines;

- Legislation that allows BPA to defer repayments of federal obligations if in financial distress; and
- The utility's important contributions to the Pacific Northwest's economy, where it indirectly serves a population of about 12 million in eight states, provides low-cost power that is critical to the region's economic health, and operates key transmission resources.

Bonneville's stand-alone credit profile reflects our assessment of the following factors:

- The federal government provides ongoing support to BPA through loans and credit lines.
- Congress increased the agency's federal borrowing authority in 2009 to $7.70 billion, up $3.25 billion (or 73%). However, Bonneville projects that, by 2019, it could consume the headroom between its $4.8 billion of U.S. Treasury borrowings and $7.7 billion as it proceeds with capital spending.
- Nonfederal bondholders benefit from the legislative mechanism that allows BPA to pay nonfederal debt as an operating expense ahead of federal debt service and to defer repaying federal obligations if it lacks the financial resources to meet all of its operating and debt obligations.
- The utility's financial performance includes a track record of at least 1.8x nonfederal accrual debt service coverage (DSC) in fiscal years 2010-2016, tempered by accrual coverage of federal and nonfederal obligations of 1.0x in 2011 and 2013, 0.9x in 2012, and 0.7x in 2016. Coverage was 1.2x in 2014 and 1.3x in 2015. The years with low coverage reflect the influence of biennial rate cases without intraperiod adjustments and the utility's operational exposure to variable hydrology conditions that affect volumes of surplus power available for sale in competitive markets, prevailing market power prices when BPA makes surplus sales, and variations in renewable energy resources' output that affect market prices. In addition, the accelerated payment of appropriations debt heavily influenced 2016's DSC. Bonneville paid $1.04 billion of appropriations debt in 2016, compared with an average of less than $200 million in the prior five years.
- BPA exhibits robust liquidity, which tempers the sometimes substantial impacts of variable hydrology conditions on financial performance and mitigates credit risks inherent in biennial rate cases. For example, in 2016, unrestricted cash and investments dropped to $853 million from $1.3 billion in the preceding year, but remained at a level that, at four months' operating expenses, we consider strong.
- An exceptionally broad and diverse service territory supports the revenue stream.
- The strong, efficient, and economical operations of the federal hydroelectric Columbia River Power System translates into favorable wholesale power prices that foster strong demand for its output and ENW's nuclear production.
- Customers demonstrated their commitment to the agency's system by entering contracts with BPA that extend from 2008-2028. However, the contracts do not establish rates and the utility continues to rely on biennial rate proceedings.
- Tiered rates underlying the customer contracts help shield BPA from market volatility by assigning to customers the costs of their energy needs that exceed their allotments of capacity from the federal hydroelectric projects and CGS.

S&P Global Ratings also incorporates the following factors in its assessment:

- Financial performance hinges on hydrology conditions that can impair surplus power sales revenues and require replacement power purchases that add to expenses. The liquidity cushion is vulnerable to hydrology conditions, power market volatility, and accelerated debt reduction, as the nearly $500 million decline in 2016's unrestricted cash and investments relative to 2015 illustrated. Biennial rate proceedings and the high threshold for triggering the utility's cost recovery adjustment mechanism limit the flexibility to respond to pressures on liquidity and DSC.
- Highly politicized and protracted biennial rate proceedings can delay rate relief and constrain the benefits of autonomous ratemaking authority and financial flexibility. Nevertheless, the utility established electric rates for its municipal and electric cooperative customers for fiscals 2016-2017 that at $34 per megawatt-hour are 7.1% above

its 2014-2015 rates and transmission rates that were 4.4% higher. Rates during 2014-2015 that were 9% higher than the rates that went into effect in October 2013 and transmission rates were 11% higher. In addition, BPA is exploring rate increases for the 2018-2019 rate period.

- Bonneville and ENW project substantial capital needs that could add to both organizations' debt and consume BPA's Treasury borrowing authority. The utility reports it is exploring nonfederal financing arrangements, including leases and energy prepayments by its customers, to address expectations that it could soon exhaust its federal borrowing capacity. BPA's capital spending program is important to maintaining the integrity of its generation fleet and managing forced outage incidents.
- The $7.7 billion federal debt limit includes $750 million carved out as a credit line, which leaves about $2.15 billion of capacity based on $4.8 billion of existing Treasury debt.
- The success of the Regional Cooperation debt refinancings and the ability to extend the tenor of BPA's capacity to borrow from Treasury hinge on the economics of refinancing opportunities for reamortizing nonfederal debt, the willingness of ENW to serve as a conduit issuer, and the potential for accelerating portions of Bonneville's federal appropriations and Treasury debt.
- The Regional Cooperation debt refinancings will strengthen nonfederal DSC in the near term, but will likely erode DSC in later years because BPA and ENW are deferring nonfederal debt service.

Outlook

The stable outlook reflects our view that Bonneville's stand-alone credit profile can withstand a further downgrade on the U.S. Also, plans to increase rates for the 2018-2019 period could help support DSC and liquidity. At the same time, ENW's willingness to serve as a conduit to capital markets remains important to managing Treasury borrowing limits.

Upside scenario

We do not expect to raise the ratings in the next two years because of the size of the BPA and ENW capital programs and our view that improvements in nonfederal debt service coverage ratios reflect the deferral of debt amortization to later years to address the Treasury's cap on BPA's borrowings

Downside scenario

If, during our two-year outlook horizon, Bonneville's sound liquidity cushion erodes further whether due to hydrology conditions, capital needs, weak market for its surplus power, or debt acceleration that saps its liquidity, we could lower the stand-alone credit profile. Also, if BPA adds significant nonfederal leverage obligations because of its statutory debt ceiling, it could lead to negative implications for the stand-alone credit profile and the 'AA-' rating.

Bonneville's Nonfederal Debt Obligations

BPA's nonfederal rated obligations include:

- $5.3 billion of ENW revenue and refunding bonds: $3.4 billion relates to the operating CGS and the balance is for the incomplete units 1 and 3;
- $78.9 million of Public Utility District No. 1 of Lewis County, Wash., Cowlitz Falls Project bonds;
- $119.6 million of Northwest Infrastructure Financing Corp. (Schultz-Wautoma project) bonds; and
- $12.8 million of Northern Wasco Public Utility District, Ore. (McNary Dam Project) bonds.

Operations

Bonneville markets electricity generated at 31 federal hydroelectric projects, ENW's nonfederal nuclear CGS, and several nonfederal small power plants. It primarily markets these resources' output to the customers of 125 public power and electric cooperative utilities (88% of sales), federal agencies, direct service industries, and the residential and farm customers of six investor-owned utilities. BPA also operates an extensive transmission system that facilitates power marketing activities. Its transmission system represents about 75% of the Pacific Northwest's transmission capacity. Power sales accounted for 73% of 2016's operating revenues, compared to transmission's 27%.

ENW debt financed two partially completed nuclear reactors and one completed reactor, CGS, a 1,157 megawatt reactor. The nuclear assets' debt is the leading component of nonfederal obligations.

Capital Spending Forecast

Bonneville projects about $4.5 billion of 2017-2021 capital projects. In descending order, transmission projects, hydroelectric asset upkeep, facilities, IT, security, and fish and wildlife protection represent the largest segments of the capital program. We view investments in the hydroelectric assets as critical to cash flow, particularly because the generating assets have exhibited an above-average forced outage factor relative to the balance of the power industry.

ENW projects about $537 million of 2017-2021 capital projects.

Appendix F – MPA Utilities Practice Overview

Morrison Park Advisors has deep experience in the utility sector, including electricity generation, transmission and distribution, as well as natural gas pipelines and distribution utilities. Both as a firm, and as individuals with prior experience, we have worked with many of the leading utilities in Canada helping them to understand and maximize the value of assets and opportunities, whether for the purpose of mergers and acquisitions, new development and construction, or balance sheet management. Given our expertise, we are often called upon to provide clients with advice in challenging situations that do not fit typical investment banking categories.

Morrison Park Advisors

- Independent, partner-owned investment banking firm established in 2005
- Co-founded by David Santangeli and Brent Walker, now ten professionals, with over one hundred successful assignments with public and private companies, governments and quasi-public entities
- Value proposition is a unique combination of Tier 1 investment banking capabilities, comprehensive scope of expertise, and excellent client value
- Integrated advisory practice, covering all facets of investment banking, capital markets and Mergers & Acquisition services

Utilities Services

- Mergers & Acquisitions
- Strategic advice on market consolidation; potential investors & partners
- Financial advice on balance sheet management, growth capital, dividend policies
- Valuation
- Regulatory reviews and expert witness testimony in legal disputes

Utilities Reference Assignments

- Manitoba Hydro Public Utilities Board: Consultant to the Board and Expert Witness on Manitoba Hydro's Needs For and Alternatives To Proposed Business Plan
- Nova Scotia Utilities Review Board: Consultant to the Board and Expert Witness on the review of the proposed Maritime Link transmission project to connect Nova Scotia with Newfoundland and Labrador Hydro
- Alberta Electric System Operator (AESO): capital markets view on Alberta electricity investing, interview of developers/owners/operators of electricity generation facilities, as well as capital providers and other capital markets participants
- Market Surveillance Administrator of Alberta: Analysis of electricity generation investment sustainability in Alberta based on market participant interviews and financial information
- Crown Investments Corporation of Saskatchewan: advice on the cost and commercial viability of a nuclear electricity generation plant in Saskatchewan.
- BC Hydro: strategic advice on market value and potential partnerships for new international and interprovincial transmission infrastructure
- City of London, Ontario: review of the value of and strategic opportunities for ownership of London Hydro
- PowerStream: financial advisor to PowerStream in its merger with Enersource Hydro and Horizon Utilities, with concurrent acquisition of Hydro One Brampton Networks, Inc., to create the new company Alectra Utilities
- City of Toronto: M&A advisor to the City of Toronto in the sale of its minority shareholding in Enwave, a district heating and cooling company in Toronto
- Altagas Utilities: independent valuation of distribution utilities for the special committee of the Board of Directors
- Oshawa PUC: advice to the Board with respect to potential merger, acquisition and sale opportunities
- Milton Hydro: advice to the Board and the special advisory committee to City Council with respect to the recapitalization of Milton Hydro, its dividend policy, and potential merger, acquisition and sale opportunities
- Enwin Utilities: strategic and financial advice on balance sheet management of electricity and water utility businesses, and advice on options available to the Board with respect to potential merger, acquisition and sales
- Haldimand Hydro: advice to the Board with respect to potential merger, acquisition and sale opportunities
- Woodstock Hydro: advice to the Board with respect to potential merger, acquisition and sale opportunities
- Hydro One: financial advisor for distribution industry consolidation from 2007 to 2009; completed valuations for more than 30 utilities; conducted negotiations; strategic advisory services in managing acquisition proposals

Sample Previous Experience of MPA Staff

- Hydro One: Directed acquisitions of Haldimand Hydro, Norfolk Power, Woodstock Hydro, and Terrace Bay Superior Wires, in addition to numerous discussions and negotiations with respect to potential transactions with electricity distributors across the province
- Province of Ontario: Development of provincial policies with respect to electricity distribution consolidation
- Province of Nova Scotia: Financial advisor to the Province on the sale of its interest in Nova Scotia Resources Limited
- Ontario Teachers, OMERS and SNC Lavalin: Advisor to consortium on the potential acquisition of 49% of Hydro One
- Fortis Inc.: M&A advisor on the $1.4 B acquisition of Alberta and BC electricity distribution assets formerly owned by Aquila Networks
- Newfoundland & Labrador Hydro: advisor on proposed privatization
- Advisor to a bidding consortium on the proposed acquisition of ENMAX, the electricity distributor of the City of Calgary

Appendix H – MPA Utilities Team

Pelino Colaiacovo

Pelino is a Managing Director at MPA. In this role he is responsible for origination and transaction execution, financial advisory and capital raising services. Since joining MPA Pelino has focused on advising clients in the energy, utilities, infrastructure and public sectors, and in addition assists clients in cleantech industry.

Utility clients have included Hydro One, BC Hydro, Enwin Utilities, Oakville Hydro, Woodstock Hydro, the Nova Scotia Utilities Review Board, the Alberta Market Surveillance Administrator, and numerous others, and more broadly in the energy sector Pelino has worked on a number of M&A and capital raising assignments for renewable energy and cleantech companies.

Prior to joining MPA in 2005, Pelino was Chief of Staff to the Ontario Minister of Energy from 2003 to 2005. During that time, he assisted in significant restructuring of the Ontario electricity sector, including the drafting and implementation of new legislation, the creation of the Ontario Power Authority, and significant procurements of new electricity generation capacity for the province.

Previously, Pelino spent more than 10 years in management, policy and communications consulting in Canada and the United States, advising clients across a wide range of sectors, including energy, transportation, telecommunications, and healthcare.

Pelino holds a B.A. and an L.Lb., both from the University of Toronto.

Bill Meeker

Bill is a Senior Advisor at Morrison Park Advisors. Since joining MPA in 2014, Bill has focused exclusively on the utility sector. Bill brings over thirty years of utility experience with Ontario Hydro, Ontario Hydro International and Hydro One Inc. to helping clients understand and meet the challenges of today's utility environment.

Bill's career has focused on transaction development in the electric distribution and transmission businesses – both internationally and in Ontario. He has led cross-functional teams in due diligence, valuation, execution and regulatory approvals. Bill's experience includes directing the acquisition of assets and shares, the sale of strategic investments, structuring complex cross-border partnerships, managing investment partnerships, and structuring merger arrangements.

Bill also led Hydro One's asset management function for electric distribution for two years from 2010 to 2012. From 2012 to 2014 Bill led Hydro One's acquisition of Norfolk Power, Haldimand County Hydro, and Woodstock Hydro.

Bill has a Bachelor of Business Administration (B.B.A.) and Master of Business Administration (M.B.A.) from York University's Schulich School of Business.

Brent Walker

Brent Walker is a Managing Director and co-founder of MPA. In this role he is responsible for transaction origination and execution, financial advisory and capital raising activities across a wide spectrum of industry segments, including energy, technology, government and quasi-government entities and a variety of other commercial sectors.

Utility clients have included BC Hydro, Altagas Utilities, Crown Investments Corporation, Hydro One, Market Surveillance Administrator of Alberta, the Nova Scotia Utilities Review Board, the Ontario Ministry of Energy and many others.

Prior to founding MPA in 2004, Brent spent over 10 years in the investment banking and financial industry. From 1996 to 2004, he was a managing director in Scotia Capital's mergers and acquisitions department, where he was the most senior M&A banker in a number of sectors including power and infrastructure, pipelines, energy midstream and real estate. During this period, he worked on the sale of the Province of Nova Scotia's interest in Nova Scotia Resources Limited, the acquisition of Aquila by Fortis, the proposed privatization of NALCOR and Enmax, and many other utility assignments.

Brent started his investment banking career at Lancaster Financial, Canada's foremost independent M&A boutique which was acquired by TD Bank in 1994.

Brent holds a B.Sc. from Dalhousie University and an MBA from McMaster University.

Benjamin Kinder

Benjamin Kinder is a Director at MPA. In this role he is responsible for transaction execution, financial advisory and capital raising services.

Since joining MPA in 2009, Ben has focused on advising clients in public and private mergers, acquisitions and divestiture transactions, and has acted as an expert witness.

Prior to joining MPA, Benjamin spent two years in Scotia Capital's investment banking and equity capital markets divisions. While there, he focused on the communications, media and technology sectors, advising clients on mergers and acquisitions, and capital markets transactions.

Benjamin holds a Bachelor of Business Administration (B.B.A.) from York University's Schulich School of Business, a Master of Arts (M.A. Cantab.) in law from the University of Cambridge.

John Park

John Park is an Analyst at MPA. In this role he is responsible for research, modeling, and assisting with transaction, execution services.

Prior to joining MPA, John served as an analyst in the business development department of a major Canadian corporation.

John holds an Bachelor of Business Administration (B.B.A,) from the Ivey School of Business at Western University.

Appendix I – Statement of Qualifications & CV of Pelino Colaiacovo

Pelino Colaiacovo – Statement of Qualifications

Pelino Colaiacovo has been a Managing Director at MPA Morrison Park Advisors Inc. since 2005. He focuses on the utility, electricity and infrastructure sectors, as well as Crown Corporations and green technology more broadly. He advises corporate, government and not-for-profit clients on mergers and acquisitions transactions, the raising of new capital, the valuation of corporations and major assets, and the financial fairness of proposed transactions or initiatives to various stakeholders. As part of this work, he has built hundreds of financial models and analyzed the financial impacts and sensitivities of scenarios too numerous to count. He tracks the view of the capital markets on initiatives and developments in the utilities, power and infrastructure sectors, and provides advice and assistance to clients that must interact with the capital markets. He regularly speaks at and participates in conferences, roundtables and industry associations with respect to energy policy development, and the likely financial impact on utility companies of new policies, technologies and financial developments. He has provided advice to several governments about energy policy.

Before joining MPA, he served as the Chief of Staff to the Ontario Minister of Energy, and was integrally involved in a large number of significant reforms to the electricity industry in that province. Prior to that he was a consultant to a wide variety of domestic and international companies and industry associations on energy and other policy issues.

Pelino appeared before the Manitoba PUB in 2014 as part of the NFAT process, and provided a view on the fairness of the NFAT to Manitoba ratepayers, and also commented on the financial viability of Manitoba Hydro's plan. He also appeared before the Nova Scotia Utilities and Review Board in 2013 on the fairness of the Maritime Link Project to ratepayers in that province (and is currently in the process of participating in the NSUARB review of the Maritime Link project to date).

PILC will rely on his expertise in financial modeling, capital markets, electricity planning and policy to comment on the financial and intergenerational consequences of Manitoba Hydro's GRA.

Pelino Colaiacovo, Managing Director

Professional Profile

- Well-known participant in the Ontario electricity sector
- Deep understanding of the Canadian utilities, energy, infrastructure and greentech sectors
- Over 20 years of experience in investment banking, government, corporate strategy, policy development, consulting

Professional Experience

August 2005 – Present Managing Director, MPA Morrison Park Advisors Inc.

- MPA is an employee-owned independent investment bank focusing on mergers & acquisitions, capital raising, and other strategic advisory services to public and private companies, as well as governments, crown corporations, regulators and not-for-profit enterprises (note that MPA's name pre-2007 was Energy Fundamentals Group)
- As Managing Director and Shareholder, responsibilities include marketing, client origination, transaction analysis, senior counsel, and transaction execution

October 2003 – August 2005 Chief of Staff, Office of the Ontario Minister of Energy

- Most senior advisor to the Minister
- Managed Minister's staff of 12

July 1993 – October 2003 Various Positions, GPC International

- Consulting firm providing policy analysis, government relations, public affairs, public relations, corporate communications and management consulting services
- Positions held in Toronto, Ottawa and Washington DC
- Progress from junior consultant to Vice President and Practice Leader
- As Practice Leader, managed both a permanent team, as well as flexible multidisciplinary teams for individual client campaigns

Education

1993 Bachelor of Laws, University of Toronto

1990 Honours Bachelor of Arts, University of Toronto (International Relations and Economics)

Detailed Experience

August 2005 – Present Managing Director, MPA Morrison Park Advisors Inc.

- Focus on utility and energy sector clients, and to a lesser extent on infrastructure projects, crown corporations, and greentech (MPA also covers mining, technology, real estate and public company M&A)
- Advisor to the Alberta Electric System Operator: Capital market consequences of transition to Coal Exit and Capacity Market
- Financial Advisor to PowerStream in its merger with Horizon Utilities, Enersource and Hydro One Brampton to create Alectra Utilities
- Expert Witness for and consultant to the Public Utilities Board of Manitoba: Commercial valuation of Manitoba Hydro's multi-billion dollar plan to build new hydroelectric facilities and export-focused transmission lines
- Expert Witness for and consultant to the Nova Scotia Public Utilities Board: Commercial valuation of the proposed Maritime Link interprovincial electricity transmission line
- Report to the Market Surveillance Administrator of Alberta on the commercial viability of new electricity generation facilities in the Alberta competitive electricity market
- Advisor to British Columbia Transmission Co (now part of BC Hydro) with respect to proposed new transmission lines to the United States and Alberta
- Financial Advisor to the City of Toronto with respect to the sale of the City's minority interest in Enwave
- Financial Advisor to the City of Toronto with respect to the proposed financing for and development of the Tower Renewal energy conservation program
- Numerous assignments as financial advisor to electricity distribution companies with respect to financial valuations, strategic reviews and mergers & acquisition opportunities (e.g., Milton Hydro, Oshawa PUC, Woodstock Hydro, Enwin Utilities, Oakville Hydro, Hydro One)
- Numerous assignments as financial advisor to buyers and sellers of renewable energy generation assets (wind, solar and hydroelectric) and district energy facilities
- Numerous assignments as financial advisor to project developers raising capital for new energy and infrastructure projects, and/or bidding into competitive procurement processes
- Energy policy and strategy advisor to the Ontario Energy Association
- Typically, clients are Boards of Directors of public companies, or senior management of private companies or government entities
- Numerous presentations before City Councils, utility regulators, and other public bodies
- Speeches and appearances at energy conferences and roundtables, guest lectures at university courses on energy policy and utility regulation, expert opinion resource for media

October 2003 – August 2005 Chief of Staff, Office of the Ontario Minister of Energy

- Principal political and policy advisor to the Minister
- Primary liaison with the Office of the Premier and with the public service
- Managed Minister's staff of 12

Final decision-maker for the Minister's public communication and stakeholder interaction

- Key accomplishments included:
  - Restructuring of the Ontario electricity sector through the passage of Bills 11 and 100
  - Development of a detailed plan to retire Ontario's coal-fired electricity generation fleet
  - Development of a smart metering strategy for Ontario
  - Creation of the Ontario Power Authority, selection of Board, appointment of CEO
  - New Board and senior management for Ontario Power Generation, new Board for the Independent Electricity System Operator
  - Review and approval of proposed refurbishment of Pickering A 1 nuclear unit
  - Negotiation of Bruce A nuclear refurbishment
  - Successful Requests For Proposals for new renewable energy facilities, and new gas-fired electricity generation plants

July 1993 – October 2003 Various Positions, GPC International

- Vice President and Corporate Practice Group Leader, Toronto
- Vice President responsible for integration of acquired offices in the United States, including Boston and Washington DC
- Senior Consultant, Ottawa
- Consultant, Toronto
- Focus on regulated sectors of the economy, including energy, transportation, media, healthcare and finance
- Leader of multi-disciplinary public affairs projects including policy development, government relations, media relations, stakeholder communications and polling
- Management consultant for large national and multi-national corporations with respect to public affairs

Appendix J – MPA Duties

The following duties were assigned to Morrison Park Advisors in the Manitoba Hydro 2017/18 and 2018/19 General Rate Application.

The Public Interest Law Centre on behalf of the Consumers Coalition, and the Manitoba Industrial Power Users Group (MIPUG), jointly retained the services of Morrison Park Advisors to assist with their participation in the Public Utilities Board review of Manitoba Hydro's Application on issues related to financial targets / capital structure, debt and debt management, and risk and uncertainty analysis.

Morrison Park Advisors' duties include:

- Reviewing the application, evidence and historical information;
- Modelling, on a very limited basis, the potential impact on Manitoba Hydro of further unplanned capital expenditures, and compare the same to other possible risks;
- Researching and benchmarking of alternatives;
- Researching and comparing the debt management strategies of comparable utilities, particularly with respect to the issue of shorter term maturity;
- Modelling; on a very limited basis, the varying impacts on customer rates over time of different financial targets, strategies, debt management plans and risks, including the use of different rate implementation strategies (i.e., higher earlier, steady increases use of “emergency” increases, etc.) and considering the impact of these various scenarios on access to capital and the Province of Manitoba;
- Preparing first and second rounds of Information Requests;
- Reviewing Information Request responses;
- Preparing a report to the Public Utilities Board;
- Responding to Information Requests, if necessary; and
- Preparing for and appearing before the Public Utilities Board, if necessary.

Morrison Park Advisors' retainer letter includes they are to provide evidence that:

- is fair, objective and non-partisan;
- is related only to matters that are within their area of expertise; and
- to provide such additional assistance as the Public Utilities Board may reasonably require to determine an issue.

Morrison Park Advisors' retainer letter also includes that their duty in providing assistance and giving evidence is to help the Public Utilities Board. This duty overrides any obligation to the Consumers Coalition and MIPUG.

Tab 151

KPMG

Manitoba Hydro

Financial Targets Review

Supplementary Update

August 2017

KPMG LLP

Notice on Supplementary Update

KPMG LLP ("KPMG") has drafted this supplementary update ("Update") to the Financial Targets Review Report issued May 2015 (the "May 2015 Report"). This supplementary update and the May 2015 Report were prepared pursuant to our engagement to assist Manitoba Hydro-Electric Board ("Manitoba Hydro" or "MH") in its review of financial targets ("Financial Targets Review") in accordance with the terms of a services agreement dated December 5, 2014.

This Update has been prepared for Manitoba Hydro. Its contents may not be shared with or disclosed to anyone by the recipient without the express written consent of Manitoba Hydro and KPMG, unless Manitoba Hydro files the report or substantive components of the report for its regulatory purposes. KPMG does not accept any liability or responsibility to any third party who may use or place reliance on this Report.

Purpose of the Update

The purpose of this Update is to:

- Provide an update of the background information in the Financial Targets Review,
- Update data and information as at March 2017 for benchmarking and comparisons of government-owned power utilities in Canada; and
- Update the scenario analysis to include IFF16 filed by Manitoba Hydro in May 2017.

Basis of Information

The data and information included in this Update and the May 2015 Report were obtained primarily from secondary sources such as annual reports, financial statements and regulatory filings of MH and other power utilities, Decisions and Orders of the Public Utilities Board of Manitoba ("PUB") and of other regulatory agencies, credit agency reports, bank reports, and other sources of Canadian and international research and statistics. Financial forecasts were derived from MH's Integrated Financial Forecast and similar documents from other select power utilities. Scenario analyses were performed on KPMG's behalf by MH using its own in-house models.

This Update and the May 2015 Report relies on data and information from these secondary sources and KPMG makes no representations with respect to their accuracy or completeness.

The procedures performed do not constitute an audit, examination or review in accordance with standards established by the Chartered Professional Accountants of Canada, and we have not otherwise verified the information we obtained or presented in this Update or Report. KPMG expresses no opinion or any other form of assurance on the information presented in the Update and the May 2015 Report, and makes no representations concerning its accuracy or completeness.

Contents

1 Background

This chapter outlines the objectives, scope and process of the project.

1.1 Objective

In 2014, Manitoba Hydro-Electric Board ("Manitoba Hydro" or "MH") retained KPMG LLP ("KPMG") to undertake a review of its current financial targets (the "Financial Targets Review"). The specific objectives of this engagement were to:

- Provide recommendations with respect to appropriate financial targets for Manitoba Hydro that align with the mandate of Manitoba Hydro and the interests of its stakeholders considering its operating and business outlook and associated risks.
- The financial target recommendations should consider at a minimum the following:
  - The objective of maintaining rate stability for customers while at the same time maintaining safe and reliable service.
  - The period of significant capital investment and infrastructure renewal that Manitoba Hydro is entering into.
  - The maintenance of Manitoba Hydro's self-supporting status for credit rating purposes.
- Conduct scenario analysis to help address PUB's directive to Manitoba Hydro to review key operating and financial risks in order to assess the adequacy of financial reserves.

The results of this review culminated in a report dated May 2015 (the "May 2015 Report"). The analyses in the 2015 report were based, among other things, on MH's Integrated Financial Forecast ("IFF14"), dated December 2014.

The scope of the work did not involve review or comment on broader policy questions associated with Manitoba Hydro's overall structure, governance framework, and business strategy, including capital plans and IFF strategies and rate decisions.

1.2 Scope and Overview of Update Process

Given the passage of time, which has been accompanied by changes in the economic environment and by changes in Manitoba Hydro's financial outlook, Manitoba Hydro retained KPMG to undertake an update of certain analyses contained in the May 2015 Report. The results of this update process are summarized in this report.

The analysis in this update is intended to supplement that contained in the May 2015 Report. Hence, this "Supplementary Update" should be read in conjunction with the May 2015 Report and does not replace it. We have not updated all of the analyses of the earlier report, nor have we revisited all of discussions of conceptual issues contained in that report. Rather, the intent of this report is to address changes in the environment and to update key financial data and metrics. In particular, we reviewed recent developments at benchmark government-owned power utilities and we updated our financial comparisons with recent financial information.

As per our scope of work, the following Supplementary Update provides updated information for Chapters 3, 4, 5, 6 and 7 of the May 15 Report.

1.3 Summary of the May 2015 Report Recommendations

It should be noted that the updates contained herein have not changed the core recommendations of the May 2015 Report. For greater certainty, we still concur with the recommendations of the May 2015 Report.

The context for the recommendations in the May 2015 Report included the following:

- Relative to other Crown utilities with a significant base of hydro-electric generation, Manitoba Hydro faces a number of heightened risks:
  - Manitoba Hydro has a large capital investment program relative to its current installed asset base and its projected revenues going forward.
  - Manitoba Hydro faces relatively greater hydrology risks than other major utilities.
  - Manitoba Hydro relies on export markets for a significant proportion of its revenue.
  - Utility debt and utility assets in Manitoba are relatively high on a per capita basis compared to other jurisdictions. Manitoba Hydro thus has a relatively limited customer base over which to spread potential future cost overruns or business set-backs.
- As shown through benchmarking, Manitoba Hydro’s target equity ratio is at the low end of those maintained or forecast by other government-owned power utilities.
- Manitoba Hydro has limited ability to restrain a drop in financial ratios during adverse conditions, such as a drought. This highlights the risk of having an equity ratio that approaches 10%. For this reason, we believe that equity ratios of 15% or higher are the minimum that should be accepted even for short periods.
- Manitoba Hydro is dependent on an accumulation of retained earnings to build up its equity base. The Manitoba government does not expect to receive dividend income from the utility but nor does it make equity injections during periods of major capital expansion. As a consequence, Manitoba Hydro has few levers with which to adjust its financial position.
- Manitoba Hydro’s capital investment program is characterized by periodic “bumps” or “hills” of large magnitude. These fluctuations magnify the challenges associated with Manitoba Hydro’s limited levers for financial control.

As further context to this update, the recommendations of the May 2015 Report are repeated below:

Recommendation 1: debt/equity ratio target of 75/25 to 70/30

- Manitoba Hydro’s current debt/equity target of 75/25 is a reasonable long-term target. Notwithstanding this finding, we note that a target of 70/30 would provide additional financial strength to address the utility’s unique financial challenges and risks. Accordingly, our overall recommendation is that the debt/equity ratio should fall within the range of 75/25 to 70/30.
- Manitoba Hydro will need to depart from its equity target during major build programs: this reflects the utility’s limited financing tools and reliance on retained earnings as its dominant source of equity. Accordingly, the equity position should rise above 25% in advance of major build programs to mitigate the deviations from target that are observed.
- We have significant concerns that an 11% equity level, as forecast under IFF14, provides a less than desirable equity base to accommodate potential adverse developments. We suggest that Manitoba Hydro’s plans be adjusted to maintain an equity ratio no lower than 15% under forecast conditions during the peak periods of its major capital build program when equity ratios are at their lowest levels.
- In the long-term, with respect to deviations from any target, it would be desirable to limit decreases in the equity ratio to 5-10 percentage points.

- In the long-term, higher equity ratios need not translate into higher rates, because Manitoba Hydro has the option to seek lower rates of return on equity than investor-owned utilities.

Recommendation 2: minimum EBITDA interest coverage ratio target of 1.8 or greater

- As noted in the May 2015 Report, the debt/equity ratio should remain the primary measure of Manitoba Hydro's financial position. An interest coverage ratio is an important element of financial targets and indicator of trends. EBITDA is a widely accepted financial measure and is closer to a cash flow metric than EBIT, albeit with limitations since it does not incorporate capital expenditure requirements or working capital adjustments.
- Our recommendation is an EBITDA interest coverage ratio, at a minimum target level of 1.8 or greater.

Recommendation 3: maintain a minimum capital coverage ratio target of 1.2 or greater

- The capital coverage ratio is also an important financial target and a unique measure to Manitoba Hydro.
- The current minimum target of 1.2 or greater is reasonable in that the corporation should be able to fund its sustaining base capital from current operations without accessing external sources of financing. However, an inherent limitation of this ratio is that it does not reflect the financial challenges associated with major expansion programs. Hence it may be misunderstood or misinterpreted by stakeholders.

Recommendation 4: other metrics to continue to monitor

- Manitoba Hydro should maintain three Financial Targets.
- Manitoba Hydro should also continue to regularly monitor other financial metrics. These include but are not limited to: revenue growth, controllable operating costs, EBITDA, net income, cash flow from operations to net debt, net debt to assets, EBITDA to revenue, capital expenditures to fixed assets, average electricity prices across different customer groups.

In the context of this review, we note that the financial position of Manitoba Hydro has deteriorated in recent years, which increases risk to the corporation and to the Province of Manitoba. Benchmarking comparisons to peer government-owned power utilities show Manitoba Hydro in a relatively worse financial position than comparisons in the May 2015 Report. The Province of Manitoba has experienced credit downgrades from two credit rating agencies since the May 2015 Report. Thus, a return to minimum equity ratio targets, which is fundamental to the financial health of the corporation and the need for a sufficient equity cushion, has increased. With Manitoba Hydro's reliance on retained earnings for equity, the need for growth in sustainable positive cash flow and net income to increase equity has increased. Further, actions at other utilities confirm the importance of a robust equity ratio to support capital expansion and to provide protection against downside risks.

2 Update of Manitoba Hydro's Financial Outlook

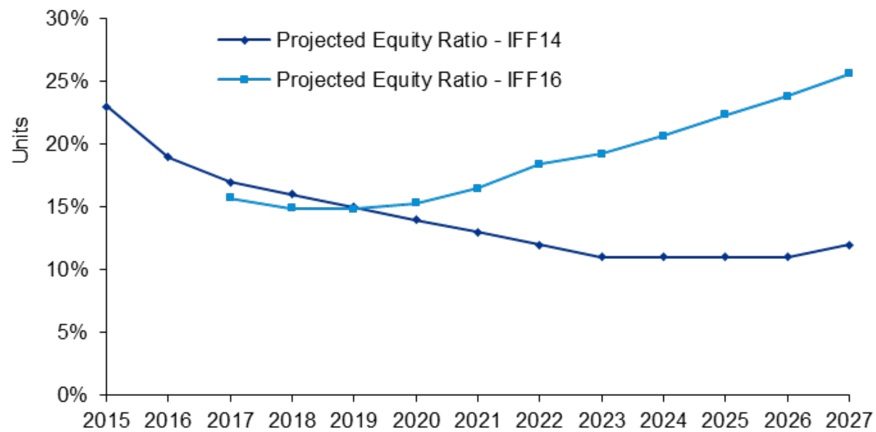
This chapter summarizes Manitoba Hydro's financial outlook under current plans as embodied in IFF16. This chapter updates some of the projections that were contained in Chapter 3 of the May 2015 Report.

2.1 Financial Metrics Forecast Over the Next 10 Years under IFF16

In this section, we compare key metrics for Manitoba Hydro under IFF16 versus IFF14. Manitoba Hydro's revised financial plan, IFF16, proposes annual rate increases in electricity rates of 7.90% for five years, 2017/18 to 2021/22, followed by inflationary increases of approximately 2.00% thereafter.

Figure 2-1 shows the projected equity ratio under the two forecasts. The projected equity ratio under IFF16 starts out from a lower position than under IFF14, but improves much more rapidly after 2020.

Figure 2-1: Projected Equity Ratio – IFF16 versus IFF14



In the short-term (through 2018), the equity ratio continues to fall under IFF16, remaining lower than under IFF14, even with projected 7.90% rate increases. This highlights the challenges related to financing large capital build programs. Given limited cash flows available from operations, Manitoba Hydro must rely significantly on debt to finance its capital expansion.

By definition, equity is a "stock" measure, and adjustments in the equity ratio over time require significant earnings flows to build up the retained earnings base and cash flows to reduce debt. If rate increases are not implemented, deficiencies in the earnings and in the cash flows available from operations could impair improvements in the utility's financial position.

Figure 2-2 below compares projected interest coverage ratios under the two forecasts (IFF16 and IFF14). Interest coverage ratios are consistently better under IFF16 after 2018 under the more recent projection, reflecting higher operating earnings.

Figure 2-2: Projected Interest Coverage Ratio – IFF16 versus IFF14

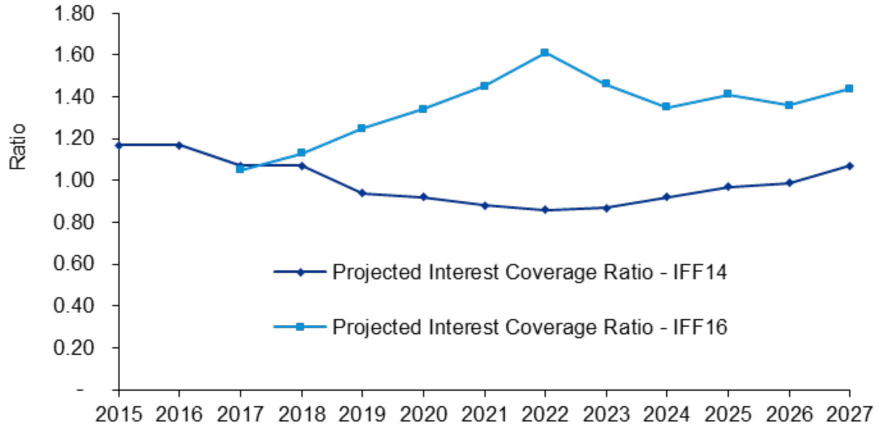


Figure 2-3 below compares projected EBITDA interest coverage ratios under the two forecasts (IFF16 and IFF14). EBITDA interest coverage starts from a slightly lower position in 2017 under IFF16, but then is consistently better than IFF14 for the remainder of the period.

Figure 2-3: Projected EBITDA Interest Coverage Ratio – IFF16 versus IFF14

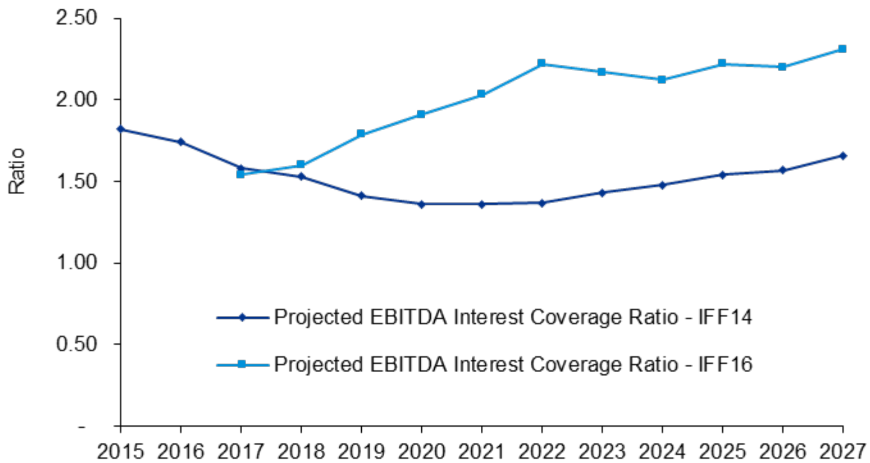

Figure 2-4 below compares projected capital coverage ratios under the two forecasts (IFF16 and IFF14). Capital coverage ratio is consistently better under IFF16. This reflects Manitoba Hydro's improved operating earnings.

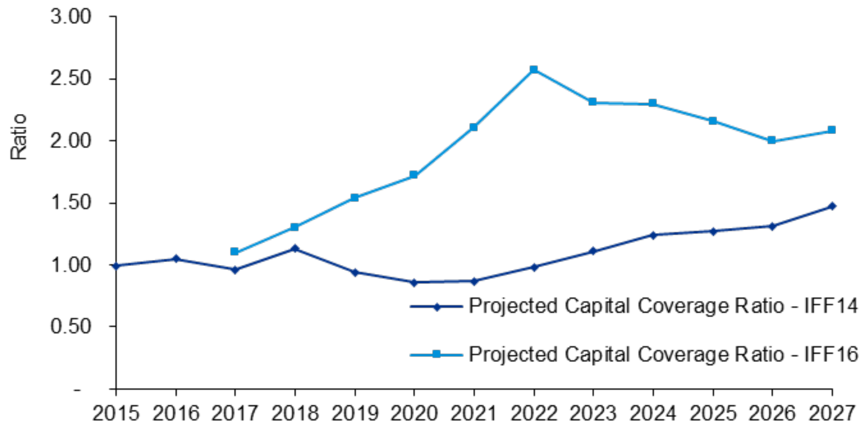
Figure 2-4: Projected Capital Coverage Ratio – IFF16 versus IFF14



In evaluating projected trends in the capital coverage ratio, the limitations of this ratio need to be taken into account. As noted in the May 2015 Report, the capital coverage ratio does not take into account the financial impacts associated with major capital programs. Hence, it needs to be interpreted with caution. By definition, the ratio takes into account only base capital expenditures. It excludes projects categorized as Major New Generation and Transmission. It thus excludes:

- Capital expenditures related to large capacity expansions (such as Keeyask).
- Major reliability projects such as Bipole III.
- Some expenditures related purely to asset sustainment, such as the Pointe du Bois Spillway replacement, which are classified as Major New Generation and Transmission projects simply because of their size.

Projects such as Bipole III and major sustainment expenditures are particularly challenging from a financial perspective for Manitoba Hydro because they do not lead to material revenue increases that could help support their carrying costs once they are introduced into service. Bipole III has been built to reduce the risk of transmission outages and sustainment projects are built to ensure the continuation of existing revenue streams.

Furthermore, the capital coverage ratio excludes ongoing cash expenditures that Manitoba Hydro has to make to continue to operate as it currently does. Examples include deferred expenditures such as DSM and mitigation spending.

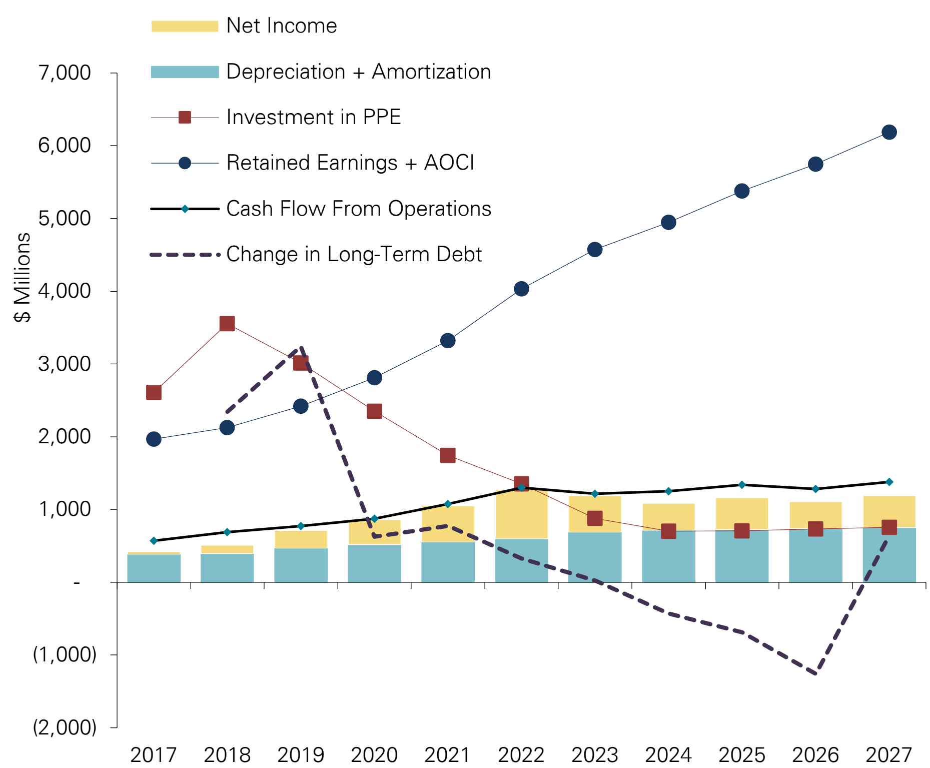
Also, the capital coverage ratio is based on cash flow from operations. This cash flow measure does not reflect the cash flow impact of interest payments that are capitalized for accounting purposes. Major capital projects result in a significant amount of such interest.

We note that Manitoba Hydro has developed an additional metric that examines adjusted cash flow to adjusted capital expenditures. This metric is intended to reflect overall cash flow impacts and related challenges in a more complete way during periods of major capital investment.

2.1.1 Integrated Assessment

Figure 2-5 shows the forecast evolution of Manitoba Hydro's financial position over the next 10 years based on projections in IFF16. This updates the data presented in Figure 3-10 of the May 2015 Report. All figures are shown in nominal dollars and are for Electric Operations alone, in contrast to Figures 2-1 through 2-4 above, which are for the overall corporation.

Figure 2-5: Forecast Evolution of Manitoba Hydro's Financial Position – IFF16



Source: IFF16 Projected Financial Statements for Electric Operations

A review of Figure 2-5 indicates the following:

- Projected capital expenditures in property plant and equipment ("PPE") are at very high levels in the near term, with a peak of $3.6 billion in Fiscal 2018. Thereafter they fall steadily to $700 million by Fiscal 2024 and then remain generally flat through to the end of the projection period. High capital expenditures in the near term reflect work associated with the construction of Keeyask and Bipole III. The capital expenditure profile is similar to that observed in IFF14, although peak spending in 2018 is higher (at $3.6 billion versus $3.2 billion). Overall spending is also higher due to increases in control budgets on the major projects.
- Depreciation and amortization expense is approximately $400 million in 2017, but increases gradually to $751 million by 2027. We note that depreciation expense has historically been significantly lower than actual annual investments in sustaining or business operations capital.
- Under IFF16 for electric operations, net income grows steadily over the period to 2022, from just $34 million in 2017 to $673 million in 2022. This provides support in reducing reliance on new debt to fund capital expenditures.

- Cash Flow from Operations tracks, but is slightly above, the sum of net income and of expenses for depreciation and amortization over the period.
- Given the limited cash flow available from net income and from depreciation and amortization, capital expenditures in the near term must largely be funded by debt. Thus, the annual change in debt during the years 2018 and 2019 is closely related to capital expenditures. The increase in debt highlights the major cash flow shortfall that Manitoba Hydro experiences during major capital projects. It also reflects that the costs of maintaining the existing Manitoba Hydro system have been $150 to $200 million more per year than what is being recognized through depreciation expense.
- Beyond 2022, net income falls again before recovering to $440 million in 2027. Over the same time period, projected capital expenditures are roughly equal to the cash flow available from depreciation and amortization expense. Because net income is retained rather than distributed as dividends, there is increasing growth in retained earnings in this period. Strong cash flow avoids the need to add new debt and, in many individual years, significant reductions in long-term debt balances occur.

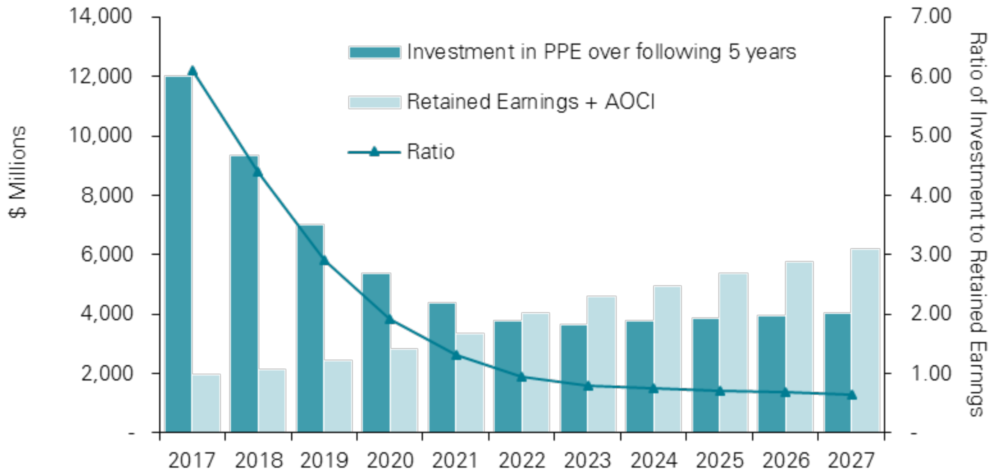
The following observations and conclusions are in order:

- Retained earnings are currently the only source of new equity for Manitoba Hydro, given that the Province has not made a practice of investing new equity into its operations.
- Because annual earnings are relatively modest in comparison to projected capital expenditures in the near term, the equity ratio declines slightly by 2019. As per IFF16, rate increases are assumed to be implemented, however, to avoid any significant reduction in the equity ratio below 15%.
- The increases in rates in the near term allow rate increases to fall to 2.0% annually beyond 2022. With moderate rate increases during this future period, the equity ratio recovers and reaches the minimum target of 25% by 2027.

Figure 2-6 provides an additional approach to examining Manitoba Hydro's financial position. This graph shows retained earnings (including AOCI) in each year as well as projected investments in PPE over the following 5 years.[1] The line shows the ratio between the two values. Higher ratios are indicative of higher capital cost risks, relative to the corporation's existing equity position, than lower ratios. Measured through this metric, capital cost risks are the highest in the first year of the outlook, in Fiscal 2016. The ratio falls rapidly over the period through 2022, as investments in Keeyask and Bipole III are completed. The ratio then continues to fall, although on a much more moderate trajectory.

[1] AOCI stands for Accumulated Other Comprehensive Income. It is a line item of the corporation's equity position.

Figure 2-6: Ratio of Projected Capital Investment to Retained Earnings



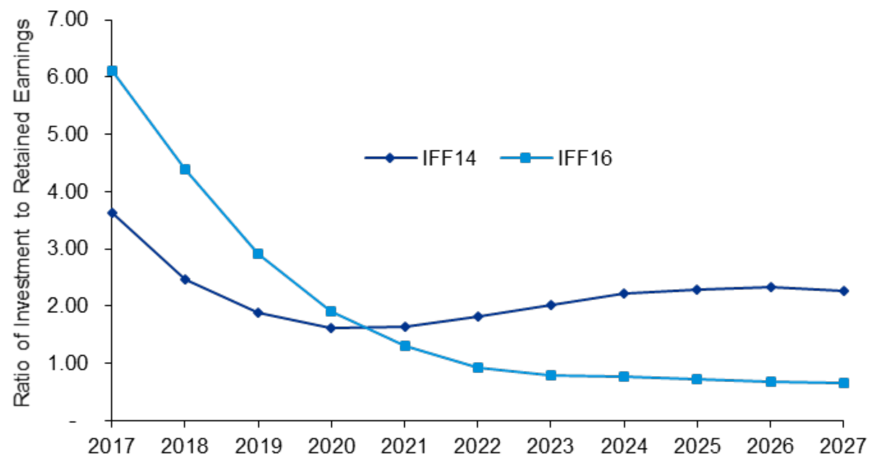
Source: IFF16 Projected Financial Statements for Electric Operations

Our observations with respect to Figure 2-6 are as follows:

- Relative to its equity base, Manitoba Hydro's risk with respect to capital costs is much higher in the next two or three years than it will be over the remaining projection horizon. There are large cash outflows in the near term without corresponding cash inflows until Keeyask is in-service.
- The decline in Manitoba Hydro's relative capital cost risk going forward is contingent on there being no new large capital projects after Keeyask. The introduction of Conawapa into the planned development sequence would result in a significant increase in capital cost risks in the future.
- As noted earlier in this Chapter, the projected equity position of the corporation is contingent on successive annual rate increases of 7.90% to 2022. Rate increases below this level would have a detrimental impact on relative capital cost risks.

Figure 2-7 below compares the ratio of near-term investment to retained earnings, as defined above for Figure 2-6, under IFF16 versus IFF14. The corporation's investment ratio improves more quickly, and more consistently, under IFF16 than under IFF14. This reflects the elimination of the extended period of negative net income that was observed under IFF14. However, the ratio starts from a higher starting point. Under IFF16, the ratio of near-term investment to retained earnings starts out at 6.1, relative to the value of only 3.6 projected for 2017 under IFF14. This indicates that relative investment risk is higher in 2017 than was forecast two years ago. This reflects, in part, delays in the construction of Keeyask, which has pushed some spending forward into the next few years. It is also a consequence of the combined $2.7 billion increase in capital budgets for Keeyask and Bipole III since IFF14.

Figure 2-7: Ratio of Projected Capital Investment to Retained Earnings



Source: IFF16 Projected Financial Statements for Electric Operations

Figure 2-8 shows trends in cash flow from operations and capital expenditures over the past 10 years. Manitoba Hydro's cash flow from operations has grown to $872 million in 2016/17 and has averaged approximately $665 million from 2008 to 2017. A cautionary note with respect to recent growth is the understanding that the total cash flow from operations for the past two fiscal years are significantly higher due to increased payable balances driven by major capital projects. Manitoba Hydro noted in its annual reports for the years ending March 31, 2016 and 2017 that the increase in cash provided from operations largely reflects significantly higher payable balances primarily related to the construction of the Keeyask generation and transmission facilities and of the Bipole III project.[2]

Total capital expenditures have ramped up rapidly since 2008. This has resulted in an increasing gap between the two metrics, which is reflected in an increase in Manitoba Hydro's borrowing needs.

As shown in Figure 2-9, under IFF16, with 7.90% rate increases for the first five years, the gap between cash flow from operations and capex during the next five years is substantial.

[2] See pages 25 and 31 of the 2016 and 2017 reports respectively.

3 Update of Developments and Issues Raised by Regulatory Bodies and Other Stakeholders in Canada

This Chapter updates the findings of the May 2015 Report with respect to regulatory developments at other utilities in Canada. The earlier findings were found in Chapter 4 of the May 2015 Report.

3.1 Structure of the Chapter

This Chapter reviews a number of recent developments at the following utilities:

- BC Hydro
- Hydro Quebec
- Nalcor
- NB Power.

Developments at these utilities are summarized, in turn, in the sections below.

3.2 BC Hydro

3.2.1 Overview

In the May 2015 Report, we noted that the BC government had put in place a 10-year plan in 2013 to improve the financial position of the utility while reducing rate increases that had been projected by the utility in an earlier rate application. With respect to the rate increases being proposed, the 10-year plan is still in effect and being followed.

On March 22, 2016, the British Columbia Utility Commission (BCUC) approved an interim rate increase of 4.0% effective April 1, 2016. The rate increase adheres to the rate trajectory laid out in the government's 2013 10-year plan. In approving the rate increase, BCUC noted that BC Hydro would actually need a rate increase of 9.7% to recover its forecast Fiscal 2017 revenue requirement during the rate year. The portion of the revenue requirement that will not be recovered as a result of the lower rate increase that was applied will be transferred to a regulatory deferral account for recovery in the future.

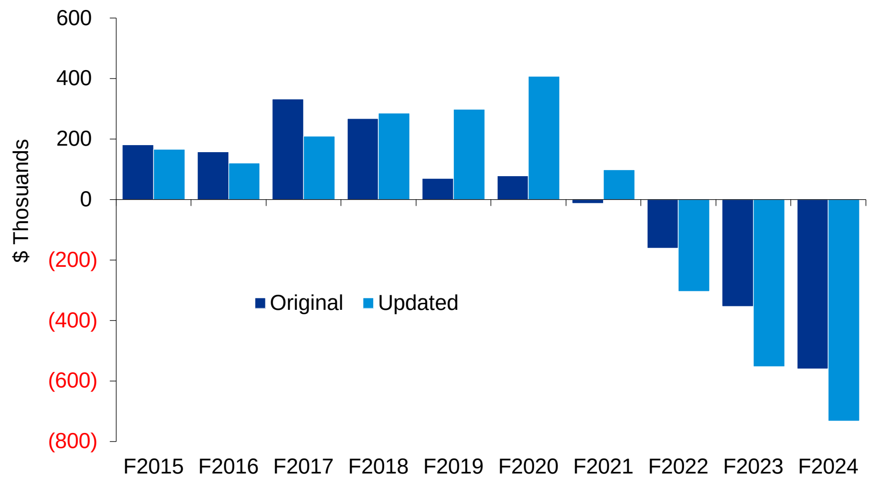
In its application for interim rates, dated February 2016, BC Hydro noted that there had been significant declines in the financial position of key commodity sectors in BC as well as delays in a decision to proceed with a Liquefied Natural Gas (LNG) project. These developments were expected to reduce load in the short term, putting additional upward pressure on rates. Accordingly, BC Hydro requested additional time to review its load and revenue forecast, in advance of submitting a full application that would seek approval of rates on a final basis.

BC Hydro submitted its full application on July 28th, 2016. It covers the 3-year period 2017 through 2019. This application maintains the request for a 3.5% effective rate increase for Fiscal 2017, consistent with the 10-year plan. While this application incorporates a lower load growth forecast in the short-term than earlier projections, BC Hydro is still projecting long-term growth across all three customer sectors (residential, light industrial/commercial, and large industrial).[3] Lower load growth in the short-term means that BC Hydro has had to take additional cost control measures to ensure that it can meet the

[3] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, July 28, 2016, p. 3-1.

targets set out in the 2013 10-year plan. [4] A particular concern is the need to recover all amounts that have been transferred to the regulatory deferral account for rate smoothing by 2024, thereby bringing balances down to zero by the end of that Fiscal Year. Deterioration in projected revenues relative to the original 10-year plan in the next few years mean that this regulatory deferral account will grow to a much larger amount than originally forecast. Figure 3-1 shows additions and withdrawals to the rate smoothing account in the original plan and as forecast in the rate application filed in 2016. Much greater withdraws from the rate smoothing deferral account will be required during the period Fiscal 2022 through 2024 than was originally forecast.

Figure 3-1: Additions / (Withdrawals) to Rate Smoothing Deferral Account



Source: derived from BC Hydro information.

Figure 3-2 shows cumulative balances in the rate smoothing account. Figure 3-2 shows that the cumulative balance grows to $1.59 billion, or almost 50% more than originally forecast. It should be noted that, although the rate smoothing account is projected to be brought down to zero by the end of Fiscal 2024, other regulatory accounts will remain in place. The balances in these other accounts are forecast to be at $3.609 billion at the end of Fiscal 2024, which is down slightly from the original forecast.

[4] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, July 28, 2016, p. 1-8.

Figure 3-2: Cumulative Balance - Rate Smoothing Deferral Account

3.3 Hydro Quebec

3.3.1 Overview

Hydro Quebec issued a Strategic Plan for the period 2016-2020 on June 8, 2016. The Strategic Plan centres on four major objectives:

- Laying the groundwork to double the utility's revenue over the next 15 years, thereby increasing profits.
- Being a benchmark in customer service.
- Contributing to Quebec's economic development and energy transition to a low-carbon economy.
- Keeping rate increases lower than or equal to inflation.

Specific financial objectives include the following:

- Generating revenue of $27 billion by 2030 (versus $13.75 billion in 2015).
- Reaching net income of $3.2 billion in 2020 and $5.2 billion in 2030.
- Increasing net income by $300 million through new exports.

Reaching these financial targets will require significant business expansion. With only its current base of operations, Hydro Quebec expects that it would achieve nominal net income of just $2.850 billion in 2020 (versus $3.147 billion in 2015) and $4.0 billion by 2030. Projected nominal income of $4.0 billion for 2030 is equivalent to about $3.0 billion in 2015 dollars. [5] Hence, continuation of only its current base of business would result in a relatively steady-state outlook in real dollar terms.

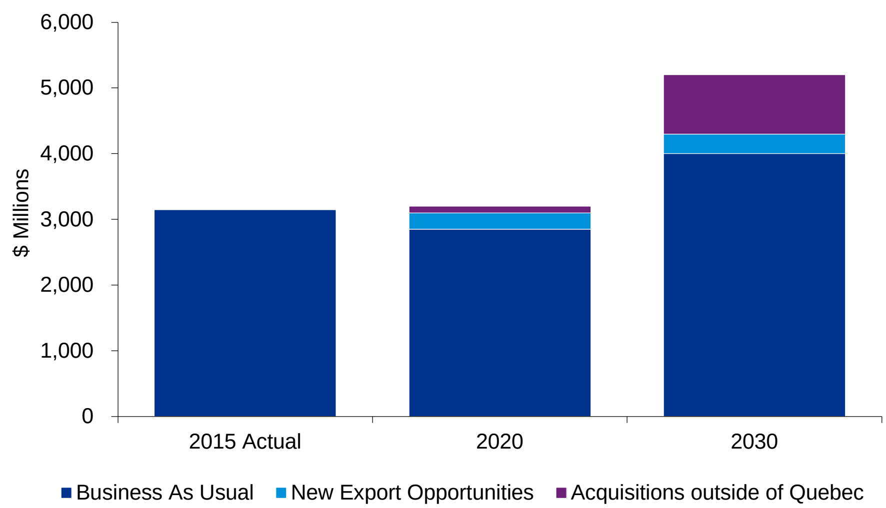
[5] Hydro Quebec, Strategic Plan 2016-2020, pp. 9-12.

To make up the difference between a 'business as usual' scenario and its long-term financial objectives, Hydro Quebec plans an increased focus on new export opportunities and on the acquisition of assets or business interests outside of Quebec. The bulk of growth will come from the acquisition of businesses and assets outside of the province of Quebec: of $1.2 billion in additional net income beyond a business as usual scenario, $900 million will come from out-of-province acquisitions.

The Strategic Plan does not specifically identify the size of investments that will be required to reach the targets for net income growth identified. Nor does it indicate if changes in dividend policy will be required to help fund this expansion through increased retention of utility earnings. Hydro Quebec has traditionally paid out 75% of its net income as dividends to the Province.

Figure 3-3 below shows the target composition of net income as outlined in the Strategic Plan.

Figure 3-3: Projected Sources of Net Income – Hydro Quebec



Source: derived from Hydro Quebec information.

In the Strategic Plan, the utility's forecast capital program over the period 2016 to 2020 is relatively stable, with annual spending of between $3.1 billion (in 2020) and $4.0 billion (in 2018). The capital program includes completion and commissioning of the last two units of the Romaine Dam complex:

- Romaine 3, with 395 MW, will come on-line in 2017, and
- Romaine 4, with 245 MW, will come on-line in 2020.

Over the 2016-2020 period, Hydro Quebec will also undertake preliminary studies to examine the feasibility of various other large-scale hydropower projects in the area of Plan Nord.[6] According to its Strategic Plan, Hydro Quebec will then be in a position to choose the next hydro-electric project, for implementation in the decade following.

[6] Plan Nord is the Province of Quebec's plan for development of Northern Quebec.

One observer has characterized the 2016-2020 years as a period of consolidation, rather than expansion, noting an increased focus on encouraging energy efficiency by customers, and on employee productivity and engagement.[7]

The Provincial government, in parallel, has introduced a new energy policy. This policy aims to make Quebec a North American leader in the fields of renewable energy and energy efficiency, thereby allowing Quebec to prosper in a low-carbon economy. Key elements of the plan:

- Enhancing energy efficiency by 15%.
- Reducing the consumption of petroleum products by 40%.
- Eliminating the use of thermal coal.
- Increasing overall renewable energy output by 25%.
- Increasing bioenergy production by 50%.[8]

Hydro Quebec Strategic Plan will support the broader provincial policy through:

- Support for the electrification of transportation, including through electric vehicle charging networks.
- Development and commercialization of innovative technologies, including battery materials and energy storage systems.
- Continued support to R&D.

3.3.2 Regulated transmission and distribution

As discussed in the May 2015 Report, only the business segments of transmission and distribution are regulated by the provincial utility regulator. The regulator approved a rate increase of 0.7% effective April 1, 2016 for residential customers and the majority of business customers, and also 0.7% for 2017. Industrial customers served under the large-power industrial rate will see no rate increase.[9] The capital structure assumed for the distributor remains unchanged, with a deemed debt/equity ratio of 65:35.

3.4 Nalcor

3.4.1 Overall Structure

On June 24, 2016, Nalcor Energy provided an update on its Muskrat Falls Project. This update indicated that there had been a material deterioration in the outlook for this project, with projected in-service costs escalating from $7.4 billion, as were forecast at project sanction in 2012, to $11.4 billion as projected at the time of the update. Excluding financing and other costs, projected construction costs alone have escalated from $6.2 billion as at project sanction to $9.1 billion currently. The completion date for the full project has also slipped from the second quarter of 2018 to the second quarter of 2020, a delay of about 2 years. These developments will put significant financial pressure on Nalcor and on the Province.

In parallel with the adverse developments noted above, the demand for power in Newfoundland has decreased as a result of the economic downturn and as a result of increased electricity costs. Annual energy deliveries on the island interconnected system are now not expected to reach levels initially forecast for 2020 until 2036.

[7] Erik Richer La Fleche, « Hydro-Quebec Strategic Plan 2016-2020 ». Blog entry posted on July 24, 2015. http://futureimperfect.ca/hydro-qubec-strategic-plan-2016-2020/

[8] Government of Quebec, "The 2030 Energy Policy: Energy in Quebec – A Source of Growth,

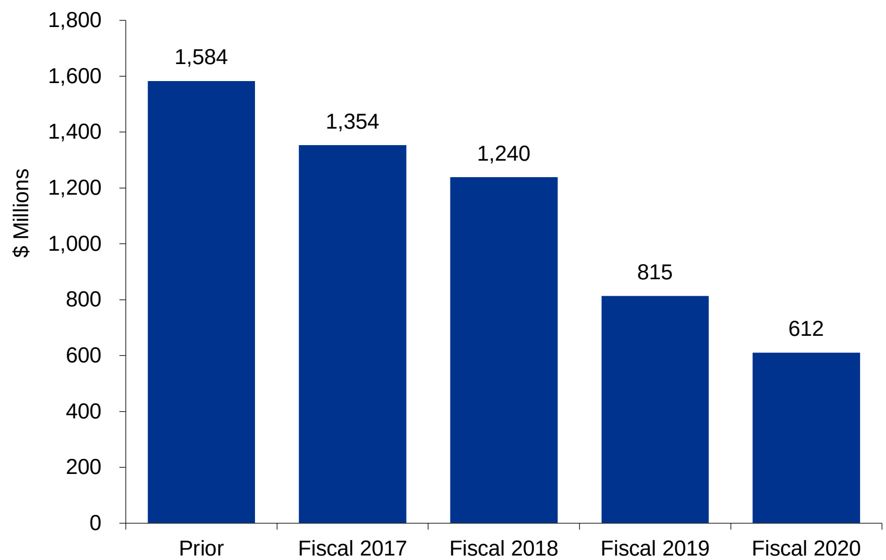
[9] Hydro Quebec press release: "2016-2071 Rate Application – An electricity rate increase below inflation", March 8, 2016.

As a result of the above developments, electricity rates for domestic customers are forecast to rise to 21.4 cents per kWh in 2021. This is about 6.3 cents per kWh more than the rates that were forecast when the Muskrat Falls project was initially approved. [10]

Although the economics of the project have deteriorated, Nalcor has indicated that it is no longer practical to cancel the project, given the amount of funds expended to date and contractual commitments for the delivery of power to Emera.

As a result of the cost overruns noted above, the Province will need to inject significant additional equity into Nalcor Energy. Total provincial equity requirements for the Muskrat Falls project are now $5.6 billion, with annual requirements summarized in Figure 3-4 below. [11]

Figure 3-4: Provincial Equity Requirements – Muskrat Falls Project



Source: derived from Nalcor information.

A DBRS rating report in November 2015 indicated that the Provincial equity commitment for the Lower Churchill Falls project was expected to be $3.2 billion, of which roughly 34% (or $1.09 billion) had already been extended. This forecast was based on then-estimated construction costs of $7.7 billion for the project.[12] As noted earlier, construction costs are now estimated at $9.1 billion, or $1.4 billion more.

Also as noted earlier, projected equity contributions are now estimated at $5.6 billion. Compared to the equity contributions noted in the November 2015 DBRS report (of $3.2 billion), equity contributions are thus now $2.4 billion higher. Increases in equity contributions reflect the increase in time to completion of the project as well as additional construction costs, both of which serve to increase project financing costs.

[10] Nalcor Energy press release: "Nalcor Energy provides update on Muskrat Falls Projects, June 24, 2016. The press release did not provide a definition of a domestic customer.

[11] Nalcor Presentation: "Muskrat Falls Project Update", June 24, 2016, p. 6.

[12] DBRS Rating Report, Province of Newfoundland and Labrador, November 19, 2015, p. 3.

In the May 2015 Report we noted that the Government had contributed $706 million in equity capital to Nalcor in 2013. This equity capital supported initial debt offerings to help fund the Muskrat Falls project. Given the figures presented above, this initial contribution will need to be followed by substantially greater contributions going forward. In the November 2015 report, DBRS had already noted that cost overruns during the construction phase could put pressure on Provincial credit metrics.

3.5 NB Power

3.5.1 Overview

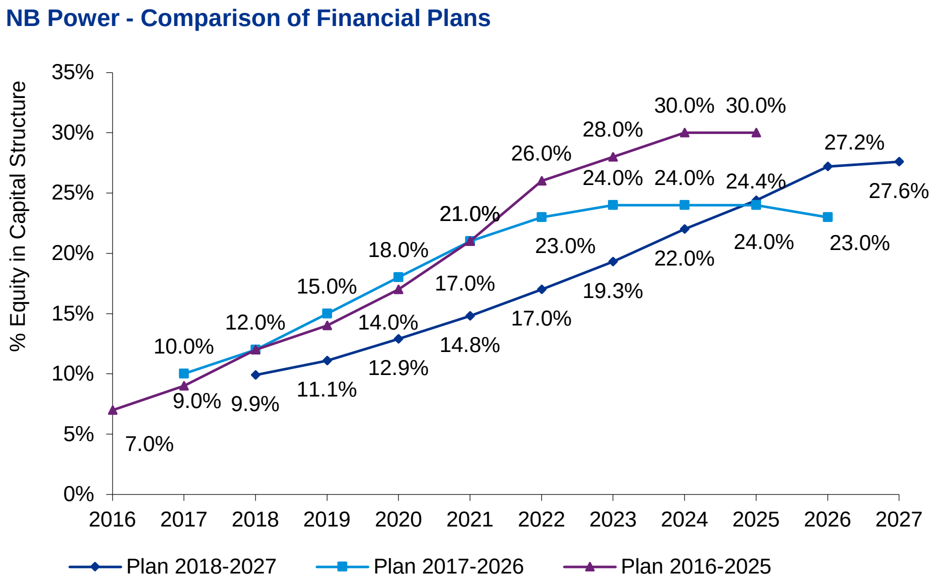
In the May 2015 Report, we noted that NB Power was operating under a long-term plan to significantly improve the utility's financial position. The key target of this plan is to achieve a capital structure with at least 20% equity. Under the plan, improvement of the utility's equity position was to be achieved through even annual rate increases of 2% over the period through 2022, with 1% rate increases thereafter. The approved rate for 2017 was 1.77%.

Since the May 2015 Report, NB Power has prepared two new 10-year plans in succession, covering Fiscal Years 2017 to 2026 and, subsequently, Fiscal Years 2018 to 2027. Under the latest plan, the achievement of at least a 20% equity position has been delayed to Fiscal 2024 from Fiscal 2021. The equity position continues to improve beyond that, to 27.6% by Fiscal 2027. However, this is still less than the 30% equity ratio projected for Fiscal 2024 and 2025 under the initial 2016-2025 plan.[13]

In both of the subsequent 10-year plans (2017-2026 and 2018-2027), rate increases of 2% extend only through to 2021, or one year earlier than under the 2016-2025 plan. Rate increases of 1% follow. The plan that was released for 2017-2026 roughly matched increases in equity shown to 2021 under the 2016-2025 plan but then showed a decline in equity growth thereafter. The most recent plan, for 2018-2027, shows strong increases in equity ratio throughout its planning horizon, although achievement of individual equity levels is considerably lagged. Overall, the deterioration in financial position relative to earlier plans appears largely related to decreases in load growth. Projected equity ratios under the various plans are shown in Figure 3-5 below.

[13] As a result of a typographical error, the May 2015 report stated at page 48 that NB Power would reach a 20% equity target by 2024 under its 10-Year Plan; the correct figure should have been 30%.

Figure 3-5: NB Power's Equity Ratio under Successive 10-Year Plans



Source: derived from NB Power information.

Over the medium to long-term, a key factor that bears on NB Power's financial position is projected spending for the Mactaquac project. Initially, NB Power expected to begin major spending on replacement or refurbishment of this dam in the early part of the next decade. NB Power has now concluded that it can extend the life of the existing facility beyond 2030 through a modified intensive maintenance program and replacement of aged equipment.[14] This has delayed the start of major expenditures to 2027 and should reduce overall total expenditures. Nevertheless, total spending of $2.7 billion for the Mactaquac project is forecast through to 2036. The delay noted above in the expenditure profile accounts for the fact that equity ratios continue to improve through 2027, rather than peaking a number of years earlier. (However, as noted earlier, improvements in the equity ratio are on a delayed trajectory.)

It is instructive to look at the rationale provided by NB Power for reaching a 20% equity target as outlined in its rate filings. In the 2016/17 General Rate Application filed December 28, 2015, NB Power noted the following:

> "The rationale for reaching the 20 per cent equity goal by fiscal year 2020/21 has not changed. First, NB Power recognizes that it requires an equity cushion as a risk management tool. The utility is subject to a variety of operational and financial risks, and an equity cushion will allow the utility to withstand negative contingencies without subjecting customers to sudden, unpredictable rate changes or the utility to financial losses."[15]

In the same application, NB Power went on to note:

> "The second justification for reaching the target of 20 per cent equity by 2021 relates to the timing of anticipated capital expenditures. NB Power needs to work towards reducing debt and improving its

[14] NB Power's 10-Year Plan, Fiscal Years 2018 to 2027. p. 18.

[15] New Brunswick Power Corporation, 2016/17 General Rate Application, December 28, 2015, p. 4.

capital structure due to the relatively low capital investments required in the next five years of the current 10-Year Plan. The current plan contemplates that the period of low capital investment will be followed by a number of years of very high investment, as the utility begins to incur costs associated with the decisions around Mactaquac. In order to prepare for that investment, and maintain stable rates as those costs are incurred, the 10-Year Plan continues to contemplate a series of smaller rate increases to build the necessary equity."[16]

While plans now call for a delay in reaching the 20% target, the underlying justification remains in place.

NB Power ultimately filed formal external evidence on an appropriate capital structure in GRA 2017/18. The evidence is in the form of a report by Elenchus Research Associates Inc.[17] The report does not provide much analysis or external data to support its conclusions but rather focuses on interpreting the government's intentions as laid out in the 2008 Electricity Act. Some highlights of this report are as follows:

- Planned rate increases should take into account the fact that events (e.g. low water-flows) could result in financial results being lower than forecast. Thus, the report notes: "Rates should be set to that there is steady progress toward the 20% target not only at the forecast level of net income but also if actual realized net income in the forecast year is at the lower end of the expected range."[18] This suggests that improvement in the equity position should occur even under adverse conditions.
- NB Power may require that the equity ratio be built up above the 20% minimum in advance of major capital programs. Thus, "projected rate projected rate increases should be high enough prior to the first year of the increased capital requirements so that the forecast equity ratio will not decline to less than 20% during the period when the high capital requirements cause the equity ratio to erode." [19]

While GRA 2017/18 included the external evidence as noted above, it did not then include any update to the 10-year financial plan provided with the GRA 2016/17. NB Power indicated that it would file a new 10-year plan only after its Board had made a decision on the option for replacement of Mactaquac. The 10-year plan for 2018-2027, summarized earlier in Figure 3-5, reflects the Board's subsequent decision to extend the service life of Mactaquac through intensive maintenance.

Based on the various sources of information summarized above, it can be observed that NB Power faces similar circumstances to Manitoba Hydro. Specifically:

- Cyclical patterns in the rate of investment in capital investment may require rate increases in advance of these investments to help bolster the utilities' financial positions.
- The shareholder does not contemplate making direct equity investments. Rather, equity is built up through retained earnings.

As part of its filing for GRA 2017/18, NB Power undertook a series of sensitivities that examined the impact of different rate trajectories over the 10-year plan, along with different scenarios for required capital spending. The different capital spending scenarios incorporated alternative estimates of the costs of Mactaquac refurbishment. As would be expected, these sensitivities showed that higher rate

[16] New Brunswick Power Corporation, 2016/17 General Rate Application, December 28, 2015, p. 5.

[17] Elenchus Research Associates Inc., "Consideration in Determining an Appropriate Long Term Capital Structure for New Brunswick Power", September 2016, filed as Appendix 06 of NB Power's 2017/18 General Rate Application, dated October 4th, 2016.

[18] Elenchus Research Associates Inc., p. 13.

[19] Elenchus Research Associates Inc., p. 14.

increases are required in individual years to maintain a target debt/equity ratio in the absence of strategies to smooth rate increases. Smoothing strategies include building up the equity ratio in advance of periods of high capital spending.[20]

In regard to these sensitivity analyses, NB Power noted in its rate filing:

> "It is NB Power's view that this analysis demonstrates the need for an overall two percent rate increase in the 2016/17 fiscal year, under any scenario in the sensitivity analysis. The need for the requested two per cent increase is enhanced if the Board ultimately approves a long-term capital structure which requires an equity component greater than 20 per cent." [21]

The request for sensitivities was prompted by a desire to see analysis of the impact of deferring achievement of the 20% equity target. The potential for deferral may have been prompted by observations that the equity ratio was projected to increase beyond 20% after the target was reached. In its 2015 Decision, the Board noted:

> "The 10-Year Plan projects that NB Power's equity ratio will increase from 21% in fiscal 2020-21 to 30% in 2024-25. Although this appears to provide NB Power with some degree of flexibility in its plans to improve its equity ratio, the Board did not receive any form of a sensitivity analysis to assess the impact of an extension scenario. A sensitivity analysis in future rate applications would provide the Board with a clear understanding of the impacts of deferring the achievement of the 20% equity goal beyond 2021."[22]

As highlighted in the above quote, the New Brunswick EUB specifically requested sensitivity analysis to better understand the potential impact of uncertainty and of different rate trajectories on achievement of the utility's financial targets. The desire for this type of scenario analysis also underlies Manitoba Hydro's decision to undertake uncertainty and sensitivity analysis with respect to future financial risks.

3.5.2 Costs of Carbon Taxes

In its most recent 10-year plan (for 2018-2027), NB Power has projected additional rate increases to incorporate the impact of federal and/or provincial actions to introduce carbon taxes. These increases will be over and above the 1% and 2% increases noted earlier to accommodate NB Power's own revenue requirement. As a utility that relies extensively on fossil-fueled generating facilities, NB Power will be significantly impacted by climate change initiatives and associated carbon taxes. In the current 10-year plan, total annual rate increases of 3.4% annually are now forecast beyond 2018. This incorporates 1.4% annual increases between 2019 and 2021, and 2.4% annual increases thereafter, to pay for carbon taxes or allowances. (These are added to base increases of 2.0% and 1.0% respectively for these same periods.) Thus, overall rate increases are projected to be much higher than in the initial 10-year plans.

3.6 Summary Observations

Each of the utilities summarized in this Chapter is facing developments that have or could put additional pressure on its financial position:

- BC Hydro has faced declines in demand relative to forecast, which has increased its need to rely on regulator deferral accounts to operate within the rate trajectory outlined in its 10-year plan.

[20] NB Power's 10 Year Plan: Fiscal Years 2017 to 2026, Appendix 2, prepared October 2015, pp. 1 - 4.

[21] New Brunswick Power Corporation, 2016/17 General Rate Application, December 28, 2015, pp. 5 - 6.

[22] New Brunswick Energy and Utilities Board, Reasons for Decision, Matter No. 272, October 28, 2015, p. 24.

- Hydro Quebec has ambitious targets for new business growth, which may require new equity investments to achieve the revenue targets as outlined.
- Nalcor has faced escalating capital costs on the Muskrat Falls project, resulting in the need for significant additional equity capital. The project will also put substantial upward pressure on electricity rates in Newfoundland and Labrador once these expenditures are put into the utility's Rate Base.
- NB Power has lowered its forecast of its equity ratio in the short- to medium-term, reflecting lower load growth and cost pressures. Delays in spending on Mactaquac refurbishment, however, have supported improvements in its projected equity ratio longer-term. NB Power is also forecasting significant additional rate increases as a result of the need to address federal and provincial climate change policies.

These various developments reinforce the need for utilities to have robust financial targets, to cushion against adverse developments in their financial outlook.

4 Comparison to Other Government-owned Power Utilities in Canada

This chapter summarizes the findings from benchmarking and review of the developments, targets and plans of government-owned power utilities in other jurisdictions. Financial data and information for government-owned power utilities are updated to the latest audited fiscal year, ending either December 31st, 2016 or March 31st, 2017. This reflects three additional years of financial data from the May 2015 Report in most cases.

4.1 Structure of the Chapter

This chapter is organized into the following sections:

- Section 4.2 provides an overview of government-owned power utilities in Canada, which have been selected as the peer benchmarking group, along with key operational metrics and comparisons on a per capita and per customer basis.
- Section 4.3 compares current debt/equity ratios and capital structures.
- Section 4.4 compares interest coverage ratios among the Canadian peer group.
- Section 4.5 looks at cash flow to capital expenditure comparisons among the Canadian peer group.
- Section 4.6 compares a number of other financial metrics among the Canadian peer group.
- Section 4.7 provides a comparison of recent electricity prices and analysis of trends in electricity prices in Canada over the next ten years based on various assumptions.
- Section 4.8 discusses financial targets and plans of other government-owned utilities in Canada.
- Section 4.9 outlines summary points of the benchmarking comparisons.

4.2 Overview of Government-owned Power Utilities in Canada

4.2.1 Overview of key operational metrics

Figure 4-1: Overview of Operating Information on Government-owned Power Utilities

Overview of Operating Information	Installed Capacity (MW)	Peak Demand (MW)	Total Electric System Deliveries (TWh)	% Hydro generation	Number of Electricity Customers
Manitoba Hydro	5,679	4,801	33.2	97%	573,438
BC Hydro	12,053	10,194	57.7	98%	1,988,167
Hydro Quebec	36,908	36,005	202.0	99%	4,244,541
Nalcor Energy	7,210	8,864	39.9	96%	> 38,000
Ontario Power Generation	16,177	n/a	78.2	40%	n/a
NB Power	3,513	3,000	16.7	25%	401,166

Source:
1. Manitoba Hydro Annual Report for the year ended March 31, 2017.
2. BC Hydro Annual Service Plan Report for the year ended March 31, 2017.
3. Hydro-Quebec Annual Report for the year ended December 31, 2016.
4. Nalcor Energy Annual Report for the year ended December 31, 2016. Note Churchill Falls represents installed capacity of 5,428 MW and its electricity is primarily exported to Hydro-Quebec. Number of customers is direct customers only, there are substantially more indirect customers through third party sales.
5. Ontario Power Generation Inc. Annual Report for the year ended December 31, 2016. All electricity generated is sold through Ontario's Independent Electricity System Operator.
6. NB Power Annual Report for the year ended March 31, 2017.

Government-owned power utilities with a significant reliance on hydroelectric generation are the most appropriate peer utilities in Canada for benchmarking the financial and operational position of Manitoba Hydro. These utilities are: BC Hydro, Hydro-Quebec, and Nalcor Energy (“Nalcor”).

In the analysis, NB Power and Ontario Power Generation (“OPG”) are also included, as both of these utilities have significant hydro assets and are Crown owned. NB Power is owned by the Province of New Brunswick and is the largest electric utility in Atlantic Canada. OPG is owned by the Province of Ontario, and operates a portfolio of hydroelectric, nuclear and other generating assets.

This group of six power utilities including Manitoba Hydro will represent the Canadian peer group for benchmarking and analysis in this Chapter.

To put into context the size of these power utilities in relation to their jurisdiction, the following is noted from comparisons in Figure 4-2:

- On a per capita basis, Manitoba Hydro has more installed generation capacity than BC Hydro, similar installed capacity as Hydro-Quebec and NB Power, and much higher capacity than OPG (although note that OPG is not the sole supplier in Ontario). It is lower only in comparison to Nalcor. (Figures for Nalcor, however, are distorted by the sale of power from Churchill Falls to Hydro-Quebec under long-term contract, which boosts its figures for capacity and sales per capita.)
- Manitoba Hydro's total power generation per capita is generally in line with per capita levels for Hydro-Quebec and NB Power, higher than BC Hydro, much higher than OPG, and much lower than Nalcor.
- Extra-provincial electricity sales represent 24% of total electricity sales, which is a very significant level and a higher share than for other power utilities. BC Hydro categorizes its extra-provincial activity as "trade" revenues and these represent approximately 11% of electricity revenues, a much smaller share than in the May 2015 Report (when the figure was 20%). Hydro-Quebec, the largest electricity exporter in Canada, also has a lower share with exports representing approximately 12% of its total sales.

Figure 4-2: Operational Metrics Per Capita and Value of Export Sales

Select Operational Metrics Per Capita	Provincial Population (2016)	Installed Capacity kW per capita	Electric System Deliveries thousands kWh per capita	Extraprovincial Electricity Sales ($ millions)	Extraprovincial / Trade Sales %electric sales
Manitoba Hydro	1,318,100	4.3	25.2	460	24%
BC Hydro	4,751,600	2.5	12.1	674	11%
Hydro-Quebec	8,326,100	4.4	24.3	1,626	12%
Nalcor	530,100	13.6	75.4	47	8%
Ontario Power Generation	13,983,000	1.2	5.6	n/a	n/a
NB Power	756,800	4.6	22.1	251	15%

Source:
1. Manitoba Hydro Annual Report for the year ended March 31, 2017.
2. BC Hydro Annual Service Plan Report for the year ended March 31, 2017. Extraprovincial exports reflects "trade" revenues.
3. Hydro-Quebec Annual Report for the year ended December 31, 2016.
4. Nalcor Annual Report for the year ended December 31, 2016. Extraprovincial sales from Churchill Falls and NLH's Energy Marketing.
5. Ontario Pow er Generation Inc. Annual Report for the year ended December 31, 2016.
6. NB Pow er Annual Report for the year ended March 31, 2017. Extraprovincial exports reflects "interconnection" revenues.
7. Populations from Statistics Canada as of July 1, 2016.

Figure 4-3 indicates the size of Manitoba Hydro, BC Hydro, Hydro-Quebec and NB Power in relation to the size of their domestic customer base. (Nalcor and OPG are not included in this figure as their customer bases are not comparable – Nalcor's customer base includes Hydro-Quebec and one major wholesale customer, Newfoundland Power Inc., and OPG is one of many suppliers to the broader Ontario market.) For the utilities that are included in Figure 4-3, note the following:

- As in the May 2015 Report, Manitoba Hydro has more installed capacity and electricity system deliveries per domestic customer than the other three electric utilities.
- Manitoba Hydro's domestic electricity revenues per customer is higher than BC Hydro, close to Hydro-Quebec and lower than NB Power.
- Manitoba Hydro has significantly more extra-provincial export revenues in relation to its domestic customer base than BC Hydro, Hydro-Quebec and NB Power.

Figure 4-3: Operational and Financial Information on a Per Customer Basis

Select Operational and Financial Information on a Per Customer Basis

	Electricity Customers	Installed Capacity kW per Customer	Electric System Deliveries thousands kWh per Customer	Electricity Revenues per Customer	Extraprovincial Electricity Sales per Customer
Manitoba Hydro	573,438	9.9	58.0	$3,360	$802
BC Hydro	1,988,167	6.1	29.0	$2,954	$339
Hydro-Quebec	4,244,541	8.7	47.6	$3,110	$383
NB Power	401,166	8.8	41.7	$4,038	$626

Source:
1. Manitoba Hydro Annual Report for the year ended March 31, 2017.
2. BC Hydro Annual Report for the year ended March 31, 2017.
3. Hydro-Quebec Annual Report for the year ended December 31, 2016.
4. NB Pow er Annual Report for the year ended March 31, 2017.

Figure 4-4 provides an overview of key financial metrics for the Canadian peer group for 2016/2017. (Appendix A provides, in addition, financial data for Manitoba Hydro and the other government-owned power utilities over the past seven fiscal years.)

Hydro-Quebec is considerably larger than the other utilities of the peer group, with annual revenues of over $13 billion, approximately 5.7 times that of Manitoba Hydro, and total assets of over $75 billion, approximately 3.4 times those of Manitoba Hydro. (The ratio of assets is down from the May 2015 Report, when it stood at 4.7, reflecting Manitoba Hydro relatively greater investments over the intervening period.) BC Hydro is the next largest. Manitoba Hydro is in the middle of the group, with revenues that are significantly larger than for NB Power and Nalcor. It should be noted, however, that Nalcor's revenues will grow with the completion of the Lower Churchill Project and Muskrat Falls.

Relative to utilities with fossil-fuel generation, the utilities based primarily on hydropower generally have significantly better operating margins and relatively higher EBITDA, EBIT and net income as a share of revenues. Hydro-Quebec's high levels of EBITDA, net income and cash flow relative to other utilities reflect its larger size and is partially due to the benefits of very low-cost electricity received under its long-term power contract with Churchill Falls in Newfoundland and Labrador.

Figure 4-4: Overview of Financial Information, Government-owned Power Utilities in Canada

Overview of Financial Information - Select Canadian Electric Power Utilities (CDN$ millions)					
($CDN millions)	Annual Revenues	EBITDA	EBIT	Depreciation & Amortization	Net Income

2. BC Hydro Annual Report for the year ended March 31, 2017.
3. Hydro-Quebec Annual Report for the year ended December 31, 2016.
4. Nalcor Annual Report for the year ended December 31, 2016.
5. Ontario Pow er Generation Inc. Annual Report for the year ended December 31, 2016.
6. NB Pow er Annual Report for the year ended March 31, 2017.

Note: Retained earnings and other equity includes share capital or contributed capital, accumulated other comprehensive income and non-controlling interest. Net debt includes long-term debt, short-term borrow ings and current portion of long-term debt less sinking funding investments and cash and cash equivalents.

4.3 Capital Structure – Equity Ratio Comparisons

Manitoba Hydro's equity ratio was 16% as at March 31, 2017. This ratio is based on Manitoba Hydro's formula, which uses net debt in its calculation and includes contributions in aid of construction ("CIAOC") as part of equity, thus providing a debt/equity ratio of 84/16.

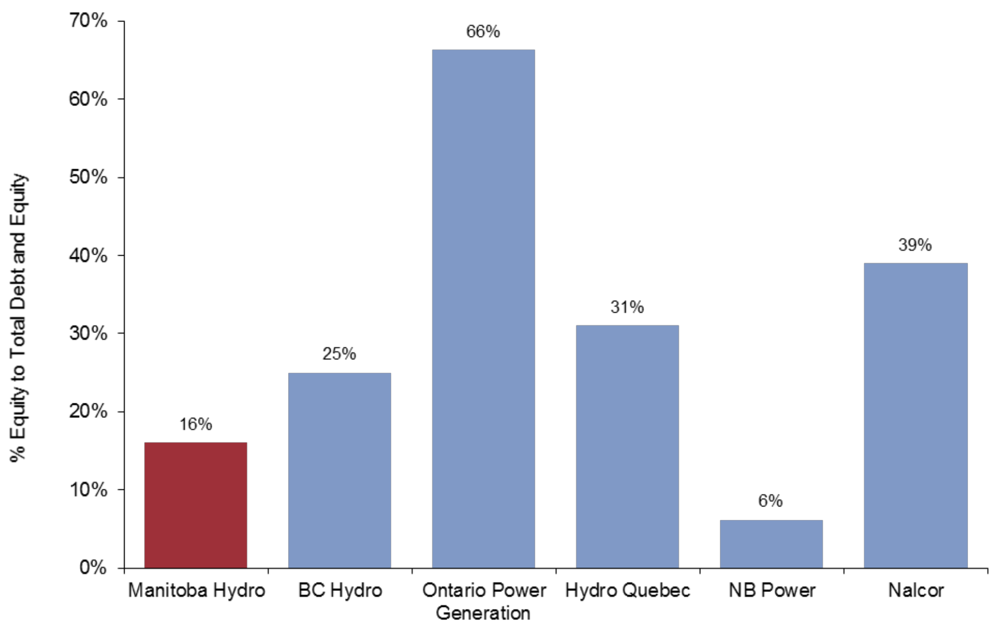
In comparing the equity ratios of government-owned electric power utilities in Canada, adjustments were made to reflect Manitoba Hydro's formula for calculating equity ratios. For example, BC Hydro's reported equity ratio has been 20% over the past five years. Making adjustments for Manitoba Hydro's definition of net debt and including CIAOC in equity, however, results in an equity ratio of 25%. Even with these adjustments, there are still some differences remaining in accounting and reporting frameworks among utilities. However, the adjustments that have been made enable better direct comparison.

Retained earnings represent the large majority of equity for most of the government-owned power utilities in Canada. Of the Canadian utilities in the benchmarking group, all include Accumulated Other

Comprehensive Income ("AOCI") as part of their equity. Like Manitoba Hydro, some utilities such as Hydro-Quebec, OPG and Nalcor have also included contributed capital as part of their equity. Manitoba Hydro also has a relatively small amount of non-controlling interest included in equity.

Investor-owned power utilities in Canada tend to have equity ratios of about 40%, but a more appropriate comparison for Manitoba Hydro is to government-owned utilities, particularly those with significant hydro-electric power. Manitoba Hydro's current equity ratio is at the lower end of those observed among government-owned power utilities. Only NB Power is lower, as NB Power has undergone considerable financial challenges and restructuring. Results are shown in Figure 4-5.

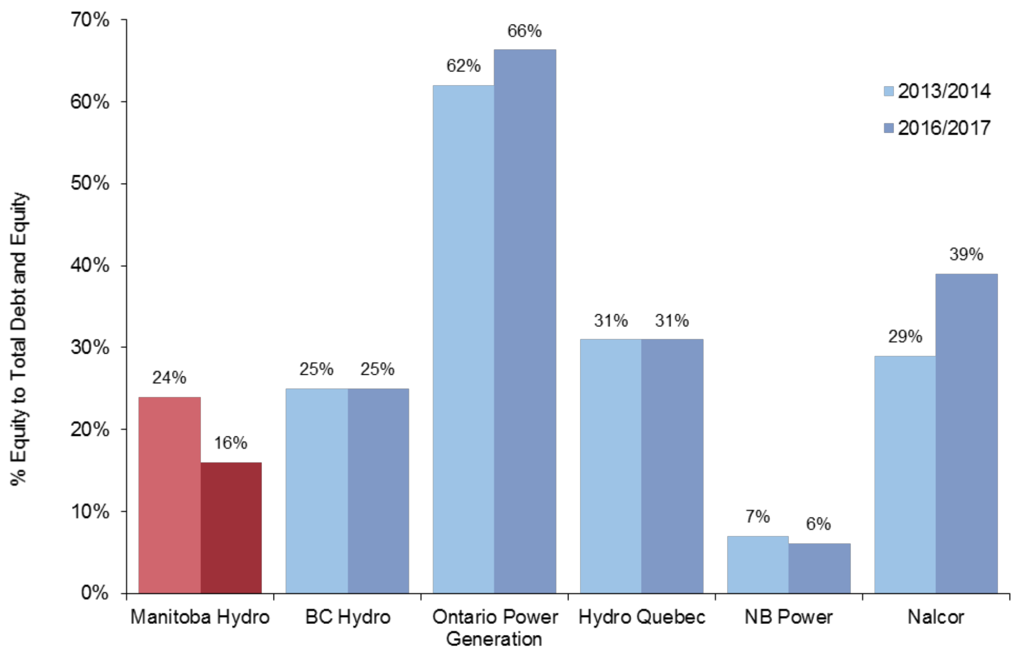
Figure 4-5: Comparison of Government-owned Power Utilities in Canada, Capital Structure – Equity Ratio, 2016/2017



Source: Derived from annual reports and financial statements for the year ended March 31, 2017 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 for OPG, Hydro Quebec and Nalcor.. Subject to adjustments due to some differences in accounting and reporting. For direct comparison to Manitoba Hydro, equity includes contributions in aid of construction ("CIAOC"), and net debt includes long-term debt, current portion of long-term debt and other current borrowings less sinking fund investment and cash and cash equivalents. Note BC Hydro reports equity to debt at 20:80, but with CIAOC, equity ratio is 25%.

Figure 4-6 compares current ratios (in 2016/17) with those presented in the May 2015 Report, representing 2013/14 data. Manitoba Hydro's equity ratio has declined markedly, from 24% in 2013/14 to 16% in 2016/17. NB Power's equity ratio also significantly declined during this period, while those of BC Hydro and Hydro Quebec were relatively unchanged. Nalcor's equity ratio increased from 29% to 39%; this was due to its shareholder's contribution of \$734.6 million in 2015 and another \$656.1 million in 2016 in relation to Nalcor's capital expenditures.

Figure 4-6: Comparison of Government-owned Power Utilities in Canada, Capital Structure – Equity Ratio, 2013/2014 and 2016/2017

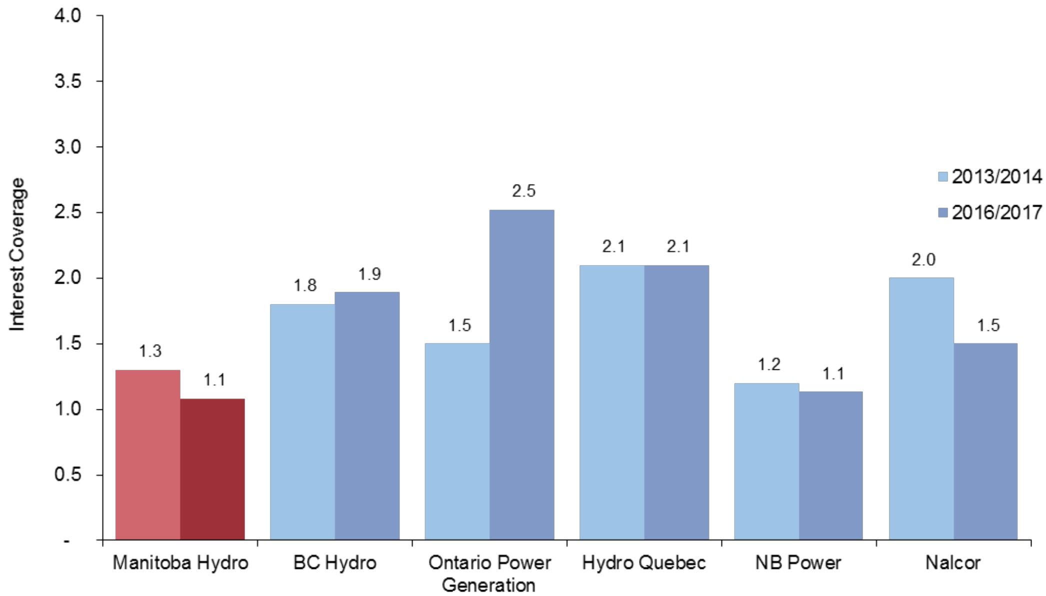


Source: Derived from annual reports and financial statements for the year ended March 31, 2017 and March 31, 2014 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 and December 31, 2013 for OPG, Hydro Quebec and Nalcor. Subject to adjustments due to some differences in accounting and reporting. For direct comparison to Manitoba Hydro, equity includes contributions in aid of construction ("CIAOC"), and net debt includes long-term debt, current portion of long-term debt and other current borrowings less sinking fund investment and cash and cash equivalents. Note BC Hydro reports equity to debt at 20:80, but with CIAOC, equity ratio is 25%.

4.4 Interest Coverage Comparisons

For the year ending March 31, 2017, Manitoba Hydro was below its historical interest coverage target of greater than 1.20. Figure 4-7 provides a comparison of interest coverage ratios among government-owned power utilities in Canada as of the latest fiscal year as well as from the previous report (2013/2014). Nalcor experienced a substantial decline in its interest rate coverage ratio from 2.0 in 2013 to 1.5 in 2016. The ratio at OPG significantly improved. The other government-owned power utilities had ratios that were relatively unchanged in 2016/2017 compared to three fiscal years earlier.

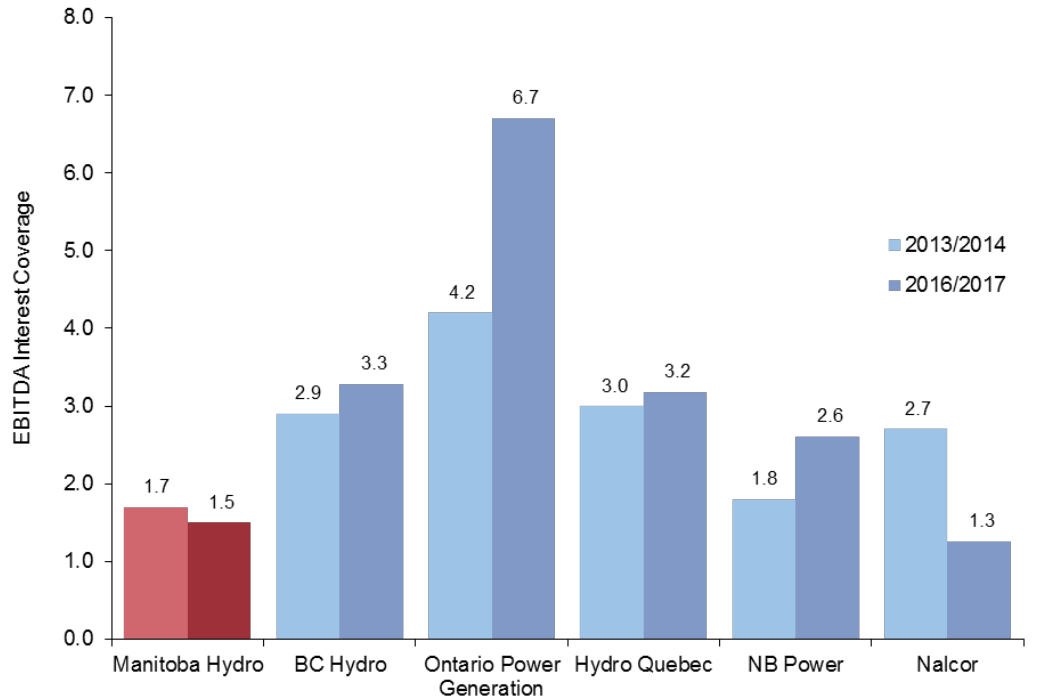
Figure 4-7: Comparison of Government-owned Power Utilities in Canada, Interest Coverage, 2013/2014 and 2016/2017



Source: Derived from annual reports and financial statements for the year ended March 31, 2017 and March 31, 2014 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 and December 31, 2013 for OPG, Hydro Quebec and Nalcor. Subject to adjustments due to some differences in accounting and reporting. Interest coverage reflects total interest paid on debt and net income divided by total interest paid on debt.

Figure 4-8 provides a comparison of EBITDA interest coverage ratios among government-owned power utilities in Canada. Manitoba Hydro's EBITDA interest coverage was down (to 1.54) from the previous report. Most of the other government-owned power utilities experienced improvements in the EBITDA interest coverage ratios in 2016/2017 compared to the three years earlier in the previous report. The notable exception was Nalcor, which experienced a substantial deterioration in its EBITDA interest rate coverage from 2.7 in 2013 down to 1.3 in 2016.

Figure 4-8: Comparison of Government-owned Power Utilities in Canada, EBITDA Interest Coverage, 2013/2014 and 2016/2017



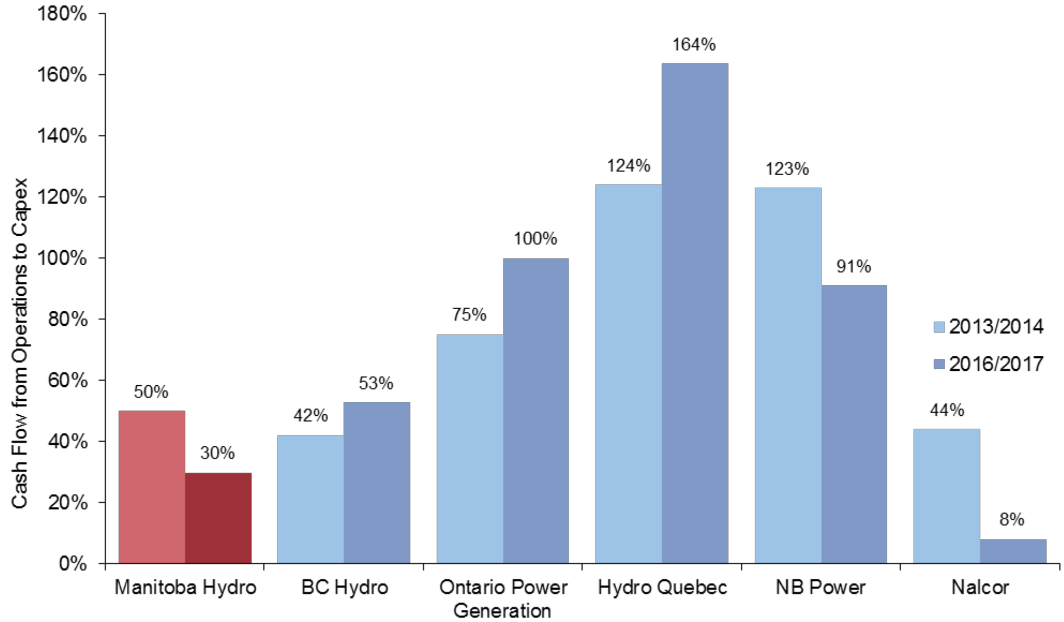
Source: Derived from annual reports and financial statements for the year ended March 31, 2017 and March 31, 2014 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 and December 31, 2013 for OPG, Hydro Quebec and Nalcor. Subject to adjustments due to some differences in accounting and reporting. EBITDA (earnings before interest, taxes and depreciation and amortization) does not include capitalized interest. Property and capital taxes are operating expenses and are not added back to EBITDA calculations; only income taxes, if any, are part of the EBITDA calculations.

4.5 Capital Coverage or Cash Flow to Capex Comparisons

For Manitoba Hydro, the ratio of cash flow from operations to total capital expenditures dropped from 50% in 2013/14 to 30% in 2016/17. As shown in Figure 4-9, the 30% ratio was higher than at Nalcor, which is also in the process of completing major hydroelectric capital projects; Nalcor's cash flow position as measured through the capital coverage ratio substantially deteriorated between 2013 and 2016. In contrast to the other utilities, OPG and Hydro-Quebec had cash flows above their current capital expenditures in the latest available fiscal year.

Note that the ratio of cash flow to capex is subject to wide variation from year-to-year depending on the timing of major capital projects.

Figure 4-9: Comparison of Government-owned Power Utilities in Canada, Cash Flow from Operations to Capex, 2013/2014 and 2016/2017



Source: Derived from annual reports and financial statements for the year ended March 31, 2017 and March 31, 2014 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 and December 31, 2013 for OPG, Hydro Quebec and Nalcor. Subject to adjustments due to some differences in accounting and reporting.

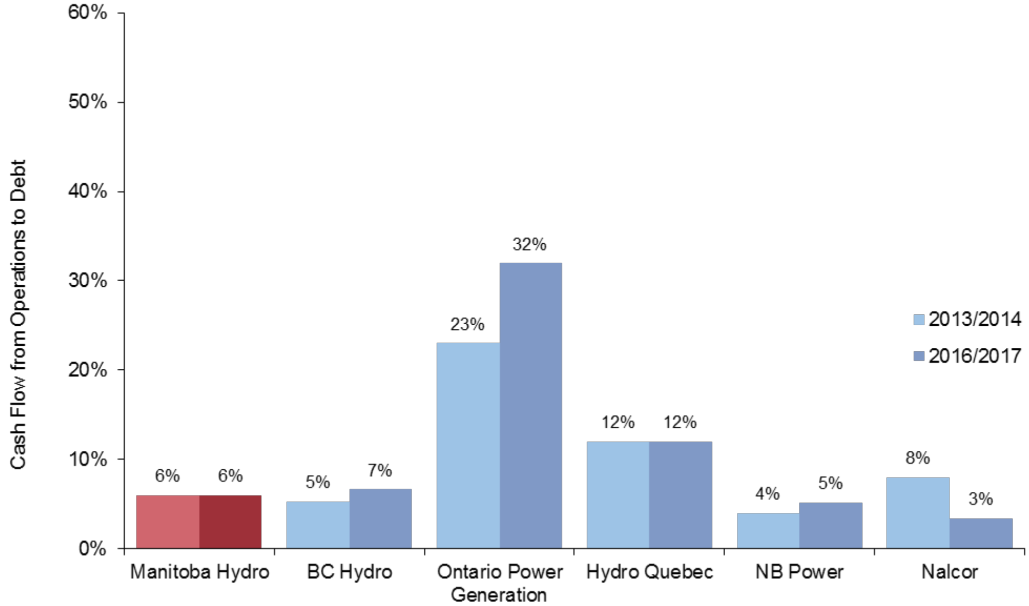
4.6 Other Financial Metrics Comparisons

The ratio of cash flow from operations to debt is one of the key measures monitored by credit rating agencies. Note that the figures for cash flow from operations shown in this section are as reported in audited cash flow statements; they have has not been adjusted for capitalized interest, which may be reported differently among utilities.

As noted earlier, Manitoba Hydro's increase in cash flow from operations grew significantly in 2016/17, reflecting significant growth in the balance of accounts payables primarily related to the construction of major capital projects. The understanding is that payables related to major capital projects will eventually reverse, which likely means that cash flow from operations for the reference year is overstated. Similarly, there may be other particular situations at other utilities that impact cash flow from operations in the reference year.

Figure 4-10 compares cash flow from operations to net debt. The ratio for Manitoba Hydro was approximately 6% as of March 31, 2017, higher than at Nalcor and NB Power, but considerably lower than Hydro-Quebec and OPG.

Figure 4-10: Comparison of Government-owned Power Utilities in Canada, Cash Flow from Operations to Net Debt, 2013/2014 and 2016/2017



Source: Derived from annual reports and financial statements for the year ended March 31, 2017 and March 31, 2014 for Manitoba Hydro, BC Hydro and NB Power, and for the year ended December 31, 2016 and December 31, 2013 for OPG, Hydro Quebec and Nalcor. Subject to adjustments due to some differences in accounting and reporting.

Figure 4-11 compares the ratio of EBITDA to total assets with significant growth in assets during a period of major construction. With significant growth in assets during this period of major construction, Manitoba's ratio of EBITDA to assets decreased from 7% in 2013/14 to 5% in 2016/17, with Nalcor lowest at 2% and Hydro Quebec highest at 11%.

Manitoba Hydro has consistently generated relatively strong EBITDA and net operating margins, reflecting its position as a power utility that is dominantly based on hydropower. Figure 4-12 compares EBITDA to total revenue. In 2016/17, Manitoba Hydro's EBITDA was approximately 47% of total revenues, among the highest ratios found among large power utilities in Canada. Of the group of government-owned power utilities, only Hydro Quebec had a higher level, at 60% EBITDA to total revenue.

Figure 4-13 compares net debt as a share of total assets. Manitoba Hydro is the highest in net debt to assets (at 71%) with NB Power second at 70%. Since the May 2015 Report, Manitoba Hydro and BC Hydro have had similar increases in this ratio. Nalcor experienced a significant decline in net debt to assets in the past three years related to significant shareholder contributions in 2015 and 2016.

Figure 4-14 compares net debt to EBITDA which varies considerably, from 2.7 for OPG to 18.8 for Nalcor. Manitoba Hydro's ratio increased from 9.8 in 2013/14 to 14.3 in 2016/17.

Subject to adjustments due to some differences in accounting and reporting.

4.7 Electricity Price Comparison

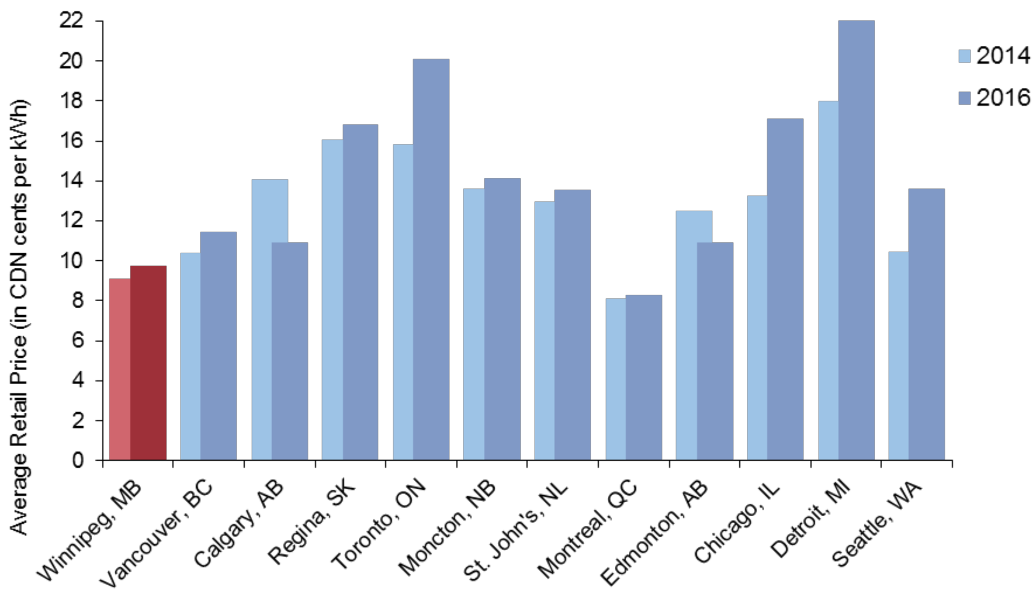
4.7.1 Manitoba Hydro's current competitive position

In this section, we have updated the comparison of retail electricity rates in Manitoba with those in a number of other North American jurisdictions. We present figures for 2016 as well as 2014, with figures for 2014 taken from the May 2015 Report. All figures are based on data from Hydro-Quebec's annual electricity price survey and are as at April 1 of the relevant year.

The analysis of electricity rates across jurisdictions can provide an indication of Manitoba's competitiveness with respect to energy costs. Manitoba Hydro has relatively low electricity rates, providing Manitoba Hydro with greater ability to raise rates in the future without causing undue adverse impact on Manitoba's attractiveness as a location for new business investment. Rate increases are necessary to ameliorate Manitoba Hydro's deteriorating equity position.

Figures 4-15, 4-16 and 4-17 below compare rates for residential, medium and large users. Figures for residential use assume monthly electricity consumption of 1,000 kWh, while those for medium and large assume monthly consumption of 400,000 and 30.5 million kWh respectively.

Figure 4-15: Comparison of Average Prices of Electricity, Residential, 2014 and 2016



Source: Hydro-Quebec. Comparison of Electricity Prices in Major North American Cities, Rates in effect April 1, 2016 and April 1, 2014 (including taxes). Residential assumption - power consumption 1,000 kWh. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills.

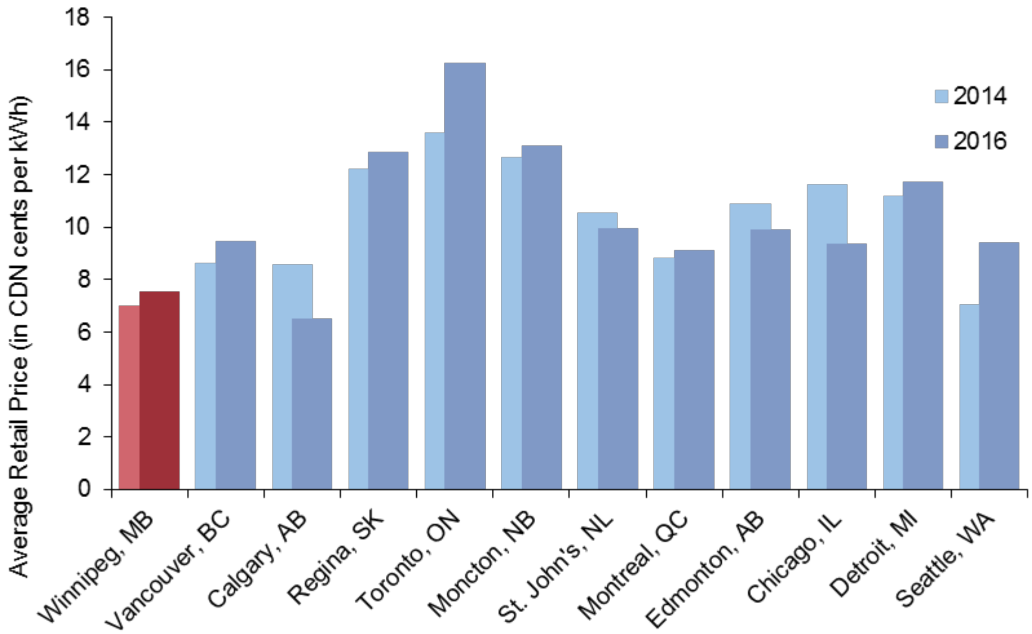
Based on Figure 4-15 we note the following:

- Manitoba currently has the second lowest electricity prices in the country for residential consumers (next to Quebec). The average price for residential customers in Winnipeg (including taxes) was 9.75 cents per kWh compared to an average of 14.1 cents per kWh among 12 Canadian cities in the survey. Manitoba prices are thus approximately 30% lower than the 12-city average.
- Residential rates in Manitoba increased somewhat between 2014 and 2016, as in many other jurisdictions, while rates in Toronto showed much larger increases (both in percentage and absolute terms). Rates in Calgary and Edmonton actually fell, reflecting lower electricity market prices in 2016. These were likely as a result of both low natural gas prices (which affect generation dispatch

costs) and a downturn in electricity market demand in the province. Both factors contributed to a decrease in prices in the competitive electricity market.

- Rates shown for US cities also increased sharply, although this may be largely attributable to changes in Canada / US exchange rates over the period.

Figure 4-16: Comparison of Average Prices of Electricity, Medium Power, 2014 and 2016

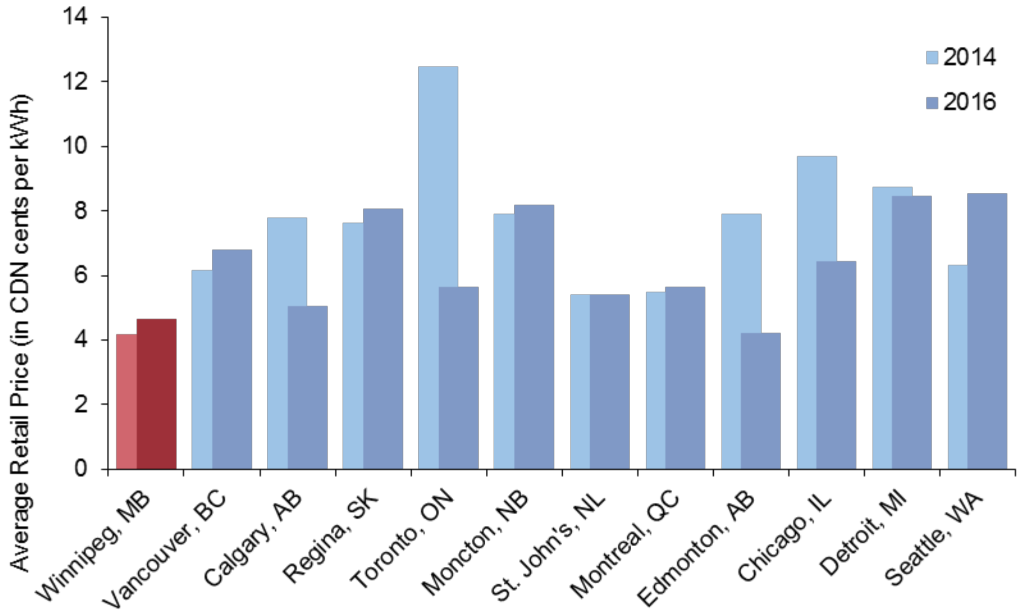


Source: Hydro-Quebec. Comparison of Electricity Prices in Major North American Cities, Rates in effect April 1, 2016 and April 1, 2014 (including taxes). Medium Power assumption - power demand 1,000 kW, power consumption 400,000 kWh, load factor 56%. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills.

Based on Figure 4-16 we note the following:

- Manitoba has the second lowest electricity prices for medium power consumers. The average price for "medium power" in Winnipeg (including taxes) was 7.5 cents per kWh compared to an average of 11.7 cents per kWh among 12 Canadian cities in the survey.
- As found in the residential rate comparison, retail prices for Toronto increased sharply, resulting in Toronto remaining the highest cost jurisdiction among those shown on the chart (and tied with Charlottetown, PEI, at 16.27 cents per kWh).
- Calgary had the lowest prices for 2016, representing a change in its relative position vis-à-vis 2014. Prices declined in both Calgary and Edmonton relative to 2014. This was driven by significant declines in the Alberta economy. Alberta is subject to relatively wide fluctuations in electricity prices.
- Rates for US jurisdictions showed both increases and decreases, showing that exchange rates were not the only factor affecting costs for medium power users in the US jurisdictions that were included.

Figure 4-17: Comparison of Average Prices of Electricity, Large Power, 2014 and 2016



Source: Hydro-Quebec. Comparison of Electricity Prices in Major North American Cities, Rates in effect April 1, 2016 and April 1, 2014 (including taxes). Large Power assumption - power demand 50,000 kW, power consumption 30,600,000 kWh, load factor 85%. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills.

Based on Figure 4-17 we note the following:

- Manitoba has the second lowest electricity prices for large power consumers. The average price for "large power" customers in Winnipeg (including taxes) was 4.7 cents per kWh compared to the 12-city average of 6.7 cents per kWh.
- Consistent with patterns observed for residential medium consumers, rates for large power users in Calgary and Edmonton fell between 2014 and 2016. Hydro Quebec reports that Edmonton is now the lowest cost jurisdiction for this class of users.
- Interestingly, the price shown for large power consumers in Ontario also fell sharply, in contrast to patterns observed for residential and medium power users (whose rates showed large increases). This fall may be attributable to the ability of large power users to avoid certain electricity costs in Ontario if they can reduce usage during system demand peaks.[23]

Overall, analysis of current price levels suggests that Manitoba remains a very low cost jurisdiction with respect to electricity rates. Accordingly, it should have relatively more ability to increase rates without jeopardizing the province's competitive position.

[23] Users classified as Class A can avoid costs associated with the "Global Adjustment" by reducing usage during the 5 hours of peak usage in the province in a year. Actual effective electricity costs can vary markedly based on usage profiles.

4.7.2 Manitoba Hydro's projected future competitive position

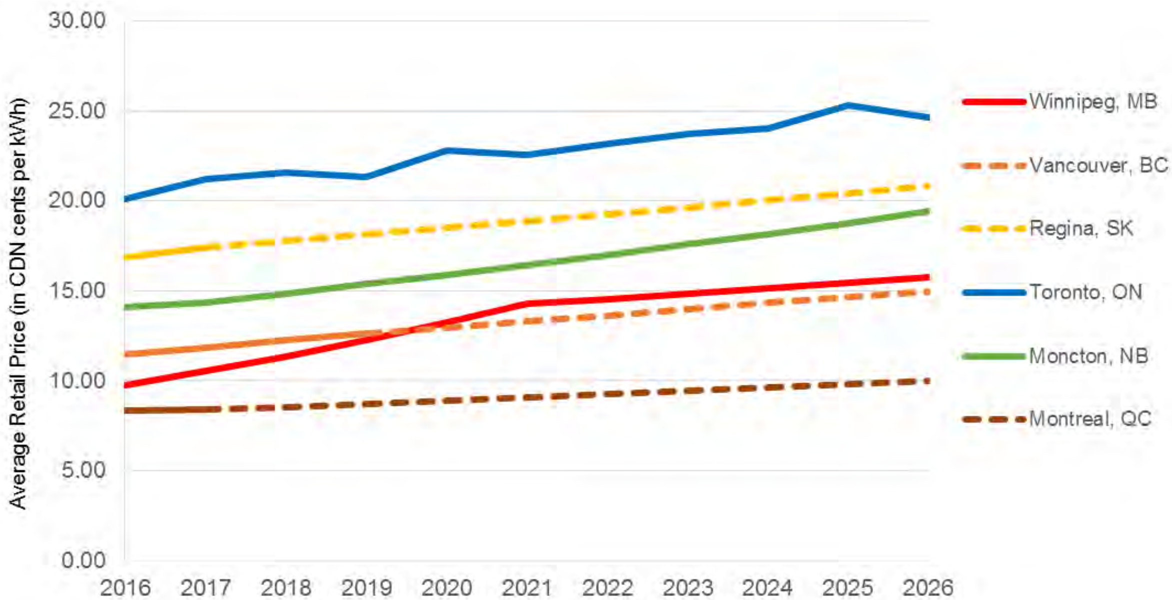
Figures 4-18, 4-19 and 4-20 indicate scenario forecasts of electricity prices over the next 10 years. These scenarios are based on public plans where available. The basis of these electricity price projections and assumptions is as follows:

- Manitoba electricity prices are based on proposed rate increases under Manitoba Hydro's IFF16.
- For BC Hydro, rate increases are based on the Province of British Columbia's 10 Year Plan, within which rate increases are prescribed for the next three years (applications for an increase of 4.0% in fiscal 2017, 3.5% in fiscal 2018 and 3.0% in fiscal 2019), and a target of 2.6% is identified for the next five years thereafter.
- For NB Power, rate increases are based on NB Power's 10 Year Plan, which outlines rate increases for the next ten years.
- For Ontario, rate increases are based on the projected increase in the unit cost of electricity as forecast by the Independent Electricity System Operator ("IESO"). Percentage increases are based on Outlook B contained in the IESO's Ontario Planning Outlook, dated September 1, 2016. As these figures reflect total system costs divided by total deliveries, they are not differentiated by customer class.
- Hydro-Quebec's rate increase is for 2016 and 2017 and SaskPower, rate increases are outlined for the next two years.
- For Nalcor, St. John's is excluded because the Muskrat Falls project is projected to lead to significant rate increases in the near and medium-term, however, there is no information at this time on projected rate increases.
- Where rate plans are not known, an assumption of 2% annually is applied.

Key findings from the review of Figures 4-18 through 4-20 are as follows:

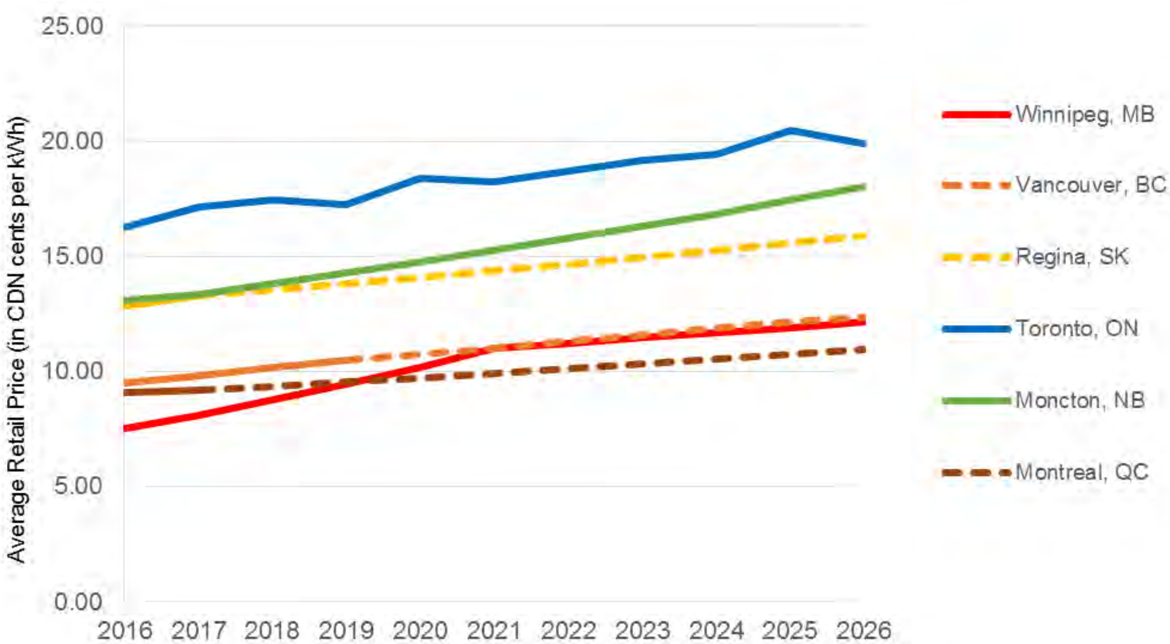
- Under 7.9% annual rate increases over the next five years, and 2.0% annual rate increases in the subsequent five years, these scenario graphs show Manitoba Hydro maintains its position as among the lowest electricity prices in Canada.

Figure 4-18: Comparison of Average Prices of Electricity in Canada, Scenario Projection 2016-2026, Residential



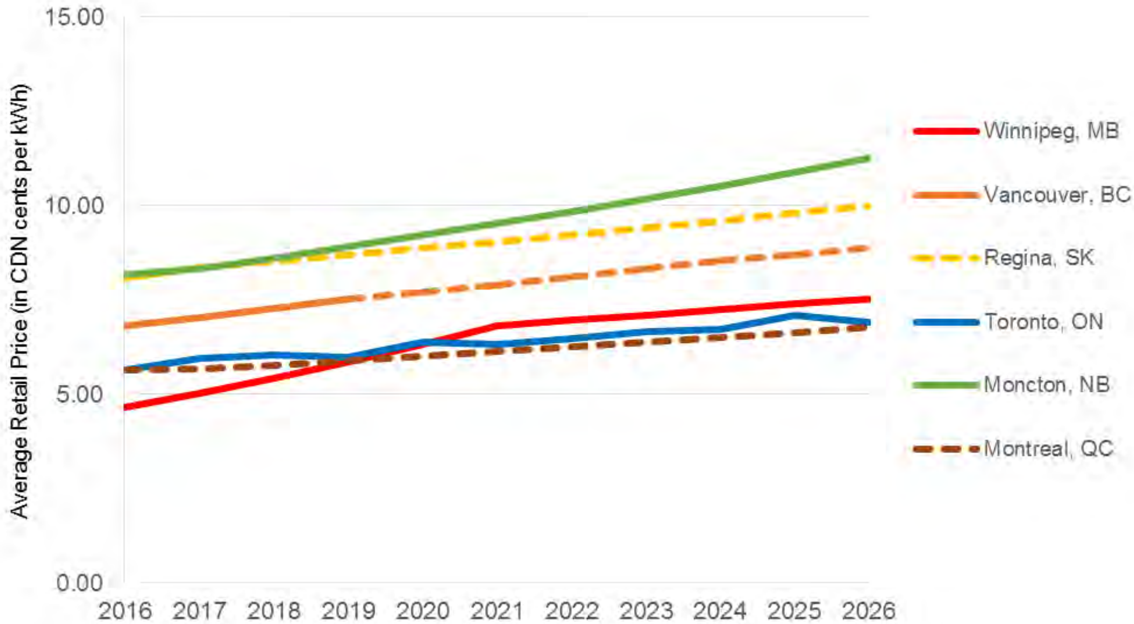
Source: 2016 base data from Hydro-Quebec Comparison of Electricity Prices in Major North American Cities, rates in effect April 1, 2016. Residential assumption - power consumption 1,000 kWh. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills. For jurisdictions, projected rate increases reflect projected plans and/or approved rates where available (see text for assumptions used). For all utilities and years where there is not a published plan, annual increases of 2% are used.

Figure 4-19: Comparison of Average Prices of Electricity in Canada, Scenario Projection, 2016-2026, Medium Power



Source: 2016 base data from Hydro-Quebec Comparison of Electricity Prices in Major North American Cities, rates in effect April 1, 2016. Medium Power assumption - power demand 1,000 kW, power consumption 400,000 kWh, load factor 56%. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills. For jurisdictions, projected rate increases reflect projected plans and/or approved rates where available (see text for assumptions used). For all utilities and years where there is not a published plan, annual increases of 2% are used.

Figure 4-20: Comparison of Average Prices of Electricity in Canada, Scenario Projection, 2016-2026, Large Power Users



Source: 2016 base data from Hydro-Quebec Comparison of Electricity Prices in Major North American Cities, rates in effect April 1, 2016. Large Power assumption - power demand 50,000 kW, power consumption 30,600,000 kWh, load factor 85%. Hydro-Quebec study notes that these bills have been estimated by Hydro-Quebec and may differ from actual bills. For jurisdictions, projected rate increases reflect projected plans and/or approved rates where available (see text for assumptions used). For all utilities and years where there is not a published plan, annual increases of 2% are used.

4.8 Financial Targets/Plans of Government-owned Power Utilities in Canada

Most of the government-owned power utilities in Canada include, as two of their primary financial metrics, one measure of capitalization (a debt to capital or debt/equity ratio) and one measure of interest coverage. Other metrics may be monitored in addition. Figure 4-21 indicates the financial targets/metrics highlighted in annual reports of select government-owned power utilities.

Figure 4-21: Key Financial Metrics or Targets of Government-owned Power Utilities in Canada

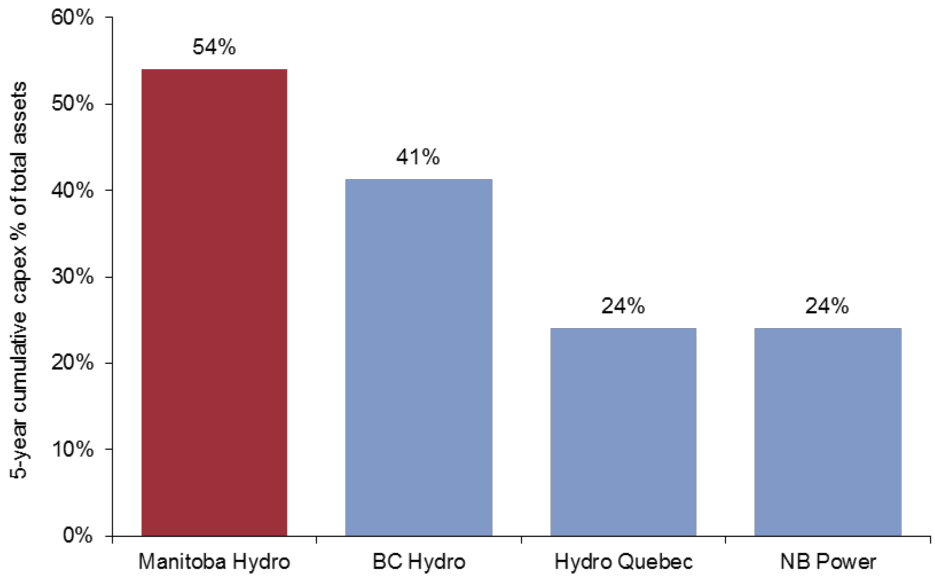
Key Financial Metrics or Targets of Government-Owned Power Utilities in Canada					
	Manitoba Hydro	**BC Hydro**	**Hydro-Quebec**	**Nalcor**	**NB Power**
Debt / Equity	• Long-term target of **75:25**, had been near target range from 2008 to 2014 • Forecast to deteriorate over the next decade due to major expansion	• Long-term target recently increased under new 10 Year Plan from **80:20** to **65:35** in 10 years • Target of 60:40 in the long-term	• Minimum requirement of **75:25**, practically has been steady in the range of **70:30** for several years • Expected to continue in the near term	• Minimum target of **70:30** for Nalcor and regulated hydro operations of NLH • Large increase in 2013 due to debt and equity for Lower Churchill Falls project	• Long-term target of **70:30** under new 10 Year Plan
Debt / Equity (as reported in latest annual report)	**84:16** (2016/17)	**80:20** (2016/17)	**69:31** (2016)	**61:39** (2016)	**96:04** (2016/17)
Interest Coverage	**> 1.8** EBITDA	target not stated	target not stated	**> 1.5** EBIT	target not stated
EBITDA interest coverage (as reported in latest annual report)	**1.54** (2016/17) • Has been significantly below target in recent years	**3.3** (2016/17) • Has averaged near 3x in recent years	**3.2** (2016) • Has averaged over 3x in recent years	**1.3** (2016) • Had averaged over 2x in recent years, but declined sharply in 2015 and 2016	**2.6** (2016/17) • Wide variance in recent years
Other financial metrics (highlighted in Annual Reports or Plans)	• Capital coverage of >1.2. **1.48** (2016/17) • Reflects cash flow to cover sustaining capital expenditures (excluding major generation and transmission expansion projects). Measure is challenged by the high amount of capitalized interest during high construction periods, and exclusion of certain capital, deferred and mitigation measures.	• Maintain rates in the first quartile. • Project Budget to Actual Cost within +5% to -5% of budget for five-year rolling data of generation, substation and transmission data.	• Return on equity from continuing operations 13.1% (2016), has ranged from 13-16% in recent years. • Profit margin from continuing operations 21.4% (2016), has ranged from 20-25% in recent years. • Self-financing, defined as cash flow from operations less dividends paid, divided by cash flows from investing activities, 58.8% (2016).	• Fixed rate debt as % of total debt, 91% (2016). • Return on capital employed (7.9% in 2016).	• Sets annual targets for net earnings, operating, management and administration costs, and net debt.

Source: Derived from annual reports, Manitoba Hydro, BC Hydro and N.B. Power for the year-ending March 31, 2017, Hydro-Quebec and Nalcor for the year-ending December 31, 2016. Also from latest published plans for various utilities.

Over the past decade, Manitoba Hydro's equity ratio climbed from 15% to be slightly over its long-term target of 25% in 2008 and 2010-2013. As Manitoba Hydro ramps up major generation and transmission projects, its equity ratio has significantly deteriorated and is forecast to deteriorate further. It will then recover after these new assets are in-service, and approach its long-term equity target. As of March 31, 2017, the equity ratio declined to 16%.

On a relative basis to assets, Manitoba Hydro's capital expansion program is larger than other government-owned power utilities in Canada. Projected capital expenditures over the next five year period are approximately 54% of the current asset base. Although this share is significantly lower than 83%, the number stated in the May 2015 Report (as significant capex is well underway now), it is still considerably higher than other government-owned utilities as shown in Figure 4-22.

Figure 4-22: Projected Capital Expenditures over the Next Five-Year Period Compared to Current Asset Base



Source: Derived from from annual reports and plans.

Hydro-Quebec

Hydro-Quebec has consistently maintained its equity ratio at slightly over 30% during the past decade, and this ratio is expected to remain near 30% over the next decade.

NB Power

NB Power has faced a number of financial challenges and this resulted in it having very low equity ratios over the past decade. Recognizing that its capital structure must improve, NB Power introduced a new 10 Year Plan, with the support of its owner, the Province of New Brunswick. The initial plan provided for a significant increase in its equity ratio over the next decade, with a target of 20% by 2021. NB Power's updated 10 Year Plan issued in 2017, indicates that various operating pressures and increased capital expenditure requirements results in a delay in meeting the internal capital structure target of 20% equity until 2024. However, recent results have continued to deteriorate, with the corporation having an equity ratio of only 6% in 2016/17.

BC Hydro

BC Hydro has maintained an equity ratio of 20% over the past decade. However, under the B.C. Government's recent 10-year plan for the utility, the Province directed that the utility move to a more robust capital structure. Under the Plan, BC Hydro targets to increase its equity ratio to 40% in the longer term (beyond the 10-year plan). The specific details of the 10-year plan, and the context for its development, are discussed in more detail in Chapter 4 of the May 2015 Report.

Nalcor

Nalcor is a holding company that holds the Government of Newfoundland and Labrador's interests in a number of energy companies, including Newfoundland and Labrador Hydro ("NLH"), which is a regulated utility whose activities encompass generation, transmission and electricity sales. Nalcor also holds entities created in the Lower Churchill Project and related investments. Nalcor's major new generation investment in the Lower Churchill Project is being undertaken outside of the regulated utility NLH. Its financial position has deteriorated in recent years, although its equity ratio was improved to 39% as a result of equity contributions in 2015 and again in 2016 from the Government of Newfoundland and Labrador.

4.9 Summary Observations – Benchmarking

Based on benchmarking and various comparisons of government-owned power utilities, particularly with hydro-based peer utilities in Canada, the following are summary observations:

- Manitoba Hydro has been and currently is at the low end of the peer group of government-owned power utilities in terms of key financial metrics including equity ratio, interest coverage ratio, cash flow comparison metrics, and other financial metrics. In benchmarking against government-owned power utilities in Canada, the gap in Manitoba Hydro's performance versus most other utilities has widened since the May 2015 Report.
- At a level of 25%, Manitoba Hydro's equity ratio target is below the current equity ratio observed at Hydro-Quebec and at Nalcor's regulated hydro operations. BC Hydro is currently near a 25% equity ratio, but plans to increase to 35% over the next decade, facilitated by a sharp drop in dividends paid to the Province of B.C. and by higher rate increases. Of the Canadian peer group, only NB Power has a lower equity ratio; however, NB Power has undergone financial challenges and its new plan is to ramp up to a minimum equity ratio of 20% over the next decade. Where government-owned power utilities have specified a plan to restore or achieve a target equity level, the planned time frame of ten years is consistent with that planned by Manitoba Hydro in IFF!6.
- Manitoba Hydro has a relatively high EBITDA to revenue ratio. The nature of the development of hydroelectric generation is that it entails very long development cycles, with very high capital expenditures during construction and relatively low operating costs and relatively strong operating margins once in service.
- Manitoba Hydro has very competitive electricity rates in Canada and North America, providing a significant advantage for ratepayers compared to other jurisdictions.
- Manitoba Hydro has relatively larger installed capacity and electric power generation per capita than most utilities, and extra-provincial electricity sales represent approximately 24% of total electricity sales, down somewhat in recent years, but a larger share than at other utilities and a very significant part of electricity operations.
- Manitoba Hydro's current capital expansion program is relatively much larger as a share of its existing asset base in comparison to other government-owned utilities in Canada (Figure 4-23).
- We note that the financial health of Manitoba Hydro has markedly deteriorated relative to forecast in the fiscal years that have passed since the May 2015 Report. For example, actual net income was significantly lower than forecast and retained earnings less AOCI dropped to $2.2 billion. These are concerning indicators for a utility in the midst of a large capital program. To be significantly off projection in the early years of a large capital program, further heightens risks and accelerates the need to return to better financial health.

Figure 4-23: Forecast under IFF14 versus Actual Results

IFF14 Projected versus Results ($ millions)	IFF14 Projected 2015/16	Actual 2015/16	% change	IFF14 Projected 2016/17	Actual 2016/17	% change
Revenues	2,337	2,258	-3%	2,387	2,327	-3%
Net income	126	39	-69%	67	59	-12%
Long-term debt	13,825	14,527	5%	16,698	16,438	-2%
Retained earnings less AOCI	2,502	2,052	-18%	2,559	2,190	-14%
Equity Ratio	19%	17%		17%	16%

5 Financial Targets in a Capital Markets Context

This chapter updates some of the credit rating perspectives as well as data on government-owned utilities in relation to their respective provincial economies and debt, from the May 2015 Report (in Chapter 6).

5.1 Overview of Credit Rating Reports on Manitoba and Manitoba Hydro

The Province of Manitoba has maintained a solid credit rating from three credit-rating agencies as indicated in the May 2015 Report (see Figure 5-1). However, since the May 2015 Report, Manitoba's credit rating from Moody's was downgraded in July 2015, and Standard and Poor's downgraded Manitoba's rating twice, in July 2016 and again in July 2017. The Moody's downgrade in July 2015 was Manitoba's first credit rating downgrade in nearly three decades.

Figure 5-1: Province of Manitoba Credit Rating

	Standard & Poor's	Moody's	DBRS
Rating	**A+**	**Aa1**	**A (High)**
Rating Outlook	Stable	Stable	Stable
Rating History	In July 2017, downgraded from AA-/Negative to A+/Stable. In July 2016, downgraded to AA-/Negative from AA/Stable Last upgrade was to AA/Stable from AA-/Positive in December 2007. Previous upgrade was in November 2006 to AA-/Positive from AA-/Stable since November 2002.	In July 2015, downgraded to Aa2 from Aa1. Outlook downgraded from Stable to Negative in August 2014. Last upgrade was November 2006, Aa2 to Aa1. Previously upgraded from Aa3 to Aa2 in January 2003, and after 13 years of A1 upgraded to Aa3 in September 1998.	Last upgrade was from A to A (High) in 2003 where it has remained since.

Source: Derived from information in credit agency rating reports – Standard and Poor's; Moody's; DBRS. Note: some credit agencies also issue a separate report on Manitoba Hydro, which reflect that Manitoba Hydro's debt is guaranteed by its owner, the Province of Manitoba.

Sovereign analysts from credit rating agencies review a number of factors in assigning ratings to governments including:

- Fiscal position and performance,
- Debt burden,
- Economy and economic fundamentals,
- Operating environment,
- Institutional framework,
- Contingent liabilities, and

- Other factors.

The Province of Manitoba's credit rating has typically been in the middle of those of Canadian provinces, lower than the Western provinces, and higher than the Atlantic Provinces and Quebec.

The credit rating agencies also issue separate analyses on Manitoba Hydro, although these reflect the fact that Manitoba Hydro's debt is guaranteed by the Province of Manitoba as its owner. Thus, Manitoba Hydro's credit rating is effectively a flow-through of the Province's credit rating. Most other government-owned utilities also receive the benefit of the credit rating of their provincial owner.

Comments from recent reports of individual credit ratings agencies are summarized in the sections below.

5.1.1 Standard and Poor's

In July 2017, Standard and Poor's lowered Manitoba's rating from "AA-" to "A+". Comments from the Standard and Poor's ratings report included:

> "Although Manitoba is taking clear steps to improve its fiscal sustainability in the long term, it faces large projected budget deficits and further growth in its already-high debt burden over the next two years. We are therefore lowering our long-term issuer credit and senior unsecured debt ratings on the Province of Manitoba to 'A+' from 'AA-'.
>
> Our assessment of the province's debt burden fully incorporates the debt on-lent to MHEB, which accounts for more than 40% of total tax-supported debt and for which the province expects to borrow heavily to finance capital projects over the next several years. We do not view MHEB as self-supporting due to its very high and rising leverage."[24]

One year earlier, in July 2016, Standard and Poor's[25] downgraded Manitoba's rating from "AA" to "AA-". Standard and Poor's commented:

> "The ratings on the Province of Manitoba reflect S&P Global Ratings' assessment of the significant rise in Manitoba's debt burden. This stems from the Province's ongoing fiscal shortfalls and significant debt on-lend to MHEB, which we no longer consider self-supporting mainly due to its high and rising leverage."[26]
>
> "Our assessment of the province's debt burden fully incorporates the debt on-lend to MHEB (nearly 40% of total tax-supported debt), whereas previously we had considered MHEB's status as a self-supporting entity to be a mitigating factor. We also expect Manitoba's interest expense will remain close to 6% of operating revenues over the next two years."[27]

The Standard and Poor's analysis outlined a number of key strengths for Manitoba including:

- Manitoba's very strong and diversified economy;
- Strong budgetary flexibility;
- Strong financial management;

[24] Standard and Poor's. Research Update: Province of Manitoba, July 21, 2017.

[25] Standard and Poor's. Supplemental Analysis: Province of Manitoba, July 29, 2016.

[26] Standard and Poor's. Supplemental Analysis: Province of Manitoba, July 29, 2016.

[27] Standard and Poor's. Supplemental Analysis: Province of Manitoba, July 29, 2016.

- Low contingent liabilities;
- Adequate liquidity;
- Canada's provincial-federal institution framework is very predictable and well-balanced.

5.1.2 Moody's

In August 2014, Moody's lowered its outlook on its rating for the Province of Manitoba from Aa1 stable to Aa1 negative. In July 2015, Moody's downgraded Manitoba's rating from Aa1 negative to Aa2 with a stable outlook.

> "The downgrade to Aa2 reflects the deterioration in Manitoba's financial metrics leading to an increased debt burden and our expectation that the province will face significant challenges in achieving fiscal balance by 2018-19." [28]

In its August 2016 rating report, Moody's[29] noted that Manitoba's ratings benefit from:

- Strong economic growth with a diversified economy;
- High debt affordability;
- Mature and supportive institutional framework and solid governance practices.

Moody's commented that the rating is challenged by the Province's elevated debt burden, substantial forecasted deficits over an extended time horizon, declining levels of liquidity, and contingent liability risk of Manitoba Hydro.

Moody's report noted the inherent risks related to increasing debt at Manitoba Hydro.

> "The province issues debt on behalf of its wholly-owned electric utility company Manitoba Hydro. Given its steady revenue stream that generates sufficient cash flow to support operations including interest payments, we view Manitoba Hydro as a self-supporting entity and therefore exclude the related debt from our debt metrics of the province.
>
> "We note, however, that Manitoba Hydro's total reported debt net of sinking of funds has risen considerably, doubling from CAD6.9 billion at March 31, 2008 to an estimated CAD14.2 billion as of March 31, 2016. We expect that its debt will continue to rise over the medium-term as the utility moves forward with construction projects, including the Keeyask hydroelectric station and the Bipole III transmission line, in anticipation of demand increases over the next few years and in order to boost electricity exports. The anticipated increase in debt continues to pressure the province's rating since it raises the contingent liability of the province.
>
> "Manitoba Hydro has flexibility to increase utility rates to ensure that its own revenues will continue to support its operations and debt payments. Political willingness to approve rate increases when Manitoba Hydro's credit metrics will reach their low point will be critical to recover expected capital expenditures and restore credit metrics." [30]

[28] Moody's Investors Service, Rating Action, July 10, 2015.

[29] Moody's Investors Service, Credit Opinion, Province of Manitoba, August 3, 2016, p.3.

[30] Moody's Investors Service, Credit Opinion, Province of Manitoba, August 3, 2016, p.4.

In its February 2017 update, Moody's confirmed its rating and Manitoba Hydro's self-supporting status, but noted the growing contingent liability risk of Manitoba Hydro:

> "Given its revenue stream that generates sufficient cash flow to support operations including interest payments, we view Manitoba Hydro as a self-supporting entity and therefore exclude the related debt from our debt metrics of the province.
>
> We note however that Manitoba Hydro's total reported debt net of sinking funds has risen considerably, doubling over the last eight years to CAD14.4 billion as of March 31, 2016, as the province moves ahead with several large capital projects. These include the Keeyask hydroelectric station and the Bipole III transmission line, which are being built to enhance reliability, meet anticipated demand increases over the next few years and boost electricity exports. We expect that the utility's debt may increase substantially by up to 70% over the medium-term from current levels just to complete these two projects, which are being hampered by significant delays and cost overrruns. The anticipated increase in debt has put growing pressure on the province's rating since it raises the contingent liability of the province (anticipated to exceed 40% of the province's total debt by 2017-18) and has increased the risk that Manitoba Hydro could require a capital injection or other support from the province."[31]

5.1.3 DBRS

In July 2017, DBRS confirmed the Province of Manitoba's "A (high)" rating with a trend of stable.[32] In its rating consideraitons, DBRS[33] outlined the following strengths and challenges:

Strengths

- Diversified and resilient economy,
- Favourable demographics,
- Prudent debt management practices,
- Abundant low-cost hydroelecricity.

Challenges

- Substantial deficits,
- Relatively high taxes,
- Moderate reliance on federal transfers,
- Below-average incomes and GDP per capita.

In July 2017, DBRS confirmed the rating of Manitoba Hydro obligations are a flow-through of the rating of the Province of Manitoba, as the Province unconditionally guarantees almost all of Manitoba Hydro's outstanding third-party debt.

> "DBRS fully expects the utility to recover its costs from the electricity rate base. As such, DBRS will continue to exclude the hydro-related debt from the calculation of tax-supported debt."[34]

[31] Moody's Investors Service, Credit Opinion, Province of Manitoba, February 24, 2017, p.4.

[32] DBRS Rating Report, Province of Manitoba, July 12, 2017.

[33] DBRS Rating Report, Province of Manitoba, July 12, 2017.

[34] DBRS Rating Report, Province of Manitoba, July 12, 2017, p.6.

DBRS notes the strengths of Manitoba Hydro including:

- Debt is a direct obligation of the Province,
- Low-cost hydro-based generation, and
- Access to favourable export markets.

Challenges of Manitoba Hydro noted by DBRS include:

- Hydrology risks,
- High leverage, and
- High level of planned capex.

The November 2016 DBRS report on Manitoba Hydro noted:

> "A new board appointed at Manitoba Hydro in 2016 intends to limit the deterioration in the Utility's balance sheet. As a result, the Utility has begun reviewing initiatives to help alleviate pressure on its key financial ratios, such as improving operating efficiencies, requesting annual rate increases higher than the previously planned 3.95%, as well as potential equity injection from the Province. DBRS sees these initiatives, if actualized, as positive to Manitoba Hydro's financial profile, as they will provide some financial flexibility for the Utility, especially in the event of adverse drought conditions or further cost overruns on the projects.
>
> DBRS continues to view Manitoba Hydro as self-supporting, as its earnings and cash flows continue to be sufficient to cover its operating expenses and to service its outstanding debt. However, DBRS could consider reclassifying a portion of the Utility's debt to be tax-supported should the financial health of the Utility deteriorate to the point where its expenses cannot be recovered through rates. If this were to occur, it could potentially put downward pressure on the Province's credit rating. Similarly, a large equity injection by the Province that materially increases tax-supported debt could also put downward pressure on the Province's credit profile. At this time, however, DBRS expects the Province's ratings to remain stable."[35]

5.2 Government-owned Power Utilities and Relation to Provincial Economies

5.2.1 Public power utilities in relation to provincial economies

As Government Business Entities and self-supporting entities, the assets and debt of Manitoba Hydro and other provincially-owned power utilities in Canada are not consolidated within the balance sheets of their respective provincial governments in Summary Financial Statements. Figure 6-6 illustrates the size of utility net debt in relation to provincial government net debt. It also shows the relative size of the combined net debt in relation to provincial population and GDP. Credit rating reports on governments in Canada focus their key debt metrics, such as net debt to GDP, on tax-supported debt, and do not include the self-supporting debt of Crown utilities. However, they do take utility debt into account and continue to monitor levels of debt. Rating agencies have generally commented that the combined debt burden is manageable for provinces.

In 2013/14, the utility net debt of Manitoba Hydro was approximately 38% of combined provincial net debt and utility net debt, slightly lower than the figure for Nalcor (39%), and higher than values for NB Power and BC Hydro (which are near 30%). As a share of GDP, combined provincial net debt and utility net debt is highest in Quebec (at 62%), followed by New Brunswick (at 51%), and then Manitoba (at 46%).

[35] DBRS Rating Report, The Manitoba Hydro-Electric Board, November 25, 2016, p.1-2.

Updated data to 2015/16 in Figure 5-2 incorporate general increases across the provinces in the past two years in combined provincial net debt and utility net debt. Data for 2015 and 2015/16 was utilized for direct comparison to audited financial statements of provinces as 2016/17 Public Accounts was not available as of August 2017 for Manitoba and most provinces.

In 2015/16, the utility net debt of Manitoba Hydro increased slightly to approximately 39% of combined provincial net debt and utility net debt, the highest share of the five provinces. As a share of GDP, combined provincial net debt and utility net debt is highest in Newfoundland at 63% (a sharp increase from 42% in 2013/14 as the province's GDP declined significantly), followed by Quebec at 60%, New Brunswick at 56% and Manitoba at 53% (up from 46% in 2013/14).

While audited financial statements were not available at this time for most provinces, we note that Manitoba Hydro net debt rose significantly to $15.8 billion in 2016/17, an increase of $2.2 billion from 2015/16 (see Figure 5-2). Provincial net debt for Manitoba is forecast at $23.1 billion for 2016/17 (from 2017 Manitoba Budget), an increase of $1.7 billion from 2015/16. Thus for 2016/17, combined provincial and utility net debt for Manitoba is estimated at $38.9 billion, which would be approximately 58% of provincial GDP.

Figure 5-2: Overview of Utility Asset and Net Debt Information and Relationship to Provincial Economy, 2015/2016

Overview of Utility Asset and Debt Information and Relationship to Provincial Economy

($CDN billions)	Provincially-Owned Utility	Utility Assets 2015/16	Utility Net Debt at Year End	Provincial Net Debt at Year End	Prov. 11. Statistics Canada

Figure 5-3 indicates that Manitoba has a relatively high level of utility assets and net debt on a per capita basis, as Manitoba Hydro plays a significant role in its provincial economy.

Manitoba Hydro's net debt per capita is nearly $12,000, slightly below Nalcor, and substantially above other government-owned power utilities in Canada. Manitoba Hydro's net debt per capita increased by approximately 43% in only three years, from 2013/14 to 2016/17. This rate of growth in net debt and net debt per capita significantly exceeded that of the other government-owned power utilities.

Nalcor has the highest level of assets per capita of the government-owned power utilities in Canada, followed by Manitoba Hydro.

Manitoba Hydro's assets per capita increased from $12,359 per capita in 2013/14 to $16,947 per capita in 2016/17, an increase of approximately 37% over the past three years and a growth rate significantly higher than other government-owned power utilities except for Nalcor.

6. Statistics Canada

Figure 5-4 shows the level of Manitoba Hydro's self-supporting debt in conjunction with the Province of Manitoba's total borrowings, guarantees and obligations (net of sinking funds). From 2009/10 to 2013/14, this share had been relatively constant at approximately 37%.

Debt advances to Manitoba Hydro are forecast in 2016/17 to be approximately 39% of total Provincial borrowings, guarantees and obligations, a marked increase in two years from 37% as Manitoba Hydro borrowings have increased from $12.5 billion in 2014/15 to a forecast level of $16.4 billion in 2016/17.

This share is expected to continue to increase in the medium term, depending upon the level of increase in the Province of Manitoba's tax-supported debt. Based on projections of Province of Manitoba borrowings outlined in the Manitoba Budget 2017, Manitoba Hydro's share is projected to significantly increase to 42.5% in 2017/18.[36] Based on Manitoba Hydro's projected debt under IFF16, self-supporting debt as a share of total Provincial borrowings, guarantees and obligations could increase to percentage range in the mid-40s by 2019/20, depending on the rate of increase of provincial tax-supported debt.

Source: 2009/10 from Province of Manitoba 2014 Budget Summary Financial Statistics. 2016/17 forecast from Province of Manitoba 2017 Budget Summary Financial Statistics. (Provincial borrowings, guarantees and obligations are net of sinking funds.)

5.2.2 Government contributions from public-owned power utilities in Canada

Figure 5-5 provides a breakdown of contributions paid to governments from Manitoba Hydro and four other government-owned power utilities in the peer group. Of these five government-owned power utilities, only BC Hydro and Hydro-Quebec currently pay a direct annual dividend to their provincial owner. In both cases, dividends are based on a formula and are capped to ensure that a minimum equity ratio is maintained.

Most government-owned utilities pay a debt guarantee fee based on a percentage of outstanding debt to their respective provincial owner.

- Manitoba Hydro pays a 1.0% fee on outstanding applicable debt, which is the highest percentage fee in the group. The Province of Manitoba's debt guarantee fee was increased from 0.5% to 0.65% effective April 1, 2000 and to 0.95% effective April 1, 2001. [37] The fee was subsequently increased to 1.0% during fiscal 2006/07.
- NB Power pays a 0.65% fee on outstanding debt.
- Hydro-Quebec pays guarantee fees to the Quebec government related to debt securities. In 2014, these fees were $205 million in 2014 which represents slightly under 0.5% on outstanding debt. [38]
- In 2008, the Government of Newfoundland and Labrador temporarily waived the guarantee fee paid by Nalcor until 2011. Upon reinstatement in 2011, the fee was reduced from 1.0% of outstanding debt to a fee of 0.5% on outstanding debt with a remaining term of over 10 years and 0.25% on outstanding debt with a remaining term of under 10 years. The new fee rates were designed to better reflect the value of the debt guarantee, and are based on a comparison of yields on bonds issued by the Province to bonds with similar maturities issued by a group of investment-grade

[37] PUB Board Order 7/03, p. 26.

[38] Hydro-Quebec 2014 Annual Report. Financial statements Note 6.

utilities comparable to Hydro. [39] NLH's recent rate application notes the cumulative impact of these fee initiatives to 2015 is $62.3 million.[40]

In fiscal 2016/17, Manitoba Hydro paid $136 million in debt guarantee fees to the Province of Manitoba, an amount that is expected to increase significantly over the next five years as borrowings ramp up to complete major generation and transmission projects.

Manitoba Hydro, BC Hydro and Hydro-Quebec pay annual water rental charges to their respective provinces. Manitoba Hydro's water rental charge is $3.34 per MW, which is a similar rate to Hydro-Quebec, and significantly lower than BC Hydro, which pays $6.896 per MW plus capacity charges. Under the *Water Power Act*, the Province of Manitoba approximately doubled water rental rates to its current level of $3.34 per MW effective April 1, 2001. Manitoba Hydro paid $131 million to the Province of Manitoba in water rental charges in 2016/17.

All utilities pay local property and related taxes in their respective jurisdictions. In addition to these taxes, Manitoba Hydro pays capital taxes to the Province of Manitoba ($84 million in 2016/17), and Hydro-Quebec pays a Provincial Public Utility Tax to the Government of Quebec.

Figure 5-5: Contributions Paid to Governments from Public-Owned Canadian Power Utilities (FY2016 or FY2016/17 in annual $ millions)

	Manitoba Hydro	BC Hydro	Hydro-Quebec	NB Power	Nalcor
Dividend (1)	n/a	$259	$2,146	n/a	n/a
Debt guarantee fee	$136		$218	$32	$4.5
Water rental charges	$131	$349	$673		$4.9
Property, capital & other taxes	$135	$234	$372	$43	not available
Total	$402	$842	$3,409	$75	$9.4
Total % revenues	17%	14%	26%	4%	1%
Per Capita (rounded dollars)	*$305*	*$177*	*$409*	*$99*	*$18*

Note: derived from annual reports and financial statements, for the year-ending March 31, 2017 for Manitoba Hydro, BC Hydro and NB Power and for the year-ending December 31, 2016 for Hydro-Quebec and Nalcor.

(1) No dividends are paid by Manitoba Hydro, NB Power and Nalcor. For Hydro-Quebec, dividend paid the Quebec government is 75% of net income; no dividend if it effectively reduced the cap rate/equity ratio to less than 25%. For BC Hydro, dividend is 85% of net income, subject to an 80:20 debt to equity cap. Dividend for the year ending March 31, 2016 and for the year ending March 31, 2017 is less than 85% due to the cap. Special Directives from the Province of BC define a minimum annual payment which was $259 million for the 2016/17 fiscal year. Note that BC Hydro's dividend payments to the Province of BC have been higher in previous years.

[39] Newfoundland and Labrador Hydro – 2013 General Rate Application, p. 3.31.

[40] Newfoundland and Labrador Hydro – 2013 General Rate Application, p. 3.32.

Based on information disclosed in annual financial statements, as noted in Figure 5-5, Manitoba Hydro's payments to government represent approximately 17% of total revenues. This is a similar share to BC Hydro (although BC Hydro's dividend payments to the Province of B.C. have been lower in recent years), a much higher proportion than government-owned utilities in Atlantic Canada, but significantly lower than Hydro-Quebec. Hydro-Quebec contributes approximately 26% of its total revenues to government, with nearly two-thirds of its government contributions in the form of dividends to its owner.

5.3 Summary Observations

Key conclusions from the analysis in this chapter are the following:

- Since the May 2015 Report, two credit rating agencies have issued a total of three credit downgrades for the Province of Manitoba. One credit rating agency no longer views Manitoba Hydro debt as self-supporting due to high and rising leverage. Two other credit rating agencies continue to view Manitoba Hydro as self-supporting.
- The combined debt of the Province of Manitoba and Manitoba Hydro has significantly increased in the past two fiscal years, and Manitoba Hydro's share of Provincial borrowings, guarantees and obligations now exceeds 40%.

6 Scenario Analysis and Testing

This chapter revisits some of the scenario analyses undertaken in the May 2015 Report (in Chapter 7) and reviews some additional scenario analyses that have been undertaken subsequently.

6.1 General Approach

In this Chapter, we have, in general, focused the analyses on differences between IFF14 and IFF16. This reflects the fact that the outlook for IFF14 was the basis of our prior analysis and that IFF16 is Manitoba Hydro's most current financial projection. In this context, figures for IFF15 are of secondary interest. Figures for IFF15 can shed light on changes in expectations over time but they are not as directly relevant to a discussion of how the environment and outlook have now changed or of the implications for Manitoba Hydro's financial targets.

6.2 Maintaining Profitability

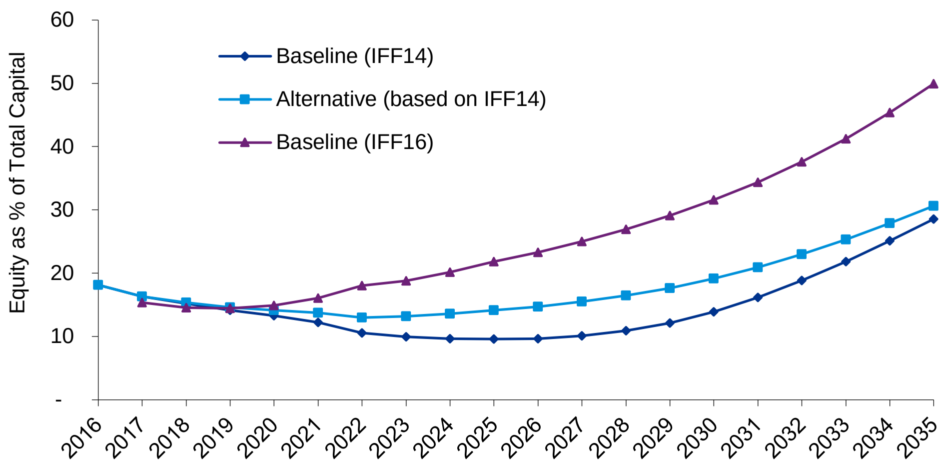
In the May 2015 Report, we noted that projections within IFF14 showed eight consecutive years of negative net income beginning in 2019. We then examined an alternative scenario with higher rate increases than under IFF14, with the rate increases set to restore profitability under expected conditions.

With IFF16, the projected outlook for Manitoba Hydro has substantially improved. The improvement relative to IFF14 is largely attributable to increases in rates, which have been used to bolster Manitoba Hydro's equity position and cash flow in parallel with large capital investments. IFF16 also reflects Manitoba Hydro's recently announced plans to reduce staff and operating costs. The improvement in outlook is also partly attributable to lower forecast interest rates, which reduce financing costs associated with Manitoba Hydro's ongoing capital program. Lower interest costs help offset reductions that are also projected in long term electricity export prices.

Figure 6-1 shows the new forecast compared to IFF14 and the alternative scenario presented in the May 2015 Report. This figure shows that IFF16 results in debt/equity ratios that improve more rapidly than before, even compared to our earlier alternative scenario, which also entailed higher rate increases than the IFF14 base scenario.

Beyond 2029, the rate of increase in equity position under IFF16 is similar to that under the IFF14 base scenario. This is the case even though IFF16 has rate increases of only 2.0% beyond 2023, while IFF14 had rate increases of 3.95% annually over the forecast horizon. This indicates the substantial benefit of restoring the equity position of the utility earlier rather than later.

Figure 6-1: Equity Ratio under IFF14, IFF16 and the IFF14 Alternative Scenario



6.3 Probabilistic Analysis

In the May 2015 Report, we summarized some scenario testing that Manitoba Hydro had undertaken based on examining potential variation in four input parameters. This scenario testing considered variation in:

- Interest rates (3 possible outcomes)
- Energy and Export prices (3 possible outcomes)
- Capital Expenditures (3 possible outcomes)
- Water Flow Sequence (99 possible scenarios).

By varying each of the inputs noted above, Manitoba Hydro obtained 2,763 distinct financial projections (calculated as 3 x 3 x 3 x 99).

As shown above, Manitoba Hydro examined just three individual scenarios for interest rates in its probabilistic analysis. These included a scenario with interest rates as forecast under IFF14, and scenarios with interest rates either one percentage point higher or lower.

6.3.1 Modelling of interest rate uncertainty

In the period since the 2015 report, Manitoba Hydro has explored a more sophisticated approach to modelling interest rate uncertainty. There has been a concern that the scenario testing undertaken in the context of IFF14, which examined interest rates just one percentage point higher or lower than forecast, did not adequately capture the actual uncertainty associated with interest rate movements. This concern arose from the observation that consensus forecasts, which are the basis of the reference case used for IFF purposes, tend to assume faster convergence of interest rates to their historical means than has been observed in practice in the past.

As an alternative to assuming a fixed adjustment above or below the reference case forecast for scenario testing, Manitoba Hydro has implemented a new approach based on using a stochastic interest rate generator. The generator is calibrated to produce outputs that are consistent with the interest rate uncertainty implied by futures market data.

As implemented for the purpose of scenario testing, the interest rate generator is used to prepare 50 interest rate trajectories. Each of these are assumed to be equally probable. The interest rate trajectories (or scenarios) are then combined with energy and export price scenarios (3 scenarios) and water flow sequences (102 scenarios) to produce a total of 15,300 outcomes.

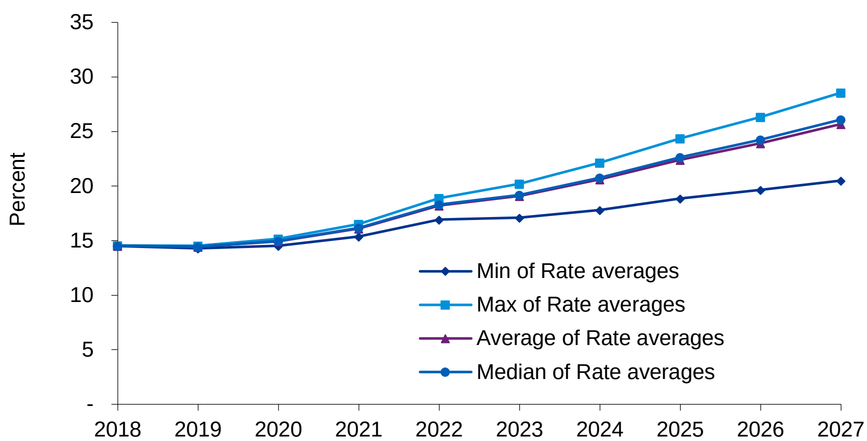
Figure 6-2 examines the impact of interest rate uncertainty on the outcomes observed. The figures presented in this chart require some explanation, and this is provided below.

As noted above, Manitoba Hydro has prepared a total of 15,300 runs, combining uncertainties in energy and export prices, water flows and interest rates. Each individual run is a combination of:

- One water flow sequence,
- One interest rate trajectory, and
- An assumption on energy and export prices (either Low, High or Reference Case).

To examine the impact of interest rates on overall outcomes, we examined, in turn, those runs associated with each individual interest rate trajectory. For each interest rate trajectory, there are 306 separate runs (which result from looking at the combination of 3 price scenarios combined with 102 water flow sequences). For each interest rate trajectory, we then calculated the average equity ratio in each year across the 306 runs and summarized these averages in a table. For these averages in each year, we then calculated the minimum, median, average, and maximum values observed across the 50 interest rate scenarios. These figures are presented in Figure 6-2 below.

Figure 6-2: Equity Ratio under Alternative Interest Rate Scenarios for IFF16



As noted in Figure 6-2 above, the minimum average equity ratio observed across the interest rate trajectories is about 14.3% in 2020. This means that the most unfavourable interest rate scenario in respect of the year 2020 showed an average equity ratio of 14.3% across the 306 runs associated with that interest rate input. Since this average is calculated across the combination of 102 water flow sequences with 3 energy and export price scenarios, the 14.3% is not the minimum observed across all runs. Rather, 14.3% is itself the average of a distribution produced by the 306 underlying runs associated with one interest rate trajectory.

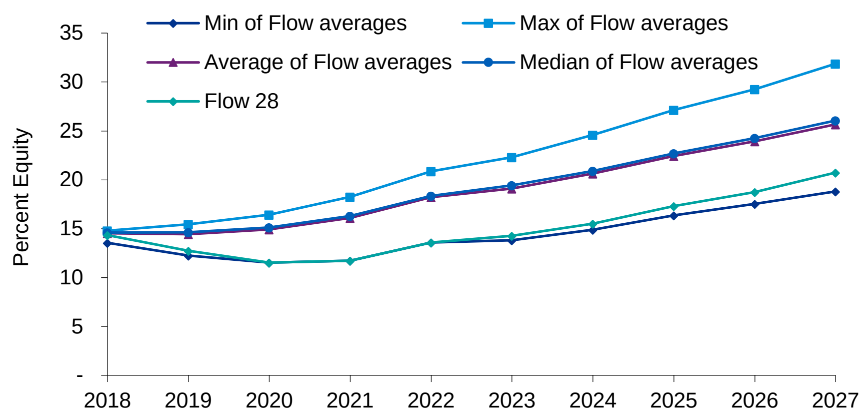
The rationale for looking at the distribution of the averages calculated for each interest rate trajectory is that it shows the contribution of the interest assumption to the variation in outcomes across the 15,300 individual projections. Variation in other assumptions is averaged out from the average calculated for individual groups of trajectories, when trajectories are grouped by interest rate assumption.

6.3.2 Impact of water flow uncertainty

In this sub-section, we focus on the impact of water flow uncertainty. In Figure 6-3 below we prepare an analysis of outcomes across the 102 water flow sequences. Our approach to the preparation of this graph was similar to that used for Figure 6-2 above, but involved grouping outcomes by water flow sequences.

For each water flow sequence, there are 150 associated runs. These result from the combination of 50 interest rate trajectories with 3 energy and export price scenarios. For each water flow sequence, we calculate the average equity ratio across these 150 runs and summarized the averages in a table. In Figure 6-3, we show the minimum, maximum, median and average value for these averages in each year.

Figure 6-3: Equity Ratio under Alternative Water Flow Scenarios for IFF16



From the results shown above, it can be observed that minimum average equity values of about 11.5 percent are observed in each of the years 2020 and 2021. As there are 102 water flow sequences, the minimum value observed could be considered to have about a 1 percent probability of being underachieved in practice (given that 1 divided by 102 equals about 0.01).

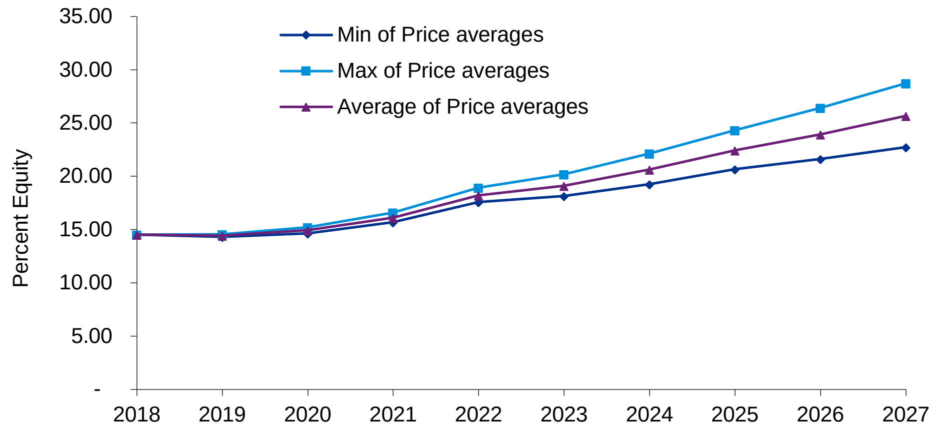
To provide greater insight on the circumstances that lead to the values shown, Figure 6-3 also shows the average equity values associated with water flow sequence 28 (labelled "Flow 28"). This line shows the average of equity values observed when water flow sequence 28 is selected, and interest rates and energy prices are varied. It can be seen Flow Run 28 accounts for the minimum average equity values observed in years 2020 and 2021. Although it does not account for the minimum values in other years, it provides values that are close to the minimum values. Accordingly, it can be seen that close to minimum values can persist for many years under certain hydrology scenarios.

6.3.3 Impact of energy and export price variation

In this sub-section, we focus on the uncertainty in energy and export prices. (Recall that energy and export price uncertainties are combined: for example, high energy prices are associated with high export prices.) In Figure 6-4 below we prepare an analysis of outcomes across the 3 scenarios ("High", "Low" and "Reference") for energy and export prices. Our approach to the preparation of this graph was similar to that used for Figures 6-2 and 6-3 above but involved grouping outcomes by price scenarios (instead of by interest rate trajectories or water flow sequences).

For each price scenario, there are 5,100 associated runs. These result from the combination of 50 interest rate trajectories with 102 water flow sequences. For price scenario, we calculate the average equity ratio across these 5,100 runs and summarized the averages in a table. In Figure 6-4, we show the minimum, maximum, median and average value for these averages in each year.

Figure 6-4: Equity Ratio under Alternative Energy and Export Price Scenarios for IFF16



From the results shown above, it can be seen that the spread in equity values produced by variation in energy and export prices is less than that associated with individual water flow sequences or with individual interest rate trajectories. In part, this can be attributed to the greater averaging of results when we look just at variation in price inputs. There are just 3 price scenarios and when we calculate average equity values for each such scenario, these are associated with 5,100 runs (the combination of 102 water flow sequences with 50 interest rate scenarios). In this analysis, it turns out that the minimum values are all accounted for by the low export price scenario. Similarly, and not unexpectedly, all of the maximum values are accounted for the high export price scenario.

6.3.4 Comparison of Impacts

In this section, we directly compare the minimum and maximum values observed under each of the analyses above. In other words, we first compare the minimum values observed in each of Figures 6-2, 6-3, and 6-4. We then compare maximum values observed in each of these figures. This presentation shows more directly the nature of variation observed when we examine differences resulting from variation in one input parameter (e.g. water flows), while averaging results across scenarios capturing variation in other parameters (e.g. interest rates and energy and export prices).

Figure 6-5 shows the minimum values taken from Figures 6-2, 6-3 and 6-4. We can see that the analysis for water flow variation results in the minimum values observed for all years.

Figure 6-5: Minimum Values for Alternative Scenario Sets under IFF16

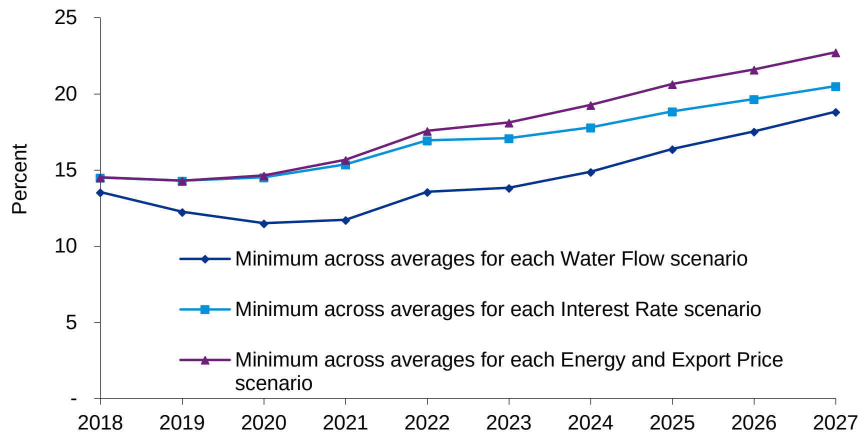


Figure 6-6 shows the minimum values taken from Figures 6-2, 6-3 and 6-4. We can see that the analysis for water flow variation results in the maximum values observed for all years for the averages found when grouping scenarios by particular input conditions. Taking into account both Figures 6-5 and 6-6, it is reasonable to conclude that water flow variation remains the biggest driver of uncertainty for Manitoba Hydro.

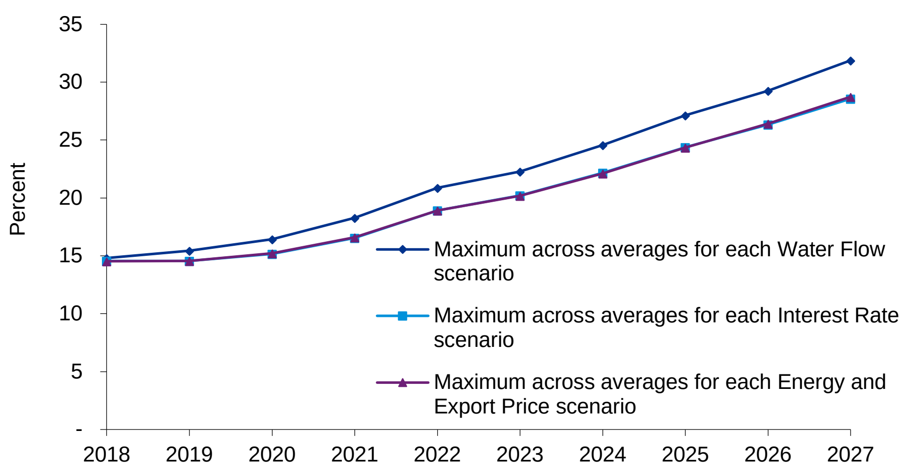
Figure 6-6: Maximum Values for Alternative Scenario Sets under IFF16



6.3.5 Contribution of different factors to overall variability

As an alternative approach to quantifying the relative impact of different factors on financial results, we looked at the impact on the full range of outcomes of adding different sources of uncertainty in turn. The approach is as follows:

- As a first step, we examine the range of outcomes when considering just water flow variability, Thus, financial results are forecast for each of the 102 water flow sequences, using Reference export prices and Reference interest rates. For each year, we then calculate the range of outcomes, or the difference between the minimum and maximum equity ratio observed across all runs.

- As a second step, we examine, in addition, the impact on variability by adding High and Low export prices to the set of financial runs. Compared to step one above, we then calculate the increase in the range of outcomes observed. (At the end of step two, we have 306 runs, obtained from 102 water flow sequences combined with 3 export price scenarios.)
- As the final step, we examine, in addition, the impact on variability by adding High and Low export prices to the set of financial outcomes obtained above. Comparing to step two above, we then calculate the increase in the range of outcomes observed. The range between the minimum and maximum equity values in each year is thus calculated based on 918 runs (102 water flow sequences, with 3 export price scenarios and 3 interest rate scenarios).

In this alternative analysis, we have examined interest rate uncertainty with 3 scenarios rather than 50 trajectories. Analysis by Manitoba Hydro shows that the 3 interest rate scenarios achieves similar outcomes to that obtained with the full 50 interest rate trajectories.

The range of outcomes observed at each of steps 1, 2 and 3 is shown in sequence in Figures 6-7 through 6-9 below.

Figure 6-7: Range of Outcomes from Water Flow Variability

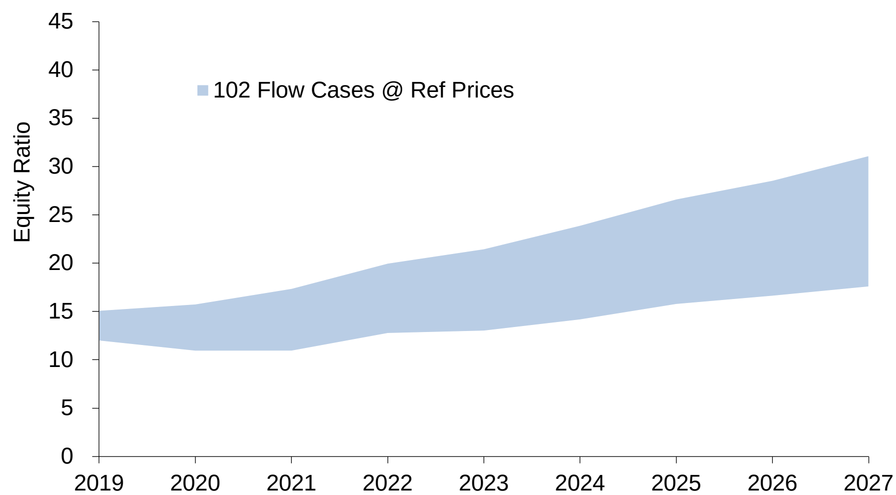


Figure 6-8: Range of Outcomes from Water Flow and Export Price Variability

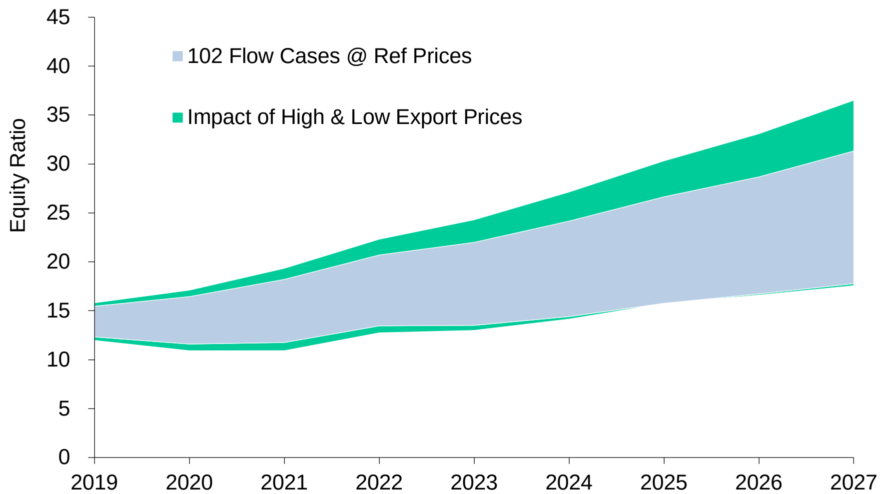

Figure 6-9: Range of Outcomes from Water Flow, Export Price and Interest Rate Variability

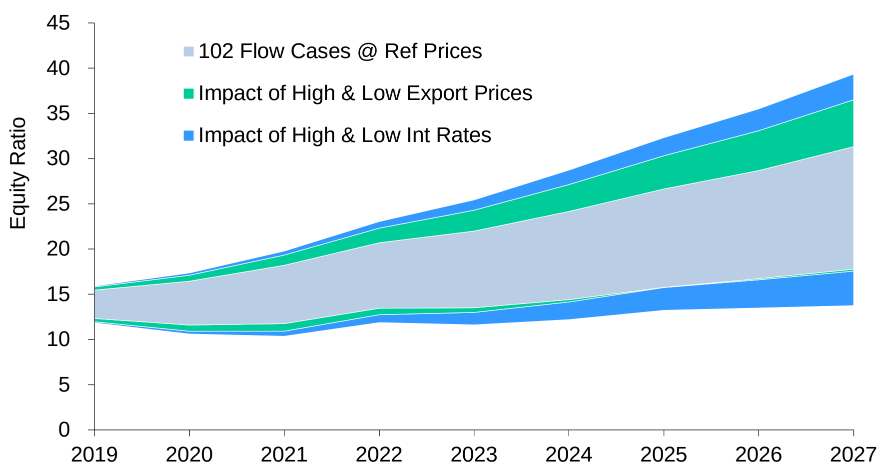

Figure 6-10 below summarizes the contribution that each factor made to total variability observed in each year. As expected, water flow remains the key contributor to the variability observed in each year through to the end of the projection period, accounting for over three-quarters of variability in 2019 and still over half in 2027. However, interest rates account for an increasing share of variability as time passes: interest rates account for 26% of variability in 2027 versus only 5% in 2019. This reflects the persistence of interest rate deviations in the modelling approach and the compounding effect that higher or lower interest rates can have on financial outcomes. Energy and export prices account for a relatively stable share of variability over the forecast period.

Figure 6-10: Factor Contribution to Total Variability

Percentage Contribution to Total Variability									
Year	**2019**	**2020**	**2021**	**2022**	**2023**	**2024**	**2025**	**2026**	**2027**

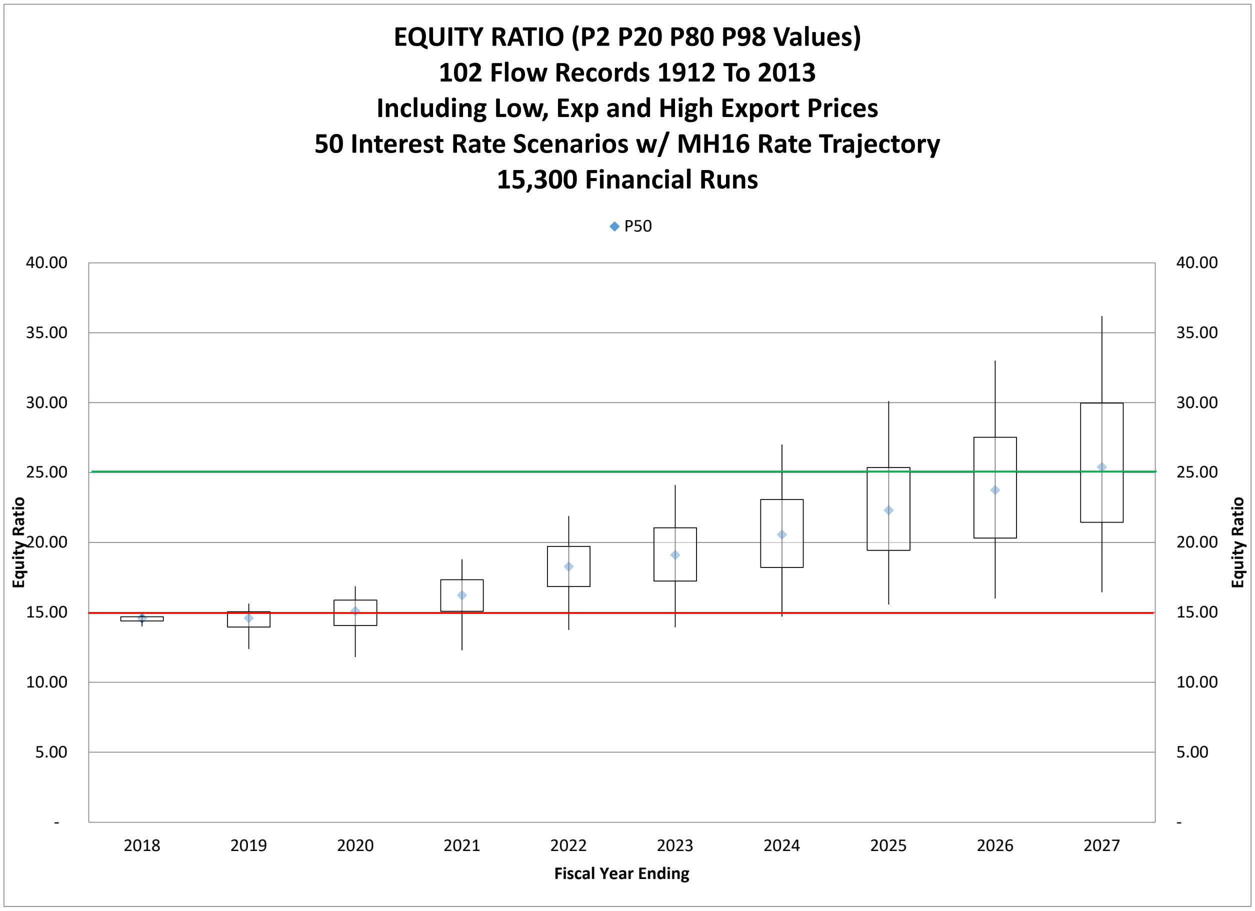
6.3.6 Combined impact

Figure 6-11 below shows the combined impact of variation across all three dimensions used in the scenario analyses (water flow, interest rate, and energy and export prices). This graph is in the form of a "box and whisker" chart. The box shows the range from the 20th to 80th percentile. The lines above and below show the range from the 2nd to 98th percentiles. The format of this graph is based on that currently used by Manitoba Hydro to present the results of its scenario analyses. We have changed the format to show values for 2nd to 98th percentiles, however, rather than for the 5th and 95th percentiles. For the consideration of financial risks, a broader distribution provides a more conservative perspective on potential variability.

In the near term, the lines below the boxes appear longer than the lines above, suggesting that the range of outcomes on the downside is wider than those on the upside. Figure 6-10 helps explain this result as water flow variation in early years has a far more profound impact on equity level than either of energy and export prices or interest rates. Moreover, as discussed earlier, water flow is an asymmetric risk for Manitoba Hydro – the negative financial impacts of low water flows are greater than the financial gains associated with high water flows. This reflects limitations in Manitoba Hydro's generating capacity and that high water flows tend to result in greater water spillage.

Figure 6-11: Combined Distribution from Uncertainty Modelling for IFF16



6.3.7 Review of a sample of runs

As an alternative approach to presenting the results, we examined about 13 individual runs, selected from across the 15,300 total runs undertaken in total. To select the 13, we plotted the 1st run out of the 15,300 total runs and then every 1,253th run thereafter. This fixed sampling approach captured results across a range of scenarios in combination.[41]

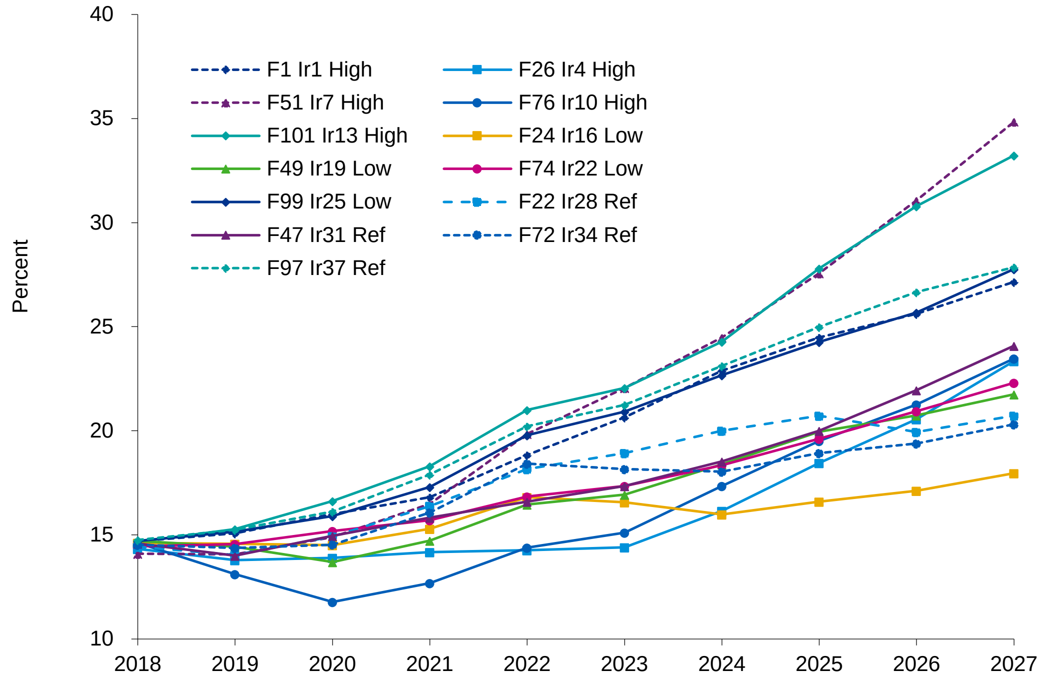
In labelling the various runs selected, the following approach is used:

- The first set of characters (with the prefix "F") indicates the water flow sequence.
- The second set of characters (with the prefix "Ir") indicates the interest rate trajectory.
- The third set of characters ("Low", "High", or "Ref") indicates the energy and export price scenario.

Figure 6-12 below shows the runs selected through this fixed sampling approach.

[41] Given the way that runs were constructed, we needed to avoid multiples of 3, 50 and 102 in setting the intervals, or periodicity, at which runs were selected for presentation. Otherwise, the scenarios presented would not show variation in the three input dimensions.

Figure 6-12: Selected Runs from Uncertainty Modelling for IFF16



The rationale for looking at individual runs is that it provides some additional insight on how various input conditions interact to produce an outcome within the overall distribution. In particular, an individual run shows how outcomes might evolve from year to year in response to a combination of input assumptions. For example, we note that the scenario defined by flow sequence 76, interest rate trajectory 10 and high energy and export prices (labelled "F76 Ir10 High") shows poor results in the initial years but improves rapidly after 2021. This trajectory is somewhat unusual amongst those plotted in that it moves from the bottom to the middle of the distribution over the forecast period. Many of the other runs plotted stay in about the same place relative to the broader group. For example, the run "F74 Ir22 Low" stays roughly in the middle of the group throughout the period. In a similar way, "F101 Ir3 High" remains at or near the top of the thirteen runs throughout. In other words, the runs selected tend to show little change over time in their relative positioning within the sample group.

6.4 Comparison of Probability Distributions

6.4.1 IFF16 versus IFF14

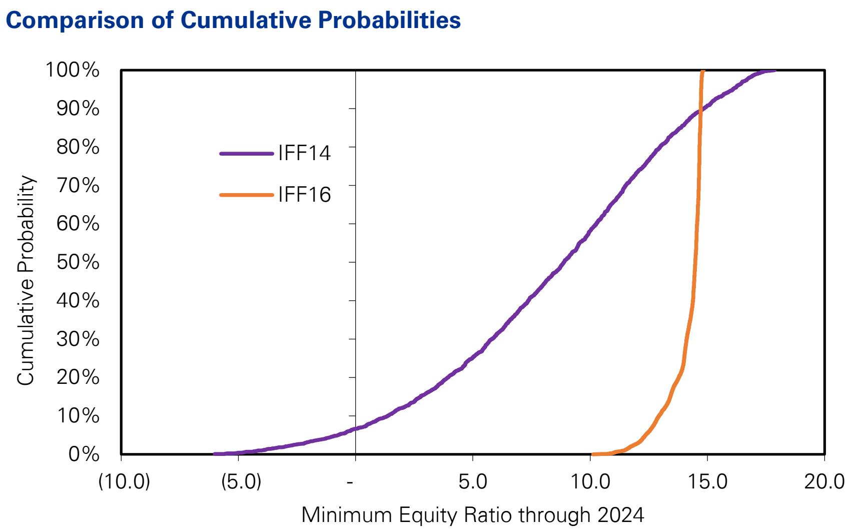
As noted at the beginning of this Chapter, the outcomes projected under IFF16 are significantly more favourable than under IFF14. One way of showing this is by comparing probability distributions for the minimum equity value observed during the period 2018 through 2024. Figures 7-7 and 7-11 of the May 2015 Report provided such distributions. Please note that the minimum equity values examined in this section are the minimum values observed over the full data set (all runs considered). They are not the minimums observed for averages calculated across groups of runs (which was the approach taken in Sections 6.3.3 and 6.3.4 earlier.)

As noted in the May 2015 Report, the interpretation of cumulative probability curves is as follows:

- For any given value on the "x" axis (representing, in this case, the minimum equity value observed through 2024), the line indicates a probability level on the "y" axis.
- The probability level observed above is the percentage of runs for which a lower equity value was observed than that corresponding to the "x" value.

In Figure 6-13 below compares the cumulative probability under IFF14 and IFF16 of various values for the minimum absolute equity ratio observed over the period to 2024. It can be seen that the line for IFF16 has been shifted considerably to the right relative to that for IFF14. There is now essentially no probability of having a minimum absolute equity value less than zero percent, versus a probability of about 7% under scenario modelling for IFF14.

Figure 6-13: Minimum Equity Value Observed 2018 through 2024 under Scenario Modelling



The dispersion of outcomes for the period 2018 through 2024 is much narrower under IFF16 than under IFF14. This reflects the following:

- Improved earnings under IFF16 as a result of higher rate increases reduce the risk of a fall in retained earnings relative to the forecast starting point.
- Because the base year (or starting point) for IFF16 is two years later than for IFF14, uncertainties have less time to evolve. For IFF16, the period 2018 to 2024 is closer to the base year from which the projection is made.
- The dispersion of input interest rates appears is narrower under IFF16 than IFF14.

6.4.2 Comparison of approaches to modelling uncertainty

As noted earlier in this Chapter, in Section 6.3, Manitoba Hydro moved to a new approach to modelling uncertainty when it presented results for IFF15 and now IFF16. The key differences are that Manitoba now uses a more sophisticated approach to representing interest rate uncertainty and it no longer accounts for construction cost variation. Because of changes in scenario modelling, some of the differences between the probability distributions for IFF14 and IFF16, as illustrated in Figure 6-13, reflect differences in the approach for modelling uncertainty rather than differences in the inherent risk associated with the baseline projections.

To help isolate differences in observed risk that are attributable to modelling approach, we asked Manitoba Hydro to model uncertainty under IFF16 using the same methodology as it had originally used for IFF14. This entailed considering uncertainty for IFF16 by taking into account 3 scenarios for each of:

- Interest rates (Reference Case, and +/- one percent point)
- Energy and Export prices (Reference Case, plus High and Low)
- Capital Expenditures (Reference Case, plus High and Low)

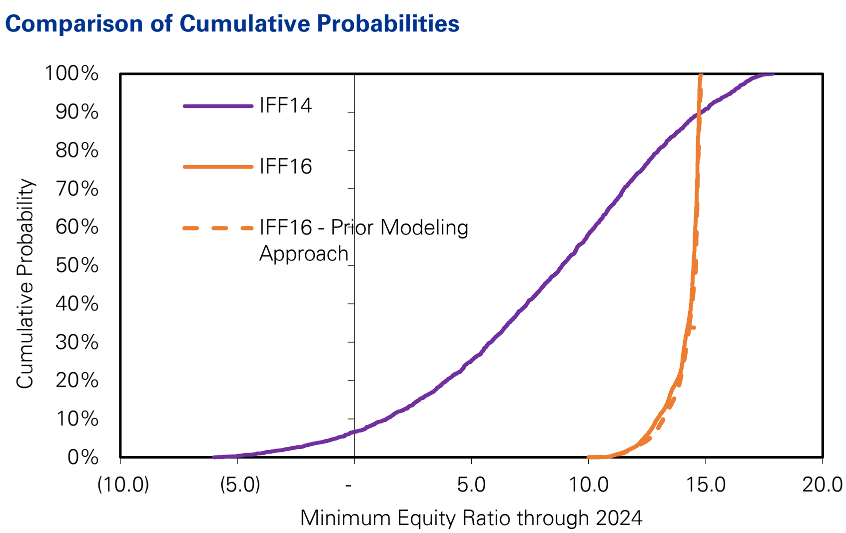
For IFF14, the combination of 27 scenarios thereby obtained was applied against 99 water flow sequences, for a total of 2673 runs.

In applying the above modelling approach to IFF16, Manitoba Hydro made a number of small changes to reflect issues of data availability:

- Capital expenditure uncertainty was modelled with annual expenditures adjusted up or down by $100 million, relative to the Reference Case, rather than by $50 million. A data set containing the higher level of cost variance ($100 million) was more readily available.
- Water flow uncertainty was modelling using 102 water flow sequences, reflecting the greater length of water flow data now available, rather than the 99 sequences used previously. This resulted in an output set of 2,754 runs rather than the 2,673 runs for the IFF14 stochastic analysis.

The probability distribution for this new set of runs has been added to the figure presented first in Figure 6-13 above. This is shown in Figure 6-14 below.

Figure 6-14: Minimum Equity Value Observed 2018 through 2024 – Alternative Scenarios



In Figure 6-14, the distribution of outcomes under IFF16 as estimated using the prior modelling approach (with adjustments as noted above) is shown with the dashed orange line. This line is virtually indistinguishable to the base analysis for IFF16 (the solid orange line), than to the outcomes shown for IFF14 (the solid purple line). This shows that the improvement in the distribution of forecast outcomes is related almost entirely related to improvement in underlying conditions, with very limited impact to results from changes in the approach for modelling uncertainty.

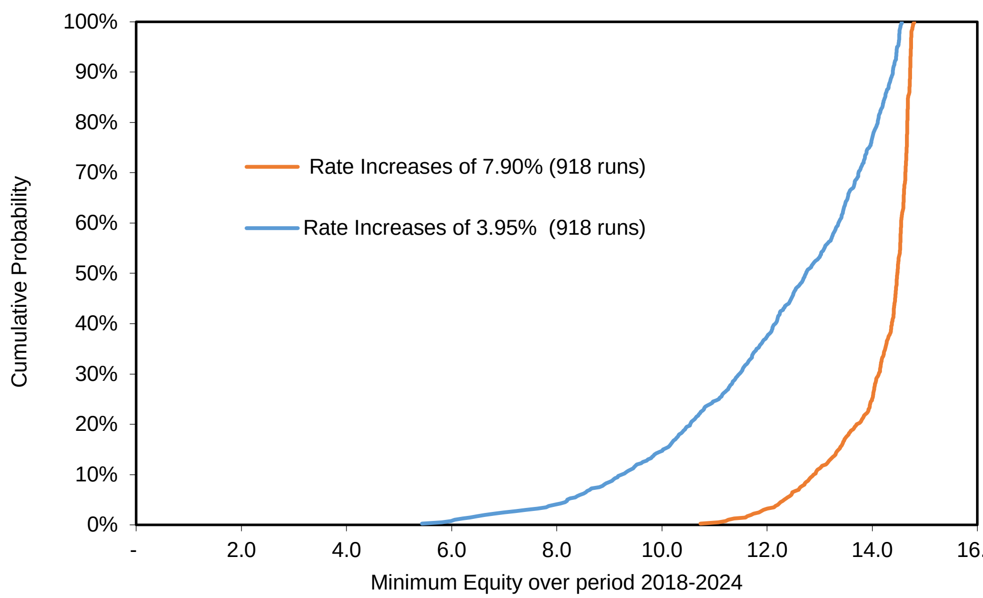
6.4.3 Impact of lower rate trajectory

As noted elsewhere in this report, IFF16 is based on the implementation of 7.90% rate increases for the first 5 years of the forecast, with increases thereafter to be in line with expected general price inflation (2.0%). Rate increases help to increase Manitoba Hydro's equity cushion. Manitoba Hydro, however, has also provided analyses of the impact of rate increases at a lower level, specifically at 3.95% over the entire projection period rather than at 7.90% in the initial years of the forecast. This lower rate trajectory follows that which had been assumed in IFF14 and IFF15.

To illustrate the impact of lower rate increases, we have prepared a cumulative probability chart that compares the two different rate trajectories in terms of the minimum equity values observed 2018 through 2024. Other assumptions are as for IFF16. Figure 6-15 shows that under the 3.95% trajectory, the risk that the equity ratio will fall below 10% is about 15%. In contrast, there is essentially no risk that the minimum equity ratio will fall below 10% under the 7.90% rate trajectory.

The probability distributions in this chart are based on an alternative scenario modelling approach than was used for earlier charts in this Chapter. For the runs summarized in Figure 6-15, Manitoba Hydro applied 102 water flow sequences against 3 energy price scenarios and 3 interest rate scenarios. This resulted in a total of 918 runs for each rate trajectory. Interest rate scenarios cover the consensus forecast, as well as plus/minus 1 percentage point. For the runs with a 7.90% rate trajectory, we confirmed that the distribution of outcomes is roughly similar to that for the same trajectory analyzed with the stochastic modelling approach with 15,300 runs as described earlier. Hence, the analysis with just 918 runs provides a reasonable assessment of the relative impacts of different rate trajectories on equity position.

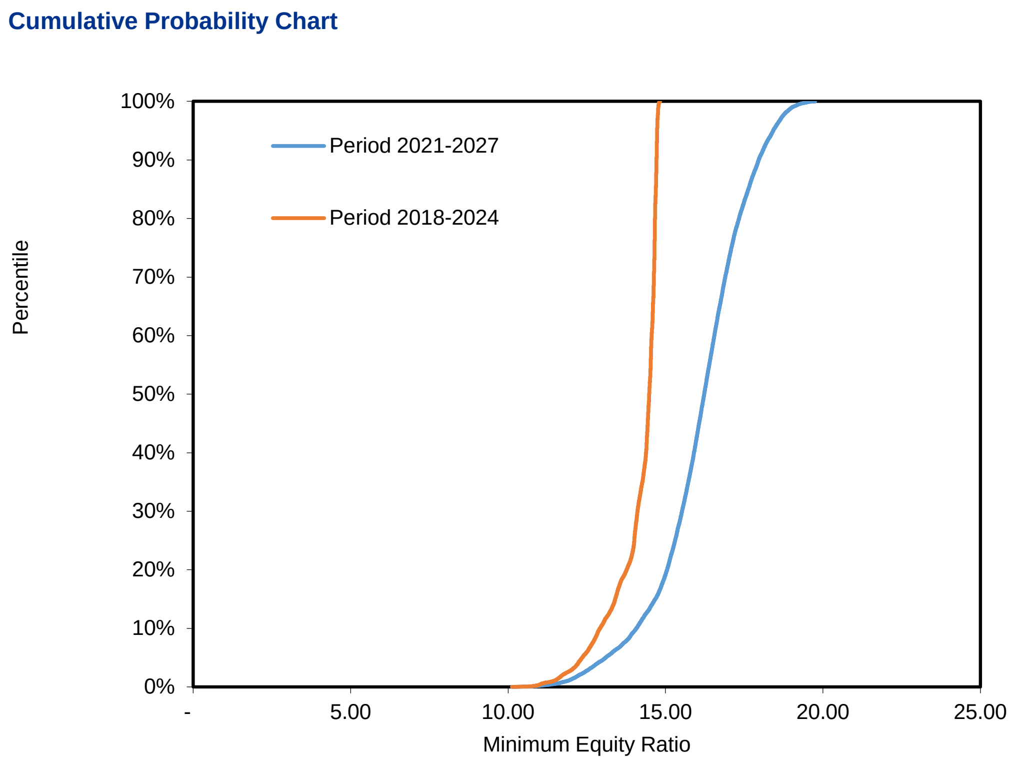
Figure 6-15: Minimum Equity Value Observed 2018 through 2024 – Alternative Scenarios for IFF16



6.4.4 Comparison of different time periods under IFF16

Figure 6-16 examines the minimum equity ratio observed over various periods for the IFF16 scenario modelling. The orange line is the same as in Figures 6-14 and 6-15 above. For the period 2021-2027, relative to 2018-2024, the distribution of minimum equity values broadens, covering a wide range of values, as indicated by the spread in values at the top and bottom of the distribution. This is not unexpected, given that the greater passage of time with a later summary period allows uncertainties to evolve and have greater impact on outcomes.

Figure 6-16: Minimum Equity Value Observed Under IFF16 Scenario Modelling – Alternative Time Periods



6.5 Changes in Equity

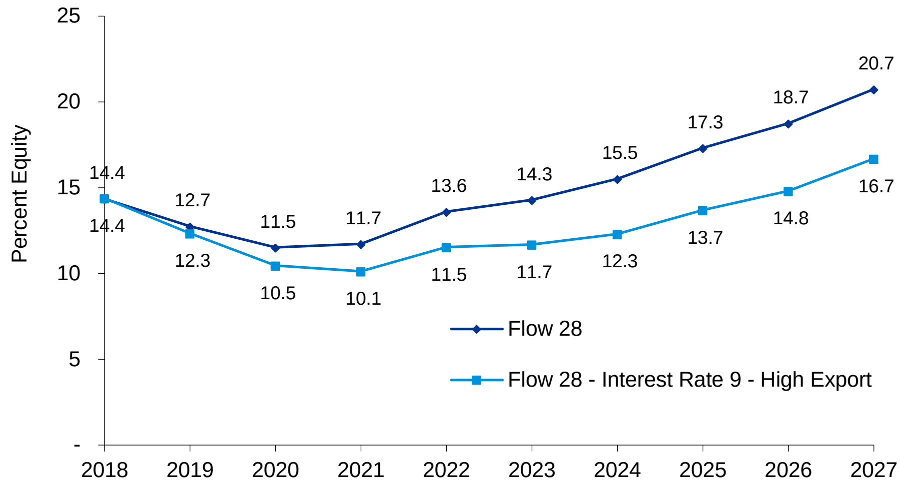
6.5.1 Analysis of selected scenarios

A particular concern for Manitoba Hydro is the potential for its equity position to deteriorate rapidly over a short time period as a result of adverse developments. Given the inherent variability in Manitoba Hydro's water flows, the potential for adverse developments is often closely associated with the potential for drought, particularly over a multi-year period. Other developments, however, such as increases in interest rates or a deterioration in export prices, can also contribute to a deterioration in financial position.

This potential for multiple factors to cause a deterioration in financial position is illustrated through Figure 6-17 below. Within this figure, we show two lines:

- Flow 28 shows the average results (in terms of equity ratio) for all runs associated with water flow sequence 28. This sequence was highlighted earlier in Figure 6–3 as contributing to the minimum average equity value observed in the years 2020 and 2021.
- The line labelled "F28 Ir9 High" shows an individual run from within the group of 150 runs associated with Flow 28. This line was highlighted because it shows a greater deterioration in equity ratios than the average. For the period 2018 through 2021, equity ratio declines by 4.3 percentage points even with the substantial rate increases proposed under IFF16; this drop is the largest decrease observed for this period amongst all 15,300 runs within the overall stochastic analysis. (The equity ratio falls from 14.4% to 10.1% over this period.)

Figure 6-17: Equity Ratio – Flow 28 Average and an Individual Run



Although the individual scenario "F28 Ir9 High" shows a notable fall, the following additional points should be noted:

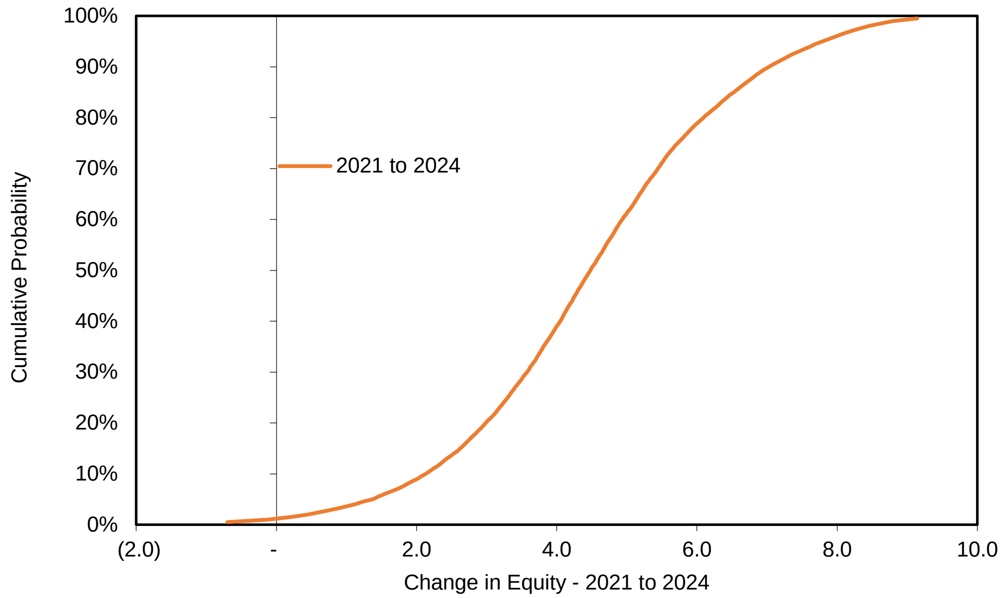
- Manitoba Hydro would likely seek to take corrective measures to ensure financial deterioration was minimized under any individual outcome.
- The scenario "F28 Ir9 High" can be assumed to be relatively improbable. It was selected because it had the worst equity drop in the period 2018 through 2021. Since it represents the maximum drop observed over 15,300 runs, it has a very small probability of occurring, assuming the various runs are equally probable and that input assumptions with respect to probability distributions are roughly accurate. (One individual run represents only 0.0065% of the total number of runs in the stochastic analysis; this number is calculated as 1 divided by 15,300).

Although any individual run may be relatively improbable, the example from Figure 6-13 highlights the fact that it may be useful to understand the probability distribution of changes in the equity ratio over multi-year periods. Events that put pressure on Manitoba Hydro's equity ratio over, say, a three to five year period, are a concern because of the difficulty that Manitoba Hydro has in bolstering its equity position through rate increases to compensate. It is difficult to raise rates quickly enough given lags in the regulatory process and general resistance to increases in rates that are above general price inflation. As a result and as noted in the May 2015 Report, the amount of additional equity that can, in practice, be made available through additional rate increases in the short term is small relative to the financial shocks that Manitoba Hydro can undergo. This was highlighted through the example provided in Section 7.9.1 of the May 2015 Report. Because we are interested in the probability of large reductions in Manitoba Hydro's equity position, we examine the probabilities of various reductions in the section below.

6.5.2 Analysis of overall results

To look at the overall distribution of equity ratio changes, we examined the change in equity ratio between 2021 and 2024 over the 15,300 runs included in the stochastic analysis. The cumulative probability distribution of the change in equity ratio is shown in Figure 6-18 below.

Figure 6-18: Change in Equity Value Observed 2021 to 2024



As noted above, the run with the largest decrease in equity ratio over this period had a fall in equity ratio of 2.81 percentage points. Over all runs, the "median" change in equity ratio was 4.48 percentage points, indicating that half of the runs showed an increase in equity of 4.48 percentage points or more. From a slightly different perspective, only 1.1% of runs had a decrease in equity. (This can be seen in Figure 6-18, where the line crosses the zero point on the "x" axis at a cumulative probability value of 1.1%.) Overall, the runs suggest that equity will likely increase over the period 2021 to 2024.

The line in Figure 6-18 was plotted using data for intervals of 0.5% probability, starting from a 0.5% cumulative probability level. As such the line does not capture or represent very small probability levels. Hence, the minimum value that appears on the graph is roughly (0.7) percentage points, rather than the true minimum value of (2.81) percentage points observed when examining the full data set. The approach of graphing values at 0.5% intervals was done for ease of graphical preparation and presentation.

Figure 6–19 takes the same approach as Figure 6–18, but looks at additional time periods. It adds data sets corresponding the change in equity value over the periods 2018 to 2021, and 2024 to 2027. Thus, it looks, in addition, at the 3-year periods before and after the 2021 to 2024 period used in Figure 6–18.

Figure 6-19: Change in Equity Value Observed – Alternative 3-Year Periods within IFF16

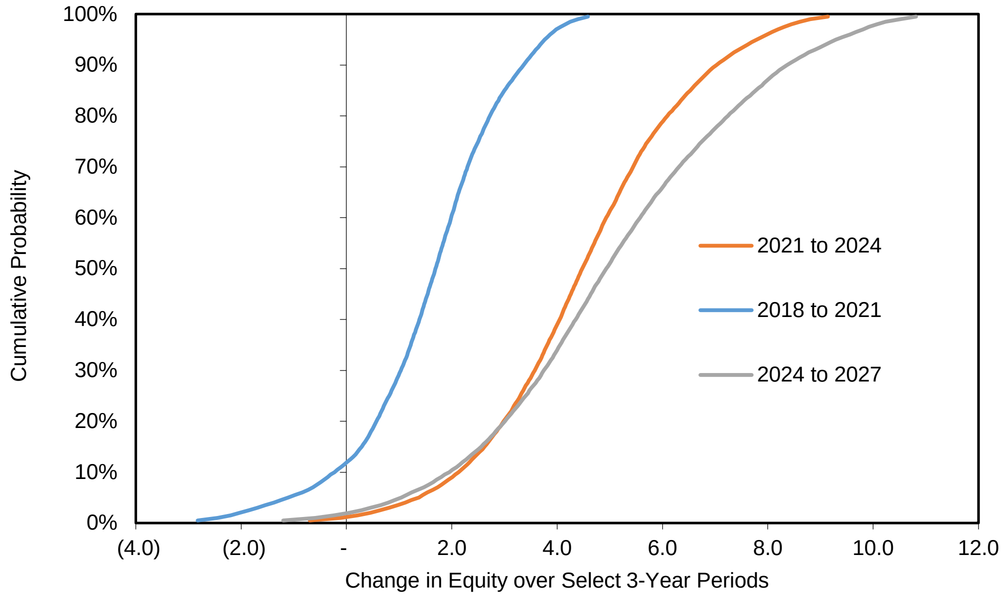


Figure 6-19 above shows that the probability of a decrease in equity ratio over a three-year lowers as you move farther out in time. About 12% of runs over the initial period from 2018 to 2021 showed a decrease in equity ratio. The share of runs with decreases in equity falls to less than 2% for the periods 2021 to 2024 and 2024 to 2027.

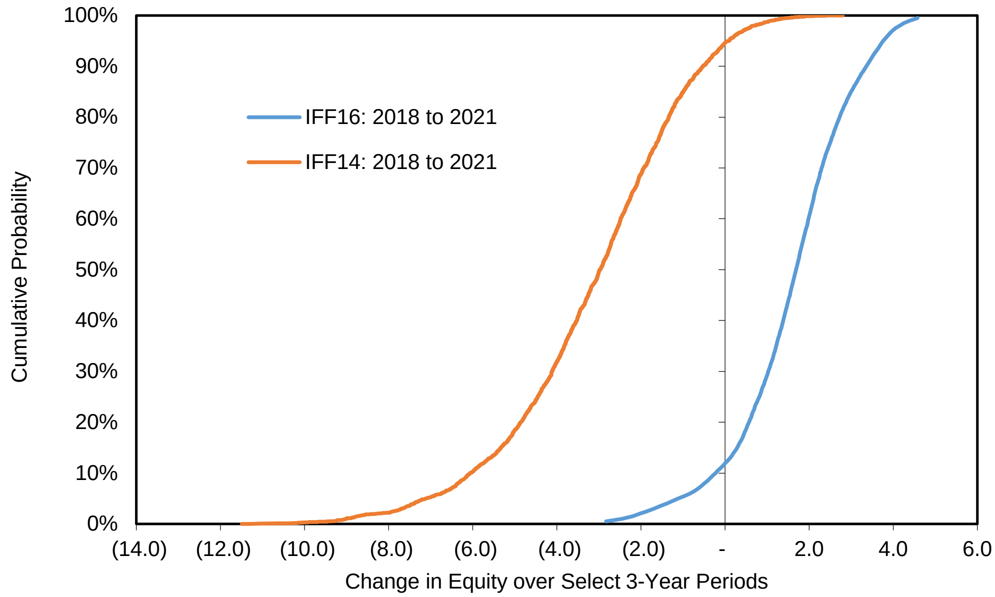
6.5.3 Comparison of IFF14 and IFF16

Figure 6-20 compares the probability distribution of changes in the equity ratio over the period 2018 through 2021 for IFF16 versus IFF14. It can be seen that the probability distribution shifts considerably to the right. Under IFF14, the median change in equity value (corresponding to the 50th percentile point on the orange curve) is about negative 3.0 percentage points. For IFF16, the same point is 1.66 percentage points (positive). The shape of the curves is roughly similar, although the distribution for IFF16 appears slightly steeper. This indicates that the spread in values for the change in equity is also smaller for IFF16 than for IFF14, suggesting relatively lower risk.

Figure 6-20: Change in Equity Value Observed – IFF16 versus IFF14



In summary:

- The shift in the distribution to the right indicates a much reduced risk of a fall in equity ratio over the period, consistent with the improved performance of IFF16 relative to IFF14 generally.
- The steeper curve for IFF16 implies that risks of deviating from expected values are also slightly smaller.

6.6 Summary Observations

Key conclusions to be drawn from the analysis in this chapter are the following:

- Forecast financial returns under IFF16 are better than those forecast under IFF14. This is mainly due to a financial plan that accelerates rate increases under IFF16 as compared to IFF14. As a result of this improvement in baseline financial condition, the risk of a fall in equity position to below zero, as observed in Manitoba Hydro's current scenario analysis, has been largely eliminated relative to the analysis for IFF14. This is consistent with a more robust financial condition.
- As expected, the dispersion observed in equity ratios under Manitoba Hydro's scenario analysis widens as you move farther into the future. (This can be seen from Figure 6-19.) The increase in dispersion simply reflects the fact that uncertainty is inherently greater as you move farther into the future.
- Water flow uncertainty remains the single largest risk factor with respect to results in the short term. This conclusion is based on examining the minimum average equity values observed when equity ratios under runs encompassing all interest rate and energy price scenarios are averaged for each water flow sequence, and the minimum value observed taken. (The results of this analysis are shown in Figure 6-3 and again in Figure 6-5.) Similar analysis for each interest rate scenario (averaging across water flows and energy price scenarios), and as summarized in Figure 6-2, shows higher minimum equity ratios throughout the forecast horizon. In addition, the analysis in Section 6.3.5 showed that water flow was the largest contributor to the range of outcomes, or difference between absolute high and low values observed.

7 Summary Observations

As noted in the background (section 1.3) to this supplementary update, KPMG reaffirms the recommendations in the May 2015 Report. These recommendations are that Manitoba Hydro should maintain the following:

- A long-term debt/equity target of 75/25 to 70/30, with a minimum of 85/15 during major capital programs.
- A minimum EBITDA interest coverage ratio target of 1.8 or greater.
- A minimum capital coverage ratio target of 1.2 or greater.

Manitoba Hydro relies on retained earnings as its sole source of equity. Thus, it requires sustained positive cash flow and net income to get back to its minimum equity target.

Further, as noted in the May 2015 Report, decreases in the equity ratio as a result of major capital expansions should be limited to 5 to 10 percentage points from the recommended target level of 25% to 30%. Implicit in these recommendations is that deviations from target should be for the minimum period of time possible.

Over the medium- to longer-term, we note that IFF16 provides for an improvement in Manitoba Hydro's financial outlook relative to that forecast in IFF14. However, this improvement is contingent on achievement of much higher rate increases under IFF16 than IFF14 in the near term (7.90% for five years versus 3.95% annually for 16 years in IFF14) and it takes into account current high reservoir levels, which help to increase forecast export earnings.

For 2017 and 2018, the projected equity ratio for Manitoba Hydro under IFF16 is actually below that originally forecast under IFF14. (See Chapter 2 of this update for a comparison of outlooks.) The EBITDA coverage ratio for 2017 is also lower for IFF16 versus IFF14. Relative investment risk, as measured by the ratio of projected investment to retained earnings, is also considerably higher now than forecast in IFF14. (See Figure 2-7.) Further, projected capital expenditures as a percent of the current asset base are significantly higher at Manitoba Hydro than at BC Hydro, Hydro Quebec and NB Power. (See Figure 4-22.)

Developments in other provinces illustrate the risks that can impede improvements in a utility's financial position, notwithstanding initial plans:

- At Nalcor, cost increases for the Lower Churchill Falls project have significantly increased the amount of equity capital that will be needed to support project completion.
- As outlined in its 2017-2018 Strategic Plan, NB Power is projecting a delay of three years in reaching its 20% equity target (to Fiscal 2024 from Fiscal 2021). This partly reflects decreases in load growth.
- As a result of reduced load growth, BC Hydro projects much larger growth in its rate smoothing deferral account (to $1.59 billion).

In comparing government-owned power utilities in Canada, we note that Manitoba Hydro remains at the low end of power utilities in terms of key financial metrics including equity ratio, interest coverage ratio, and cash flow comparison metrics. The gap in Manitoba Hydro's performance versus most other utilities has widened since the May 2015 Report.

Manitoba Hydro still has very competitive electricity rates compared to other Canadian and North American jurisdictions, giving the utility some flexibility in raising rates to respond to its current financial challenges.

Standard and Poor's downgraded the Province of Manitoba's debt rating in 2016 from "AA" to "AA-" and downgraded again in 2017 from "AA-" to "A+", citing fiscal deficits and significant debt loads at Manitoba Hydro. Most notably, Standard and Poor's indicated that it no longer considers Manitoba Hydro to be self-supporting. Moody's has also highlighted increasing debt loads at Manitoba Hydro as a concern and, although it continues to consider the utility to be self-supporting, it too has downgraded the Province of Manitoba's credit rating since the May 2015 Report.

DBRS, in November 2016, cited Manitoba Hydro's request for rate increases greater than 3.95%, "if actualized", as a positive factor for the utility's financial profile. While DBRS continues to view Manitoba Hydro as self-supporting, it noted that it could consider reclassifying a portion of Manitoba Hydro's debt to be tax-supported if the financial health of the utility deteriorates such that its expenses cannot be recovered in rates.

As noted in Chapter 5, the combined debt of the Province of Manitoba and Manitoba Hydro has significantly increased in the past two fiscal years, and Manitoba Hydro's share of Provincial borrowing, guarantees and obligations now exceeds 40%.

The scenario analysis in Chapter 6 suggests that Manitoba Hydro has an improved financial outlook under IFF16 than under IFF14. However, this improvement is largely contingent on higher rate increases. As shown in Figure 6-15, the distribution of minimum equity values observed over the period 2018 through 2024 is both wider and much lower if rate increases of only 3.95% are implemented. Even with 7.90% rate increases, uncertainty modelling shows that the median value for equity ratio begins to recover only after 2020.

All of these factors suggest that a continued focus on improving Manitoba Hydro's financial position is paramount to prudent risk management. Manitoba Hydro is in an environment of continued uncertainty and inherent business risk. In the near term, Manitoba Hydro remains particularly vulnerable to interest rates and drought as its debt leverage increases substantially to complete the Keeyask and Bipole III projects. In the longer term, water flow uncertainty will remain the paramount factor in evaluating appropriate financial targets. This and other fundamental business risks have not changed for Manitoba Hydro since the May 2015 Report, reinforcing the need to maintain its financial targets.

PREAMBLE TO IR (IF ANY):

QUESTION:

Quantify all payments to Government included in the forecast, by year, for Keeyask (by component) and for Bipole III (by component) and also as a percentage of MH's gross revenues.

RATIONALE FOR QUESTION:

RESPONSE:

The following tables quantify payments to the Government for the Keeyask and Bipole III projects. Please note the following assumptions:

- Water rental payments have been assigned based on the forecasted supply for the Keeyask Generating Station. No such payment is applicable to Bipole III.

- Manitoba Hydro issues debt based on the consolidated cash requirements of the Corporation and does not assign specific debt issues on a project-by-project basis. As such, the Provincial Guarantee Fee (PGF) attributable to a specific project is estimated for the purposes of this analysis by applying the 1% PGF to construction work in progress until the asset is in-service and the net book value (projected in-service cost net of accumulated depreciation) thereafter.

- Capital taxes are estimated by applying a fixed 0.5% capital tax rate to construction work in progress until the asset is in-service and the net book value thereafter. Similar to finance expense, the use of net book value as a proxy for paid up capital to estimate capital taxes may result in implied impacts to customers for each project that are not representative.

Tab 153

Undertaking #65 (Transcript pages 6459 - 6465)

MIPUG to provide a table similar to Board counsel book of documents Exhibit PUB-42-4, page 322, depicting one (1) to two (2) year water rentals paid for BC Hydro; as well as a table showing water rentals paid for Hydro Quebec, to include for the time period selected provincial payments as a percentage of gross revenue.

Response:

Government charges for crown-owned electric utilities compared to Manitoba Hydro (including Hydro Quebec, BC Hydro, Newfoundland Labrador Hydro, SaskPower and New Brunswick Power) are provided below in Table 1. Government charges as paid by these utilities are split by category including: water rentals, provincial guarantee fee, capital & other taxes and other government charges as applicable.

The information also separately shows dividend payments. The structure of dividend payments is in many cases (e.g., Hydro Quebec) not a typical "government charge" of the types noted above, but rather a payment to the government as investor tied to the risks and performance of the utility. Dividends can be specifically relevant in cases where (a) the government invested equity funds, (b) the government separately undertakes risks and rewards related to export sales, and/or (c) the government establishes rate directives whereby rates are established to fund returns on equity.

For comparison purposes gross electricity operations revenue and provincial payments as a percentage of gross revenue is provided, similar to the table in Exhibit PUB-42-4, page 322. For all but Hydro-Quebec the 2018/19 forecast year is provided[1]. Gross revenues provide one basis to compare these total government charge payments to government by different crown utilities; however, circumstances differ among these utilities. Charges on capital and debt are perhaps best compared based on debt or capital, rather than based only on revenues. Water rental overall charges reflect hydro generation levels, charge rates for use of water resources, and may also reflect the extent that utility hydro generation can earn attractive revenues in export markets. Overall, charge rates for water rentals, debt and capital may also vary depending on the whether assets are major new developments versus long-established facilities.

Attached to this response are relevant documents already on or previously on the record and therefore available to the Board on this topic, including:

[1] As Hydro-Quebec generation rates are not regulated, forecast government charges are not easily available. Therefore actual amounts from the most recent 2016 Annual Report are provided.

1. MH/MIPUG (Bowman) – 4 which includes background on utilities including BC Hydro, Newfoundland and Labrador Hydro and Hydro-Quebec regarding equity investment made by owner, dividend payments, debt guarantee fees, etc.
2. From Manitoba Hydro's Appendix 4.5, Updated Financial Target Review Report by KPMG, Section 5.2.2: Government Contributions from public-owned Power Utilities (pages 59-61), including Figure 5-5: Contributions Paid to Governments from Public-Owned Canadian Power Utilities
3. Exhibit MIPUG-26 in the NFAT Review (Response to Undertaking 144) with various examples of government support or intervention in projects to deal with rate pressures.

Topic:			
Subtopic:			
Issue:			

PREAMBLE TO IR (IF ANY):

Mr. Bowman cites the price charged for electricity by BC Hydro, Yukon, Northwest Territories, Newfoundland and Labrador and Nova Scotia as being regulated based on a cost of service approach and indicates that Manitoba Hydro also fits into this category. Manitoba Hydro would like to understand the comparability of the cited utilities.

QUESTION:

a) For each of the utilities cited in the above reference, and for Hydro Quebec, please indicate:
   i. Ownership type (e.g. Crown, privately held shareholder, municipal)
   ii. Are equity investments made by the owner?
   iii. Is a rate of return charged on equity?
   iv. Are dividend payments made?
   v. Is the utility's debt guaranteed by government? If so, what is the guarantee fee?

RESPONSE:

(a)

The citation in question is referring to the model of regulation used by a jurisdiction, not necessarily a given utility within the jurisdiction.

In respect of the electrical utilities in the jurisdictions noted (British Columbia, Yukon, Northwest Territories, Newfoundland and Labrador and Nova Scotia), as well as Quebec:

i. Ownership type:

   a. British Columbia – mix of public, private and municipal.

   b. Yukon – mix of public and private.

c. Northwest Territories – mix of public and private.

d. Newfoundland and Labrador – mix of public and private.

e. Nova Scotia – understood to be a mix of private and municipal.

f. Quebec – understood to be a mix of public, municipal and cooperative.

ii. Equity investment made by the owner: This question is not meaningful in respect of private utilities, and information on municipal and cooperative utilities are often unavailable (plus these utilities are typically small and sometimes numerous). Focusing only on the publicly owned utilities:

a. The only example Mr. Bowman is aware of recently where an equity investment was made to a Crown Corporation per se is Newfoundland and Labrador Hydro, where the government of the day contributed $100 million in equity[1] along with waiving annual debt guarantee fee charges for a period. This was part of implementing recapitalization based on making Newfoundland Hydro equivalent to the profit-earning private utility in the jurisdiction (Newfoundland Power). The effect of this measure was to impose upward rate pressures on customers to ensure the utility earned a larger return on equity than has been the case in earlier rate proceedings through the 1990s and 2000s.

b. In the case of BC Hydro, while not an equity investment per se, Mr. Bowman is aware that the utility has in the past been prescribed to earn a large return on equity (equal to the fair return that a private sector utility would earn, plus the taxes that a private sector utility would pay despite the fact that BC Hydro is non-taxable) and pay a significant portion of that return on equity to the government in the form of a dividend. (as reviewed at Manitoba Hydro hearings over the years, notwithstanding that BC Hydro pays this dividend, it has traditionally paid a much smaller share of rate revenue to government than Manitoba Hydro since BC Hydro pays much lower charges in other areas like debt guarantee fees). The BC Government has foregone this entitlement to a dividend as part of addressing the capitalization of BC Hydro and rate relief, including as part of current efforts to address cost pressures related to Site C (per OIC 095-2014, dividends are to be suspended until BC Hydro reaches a debt:equity level of 60:40; as such, the equity increases are being funded by government foregone dividends). Although this is not an equity investment per se, it serves to function as a government support to major capital projects.

[1] http://www.releases.gov.nl.ca/releases/2009/nr/0617n04.htm.

iii. **Return on Equity:** In all cases Mr. Bowman is aware of, private sector utilities earn a rate of return on equity. Typically municipal utilities and cooperatives are not set up to enshrine a formal return on equity measure. In the case of publicly owned utilities, each of BC Hydro, Yukon Energy, Northwest Territories Power, and Newfoundland Hydro earn a return on equity but in each case because the respective provincial government has explicitly included a provision for such return in legislation or government policy. Mr. Bowman is not versed in the setting of rate for Hydro Quebec in respect of a return on equity.

iv. **Dividend payments:** In respect of private utilities, it would be understood that dividend payments are the norm. For municipal or cooperative utilities, Mr. Bowman cannot generalize, though there are examples Mr. Bowman is aware of that do earn positive financial returns for municipal governments. In respect of publicly owned utilities:

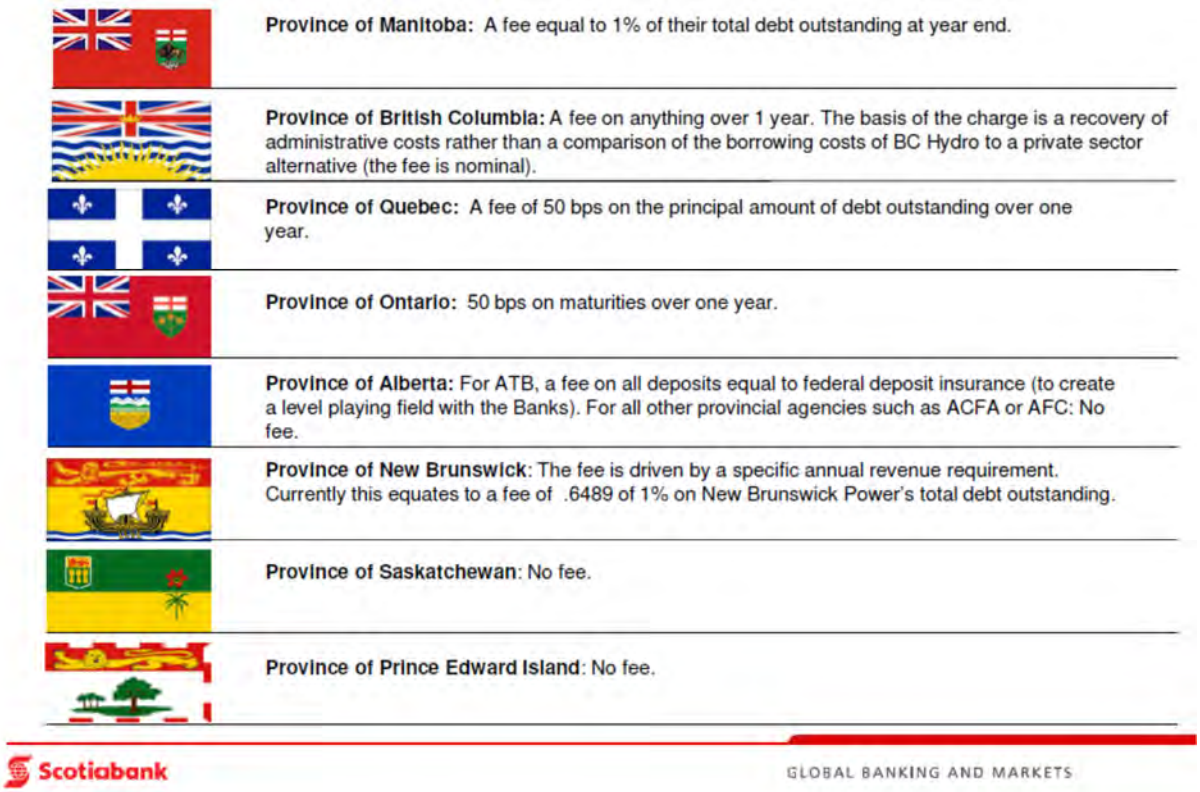
   a. the situation of BC Hydro is described above in item (ii).

   b. Hydro Quebec and Yukon Energy pay dividends to their respective shareholders. It is not known whether Hydro Quebec derives dividends from the regulated business or only from the non-regulated power generation functions.

   c. Northwest Territories Power and Newfoundland Hydro are not making dividend payments from the regulated businesses.

v. **Debt guaranteed by government and fee charged:** This question is assumed to only relate to publicly owned (provincial) utilities. The latest information available to Mr. Bowman on debt guarantees and guarantee fees is from a 2013 Newfoundland Hydro hearing,[2] summarizing the work of Scotiabank Government Finance as follows:

[2] http://www.pub.nf.ca/applications/NLH2013GRA/files/rfi/PUB-NLH-061.pdf.



Province of Manitoba: A fee equal to 1% of their total debt outstanding at year end.

Province of British Columbia: A fee on anything over 1 year. The basis of the charge is a recovery of administrative costs rather than a comparison of the borrowing costs of BC Hydro to a private sector alternative (the fee is nominal).

Province of Quebec: A fee of 50 bps on the principal amount of debt outstanding over one year.

Province of Ontario: 50 bps on maturities over one year.

Province of Alberta: For ATB, a fee on all deposits equal to federal deposit insurance (to create a level playing field with the Banks). For all other provincial agencies such as ACFA or AFC: No fee.

Province of New Brunswick: The fee is driven by a specific annual revenue requirement. Currently this equates to a fee of .6489 of 1% on New Brunswick Power's total debt outstanding.

Province of Saskatchewan: No fee.

Province of Prince Edward Island: No fee.

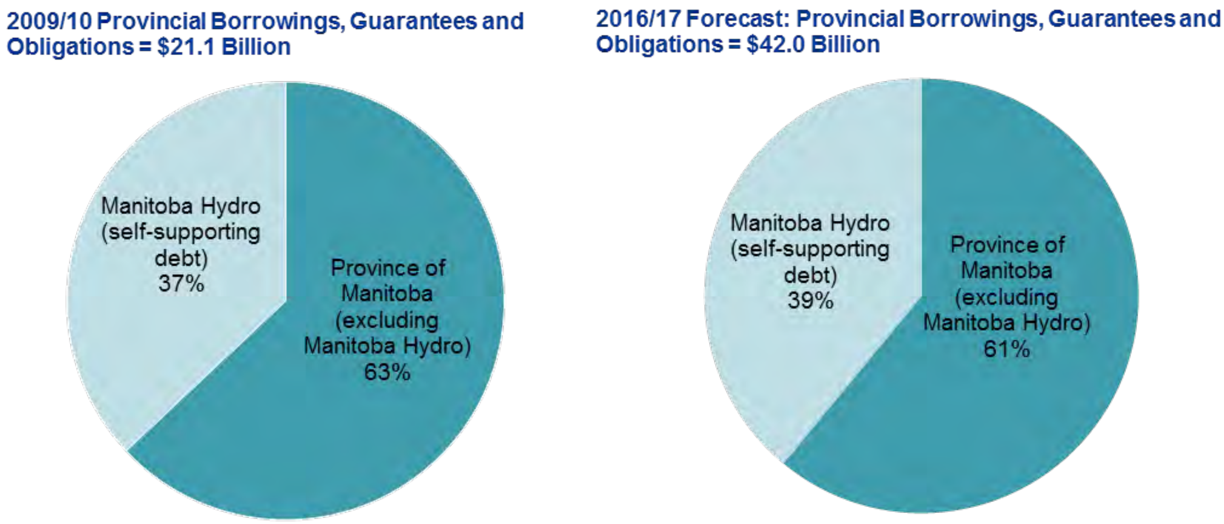
Scotiabank GLOBAL BANKING AND MARKETS

In respect of total amounts paid, Mr. Bowman's most current evidence is from the submission of KPMG in Appendix 4.4 (KPMG's Figure 5.5). This figure highlights the scope of payments made by each of the utilities, including as a percentage of the revenues charged and on a per capita basis.

Figure 5-5: Contributions Paid to Governments from Public-Owned Canadian Power Utilities (FY2016 or FY2016/17 in annual $ millions)

	Manitoba Hydro	BC Hydro	Hydro-Quebec	NB Power	Nalcor
Dividend (1)	n/a	$259	$2,146	n/a	n/a
Debt guarantee fee	$136		$218	$32	$4.5
Water rental charges	$131	$349	$673		$4.9
Property, capital & other taxes	$135	$234	$372	$43	not available
Total	$402	$842	$3,409	$75	$9.4
Total % revenues	17%	14%	26%	4%	1%
Per Capita (rounded dollars)	*$305*	*$177*	*$409*	*$99*	*$18*

Figure 5-4: Province of Manitoba Borrowings, Guarantees and Obligations, 2009/10 and 2016/17 Forecast



Source: 2009/10 from Province of Manitoba 2014 Budget Summary Financial Statistics. 2016/17 forecast from Province of Manitoba 2017 Budget Summary Financial Statistics. (Provincial borrowings, guarantees and obligations are net of sinking funds.)

5.2.2 Government contributions from public-owned power utilities in Canada

Figure 5-5 provides a breakdown of contributions paid to governments from Manitoba Hydro and four other government-owned power utilities in the peer group. Of these five government-owned power utilities, only BC Hydro and Hydro-Quebec currently pay a direct annual dividend to their provincial owner. In both cases, dividends are based on a formula and are capped to ensure that a minimum equity ratio is maintained.

Most government-owned utilities pay a debt guarantee fee based on a percentage of outstanding debt to their respective provincial owner.

- Manitoba Hydro pays a 1.0% fee on outstanding applicable debt, which is the highest percentage fee in the group. The Province of Manitoba's debt guarantee fee was increased from 0.5% to 0.65% effective April 1, 2000 and to 0.95% effective April 1, 2001. [37] The fee was subsequently increased to 1.0% during fiscal 2006/07.
- NB Power pays a 0.65% fee on outstanding debt.
- Hydro-Quebec pays guarantee fees to the Quebec government related to debt securities. In 2014, these fees were $205 million in 2014 which represents slightly under 0.5% on outstanding debt. [38]
- In 2008, the Government of Newfoundland and Labrador temporarily waived the guarantee fee paid by Nalcor until 2011. Upon reinstatement in 2011, the fee was reduced from 1.0% of outstanding debt to a fee of 0.5% on outstanding debt with a remaining term of over 10 years and 0.25% on outstanding debt with a remaining term of under 10 years. The new fee rates were designed to better reflect the value of the debt guarantee, and are based on a comparison of yields on bonds issued by the Province to bonds with similar maturities issued by a group of investment-grade

[37] PUB Board Order 7/03, p. 26.

[38] Hydro-Quebec 2014 Annual Report. Financial statements Note 6.

utilities comparable to Hydro.[39] NLH's recent rate application notes the cumulative impact of these fee initiatives to 2015 is $62.3 million.[40]

In fiscal 2016/17, Manitoba Hydro paid $136 million in debt guarantee fees to the Province of Manitoba, an amount that is expected to increase significantly over the next five years as borrowings ramp up to complete major generation and transmission projects.

Manitoba Hydro, BC Hydro and Hydro-Quebec pay annual water rental charges to their respective provinces. Manitoba Hydro's water rental charge is $3.34 per MW, which is a similar rate to Hydro-Quebec, and significantly lower than BC Hydro, which pays $6.896 per MW plus capacity charges. Under the *Water Power Act*, the Province of Manitoba approximately doubled water rental rates to its current level of $3.34 per MW effective April 1, 2001. Manitoba Hydro paid $131 million to the Province of Manitoba in water rental charges in 2016/17.

All utilities pay local property and related taxes in their respective jurisdictions. In addition to these taxes, Manitoba Hydro pays capital taxes to the Province of Manitoba ($84 million in 2016/17), and Hydro-Quebec pays a Provincial Public Utility Tax to the Government of Quebec.

Figure 5-5: Contributions Paid to Governments from Public-Owned Canadian Power Utilities (FY2016 or FY2016/17 in annual $ millions)

	Manitoba Hydro	BC Hydro	Hydro-Quebec	NB Power	Nalcor
Dividend (1)	n/a	$259	$2,146	n/a	n/a
Debt guarantee fee	$136		$218	$32	$4.5
Water rental charges	$131	$349	$673		$4.9
Property, capital & other taxes	$135	$234	$372	$43	not available
Total	$402	$842	$3,409	$75	$9.4
Total % revenues	17%	14%	26%	4%	1%
Per Capita (rounded dollars)	*$305*	*$177*	*$409*	*$99*	*$18*

Note: derived from annual reports and financial statements, for the year-ending March 31, 2017 for Manitoba Hydro, BC Hydro and NB Power and for the year-ending December 31, 2016 for Hydro-Quebec and Nalcor.

(1) No dividends are paid by Manitoba Hydro, NB Power and Nalcor. For Hydro-Quebec, dividend paid the Quebec government is 75% of net income; no dividend if it effectively reduced the cap rate/equity ratio to less than 25%. For BC Hydro, dividend is 85% of net income, subject to an 80:20 debt to equity cap. Dividend for the year ending March 31, 2016 and for the year ending March 31, 2017 is less than 85% due to the cap. Special Directives from the Province of BC define a minimum annual payment which was $259 million for the 2016/17 fiscal year. Note that BC Hydro's dividend payments to the Province of BC have been higher in previous years.

[39] Newfoundland and Labrador Hydro – 2013 General Rate Application, p. 3.31.

[40] Newfoundland and Labrador Hydro – 2013 General Rate Application, p. 3.32.

Based on information disclosed in annual financial statements, as noted in Figure 5-5, Manitoba Hydro's payments to government represent approximately 17% of total revenues. This is a similar share to BC Hydro (although BC Hydro's dividend payments to the Province of B.C. have been lower in recent years), a much higher proportion than government-owned utilities in Atlantic Canada, but significantly lower than Hydro-Quebec. Hydro-Quebec contributes approximately 26% of its total revenues to government, with nearly two-thirds of its government contributions in the form of dividends to its owner.

5.3 Summary Observations

Key conclusions from the analysis in this chapter are the following:

- Since the May 2015 Report, two credit rating agencies have issued a total of three credit downgrades for the Province of Manitoba. One credit rating agency no longer views Manitoba Hydro debt as self-supporting due to high and rising leverage. Two other credit rating agencies continue to view Manitoba Hydro as self-supporting.
- The combined debt of the Province of Manitoba and Manitoba Hydro has significantly increased in the past two fiscal years, and Manitoba Hydro's share of Provincial borrowings, guarantees and obligations now exceeds 40%.

REFERENCE: Undertaking #144, Transcript page 10,242

QUESTION:

a) MIPUG panel to provide brief summary of various examples of government support or intervention in projects to deal with rate pressures; also to look into examples of relief to ratepayers and, if available publicly, relief between government and other stakeholders, including First Nation government.

ANSWER:

(a)

As requested, Mr. Bowman has appended the information available to him at this time in regard to government support for energy developments, to address either (a) government protection for identified risks, (b) government support for projects that would otherwise have early-years upward pressure on rates, and (c) in some cases outright government subsidies of projects. Please note that Mr. Bowman did not identify any readily summarized examples (i.e., public information) for federal/provincial/territorial government relief for First Nation government investors in energy projects. The information is separated below by province.

Additional examples of government support on projects has been provided on the record in response to MH/MIPUG I-3.

PRINCE EDWARD ISLAND

PEI-New Brunswick Cable Interconnection

In the absence of indigenous resources for hydroelectric development, PEI connected to New Brunswick's electricity system through an underwater cable. The underwater cable was to be owned by the Province of Prince Edward Island and leased to the investor owned utility, Maritime Electric (ME). In 1977, the province took advantage of federal funding that was not available to ME in order to build the cable. The cost was approximately $36 million of which the federal government contributed $18 million and financed another $9 million at Crown corporation rates. The province financed the remaining $9 million. The debt was set up to be repaid in thirty equal annual instalments of principal and interest.

Maritime Electric built the cable under the Interconnection Lease Agreement whereby ME made annual payments to the provincial government equivalent to the financing charges. It was intended that once the debt was retired, ME will continue to lease the cable for $1 per year. The lease also provided that either ME or the province could propose any additions or alterations to the interconnection and the province had the option of financing these additions or let ME do so.

NEW BRUNSWICK

Point Lepreau Nuclear Station

The Government of Canada established a policy of co-financing any first application of Canada Deuterium Uranium (CANDU) nuclear technology in a Canadian province. In the case of the Point Lepreau, the initial agreement provided for federal loans at Crown corporation rates to cover 50 per cent of the capital costs of the plant. However, final costs exceeded the initial estimates by multiples and consequently the ceilings on federal loans were raised above the initially planned levels. The loans represented approximately 25 per cent of the final $1.4 billion total cost. In addition to the commercial aspects of this loan, the Government of Canada forgave interest payments on its loan for the first three years of operation up to a maximum of $102 million. The loans were repayable in equal annual instalments of principal and interest over 25 years. On April 1, 1993, New Brunswick Power repaid the full amount of the loans to Atomic Energy Canada Limited[1].

A more unique feature of the Point Lepreau arrangement was that Canada agreed to make performance loans to New Brunswick Power if the generating station operated below 75 per cent of capacity. This loan commitment is to a maximum of $49 million in any one year up to $130 million overall. These loans were to be repaid when the facility was operating at above 75 per cent capacity.

[1] NB Power 1993/1994 Annual Report.

<u>HVDC Interconnection with Quebec</u>

Through its agent Northern Canada Power Commission (NCPC), a federal Crown corporation, the federal government lent money to New Brunswick Power, at federal Crown corporation rates, to construct the HVDC transmission line from Quebec. The line was constructed in the early 1970s in conjunction with the world's largest converter station on the Eel River (bordering between New Brunswick and Quebec). The converter was designed to allow the Hydro-Quebec Power Commission and the New Brunswick Power Commission to exchange large amounts of power. The loans from the federal government were at rates varying from 4.5% to 8.5% and were to be repaid in equal principal and interest instalments to the year 2011.

NEWFOUNDLAND

<u>Bay d'Espoir</u>

The first major hydro development on the Island, Bay d'Espoir, was constructed in the mid-1960s. This project was funded $20 million (out of an estimated $90 million cost) by the federal government through the Atlantic Development Board.

<u>Roddickton</u>[2]

In 1981, the Roddickton small-scale hydroelectric generating plant (425 kW) was officially opened at White Bay, Newfoundland. The $1.2 million plant was largely funded by the federal government to show the potential of using indigenous energy sources to displace oil.

MANITOBA

<u>Hydro development on the Nelson River – Initial Investigations</u>

The Federal Government entered into a series of agreements to share equally with both the government of Manitoba and Manitoba Hydro the cost of investigating the hydroelectric potential along the Nelson River. Under this arrangement, the Nelson River Programming Board would be responsible for pre-feasibility support to assess the merits

[2] Natural Resources Canada: Canadian Energy Chronology: http://www2.nrcan.gc.ca/es/es/EnergyChronology/index_e.cfm, Viewed on May 8, 2007.

of and prepare a plan for developing hydro power on the Nelson. The initial study, conducted between 1963 and 1964 resulted in an in depth feasibility study, completed in 1968. The initial study under the cost-sharing agreement was $1.3 million, and the subsequent cost for further feasibility studies was an estimated $3 million[3][4].

<u>Nelson River Transmission</u>

In 1966, Manitoba and Canada signed an agreement (Canada-Manitoba Nelson Transmission Line Agreement) that enabled the development of Manitoba's hydro potential on the Nelson River. Canada, through its agent Atomic Energy of Canada, agreed to build an HVDC transmission line between Nelson River and Winnipeg as well as the converter stations and the related microwave communication system. Without this agreement Manitoba Hydro's next best alternative would have favoured thermal generation in southern Manitoba.

Atomic Energy of Canada owned the transmission line, and under the agreement it leased the line to Manitoba Hydro. From 1971, payments to Canada were based on a share of the revenue from sales of electricity over the line; however, the payments fell far short of the annual interest payments (interest rate of 5.625 per cent). In 1977 a repayment schedule was worked out that gradually increased from $2.5 million in 1977/78 to $22.5 million in 1988/89. Any balance remaining at that time was to be amortized over the next thirty years (to 2018/2019) at the original 5.625 per cent interest rate. Unpaid interest accrued to capital which increased from an initial sum of approximately $227 million to approximately $370 million as at 1987. This lease back arrangement enabled Manitoba Hydro to develop the Kettle Rapids hydroelectric generating station, which would not have been viable had the HVDC line been capitalized with the project.

Lease payments for the transmission line were structured to provide economic relief to ratepayers in the early years of development, with anticipated higher rates during the later years.

[3] Natural Resources Canada: Canadian Energy Chronology: http://www2.nrcan.gc.ca/es/es/EnergyChronology/index_e.cfm, Viewed on May 8, 2007.
[4] Manitoba Hydro: A History of Power in Manitoba: 1963. http://www.hydro.mb.ca/corporate/history/history_master.html Viewed on June 12, 2007.

In 1991-1992, Manitoba Hydro bought-out the lease agreement for $198.1 million, resulting in lower charges to operations in the future than had they continued with the arrangement[5].

<u>Nelson River Environmental Investigations</u>

Finally, to ensure that social, economic and environmental interests were fully explored during the development of the Nelson River projects, the federal and Manitoba governments initiated a $2 million study of the Lake Winnipeg Regulation, Churchill River Diversion that ultimately led to the Northern Flood Agreement with the affected northern Manitoba First Nations, and agreements with the cities of Thompson and Churchill[6].

<u>Development of Related Infrastructure</u>

Provincial Highway 280 (from Thompson to Gillam) was built by the Government of Manitoba to facilitate hydro development on the Nelson River system, as well as provide year-round road access to the community of Split Lake.

YUKON

<u>Canada Flexible Term Note – Whitehorse Hydro Facility Fourth Wheel</u>

In 1987, ownership of the Northern Canada Power Corporation (NCPC) was transferred from the Federal Government to the Yukon Energy Corporation (YEC), a wholly owned subsidiary of the Yukon Development Corporation (YDC).

At the time, one of the utility's major customers was a lead/zinc mine located at Faro. This mining operation was recognized as a major risk to the utility operations as the mine had recently been shut down (1982) due to metal market conditions.

In the mid-1980s, NCPC had developed a fourth turbine at the Whitehorse Hydro facility (called Whitehorse #4) to increase the installed capacity of the facility from 20 MW to 40 MW. The unit was added to displace diesel generation costs associated with the Faro

[5] Manitoba Hydro-Electric Board (1992) 41st Annual Review.
[6] Manitoba Hydro (1996) History and First Order Effects: Split Lake Cree Post Project Environmental Review, Vol 2.

Mine; however, the unit was of no value when the Faro mine was closed as the system had substantial surplus hydro and no export connections to sell the power.

Although the Faro Mine reopened during the period of the negotiations between Canada and Yukon to buy the NCPC Yukon-based assets, Yukon was reluctant to assume the full risks associated with Whitehorse #4 given that the mine could close again. The parties resolved a mechanism for a “Flexible Term Loan” from Canada to Yukon for $40 million. This loan provided that Canada would receive annual principal payments of $1 million and interest of 7% when the unit was fully required (the annual system sales were above 310 GW.h), and all interest was forgiven and principal deferred when the unit was not required (system sales below 200 GW.h). In the range of 200 and 310 GW.h, the interest and principal payments were adjusted on a linear sliding scale. All principal not paid would be deferred and all interest not paid in any year would be forgiven. As such, Canada retained all load-related risks associated with the unit.

<u>Mayo-Dawson Transmission Project – Yukon Development Corporation Financing</u>

Yukon Energy developed the Mayo-Dawson transmission line in 2001-2003 to allow otherwise surplus hydro at Mayo to be used to displace diesel generation at Dawson. The project received support from the Yukon Development Corporation (a Yukon Crown Corporation, and the sole shareholder of Yukon Energy) in two ways:

One-time contribution: Yukon Development Corporation (YDC) has provided $5.75 million in non-repayable contributions to Yukon Energy to offset project costs including $4 million for overall project costs, and $1.75 million for targeted items that could not otherwise be justified within the scope of the Mayo-Dawson project. YDC has also provided $50,000 for acquisition of additional land at the Calliston site that is not now repayable but will become repayable (without interest) should Yukon Energy decide to relocate the Dawson diesel plant to this location in the future.

Flexible financing: YDC provided $18 million in debt under a new “flexible financing” plan. Yukon Development receives principal repayments of $450,000 a year (1/40 of the principal). In addition, Yukon Development receives interest payments that are the lesser of 6.55% or the maximum Yukon Energy can afford to pay from the diesel savings – with the net result that the total cost to Yukon Energy for the project will in no year be above what it would have cost to serve Dawson using diesel generation power.

THE ENVIRONMENT ACT
LOI SUR L'ENVIRONNEMENT

Manitoba

LICENCE

Licence No. / Licence n° 3055

Issue Date / Date de délivrance August 14, 2013

In accordance with *The Environment Act* (C.C.S.M. c. E125) /
Conformément à la *Loi sur l'environnement* (C.P.L.M. c. E125)

Pursuant to Section 12(1) / Conformément au Paragraphe 12(1)

THIS LICENCE IS ISSUED TO: / CETTE LICENCE EST DONNÉE À:

MANITOBA HYDRO:
"the Licencee"

for the construction, operation and maintenance of the Development being the Bipole III Transmission Project, consisting of a new 500 kV HVdc transmission line connecting two new converter stations, one in the north near Gillam (Keewatinoow Converter Station) and one in the south near Winnipeg (Riel Converter Station), two new ground electrodes connected to each of the new converter stations, and new 230 kV ac transmission collector lines to connect the new northern converter station to existing northern converter stations, in accordance with the Proposal dated December 14, 2009, the Bipole III Transmission Project Environmental Impact Statement (EIS) filed under The Environment Act in December 2011, supporting information filed in association with the EIS dated June 22, July 31, August 8, September 17 and 20, October 2, 23, and 19, 2012, January 28, February 19, and 25, 2013, in consideration of the June 2013 Clean Environment Commission Report on Public Hearings, and subject to the following specifications, limits, terms and conditions:

DEFINITIONS

In this Licence:

"bog" means a peat-covered wetland in which the vegetation shows the effects of a high water table and a general lack of nutrients. The surface is often raised relative to the surrounding landscape and isolated from mineralized soil waters. At least 40 cm of peat are present. The plant community is dominated by cushion-forming Sphagnum mosses (peat mosses), ericaceous shrubs and black spruce trees;

"Director" means an employee referred to in this licence, so designated pursuant to *The Environment Act,* who is the Director of the Environmental Approvals Branch of the Department of Conservation and Water Stewardship (CWS), unless otherwise specified;

"Environment Officer" means an employee so designated pursuant to *The Environment Act;*

****A COPY OF THIS LICENCE MUST BE KEPT ON SITE AT THE DEVELOPMENT AT ALL TIMES****

"native habitat" means grasses, wildflowers, shrubs, trees, and other vegetation that occur naturally and support fauna indigenous to the area;

"Minister" means the Minister of Conservation and Water Stewardship;

"quarry" means a mine that is an open excavation from which quarry mineral is removed;

"quarry mineral" means a mineral, other than a diamond, ruby, sapphire or emerald, that is obtained from a quarry, and includes sand, gravel, clay, shale, kaolin, bentonite, gypsum, salt, peat, peat moss, coal and amber, and rock or stone that is used for a purpose other than as a source of metal, metalloid or asbestos;

"record drawings" means engineering drawings complete with all dimensions which indicate all features of the pipeline as it has actually been built;

"Region" means the geographic areas of the Province of Manitoba in which the Department of Conservation and Water Stewardship has been divided;

"Regional Director" means an employee so designated by the Department of Conservation and Water Stewardship;

"Regional Forester" means an employee so designated by the Department of Conservation and Water Stewardship;

"riparian area" means an area of land on the banks or in the vicinity of a waterbody, which due to the presence of water supports, or in the absence of human intervention would naturally support, an ecosystem that is distinctly different from that of adjacent upland areas (*The Water Protection Act* 2005);

"rutting" means a sunken track or groove made by the passage of vehicles;

"slash" means branches and other woody debris that result from forest clearing;

"transmission line right-of-way" means the corridor for the proposed 500 kV HVdc transmission line, as defined and described in the EIS;

"waterbody" means any body of flowing or standing water, whether naturally or artificially created, and whether the flow or presence of water is continuous, intermittent or occurs only during a flood, including but not limited to a lake, river, creek, stream, and wetland (slough, marsh, swamp, etc.), including ice on any of them (*The Water Protection Act* 2005); and

"wetland" means land that is saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic vegetation, and various kinds of biological activity which are adapted to a wet environment. They are generally less than approximately 2 metres in depth (National Wetland Working Group 1997).

GENERAL TERMS AND CONDITIONS

This Section of the Licence contains requirements intended to provide guidance to the Licencee in implementing practices to ensure that the environment is maintained in such a manner as to sustain a high quality of life, including social and economic development, recreation and leisure for present and future Manitobans.

1. The Licencee shall, in addition to any of the following specifications, limits, terms and conditions specified in this Licence, upon the request of the Director:
   a) sample, monitor, analyse or investigate specific areas of concern regarding any segment, component or aspect of the Development for such duration and at such frequencies as may be specified;
   b) determine the environmental impact associated from the Development; and
   c) provide the Director, within such time as may be specified, with such reports, drawings, specifications, analytical data, descriptions of sampling and other information as may from time to time be requested.

2. The Licencee shall submit all information required to be provided to the Director under this Licence, in writing, in such form (including number of copies) and of such content as may be required by the Director and each submission shall be clearly labeled with the Licence Number and Client File Number associated with this Licence.

3. The Licence shall adhere to the commitments made in the EIS and supporting information filed in association with the EIS during construction and operation of the Development.

SPECIFICATIONS, LIMITS, TERMS AND CONDITIONS

Respecting Pre-Construction

4. The Licencee shall submit a complete Environmental Protection Plan (EPP) for approval of the Director prior to construction of the Development. The EPP shall describe the approach to be used by the Licencee to ensure that mitigative measures are applied systematically, and in a manner consistent with the commitments made in the EIS, including commitments for mitigation measures to address concerns raised by First Nations, Metis communities and local Aboriginal communities about potential adverse effects on the exercise of Aboriginal treaty rights as summarized in the EIS commitment table. If prior approval is given by the Director, separate EPPs may be submitted for the construction and operation phases, as well as for different reaches or components of the Development. Specifically, the EPP shall:
   a) describe the environmental management system and protocol for internal reporting on monitoring and compliance for the construction of the project;
   b) provide field construction personnel with clear instructions on the mitigation measures to be implemented and on the appropriate lines of communication and means of reporting to be followed throughout the full-life cycle of the project;
   c) summarize environmental sensitivities and mitigation actions and emergency response plans and reporting protocols;

d) provide specific information on waste management practices to be used during the construction phase of the project, including consideration of all liquid and solid wastes generated;
e) identify how Aboriginal Traditional Knowledge will be enhanced and used in activities addressed in the EPP; and
f) address issues and concerns identified by representatives of First Nations, Metis, and local Aboriginal communities relating to the environmental effects of the project as described above.

5. The Licencee shall, prior to construction of the Development in a Wildlife Management Area (WMA), obtain a WMA Use Permit from the Director of the Wildlife Branch of CWS.

6. The Licencee shall, prior to construction of the Development in agricultural areas, consult with agricultural land owners to determine the tower placement that would have the least impact on agricultural operations, and incorporate those changes into the final design of the Development unless there is compelling rationale to depart.

7. Where routing is along existing drains, the Licencee shall place towers for the Development in or immediately adjacent to the grass swales along the field side of drains, unless there is compelling reason to depart.

8. The Licencee shall follow the recommended routing changes cited in recommendation 9.3 in the Clean Environment Commission's report unless there is compelling reasons not to do so. Any proposed deviations from the route changes recommended by the Clean Environment Commission's recommendation 9.3 shall be provided to the Director, for approval prior to construction in those areas, providing compelling rationale for the final route preferred.

9. The Licencee shall, prior to construction of the Development in the areas cited in the Clean Environment Commission's recommendations 10.1, 10.2, and 10.3, incorporate the changes recommended in the transmission line route into the final design of the development for those specific locations.

10. The Licencee shall, prior to construction of the Development, submit maps of the final route to the Director with a description of any changes from the Final Preferred Route identified in the EIS. Maps may be submitted all at once for the entire route or in several separate submissions for portions of the route to accommodate construction schedules.

11. The Licencee shall prepare a plan for construction and maintenance associated with the Development within the area of the Lake Winnipegosis Salt Flats Ecological Reserve, the proposed expansion, and the source salt spring in consultation with the Parks and Natural Areas Branch and submit the plan for approval of the Director prior to initiating construction in this area.

12. The Licencee shall, for each region of CWS, re-establish any of the Forestry Branch's existing Permanent Sample Plots (PSPs) located within 200 m of the transmission line right-of-way with two new PSPs prior to construction in each applicable Region. Approval of the locations of the new PSPs shall be obtained from the Director of the Forestry Branch.

13. The Licencee shall, prior to construction in forested areas, consult with the responsible Regional Forester of the Forestry Branch to determine the disposition of timber cleared in association with the Development in those areas.

14. The Licencee shall, prior to construction, retain a qualified archaeological consultant to conduct a Heritage Resources Impact Assessment (HRIA) to identify and assess any heritage resources that may be negatively impacted by Development. Plans for the identification of and mitigation for Aboriginal sacred or ceremonial sites shall be included in the report. The HRIA shall be submitted to the Director for approval prior to construction.

15. The Licencee shall, prior to construction of the Development, submit access management plans for approval of the Director. The access management plans shall include, but not be limited to, the anticipated types and locations of roads, trails, and water crossings required to access the right-of way of the Development, and associated decommissioning plans. The plans may be submitted all at once for the entire route or in stages along the route as construction progresses.

16. The Licencee shall use terrain features and vegetation composition to limit access to and line-of-sight along the Development right-of-way.

17. The Licencee shall, prior to construction of the Development, submit a general plan for addressing any unanticipated adjustments to the transmission line right-of-way for approval of the Director. The plan shall describe the action and process that will be followed in the event an unanticipated adjustment is needed due to field conditions.

18. The Licencee shall prepare a report on monitoring programs to be undertaken in relation to the mitigation measures outlined in the EIS and supporting information. Monitoring of community socio-economic and cultural effects should be included in the report. The report shall be submitted prior to June 30, 2014, for the approval of the Director, and:
    a) provide a description of the proposed activities for monitoring effects to the physical, aquatic, and terrestrial environments arising from construction of the Development;
    b) describe the parameters to be measured, the methodology and frequency of measurement, references to establish thresholds and sustainability indicators, where appropriate, and the protocol for reporting the results of monitoring of the environmental conditions affected by the Development to CWS;
    c) in cooperation and consultation with the Wildlife Branch, monitor white-tailed deer distributions and prevalence of brainworm along the transmission line; and
    d) using methods approved by the Wildlife Branch, include descriptions of proposed programs:
        i) to continue monitoring the population status and movements of the woodland caribou herds specifically affected by the Development for 25 years, or less if approved otherwise by the Wildlife Branch. Collaring may be included over the timeframe as determined by the Wildlife Branch;
        ii) for the monitoring of black bear and timber wolf populations, distribution, and predation on woodland caribou in sensitive areas within the caribou ranges in the vicinity of the transmission line right-of-way;
        iii) to conduct periodic moose surveys for 25 years, or less if approved otherwise by the Wildlife Branch including, but not necessarily limited to, Game Hunting Areas 14, 14A and 19A; and

iv) to monitor the use of major points of access within the Development to sensitive wildlife areas by humans and animals using trail cameras, or other more effective techniques, for at least five years after clearing is completed.

19. The Licencee shall, prior to construction which may affect the Gillam area, conduct a community health assessment of the Gillam area to determine the potential impact that a large temporary influx of workers may have on personal, family and community life.

20. The Licencee shall consult the Wildlife Branch of CWS regarding the design and implementation of mitigation measures for the protection of moose and caribou in known sensitive ranges along the transmission line right-of-way. A mitigation plan for these ranges shall be submitted to the Director for approval prior to clearing of the transmission right-of-way in known sensitive areas.

21. The Licencee shall consult the Wildlife Branch and include in the plan required in Clause 18, regarding the design and implementation of mitigation measures and monitoring for impacts to birds of prey including the species at risk such as the peregrine falcon and ferruginous hawk.

22. The Licencee shall conduct clearing components of the Development between August 1 and April 30 of each construction year to avoid potential impacts to the nesting habitat for migratory birds and the calving and rearing habitat for woodland caribou. Should any transmission line clearing be required after April 30, the Licencee shall, prior to the construction activity, consult and reach an agreement with the Wildlife Branch regarding the location of any key wildlife habitats to be avoided including caribou calving areas and bird nesting and brooding areas.

23. The Licencee shall, prior to construction of the Development, provide a copy of this Licence to the contractor and subcontractor(s) involved in the Development.

24. The Licencee shall, prior to construction of the Development, arrange meetings with the construction project managers and the Northeast, Northwest, Western, and Central Regional Directors of Department of Conservation and Water Stewardship (CWS) to review construction related matters.

25. The Licencee shall not less than two weeks prior to beginning construction of the Development in each Region of CWS, notify the responsible Regional Directors of the intended start date of construction within a particular Region and the name of the contractor responsible for the construction.

26. The Licencee shall, prior to the commencement of construction on Crown land, apply for and obtain the appropriate land tenure allocations in accordance with ***the Crown Lands Act*** from the Crown Land and Property Agency.

27. The Licencee shall, prior to construction of the Development in each Region of CWS, obtain work permits and general land permits from the appropriate Regions and comply with the conditions of all permits.

Respecting Construction and Maintenance

28. The Licencee shall, during construction of the Development, employ qualified environmental inspectors to monitor the work on a daily basis to ensure that all the environmental practices outlined in the EIS, the EPPs, and supporting information are carried out.

29. The Licencee shall, during construction of the Development, arrange quarterly meetings with the responsible Regional Directors of CWS to discuss construction, environmental protection, and emergency response issues.

30. The Licencee shall expand and enhance the furbearer pilot study conducted on the Wuskwatim Transmission Project to include areas along the transmission line right-of-way.

31. The Licencee shall submit, to the Director for approval, a plan to accommodate the continuation of educational programs on community traplines that are affected by the Development.

32. The Licencee shall develop a policy, for submission to the Director, to manage documented losses to outfitters that are attributable to the Development and provide an option for disposition of payments in an annual format where compensation is deemed necessary.

33. The Licencee shall, prior to construction of the Development, develop a policy, for submission to the Director, to provide an option for disposition of payments in an annual format where compensation is paid in agricultural areas associated with the Development.

34. The Licencee shall design and decommission quarries in connection with the Development in accordance with the ***Quarry Minerals Regulation 65/92***. Reclamation of individual quarries shall occur as soon as they are no longer in use for the Development.

35. The Licencee shall submit annual plans for the harvest of timber on Crown Lands within the transmission right-of-way of the Development to the applicable Regional Forester in advance of clearing in those areas.

36. The Licencee shall, in consultation with the Forestry Branch, manage vegetation along the transmission right-of-way in coniferous dominated forest to retain the coniferous character.

37. The Licencee shall, during construction of the Development, dispose of all sewage and septage from on-site sanitary facilities in accordance with the ***Onsite Wastewater Management Systems Regulation 83/2003,*** or any future amendment thereof.

38. The Licencee shall dispose of non-reusable construction debris and solid waste from the construction and maintenance of the Development at a waste disposal ground operating under the authority of a permit issued under ***Waste Disposal Grounds Regulation 150/91***, or any future amendment thereof, or a licence issued pursuant to *The Environment Act*.

39. The Licencee shall, during construction and maintenance of the Development, adhere to the general recommendations on design, construction, and maintenance of stream crossings as specified in the Manitoba Department of Natural Resources guidelines titled ***Manitoba Stream Crossing Guidelines for the Protection of Fish and Fish Habitat, May 1996***, and the current versions of applicable federal Department of Fisheries and Oceans Operational Statements.

40. The Licencee shall establish any fuel storage areas required for the construction and maintenance of the Development:
    a) a minimum distance of 100 metres from any waterbody; and
    b) in compliance with the requirements of the ***Storage and Handling of Petroleum Products and Allied Products Regulation 188/2001,*** or any future amendment thereof**.**

41. The Licencee shall, during construction and maintenance of the Development, operate, maintain, and store all materials and equipment in a manner that prevents any deleterious substances including fuel, oil, grease, hydraulic fluid, coolant, and other similar substances from entering any waterbodies. An emergency spill kit for in-water use shall be readily available on site during construction.

42. The Licencee shall, in the case of physical or mechanical equipment breakdown or process upset where such breakdown or process upset results or may result in the release of a pollutant in an amount or concentration, or at a level or rate of release, that causes or may cause a significant adverse effect, immediately report the event by calling 204-944-4888 (toll-free 1-855-944-4888). The report shall indicate the nature of the event, the time and estimated duration of the event and the reason for the event.

43. The Licencee shall, following the reporting of an event pursuant to Clause 42:
    a) identify the repairs required to the mechanical equipment;
    b) undertake all repairs to minimize unauthorized discharges of a pollutant;
    c) complete the repairs in accordance with any written instructions of the Director; and
    d) submit a report to the Director about the causes of breakdown and measures taken, within one week of the repairs being done.

44. The Licencee shall minimize the burning of slash generated during clearing of the Development where smoke may affect residences. In these areas, the Licencee shall dispose of slash using environmentally suitable methods such as chipping and mulching where feasible.

45. The Licencee shall not use herbicides in association with construction of the Development.

46. The Licencee shall, during construction and maintenance of the Development, prevent the introduction and spread of foreign aquatic and terrestrial biota (e.g., weeds, non-native species) to surface waters and in native habitats and prevent invasive species to agricultural lands. To ensure this, all equipment used for the construction of the Development, including transport trucks and trailers, shall be cleaned prior to moving between areas of differing vegetation types (e.g., cultivated land to natural prairie, to forested, etc.).

47. To prevent rutting having the potential of mixing of soil layers, the Licencee shall implement mitigation measures as appropriate (e.g., avoiding excessively wet soils or other means).

48. The Licencee shall, during maintenance of the Development in Environmentally Sensitive Sites (ESSs) identified in the EPP related to traditional plant harvesting:
    a) clear vegetation using only low impact methods including hand clearing;
    b) not apply herbicides in the ESSs and within a buffer from the sites, unless a vegetation management agreement stating otherwise is developed with the First Nations, Metis communities and local Aboriginal communities that utilize the specific sites; and

c) post signs indicating herbicides have been applied in areas along the transmission line right-of-way when and where herbicides have been applied in the vicinity of the ESSs. The postings shall be left in place for one month after the application has occurred.

49. The Licencee shall, during construction and maintenance of the Development, clear only tower locations, danger trees, and trees in excess of 17 meters in height within the transmission line right-of-way along the approximately 8 kilometer long section of Game Hunting Area 19A, which is currently inaccessible by means of existing fence lines and trails.

50. The Licencee shall leave wildlife trees, where possible, throughout the Development right-of-way where they do not pose a hazard.

51. The Licencee shall, in consultation with Wildlife Branch, manage the Development right-of-way from Swan River northward to discourage population increase and distribution of white-tailed deer.

52. To ensure no net loss of wetlands, the Licencee shall, during construction and maintenance of the Development, maintain a minimum 30 meter riparian buffer zone immediately adjacent to wetlands and the shoreline of lakes, rivers, creeks, and streams. Within the riparian buffer zone:
a) trees that must be removed shall be cleared using only low impact methods including hand clearing;
b) all existing low growth vegetation such as grasses, shrubs, and willows shall be maintained;
c) the application of herbicides shall be prohibited; and
d) any affected wetland area will be restored, replaced or offset as approved by the Director to ensure no net loss of wetlands.

53. The Licencee shall, where native prairie habitat is disturbed during construction of the Development, retain a native prairie re-vegetation specialist to plan and oversee reclamation of these areas. Re-vegetation monitoring shall be conducted by the native prairie re-vegetation specialist for a minimum of three complete growing seasons. Follow-up monitoring, seeding, maintenance, and/or weed control shall be conducted until disturbed areas are re-vegetated to the satisfaction of the Director. Re-vegetation shall:
a) where conditions are ideal regarding topography, slope, moisture, time of year, and the condition of nearby prairie, allow for natural re-vegetation; or
b) where conditions are not ideal for natural recovery, re-vegetate areas exposed during the construction with native seed mixes approved by the Wildlife Branch of CWS.

54. The Licencee shall ensure access within the Development, where possible, to quarry mineral withdrawals by Manitoba Infrastructure and Transportation (MIT) in Townships 22-11W, 30-17W, 22-12W, 30-18W, 23-12W, 31-19W, 25-13W, 32-20W, 26-13W, 33-21W, 30-18W, 33-25W, 32-20W, 44-25W, 49-25W, and 45-25W.

55. The Licencee shall remove any temporary construction access routes and rehabilitate all disturbed areas within MIT's right-of-way and controlled area upon completion of construction of the Development in the locations identified in Clause 54 of this Licence.

56. The Licencee shall implement the monitoring programs approved pursuant to Clause 18 of this Licence.

57. The Licencee shall, during construction of the Development, submit annual reports to the Director on the success of the mitigation measures employed during construction, a description of the adaptive management measures undertaken to address issues, and recommendations for improvements of mitigation in future projects. The reports shall include a progressive assessment of the accuracy of predictions made in the EIS and supporting information, including those relating to domestic use of resources (including Aboriginal Traditional Knowledge) by First Nations, Metis communities and Local Aboriginal communities and the socio-economic and cultural impacts to those groups. The annual reports shall be submitted for five years after completion of construction or as otherwise approved by the Director.

Respecting Post-Construction

58. The Licencee shall provide the data and report annually to the Director, on the results of the monitoring programs approved pursuant to Clause 18 of this Licence.

59. The Licencee shall:
    a) prepare "record drawings" for the Development and shall label the drawings "record drawings"; and
    b) provide to the Director, within six months of the completion of construction of the Development, two sets of "record drawings" of the Development.

60. The Licencee shall, for approval of the Director, submit a vegetation control plan for line maintenance. The plan shall consider Integrated Pest Management (IPM) strategies and shall eliminate the use of herbicides during maintenance unless there are no other feasible means available. If herbicides are used, the Licencee shall adhere to the ***Pesticides Regulation 47/2004,*** or any future amendment thereof, for the storage, handling and application of pesticides in conjunction with the Development.

61. The Licencee shall not, during maintenance of the Development, use herbicides in Wildlife Management Areas, unless otherwise approved in the vegetation control plan referenced in Clause 60 above.

62. The Licencee shall not use herbicides in bog areas during maintenance of the Development.

63. The Licencee shall, upon completion of construction of the Development, undertake a third-party environmental audit to assess whether commitments they provided in their EIS and supporting information were met and to assess the accuracy of the assumptions and predictions in these documents. The audit shall be repeated after five years. Reports on the audits shall be submitted to the Director.

64. The Licencee shall, no later than December 31, 2013, develop and maintain an easily accessible project-related website to contain all of the information related to monitoring and assessing environmental mitigation and management committed to in the EIS and as noted in the CEC report. The website should contain minutes from community meetings related to the Development monitoring and mitigation management.

Respecting Alterations to the Development

65. The Licencee shall obtain approval from the Minister for any proposed alteration to the Development before proceeding with the alteration in accordance with *The Environment Act*.

REVIEW AND REVOCATION

66. If, in the opinion of the Minister, the Licencee has exceeded or is exceeding or has or is failing to meet the specifications, limits, terms, or conditions set out in this Licence, the Minister may, temporarily or permanently, revoke this Licence.

67. If the construction of the Development has not commenced within three years of the date of this Licence, the Licence is revoked.

68. If, in the opinion of the Minister, new evidence warrants a change in the specifications, limits, terms or conditions of this Licence, the Minister may require the filing of a new proposal pursuant to Section 12 of *The Environment Act.*

Shannon Johnson, Manager
Manitoba Hydro
820 Taylor (3)
Winnipeg MB R3C 0J1

Dear Ms. Johnson:

Enclosed is **Environment Act Licence No. 3106** dated July 10, 2014 issued to **Manitoba Hydro** for the construction, operation, maintenance and decommissioning of the Keeyask Transmission Project, to be located north of the proposed Keeyask Generation Station, in accordance with the Proposal filed under *The Environment Act*, dated November 5, 2012, and additional information dated April 26, 2013.

In addition to the enclosed Licence requirements, please be informed that all other applicable federal, provincial and municipal regulations and by-laws must be complied with. A Notice of Alteration must be filed with the Director for approval prior to any alteration to the Development as licensed.

For further information on the administration and application of the Licence, please feel free to contact Darrell Ouimet, Environment Officer at 204-803-1389.

Pursuant to Section 27 of *The Environment Act*, this licensing decision may be appealed by any person who is affected by the issuance of this Licence to the Minister of Conservation within 30 days of the date of the Licence.

Yours truly,

"original signed by"
Tracey Braun, M.Sc.
Director
Environment Act

LICENCE

Licence No. / Licence n° **3106**

Issue Date / Date de délivrance **July 10, 2014**

In accordance with *The Environment Act* (C.C.S.M. c. E125) /
Conformément à *la Loi sur l'environnement* (C.P.L.M. c. E125)

Pursuant to Section 11(1) / Conformément au Paragraphe 11(1)

THIS LICENCE IS ISSUED TO : / CETTE LICENCE EST DONNÉE À :

MANITOBA HYDRO;
"the Licencee"

for the construction, operation, maintenance and decommissioning of the Keeyask Transmission Project, consisting of 22 km of a new 138 kV ac Construction Power transmission line, a new 138 kV ac to 12.47 kV ac Construction Power Station to be located north of the proposed Keeyask Generation Station, upgrades to the existing Radisson Converter Station, a new Keeyask Switching Station to be located south of the Nelson River, 4 km of four 138 kV ac Unit transmission lines that will transmit power from the proposed Keeyask Generation Station to the Keeyask Switching Station, and 38 km of three 138 kV ac Generation Outlet transmission lines that will transmit power from the new Keeyask Switching Station to the Radisson Converter Station, in accordance with the Proposal filed under *The Environment Act*, dated November 5, 2012, and additional information dated April 26, 2013, and subject to the following specifications, limits, terms and conditions:

DEFINITIONS

In this Licence:

"Director" means an employee so designated pursuant to *The Environment Act*;

"Environment Officer" means an employee so designated pursuant to *The Environment Act;*

****A COPY OF THIS LICENCE MUST BE KEPT ON SITE AT THE DEVELOPMENT AT ALL TIMES****

“riparian area” means an area of land on the banks or in the vicinity of a waterbody, which due to the presence of water supports, or in the absence of human intervention would naturally support, an ecosystem that is distinctly different from that of adjacent upland areas (*The Water Protection Act* 2005);

“waterbody” means any body of flowing or standing water, whether naturally or artificially created, and whether the flow or presence of water is continuous, intermittent or occurs only during a flood, including but not limited to a lake, river, creek, stream, and wetland (slough, marsh, swamp, etc.), including ice on any of them (*The Water Protection Act* 2005); and

“wetland” means land that is saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic vegetation, and various kinds of biological activity which are adapted to a wet environment. They are generally less than approximately 2 metres in depth (National Wetland Working Group 1997).

GENERAL TERMS AND CONDITIONS

This Section of the Licence contains requirements intended to provide guidance to the Licencee in implementing practices to ensure that the environment is maintained in such a manner as to sustain a high quality of life, including social and economic development, recreation and leisure for present and future Manitobans.

Compliance

1. The Licencee shall adhere to the commitments made in the Proposal, supporting information filed in association with the Proposal, and plans submitted and approved pursuant to this licence during construction, maintenance, operation and decommissioning of the Development.

Additional Permits

2. The Licencee shall, prior to commencing construction of the Development, apply for and obtain all land tenure allocations and Work Permits as required from the appropriate Conservation and Water Stewardship district office and shall comply with the conditions of all permits.

Additional Reporting

3. The Licencee shall, in addition to any of the specifications, limits, terms and conditions specified in this Licence, upon the request of the Director:

a) sample, monitor, analyse or investigate specific areas of concern regarding any segment, component or aspect of the Development for such duration and at such frequencies as may be specified;
b) determine the environmental impact associated from the Development;
c) conduct specific investigations in response to the data gathered during environmental monitoring programs; or
d) provide the Director, within such time as may be specified, with such reports, drawings, specifications, analytical data, descriptions of sampling and other information as may from time to time be requested.

Environmental Inspection

4. The Licencee shall, during construction of the Development, employ qualified environmental inspectors to monitor the work on a daily basis to ensure that all the environmental practices outlined in the Proposal, supporting information, and the plans submitted pursuant to this Licence are carried out.

Reporting Format

5. The Licencee shall submit all information required to be provided to the Director or Environment Officer under this Licence, in writing, in such form (including number of copies) and of such content as may be required by the Director or Environment Officer, and each submission shall be clearly labelled with the Licence Number and Client File Number associated with this Licence.

SPECIFICATIONS, LIMITS, TERMS AND CONDITIONS

Notification

6. The Licencee shall, prior to beginning construction of the Development, provide notification to the Environment Officer responsible for the administration of this Licence of the intended start date of construction and the name of the contractor(s) responsible for the construction.

7. The Licencee shall, prior to construction, provide a copy of this Licence to the contractor(s) and subcontractor(s) involved in the Development.

Access Routes and Line of Sight

8. The Licencee shall not create or improve roads or short access routes for construction and/or maintenance of the Development without written approval from the Northeast Region Integrated Resource Management Team (IRMT) of Conservation and Water Stewardship.

9. The Licencee shall submit an access route inventory and decommissioning and rehabilitation plan for all access routes created or improved in association with the Development, upon completion of construction of the Development, as required by the Northeast Region IRMT.
10. The Licencee shall maintain existing vegetation screens at all points where the transmission right-of-way of the Development intersects an existing road or trail to limit the ability of humans to observe wildlife along the right-of-way.

11. The Licencee shall, during maintenance of the Development, to the extent possible without impeding maintenance activities, maintain natural re-growth of shrubs and other understory vegetation along the transmission line right-of-way to minimize the line of sight of hunters and predators.

Air Quality

12. The Licencee shall minimize the burning of slash generated during clearing of the Development where smoke may affect residences. In such cases, the Licencee shall dispose of slash using environmentally suitable methods such as mulching, where feasible.

Environmental Protection Plan

13. The Licencee shall submit an Environmental Protection Plan for the approval of the Director for the construction of the Development. This plan shall describe the approach to be used by the Licencee to ensure that mitigative measures are applied systematically, and in a manner consistent with the commitments made in the Proposal. Separate plans may be submitted for different components or phases of the Development. Specifically, the plan shall:
    a) describe the environmental management system;
    b) provide field construction personnel with clear instructions on the mitigation measures to be implemented and on the appropriate lines of communication and means of reporting to be followed throughout the life cycle of the project;
    c) summarize environmental sensitivities and mitigation actions and emergency response plans and reporting protocols.

Environmental Monitoring Plan

14. The Licencee shall prepare an Environmental Monitoring Plan to be undertaken in relation to the mitigation measures outlined in the Proposal and supporting information. The plan shall be submitted prior to November 30, 2014, for the approval of the Director, and:
    a) describe the protocol for reporting on compliance monitoring;
    b) describe the specific monitoring measures to be installed/undertaken;
    c) outline the communication and reporting protocol on implementation progress;

d) define the parameters to be measured and the methods to be used to evaluate the environmental effects of the Development to pre-Development baseline conditions;
e) describe how the performance and effectiveness of the recommended mitigation measures will be evaluated during implementation; and
f) describe how adverse effects will be adaptively managed.

15. The Licencee shall implement the plans approved pursuant to Clauses 13 and 14 of this Licence.

Annual Reporting

16. The Licencee shall, during construction, report annually, before June 15th, to the Director on the results of environmental monitoring plans, as approved pursuant to Clause 14 of this Licence and include sufficient detail that assessments can be made as to the accuracy of predictions, success of mitigation actions and commitment to future actions. These reports will provide assessments of any trends detected over the entire reporting period. The annual reports shall be submitted for five years after completion of construction or as otherwise approved by the Director.

Dangerous Goods Storage and Handling

17. The Licencee shall comply with all the applicable requirements of:
a) ***Manitoba Regulation 188/2001,*** or any future amendment thereof, respecting ***Storage and Handling of Petroleum Products and Allied Products.***
b) *The Dangerous Goods Handling and Transportation Act*, and regulations issued thereunder, respecting the handling, transport, storage and disposal of any dangerous goods brought onto or generated at the Development; and
c) The Office of the Fire Commissioner – Province of Manitoba.

18. The Licencee shall establish any fuel storage areas required for the construction and operation of the Development a minimum distance of 100 metres from any waterbody.

19. The Licencee shall, during construction and maintenance of the Development, operate, maintain, and store all materials and equipment in a manner that prevents any deleterious substances including fuel, oil, grease, hydraulic fluid, coolant, and other similar substances from entering any waterbody. An emergency spill kit for in-water use shall be readily available on site during construction.

Spill Response

20. The Licencee shall, in the case of physical or mechanical equipment breakdown or process upset where such breakdown or process upset results or may result in the

release of a pollutant in an amount or concentration, or at a level or rate of release, that causes or may cause a significant adverse effect, immediately report the event by calling 204-944-4888 (toll-free 1-855-944-4888). The report shall indicate the nature of the event, the time and estimated duration of the event and the reason for the event.

21. The Licencee shall, following the reporting of an event pursuant to Clause 20,
    a) identify the repairs required to the mechanical equipment;
    b) undertake all repairs to minimize unauthorized discharges of a pollutant;
    c) complete the repairs in accordance with any written instructions of the Director; and
    d) submit a report to the Director about the causes of breakdown and measures taken, within one week of the repairs being done.

22. The Licencee shall, in a manner approved by the Environment Officer, remove and dispose of all spilled dangerous goods.

23. The Licencee shall, following construction of the Development, verify that terrestrial contamination of the environment has not occurred in work areas of the Development. Any areas of contamination shall be remediated to the satisfaction of the Environment Officer.

Heritage Resources

24. The Licencee shall, during construction and operation of the Development, apply measures to protect heritage resources, as directed by the Historic Resources Branch of Manitoba Tourism, Culture, Heritage, Sport, and Consumer Protection.

Oil Containment Facilities

25. The Licencee shall, prior to commencement of construction activities for the oil containment facilities of the Development, submit to the Director the results of an Oil Containment Assessment. Oil containment plans and specifications, as recommended in the Oil Containment Assessment, shall be approved by the Director prior to the commencement of construction of the oil containment facilities of the Development.

26. The Licencee shall construct and install the oil containment equipment, as described in the Plans and Specifications approved by the Director, as required by Clause 25 of this Licence.

Onsite Wastewater Disposal

27. The Licencee shall, during construction of the Development, dispose of all wastewater from on-site sanitary facilities in accordance with ***Manitoba Regulation***

83/2001, or any future amendment thereof, respecting ***Onsite Wastewater Management Systems.***

Pesticide Application

28. The Licencee shall not use herbicides in association with the construction of transmission components of the Development unless there are no other feasible means available. If herbicides are used, the Licencee shall adhere to the ***Manitoba Regulation 47/2004,*** or any future amendment thereof, respecting ***Pesticides***.

Waste Disposal

29. The Licencee shall dispose of non-reusable construction debris and solid waste from the construction and maintenance of the Development at a waste disposal ground operating under the authority of a permit issued under ***Manitoba Regulation 150/91***, or any future amendment thereof, respecting ***Waste Disposal Grounds,*** or a licence issued pursuant to *The Environment Act*.

Water Crossings

30. The Licencee shall, during construction and maintenance of the Development, adhere to the general recommendations on design, construction, and maintenance of stream crossings as specified in the Manitoba Department of Natural Resources guidelines titled ***Manitoba Stream Crossing Guidelines for the Protection of Fish and Fish Habitat, May 1996***, and the current versions of applicable federal Department of Fisheries and Oceans Operational Statements.

Riparian Areas

31. The Licencee shall, during construction and maintenance of the Development within riparian areas associated with fish-bearing and potentially fish-bearing waterbody crossings:
    a) maintain all existing low growth vegetation such as grasses, shrubs, and willows;
    b) clear trees that must be removed using only low impact methods including hand clearing;
    c) prohibit the application of herbicides;
    d) where natural revegation methods will be insufficient to stabilize disturbed soils, biodegradable erosion control materials and a seed mix native to the area will be utilized.
    e) where possible, maintain 15 metres of riparian area from the high water mark of 1^{st} and 2^{nd} order creeks, and 30 metres from the high water mark of 3^{rd} order and higher streams and rivers;
    f) minimize in-stream construction time to reduce sedimentation;
    g) avoid use of organic soil, silt, or clay in temporary winter stream crossings; and

h) remove all materials used in the construction of ice bridges from the watercourse or water body prior to spring breakup.

Sedimentation and Erosion

32. The Licencee shall, during construction and maintenance of the Development, take all appropriate measures to prevent erosion and the deposition of sediment into any waterbodies. Construction adjacent to waterbodies shall not occur during high rainfall events if construction activities will result in increased erosion and sediment disposition in the adjacent waterbody.

Instream Works

33. The Licencee shall only conduct construction activities in connection with the Development in fish bearing waters or potentially fish bearing waters in accordance with applicable federal *Fisheries Act* Authorizations. The Licencee shall notify Conservation and Water Stewardship, Fisheries Branch, if an application is made to the federal Department of Fisheries and Oceans to work outside the prescribed in-stream work timing windows.

Wetlands

34. The Licencee shall not, during construction, clear, compact, grade or fill any wetlands or native upland habitat, which are not required for the construction of right-of-way of the Development.

Wildlife

35. The Licencee shall only conduct clearing components of the Development between August 1 and April 30 of each construction year to avoid potential impacts to the nesting habitat for migratory birds and the calving and rearing habitat for caribou. Should any transmission line clearing be required outside of this period, the Licencee shall, prior to the construction activity, consult and reach an agreement with the Wildlife Branch regarding the location of any key wildlife habitats to be avoided including bird nesting and brooding areas, and obtain approval of the Director.

36. The Licencee shall not remove, destroy or disturb species pursuant to ***Manitoba Regulation 25/98***, or any future amendment thereof, respecting ***Threatened, Endangered and Extirpated Species***, and in the federal *Species at Risk Act*.

37. The Licencee shall, during construction and maintenance of the Development, take measures to prevent the introduction and spread of foreign aquatic and terrestrial biota.

38. The Licencee shall not, unless otherwise approved by Environment Canada under the federal *Migratory Birds Convention Act*, disturb active migratory bird nests during construction and maintenance of the Development.

39. The Licencee shall avoid when possible, during construction and maintenance of the Development, operating helicopters at low level near calving habitat from May 1 to June 30.

Revegetation

40. The Licencee shall, when natural re-vegetation methods are insufficient to revegetate soil in areas of the Development exposed by construction, a mixture of native or introduced grasses or legumes will be utilized. Native species shall be used to revegetate areas where native species existed prior to construction. Exposed areas shall be revegetated as quickly as possible following construction to prevent soil erosion and the establishment of noxious weeds.

Decommissioning or Alteration

41. The Licencee shall, prior to decommissioning of the Development, submit for approval of the Director, a decommissioning plan for the Development.

42. The Licencee shall implement the decommissioning plan as approved pursuant to Clause 41 of this Licence.

43. The Licencee shall obtain approval from the Director for any proposed alteration to the Development before proceeding with the alteration.

REVIEW AND REVOCATION

44. If, in the opinion of the Director, the Licencee has exceeded or is exceeding or has or is failing to meet the specifications, limits, terms, or conditions set out in this Licence, the Director may, temporarily or permanently, revoke this Licence.

45. If construction of the development has not commenced within three years of the date of this Licence, the Licence is revoked.

46. If, in the opinion of the Director, new evidence warrants a change in the specifications, limits, terms or conditions of this Licence, the Director may require the filing of a new proposal pursuant to Section 11 of *The Environment Act.*

A History of Electric Power Development in Manitoba

by Leonard Bateman
Bateman and Associates Ltd., Winnipeg, MB

Abstract

Today, with deregulation in the power industry occupying a good deal of public attention, this article presents the history of power development in Manitoba. Winnipeg was probably the only place in North America where competition between the private company and the municipal utility for customers was possible using the same power poles. This situation prevailed from 1912 to 1955. Manitoba is well endowed with rivers with significant hydroelectric power sites. The paper outlines the history of development up to and including the development of the Nelson River in the late 1960Õs.This involved the diversion of the Churchill River into the Nelson River and the regulation of Lake Winnipeg. The largest capital expansion program in the history of the utility was undertaken during this period and involved moving the power from the north using direct current transmission at +/-500 kV. The various stages of evolution and consolidation of the power industry are covered, with Manitoba Hydro ending up as the only utility in Manitoba serving all the citizens at a uniform rate.

Sommaire

De nos jours, avec la d”r”glementation de lÕindustrie”nerg”tique qui re“oit une bonne part de lÕattention du public, cet article pr”sente un historique du d”veloppement de lÕ”nergie au Manitoba. Winnipeg ”tait probablement le seul endroit en Am”rique du Nord oš la comp”tition entre des compagnies priv”es et les services publics municipaux utilisant les m’mes poteaux ”lectriques ”tait possible. CÕ”taitle cas de 1912 ‹ 1955. Le Manitoba regorge de complexes hydro”lectriques. Cet article dresse un historique du d”veloppement hydro”lectrique, des d”buts jusquÕauprojet de la rivi‘re Nelson ‹ la fin des ann”es 60. Durant ces ann”es-l‹, il y eut diversion de la rivi‘re Churchill vers la rivi‘re Nelson et la r”gularisation du Lac Winnipeg. Le plus grand programme dÕexpansion dans lÕhistoiredu service public a ”t” entrepris durant cette p”riode et a exig” le transport de lÕ”nergiedu Nord par des lignes de transmission de courant ‹ plus ou moins 500kV. Les diff”rentes ”tapes de lÕ”volutionet de la consolidation de lÕindustrie”nerg”tique sont discut”es, avec Manitoba Hydro devenant le seul service public au Manitoba offrant aux citoyens lÕ”lectricit” ‹ un taux uniforme.

1.0 Early History

Electric Arc Lamps were first seen in Winnipeg, Manitoba in March 1873, just three years after the Province of Manitoba was formed. This was six years before Edison invented the incandescent lamp. It was not long after this that a newly incorporated company received a contract to install arc lamps in the City. This was the beginning of several business ventures by a variety of new companies, and when electric trolley conveyance was demonstrated in 1891, it was the Winnipeg Electric Railway Company (WECO) that received the franchise from the City. This company built a thermal generating station on the banks of the Assiniboine River. It purchased its last competitor in the mid nineties. With a rapidly growing city and the demand for more uses of electricity, WECO looked to the Winnipeg River for hydroelectric development.

It was not the first company to develop a hydro plant in Manitoba. This was done by a company in Brandon some 120 miles west of the City of Winnipeg. They developed a plant on the Minnedosa River (now known as the Little Saskatchewan River) but the flow was such that the plant could only operate for a maximum of eight months of the year. The plant served the City of Brandon using an 11 kV wood pole line. The plant was dismantled in 1924.

2.0 Development of the Winnipeg River

At the beginning of the 20th century, WECO examined the possibility of a development on the Winnipeg River. The consultants that they engaged selected the Pinawa Channel, which is a channel parallel to the Winnipeg River, partially bypassing the Seven Sisters Falls site. It required the construction of a weir to divert the water into this channel with some enlargement of the intake. To build a hydroelectric plant in the wilderness with horses was a remarkable achievement. There were no roads or railways; access was by river or winter road. Construction started in 1902 and the first power was delivered using a 60 kV steel tower line to Winnipeg in 1906. The output of the plant was 22 MWs.

The WECO had a monopoly on the supply of electric power and was charging twenty cents per kWhr, which did not sit very well with some of the aldermen of the City. The company did lower its rate to 10 cents per kWhr when the Pinawa plant was completed. One alderman in particular, Alderman John Wesley Cockburn, managed to get the water rights for the Pointe du Bois site on the Winnipeg River and when the City Charter was amended to permit it to float a bond issue for the development of a hydroelectric site, he transferred the rights to this site to the City. The citizens of Winnipeg voted in favor of developing Pointe du Bois with the promise of power at 3 cents per kWhr. A railway was constructed from the nearest CPR line at Lac du Bonnet. This involved building bridges over the Winnipeg River and the Pinawa Channel. This site was developed into what is now the oldest plant still operating on the Winnipeg River. It has a 46-foot head and is rated at 78 MW. The first power was delivered in October 1911. The rate was set at 7 and cents per kWhr. This sparked a vehement protest from the citizens who had been promised 3 cents. The public outcry resulted in City Council lowering the rate for power to 3 and 1/3 cents per kWhr, which the private company met. This rate remained in use until 1968.

The delivery of power from the CityÕsplant caused a mad scramble to connect customers. It was not uncommon for the City to begin construction of a line on the opposite side of the street on a Saturday morning to supply an industrial customer on Monday morning. The multitude of lines eventually resulted in a judicial decision in 1912 to require both utilities to share the same poles. This arrangement continued until the power industry was rationalized in 1955.

3.0 Rural Electrification

The settlements in rural parts of the province also wanted to share in the benefits of this new form of energy. It spawned a multitude of entrepreneurs; all charging what they thought was reasonable. In order to rationalize this, the Government created the Manitoba Power Commission in 1919 and undertook to sell power to the municipalities, much the same as Ontario was doing, but by 1933, when the depression forced many municipalities into financial difficulties due to residents not paying their electric utility bills, they amended the legislation to permit the Commission to sell directly to the customer and do away with the so called middle man. The growth of consumption required Winnipeg to complete the second half of Pointe du Bois, a project they commenced in 1919 as they had a contract to supply the Commission with its requirements. The WECO also undertook to develop a new site at Great Falls on the Winnipeg River with a capacity of 132 MW. This was the first use of propeller type turbines and resulted in some interesting developments. The admission of air to the draft tube to reduce cavitation was first used at this plant and was soon to be the norm.

The growth in the twenties required the City and WECO to seek new sites for development on the Winnipeg River. The City received the license to develop Slave Falls [1], while WECO received the license to develop Seven Sisters, with a reservation of 35 MW for the Power Commission. The contract that the City had with the Government to supply the Commission was terminated in 1935 when the Company supplied the power from its Seven Sisters Plant. With the

Figure 1: Slave Falls Plant (Source: Manitoba Hydro)

simultaneous development of two sites, nobody foresaw the crash of 1929, and the result was rather catastrophic. The City actually ran its Slave Falls plant with only two units installed on a one-shift basis and incurred a deficit. Units three and four were installed by 1938. The Company shut the three units installed at Seven Sisters down and defaulted on the bond interest. In one respect it was provident that this surplus capacity was available when the 1939 war broke out. It made it possible for the Province to assist in the war effort. However, the growth in the war years required the City to develop a water heater control program, which shut the water heater load off at noon and again during the evening peak, using carrier current injected frequencies into the residential feeders. These were picked up by relays installed in each household. These measures to control the peak demand, along with the use of thermal generation from the Amy Street standby plant that was installed in 1924, resulted in the City meeting its firm load requirements. This thermal plant was built as a result of the loss of all transmission from the Pointe du Bois plant due to a very severe windstorm. It was combined with a central heating system to supply central heat to the downtown city area. Three electric boilers, in addition to the coal-fired boilers, were installed. The operator of these boilers had a recording totatalizer of the Winnipeg Hydro load at his workstation. His job was to utilize all the spare capacity in the system as load on the electric boilers with a resulting saving in coal for the central heating plant. This resulted in a very high load factor on the CityÕs two hydro plants.

The supply of some defense industry load during off peak hours, by arrangement with the WECO, further helped the City to meet its firm load requirements.

Even before the war ended, the City received permission from the Wartime Prices and Control Board to order the steel for the extension of the Slave Falls Plant, which was commenced in 1945. The plant with a total of eight units was completed in 1948. The transmission voltage was raised to138 kV - the first use of this voltage in Manitoba. Meanwhile the WECO undertook the completion of the Seven Sisters Plant to a capacity of 150 MW by raising the head and excavation in the tailrace. This utilized the full flow of the river. The retirement of the Pinawa Plant occurred in 1951.

The Government undertook a study of farm electrification in 1942 and with the completion of the war, commenced this program. The growth of the farm and rural load made it evident that someone had to add new capacity to meet these requirements. The private company would not invest in a new plant unless they received an agreement from the Province for a long-term commitment. The City was in a similar position. Without a guarantee, they were reluctant to commit the necessary funds for expansion of either of the two remaining hydro sites on the Winnipeg River.

4.0 Birth of The Manitoba Hydro Electric Board

This stalemate resulted in the Government creating the Manitoba Hydro Electric Board and the development of the Pine Falls site on the Winnipeg River. The City protected its position during the rather prolonged negotiations on how the power industry should be rationalized, by installing two thermal units of 15 and 25 MW capacity in the Amy Street thermal plant it built in 1924.

The plan for reorganization of the power industry, proposed by the Government, was turned down by the citizens of Winnipeg in a referendum. As a result, the Government forged ahead with its plans and bought the WECO and sold the load in the City, formerly supplied by the Company, to the City in exchange for the City load outside the City boundaries. It also agreed to leave the two City plants at Pointe du Bois [2] and Slave Falls with the City, but undertook to develop all future generation needs for the Province and entered into a cost sharing agreement with the City in 1955, based on the peak demand of the City load and the Provincial loads. The latter soon outdistanced the City load, due to the farm electrification program. Thus the competition for customers in Winnipeg by the two suppliers of power came to an end.

An interesting development occurred in January of 1957, when Manitoba Hydro Electric Board received a letter of intent from INCO to supply power for their new nickel mine being developed at Thompson Manitoba. This was a wilderness location, but the Hudson Bay Railway was some 50 miles away to the south. A hydro site on the Nelson River named Kelsey was available some 60 miles away and Manitoba Hydro undertook to develop this site on the Nelson. The schedule was very demanding, requiring power by 1960. This involved building a railway into the site, building dikes on perma-frost, and building the final earth and rock fill closure dam under a hoarding in the wintertime. The INCO estimated load required four units, but in anticipation of growth in the new town at Thompson, a fifth unit was added, and unit Number 7 was installed by 1972. This five-unit plant rated at 160 MW supplied an isolated load, including two arc furnaces rated at 18 MW each. Special governor characteristics were developed to handle the sudden loss of this furnace load, and governor development tests were run on the Pine Falls plant using electric boilers at the Paper Mill, close by, to simulate the condition of the loss of a furnace under load conditions. These tests were run with the help of Woodward Governor engineers to validate the anticipated governor performance. They are reported in a paper at the 1961 meeting of the AIEE and are recorded in the Transactions of the Institute. INCO placed limits on the amount of load that could be dropped; however very shortly after the tests, but before the instrumentation had been removed, an interruption of greater than one furnace occurred, and the governor performance for control of the machines was superb.

This first plant on the Nelson River was a good experience for future developments.

5.0 Formation of Manitoba Hydro

By 1961 the Government again moved to rationalize the power industry by an amalgamation of the Manitoba Power Commission and the Manitoba Hydro Electric Board. The new organization was called Manitoba Hydro.

With the growth of load in the fifties, the newly created Manitoba Hydro was struggling to stay ahead of the demand. It completed the last two sites on the Winnipeg River at Pine Falls and McArthur Falls and constructed a thermal generating station at Brandon, and another at Selkirk, while it studied its options for more hydro development on the Saskatchewan and Nelson rivers. The decision was made in 1960 to develop the Grand Rapids four-unit site with a capacity of 479 MW on

Figure 2: Pointe du Bois Plant (Source: Manitoba Hydro)

Figure 3: Kelsey Generating Station (Source: Manitoba Hydro)

the Saskatchewan River where it empties into Lake Winnipeg. This was, and still is, the largest head in Manitoba at 120 feet. The decision was made to use Kaplan units. The site was unique, in that it was built on a porous limestone foundation. This required extensive grouting, and became the largest grouting program ever encountered by any geophysical consultant. One sinkhole under the powerhouse location required approximately 6,000 cubic yards of grout.

6.0 Nelson River Sites

While this construction was progressing, studies were underway on future Nelson River sites. The Federal Government participated in these studies, which involved the future development of the northern Manitoba rivers for supplying the growing electrical load of the province. The outcome of these studies was an announcement in February 1966 of an agreement between the Federal Government and the Province of Manitoba to proceed to the Northern Sites for the future power requirements of the province. This agreement required Manitoba Hydro to build a 1272 MW power plant at the Kettle Rapids site [4] on the Nelson River, control Lake Winnipeg for storage for this and future Nelson River plants, and divert the Churchill River into the Nelson at a point above Kettle. The license from the Provincial Government to undertake these projects provided for four feet of storage on Lake Winnipeg and ten feet of storage on South Indian Lake, the reservoir for the Churchill River flow. The Federal Government agreed to lend the Province money, which the Federal Government would use to build a DC transmission line from the Nelson River Kettle site to a point near Winnipeg. Atomic Energy of Canada was the federal agency assigned to build the line. This loan was to be repaid by Manitoba Hydro when the load growth was sufficient to carry the financial burden of the line. In the meantime the interest was accumulating and being charged to the line capital account. This loan was discharged in 1992 when Manitoba Hydro bought the line and the accumulated debt.

To supply power to the construction site of the Kettle Plant, a 138 kV line was constructed from Kelsey [3] in 1966. In 1997, the Kelsey station was connected to the southern system by construction of a 230 kV line from Kelsey to Grand Rapids.

This present and future system expansion required additional revenue. As a consequence of this, the first rate increase in 57 years went into effect in July 1968.

7.0 Interconnection with the United States Utilities

This ambitious construction program with the many unknowns caused the Utility to look at alternatives to meet its load requirements in 1970. One option was the addition of another thermal unit at the Selkirk Plant, and an option on a shaft was actually bought. Another, which proved to be the preferred option, was to interconnect with the three utilities south of the border, namely Otter Tail Power, Northern States Power, and Minkota Power Cooperative Inc. and buy capacity for the winter of 1970. This alternative was pursued successfully and a 230 kV line was constructed after receiving approval from the National Energy Board. This line permitted the purchase of 90 MW of capacity for the winter of 1970. It also permitted the export sale of surplus energy, which proved to be very beneficial to all parties.

The first unit of the Kettle Plant [4] came on line in 1970, however the DC transmission terminal equipment was not ready. The two completed DC lines, approximately 900 km in length were used as a temporary 230 kV line with a reactor hung on at approximately the mid point at Grand Rapids to inject this power into the 230 kV system. It meant that Manitoba not only had the US utilities to support the Manitoba System, but the first unit at Kettle also improved the reserve and energy position. Long Spruce came on line in 1976 associated with the second bipole of the DC transmission Line. The converter station, named Henday was located at the site of the future Limestone plant to facilitate the conversion of this plant to DC. All Nelson River plants are interconnected with 230 kV transmission lines. The Limestone Plant came into service in 1990. There are still several sites on the Nelson and other rivers in the north to develop. Wuskwatim, on the Burntwood River, which carries the diverted Churchill River into the Nelson, is on the verge of being developed. The largest site in Manitoba is on the Nelson at Conawapa below Limestone and is being considered for a sale of power to Ontario Power Generation. A fourth interconnection, rated at 230 kV, has been added to the US system from the western part of the Manitoba system.

8.0 Interconnections

The first Interconnection from the Manitoba Hydro system was with Ontario HydroÕsisolated Northwest system in 1957. This was followed by an interconnection with Saskatchewan Power Corporation in 1960 between their Estevan Plant and Brandon. This was initially operated at 138 kV, but designed to be raised to 230 kV, which was accomplished in a few years. With the completion of the first 6 units of the 12 unit Kettle plant, Manitoba had a surplus of generation and negotiated a sale to Ontario Hydro commencing in 1972, but by this time the Northwest Region of Ontario Hydro was interconnected with their main system. This meant there would be a circulation of power around the Great Lakes unless phase shifting transformers were installed on this interconnection. Two 200 MVA phase shifting transformers with a 180 degree shift capability were installed to supply two new 230 kV lines to the Ontario System. This rather large angle was determined by test of an isolated machine on the tie line to Ontario and the Manitoba system tied to the US system.

A second 230 kV line was constructed between Saskatchewan and the Manitoba system in 1973.

The operation of the first tie to the US proved so successful that another utility, Minnesota Power and Light, negotiated a tie to their system near Duluth, which went into service in 1976. An agreement was reached with Northern States Power to interconnect their system with Manitoba Hydro at 500 kV. This was negotiated using seasonal diversity as one of the economic justifications for the line. It also provides the Manitoba system with a good backup in case of trouble on the DC system [5] from Northern Manitoba. The line came into service in 1980.

Figure 4: Kettle Plant (Source: Manitoba Hydro)

Figure 5: A view of the largest mercury arc rectifier ever built - this type of valve was originally used in the AC-DC conversion stations in the Nelson River DC transmission system. Most of these valves have now been replaced by thyristors. (Source: Manitoba Hydro).

The value of this 500 kV interconnection [6] with the US system was very vividly demonstrated in 1997, when a wind shear toppled 19 towers on the DC line. This occurred in the early morning hours, before daybreak. The Manitoba system went from an export mode to an import mode without any customer interruptions. The public and some large industrial customers were asked to conserve energy and capacity for the few days it took to build a temporary line around the downed towers. This 500 kV interconnection has had series compensation installed to increase its export capabilities. It has proven to be a valuable source of revenue as well as a source of energy during the 2002-03 years, when one of the worse droughts on record was experienced on the Prairies.

9.0 Winnipeg Hydro

The agreement between the Province and the City of Winnipeg in 1955, which provided for the City to retain its two generating stations and share in the cost of new generation, transmission, and interconnection revenue, was renegotiated each 10 years. The ratio of peak demand and energy use on the two systems had increased to approximately 90/10 and in 2002 Manitoba Hydro purchased the Utility, resulting in one utility supplying the entire province [7] with rates uniform throughout the system and one of the lowest rates in Canada.

About the author

Leonard A. Bateman is an electrical engineering graduate from the University of Manitoba with post-graduate qualifications in Engineering and Business Administration. His career spanned thirty-six years in the utilities of Manitoba. His last six years were spent as Chairman and CEO of Manitoba Hydro. He was the last person to hold both of these positions. He has served as President of the Canadian Electrical Association, The Association of Professional and Geophysical Engineers of the Province of Manitoba. He was the first and founding President of the Canadian Society for Senior Engineers. When he left Manitoba Hydro in 1979, he formed his own consulting company - Bateman and Associates Ltd., of which he is still President. As a consultant he has worked and presented papers in many countries of the world. He has received recognition by his peers in many organizations, and in 1994 received the Canadian EngineersÕGold Medal. In 2002 he was awarded the highest recognition that the Province of Manitoba bestows on its citizens - The Order of Manitoba. He is still interested in traveling as well as volunteering in seniorsÕorganizations, having served the two thousand members of Creative Retirement Manitoba as their President in the years 2001 and 2002.

The shaping of Limestone

BUSINESS/ECONOMY

Towering above scrubby spruce trees in northern Manitoba's rugged landscape, the 70-mhigh, manmade hill is visible from two kilometres away. Around the sides of the heaped mass of more than 400,000 cubic metres of rock, huge trucks and bulldozers shift loads of granite that are being crushed to make concrete for the Limestone hydroelectric dam. When it is fully

completed in 1992, Limestone—located on the Nelson River 90 km from Hudson Bay—will be generating 1,280 megawatts of electricity annually, making it Canada's 10th-largest dam. But because declining oil prices have forced delays in other energy projects, Limestone holds a unique distinction: it is the largest construction job under way in Canada this year. And it is stirring excitement among workers from coast to coast. "Guys all across the country are dying to come here," said Barry Cozac, 35, an

By FRED BRUNING

ironworker from Calgary. “There is nothing else like it.” Attracted by the prospect of big paycheques and steady work, by last week 1,300 workers had already settled into bunkhouses at the Limestone construction camp and in the company town of Sundance, ve kilometres away. They included carpenters fresh from the building of British Columbia’s $2-billion Revelstoke dam, ironworkers who reminisce about Calgary’s building boom and crane operators experienced in High Arctic oil exploration. Some, like Manitoba Hydro structures superintendent Dale Woods, who worked on the Long Spruce and Kettle dams built on the Nelson River in the 1970s, are returning to familiar territory—and

faces. Said Woods, who will likely spend the next six summers working at Limestone: “These are extremely challenging projects. I like the area, I like the way of life, I like the people.”

For the NDP government of Premier Howard Pawley, lagging activity in the construction industry has enabled Manitoba to win favorable terms from contractors. Three years ago Manitoba Hydro estimated that Limestone would cost $3 billion to build. But bids were so competitive that the price has fallen to $1.94 billion. The largest contract, for excavating the damsite and pouring concrete, was won last summer by joint-venture partners Bechtel Canada Ltd. and Japan’s giant Kumagai Gumi Co. Ltd. Their $236-million bid was the lowest of six o ers.

Roger Picard, project manager for Bechtel-Kumagai, said that the consortium's bid was low for the amount of work involved. But because there are so few heavy-construction projects under way in North America, the company has been able to hire hundreds of highly experienced workers. Efficiency, Picard added, is the only way to make money on a construction project in the 1980s. Added the 41-year-old native of Beauport, Que.: "We are bring-

ing in the most sophisticated, expensive equipment, and we have the very best men. All we can do now is make sure we get the best use out of both."

Premier Edward Schreyer's NDP government allowed Limestone's preliminary construction to begin in the mid-1970s, but Premier Sterling Lyon stopped it because of shrinking hydro demand when the Conservatives came to power in 1977. Construction started again last fall under the Pawley government, after the Manitoba Energy Authority signed a $3.2-billion, 12-year agreement to sell z up to 500 megawatts of Lime-

0 stone's output to the Minneapolis lis-based Northern States Pow? er Commission.

Still, Manitoba's opposition

1 Conservatives say that because 9 Limestone will begin generatE ing power in 1990—two years

before the contract takes effeet—Manitoba Hydro's cus-

But spokesmen for the Pawley government—which was re-elected in March, 1985, partly on the strength of its commitment to Limestone—say that the project will be profitable. Limestone will create 6,000 personyears of direct employment and another 17,000 person-years in support industries. And the power contract with Minnesota, officials say, will net a total profit of $1.7 billion.

pay year in interest charges on funds borrowed to build the dam. And some economists have criticized the policy of spending money to increase exports of energy—and indirectly create jobs in the United States—instead of developing Manitoba's industrial sector.

For Bechtel management and the workers on the Limestone site, there are more immediate concerns. They are hurrying to reach the current season's goal of pouring 190,000 cubic tons of concrete before the onset of winter in mid-October shuts down operations until next spring. According to Bechtel's Picard, work was slowed by a colder than usual spring. "But now everything is falling into place," he said.

At the same time, Manitoba Hydro has made determined efforts to create rst-class living and working conditions. At the main campsite, about 1,200 workers live in 40 prefab bunkhouses. The company town of Sundance has trailer-lot accommodation for about 280 married workers and their families. The two recreation centres at the main campsite—there is a third at Sundance—include television rooms, a library, weights, a billiard room, hockey and curling rinks and a baseball diamond. “This is a pretty damn good camp,” said William Liston, site representative for the Allied

Hydro Council, an association of trade unions involved in the building of Limestone. “When I went to my rst camp in 1953 up in Kitimat, B.C., we were living in tents. We have come a long way.” Added William Beaton, a crane operator from Winnipeg: “This is a fantastic job—the best camp I’ve ever been in.”

The buildup of the Limestone workforce, which is expected to climb to a total of 1,800 in the peak construction years of 1987-88, has reunited a special breed —engineers and skilled tradesmen who have labored together on previous dam projects in Canada. One veteran dam builder is Stephen Wight, a 71-year-old carpenter who will be at the site all summer designing and building the curved wooden forms used to cast the giant concrete draft tubes that will carry water from the dam’s turbines downstream into the Nelson River. Proud of his unusual skill, Wight said, “There are not many people who can do it.” He was also pleased when he discovered that Winnipeg’s Hugo Erhardt would be in charge of Limestone’s carpentry shop. “He’s about the best you’ll run into anywhere," said Wight. He added, "Pretty near half the force in the carpentry shop I've worked with elsewhere."

Because of the abbreviated 6V2month northern working season, the dam workers have been put on ninehour shifts that continue through the night under floodlights. At night the site resembles a vast movie set. Laborers and tradesmen work six days a week for 40 to 45 days before becoming eligible for a free flight from Gillam, Man.—50 km from the campsite—to their point of hire for six working days off.

But while the hours are long, the rewards can be considerable. Wages range from $13.40 an hour for heavyconstruction laborers to $17.88 an hour for ironworkers or $20.29 for pipe tters. Calgary's Barry Cozac calculates that with overtime he stands to earn as much as $1,100 a week. "If you're careful," said Cozac, "you can afford to never work again in winter for the rest of your life."

Camp life does have its inconveniences. Two months ago there were only ve pay telephones available for workers at the main campsite—now there are 10. And men and women— even if they are married—must stay in separate quarters if they live at the main camp. "There's too much segregation," said Michael Ontonovich, a bearded ironworker from Sault Ste. Marie, Ont. "If you get caught with a woman in your room, you are out of the camp." But others express satisfaction with the arrangements. Said

Bernard Potocki, a carpenter from British Columbia: “This is not Love Boat. It’s a production centre—but not for the next generation.”

To ensure that northern Manitoba native people share in Limestone’s rewards, the collective agreement between the unions, the contractors and the provincial government established hiring goals for various job categories. As many as 40 per cent of laborers, 60 per cent of apprentices and 30 per cent of some skilled categories must be natives. But last May Hydro chairman Marc Elieson caused a wave of complaints when he announced that with natives comprising about 35 per cent of Limestone’s unionized workforce, hiring goals in many job categories—including laborers and caterers—were being suspended for four months. Yvon Dumont, co-chairman of the Limestone Aboriginal Partnership Directorship Board, charged that Hydro was attempting to slip out of its commitment to native workers. The most recent gures show that as of June 30, natives made up 22 per cent of the workforce.

Still, the government has already improved on its record of the 1970s, when less than 10 per cent of the workforce on the province’s dam projects, such as Jenpeg and Kettle on the Nelson River, were natives. Preferential treatment for native entrepreneurs has resulted in the opening of a native-operated post office, grocery and liquor store in Sundance. At the main campsite, security guards wear distinctive badges depicting a yellow rising sun—the emblem of Wapun Security, a rm owned by ve northern Manitoba Indian bands in partnership with the Saskatchewan Indian and Native Peoples Corp.

To supply native workers with the needed skills, last summer the government set up a training camp at an abandoned Inco Ltd. strip mine at Pipe Lake, 30 km west of Thompson, Man. Nearly 1,000 natives have graduated from the camp with skills ranging from carpentry to machine maintenance. To instil the discipline needed to work at Limestone, life at the Pipe Lake camp is strictly regulated, with an 11.30 p.m. curfew and a total ban on alcohol.

The tough training appears to be effective, with both natives and non-natives praising its effectiveness. Native workers at Limestone, said Thomas Cummins, labor relations officer for Bechtel-Kumagai, seem “to have more staying power; they don’t seem to be dropping out of the workforce as much as in the past.” Les Cook, a Métis from Thompson, described the Limestone training program as nothing less than an opportunity to “join the human race, to join the flow of economic life.” Indeed, for many Canadian workers, a job at the Limestone dam in Manitoba’s inhospitable north is highly cherished.

NO.	DESCRIPTION	PAGE NO.
13	Manitoba Hydro to provide whether they can continue to meet their contractual obligations if the delay of Keeyask is longer than thirty-two (32) months	2090

--- Upon commencing at 9:01 a.m.

THE CHAIRPERSON: Good morning, everyone. I hope you had a nice weekend. Ms. Steinfeld...?

MS. DAYNA STEINFELD: Thank you, Mr. Chair. We're going to begin today with the Business Council of Manitoba. I understand they expect to be approximately fifteen (15) minutes, at which point in time GSS/GSM, in cap, will conduct their cross-examination. We also expect that requests will be made for a few parties to follow up on some undertakings that were filed in the last few days.

Before turning it back over, I'd just like to note, as well a reminder to the parties, that the Board no longer requires proposed expert witnesses to be qualified as an expert prior to their direct testimony. And the process that the Board has followed since the Cost of Service Study methodology review has been to have the party introducing the expert witness, briefly review the qualifications or CV of that expert to indicate to the Board and other parties the specific areas that the expert will be put forward to testify on. There will not be a void dire process where parties would have the opportunity to question the qualifications or expertise; rather, the witness will be allowed to provide their direct evidence, including opinion evidence. And on cross-examination, it is open to parties to question the expert witness as to qualifications and expertise, such that in closing submissions the party may request that the Board limit the weight that should be given to the expert witness' testimony.

We suggest that if any party has questions that they get in touch with Board counsel. Thank you, Mr. Chair.

THE CHAIRPERSON: Thank you. Mr. Williams...?

MR. KEVIN WILLIAMS: Thank you, Mr. Chairman. Thank you for accommodating my --

THE CHAIRPERSON: Excuse me. Ms. Ramage, did you --

MS. PATTI RAMAGE: I just wanted to interject, that we understand Mr. Williams has a date at the courthouse at 9:30 and will go first, but we had a matter we wanted to address and we'd ask that we'd -- after Mr. Williams is complete, we could -- we'll get on the mic to deal with that.

THE CHAIRPERSON: Certainly. Okay. Mr. Williams...?

MR. KEVIN WILLIAMS: Thank you. Thank you for accommodating my scheduling difficulties, Mr. Chairman.

CROSS-EXAMINATION BY MR. KEVIN WILLIAMS:

MR. KEVIN WILLIAMS: I just want to start with a few questions about the Manitoba Hydro Act itself, and I don't know who -- who they're best directed at, but I'll look across the room and see who responds and I'll follow it up from there, so.

Pursuant to Section 40 of the Manitoba Hydro Act, Manitoba Hydro is required to establish depreciation and stabilization reserves.

Is somebody familiar with that?

MR. JAMES MCCALLUM: Yeah, I -- I've read the act.

MR. KEVIN WILLIAMS: Okay. Can -- can you explain, in simple terms, what the purpose of the depreciation and stabilization reserves mandate by the Act is?

MR. JAMES MCCALLUM: Well I -- and I -- and I just --

MS. PATTI RAMAGE: May --

MR. KEVIN WILLIAMS: Section 40 of the Act, sorry.

MS. PATTI RAMAGE: Mr. McCallum can explain the need for reserves. I'm not sure that it's fair to ask him to explain the legislative part, but -- so it's -- it's a partial objection but I think he can proceed on the basis knowing that it's not a legal opinion.

THE CHAIRPERSON: Yes, well, let's -- let's see what the question is.

MR. JAMES MCCALLUM: Okay. So maybe we can pull -- was it Section 40?

CONTINUED BY MR. KEVIN WILLIAMS:

MR. KEVIN WILLIAMS: Forty.

MR. JAMES MCCALLUM: Forty.

(BRIEF PAUSE)

MR. KEVIN WILLIAMS: And -- and just so we're clear, I'm -- I'm not interested in what -- you speaking as to the legislative intent, I'm actually just asking you from Manitoba Hydro's perspective what their understanding is of -- of this is.

MR. JAMES MCCALLUM: And -- and it's best I don't speak to the legislative intent, but, you know, in my mind specifically as to I think your question was -- was on depreciation, but I believe and it might be a little further down in 40-2, but there's a provision or -- or a idea in the Act that reserves should be drawn from ratepayers and collected and maintained to allow for renewal and reconstruction of the fixed works to the -- of the Corporation.

MR. KEVIN WILLIAMS: And -- and have such reserves been establis -- been established by Manitoba Hydro?

MR. JAMES MCCALLUM: Well, I think our argument is that, you know, rates have been -- rate increases have been insufficient certainly over the last ten (10) years. If you recall back -- and I don't know that we need to pull it up, but -- but to our direct evidence of the policy panel I think it's Hydro Exhibit 64, page 66, you can -- you can see a chart that shows Manitoba Hydro's net income over the last nine (9) or ten (10) years. And you can see our net income goes from about $350 million a year to basically zero. While our fixed assets, our net plant in service go from 8 billion to 12 billion.

So I would -- and -- and then if you look forward from there, you know, a financial plan basis 3.95 percent rate increases will see the net plant in service doubling again to 25 billion while we've flipped to a significant net loss position.

And this is of great concern to Manitoba Hydro. We would argue that there are no reserves being -- being paid in rates to address significant infrastructure renewal needs and to address financial stability, rate stability and to provide for the unknown which is that we -- we obviously do our best to forecast but Manitoba Hydro is subject to significant volatility in its financial results owing to many things including weather, export prices, hydrology and interest rates.

So we would argue that, no, there's been extremely limited contribution to reserves over the last eight (8) or ten (10) years.

MR. KEVIN WILLIAMS: So -- so do I take it from that response that -- that -- that there aren't reserves reflected in the integrated financial that are before the Board?

MR. JAMES MCCALLUM: Well, it -- it -- you know, reserves I think is -- is a concept that you need to understand and in one (1) line of thinking reserves are -- is your equity position. I think that we would look at it and say that is, in part, true, equity is debt avoided. And that's really important to us.

However, equity -- book equity that is the accumulation of net income made since the Corporation was -- was began and hasn't been added to in the last, you know, number of years is really not that useful as a -- as a buffer. When you have no net income and things start going badly whether it's low water conditions or -- or something else that you haven't predicted, then you need to fund your business and the only way you do that is by borrowing more money or increasing rates.

You don't have -- equity is not a -- it's not a cash pile. It's -- at least not -- not the way we do it. It's not a cash pile that you -- you look to and draw from to help subsidize your business when you don't have the revenue you need to run it.

MR. KEVIN WILLIAMS: Thank you. Turning now briefly to Section 41 of the Act which is -- relates to the establishment of a sinking fund.

Are you familiar with that provision of the Act?

MR. JAMES MCCALLUM: I am. I'm fortunate that Ms. Stephen is beside me this morning. She can speak more directly to how the sinking fund provisions work.

MR. KEVIN WILLIAMS: I'm -- I don't really have specifics as to how they work. My questions are very general in nature so -- so has a sinking fund been established?

MS. SUSAN STEPHEN: We do have a legislated requirement to make a sinking fund contribution on an annual basis. As of late for probably the last two (2) or three (3) years we have made the minimum legislated requirement and we have withdrawn it for debt maturities in the same year.

MR. KEVIN WILLIAMS: And so I take it then, Ms. Stephen, as a consequence of that response that -- that the activity with respect to the sinking fund is reflected in the integrated financial forecasts that are before the Board as it relates to -- to the transaction that you just said how it was used; is that fair?

MS. SUSAN STEPHEN: That's correct.

MR. KEVIN WILLIAMS: Thank you. I want to turn now for a moment to reserves and regulatory deferrals. I looked at the testimony of Stephen, Ms. Bauerlein and Mr. McCallum and -- so someone who tried to be an accountant but failed, I would inarticulately refer to these deferrals and reserves as representative of timing differences between when the cash event occurs and when it's reflected in the Manitoba Hydro's income statement.

Is -- would you agree with that?

MS. SANDY BAUERLEIN: Good morning. I would characterize it as really timing differences between when costs are necessarily for financial reporting purposes versus when they're recognized for rate setting purposes.

MR. KEVIN WILLIAMS: So I -- I thought of them as revenue expense items that are not recognized in the income statement in the year that they occur from a cash flow perspective.

Is that -- is that fair?

MS. SANDY BAUERLEIN: Some accounting can be accrual based so it's not necessarily cash based but you can think of it that way. You can think of it as -- typically it's expenses that are incurred in one (1) year that we would recognize as a period expense for financial reporting purposes but for rate-setting purposes they're reflected over a longer -- or different timeframe.

MR. KEVIN WILLIAMS: It's becoming more apparent by the moment why I never became an accountant, I suppose.

Let me try to run it down to ground

with an example. So, Manitoba Hydro builds a generating station, and -- and -- for the most part all the cash outlays are incurred prior to that generating station -- station's in-service date.

Is that reasonable?

MS. SANDY BAUERLEIN: That is correct.

MR. KEVIN WILLIAMS: However, the expense associated with the outlay of that cash is reflected over a number of years through depreciation or amortization on the Corporation's income statements; isn't that correct?

MS. SANDY BAUERLEIN: That is correct.

MR. KEVIN WILLIAMS: As it relates to Bipole III, the reserve account represents cash that is coming in from rate increases that have been granted; isn't that correct?

MS. SANDY BAUERLEIN: The Bipole III reserve?

MR. KEVIN WILLIAMS: Yeah.

MS. SANDY BAUERLEIN: Yes, reflects cash that's been coming in that has been set aside for when Bipole is in service, correct.

MR. KEVIN WILLIAMS: Correct. And from an accounting perspective that reserve won't be utilized in the income statement until Bipole III goes

into service. Do I have that right?
MS. SANDY BAUERLEIN: And it won't be reflected in revenue, correct, until -- yes.
MR. KEVIN WILLIAMS: But the revenue's reflected on the income statement, right?
MS. SANDY BAUERLEIN: Correct.
MR. KEVIN WILLIAMS: Thanks, okay. But the cash receipts from the rate increases granted, which have been attributed to the Bipole III reserve account, have been consumed in -- in Manitoba Hydro's ongoing operations; correct?
MR. JAMES MCCALLUM: Yes, that's -- that's correct. If -- our net debt amount is reflective of having collected and I don't have the figure in front of me, but a couple hundred million dollars of -- of rates associated and allocated to the Bipole III reserve. It's not a cash -- we don't have that cash sitting on our --
MR. KEVIN WILLIAMS: I sta --
MR. JAMES MCCALLUM: -- a special account.
MR. KEVIN WILLIAMS: -- that's what my understanding was as well.
Now, from our test -- from your testimony, Mr McCallum, the other areas where

deferrals or reserves are utilized, you indicated were demand-side management expenditures, correct?

MR. JAMES MCCALLUM: That's one (1) area, yes.

MR. KEVIN WILLIAMS: Certain depreciation and amortization accounts, correct?

MR. JAMES MCCALLUM: I don't know that -- depreciation and amortization wouldn't flow through a regulatory deferral account, other than certain -- maybe Sandy should -- maybe Ms. Bauerlein should speak more. I think we're getting a few things kind of --

MS. SANDY BAUERLEIN: Well, you may be talking about the difference between depreciation methodologies. So for financial reporting purposes, we use the equal life group method of depreciation, compliant with IFRS. For rate-setting purposes we use the average service life methodology compliant with Canadian Generally Accepted Accounting Principles.

So the differential and depreciation between those (2) is captured in a regulatory deferral.

MR. KEVIN WILLIAMS: Okay. Thank you. And as it relates to certain site restoration costs are deferrals or reserves used for those?

MS. SANDY BAUERLEIN: Site restoration

costs are deferred, correct.

MR. KEVIN WILLIAMS: And certain -- certainly, some of the regulatory costs are as well?

MS. SANDY BAUERLEIN: Our regulatory costs are also deferred, yes, and amortized over a different timeframe. Typically those costs would be at a period expense.

MR. KEVIN WILLIAMS: And in each case the actual cash outlay or receipt in a particular year is not fully reflected in that year's financial statements due to the timing differences; is that fair?

MS. SANDY BAUERLEIN: It's not reflected in the statement of income but you would see your cash in your -- your cash flow statement.

MR. KEVIN WILLIAMS: Okay. So now I want to turn, for a moment, to Appendix -- Manitoba Hydro tab 3, Appendix 3.8, and I just want to run a couple of these concepts to ground for a moment.

So unfortunately they're all labeled page 1 of 6, but I'm looking at the first page 1 of 6. So, if we look at the Bipole III reserve account. This is the projected operation statement for Manitoba Hydro 16 updated with the interim rate grant. I see that -- that for 2017, 2018, the Bipole reserve account is reflected as a reduction of revenue for -- for those years totalling about $247,000.

Do I have that correct?

MR. JAMES MCCALLUM: I'm sorry, sir, where -- where do you see 200 -- these are all in millions.

MR. KEVIN WILLIAMS: Sorry, I misspoke, 96 million and 151 million total 247.

MR. JAMES MCCALLUM: They -- they -- yes, they do but in -- in fiscal 2018, we will be collecting roughly $151 million in customer rates and allocating that to the Bipole reserve. And last year we did the same to the extent of 96 million.

MR. KEVIN WILLIAMS: Yeah, I don't think we're saying anything different.

MR. JAMES MCCALLUM: Okay. Just the add -- the adding them I just wanted --

MR. KEVIN WILLIAMS: Right, yeah, but I guess what I then notice is as we move to 2019 to 2024, that timeframe.

MR. JAMES MCCALLUM: Yep.

MR. KEVIN WILLIAMS: We now see additions to revenues coming from the Bipole III reserve account.

MR. JAMES MCCALLUM: That's right.

We've -- we've made an assumption that we will amortize into our revenues this Bipole III reserve account over five (5) years after Bipole comes into service. And so that's a -- it's -- it's not cash, unfortunately. Cash has already been received but this is just the -- flowing it into your revenue as you spoke to a timing difference.

MR. KEVIN WILLIAMS: Right. And so -- so are you able to say -- like, when you add up the number of millions of dollars that are being reflected as additional revenue in the years 2019 to 2024, I noted that they added up to $348 million.

MR. JAMES MCCALLUM: It's more -- it's closer to 400 million in the first half of 2019 we're collecting. If you looked at our financial statements for -- for fiscal 2019, you'd see from March through August -- or April through August, you would see a deduction in allocation to the Bipole III reserve account.

MR. KEVIN WILLIAMS: Right.

MR. JAMES MCCALLUM: Which then reverses when you begin amortizing that account in the second half of the year when -- when Bipole is in service. So, the two (2) net off to that $1 million.

MR. KEVIN WILLIAMS: I see, okay.

MR. JAMES MCCALLUM: But the total amortization over five (5) years, subject to check, is 400 million.

MR. KEVIN WILLIAMS: Okay. Now if you look down to the -- still on that same statement to the net movement in the regulatory deferral. I -- I note that -- that it is positive through 2023, and then -- and then reverts to a negative position for the balance of the forecast.

Can you explain why it is that the -- that that happens?

MS. LIZ CARRIERE: Until 2023 we're capitalizing ineligible overhead to a regulatory deferral account, as well as the difference in depreciation methodology is also being capitalized to a deferral account to that date.

We stopped capitalizing it and then we're left with the amortization of it thereafter.

MR. JAMES MCCALLUM: Yeah, so -- so I guess, Mr. Williams, the way to look at it or the way that a non-accountant see it, is in the first five (5) or six (6) or seven (7) years of the forecast these regulatory deferral accounts are basically caused by differences between how the financial reporting standards tell us to -- you know, to -- to put the numbers together and then any differences that -- that a regulator wants to see.

So in -- in the first four (4) or five (5) years we're seeing the effect of -- of certain regulatory direction that causes certain expense items to be instead capitalized to a regulatory asset and then we see later in those years, later in the forecast, kind of a reversing effect as we see amortization of those deferrals eclipse additions.

MR. KEVIN WILLIAMS: Okay.

MS. SANDY BAUERLEIN: I just wanted to note that also in 2019/'20 you start seeing amortization of Conawapa.

MR. KEVIN WILLIAMS: Okay. Thank you. Now then if we move three (3) pages ahead in the same exhibit and we look at the operating statement, there's a regulatory deferral balance reflective on the asset side.

And once again we see it increasing to approximately 1.111 billion in -- sorry, 1.246 billion in --

MR. JAMES MCCALLUM: I think we need to go a page up.

MR. KEVIN WILLIAMS: Oh, sorry.

MR. JAMES MCCALLUM: Backwards. There

we go.

MR. KEVIN WILLIAMS: Okay, so it goes to 1.289 billion in 2023, and then starts -- starts reducing. And so -- so -- so are you able to explain exactly why it is that that's occurring?

MR. JAMES MCCALLUM: This is the -- sort of the impact of what we just spoke about on the statement of income. In the first few years we are capitalizing to -- to the regulatory asset a number of things to -- to -- which -- which has the effect of -- of increasing income, and so you see that balance build up.

A good chunk of that from 2019 to 2020 is -- is Conawapa but there are, you know, a number of other significant contributors. And then as you get out towards 2025 you start seeing the cumulative effect of depreciating these -- these -- and these are assumed -- we've made assumptions around, you know, depreciation or amortization periods that, you know, as part of this we're looking for some -- some direction from the Board on, but our assumptions are in there and you see that we start working down this -- this asset over time through amortization.

MR. KEVIN WILLIAMS: And -- and I take it then your responses would be the same as it relates to the Bipole III reserve account and the liability and equity side, as well as the regulatory deferral balance in terms of the -- the timing difference and -- and -- and what's happening as it relates to those various accounts?

MS. SANDY BAUERLEIN: Yes, it's just the collection of that money and then you're seeing the drawdown or amortization over the five (5) year period. Same on the asset side, again, that big increase in 1920 as you're adding the additional Conawapa and then you slowly start amortizing that under the assumption that we made of thirty (30) years.

MR. KEVIN WILLIAMS: How, if at all, do these regulatory deferral accounts impact on the need for the requested rate increase?

MR. JAMES MCCALLUM: Well, I would -- I would argue that have limited impact.

MR. KEVIN WILLIAMS: Are you able to explain briefly why that is?

MR. JAMES MCCALLUM: Well, I think the, you know, the heart of our -- our rate case here is that we need to come to terms with our debt balance and the growth in our debt balance and these are, you know, important tools by which to, you know, to provide for the recognition of income and expense.

But in the main, these are not really cash items and its cash that -- that we look to to kind of, in part, judge revenue rates sufficiency but, most importantly, as a means to come to terms with a -- with a debt that -- that isn't sustainable?

MR. KEVIN WILLIAMS: Okay, thank you, those are my questions.

THE CHAIRPERSON: Thank you, Mr. Williams. Ms. Ramage...?

MS. PATTI RAMAGE: Mr. Chair, thank you. What Manitoba Hydro wanted to do this morning was address a request from counsel for MGF to extend the deadline for the filing of MGF's answers.

THE CHAIRPERSON: Can I interrupt for a second. I was informed by counsel. This may take awhile. What -- what I would propose is that we finish the matters with this panel and then deal with it after, as a procedural motion. So that we -- we deal with Mr. Monnin. We have the cross-examinations, deal with the undertakings, have the -- we have the issue of the presentation on the question that I had asked before. Then deal with re-examination in then with the procedural motion at that time.

Because what I don't want to do is I

don't want to get into a situation where we're extending this panel sitting here on a procedural motion that may or may not relate to them but relates to the position of Manitoba Hydro.

MS. PATTI RAMAGE: That seems appropriate. Board counsel had asked all parties to put their position in writing, and I thought it was important that parties, before they do that, understand Manitoba Hydro's position and Manitoba Hydro's timelines but we can do that after the panels are done, but, if they're to put their submissions in writing this evening, we thought --

THE CHAIRPERSON: Well, let's -- let's see where we are at noon. I want to give parties an adequate -- adequate time but it's also a matter I think we need to set aside adequate time for and I don't want to see a situation where Mr. Monnin is sitting here for maybe an hour to two (2) hours or whatever. I'd like to get through the -- the cross-examination of this panel by the Intervenors first and then we'll --

MS. PATTI RAMAGE: That seems --

THE CHAIRPERSON: -- deal with it, okay.

MS. PATTI RAMAGE: -- reasonable. We

would just like to have time to speak to it before parties speak to --

THE CHAIRPERSON: You will absolutely have time to speak to it. Mr. Monnin...?

MR. CHRISTIAN MONNIN: Thank you, Mr. Chair, and if gives you any further comfort to Ms. Ramage, and I'm given a two (2) hour slot today. I don't expect to take up to two (2) hours. I'm quite confident I'll be done within the hour.

CROSS-EXAMINATION BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Could you please proceed to Manitoba Hydro Exhibit 60, at slide 41 please. I'd like to start with some questions on OM&A. Thank you.

Now here at slide 41 of Exhibit 68 Manitoba Hydro states that:

> "A rate request is not meaningfully impacted by further reductions to OM&A expense and describes an illustrative exercise which arrived at 7.41 percent."

And I want to peremptorily apologize for two (2) things. I'm a little under weather so if I'm coughing into the microphone, I apologize and if my voice is a little hoarse again, to ask me to repeat the question. And on the issue of repeating questions, I've tried my level best going through the transcripts of this panel and hopefully I don't double-down and ask you a questions that's already been asked.

Is anyone on the board able to -- for clarification, provide an estimate of the incremental savings derived from a reduction of an additional 500 FTEs as identified in this slide?

MR. JAMES MCCALLUM: I assume your question -- you said "Board" but -- panel?

MR. CHRISTIAN MONNIN: Pardon me, panel, correct.

MR. JAMES MCCALLUM: Five hundred (500) operational staff would -- Ms. Bauerlein likely creating incremental savings in the order of $50 to $60 million?

MR. CHRISTIAN MONNIN: And can Manitoba Hydro speak to a breakdown position reductions performed in this analysis, as we see on slide 41?

MR. JAMES MCCALLUM: No, this was just illustrative using -- using five hundred (500) staff at -- at kind of an average, fully loaded cost.

MR. CHRISTIAN MONNIN: And when you were working through this analysis, you - being Manitoba Hydro -- I won't take you there but, for example, at PUB-Manitoba Hydro IR-13 (a) to (c), there's a table in the form of that -- that response identifying the breakdown on the projections, was that done with respect to the analysis that's found at -- at slide 41?

MS. SANDY BAUERLEIN: This was, again, as Mr. McCallum indicated an illustrated example. We took an average salary for employees, assuming that, again, there would have to be some type of a severance compensation if you were to reduce by a further five hundred (500) people and so it wasn't to which people would leave, it was just doing a -- a basic assumption as to the impacts on the rates.

But, as well, it's important to note that we feel that the further reductions to our staffing levels, again, we're going down to about thirty-two hundred (3200) operational employees as a result of the -- the VDP program, so, this would take us down a further five hundred (500) from that which we actually feel puts the -- the Corporation at risk. So, we're not looking at the full six thousand (6,000) employees, you're only looking at now starting at about thirty-two hundred (3200).

MR. CHRISTIAN MONNIN: And -- and when you say you -- you feel it puts the Corporation at risk, that is something that was determined by --by whom in particular at Hydro?

MR. JAMES MCCALLUM: It was determined by the -- the executive of Hydro and I think, you know, you would have heard or -- or seen in Mr. Shepherd and my's presentation that the -- our direct evidence at the policy panel that, you know, we -- we've taken all the steps that we think we can, and that if we thought we could cut more, we would have cut more.

It -- you know, these were the steps we took before formulating and concluding our financial plan where the last piece was the requisite rate increases. So, clearly, we've given a lot of thought and attention to -- to what can Hydro do on its own accord to mitigate rate inc -- increases and rate impacts to our -- our customers.

MR. CHRISTIAN MONNIN: And when Hydro here states just at slide 41 that the rate request is not meaningfully impacted about -- who are they referring to that -- who is it not meaningfully impacting; Hydro or the ratepayer?

MR. JAMES MCCALLUM: I think what we're saying is that five hundred (500) operational staff would be an extremely significant cut over and on top of the seven hundred (700) or so operational positions that will be out by the end of January of next year, and over and on top of the four hundred (400) plus operational positions that were reduced over the last several years, with the consequence of being able to reduce the -- the rate increase from 7.9 to 7.4 percent, which I think we would say in the context of 7.9 percent is not a material move.

We're not remotely suggesting that -- that, you know, any rate impact isn't -- isn't of -- of concern or challenge to our customers.

MR. CHRISTIAN MONNIN: So if I can take away from that -- and there's a whole lot to unpack in that answer, sir -- if I can take away from that, Hydro saying that it -- it -- the impact is not a meaningful impact on the rate request that it's putting forward going from seven point nine (7.9) to seven point forty-one (7.41), correct?

(BRIEF PAUSE)

MR. JAMES MCCALLUM: We -- the -- .5

percent on 7.9 percent, the -- the purpose of the -- the illustration, and again, it's an illustration, we can't do this. We can't do it. So the purpose of the illustration was to say even if we could -- and this is symptomatic of, really, all the offer -- all the -- all the -- the avenues you might want to go down around changing the model.

At the end of the day, nothing changes the big iceberg of $25 billion in debt. It drives everything. So as -- an infeasible operational headcount affects the rate increase by .5 percent.

MR. CHRISTIAN MONNIN: And perhaps I can view it from a different angle and put it this way to you, sir. Manitoba Hydro is not in a position to suggest in any way whether a .49 percent of a rate increase is meaningful to a ratepayer or not, correct?

MR. JAMES MCCALLUM: Correct.

MR. CHRISTIAN MONNIN: Thank you. If you can go to Appendix 5.1, please. That would be the UMS Group report. The UMS Group was engaged by Manitoba Hydro in September of 2016 to conduct a GAAP assessment of its assessment management capabilities.

Is that correct?

MR. JAMES MCCALLUM: That -- that's correct. I think we are probably in the process of alerting Mr. Wortley that he might be required here. We had not understood from your email last night you wanted to examine on UMS, which is fine, we just need to get the right personnel.

MR. CHRISTIAN MONNIN: Well, I'm sorry. My -- the email on Friday, I think, and I just sent two (2) orders across. And my understanding -- my take-away from Ms. Ramage last week was, Anything that's not on the record needs to be given a heads-up, which I did my level best to circulate to --

MR. JAMES MCCALLUM: I'm -- and it was Friday, for -- for the --

MR. CHRISTIAN MONNIN: And I'm not --

MR. JAMES MCCALLUM: -- and it wasn't criticism at all. I just -- we -- we hadn't been -- everything in our evidence is fair game. We -- we're not disputing that. It's just we didn't have the right people here.

MR. CHRISTIAN MONNIN: And -- and I took it like that, and please don't fret about criticism. I truck and trade in the misery of others, and I get criticized on a daily basis, so.

MR. JAMES MCCALLUM: Okay. Then I'll --

MR. CHRISTIAN MONNIN: No harm, no

foul. Thank you.

MS. PATTI RAMAGE: Mr. Wortley is on his way.

MR. CHRISTIAN MONNIN: I -- I apologize for -- for that gap. Perhaps if I can jump to something -- well, I...

MR. JAMES MCCALLUM: He'll be right up.

MR. CHRISTIAN MONNIN: Thank you.

(BRIEF PAUSE)

THE CHAIRPERSON: Nice to see you, Mr. Wortley.

MR. JOEL WORTLEY: Thank you. It's a pleasure to be here.

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Mr. Wortley, over here, good morning. I apologize. I'm the reason why you had to come to the panel on short notice.

I was asking some questions with respect to the UMS Group's report on asset management GAAP assessment, and as I'd stated earlier, my understanding was that UMS was engaged in September of

2016 to conduct a GAAP assessment of its asset management capabilities. Is that correct?

MR. JOEL WORTLEY: That's right. UMS was hired to come in and work with us to identify opportunities for improvement.

MR. CHRISTIAN MONNIN: And the scope of the assessment was to evaluate Manitoba Hydro's curs -- current asset management capabilities, and practices, and make recommendations for implementing a best practice asset management system; correct?

MR. JOEL WORTLEY: That sounds about right. I'd have to review the exact wording of their engagement, if that's what you're reading from.

MR. CHRISTIAN MONNIN: Kristen, if you can go down one (1) page, perhaps I will make a few -- a couple pages.

And a brief compris -- if I understand correctly, this report comprised a review of Manitoba Hydro's existing corporate business unit level asset management practices and comparisons to indusy -- industry best practices.

Are you able to educate me what asset management is at a very high-level?

MR. JOEL WORTLEY: So asset management, as we've talked about a little bit previously in this forum, often gets confused a little bit. There is -- there is making decisions about assets, which is usually termed as managing assets, and then there's asset management, which is how you run your asset-intensive business, and it's the alignment of all your activities to cert -- to your business objectives to realize value from your assets. And so in -- in the broadest sense, asset management is how you run your company.

MR. CHRISTIAN MONNIN: And Kristen, if you can go to page 4, please, of this report. Under the heading 'Strategic Value of Asset Management', among others, UMS report that benefits which can be achieved by Manitoba Hydro through the -- the maturation of its asset management system include -- and I'm looking at the fourth bullet -- fifth bullet down:

> "Improved effectiveness of expenditure dollars through focus on performance management and continuous improvement, and then optimizes use of human resource by matching the workforce in terms of size and composition to the work required, rather than creating work

"to keep the workforce busy."

Is that correct?

MR. JOEL WORTLEY: That's what it says, yes.

MR. CHRISTIAN MONNIN: And if you go to Tab -- sorry, page 7, please. In particular, after the stream of bullets, UMS identifies a number of gaps with Manitoba Hydro for which no current initiative is underway to close, and below is a summary of these key gaps, along with corresponding key recommendations.

And if you go to the next page over, please. And at page 8, some of the key recommend -- no, sorry. UMS noted that:

"Some of the key elements of an asset management system are missing from Hydro today. These include audits, controls, and performance metrics, which leadership can use to ensure to the stab -- the suitability, adequacy, and effective -- effectiveness of the system."

Is that correct?

MR. JOEL WORTLEY: That is what the report says, yes.

MR. CHRISTIAN MONNIN: And again:

"Different functions within each business unit have different roles in the asset life cycle leading to a situation where no one (1) group or function is responsible for optimizing total asset life cycle cost. In addition, most asset management efforts are focused on capital spending with minimal attention given to optimizing O&M, which is a key part of the asset life cycle."

Correct?

MR. JOEL WORTLEY: That's right. That's what it says.

MR. CHRISTIAN MONNIN: And under the heading 'Recommendations', namely, they recommend deci -- that Manitoba Hydro's decide on, declare, the operating model for asset management, roles, decision-making processes, goals, and key performance indicators, and the timetable for implementing these changes.

What has Manitoba Hydro done with these recommendations?

MR. JOEL WORTLEY: I -- as you noted,

the report was commissioned in 2016. Since then, a number of -- a number of initiatives have been put in place, first of all being our corporate asset management initiative to centralize asset management responsibility for the Company, which involved creating my own position, as the director of strategic business integration; involved creating the corporate asset management executive counsel, a group of vice-presidents responsible for ensuring -- or the stewardship of asset management within the Company; and a corporate asset management steering committee of directors responsible for deploying those asset management practices within their respective groups.

We've got a number of more technical initiatives underway to improve our asset health: indexing to create a corporate value framework to provide a common basis for valuing projects, and to roll out a computer foundation called C55 to allow portfolio management planning and the optimization of capital expenditures.

The next -- next on our list of things to do is to continue down our -- the development of our corporate asset management framework, phase 1 being this UMS report, where we looked for having UMS come in and identify opportunities for improvement.

Phase 2 is to develop asset management policy strategies and objectives, and phase 3 is a roadmap to close gaps and move us towards best practice.

MR. CHRISTIAN MONNIN: And so we're -- we're in phase 1, or we've started phase 2 now?

MR. JOEL WORTLEY: Phase 1 is complete. Phase 2 is next.

MR. CHRISTIAN MONNIN: And the -- at the foot of page 8, another recommendation is:

"Develop processes, implement tools to address operations and maintenance spend and the trade-off between O&M and capital in each business unit."

And that is comprised in phase 2?

MR. JOEL WORTLEY: No. If -- if you continue down the report towards the end, the -- UMS's recommendations are broken into four (4) steps. I think it's -- keep going.

(BRIEF PAUSE)

MR. JOEL WORTLEY: There, I believe, or one (1) page back. There we go.

And so what they're recommending is

that first, you need to create the right environment, then design the change the things that you want to accomplish, and then implement. And as you roll things out and they become adopted, then you work at achieving excellence.

MR. CHRISTIAN MONNIN: Okay, so when we were going through phase 1, 2, and 3, where do those fit in with these -- these four (4) steps?

MR. JOEL WORTLEY: So phase 1 and 2 would be -- phase 1 would be prior to these steps. Phase 1 was the -- the baseline. Phase 2, creating the right environment, is we're currently sitting, and phase 3, in terms of the roadmap, will be designing the change.

MR. CHRISTIAN MONNIN: And then the other two (2) implement the change?

MR. JOEL WORTLEY: That's right.

MR. CHRISTIAN MONNIN: That's the phase -- is that another phase, or?

MR. JOEL WORTLEY: We haven't named it a phase at this point. We'll have to see how we roll that out.

MR. CHRISTIAN MONNIN: And as -- as far as a roll-out for these phases, what's the timeline are we looking -- that we're looking at?

MR. JOEL WORTLEY: The -- there's no particular schedule being established right now. I expect that phase 2 will roll -- or will -- will be executed over the next year or so. The actual timing for phase 3, the roadmap and the execution really depends on what we're going to try to accomplish, and that -- that's subject to a cost/benefit analysis to see which -- which gap's first, and how long is it going to take, and what it's going to cost.

MR. CHRISTIAN MONNIN: Does Manitoba Hydro at this point have any notion or idea of this -- the cost savings or benefits that can be availed from proceeding with this -- these recommendations?

MR. JOEL WORTLEY: We haven't progressed far enough to be able to do a delta -- or a -- a cost analysis or a benefit analysis -- opportunity analysis for our own business. We know from other experience, we know from UMS themselves that other companies have achieved savings -- I believe UMS quotes 20 -- 20 percent, something like that. It -- it's in the early part of the report if you want to see it.

MR. CHRISTIAN MONNIN: No, that's fine. Thank you.

Ms. Bauerlein, I have some questions

for you still on -- on O&A. And as I understand matters in this GRA, Manitoba Hydro did not have the ability to prepare a detailed operating and administrative expense breakdown. Is that correct?

MS. SANDY BAUERLEIN: Correct.

MR. CHRISTIAN MONNIN: And the reason for that is -- is due to the fact that the full measure and impact of, for example, the voluntary departure program, and other directions are -- are still moving along. Is that correct? They're not come -- they're not finalized yet?

MS. SANDY BAUERLEIN: That's correct. To do a detailed budget, we have to understand exactly where every person is going to be and exactly what function they're going to be doing. With the people leaving, there's still a lot of transition happening across the Company.

MR. CHRISTIAN MONNIN: And my understanding on the evidence to date is that Manitoba Hydro has handled the voluntary departure program and the delimiting of positions internally. Is that correct?

MS. SANDY BAUERLEIN: That is correct. In some cases -- in many cases, the positions are delimited. In other cases, sometimes staff are redeployed to a position that a person may be leaving, but we feel that is a critical role, and that another subsequent follow-on position would be eliminated.

MR. CHRISTIAN MONNIN: And is Manitoba Hydro intending to hire any exterior -- external experts or consultants as it moves along with the workforce reduction plan and the optimizing of the O&M?

(BRIEF PAUSE)

MS. SANDY BAUERLEIN: On some areas may be looking to -- for assistance in trying to manage their specific functions. So while as -- as a company we haven't hired a consultant, there are certain areas that are looking for assistance to help refine some of their -- their processes.

MR. CHRISTIAN MONNIN: Kristen, if you could please go to Appendix 12 -- sorry, 10.12, and page 2 of 5. It's an operational cost and breakdown of benchmarking as prepared by the Boston Consulting Group.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: I'd said 2 of 5. I apologize, it's 4 of 7 on this -- this slide. If you scroll down a little bit, please. As a footnote number 1, it:

"...appears determined by size of global Hyd -- Hydro generation fleet."

Is Manitoba Hydro able to -- other than from that footnote, based on its dealings with Boston Consulting Group, are they -- is Manitoba Hydro able to describe the basis for selecting the utilities, and the numbers of utilities, and whether any of these selective comparatives are verily integrated to prepare this benchmarking study?

MS. SANDY BAUERLEIN: I'm not aware as to what -- how the section process was for the comparison that was done by BCG.

MR. CHRISTIAN MONNIN: And I understand that one (1) of the cost-saving measures that Hydro is looking for it pertains to supply change cost savings?

MS. SANDY BAUERLEIN: That is correct.

MR. CHRISTIAN MONNIN: Has Manitoba Hydro done anything to identify the streamlining and the savings that can flow from that?

MS. SANDY BAUERLEIN: Yes, it does. We have a supply chain initiative which, again, we have identified specific activities, similar to the capital asset management processes. We have different activities happening within different waves.

And as we discussed in the opening presentation, we expect to see -- or achieve savings of around -- a cumulative savings of around 150 million by -- I think it's 2021 -- 20 -- around that timeframe.

MR. CHRISTIAN MONNIN: Are -- are you familiar with what's referred to as a total factor productivity analysis?

MR. JAMES MCCALLUM: I have not heard that term.

MR. CHRISTIAN MONNIN: It represents a study -- the total quantity of outputs of a firm relative to the quantity of all the inputs of it -- that it employs. Is this something that -- anyone in Manitoba Hydro in the panel has -- has heard of in the past?

MS. SANDY BAUERLEIN: I have not.

MR. CHRISTIAN MONNIN: Thank you. I have now some questions with respect to Keeyask.

THE CHAIRPERSON: Sorry, Mr. Monnin,

can I just interrupt for a second? Can I just ask, on the GAAP assessment report, when was it actually ordered? When -- when was there a decision made to move forward with a gap assessment report?

MR. JAMES MCCALLUM: This is the UMS report, sir, on asset management?

THE CHAIRPERSON: Yeah.

MR. JAMES MCCALLUM: I -- I think we'll have to get back to you on that.

THE CHAIRPERSON: Okay. I -- I'm just wondering -- the -- the second question I had was: Who made the decision? Is this a management decision, or is this something that was reviewed with the Board? And you can get back to me on that one as well.

MR. JAMES MCCALLUM: Before my time. I'll have to --

THE CHAIRPERSON: Okay.

MR. JAMES MCCALLUM: -- endeavor to find out.

THE CHAIRPERSON: Thank you. Sorry, Mr. Monnin?

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Not a problem, Mr. Chair. Thank you.

I have some questions that I'd like to put to the panel with respect to Keeyask. Mr. McCallum, my take-away from your evidence on the policy panel was that Manitoba Hydro recognizes and anticipates that Keeyask will be a net detractor to its financial position for a considerable -- considerable period of time. Is that correct?

MR. JAMES MCCALLUM: Yes, that's correct. As we look at the future, here, we are seeing that domestic load growth is considerably slower than we had earlier anticipated, and we are -- which pushes out the -- the need for Keeyask in order to serve customers in the Province of Manitoba to a later date.

And then the capital cost has obviously increased significantly, and the export pricing on the opportunity market has -- has not recovered the way we had previously hoped and planned. And so as a result, you know, our -- and -- and this is in -- in Tab 2 of our application, albeit using some -- some dated and higher export pricing, but you can see that there is a material negative differential between the revenues we anticipate for Keeyask and the incremental carrying costs when the asset comes into service.

MR. CHRISTIAN MONNIN: And the take-away from that is based on the current outlook for its costs and the revenues that flow from it, that considerable period of time can feasibly be measured in decades. Is that correct?

MR. JAMES MCCALLUM: Yeah -- whether it's decades being 20 years, I'm -- I'm not sure. It depends a lot on the assumptions you look at, but clearly into the 2030s.

MR. CHRISTIAN MONNIN: And so safe to say that Manitoba Hydro reviews and would agree that Keeyask is a primary driver of the proposed rate increases?

MR. JAMES MCCALLUM: It's a significant driver of the rate increases, but so too are the limited contribution to reserves that's been made over the last several years, and, of course, in service of Bipole III reliability project next year.

MR. CHRISTIAN MONNIN: And Kristen, if you go to Tab 2, please, of the application, page 58 of 61.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: And I think this -- looking at lines 16, Mr. McCallum, I think

this ties into the evidence that you were just
providing, starting on line 16, going to the last
period on line 20:

"Since its last year rate application, Manitoba Hydro's experienced a further deterioration of its anticipated expert revenues, significant weakening in its forecast of domestic load, and sig -- significantly increased capital costs associated with its major new generation and transmission projects. In response to these challenging conditions, Manitoba Hydro is dramatically advancing the pace and scale of internal cost reductions."

Now, I'm -- I'm reading that not because -- I know everyone can read very well. I'm just reading that for the benefit of the record, and I thank you for your patience and allowing me to do that.

And so, in view of the changing environment, here's the question: In view of the changing environment, did Manitoba Hydro consider alternatives of scaling down, or modular versions of Keeyask in order to different portions of the capital costs?

(BRIEF PAUSE)

MR. JAMES MCCALLUM: I was just looking around to ensure that Mr. Miles was -- was with us. But, you know, at the heart of the Boston Consulting Group review of -- of the summer of 2016 was looking at, really, both major capital projects and the financial impact of -- of same, and to examine whether there were opportunities to -- to delay or halt the projects. And that analysis kind of came back with, you know, in a -- in a punchline, no choice but to move forward.

And as the Keeyask project, subsequently, we -- we reviewed and -- and updated the control budget in February or March of 2017, and -- and we -- and this is in our evidence -- refreshed, you know, a similar analysis to what BCG did of the Keeyask project and concluded that, again, the -- the best path forward for impacts on -- on ratepayers in the Company was to finish the project and get it in service.

MR. CHRISTIAN MONNIN: So I twigged to the use of the word -- or the -- in your response, sir, I twigged to you saying, In a punchline, BCG came back.

Was -- did BCG conduct an examination on the merit of such options and that would reduce the rates inquired -- the -- the rates that are now being required? More than a punchline, did it actually do an analysis of -- of scaling back or doing modular versions?

MR. JAMES MCCALLUM: I'll have to -- to let Mr. Miles speak to even the feasibility of any modular concept. Certainly in our -- our -- and -- and I wasn't here for the BCG work to speak to -- to rate impact analysis. We did do those analyses in February and March of this year to quantify and -- and similarly confirm that -- that the rate impacts were far worse by abandoning the project versus completing it.

MR. TERRY MILES: Maybe I -- Mr. Monnin, exactly what do you mean by modular options and different options? I'm not aware of any alternatives that -- that BCG would have looked at in terms of alternate structure makeup, but if you could provide a little more clarification as to what you mean by modular --

MR. CHRISTIAN MONNIN: Sure. Modular -- I believe Keeyask is -- is it seven (7) turbines? If you could scale that down, it would be modular. Looking -- if you could have two (2) going rather than the -- than the seven (7), then you can scale those out. That's what I would be referring to as modular.

And -- and in particular on that piece is I would -- would appreciate to know if -- if Boston Consulting Group conducted such an analysis to consider these alternatives and -- and where -- where that could be found.

MR. TERRY MILES: I -- I don't believe Boston Consultants considered those types of things. I think with a project like Keeyask, once it's at the state that it was at, about 75 to 80 percent of the actual cost is in the civil works, the main structures that are there. The mechanical turbines and that then ends up being incremental on top of those. And then typically, completing those and installing those resources actually helps to extract the value from that.

Once you've invested in the 75 to 80 percent of the civil -- civil works, the turbines and that actually help extract the value of it, and there's benefit in completing those at the time to do that, not -- the alternative is to not completing the turbines at the time. That would be my -- my understanding of that.

MR. CHRISTIAN MONNIN: So I appreciate it's qualified that depending -- it is qualified on -- based on the -- on the -- the point where Keeyask was -- was -- and what the situation was, and -- and the part of its development, it's -- with that qualification, is it safe to say that Boston Consulting Group did not conduct such an analysis?

MR. TERRY MILES: I'm -- I'm not aware of the analysis, and I'm not aware that they were asked -- asked to do that. I can't comment on that.

MR. JAMES MCCALLUM: Yeah, nor -- nor can I, but to -- to my awareness and knowledge, no.

MR. CHRISTIAN MONNIN: Okay. If you can go to Manitoba Hydro -- I believe it's MFR-72, page 1...

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: Yes, I'm sorry, and it really just -- and that -- I don't need to drag everyone there, but what I'm looking at is the -- I would draw your attention to the June 2nd, 2016 letter from BCG, to -- setting out the scope of work. And one (1) of the bullets is, "What viable alternatives exist to maximize value?"

And I think we've established that they haven't looked at alternatives. But my suggestion was -- would it -- being that under the scope of work, that would have been something they ought to have looked at?

MS. PATTI RAMAGE: If I could interject, Mr. Monnin?

MR. CHRISTIAN MONNIN: Please.

MS. PATTI RAMAGE: I don't think we've established what BCG did at all. We've established that this panel is not aware of -- of what that was.

MR. CHRISTIAN MONNIN: Well, then we'll leave it at that. Thank you, Ms. Ramage.

(BRIEF PAUSE)

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Is -- is -- and I -- I apologize. I'm asking this question because the pole's in front of me, and that's of my own making. I could have moved.

Is Mr. Cormie on the panel this

morning?

MR. JAMES MCCALLUM: No, he's not here this morning.

MR. CHRISTIAN MONNIN: Okay. I will ask the questions regardless that I were going to put to Mr. Cormie. If someone is able to respond to them, all the better; if not, then I will move on.

You may recall an exchange with my friend Mr. Peters. Mr. Cormie was put questions about the delay of Keeyask to thirty-two (32) months, and whether that would have any impact on Hydro's current contractual obligations. And Mr. Cormie's evidence was that they had -- that "they" being Manitoba Hydro had the resources to meet the obligations if the delay was extended to thirty-two (32) months.

As Mani -- can Manitoba Hydro provide -- anyone on the panel provide any -- is able to answer this question: What would happen if the delay was further than thirty-two (32) months, say an extra twelve (12) months? Would that affect Manitoba Hydro's abilities to meet its contractual obligation?

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: And Kristen, if

you could go to PUB book of documents, Exhibit 42, Tab 4, page 182, that'll set out the contracts, the obligations that I'm referring to.

(BRIEF PAUSE)

MR. JAMES MCCALLUM: I -- I think we'll need Mr. Cormie to speak specifically, but I -- I would just say that there -- there are important kind of pieces of calculus that go into a delay decision that go beyond Manitoba Hydro's ability to service the contract from -- from its excess dependable energy without Keeyask, which is, I think, where you're -- you're going, and those include the contractual terms of these export contracts that are specific to Keeyask.

But also not to be missed is we're building this -- this project in partnership with four (4) Cree nations who have -- Manitoba Hydro has made commitments to. And so there -- there is much more that goes into this analysis than simply whether we have the additional dependable power.

MR. CHRISTIAN MONNIN: That's fair. And I suppose this is something that Mr. Cormie would have to -- to respond to, but I appreciate the other factors in the consideration of meeting the obligations, but this was really specific to being able to meet the resource obligations. And Mr. Cormie's evidence was that, you know, with a thirty-two (32) month delay, if Manitoba Hydro had the resources, it could enter the market.

If -- if you could go to -- if thirty-two (32) months delay occurred, then I was just wondering whether the resources would be there if the delay was greater than thirty-two (32) months.

MR. JAMES MCCALLUM: We -- we will have to reserve on that. I -- I don't personally have the answer.

MR. CHRISTIAN MONNIN: That's fair.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Monnin, would you like that by undertaking, or -- we have put out the call for Mr. Cormie, but --

MR. CHRISTIAN MONNIN: You know, whatever's easier for you folks over there. Frankly, I'm -- I'm fine either way.

MS. PATTI RAMAGE: Let -- let's take it by undertaking, and if Mr. Cormie -- I believe he's in meetings, but if we can pull him away, we'll get him back here and deal with it that way, if -- if this morning, we can get him here. And -- and we apologize. We weren't aware that --

THE CHAIRPERSON: Yeah. No.

MS. PATTI RAMAGE: -- Mr. Cormie was specifically required this morning.

THE CHAIRPERSON: Yeah. That's fine. We'll deal with it.

MS. PATTI RAMAGE: Gave him a pass.

--- UNDERTAKING NO. 13: Manitoba Hydro to provide whether they can continue to meet their contractual obligations if the delay of Keeyask is longer than thirty-two (32) months

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Kristen, if you can go to some of the IRs, GSS/GSM Manitoba Hydro 1-4, please.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: Thank you. Now, this might seem a little picayune, but here on the response we're referring to cancellation costs. And here we have 1.35 billion. And when I'm looking at the tab 2 application, it's 1.3 billion. And I say it's picayune because we're only looking at the difference being 1.3 and 1.35.

And I'm just wondering why there's that difference, and is it just because at the time of the application, vis-a-vis the time of response to the IR? Can anyone elucidate me on that over there?

(BRIEF PAUSE)

MR. TERRY MILES: Can you repeat the question, please, Mr. Monnin?

MR. CHRISTIAN MONNIN: Absolutely. In tab 2 of your application, Manitoba Hydro quantifies the additional cancellation costs of Keeyask at 1.3 billion, and in this IR it's quantified at 1.35 billion. And I said I appreciate it's picayune. It's very small, but I'm just wondering what the discrepancy is, and whether that's just because of the temporal issue of when the application was filed.

MR. JAMES MCCALLUM: No, I -- and I'll

let Mr. Miles overrule me. I -- I believe what's happened -- the -- the number I have in my head from February or March of this year when we -- when we, you know, refreshed our analysis of -- of whether to carry on with the Keeyask project in light of the new capital budget -- the number I have in my mind from then is 1.35 billion as being our estimate -- and it's important to emphasize estimate of -- of the cancellation costs and remediation costs. And so I -- I can't -- I don't know how that ended up being 1.3 billion in the -- in the application. It could well be just a typographical matter.

MR. CHRISTIAN MONNIN: And did -- did Hydro include the sunk costs in making a determination of whether or not to proceed with Keeyask?

MR. JAMES MCCALLUM: No, the sunk costs were taken as -- as just that, sunk costs. This was an analysis of paths forward, comparing the path of expending the additional capital to finish the project, obtaining the benefit of the export contracts, versus a path of halting construction, remediating the site, paying the breakage costs associated with the relationships that are contingent on the project. And then constructing the -- the comparison analysis was to construct a gas plant projected, you know, with a new projected need date for new resources.

MR. CHRISTIAN MONNIN: My Friend Mr. Williams referred to his failure in -- in going to accounting. My track record is even worse and it'll reflect in this question.

What's the difference between a sunk cost and actual costs incurred?

MR. JAMES MCCALLUM: Well, a -- a sunk cost is typically, at least in my mind, thought of as a cost that's in your rearview mirror. It's been expended. You can't do anything to recover it. And so really when you're -- when you're managing a business you're looking at the path forward and looking at the best decision you can make basis where you're at.

So when we -- when you -- you ask the question of, you know, is -- is Keeyask going to be -- effectively your question was: Is your -- is Keeyask going to be a net drag on Manitoba Hydro's income in the years after it comes into service. The question -- the answer that was -- is clearly yes.

But that doesn't mean that it is wrong choice to finish the project. What you're doing is you're -- you're saying, There's not much I can do about what's already been expended. But a -- a half built generating station is of no use to anyone. And so your path -- you're -- you're looking at alternate paths forward. Do I expend the remaining 4-odd billion dollars and finish the project? Or do I not do that -- expend in our estimate is 1.35 billion, forgo the export revenue tied to the project and have the ratepayers pay the interest cost on -- on 5 or $6 billion invested with no functioning asset to show for it? That's the analysis.

MR. CHRISTIAN MONNIN: I want to try -- try this again because -- and try to break it down even more simply because my brain only thinks in very simple ways.

And so I think my question was definition-wise, what's the difference between sunk costs vis-a-vis actual costs incurred? Are they the same, or are they a different animal?

MR. JAMES MCCALLUM: No, I'd regard them the -- as the same.

MR. CHRISTIAN MONNIN: All right. So here we have sunk costs at 2.8 billion, in this IR. And, Kristen, if you can go to the IR previous to that MH-1-3(a) to (c), page 3 of 3 is -- is fine. And again, this might just be because this is actual costs as April 3rd of 2017. We have -- and my understanding now from your evidence is sunk costs at 2.8 in the previous one (1) is the same as actual costs incurred. This is 3.348 billion. And I'm just trying to understand why there's a difference on these IRs for the sunk costs or the actual costs incurred.

MR. JAMES MCCALLUM: One (1) moment.

(BRIEF PAUSE)

MR. JAMES MCCALLUM: So I believe -- I believe the difference -- and we'll, subject to check -- it's an excellent question, Mr. Monnin. But -- but I believe if you look down to the --

MR. CHRISTIAN MONNIN: It might be my only one (1).

MR. JAMES MCCALLUM: If you look down to -- and, I'm sorry, I've lost the reference for which IR this is, but if you look -- just for the record's purposes -- if you look down at the bottom you'll see interest of 0.476. That's $476 million. That has been capitalized to the project, bringing the total from 2.8 billion to 3.348.

So I believe in the answer to the other IR that you referenced the 2.8 billion was without the

-- it was sort of the -- the sunk costs of -- you know, for buying nuts and bolts and widgets and concrete. And then you also need to consider the interest we've expended on the funds borrowed to progress the project to date. So that would be the difference.

MR. CHRISTIAN MONNIN: Thank you, Mr. McCallum. Kristen, if you can go to IR GSS/GSM 1-6, please.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: Oh, if you'd -- that's -- scroll up a little bit more. Thank you. Here -- a little bit more, please. Perfect. Here GSS/GSM puts one (1) statement from Hydro that's found at page 43 it's app -- of its application. And it speaks to:

"In examining the original decision BCG analyzed the NPV, net present value, of Keeyask and then Keeyask plus the US tie-line project against the base case of gas-fired generation, and concluded that the Keeyask 2019/'20 ISD with US tie-line provided the greatest benefit to both Manitoba Hydro and the province."

And Hydro was asked to reconcile that statement with BCG's statements below which read as follows:

"Conversely, a decision to build Keeyask and its associated infrastructure was an imprudent one (1) due to a failure to fully assess the risks associated with moving forward. And all three (3) projects, the Bipole III, Keeyask, and the associated tie-line should have been reviewed on an aggregate basis instead of individually to properly assess the collective risks of conducting all projects at once. While a Bipole III could have been pursued as a standalone project, the feasibility to Keeyask and the tie-line were both dependent on one another and on construction of the Bipole III as well."

Now with respect to the answers

provided, I just want to clarify a few points. Now, I've always been accused of having a firm grasp on the obvious, but the first response is as follows:

"Manitoba Hydro's interpretation of the above statements."

Is it safe to say that that's exactly what this is? It's a centre -- Manitoba Hydro's interpretation? It did not go back to Boston Consulting Group to confirm that?

MR. JAMES MCCALLUM: That's correct.

MR. CHRISTIAN MONNIN: And the next page over, Kristen. And the last paragraph:

"As to statement 2, Manitoba Hydro infers that BCG's conclusion is" --

And again, is it safe to say that Manitoba Hydro did not go back to BCG to confirm this -- what is being inferred?

MR. JAMES MCCALLUM: That -- that's right.

MR. CHRISTIAN MONNIN: Now, Mr. Chair, I had circulated some orders that I had some questions for on Friday. And they were really with respect to an exchange that My Friend Dr. Williams had with Mr. Barnlund. I appreciate he's not on the panel. I can defer these questions to the panel where Mr. Barnlund will be participating in. I have no problem with that. But I thought it prudent to have them ready, because the exchange occurred with respect to the revenue requirement panel.

MS. PATTI RAMAGE: Mr. Chairman, we can have Mr. Barnlund --

THE CHAIRPERSON: Ms. Ramage...?

MS. PATTI RAMAGE: -- here and I am also told Mr. Cormie is on his way, so.

THE CHAIRPERSON: I guess we'll keep going.

MS. PATTI RAMAGE: We might as well keep going.

THE CHAIRPERSON: Yeah, I'm just -- Mr. Monnin, do you have other questions besides those for Mr. Cormie or Mr. Barnlund?

MR. CHRISTIAN MONNIN: I -- I see that Mr. Cormie has just -- just entered. The ones that I have, the balance would just be for Mr. -- for Mr. Barnlund. And again, I --

THE CHAIRPERSON: Okay. Well --

MR. CHRISTIAN MONNIN: -- I have no problem delaying those to the next panel.

THE CHAIRPERSON: Well, no. But if Mr. Barnlund is on the way we might as well deal with it now. Mr. Cor -- if Mr. Cormie could be seated, and then we'll -- we can put his -- your questions to him. And then if Mr. Barnlund --

MR. JAMES MCCALLUM: Do you think you're finished with Mr. Wortley?

MR. CHRISTIAN MONNIN: I am. Thank you.

MR. JAMES MCCALLUM: Okay.

THE CHAIRPERSON: Thank you, Mr. Wortley. Mr. Cormie, good morning.

MR. DAVID CORMIE: Good morning, sir.

THE CHAIRPERSON: Mr. Monnin.

MR. CHRISTIAN MONNIN: Thank you, Mr. Chair.

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Good morning, Mr. Cormie.

MR. DAVID CORMIE: Good morning.

MR. CHRISTIAN MONNIN: And I -- I appreciate you being to attend this morning to answer a few -- the very few questions I have for you. Perhaps, Kristen, out of fairness it would be of benefit to putting up PUB book of documents at Exhibit 42-4, page 182.

Mr. Cormie, during cross-examination on this panel by My Friend Mr. Peters on behalf of the Board, there was an exchange between yourself and him with respect to Hydro's obliga -- ability to meet its obligations under contract, and -- that are found at page 182. And your answer on that at page 1278, no need to go there, but was:

> "Subject to check, Mr. Peters, I believe we do. We also have the ability to acquire resources in the short-term if that became necessary. We can enter the market, and if it was necessary acquire resources if -- if there were a thirty-two (32) month -- months for additional delay."

And do I understand that on the one (1) hand this answer, Mr. Cormie, is Manitoba Hydro can meet its obligations in two (2) ways: by going into market, or with the current resources it has.

MR. DAVID CORMIE: Well, clearly, Mr. Monnin, if we didn't have Keeyask, if it didn't come into service, that would be a significant strain on our system under the planning criteria. However, because we are also building a new 500 kV transmission line to the United States, we have access to additional resources that could be called upon from the market in the circumstances that things were delayed further than what we're planning. And -- and we would -- we would go to the market and use that firm transmission to pro -- to acquire those resources if necessary.

MR. CHRISTIAN MONNIN: And this exchange with Mr. Peters was in particular regard to a thirty-two (32) month delay.

What would occur in that scenario if the delay was greater than thirty-two (32) months?

MR. DAVID CORMIE: Well, we'd have to -- we'd have to -- we would be monitoring the progress of Keeyask. And -- and probably a year in advance of any deficiency that we would identify that put the company at risk, we would go to the market and acquire the resources.

MR. CHRISTIAN MONNIN: And are you able to say today whether -- if Keeyask was delayed for greater than thirty-two (32) months, whether Manitoba Hydro would be able to meet its obligations as set out on page 182 here?

MR. DAVID CORMIE: Which -- what -- 182 is that table of contracts? Mr. Monnin, if you remember, Manitoba Hydro supplies system power to all its con -- under all its contracts. It's from our portfolio of resources, including purchases. There are -- there are no contracts that are specifically tied to any specific resource. And so we would add a system resource, either a capacity purchase, or if -- if necessary, we would enter into a call option for energy. And that would become part of our portfolio, and it would be completely suitable for meeting any of our obligations either in -- to -- under our export sales or to our -- to our Manitoba customers.

MR. CHRISTIAN MONNIN: So to unpack that, the answer would be that Hydro would be able to meet its contractual obligations if the delay was greater than thirty-two (32) months; correct?

MR. DAVID CORMIE: Well, I'm -- I'm expecting that given our -- that the Great Northern transmission line and the Minnesota/Manitoba transmission line would be in service we can tolerate additional delays, yes.

MR. CHRISTIAN MONNIN: Thank you. Those are my questions. Mr. Chair, this might be an appropriate time to have the quick morning break. I see Mr. Barnlund has arrived.

THE CHAIRPERSON: I'm sorry. Sorry.

Mr. Monnin, how long do you think would be with Mr. Barnlund?

MR. CHRISTIAN MONNIN: I'd -- probably about ten (10), fifteen (15) minutes.

THE CHAIRPERSON: Well, why don't we do Mr. Barnlund now and then we can -- if we're done with him then Mr. Cormie, Mr. Barnlund can -- can leave unless they're required by -- well, I guess you're the last one (1) up, so. I'd just like to get through this and free up people so they don't have to sit here if they're not needed. So why don't we proceed, Mr. Monnin, and you can finish your cross.

MR. CHRISTIAN MONNIN: If I might just take thirty (30) seconds to refresh my glass of water, I'd...

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: My Friend has been kind enough to -- to take that on for me, so I'll -- and I'll just proceed.

THE CHAIRPERSON: Certainly.

CONTINUED BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Thank you.

Good morning, Mr. Barnlund.

MR. GREG BARNLUND: Good morning.

MR. CHRISTIAN MONNIN: Mr. Barnlund, I understand that you're the person who has been identified by Manitoba Hydro as being responsible for responding to and dealing with Board Orders.

Is that correct?

MR. GREG BARNLUND: That's correct.

MR. CHRISTIAN MONNIN: And in that regard you are the appropriate person to respond to any questions relating to the Board Orders; correct?

MR. GREG BARNLUND: That's correct.

MR. CHRISTIAN MONNIN: Now, I'm mindful of what was -- the -- the concern was raised by My Friend Ms. Ramage last week ensuring sufficient time to receive and review documents that are not currently on the record for this GRA. I sent an email out on Friday, December 15th, copies of Board Order Number 101/04, and Board Order Number 34/05.

Did you receive copies of those Orders, sir?

MR. GREG BARNLUND: Yes, I did.

MR. CHRISTIAN MONNIN: And are you able to confirm that you had sufficient time to review those Board Orders?

MR. GREG BARNLUND: I gave them a -- a quick review. I'm -- I'm prepared to speak to them, yes.

MR. CHRISTIAN MONNIN: Okay. I'd like to take you back to an exchange that you had with My Friend Dr. Williams on December 12th, 2017. For the record, those can be found at pages 1469 and 1459 of the transcript. No need to take you there now.

Mr. Barnlund, you may recall you jumped in on an exchange between Dr. Williams and Mr. McCallum on the issue of rate shock. Do you recall that?

MR. GREG BARNLUND: Yes, I do.

MR. CHRISTIAN MONNIN: And do you recall your evidence that you advised that Manitoba Hydro did not consider that the 7.9 percent increase as being requested to meet the threshold of rate shock?

MR. GREG BARNLUND: That's correct.

MR. CHRISTIAN MONNIN: And you then advised that that was based on in 2004 the PUB looked at Manitoba Hydro's -- sorry, the PUB, the Board, the Public Utilities Board looked at Manitoba Hydro's application for an August 1 rate increase.

Is that correct?

MR. GREG BARNLUND: That was the one (1) I spoke to when I was exchanging with Mr. Williams -- with Dr. Williams. I might add, too, that there are some -- in other jurisdictions if you'd find the Ontario Energy Board and the Alberta Utilities Commission more clearly define a threshold for rate shock as being a 10 percent increase.

MR. CHRISTIAN MONNIN: Right. But in the evidence that you provided that day when you exchanged with Mr. Williams, you specifically referred to a 2004 Public Utilities Board of Manitoba's decision.

Is that correct?

MR. GREG BARNLUND: That's correct, yes.

MR. CHRISTIAN MONNIN: Okay. And I'm going to suggest to you that that decision is Order Number 101/04.

You have no reason to contest that?

MR. GREG BARNLUND: I believe that's correct.

MR. CHRISTIAN MONNIN: And based on the Board Order in 2004, the Board Order of the Public Utilities Board of Manitoba, your evidence was that as long as the increases were no more than 8 or 9 percent then they would not be considering those as rate shock.

That was your evidence?

MR. GREG BARNLUND: That was a finding -- and I'm just going to look it up here on which page of the Board Order it was.

MR. CHRISTIAN MONNIN: It's page 24 if you want to go there, and we'll take you there in -- in --

MR. GREG BARNLUND: Okay.

MR. CHRISTIAN MONNIN: -- in a bit, but I'm just more fixed -- I'm concentrated on your -- your evidence right now, sir.

MR. GREG BARNLUND: Okay.

MR. CHRISTIAN MONNIN: Do you recall give -- your -- your evidence of last week that was as long as the increases were no more than 8 or 9 percent, then they would not be considering those as rate shock? Was that your evidence, sir?

MR. GREG BARNLUND: That was what I read in the Board Order, yes.

MR. CHRISTIAN MONNIN: Pardon me? Can you repeat?

MR. GREG BARNLUND: That was what I read from the Board Order, yes.

MR. CHRISTIAN MONNIN: Okay.

MR. GREG BARNLUND: It's on page 27 of Order 101/04.

MR. CHRISTIAN MONNIN: And now, we'll get to the Board Order in just a moment, and also Board Order 34 -- 34.05. And when you said in your evidence last week that we don't considered it to be rate -- meeting the threshold of rate shock, and that rate shock threshold is 8 to 9 percent, when you mean "we," obviously you mean your evidence was on behalf of Manitoba Hydro?

MR. GREG BARNLUND: Well, to be clear I think that Manitoba Hydro's position is that a rate increase of 7.9 percent would not constitute rate shock. We would -- we do not have an official policy threshold in terms of what would be deemed as rate shock. However, we're cognizant of a level of 10 percent as being widely recognized in the utility industry as constituting a potential for rate shock.

MR. CHRISTIAN MONNIN: And we'll get to that in a bit. I'm just dealing with your evidence and dealing with what this Public Utilities Board of Manitoba has opined -- or has determined to be rate shock. And now, this decision that we're -- we're referring to, and we'll get to it, it sets a threshold of rate shock of 8 to 9 percent.

Is that correct?

MR. GREG BARNLUND: I wouldn't characterize it as it set a threshold of 8 to 9 percent. It determined that Manitoba Hydro's increase was not -- did not constitute rate shock. And it simply opined that other Intervenors had indicated a range of between 8 to 9 percent as being their definitions of constituting rate shock.

MR. CHRISTIAN MONNIN: So having this Board identify the threshold of rate shock -- and we can get -- that's page 27, as you quite said -- right -- right said, Mr. -- Mr. Barnlund. The last paragraph:

> "In coming to a decision on the rate increases, firm and conditional, the Board considered the issue of rate shock and opines that the rate increases for most customers would be within the thresholds put forth by the Intervenors, i.e., no more than 8 to 9 percent for any customers for the August 1, 2004 increase, and much less for most."

Are you able to advise whether Manitoba

Hydro's decision to put forward a 7.9 percent increase in this GRA was in light of the threshold here being 8 percent? Did that have any factor in -- in the rate that was being put forward?

MR. JAMES MCCALLUM: I -- I can answer that. The answer is no --

MR. CHRISTIAN MONNIN: Okay.

MR. JAMES MCCALLUM: -- because this is the first time that I've been made aware of this Board Order.

MR. CHRISTIAN MONNIN: The second, if you refer to last week's evidence of Mr. Barnlund. Now, Mr. Barnlund, in your exchange with Mr. -- Dr. Williams last week, you also provided further evidence that while the proposed rate increases in this GRA are difficult, and that's your evidence, they do not equate to rate shock because the rate shock also infers a sudden surprise on the customer.

Do you recall giving that evidence?

MR. GREG BARNLUND: Yes, I do.

MR. CHRISTIAN MONNIN: And you've added that Manitoba Hydro had been very clear in terms of its communications of its financial situation in indicating that there would be a need for continual rate increases of this order of magnitude; correct?

MR. GREG BARNLUND: Yes, that's correct.

MR. CHRISTIAN MONNIN: And based on this heads up, for lack of a better term, Manitoba Hydro would not necessarily consider this to be rate shock.

Is that correct?

MR. GREG BARNLUND: That's correct.

MR. CHRISTIAN MONNIN: And would you agree with me, sir, that -- just bear with me for a moment.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: Now, if you look at what this Board has said at page 27 here, and I'm suggesting to you that there's no reference on this -- in this paragraph or anywhere else in the order that the Board established that provided it was communicated properly, it wouldn't be rate shock.

Do you agree with that?

MR. GREG BARNLUND: I'm -- I'm not aware of any other clear, I think, policy distinction this Board has made. I might, I guess, maybe draw your attention though to some of the decisions that this Board has made with respect to the natural gas utility, Centra Gas Manitoba, which, of course, deals with a much more volatile cost structure due to the fact that a great deal of that cost as passed on to customers is a cost of gas that's procured in the wholesale market.

And there's been ten (10) at least -- or ten (10) occasions where this Utilities Board has approved increases to natural gas customers in excess of 10 percent. And a situation in 1999 and 2000 when wholesale commodity prices really increased at a -- at a very fast pace, the Utilities Board passed through an increase upwards of 25 percent on one (1) occasion.

MR. CHRISTIAN MONNIN: Okay. So that's -- I appreciate that. And we can maybe get to that at a later time. But this Order here, sir, is -- is a general rate application for Manitoba Hydro, the -- the PUB 101/04; correct?

MR. GREG BARNLUND: Yes. And -- and you were asking me about the surprise to customers. And certainly some of the gas rate increases that have been approved by this Board were driven by some surprising changes in the wholesale market where there is relatively little notice that was provided to customers of those changing conditions. And that was more of an issue of rate shock to be contended with than what we are certainly referring to here in this General Rate Application, sir.

MR. CHRISTIAN MONNIN: So I think it's best to take this in pieces in order to ensure that we move along in a timely fashion. So if you can go to page 24 of the decision. I just want to go through what the order -- what the -- what the PU -- Public Utilities Board said here.

MR. GREG BARNLUND: Yes, sir. I have that.

MR. CHRISTIAN MONNIN: Okay. So if you could scroll down a bit, please. Now, the last two (2) paragraphs, I think we can agree on -- on the penultimate paragraph that's before the last one (1):

> "The two (2) concerns of the Board when dealing with Manitoba Hydro applications, the interest of the Utility's ratepayers and the financial health of the Utility. Together, in the broadest interpretation, these interests represent the general public interest."

You take no issue with that, sir?

MR. GREG BARNLUND: Yes, sir.

MR. CHRISTIAN MONNIN: And here, the second paragraph, or the last paragraph, rather:

"In a sense, Manitoba and ratepayers are fortunate that the objective of avoiding rate shock plays a role in rate setting. In the case of other commodities, oil and gas, the market price changes ignore the concept."

Do you agree with that, sir?

MR. GREG BARNLUND: I see that statement, yes.

MR. CHRISTIAN MONNIN: We're dealing with a different beast here.

Do you agree with that, sir.

MR. GREG BARNLUND: Well, I would agree that certainly for -- for products or commodities that are transacted at a market price that -- that the potential for rate shock does exist for those particular commodities, yes.

MR. CHRISTIAN MONNIN: Now, I wasn't here in 2004. And -- and I wasn't here for Board Order 35 -- 34/05, which I also shared. But, Mr. Barnlund, were you here at that time?

MR. GREG BARNLUND: I was employed

with Manitoba Hydro, but I was not involved in those applications at that time.

MR. CHRISTIAN MONNIN: Okay. But you -- you familiarized yourself with these Orders?

MR. GREG BARNLUND: Yes, sir.

MR. CHRISTIAN MONNIN: Now, my understanding of that at this time frame, November -- Board Order 101/04 and Board Order 34/05, we were dealing with a significant -- an extremely significant financial impact of a drought; correct?

MR. GREG BARNLUND: That's correct, yes.

MR. CHRISTIAN MONNIN: And at page 28 of Board Order 101/04, the Board is referring to conditional and firm -- sorry, firm and conditional rate increases.

Do you agree with that?

MR. GREG BARNLUND: Yes.

MR. CHRISTIAN MONNIN: And -- and my understanding of that point, what they're referring to here is that the Board in this decision gave firm rate increases and conditional rate increase. A firm rate -- and the reason for that can be found -- bear with me again.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: At page 22, last paragraph:

> "Accordingly, after careful consideration and realizing the additional burden that will be placed on the economy, the Board has determined to vary Manitoba Hydro rate -- rate increases."

And what the Board determined in this decision was to give a firm increase of 5 percent, and conditional increases of 2.5 percent in April and October of the following year, pending satisfactory information being filed by Manitoba Hydro to the Board, that those rate increases were set -- were -- were necessary.

Do you agree that's what occurred, sir?

MR. GREG BARNLUND: And I -- and I think what was occurring at the time and -- and part that was taken into consideration by the Utilities Board in arranging these increases on a firm and on a provisional basis, was that a number of things in addition to the significant loss that have been occurred -- that had been incurred, excuse me, in the year of the drought.

This Board also expressed a concern with the ability or the pace at which the Utility was approaching attaining its revenue -- or, sorry, attaining its equity targets. And it had concerns that -- that the Company was not on track to be able to do that appropriately. It was also concerned that in the face of looking at the construction of Wuskwatim, which was scheduled to occur within the next couple of years that this Board expressed a concern that -- that sufficient financial strength had to be -- had to be obtained by the Corporation in light of that major capital expenditure. And the Wuskwatim plant, at that point in time, was budgeted to be probably a eight hundred thousand (800,000) -- or a $800 million project.

MR. CHRISTIAN MONNIN: So you're not disputing that in Board Order 101/04, that after careful reflection realizing additional burden that would be placed on the economy, the Board varied the rate increases. It staggered them, for lack of a better term.

You don't dispute that at least, sir?

MR. GREG BARNLUND: It did -- it did more than stagger them. It actually awarded the

Utility more than it had requested.

MR. CHRISTIAN MONNIN: But, sir, you're not going to disagree that it gave a lesser increase, and then conditional increases where Manitoba Hydro was required to return before the Board to justify that these conditional increases were necessary.

Do you agree with that, sir?

MR. GREG BARNLUND: No, I think to make clear, the Utilities Board awarded Manitoba Hydro a larger increase for August 1 than it had initially requested, and then followed by requiring Manitoba Hydro to file, on a provisional basis, updated financial information prior to considering any -- or its next rate increase for April 1 of 2005.

MR. CHRISTIAN MONNIN: Is it safe to say, sir, that Manitoba Hydro views the issues of economic competitiveness and economic development as something that, while important, are mostly beyond its mandate and control?

MR. JAMES MCCALLUM: Sorry, Mr. Monnin, can you repeat the question?

MR. CHRISTIAN MONNIN: Is it safe to say that Manitoba Hydro views that the issues of economic competitiveness and economic development is something that, while important, are mostly beyond Manitoba Hydro's mandate or control?

MR. JAMES MCCALLUM: Well, I think clearly Manitoba Hydro has an interest in economic development. Economic development and -- and growth support Manitoba Hydro's business. I think our concern would be trying to use rate strategy in order to artificially deal with issues of economic competitiveness that go far beyond electricity rates.

MR. CHRISTIAN MONNIN: Is it safe to say that in preparing this application Manitoba Hydro did not turn its mind to the impact of the impending carbon tax and what that will have on -- on ratepayers' ability to absorb the proposed rate increases?

MR. JAMES MCCALLUM: Well, at the time we prepared our application we didn't have knowledge of the Province of Manitoba's choices around the carbon tax.

MR. CHRISTIAN MONNIN: You had knowledge that the federal government was imposing --

MR. JAMES MCCALLUM: Of course.

MR. CHRISTIAN MONNIN: -- which would apply to all provinces, unless a province has opted out and did their own; correct?

MR. JAMES MCCALLUM: That's my understanding.

MR. CHRISTIAN MONNIN: So there was a knowledge of a carbon tax of one (1) form, shape, or another at the time; correct?

MR. JAMES MCCALLUM: I would say that's correct.

MR. CHRISTIAN MONNIN: So is it safe to say that that didn't factor into Manitoba Hydro's analyses while preparing this application?

MR. JAMES MCCALLUM: I wouldn't -- yeah, I would agree with that directionally.

MR. CHRISTIAN MONNIN: And is it safe to say that in the same vein that Hydro has not attempted to identify the trade-offs between the impact of the rate increases on its financial health -- health on the one (1) hand, and that of the province and the ratepayers on the other hand in preparing its application.

Is that safe to say?

MR. JAMES MCCALLUM: Sorry, can you repeat your question?

MR. CHRISTIAN MONNIN: Sure. In the same vein, is it fair to say that Manitoba Hydro has not attempted to identify the trade-offs between the impact of the rate increases on its financial health, on the one (1) hand, that of the province and the ratepayers on the other hand?

MR. JAMES MCCALLUM: Oh, I don't think I'd agree with that. I think we had a tremendous amount of discussion around the executive and board around impacts of the rate increases on -- on the economy. I think, ultimately, our job is to look after the health of the Utility and I think what we put forward here we've said is what we believe is the minimum required to do so.

MR. CHRISTIAN MONNIN: And in those deliberations was an in-depth analysis done on behalf of Manitoba Hydro on the impacts that these rate increases would have on the one (1) hand, and on the benefits -- or on the impacts to the province and the ratepayers on the other hand?

MR. JAMES MCCALLUM: In-depth analysis -- no, when we relied on the judgement and experience of the executive team and its Board of Directors who are collectively a group of fairly experienced individuals.

MR. CHRISTIAN MONNIN: Mr. McCallum, members of the panel, members of the Board. Thank you. Those are my questions.

THE CHAIRPERSON: Thank you. We will break until 11:00. Ms. Ramage and Mr. Haight, I want to talk to the Panel about the issue of the motion. So we may revisit it immediately after we come back or we may wait till later. But they haven't had an opportunity to even know that there is a proposed motion, so. Okay. Thank you.

--- Upon recessing at 10:43 a.m.
--- Upon resuming at 11:05 a.m.

THE CHAIRPERSON: Okay, we're going to start. I guess -- our understanding is this matter relates to one (1) of our IACs. Mr. Haight's here, I'm just wondering, Ms. Ramage, if where to start would be for Mr. Haight to give us a background and then Manitoba Hydro could put forward your position.

MS. PATTI RAMAGE: That would make sense, it's Mr. Haight's request so.

MOTION BY MR. BILL HAIGHT:

MR. BILL HAIGHT: Thank you, Mr. Chair, I am here today just to speak to the issue of the deadline for MGF. One (1) of the IEC's that has been retained to give expert opinion evidence in this proceeding. To extend its deadline for provision of its IRs by two (2) days from January 3rd to January 5.

There are a couple things that I -- I want to advise of and -- and one (1) of them, in particular, is -- is the timing of this request and the request -- the timing of it being made at this juncture.

The -- when the schedule was announced and the IR deadlines were posted on the schedule, MGF immediately made known to me its concerns that there was a deadline for them to be provided with the IRs is this Friday, December 22nd, and that their IR responses are to be provided by January 3rd.

They made me know that their concern was -- was this: It was that MGF closes their office for Christmas; has done so for the last twenty (20) years, and the three (3) principals that are with the preparation of this report all, prior to the schedule being announced, had made plans to be out of town, and some out of the country.

And so when the made this known to me, we were also -- they were heavily involved in preparing their report which is significant and substantial as -- as I think everybody knows, it was actually just posted today, this morning, on PUB's website, having been with Manitoba Hydro and other -- Manitoba Hydro and PUB since Friday, December 8th for the purposes of redaction.

My advise to MGF at that time was, you know, work on the report. Get that report in. Once the parties can see its scope, its breath then perhaps there -- you'll be in a better position to ask for this brief extension. Some good can be engendered by providing that report, getting it in, so that the IRs can be dealt with. My thinking that it wouldn't be a significant ask for me to then appear and speak with Hydro, speak with your counsel about this short extension.

So the difficulty is -- is -- is that despite efforts by both Manitoba Hydro's counsel and I to try and work at some form of compromise that we could come to you with today, that has not been possible. We have not been able to agree on this extension.

I have sent around over the weekend a request to have the time extended to January 5. I have received responses from counsel for MIPUG, counsel for the Coalition that they are not opposed to -- to this request. It does but Hydro in a difficult spot and I'll let Ms. Ramage speak to that.

But, some of the things that were discussed is, all right, you've had the report since December 8th going through the redaction process, do you have IRs to identify -- that have come to light as a result of the redaction process; if you do, give them to us, we'll start working on them right now. And so that, therefore, the amount of IRs that would come in on the 5th would be significantly less and -- and that -- that efforts could be made by MGF to try and provide IR responses right away, this week.

Unfortunately, I'm told that that's not possible and -- and MGF remains prepared to do whatever it can this week to try to deal with that. These plans were made before the schedule was announced. They're plans that had been in place -- the travel plans of the principals and the closing of the office.

And so what I'm proposing is -- is that the deadline for MGF's response has been moved to the 5th; that we could provide Hydro with some more time to provide its IRs if -- and we could bump the 22nd to the 29th, and that would accommodate Hydro in some fashion in terms of providing it with some extra time in order to get the IRs to MGF.

And then, as you know, there is the

issue of the redactions to the IRs that have to be dealt with; that was to be dealt with on the 5th. I had proposed that we move that to the 9th and then provide Hydro effectively with that weekend to deal with Irs. I know that there is the week of the 8th to the 12th is going to be a busy week with Daymark appearing on that -- at that time in order to talk about load forecasts and export forecasts.

But, it is a very short time frame that we're seeking and there is a very reasonable explanation for the -- not only the request but the timing of the request and I would respectfully ask that Daymark might be accommodated and that Hydro be accommodated as well in order to get the process fully and completely before this -- the panel.

THE CHAIRPERSON: Mr. Haight, I'm just looking at the schedule. I'm trying to figure out, your proposal for Hydro would be to move the response from when to when?

MR. BILL HAIGHT: So firstly to move the -- the IRs that are to be provided by all parties, including Hydro from the 22nd to the 29th; that would accommodate not only Hydro, but all -- all Intervenors and -- but, as I've said, MIPUG and the Coalition have advised that they have -- do not have a concern or they're not opposed to the request that's being made by MGF. This is just my suggestion as to how all parties might be less inconvenienced by the request.

Then to move the IR responses for -- of MGF and Daymark on the Sask Power, we don't need to move Daymark's but to move the IR responses cleared for the public by Manitoba Hydro from January 5 to January 9.

Subject to any questions that any members may have, that's my submission.

THE CHAIRPERSON: Any questions from the Panel?

Ms. Ramage...?

SUBMISSIONS BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Yes, Mr. Chairman, the basis for this request is MGF's offices closing for the holidays. We've heard from Mr. Haight that's been a practice of that firm for many, many years and it was known to them. It was known to them last summer. It was known to them in October when the schedule was developed. It was known to them when the schedule was issued. It was known to them in November when they asked for a second extension. It was known to them when -- in that second extension there was two

(2) options. One was just give it to Stanley (phonetic) or give it to both of us.

THE CHAIRPERSON: I'm sorry, just give it? I missed the word.

MS. PATTI RAMAGE: Stanley Consulting; their subconsultant.

THE CHAIRPERSON: Yes, okay.

MS. PATTI RAMAGE: That they were having issues with. It was known to them when they -- when they said, the Board has two (2) options, one, just give it to Stanley or give it to both of us. But they preferred that it be given to both of us.

And never during any of those -- that series of events was it raised that the schedule that was on the board had IRs due between December 19th and -- because December 19th was the October date, December 19th and January 3rd.

So, we went through that entire period, granted a number of ext -- this Board granted a number of extensions and that was never raised.

Manitoba Hydro, we simply don't understand why it's only being raised, the logic of that. But if I could deal with the request in two (2) parts:

First, there -- there was a discussion

regarding or a request that Manitoba Hydro -- that Manitoba Hydro file its Information Requests earlier this week. So of a as-it-goes type Information Request process. This isn't it possible. The report has been received one (1) week later than first expected. And Manitoba Hydro of -- that was on Friday, December 8th. We worked diligent -- diligently for the following week to get -- to extract the CSI from it and get it filed. And we filed it at Board counsel's request one (1) day earlier than the Board had asked.

The focus now shifts for our staff from that CSI review, which is a very important process, how they shift Information Requests and we are expecting there's going to be a high volume of IRs coming out of this report. It is lengthy. It covers four (4) major capital projects. And it contains a number of errors that Manitoba Hydro had attempted to address directly with MGF during that C -- as part of that CSI review process but MGF did not make those changes.

We don't know if the reason MGF did not make those changes was because it didn't have time or because it disagrees with Manitoba Hydro, but they're significant and we need to be able to focus our time on the Information Request process in order to address that.

Frankly, the report that -- the concerns we have, ultimately, would support our rate increase but that's not how to proceed with this. We have to get the best information in front of this Board so we need to address those concerns.

The project groups are already working under an extremely compressed timeline to develop their Information Requests and the Panel should understand that by necessity part of the process at Manitoba Hydro shop is that we have to review the report and those requests with our First Nation partners. The process can't be fast tracked. This is a two hundred and fifty-eight (258) page report, and it's a complex subject matter.

The October 5th schedule that we were all working with gave us eleven (11) days to file IRs. That was tight. And as a result of the extension granted to MGF in November, we were cut back to eight (8) days; that's razor thin.

Now, MGF -- or Mr. -- Mr. Haight has suggested that we bump the date from the 22nd to 29th. I want to be clear, Manitoba Hydro hasn't asked for that extension. It has planned all of its processes and all of its work for the 22nd date. We are dealing with people on the major projects here and they have significant responsibilities for those major projects. They can't, at a drop of a hat, re-organize all of their work processes.

We have a schedule and we have to stick to it. The projects are, by our own admission, still have risk, and we need our people's eye on the ball and they need to be able to count on schedules and they need to be able to plan accordingly.

I want to point out that also the request is for two (2) additional dates: January 3rd to January 5th. And that may not sound like a lot but there's two (2) issues at play here: First, following the November extension the deadline for Manitoba Hydro's rebuttal -- and I'm not sure why because it didn't -- was a part of their extension -- was cut by three (3) days. So we went from January 15th to January 12th; twelve (12) days to nine (9) days. Nine (9) days barely allows Manitoba Hydro enough time to file its rebuttal evidence by the revised deadline.

The entire schedule was already condensed to allow MGF to file its report late, and that greatly impacted Manitoba Hydro's ability to react and respond thoroughly, but we've adjusted all of our timelines to do that.

Now, following that November 28th request, Manitoba -- I want to be clear on this, Manitoba Hydro, in the juggle of days, lost eight (8) days of preparatory time for its IRs and for its rebuttal. MGF lost three (3).

And as it stands, staff are going to be working simultaneously on rebuttal, on drafting its presentation for direct, which comes to the Board on January 18th, and preparing for cross-examination, and all the while monitoring what's going on in this hearing, because there has been crossovers, as we've seen this morning. Now, some of those same staff are also working on redacting the Daymark report that's related to the Manitoba-Saskatchewan transmission line, so they have that added task.

So the suggestion that we move from January 5th to 9th, which is the first we've heard of that suggestion, but I can say right off the top of my head doesn't work, because our staff are already double-booked there with Daymark, and they can't do that next task.

So to take away any days from our ability to respond is extremely concerning. We have to present our direct on January 18th. The notion that we move our rebuttal to -- I'm seeing what the proposal is -- yeah. There is no change in the rebuttal, so that we would do our rebuttal, and then three (3) days later be testifying, it -- it's simply not possible. This is a topic on which Manitoba Hydro is seeing this just now, and our rebuttal is going to be our capital presentation, and there's going to be a lot of material to cover, and -- and it's just not possible.

And the other concern I have is, in terms of all of the changes that have been made to date, as I've said, it has impacted Hydro and we have responded, but in our view, the ability to use Manitoba Hydro staff that as the release valve has been completely exhausted now. The timelines are too tight. We can't get to it.

We -- the second concern, anyways, I had with the -- the January 2nd -- 3rd to 5th change is that we were told that the main principals will be away December 22nd to January 3rd, and our view is it's high -- we've been through this IR process many times, and we know based on the reports that there is going to be some substantial IRs coming, and it's highly unlikely that MGF would be able to complete its answers in such a short period of time. They're effectively saying they can turn around IRs in two (2) days.

So we are already anticipating a further request by MGF in the new year for a further delay, and that puts the entire hearing schedule at risk. So by changing anything right now, we have to keep our powder dry. We can't extend now for holidays knowing that there is a high risk of -- yet another risk -- another request coming down the pipe.

I -- Mr. Haight mentioned this morning that MIPUG and Coalition have not opposed this request. They have no skin in this game. This is about Hydro being able to respond to this report, and it's an important report, and there are gaps in the report that need to be addressed.

It -- it may be that MGF will agree with Manitoba Hydro, but it may be that they won't, and it's going to take time to deal with that. And to -- to use up that time now is unwise, because if our concerns manifest themself and they don't get it done by January 3rd, we're going to be looking at juggling the schedule.

And in that regard, we would simply ask now that we be consulted before making any of those kind of specific changes, because as I've indicated, Manitoba Hydro has planned all its activities around the current schedule, and we have a business to run, and our subject matter experts made commitments to other parties and to other work, and the huge proj -- these huge projects are ongoing, and we've got to be able to work with that schedule. We can't just flip these people around, or otherwise we're risking -- putting at risk what all of us want to protect.

We shouldn't be blindly changing the staff schedules at this point in order to accommodate what is -- I -- I was dumbfounded by this request on Saturday, that -- that -- and I think there's an obvious answer, and I think the obvious answer right now is we have to stick with the schedule we've all been working to.

And it's -- it's -- I don't want to be the Grinch and tell somebody that their Christmas is gone, but they were told back in October, and so for this to come in on Saturday morning to us was -- it's an understatement to say that we were surprised.

One moment.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And I think maybe

to show the importance, Mr. McCallum wanted me to remind again that we just -- we're not in a position -- we -- we think there's going to be a lot of IRs. We think there's going to be a lot of material to address in rebuttal, and we just aren't in a position to shave that down any further.

And -- and I would repeat, we didn't ask for December 29th. We have work plans over the holidays, to be working on the rebuttal. We need to get the IRs done, get to our -- our next stage. There has to be some linear -- I -- I don't even know if it's a word, but we need to work in a linear fashion to be able to move this thing forward, and adding more and multiple layer of tasks is -- just doesn't work.

THE CHAIRPERSON: All right. Ms. Steinfeld...?

MS. DAYNA STEINFELD: Mr. Chair, can -- can we -- I would just ask that Ms. Ramage -- clarify and confirm her comments regarding the deadline for the Hydro rebuttal having changed at some point in this process.

It's my understanding that it was always scheduled to be filed for the rebuttal of Daymark, Sask Power and MGF on January 12th, so if we'd just ask her to check that and confirm. I'm looking now at the schedule that dated back to prior to the MGF request for an extension, so if that could be checked and confirmed for the purposes of the record.

It may also be helpful to clarify the timing between when Hydro first received the MGF report and the deadline of the responses. I think the calculation is being done by Ms. Ramage as between when the CSI redactions were completed, and when the IRs were due, but it may be helpful to put on the record the timing between when Hydro received the report in its unredacted form from MGF and the timing of the IR question deadline.

MS. PATTI RAMAGE: If you give me a moment, I can call that up right now.

THE CHAIRPERSON: Sure.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Yes. With respect to the filing of Manitoba Hydro's rebuttal, I can confirm that, as indicated in the PUB's letter of October 5th, it indicated that Manitoba Hydro's rebuttal evidence on the MGF report would be filed on January 15th. That was changed, I believe, subject to check, on the November 28th report or letter from the Board, and that was changed to January 12th. So my comments stand on that aspect.

In terms of timing between CSI, again, I -- I don't think it's useful to do this on the mic, for me to check the dates. I will check them afterwards, but based on my review here, I don't have a reason to believe these dates are incorrect. What Ms. Steinfeld might be referring to is that we -- I referred to the date we have from the time we have CSI released to the time we have our IRs filed, and there may be a misconception that we start working on IRs when we get that report.

The task at hand is to get the CSI done, and while you may think of topics, IRs are not being developed. It's not -- it -- it's just not a process -- the process can't accommodate that. You -- you focus on the task at hand, get that done, and then you move to the next task of -- of answering IRs. But I will check, but I do believe the dates we've put on the record are correct.

THE CHAIRPERSON: Okay. Mr. Haight...?

REPLY MR. BILL HAIGHT:

MR. BILL HAIGHT: Thank you. A few brief comments in reply. You heard Ms. Ramage say that the report substantively supports Hydro's rate application, so I -- I wonder how something could be procedurally unfair when substantively, it's -- it's helping Hydro. So I -- I --

THE CHAIRPERSON: Well, here -- here's the -- sorry. Sorry to interrupt. Here's the problem.

MR. BILL HAIGHT: M-hm.

THE CHAIRPERSON: We haven't seen the report.

MR. BILL HAIGHT: M-hm.

THE CHAIRPERSON: We're not going to deal with the report. In terms of the substance, I -- I, you know, I -- I -- you made the comment -- as far as I'm concerned, I don't care. I'm -- we're dealing with the procedural motion, not with the substances, so I -- I think -- the substance of the report, you know, to talk about the substance of the report before we actually receive the report into evidence just -- just doesn't -- I don't think it's the appropriate way to deal with it.

So I -- I, you know, I -- I'm sorry to interrupt, but we -- we need to deal with the procedural issue and the dates, so.

MR. BILL HAIGHT: I -- I hear you, Mr. Chair, and -- and I only wanted to make that comment as well, because when you were -- when you are looking at the issue of procedural fairness, the fact that counsel to Manitoba Hydro indicated that on the record I think something that you want to --

THE CHAIRPERSON: Yes.

MR. BILL HAIGHT: -- keep in mind. And the other point is -- is Ms. Ramage spoke about beg -- you know, beg -- beginning to work on rebuttal, but you also said that their rebuttal is -- is essentially their capital project presentation. So Manitoba Hydro has known for some time -- if we want to talk about when people knew things -- Manitoba Hydro has known for a long time what its capital presentation is going to be. Of course, it has to fine-tune that, but it knows when it made the rate application.

And -- and it's had MGF's report since December 8th. So it's known, since it's reviewing that, and -- and the point is made that, Well, you're looking at CSI, and so therefore you have to -- if you just do that process, and then the next process, the substance of that report is clear, and when Manitoba

Hydro read -- reads that, and has been reading it since December 8th, it's known at that point in time what its rebuttal evidence is going to be. It's clear from the report.

So -- so to suggest and to confine timelines about the schedule of when CSI is done, when IRs are done, it really overlooks the fact that their capital presentation and their rebuttal are the same, and -- and that they have known for a long period of time what that case is that they have to meet, and that they've had the Daymark report since December 8th, so those are the only comments in -- in reply -- MGF, excuse me. Thank you.

THE CHAIRPERSON: Thank you. My understanding is that MIPUG's position is on the record on this issue. Is that correct?

MR. ANTOINE HACAULT: It -- it's not on the record in the sense of we haven't filed an exhibit, but I will put it on the record we did send an email confirming we're not opposed to this two (2) day extension. We can work with it, and I guess what I would encourage -- I see some discussion happening here while we might able to get with -- together with MGF and correct a lot of these things we might have to do through interrogatories.

We've always encouraged, as an Intervenor, open discussions and -- and trying to deal with things in a collegial way. I'm sure parties will try to do that, but there are ways to solve a two (2) day problem if people are talking to each other in answering IRs, and -- and -- and I'd ask the Board to consider and encourage the parties to continue to cooperate in these proceedings, as we have always tried to.

THE CHAIRPERSON: Ms. Dilay...?

MS. KATRINE DILAY: I can also confirm on behalf of the Coalition that we did not oppose the extension of time requested by MGF, and we would also echo MIPUG's comments on that.

THE CHAIRPERSON: Thank you. Mr. Monnin, I don't know if you want to take your position now, or file something in writing by the end of the day?

MR. CHRISTIAN MONNIN: You know, I'll -- I'll sit firmly on the fence on this one, Mr. Chair. I -- I am fine either way, whichever the Panel finds, we will -- we'll proceed, and that's about all I can say at this point, so.

THE CHAIRPERSON: Okay.

MS. PATTI RAMAGE: Mr. Chair, I should

correct something.

THE CHAIRPERSON: Go ahead --

MS. PATTI RAMAGE: I'm advised by --

THE CHAIRPERSON: -- Ms. Ramage.

MS. PATTI RAMAGE: -- Ms. Minier (phonetic) in the back row that I misspoke.

THE CHAIRPERSON: Okay.

MS. PATTI RAMAGE: In terms of Manitoba Hydro corrections. I said, "in CSI process." It has been an ongoing process in terms of those corrections, and Manitoba Hydro did not receive responses in terms of when it -- it -- when it submitted its response to MGF, because they provided...

(BRIEF PAUSE)

MS. PATTI RAMAGE: -- there was -- there was back-and-forth, but they -- those changes weren't incorporated and -- and I -- Manitoba Hydro can't respond to something it hasn't seen. So it's --

THE CHAIRPERSON: Yes.

MS. PATTI RAMAGE: -- it's nonsensical to suggest that we should respond before we can prepare our response to a report we haven't seen.

THE CHAIRPERSON: Yeah. Mr. Orle...?

MR. GEORGE ORLE: All that trouble for and take no position on the matter.

THE CHAIRPERSON: Thank you. As I understand it, counsel sent it to me and to all the Intervenors and gave me until the end of today. So we're -- the Board -- the Panel is not going to consider this until the time is elapsed in case any of the other Intervenors want to respond. And we will consider it in due course.

Mr. Hacault made the comment about the parties working together. Throughout this process we've tried to ensure all counsel knew what was going on. We've actually had a lot -- very good cooperation in terms of the schedule. This is a difficult matter to schedule. Our counsel spent an enormous amount of time and, quite frankly, this panel went through numerous schedules, so if there is an opportunity for counsel to try and come to some resolution of this they -- I guess they have today. Otherwise, the Panel will deal with this issue either at the end of today or sometime tomorrow and we will provide our decision to the parties.

Okay. On that note, I guess we are into the issue of the undertakings?

MS. PATTI RAMAGE: I have provided Mr. Simonsen with a number of undertakings. And does the Panel have them?

MR. KURT SIMONSEN: Not yet.

MS. PATTI RAMAGE: Okay.

(BRIEF PAUSE)

MS. PATTI RAMAGE: The first two (2) of the undertakings that are being distributed are Number 7 and Number 8. Mr. Simonsen had already assigned them Manitoba Hydro Exhibit 84 for Number 7, and Exhibit 85 for Number 8.

--- EXHIBIT NO. MH-84: Answer to Undertaking No. 7

--- EXHIBIT NO. MH-85: Answer to Undertaking No. 8

MS. PATTI RAMAGE: And I wanted to -- with respect to Number 7, the copy that was distributed electronically on which the paper copies provided have one (1) error in it that we wanted to correct. We will get a new electronic copy to Mr.

Simonsen, but rather than kill trees, on Undertaking Number 7, if you first look to the chart on the -- it's on page 3 of 5. We should delete the reference to gigawatt hours. The slash in gig -- the -- or the slash stays. Just "gigawatt hours" should come out. That's an incorrect reference.

And then similarly on page 4 that follows you'll see in the last two (2) columns of the right -- to the right, it should refer to not gigawatt hours but megawatt hours. And as I say, that correction will be made on the electronic copy, but we are hoping people could just do it by pen rather than reprinting all of these.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Okay. The next --

BOARD MEMBER KAPITANY: Ms. Ramage, can I just ask on that table, page 4 of 5, is it all three (3) columns that we're meant to change gigawatt hours to megawatt hours, or just the second last column?

MS. PATTI RAMAGE: It was the two (2) last columns, net cost -- net cost, it's mega -- it said "gigawatt hour." It should be megawatt hours.

And net cost, megawatt hours year over year increase should change.

BOARD MEMBER KAPITANY: Okay. So the domestic load remains in gigawatt hours?

MS. PATTI RAMAGE: Yes, it does. Too many papers at once here. So the --

BOARD MEMBER KAPITANY: And then page 5 of 5 as well? Sorry.

MS. PATTI RAMAGE: Yes.

BOARD MEMBER KAPITANY: Okay. Thank you.

MS. PATTI RAMAGE: The next undertaking that we've provided is Manitoba Hydro Underna -- Undertaking Number 12. And that was producing the IFF runs that assume zero payments to government. That was provided to MKO at transcript page 1987. And that should now be given Manitoba Hydro 86.

Is that correct, Mr. Simonsen?

MR. KURT SIMONSEN: That's correct.

--- EXHIBIT NO. MH-86: Answer to Undertaking No. 12.

MS. PATTI RAMAGE: And then lastly we

have a revised IR. This is an IR that Mr. Miles was asked about by both the Coalition and PUB counsel. It's a revision to PUB/Manitoba Hydro 1st Round 131(b)(c), and that was -- actually it was in the IR itself, indicated that we would update values when they became available. And they are available. We have updated them.

Now, in this IR I should also explain that on page 3 of that IR, there is -- redactions have been made. Those redactions are exactly the same as in the original response with the same redaction code. So it's -- it's just an update to that information. So we will -- the CSI version will be with the Board and this is the public version.

MR. KURT SIMONSEN: Do you want that as an exhibit? That'll just be a -- a bolt on to the existing IR?

MS. PATTI RAMAGE: I think that's all we have to do with that one (1).

MR. KURT SIMONSEN: Thank you.

MS. PATTI RAMAGE: Mark it as revised.

(BRIEF PAUSE)

MS. PATTI RAMAGE: One (1) other point.

Undertaking 8. It's --

THE CHAIRPERSON: Sorry, which one (1), Ms. Ramage?

MS. PATTI RAMAGE: Undertaking 8. Oh, no, I'm sorry. It's Undertaking 7 is -- it's just the double-side of both pages.

THE CHAIRPERSON: Okay. Good. Thank you.

MS. PATTI RAMAGE: There is no further change.

(BRIEF PAUSE)

THE CHAIRPERSON: Mr. -- sorry. Ms. Ramage, are you done? What --

(BRIEF PAUSE)

MS. PATTI RAMAGE: Just to be clear, because I'm not sure I addressed it, I thought -- is in Undertaking 8, the second page also has a graph with gigawatt hours that should be crossed out. The 7 and 8.

THE CHAIRPERSON: Okay. That's the one (1) in the heading? Got it. Okay.

MS. PATTI RAMAGE: Correct.

THE CHAIRPERSON: That's it?

MS. PATTI RAMAGE: Yes, it is.

THE CHAIRPERSON: Mr. Hacault...?

MR. ANTOINE HACAULT: Thank you, Mr. Chairman. Manitoba Industrial Power Users Group thanks Manitoba Hydro for having put this information together. As you will note in -- in the response to Undertaking Number 7, provided last night, most of the references are to materials which are not on the record.

And some of the information unfortunately isn't necessarily readily available on, I'm going to say, the electronic record. Some of the references to evidence which supports this graph dates back to applications and General Rate Applications which were only done in a paper format. So I think we're actively trying to pull some of those from InterGroup's archives.

And in the circumstances I'm unable to advise whether or not we have any questions. We'll do our best to deal with it as soon as we can and advise the Board as soon as we can. But as I said, unfortunately, this graph and information was not largely based on the current records. So we didn't have a chance to ask IRs on it. And we've got to dig out some material to determine whether or not we would need to do that.

THE CHAIRPERSON: Okay.

MS. PATTI RAMAGE: Mr. Chair --

THE CHAIRPERSON: Sorry.

MS. PATTI RAMAGE: -- Mr. Hacault is correct --

THE CHAIRPERSON: Okay.

MS. PATTI RAMAGE: -- that it was not based on IRs, but it was in response to --

THE CHAIRPERSON: Right.

MS. PATTI RAMAGE: -- MIPUG's evidence. Therefore, there wouldn't have been an IR process for that, but...

THE CHAIRPERSON: Mr. Hacault, do you have any --

MS. PATTI RAMAGE: We will attempt to assist --

THE CHAIRPERSON: I'm sorry, Ms. Ramage?

MS. PATTI RAMAGE: I -- I said we can assist MIPUG as required.

THE CHAIRPERSON: Yeah. Do you have any idea what sort of time frame we're talking about?

We're talking this week or are we talking after Christmas?

MR. ANTOINE HACAULT: I would expect this week. To the extent we don't have ready access to the archives, Ms. Ramage has kindly indicated that she'll assist. So we'll do our best to advise this week whether we have any questions.

THE CHAIRPERSON: And if you -- right. And if you could, if you do have questions, if you could determine which witnesses on this panel you would need to ask questions, so that we don't have to bring back everybody if they're not needed.

MR. ANTOINE HACAULT: Yes, Mr. Chairman, we will do that. And prior to the previous questioning, we had an exchange with Ms. Ramage as to which people we needed on the panel. And I am grateful for the good cooperation we've received in making those people available. And I'm sure that'll continue.

THE CHAIRPERSON: Thank you. We have -- sure, go ahead.

VICE-CHAIRPERSON KAPITANY: Ms. Ramage, can you just clarify now, on this graph page 3 of 5, what is the units on the y-axis, the y-axis of the graph? What are the units?

(BRIEF PAUSE)

MS. LIZ CARRIERE: It's -- it's an index of net costs.

VICE-CHAIRPERSON KAPITANY: Thank you.

MS. LIZ CARRIERE: And revenue, sorry.

(BRIEF PAUSE)

MR. JAMES MCCALLUM: Sorry. Madam Vice Chair, if, if it's helpful the graph is an indexed graph trying to show the relationship and the changing relationship between net unit costs and -- and customer rates taken from the 2000 starting point through to 2017, and then -- and then going forward. And so it's indexed to one hundred (100) as to say at that point how have they changed relative to each other since then.

MS. LIZ CARRIERE: Thank you. Sorry I missed the nineteen (19) -- ninety-nine (99,000) equals a hundred. Thank you.

THE CHAIRPERSON: Okay. I believe the -- the remaining piece prior to re-examination, Ms. Ramage, would be the -- the issue that was raised before about the presentation on the decision-making process for the business operations capital budget. And I had spoken to -- to Board counsel and asked him to prepare questions if there are follow-up. I'm just -- I don't expect it's going to take very long.

I'm -- I'm thinking that what we should do is break for lunch now, and then we can do that right after lunch and then finish with your -- with your re-examination. And I think that probably will conclude the matters before this panel, subject to the -- you know, to Mr. Hacault's possible questions of this panel later on. Okay.

MS. PATTI RAMAGE: Yeah, that sounds fine.

THE CHAIRPERSON: Okay. So we'll break for -- we'll -- we'll break till one o'clock. Thank you.

--- Upon recessing at 11:50 a.m.

--- Upon resuming at 1:05 p.m.

THE CHAIRPERSON: Ms. Ramage...? Did you want to put that on the record?

MS. PATTI RAMAGE: Yes. This undertaking is Manitoba Hydro's -- took this undertaking under advisement and that was with respect to getting permission, and providing details and analysis to support a request for an equity injection and as indicated in the response to the undertaking, Manitoba Hydro respectfully declines to provide the information.

In discussions with Mr. Peters he requested Manitoba Hydro put its position in writing. So we have provided our position in the response to the undertaking and as you will note and we can address it in further detail, if required, and if parties take issue but Manitoba Hydro has declined on the basis of relevance and on the basis of public interest privilege.

And if I could comment under the relevance because, Mr. Chair, you made this comment on Friday with respect to a similar topic. We include in our comments regarding relevance the concept of making recommendations on matters which are not strictly within the PUB's mandate and we address that issue in this indicating that these types of recommendations have arose out of evidence produced in the context of the normal review of rates and we think that is quite different from embarking down a path of inquiry for the sole purpose of making a recommendation on matters that are beyond this Board's mandate.

So, I will file that and await further directions, if any, on how we'll deal with that.

THE CHAIRPERSON: Okay, thank you.

MS. PATTI RAMAGE: And if I didn't say it, I think it's Exhibit 87.

THE CHAIRPERSON: Exhibit 87, yes, I was just going to say that. Okay. Exhibit 87.

--- EXHIBIT NO. MH-87: Manitoba Hydro's written response to undertaking given under advisement.

THE CHAIRPERSON: I guess the next matter was the issue of your presentation or Hydro's presentation on this issue of the decision-making for the business operations capital budget, and we have had evidence before about the way it was done for distribution, transmission and generation, and whether there are priorities set on -- on a corporate basis.

There was a suggestion, I guess there's testimony, that it wasn't done on a corporate basis, it was done with the different groupings and I had asked if you could explain to us what the decision-making process is, and I believe Mr. Wortley had said that there's -- there's a view of moving -- and I guess it was a three (3) to five (5) year period toward something on more of a corporate basis.

And I'd just be interested in knowing how you decide how to budget for it when you may be in a position not to have enough money for the requests of -- of all of your divisions which, quite frankly, has always been my experience.

So if somebody wants to go through that.

MS. PATTI RAMAGE: Yes and Mr. Wortley and Ms. Bauerlein have prepared some brief comments for the Board.

THE CHAIRPERSON: Thank you.

MS. SANDY BAUERLEIN: Good afternoon. I thought if we could just bring up IR -- it's PUB-MH-1-64(b). It actually has a schematic diagram of sort of how the current process works today and how we set targets and allocate our targets to each of the different groups. So, if we could bring that up I'd thought then I would just -- we'd walk through that, Mr. Wortley and myself, and talk a little bit about where we're at today and -- and where we see ourselves going in the future.

So, it kind of starts on the far left

side. So, you'll see there's a box that talks about executive committee establishes business operations capital targets. So, again, we're not a new company so those are really the targets -- each CEF you're taking a look at what was approved in that - in the prior CEF.

And so when looking at that early in the development of the capital expenditure forecast the -- the four (4) vice-presidents responsible for generation, transmission, distribution assets, as well as assets such as like our buildings and IT meet with finance and -- and now it would be Mr. McCallum and we discuss some sort of what has changed or what might be different in terms of what was approved previously.

So if I kind of give an example, back in 2012/'13 the overall target for business operations capital was around 430 million. In 2016/'17, it's 530 million. And in that five (5) year window there's been a lot of discussions at the vice-president level talking about -- we have a capacity -- there's been a problem in some capacity in certain geographic areas of the province, which I think we've talked about throughout this hearing or at times in this hearing.

So, these were sort of raised by both the vice-president of transmission and the vice-president of distribution at the time. So, you know, there was evidence pointing towards we had some issues along areas like Lake Winnipeg East in the southern Steinbach area. Within the City of Winnipeg we have some substation issues.

And so while it's not a sort of precise calculation, it's looking at, here is some of the issues here is what we think it's going to cost, here's some of the resource constraints, you know, we have financial constraints from the perspective of we typically in the past have looked towards the capital coverage ratio as an indicator of, you know, whether or not that was a reasonable ability for us to -- to spend, and we looked at, you know, people availability, as well as availability of -- of perhaps contracting out that work.

So while it wasn't anything exact, it did help us establish sort of the allocation for what that pot of money should look like and you can see that over the five (5) years we have increased that allocation.

It's important to note when we do this, though, we kind of look a lot -- and I think Mr. Wortley has talked about this and -- and perhaps can elaborate a little further, is we do look a lot at the short -- the -- the next couple years, next one (1) to three (3) year timeframe.

Really, the targets beyond that are right now currently sort of set just based on historical spend and anything that we might sort of know of in the future. But again, they're -- they're fairly preliminary and as those years become closer, we refine them.

So in each year even when we look at the allocation of the target to each of the areas, again, we're looking at where the specific requirements are. So, for example, if you compare the capital expenditure forecast from CEF15 to CEF16, you'll see again that there was a -- based on a review of where some of the risks were and the requirements, there was a -- a reallocation of -- of actually a change in the overall target, as well as a reallocation of that target funds from the generation portfolio to, you know, some in the transmission and distribution portfolio is based on -- on the understanding of the risk and the needs and the requirements.

So that's sort of at the highest level how the targets are established and it's an iterative process. Those targets are then finalized by approval of the capital expenditure forecast by executive committee as the sort of input into the integrated financial forecast, and then they are also now finalized by the MHEB capital -- capital committee, so it's a subcommittee of the Manitoba Hydro Electric Board.

So I'll let Mr. Wortley add to that a little bit in terms of where we now take the target and how we, you know, prioritize the investments within those targets.

MR. JOEL WORTLEY: So the first thing it's really important to understand that all -- albeit it's one (1) supply chain and one (1) company, the -- the role of generation versus transmission versus distribution, there's -- it's very different.

And so if we think about that first when you're planning your investments, the first thing to come off the table are the really big things. You're going to make sure that you've got the security of your dams locked down because a cascading failure of, say, the lower Nelson River is just completely unacceptable. So when you're talking about planning investments, those things have already been taking care of, and you've also secured the things that would say -- insure you against a -- a provincewide blackout because that's -- that's not acceptable either. When you're getting into really the -- the marginal planning in terms of optimization, you're into the marginal risks and the marginal benefits.

And the marginal risks and benefits are very different from generation to transmission to distribution. Because in generation any excess energy is sold on the export market. It's simply a revenue question. If you decide not to invest in a generating unit and it comes off-line, you lose the revenue that you have gotten by exporting that energy on the export market.

In transmission, it's a question of bulk grid reliability and revenue to a certain extent if you're dealing with a -- a tie-line or an export line. And so, as you decide whether to invest or not, again, the premise being that your big risks and your -- your customer connections, your capacity issues have come first, you're into that -- that marginal area of: Can I afford to be without this particular element from a reliability perspective? And if you -- if you've -- if you've done your job well you won't -- the difference is hard to see. If you've done your job poorly, you have big problems with rolling blackouts or brownouts, and grid reliability issues.

And so in generations its revenue; in transmission it's reliability; and distribution, it's direct impact to the customer in terms of outage and -- and not having the energy when they want it.

And so when you -- when you line those three (3) things up, and you say what -- what's the level of risk tolerance that I should apply across the board with these things, they're very difficult to compare to each other. You can't say that this much reliability is worth that much outage time for -- from a customer they're different units.

And so what happens in our current practice is that each of those groups is responsible for planning their capital such that they reduce those risks, the risk to their particular portion of the business to an acceptable level.

As we go forward and what we're doing is we're moving from that individual portfolio perspective to a common basis evaluation for the Company. And what that means is we've developed something called the corporate value framework. And the corporate value framework works in five (5) categories to use twenty-eight (28) different value measures to assess how much risk am I buying down or how much benefit am I achieving from this particular investment.

And it will give you a score on a common basis, a common denominator, whether it's in generation, transmission or distribution such that you've got a -- a means of comparing them to each other.

The ele -- elements of common risk: environment, safety, corporate citizenship are all done on a -- on a common consequence scale, but the -- the revenue -- well, revenue is revenue it's easy, it's dollars, but the -- the reliability and the customer reliability need to be levelled against the other, each other.

And so we've done that in this corporate value framework, and -- and it -- it brings that leveling of risks and benefits such that you do get a common denominator evaluation of all your investments, which is cal -- you can calibrate it. You can change it such that if you -- if you're finding that the output is not supporting your corporate objectives, it can be re-leveled and -- and you can carry on.

On the basis of that corporate value framework, we are in the process of and -- and the three (3) to five (5) year time frame was mentioned, the corporate value framework exists today. It's being piloted. It's been rolled out. We will be using it in the next little while to optimize each of our investment portfolios. So you'll have an optimized portfolio in generation, an optimized portfolio in transmission, and an optimized portfolio in distribution.

You can then take that and compare them to each other because they're on -- they're on a common point system to say, well, the last dollar that went into generation bought his many points and the last dollar that went into distribution bought that many points. Maybe, you know, if they're not the same, if they're out of whack, would give you the opportunity to -- to -- to adjust.

And that's exactly what we're working on. That's our -- our objective of optimizing or executing portfolios and would be the information that we would use to adjust targets as we go forward.

The other piece of information is the longer-term outlook and so the same tools and the same monitoring of asset condition, forecasting, and degradation, and therefore forecasting of end-of-life of assets will be used to say, well, how much money are we going to need longer-term to keep the assets functioning, to keep the system safe and reliable and to make sure that we don't get into a situation where we're -- we're suddenly surprised or overwhelmed by a -- a bulge in asset replacements.

And so that -- that -- that is not an easy thing to do. Forecasting anything is fraught with uncertainty. Forecasting then an asset is going to expire and what you might think you might want to do about it when it does expire, cause you may not be a straight replacement, you might want to intervene some other way, whether it's life extension, or some operating mitigation. Trying to understand what it might cost you in ten (10) years to -- to deal with that asset has a lot of uncertainty in it.

And so, we want to make sure as we approach that that we're not burying a lot of time and expense in forecasting -- you know, trying to fine-tune a forecast number that doesn't really change anything. It's got to be meaningful and so that -- those are steps ahead of us to see how -- how good are these forecasts; do they drive decisions; and then if they do, it's worth it. If -- if they don't well that's a lot of engineering and a lot of -- a lot of time spent producing forecasts that isn't worthwhile.

THE CHAIRPERSON: Mr. Wortley, when

you -- you moved to this system where you're going to be, sort of establishing common measurements, how to you actually test against it? What do you do, for example, let's say you've moved -- you're now using this -- this new system and you're at the end of year one, how are you testing whether you're actually achieving the kind of results you were hoping for versus just, you know, creating a more complicated system that's difficult to evaluate?

MR. JOEL WORTLEY: So the -- the testing of the output comes in a number of different forms; mostly to do with release, running scenarios, sensitivity analyses, looking at, if I -- say if I -- if I subtract 10 percent of my capital what -- what happens if I add 10 percent more. Do I actually get more value?

And so there's that portfolio level of questioning my output but then within a project there's a -- there's another level of questioning or testing that goes on, which is that, if are you using the system to its full capability instead of having one (1) project, one (1) solution in the system, you've got one (1) project with three (3) or four (4) different options that you're considering for that particular issue.

And so when you run the optimizer you're allowing the computer to look at -- the computer understands how the asset is going to degrade over time. It understands -- you've told it potentially that your costs may go up, your costs to -- to mitigate may go up over time as degradation carries on it. It -- it understands the difference between you're A, B and C options and -- and will allow trade-offs.

And so if it chooses, say, option B you've got the opportunity to look at that and say, hmm, it chose B over A, which had a cost difference of whatever it happens to be, Does -- does that make sense? Does that make sense from a risk tolerance perspectives? Does that make sense from a value perspective? Did I get enough value? Did I feel like I -- I got what I paid for.

And so you can see it at the project level. You can see it at the portfolio level. You can -- you can run scenarios and -- and test the output to say: Does this risk -- level of risk tolerance that's coming out here, does the place where the dollars are being programmed make sense.

And fundamentally that's the test you've got to come back to. Because at the end of the day, generation knows its business and knows where -- where the revenue is at stake. Transmission knows where reliability is at risk and distribution knows where the customers are at risk.

And if we got something out in a black box type scenario that didn't make any sense at all, then we're definitely doing it wrong and that's not the case at all. It's -- it's not black box. It's very transparent. You can see this mon -- this money buys down these risks. So you've got the opportunity to -- to question. You don't have to accept what comes out. It is just a decision support tool, not a decision tool.

THE CHAIRPERSON: Do you have any questions. Mr. Peters...?

RE-CROSS-EXAMINATION BY MR. BOB PETERS:

MR. BOB PETERS: Yes, thank you. I would like to follow-up on -- on just a couple of areas if I could, Mr. Chair, and Mr. Wortley, and Ms. Bauerlein.

Would it be correct that the capital budgets are not currently based on the quantified and objective processes that Manitoba Hydro intends to use after phase 3 of its capital asset management program is implemented?

MR. JOEL WORTLEY: You've almost got it right there in that the -- the -- phase 3 is not -- not directly related to the capital asset management practices or, sorry, the capital planning practices that we're implanting.

The plans to deploy our capital asset planning tools are already in motion. They're not waiting for phase 3. Phase 3 of our corporate asset management framework is the larger endeavour about aligning the Company's activities. The capital planning processes and tools are being deployed currently and by the end of this year they'll all be in place and what needs to happen before the -- the three (3) to five (5) year timeframe comes from building the data sets, getting good at the processes and challenging the -- the outputs such that we get to a place where we are confident that we're -- that we're getting what we need out of these systems.

MR. BOB PETERS: Mr. Wortley, does that suggest to the Panel that the phase 3 is going to take place sometime after the next three (3) to five (5) years that you've spoken about?

MR. JOEL WORTLEY: Not necessarily. These things -- it's -- it's a journey and it's a journey that happens in different phases, and it happens very broadly across the organization. And so the challenge is to foster the changes you want to see in a coordinated and efficient fashion without overloading areas. If you -- if you try to move too quickly, undoubtedly people check out.

So no, phase 3 does not have to wait for the completion of the capital planning tools. It will happen when the Company's ready.

MR. BOB PETERS: And you're not able to put time estimate on when the Company will be ready for that?

MR. JOEL WORTLEY: I could estimate right now that it -- it -- we would likely start phase 3 towards the end of the coming year, but at this point that's uncertain.

MR. BOB PETERS: In the Manitoba Hydro rebuttal evidence which was Manitoba Hydro, I think it's, Exhibit 52, and specifically on page 49, which is on the monitors in front of us, at the end of the second paragraph there is a sentence that says:

"Past practice has been to assume that past renewal investment requirements are indicative of future mid and long-term renewal investment requirements."

Do you see that?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: Does that suggest that that is no longer the practice or is that still the practice as we sit here today?

MR. JOEL WORTLEY: With respect to CEF16, that is the practice. I'd say we are in transition. It will not be the future practice.

MR. BOB PETERS: So what you're telling the Board is that instead of using that -- the new science and the computer assistance that you just mentioned in a previous answer from your asset management techniques, for the two (2) test years that Hydro is -- has before this Board, Manitoba Hydro is relying on the trends, and assuming that things will be the same as they have been in the past?

MR. JOEL WORTLEY: Not quite. This sentence refers to mid- and long-term investment requirements. So, these are outside of the test years.

The test year investments are programed based on current issues, current condition of the assets and the need to ensure the safe, reliable operation of the system.

MR. BOB PETERS: All right. Well,
let's -- let's stay with that thought in terms of the test year and we may have to go back to -- well, let me ask the question and we'll see if we need the schematic back up again.

But, would the Board be correct in understanding, Mr. Wortley, that the current and the test years and the capital budgets that Manitoba Hydro has in those test years would -- would be coming down in front of the senior executives to the management?

MR. JOEL WORTLEY: They begin with the senior executive, yes. It's -- it's sort of a top-down/bottom-up meet-in-the-middle type process where the -- the needs identified in the operating areas are -- are brought up, and the -- the need for constraints and limiting spending are brought down from the upp -- executive of the Corporation with a bit of a negotiation in-between.

MR. BOB PETERS: All right. Maybe we could go back then just to show the Panel that Schematic. Thank you.

We see in the top left-hand area of the screen, and this is PUB first round interrogatory 64 (a) and (b) that the executive committee will establish the budget, the capital targets; correct?

MS. SANDY BAUERLEIN: As I said, those are really the establishment from, you know, prior CEF. Again, we're not starting at square 1. So that's really saying today if I was looking at CEF16, I would be starting with what had been approved in CEF15 for those years.

MR. BOB PETERS: But there can be adjustments to what was approved previously, and you've told the Board about that this afternoon; correct?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: But I also see Mr. Wortley's point, I think, that the capital expenditure forecast inputs comes from the bottom-up is what I think I understood Mr. Wortley to say and then as well as from the top down.

Is that practically what happens, Mr. Wortley?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: So in that particular instance, the executives know how much was approved in the prior year, and they're getting feedback from the vice-presidents as to how much they want for the current year, and they're going to meet somewhere in the middle?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: I wonder if we could also go to, hopefully not forgotten, PUB Exhibit 42-4 of the fourth book of PUB counsel documents and I think we'll go to page 578. And I think we can look at the bottom of the page, the last paragraph. It's not highlighted, but it relates to a point that Ms. Bauerlein and Mr. Wortley that you just talked to the Chairman about, and I'm looking at the end of the paragraph, starting in the middle. I'll read it for the record.

> "On this basis approved capital targets are reviewed at the vice-president level to assess whether re-allocation of funds is required in order to balance operational priorities and optimize overall corporate value considering changes in business, financial and economic assumptions, as well as operational risk factors. Any proposed target adjustments are reviewed and approved by all impacted vice-presidents to balance operational priorities and risks."

Do you see that portion I read?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: Now, does that suggest that currently as amongst the vice-presidents, they will have to make trade-offs as between who gets how much based on how they assess the risks?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: And you've already indicated that different divisions and I'm thinking of the generation as a division, the transmission as a division, and the distribution as a division, they may have different measuring sticks as to what their risks are; correct?

MR. JOEL WORTLEY: Yes, they have different risks, that's right.

MR. BOB PETERS: They have different risks and they -- and therefore measure them differently as well.

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And so if the vice-presidents are supposed to decide who gets how much of the capital budget, how meaningful can that be if -- if they are all using different risk definitions and assessments of risk?

MR. JOEL WORTLEY: This is the

challenge. And it -- and it's not an easy one to overcome. In this particular case with this practice. the vice-presidents are -- are the operating vice-presidents. They understand their operations and they understand where -- they define what is a tolerable level of risk to carry with respect to their operation. And so this -- look at the -- at the -- at their targets and the unfunded -- the work they can't fit into their targets is a look at what risks are there to my business at this level of funding.

And teaching in -- in the perspective of their own operating context: Is this tolerable or not? And if it's -- if they deem it to be intolerable, then it's up to them to bring that -- that perspective forward, make their case to the other vice-presidents to say -- to demonstrate that it's not tolerable.

MS. SANDY BAUERLEIN: Which is really what they've done over the last number of years with respect to some of the issues around some of the capacity constraints. So, they've been bringing those risk assessments forward for discussion.

MR. BOB PETERS: And, Ms. Bauerlein, what you're telling the Panel is that the capacity constraints -- do I assume that's mostly transmission?

MS. SANDY BAUERLEIN: And distribution, a lot of substations. So again, it's in certain geographic parts of -- of the province and -- and even parts of -- of the City of Winnipeg.

MR. BOB PETERS: So would it be accurate then to suggest that the -- the vice-presidents of transmission and distribution have to convince the vice-president of generation that their risks are of a higher priority than what perhaps the VP generation has on -- on that VP's risk register?

MR. JOEL WORTLEY: It's about a discussion for what's -- what's best for the Company, what's best for the customer.

MR. BOB PETERS: And is it correct then that under this corporate value framework that you're -- you're migrating to, Mr. Wortley, Manitoba Hydro's executive has not yet sat down and established corporate wide risk measures and acceptable levels?

MR. JOEL WORTLEY: The corporate value framework is -- embeds those risk tolerances, those risk levels in terms of how the consequences are rated. And so within the corporate value framework, there are fourteen (14) identified consequence categories, each with nine (9) levels of impact.

And so how you -- how you balance those

defines your risk tolerance. And so the corporate value framework, as it exists today, has been developed based on existing practice. So it's essentially a documentation of our current risk tolerance. It gives us the opportunity now, as we go forward, to change it. To say we want to take more risk in this area, or we see that we need to reduce our risk in this area and actually target those outcomes.

MR. BOB PETERS: And so you're telling the Panel that going forward you'll be making use of this corporate value framework by looking at each of those fourteen (14) risk areas and the nine (9) different risk levels for each of the operating units?

MR. JOEL WORTLEY: The corporate value framework is applied on an investment -- at an investment level. You can then use it to roll up aggregate, how much risk is -- what is the risk level under a particular consequent -- or sorry, under a particular category or how much risk am I buying down on a particular portfolio.

So it becomes the basis for communicating those -- those elements, as well as making decisions as to the acceptability.

MR. BOB PETERS: Just so the panel

understands that answer, Mr. Wortley, doesn't this corporate value framework mathematically give the information that still, then, has to be subjectively analyzed by -- by the vice-presidents?

MR. JOEL WORTLEY: Absolutely. You -- you'll never get to a place where you take the human factor, the -- the judgment out of the decision. The -- the corporate value framework provides a quantification for consideration by the decision-makers.

MR. BOB PETERS: And -- and -- so how long until that corporate value framework is fully populated by all of the units?

MR. JOEL WORTLEY: So the -- it's being -- it was rolled out this year to all operating groups, and they're starting to use it. It will take some time, which is why we've given this three (3) to five (5) year window for -- for getting fully up and running with -- with the tool, and that there are a number -- dozens and dozens of projects already existing in the system, and so to -- to score them all, and to score them all rel -- reliably and repeatably is going to take some time.

And so we want to work our way into it and make sure that we're getting solid -- solid data, solid, repeatable outcomes before we -- we -- walk before we run, in a sense. And so I would anticipate that all new projects in the coming year will be put through the -- the screening through the corporate value framework, or certainly most of them. And then in -- in time, the older projects that were not screened will be completed and -- and weeded out of the system such that you'll arrive at a place where all projects have a -- a common basis scoring.

MR. BOB PETERS: I don't want to go over matters that we've previously talked about, but an example that I believe was given by yourself to this Board was when Pointe du Bois was reevaluated, changing from one (1) Capital Expenditure Forecast to another, there was an economic decision made that the export revenues wouldn't be sufficient to justify proceeding on Pointe du Bois. Is that correct?

MR. JOEL WORTLEY: That is correct.

MR. BOB PETERS: Was that decision not to proceed on Pointe du Bois as a result of the corporate value framework, or was that as a result of -- of the vice presidents just looking at the economics of the project?

MR. JOEL WORTLEY: It was primarily the economics of the project, which obviously would be available without the corporate value framework. What the corporate value framework allows you to do is -- is to take that evaluation a step further and to say, Pointe du Bois is a hundred year old powerhouse with some safety issues associated to it. And so by deciding to -- if I have two (2) options, to continue operating in its current mode, I'm taking safety risks every day by having staff working in that environment, as well as foregoing the potential for additional revenue if I -- I re-power the units.

So we're re-powering the units, it may bring financial benefit, but it may also bring a safety benefit, and it may even bring an environmental benefit, depending on -- on your particular scenario. The corporate value framework allows you to consider all of those things in one (1) scoring rather than simply the financial payback of that investment.

(BRIEF PAUSE)

MR. BOB PETERS: So, Mr. Wortley, when -- when Pointe du Bois was on the Capital Expenditure Forecast, some money had to be found from other divisions to support the increased spending on that generation station. Would that be correct?

(BRIEF PAUSE)

MR. JOEL WORTLEY: In -- in essence, anytime there's a spending in the program or in the -- in the CEF, it's -- you're committing dollars somewhere that you can't go somewhere else. So in that sense, yes, by committing money to Pointe du Bois, it's money that was not available to go somewhere else. The -- when Pointe du Bois was added to the forecast, I can't tell you if something was specifically displaced to make room for it.

MR. BOB PETERS: Mr. Chair, I was looking at page 568 of Board counsels' fourth book of documents just to orient myself back to the discussion that we had previously.

And -- and Mr. Wortley, let's not spend much time on this, but the comparison between the Capital Expenditure 15 and 16, we already saw that under the generation line items at the top of the page, that there was $140 million of savings found over the next ten (10) years, correct?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: And I think it's common ground that that savings is almost all attributable to the Pointe du Bois decisions to -- to not proceed with the -- I'm going to call it the powerhouse and the station to --

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: -- to upgrade it. So now that that $140 million comes off, does that allow transmission and distribution increase budget to -- to fill the gap based on their needs as opposed to a corporate rebalancing of the risk?

MR. JOEL WORTLEY: So in this particular case, the needs at the time were to add some spending in transmission and on the distribution system to account for some capacity issues, but overall, not all the money was required, and so the target overall was reduced. And so you can see in the bottom row that over the ten (10) years, we see a fifteen (15) to sixteen (16), the total went down by $240 million.

MR. BOB PETERS: But Mr. Wortley, if we stay on the 2018 column, and we go down just past generation and wholesale, we'll see that transmission increased -- it looks like 7 million, and the marketing and customer, which we now understand to be distribution, has increased by about 8 million, correct?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And so when generation has gone down, it looks like transmission and distribution have been increased to help fill that gap, and I'm wondering was that based on a risk assessment, or was that just based on there being available cash or capital?

MR. JOEL WORTLEY: The additional money in transmission and distribution, beginning in 2018, reflects the capacity demand due to regional load growth. So it's not a question of pushing money around. It's a question of funding the risks it needed.

MR. BOB PETERS: Mr. Wortley or Ms. Bauerlein, can you indicate to the panel how the executive team ensures that the decisions being made provide a net benefit to the ratepayer?

MR. JOEL WORTLEY: As we've discussed, I think quite a bit here, the -- it's about that balance of cost performance and risk that's going to deliver for the customer. It's the customer, ultimately, who is subject to that balance of cost -- cost performance and risk, and essentially, the -- the safe, reliable operation of the system is deemed to be what's best for the customer. And so these are the dollars are required to protect that safe and reliable operation and make sure that the customer -- we're there when the customer needs us.

MR. BOB PETERS: And in three (3) to five (5) years, Manitoba Hydro hopes to have a numerical basis on which to assess and quantify that risk to make that judgement that it's now making?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: Because presently, it's making that value judgement without the empirical data?

MR. JOEL WORTLEY: It's making that value judgement essentially on the assumption that we want to continue the -- the level of performance and -- and balance of risks that we've had to date. And so the -- the indicators are -- are positive in terms of the customer experience, are positive in terms of the assets, in terms of how long the assets are living, positive in terms of the amount of reinvestment required. And so the -- the tacit assumption is that by carrying on, we're -- we're doing at least what's -- what, at face value, is the right thing for the customer.

(BRIEF PAUSE)

MR. BOB PETERS: But at this point in time, Mr. Wortley, I thought we covered it, that the -- Manitoba Hydro doesn't have a mandate from its ratepayers as to how much more they want to spend on -- on the system upgrades. Is that correct?

MR. JOEL WORTLEY: It would be fair to say that we don't have a mandate from the customer as to how much more they want to spend, nor do we have a mandate from the customer as to how much less reliability they like, so that -- that, yes. You're correct.

MR. BOB PETERS: All right. Okay. I'd like to, Mr. Chair, just turn to a matter that I -- I mentioned to my friend Ms. Ramage that I was going to start with Mr. Wortley, and see if this was something that was on this panel and not the capital panel.

And I wanted to start with an IR that might make it to Board counsels' fifth book of documents, but it's not presently compiled, and that's an undertake -- sorry, an Information Request PUB Manitoba Hydro First Round 62.

And this one has a chart. I'm not going to review the chart in any detail, but Mr. Wortley, you're familiar with these progression of

Capital Expenditure Forecast numbers?

MR. JOEL WORTLEY: I've seen before. I haven't studied them ad -- ad nauseam.

MR. BOB PETERS: All right. And I wouldn't expect you to, sir, in fairness, but one (1) of the concerns is that when a project makes it to the Capital Expenditure Forecast list, that means it has to go up the channels and make it to the vice presidents, and then to the executive of Manitoba Hydro. Would that be correct?

MR. JOEL WORTLEY: The approval process is such that depending on the dollar value, it goes to an appropriate level of management for -- for approval, and then the plan itself does go up to executive to be approved. So there's an individual approval of the project, and then there's an approval of the plan.

MR. BOB PETERS: And --

MR. JAMES MCCALLUM: And just to jump in, the plan is all the CEF, or Capital Expenditure Forecast, is approved by the Board of Directors.

MR. BOB PETERS: Thank you, Mr. McCallum. That means it's gone through the executive committee at Manitoba Hydro?

MR. JAMES MCCALLUM: That's right.

MR. BOB PETERS: Would it be correct that when an item makes it to the Capital Expenditure Forecasts, that item includes what are the expected in-service costs, Mr. Wortley? Like, that is for Ms. Bauerlein, those are the costs that the Corporation expects it will have incurred up until the date that that item becomes in service and of use to the ratepayers?

MS. SANDY BAUERLEIN: Not necessarily when the item is first placed in the CEF. The -- and Mr. Wortley can expand a little bit further, but that may be sort of a -- which is why we've now sort of redefined sort of the look and feel of our report, to give a better perspective on when things are here, as we think there's a potential investment, and we've done some from preliminary work to assess at a high level, and then there's, of course, further refinement as to what the overall scope, and overall requirements, and therefore, in-service costs of the project will be as it progresses through that -- that analysis.

Mr. Wortley, do you want to add to that?

MR. JOEL WORTLEY: The practice has -- had been that to begin any sort of work on project, an approval -- a -- budget had be raised and -- and approved to -- to do any sort of work on the project, including defining its scope to any real extent. As a result, what often happened was that a -- a very, very rough budget was put into the system long before there was any clear understanding of the scope of the project, which inevitably turned out to be wrong, way wrong, because it was produced at a time when there was no clear understanding of what was actually trying to be accomplished or what the scope of work was going to be.

And so we -- we've discontinued that practice now in favour of a practice that allows some money to be spent on some preliminary engineering to define the scope, schedule the project, and therefore, firm up the budget before it's approved. But what you'll see here in many instances, I'm sure, if we look, is a situation where that initial budget, which was a bit of a guess, turns out to be very different from the final number.

MR. BOB PETERS: All right, Mr. Wortley and Ms. Bauerlein, I am going to give you a chance to explain to the panel the current system. So we'll -- we'll come to that with the aid of, I think, one (1) of the Information Requests.

But Mr. Wortley, is the process the same on this Capital Expenditure Forecast for business operations capital items, as it is for the major new generation items?

MR. JOEL WORTLEY: It is insofar as that anytime the -- the budget can only reflect what you know what you know about the project. So if you're very early in the project life cycle, you don't know a lot about it. Your -- your budget is inevitably uncertain. As the project progresses, the scope is defined, the design is completed, the projects -- contracts are let, ground is broken, you learn more as you go, you gain more confidence, more certainty in the actual cost.

And so if you're very early in the project, whether it's a major new gen and transmission, or whether it's business operations capital, inevitably, you don't know a lot about what it's going to cost, but as you progress into the project, and it -- its scope matures, you gain more confidence.

MR. BOB PETERS: Okay. Well, let's follow that through, and I'll ask that your -- Manitoba Hydro's rebuttal evidence, Manitoba Hydro Exhibit 52 be brought up again, and specifically, page

53 of that document, 53 of 78, if that's available, and I believe what we have here is -- is what -- what I think will help the Board understand.

I want to start with -- the premise of this is Manitoba Hydro's rebuttal to METSCO, one (1) of the experts that was engaged by the Consumers Coalition, correct?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And one (1) of the observations that METSCO made was -- and Mr. Wortley, in fairness, I think you made the same one, is it appears that Manitoba Hydro's capital costs are materially underestimated relative to what actually becomes the capital cost, correct?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: And so you took -- Manitoba Hydro took the time to explain in this rebuttal -- and I'm now looking at line 13 -- at the time these projects were conceived, and -- and Mr. Wortley, let's assume these projects are either business operations capital, or major new generation, it really doesn't matter. Are you okay with that?

MR. JOEL WORTLEY: Yeah, I think that's fair.

MR. BOB PETERS: All right. So when

these projects are conceived, and that means that -- and I don't -- you know, somebody's come up with the idea that you need a new substation, you need a new generating station, you need a new transmission line. Somebody's come up with that idea?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And -- and I'm not -- and I'm not belittling the work that it takes to get to that decision, but somebody's come up with the idea, then at the time they come up with the idea, they're also supposed to put a -- a project budget estimate forward for that idea. Is that correct?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And so what you're telling the panel is if you need a new substation, a new transmission line, a new generating station, the Manitoba Hydro folks who conceived the idea should also put a price tag on it?

MR. JOEL WORTLEY: Yes. Again, this is the -- the past practice where the transmission line is a great example, where you may have a starting point and an end point to that transmission line, but not a route. And so if you put an estimate on that transmission line on day 1, without knowing what route it -- the line needs to follow, inevitably, that estimate is not going to be very good.

MR. BOB PETERS: Mr. Wortley, you told the Board that -- and -- and I want to stick with it -- this is the historic way Manitoba Hydro used to do things?

MR. JOEL WORTLEY: That's right. In our current practice --

MR. BOB PETERS: And -- and -- well, I -- I'm going to let you get there, but you've got to -- you've got to trust me on that, and your counsel will make sure I do, but when you say it's historically how you did it, when did Manitoba Hydro have the about-face, or the change in methodology?

MR. JOEL WORTLEY: It -- it's happened a little bit over time in that -- in the last -- in the last year or so, we've -- we've adopted a formal process by which the groups can now raise what's called a -- a capital investment concept to get a little bit of money to do some preliminary engineering, but in -- in years prior to that, there was some opportunity to rai -- raise some preliminary engineering money that some groups were taking advantage of. So it -- it's a little bit inconsistent on when it happened in which groups.

MR. BOB PETERS: Okay. So it's

relatively new with -- we'll say within the last year, and you're trying to get to a common platform?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And you're not quite there yet?

MR. JOEL WORTLEY: I -- I would think we're -- I would say we're -- we're there in terms of -- we're there in terms of when projects are raised today, the approval on the -- the approval on the project justification is not proposed until there's a firm definition of the scope, schedule, and budget. You need that in order to value -- there's no point in scoring the value the of the project if you -- if you don't really know what it costs, because the -- the value is obviously not going to be correct either.

However, projects last a long time at Manitoba Hydro. A lot of our -- our big jobs have been over many years, and so you can have many projects in the system that were still started under the old process that will be there for many years to come. So it -- it will appear, even though the -- the practices in place today to avoid the situation, the hangover is still there from the past practice and will be for many years.

MS. SANDY BAUERLEIN: So I did want to

add, in the last CEF, we actually tried to, from a presentation perspective, make it a little clearer by defining executing projects, so these are projects that are underway, versus one (1) that we were calling potential investments. So this is really where you know you're going to build a transmission line, but again, we're not sure exactly what the route is. So we were trying to make it a little clearer in even our presentation of the Capital Expenditure Forecast, the difference.

MR. BOB PETERS: So does Capital Expenditure Forecast 16 contain the new methodology, Ms. Bauerlein?

MS. SANDY BAUERLEIN: It -- it contains the new presentation, and Mr. Wortley said, the transition of some of the -- the new methodology where we're trying to actually have now scope approved separate from actual project costs.

MR. BOB PETERS: All right, and we'll come to that. I promised again. So CEF17 will be the first time the Board will be able to see the Capital Expenditure Forecast using the new methodology that Manitoba Hydro has migrated to?

(BRIEF PAUSE)

MR. JOEL WORTLEY: For new projects, that will be the case. Year 1 in the CEF is a mixture of projects in flight and new starts. So the new starts, that -- that will be the case.

I guess maybe I should add one (1) more clarification, which is that there are instances where a project was first conceived many years ago, and then followed in time, and -- and deferred, because it wasn't needed right away, that's still -- still waiting to be actioned. And so when that one comes up to be executed in year 1, it will still have somewhere on the books an initial project justification that was done under the old -- under the old process.

MR. BOB PETERS: All right. I -- I want to complete the old process as quickly as I can, and I'm still on Manitoba Hydro's Exhibit 52, page 53 of 78, and I was still up on lines 13 and 14.

And so you've told us that under the old methodology, which we have seen on the progression of Capital Expenditure Forecasts that we've just had on the monitor, this old process had the project budget estimated and approved prior to ending -- engineering or planning being done to define the project scope, correct?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And so who approved that? Who -- under the old system, who was approving this capital expenditure if it hadn't gone yet to engineering or planning to define the scope?

MR. JOEL WORTLEY: Again, depending on the level of spend, the appropriate level of management, as per the policy, would be required to improve the investment.

MR. BOB PETERS: Okay. So remind the panel, in terms of the level of spend, is there a dollar amount that has to make it to the executive committee and the vice president level?

MR. JOEL WORTLEY: Yes.

MR. BOB PETERS: And what's that dollar amount?

(BRIEF PAUSE)

MR. JOEL WORTLEY: It -- it's changed a little over time, which makes them -- I don't want to give you a half hour long answer. At -- at one time, it was anything over 2 million was going to EC, executive committee.

MR. BOB PETERS: And -- and is that your best understanding as to what was used at the time CEF16 was prepared?

MR. JOEL WORTLEY: CEF16 was approved under our new process, and our new process has multiple -- new process and new policy has multiple approval levels. I think 25 million?

MS. SANDY BAUERLEIN: Current -- under the new approval policy, 25 million goes -- anything greater goes to executive committee. Anything greater than fifteen (15) goes to our corporate asset management executive counsel.

MR. BOB PETERS: And anything lower than fifteen (15) goes to the director level?

MS. SANDY BAUERLEIN: Vice-president is --

MR. JAMES MCCALLUM: An individual will get the director level, an individual vice-president can approve up to a fifteen (15), $15 million project. The corporate asset management executive counsel, which is the four (4) operating group. That's marketing and customer service, transmission, generation, and then human resources and corporate services, those four (4) and me as the chief financial officer are on that committee. I chair it, and that approves projects between 15 and $25 million. Above $25 million goes to the full executive committee, which includes any remaining vice-presidents, plus the president, of course, and then above 50 million, a project goes to the Board of Directors of Manitoba Hydro.

MR. BOB PETERS: Okay. I think I've got the -- the latter, there, and I thank you, Mr. McCallum.

I would like to complete on this item in front of us on the screen, this page 53 of the rebuttal.

(BRIEF PAUSE)

MR. BOB PETERS: What you're showing the Board on lines 18 to 21 is that this original estimate that may have made its way to the original Capital Expenditure Forecast was, by Manitoba Hydro's expectations, expected to be wrong in a significant way, because no engineering or planning had been done for that?

MR. JOEL WORTLEY: It was the best information at hand at the time.

MR. BOB PETERS: But Manitoba Hydro chose not to get better information which was available at the time. Would that be true?

MR. JOEL WORTLEY: Better information was not at hand at the time, it would have had to have been studied and -- and the engineering advanced to get better information.

MR. BOB PETERS: And Manitoba Hydro chose not to do that, at that -- at the initial stage?

MR. JOEL WORTLEY: You know, it's the life cycle of a project. And so at that time the project was relatively immature. As it progressed that level of maturity increased and a better definition of scope, schedule and budget would have -- would have resulted. So it wasn't so much a choice not to get it, it just hadn't been gotten yet.

(BRIEF PAUSE)

MR. BOB PETERS: I'd like to -- was there anything further? Thank you. I'd like to turn to tab 5, page 4 of 28 of Manitoba Hydro's application. And I believe Ms. Bauerlein and Mr. Wortley, this will make good on my promise to you to get to a current state.

Under this, what is described on lines 7 to 13 is the current state that Manitoba Hydro talked about, and that was depicted in the capital expenditure forecast narrative. Correct?

And I'm sorry on the screen, I would ask for page 4 of 28 of Manitoba Hydro's tab 5 and there it is at 5.1.2. That's correct.

But one (1) of the things that's said, Mr. Wortley, on line 9 is that certainty in the capital plan is the highest in the year one (1).

Do you see that?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: That -- that doesn't intuitively follow to me that -- that certainty is available in year one (1) because the scope is defined, the schedule and the budget is all known.

I thought you were telling us that longer-term projects, you didn't have that certainty and you expected that the number would change over time, and likely grow over time?

MR. JOEL WORTLEY: This -- what's being referenced here is that in year one (1) of the forecast is the one that you know the most about. And so it's the ones -- the projects that you're committing to begin, the ones that have already been committed and are in flight. Every year beyond that has a growing level of uncertainty as to actually what work you're going to perform, as in which projects are going to be in the plan and which ones are out.

And so year one (1) is the one that has the most mature projects 'cause they're ready to begin execution, as well as the ones that are already in flight that are even further more mature than the ones you're about to begin and, therefore, the ones you know the most about.

MR. BOB PETERS: All right. I didn't understand it to mean that it was the year of the capital expenditure forecast in which you had most certainty, I thought it was year one (1) of a project is the year in which you have the most certainty, and that's certainly not the case?

MR. JOEL WORTLEY: No. This -- this refers to year one (1) of the forecast.

MR. BOB PETERS: Mr. Wortley, if Manitoba Hydro chose, they could assign resources to a project and engineers to a project and accountants to a project to -- to, essentially, study it and scope it to a pretty finite number very early in the planning cycle.

Would that be true?

MR. JOEL WORTLEY: The very act of advancing the studies you're describing is -- is to mature it through the planning cycle. So no, you can't do it early in the planning cycle, because what you're doing is advancing the planning cycle by -- by doing those studies.

MR. BOB PETERS: Okay, you're going to have help me understand that or explain it so that I -- how is it that you can't study a project initially and know exactly what it's going to cost you in three (3) years to bring this project in using the assumptions as to interest rate assumptions as to escalation.

Why can't Manitoba Hydro determine that before the shovel goes in the ground?

MR. JOEL WORTLEY: You can advance your planning, you can advance your definition, and you can advance -- for instance, take your design right through to contract ready, we'll say, ready to be bid. What I was trying to say was that by doing so you are not at the beginning of your planning process anymore. Within your project you are some ways into your planning of that project.

MR. BOB PETERS: All right. And so Manitoba Hydro's current methodology is Manitoba Hydro doesn't study the details of the project until it's advanced through various years of -- of process?

MR. JOEL WORTLEY: The two (2) are

synonymous in that as you -- as you start from an -- an idea, we think we want to do this, that's the first step in your -- your planning process for that project. From there you may identify different alternatives, different concepts, what's the right solution to this particular problem. And those as -- as your planning progresses may be developed, flushed out, to the point where you have some understanding of their relative merits.

A particular option at some point is chosen to be further advanced in terms of flushing out the scope, the design, coming to a place where more of the details are known and the budget is -- is more mature.

MR. BOB PETERS: The last sen -- the last sentence, Mr. Wortley, on page 4 of 28 of Manitoba Hydro's tab 5 reads:

"Long-term planning investments have only a notional definition of scope, schedule, and budget."

Do you see that?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: What would be a long-term planning investment? Would that be a generating station, as an example?

MR. JOEL WORTLEY: No, in this sense long-term means things that been identified as one day going to need to be invested in. And so, for instance, we will know how many transformers we've got on the system. We will know that eventually some of those transformers are going to need to be replaced and, therefore, a long-term planning investment may be to put some -- flag some money for re-investment in those transformers.

And so the -- the scope is transformers, the schedule is sometime in the future, and the budget is rough. In time, as those long-term planning investments come in -- into the nearer term, which transformer gets identified. The one that's in rather -- relatively poor shape may be identified as going to be the one that might be next. Its particular size, where it is, what work is going to have be done to -- to address the degradation. Is it just the transformer? Are there other works that will need to be done around it.

Those -- all those things are considered and built to -- into a project plan such that now you have some definition of -- of scope, schedule, and budget. And so what's being differentiated here is that long-term outlook to say, we know there's been a need to be money spent versus we have a particular potential investment that we're considering.

MR. BOB PETERS: I'd like to turn to page 5 of 28, the next page on -- on Manitoba Hydro's document and -- and conclude my questioning in this area.

This is a -- an attempt to conceptualize Manitoba Hydro's current capital planning model, Ms. Bauerlein?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: Now the axis are not identified with any scale other than that time runs out on the right and capital increases on the left. Correct?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And when we see the word "target" on this capital planning model, that's a target that has been set by the executive level as to where the executive currently feels the capital budget is best set?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And, Ms Bauerlein, you were cleared to show the Board that executing projects is a new terminology meaning these are projects that are already underway and were developed prior to the new methodology.

MS. SANDY BAUERLEIN: Already underway or about to begin in that next -- that year one (1) as Mr. Wortley was talking about. So they're about -- so you're looking at year one (1), and you're looking at projects that are in flight or projects that are -- that are going to begin.

MR. BOB PETERS: And that could be either business operations capital, or that could be major new generation and transmission assets.

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: And so, the Board would understand that in the first year of the CEF when the most certainty is there, the certainty is really only as to the target level of money that's available?

MR. JOEL WORTLEY: What -- what's trying to be depicted here is that if you stood in year zero (0), as we are today, and you look forward, you would see that in year one (1) of the CEF you've got some program spending, which is the -- the base of the diagram here, and that's -- that's money being spent on common assets, a certain number of run-to-fail assets that you know are going to need to be replaced annually. And so there's money flagged there, but it's not broken up into individual projects.

Up from that in the executing projects triangle, there are a collection of projects and you can think of them is as -- as layers, horizontal layers. Where up near the top of the triangle they're just endings so they don't have a lot of spending in the -- in the current year or they only run just beyond the current year.

And down on the bottom of the executing projects triangle maybe are ones that are just beginning and are going to run for several years.

The top portion up there is that little wedge of scope development, are the projects that have been -- or the potential investments that have been identified that need flushing out in terms of their scope, schedule and budget. So a little bit of money is identified to advance the engineering, firm up the scope, firm up the schedule, and the budget for those.

Beyond that, in the potential investments are specific projects, so, specific assets, specific projects with a preliminary scope, schedule and budget that are being considered. They -- they're -- they're not tied to a particular time frame yet, but they're out there and are being considered potentially to be advanced execution next year, the year after, as required.

And then out -- even in -- further into the future, the long-term planning investments that we talked about a minute ago, where through watching the degradation of the assets, monitoring the asset health, you know that there is going to be money that will need to be spent on certain assets, but you haven't flushed them out into how much money, when to do what.

And so in time those long-term planning investments are developed into potential investments, and in time, their scope is developed to give them a firm budget and schedule and they arrive at the first year of the CEF to be actioned or to put a shovel in the ground. And so --

MR. BOB PETERS: I'm sorry.

MR. JOEL WORTLEY: And that -- that is the life cycle or the -- the development of -- of projects from those long-term planning to executing.

MR. BOB PETERS: Why is it that the scope development item stays stagnant where it is and lets the calendar elapse to bring all of the long-term planning investments closer to it, ra -- instead of having the scope development moved out further or having monies allocated further out so that you can study the long-term planning much earlier than currently done?

MR. JOEL WORTLEY: So what's trying to be depicted here is that year one (1) is the only year that you can actually do things in. Everything -- beyond that is things you can see but you -- you can't do work in year five (5) until year five (5) becomes year one (1). If that makes any sense.

This is a -- this is a look forward. And so it's not what you're going to do in year five (5), it's what you know about year five (5) or year ten (10) or -- or the outlook.

The choices you make are all about year one (1). What am I going to start this year? How much engineering am I going to do? How much construction am I going to do?

By doing some scope development work on a particular potential investment, you then gain the information to know whether you want to put it in as an executing project next year, or maybe you find out it's going to be significantly more expensive than you originally thought and it gets deferred.

MR. BOB PETERS: Thank you. I believe

I have your points. Last question to you, Mr. McCallum, you told us the ladder of approval levels and the dollars amount that went with it.

I -- I neglected to ask, and I will now: At what level does Manitoba Hydro seek approval from the province of Manitoba for any of these projects, if at all?

MR. JAMES MCCALLUM: I -- I -- the answer to that is there's no dollar level upon which, that I'm aware, that we go to the province of Manitoba, although -- and perhaps Ms. Bauerlein or Ms. Ramage can jump in, my understanding was that certain classes of project, for example, a new generating station require a provincial approval, amongst others.

MR. BOB PETERS: Is that approval as a result of environmental issues? Is that what you're referring to?

MR. JAMES MCCALLUM: Yeah, I -- I can't speak to that. I think obviously The Clean Environment Commission is one. I think there's layers of approval for including federal for extra-provincial transmission lines.

Yeah, I can't speak to the specific for the approval of a new generating station, for example, certainly requires environmental licensing but I'm not aware of if there's other provincial approvals for other reasons.

MR. BOB PETERS: All right. Thank you. Mr. Chair, I want to thank the Panel again. Those are the questions that I have.

MR. CHAIRPERSON: Thank you. Ms. Ramage, re-examination, do you have any? And if so do you want a break? Or do you want to go straight into it?

MS. PATTI RAMAGE: We would like a break please.

MR. CHAIRPERSON: Okay. And how long would you like?

MS. PATTI RAMAGE: Ten (10) minutes.

MR. CHAIRPERSON: Sure, fifteen (15).

MS. PATTI RAMAGE: Okay. If we're bargaining.

MR. CHAIRPERSON: I like even -- even numbers. I'm not very -- you know, if we say ten (10) minutes we'll be back in fifteen (15) anyway, so. Okay, thank you.

--- Upon recessing at 2:14 p.m.

--- Upon resuming at 2:36 p.m.

THE CHAIRPERSON: Ms. Ramage...?

RE-DIRECT EXAMINATION BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Yes, we have a couple of matters for redirect. The first I would like to put to Mr. Wortley, and it relates to questions I believe posed by you, Mr. Chairman, that we will respond to in redirect is the easiest way of doing it.

And Mr. Wortley, with respect to the Corporation's asset management journey, could you tell us how and when the decision was made to perform a GAAP assessment?

MR. JOEL WORTLEY: As -- as we've discussed a little bit, asset management is still relatively new in North America. It's come out of Europe and -- and Australia in the last decades, and so the -- the North American -- the ISO standard was written in 2014, and in 2015 a number of individual efforts were started at Manitoba Hydro in different parts of the Corporation to improve their asset management practices such that in -- in late '15/early '16, the executive committee directed that a more concerted, more coordinated effort be undertaken by the Corporation to manage its asset management practices.

And at that time in January 2016, the corporate asset management executive council and steering committees were -- were created with membership from the operating groups and it was under this -- under the governance of these committees that the GAAP assessment was first -- was first proposed, as well as the -- as part of the -- the three-phase framework development that we've talked about several times.

And so in -- in April '16, the RFP was released to perform the GAAP assessment. It was wrapped up by December of '16, and in response to the findings of the GAAP assessment, a little bit of reorganization took place at Manitoba Hydro to which the -- the hybrid model referred to in the UMS report was created by -- by forming a -- a central seat for asset management, which is my own position under Mr. McCallum and the -- the nature of the corporate asset management executive councils and steering committees was -- was shifted to have a central role and a central authority as in Mr. McCallum took over chairing the corporate asset management steering committee, I took over -- sorry, the corporate asset management executive council. I took over chairing the corporate asset management steering committee, and that's the basis on which we've moved forward.

MS. PATTI RAMAGE: Thank you, Mr. Wortley, and now to you, Mr. McCallum. Over the past couple of weeks you've been asked a number of times questions regarding your knowledge of the regulatory text principles of public utility rates by James Bonbright. You've been called upon to read a number of chapters of Bonbright and the Coalition included a number of excerpts of that text in its book of documents.

Your discussions with Mr. Williams were, however, fairly abbreviated. Given you were directed to Bonbright and certain excerpts have been placed on the record, do you have any additional observations regarding Bonbright's views on the used and useful concept that was -- the discussion was cut off at transcript page 1515 but do you have any additional observations to add to the discussion?

MR. JAMES MCCALLUM: Yes, I do. During the first week of the hearing each of Mr. Monnin, Mr. Hacault and Dr. Williams made an -- an effort to make clear that I'm not steeped in complex theology of regulatory principles.

I can report I'm still not, but I did

take the time to go read parts of Dr. Bonbright. And I wouldn't claim to be any more expert than two (2) weeks ago but when I listened to Dr. Williams and reading the evidence that -- that he asked us to look at, I expected to find pretty strong statements that would be a great affront to the Bonbright doctrine for a utility that for when adding new -- major new works, you can't do anything other than capitalize the interest costs and wait until the asset was in-service and not a moment sooner to begin recovering from your customers, you know, those costs through the recovery of depreciation expense and interest.

And so the issue here is the idea of quote "used and useful," unquote, a fundamental regulatory principle. This is the notion that it would be a breach of principle to charge today's ratepayers for Keeyask and Bipole III before those assets are in-service. So here we find a regulatory principle that has been put forward in what I would regard as an incomplete and misleading way as a justification for putting off coming to terms with our -- what we regard as our unsustainable debt load.

So when I look to Bonbright on the issue of capitalization of interest during construction, I found this quote: [quote]

"As long as this withholding
practice exists, as I think it
should, at least in times of rapid
plant expansion there arises a need
for some rate making provision where
the company may eventually receive
an adequate compensation for its
advanced commitment of capital. The
standard provision of this nature,
and the one that I believe most
satisfactory is that of a compound
allowance for interest during
construction. An allowance not
restricted to the contract interest
that the company may pay on loans
designed to finance the construction
work." [closed quote]

Bonbright goes on to say that any practical rule of rate control by appeal to general principles of accounting is unconvincing to him but, instead, the funda -- fundamental question is whether the provisions for compensation on capital that has been tied up in work under construction should take the form of a rate-based enhancement or rate of return based enhancement. Dr. Bonbright favours the latter.

It is not that the Utility should not be paid for tying up capital, but that it should be paid through the determination of its rate of return. But Manitoba is not a rate-based rate of return jurisdiction. I'm aware of that. I'm aware of that much.

I'm not remotely suggesting anything should be different; that's not in the scope of this application, and lies in the hands of government, in any event. But because we are not a rate-based rate of return environment, we have to really know what we're doing when we apply these regulatory principles.

The fair rate of return principle is the one that I have not heard the Intervenors talk about. I don't think they want to talk about it because it's the unifying principle, near as I can tell, that enables all of these other principles that can otherwise be put forward as the basis for putting off problems on tomorrow's customer.

The fair rate of return is the means by which a Utility can be regulating -- regulated using all of these principles without becoming financially unstable. So used and useful is a principle that sounds great in theory but can fail in the absence of a fair rate of return.

Turning back to Dr. Bonbright, do we

find great opposition? No, again, we find a scholar who is actually quite okay with the notion of the utility shareholder expecting to get paid for the value of tying up capital for years building large assets before they can be completed and brought into service.

Again, his solution is to deal with it in the rate of return. Instead of capitalizing just the interest on borrowed funds, Bonbright supports capitalizing to the project to reflect a rate of return as well.

So the issue is the timing and method of recovery, not the notion that the Utility should not be paid for tying up its capital for many years. With that promise, the Utility is able to attract capital, equity capital, which is another Bonbright principle we need to be aware of; that is to say, that regulation must allow the Utility to attract the capital it needs to keep it financially stable while it invests in step-change levels of plant investment.

So rigidly following the Bonbright principles fails in the absence of a rate of return. We have to find another way. And as I discussed while being cross-examined we're skipping over the most important regulatory principle which is that the public interest is the primary goal of ratemaking. The public interest trumps all. Bonbright says this. The PUB says this in Order 73/15, wherein they speak to the compelling policy interest to phase in the required rate increase over a number of years in advance of the in-service dates of the new major capital projects; as we done with Bipole and the Bipole III reserve.

In keeping Manitoba Hydro financially stable is, as the Manitoba Court of Appeal has said, a key component of the public interest. We are midflight on a doubling of our asset base. It is not in the public interest to wait for these assets to be in-service. There's numerous examples in both constating legislation and regulatory practice throughout North America to supersede the used and useful principle to ensure that the Utility is financially stable and can support the timely and cost-effective addition of major assets.

MS. PATTI RAMAGE: Thank you. And you had a discussion with Mr. Hacault beginning at transcript page 1708, where he had you acknowledge that Manitoba Hydro's assets have long lives and their costs will be covered in depreciation.

Did those discussions serve to present

the full picture of this situation of the issues facing Manitoba Hydro?

MR. JAMES MCCALLUM: No, I don't believe it. And I'm going to, again, veer into a discussion of regulatory principle again, and the importance of this rate of return concept.

Mr. Hacault asked the revenue requirement panel questions regarding our business operations' capital; that's the ongoing regular expenditures we make to sustain our assets, maintain safe and reliable service, expand capacity to meet, you know, generally localized needs, and accommodate service extension to our new customers.

When you look historically over the last few years and prospectively, Manitoba Hydro's expenditures in this regard are actually fairly steady in and around the $500 million a year mark and that's as we continue to try to manage investments related to continuously aging infrastructure. So Manitoba Hydro provided evidence at tab 2, pages 15 through 18, that has a material ongoing cash shortfall and this was the genesis of Mr. Hacault's questioning around our business operations capital. Cash shortfall at present electricity rates due in part to a substantial difference roughly $250 million a year between what we recover in revenue requirement through annual depreciation charges and what we must expend annually to maintain, replace and enhance existing infrastructure in the normal course.

The issue is that depreciation expense is determined based on the historical cost of assets when they're first installed. Manitoba Hydro's reality is at the cost of replacing these assets, as they expire, is an ongoing cash need that comes in the form of today's costs, which due to the age of our infrastructure and the inflation and construction costs and otherwise, bears almost no relation to historical cost.

As can be seen in the transcript, Mr. Hacault has Manitoba Hydro acknowledge that the replacement assets we build have long useful lives and at the cost of these -- buildings assets will serve today's and future ratepayers, and be recovered from the same in future depreciation. In other words, the assets will be paid for overtime and, therefore, there is no problem. Certainly not one that today's ratepayer should be asked to do anything about.

But there's a big problem and I think it's important that the Board get a complete picture on this point and -- and -- and I'll do so in tying it, in due course here, to -- to -- to some of these Bonbright principles that we rely on and look to.

I -- I want to start with a simple example just to illustrate the issue and why it's critical we look at cash flow and cash flow deficiency. So imagine if we could produce, and this is a very simple example but bear with me, all of Manitoba Hydro's system to one (1) asset. And let's say the asset we acquired it in 1974 for $250 million. And let's further assume that the asset has a fifty (50) year life. So that means, for accounting purposes, we'll depreciate that asset to the tune of $5 million a year, and following the concepts here, we will -- we will recover from our ratepayers $5 million a year on account of that -- that asset.

So the ratepayers of 1974 and 1975, they're paying $5 million a year, which basically represents, you know, a then present day fair price for the one-fiftieth of the asset's usable life they are consuming each year. But as we know, inflation, whether modest like now or high like at other times, has been a fact of life for over almost any period in history. But the ratepayer keeps paying $5 million per year regardless. B 2017 the ratepayer's still paying $5 million per year, based on 1974 prices, but, using 2017 money; that's a bargain.

Adjusted for inflation, 5 million in 1974 is the same as 24 million today. So it becomes a bargain that the Utility struggles to afford, absent another approach. So that's play the very simplified example out further.

In 2024 we reached the end of our fifty (50) year life of the asset. It has to be replaced. Remember, we paid 250 million for it in 1974. Adjusting for inflation, by 2024 that asset will cost us $1.4 billion to replace.

Let's assume it too is expected to last fifty (50) years. So now our depreciation charge, and following the model, the cost assigned to our ratepayers each year is $28 million a year, up from five (5). So 2024, the ratepayer goes from paying 5 million per year, to complete the final use and depletion of the old asset, wakes up the next day, has no change in service, but now must pay $28 million a year; 450 percent more.

That's what happens if we dogmatically follow accounting policy as our means of assigning costs across the generations. It's actually worse. Our asset costs have not followed the basic consumer price index. I'll take Kettle Generating Station, for example. We built it for $250 million in 1974. Total coincidence. That works out to 1.2 billion today. The plant cost 1 million per megawatt of capacity in today's dollars.

We built Limestone Generating Station in around 1992 for 1.43 billion. That's 2.3 billion in today's money, or roughly 1.7 million per megawatt. So in today's dollars, Limestone was 70 percent more expensive per unit of capacity than Kettle.

While Keeyask is a different project, as each of them are, I'll just point out that at 8.7 billion for 695 megawatts, Keeyask will be about $12 million per megawatt, better than twelve (12) times Kettle and six (6) times Limestone, both using today's dollars.

And we can show examples like this throughout our asset fleet, from wood poles to -- to Bipoles. Costs have gone up both for inflation, but also for changes in construction standards and techniques.

So the example I gave, the one that results in a 450 percent rate increase when we finally deplete this one (1) fifty (50) year old asset that once cost 250 million, start using our shiny new one that costs 1.4 billion due to inflation, probably understates the cost increase and consequent rate impact. If we just used the escalation from Kettle to Limestone as our example, 70 percent, we would complete the depletion of a $250 million asset and immediately replace it with a $2.4 billion asset. Rates would need to increase tenfold, and it doesn't speak to the debt issue.

On that day in 2024, when we switched from the old asset to the new asset, we go from paying interest on whatever's left of the original 250 million in debt, presumably almost nothing, to paying interest on the new debt, which may be ten (10) times greater in value.

So to recap, ratepayers, in an instant, go from paying 5 million of depreciation and virtually nothing in interest to paying 47 million in depreciation and $118 million in interest, using a 5 percent interest rate as an assumption. So rates must actually go up over thirty (3) fold. And would this be in the public interest?

Obviously, it's a grossly simplified example. Manitoba Hydro's system is a compilation of thousands of assets in varying vintages with varying degrees of inflation impacts when you look to replacement value, and this smooths out and obscures the very real issue we face of having failed to fund asset replacement in a way that doesn't compromise our balance sheet.

The example is -- illustrates a signif -- significant issue of relentlessly -- relentlessly hewing to this notion or principle of cost causality. Current rate -- ratepayers are enjoying quite a break paying 1950s, 60s, and 70s prices, to consume and deplete a system where a lot of the major components were put in place ages ago, but that now need to be replaced in 2017 dollars.

It results in a huge buildup of debt pressure, rate pressure, and rate volatility if we don't find a way to charge today's ratepayers for the reality of what it cost to continue maintaining and enhancing the system they use and rely on every day. And to put the problem off, to allow our debt to expand and expand at a rate much faster than the underlying customer base and load is growing, and it -- to explain and enable it under the guise of intergenerational fairness is frankly hypocritical.

So how other utilities manage this issue, because we all have this issue in front of us -- it's not unique to Manitoba Hydro, it's not particularly unique to the present day. So again, I turned as I was told to, to Bonbright, expecting to find pretty strong statements that it would be a violation of doctrine for there to be any recognition in customer rates for the fact that new assets are going to cost a lot more than the assets they replace.

What I found is quite interesting. Dr. Bonbright's chapter 11 is called "The Rate Base: Cost or Value?" He starts -- unquote. He starts the discussion of whether the rate base should be set at historical cost less depreciation, or at some proxy for replacement value by saying this debate is,

> "The most widely disputed legal issue in the history of American public utility regulation."

Reading further, Bonbright, at least to me, doesn't take the position that replacement value-based rate -- rate regulation is intellectually indefensible by any stretch. He appears to favour historical cost basis for the simple reason that it's significantly more practical and efficient from a regulatory standpoint, what he called superior administrative flexibility. In other words, he felt the confusion and unpredictability witnessed in trying to establish "fair value" was not worth the effort. It would be just too hard to get right as opposed historical costs, which are known facts. They're non-negotiable.

So he agrees the Utility must receive credit for replacement cost and cost escalation, but to deal with it through the determination and setting of a fair rate of return. So how does that work? Well, it means that the owners of a Utility know that when they put up new capital to build new assets, they will receive a rate of return, and per Bonbright, that rate will include an allocation for inflation, such that they protect against a diminution of the purchasing power of their capital.

This promise of a fair return enables the Utility to attract equity capital, as I mentioned, a critical Bonbright principle, which allows the Utility to fund the renewal of its system at actual costs that were compromising its credit-worthiness or capital stability.

In other words, the promise of a rate of return enables the Utility to not 100 percent debt fund replacement costs and avoid the risk of doing what Manitoba Hydro is doing, which is increasing debt at a much higher rate than the underlying customer base is growing.

So if we don't have fair rate of return

in our model, what do we do? Well, the first thing we have to do is be aware of the difference between what we're recovering in our existing rates from historical costs, base depreciation, and we -- what we are having to reinvest in the system and -- to keep it reliable and safe.

We have to identify, as Manitoba Hydro has, that all else being equal, 100 percent of this difference is being added to our debt. We have to recognize that particularly in a fairly low-growth environment, this has and will continue to contribute to a destabilization of our balance sheet, and therefore, we have to find another way.

It's convenient to argue that we should simply be paid back over the fifty (50) or seventy (70) years, but that ignores the fact that we need the cash today, and that this issue is and will be presenting every year. So we are, each year, stacking and stacking again more debt without really increasing the number of customers who are around to help us pay for it. This is in part how debt gets out of all historical proportion to the size of our business, which I think we've amply demonstrated has occurred.

So Manitoba Hydro's proposed solution is simple. We need to start listening to what the

Manitoba Hydro Act says. At Section 40, part 2, clause (b), and we spoke about this a bit this morning with Mr. Williams from Business Council, where it says:

> "The Board shall establish, maintain, and adjust reserves such that they be used amongst other things, towards the renewal, reconstruction, and replacement of depreciated property and works."

Morrison Park Associates points to the need for reserves since there are no equity investors who have capital at risk. If we don't have a rate of return and a ready source of equity to provide for financial stability, then we have to turn to reserves. Reserves have to mean an annual charge on the customers, just as surely as customers are charged for interest, and operating costs, and everything else, and we've not been charging enough for reserves in today's rates. In fact, we haven't been charging at all. We have slowly but surely depleted the annual conterburtion -- contribution to reserves embedded in our rates at the same time as we have been dramatically growing our business.

Going forward. If we follow the 3.95

percent rate path, our net income will be negative over ten (10) years while our plant and service more than doubles. In 2017, we made thirty (30) million on the operations, and that's what we expect to make in fiscal 2018. These aren't contributions to reserves on a business that is twenty (20) billion and heading to thirty (30) billion in size of its assets.

In fact, Mr. Monnin pointed us this morning to Board Order 101/'04, wherein at page 13 the Public Utilities Board says:

"A net income of forty (40) million is minimal for a corporation with assets of then ten (10) billion."

So it -- a net income of negative two hundred (200) million is consequently more minimal for assets --

MR. CHAIRPERSON: Sorry, can I interrupt for a second. This isn't even close to redirecting, you know, Ms. Ramage. This isn't redirect, this is final argument. You know, and I expect -- I didn't want to interrupt, I was prepared to allow Mr. McCallum to do this but this is inappropriate.

If you have redirect -- you know what redirect is, you're seasoned counsel. If you have redirect, ask in redirect. This isn't a time to give a -- to read a written speech. I've got Bonbright in my office, I can read Bonbright.

So if there's proper redirect put the questions to him. In my opening comments I asked that questions and answers be clear and concise. You know, there may be very well a good argument but it's for -- for the argument phase, not for redirect because I don't want to get the next panel when you -- when you're asked for redirect, where you get to summarize your entire case and put it in an argument form.

MS. PATTI RAMAGE: Thank you, Mr. Chair, and I understand and I apologize. I will say, however, that because chapters of Bonbright were put to the witness this is where we were going to explain how it fits into the system. But we will --

MR. CHAIRPERSON: Yeah, but come on, Ms. Ramage, I mean, you could put questions to him, specific questions to him. I mean, redirect's intended for something not anticipated. I can understand putting a Bonbright question to him. And Mr. McCallum is reading very eloquently from written comments which are normally done by counsel at the end of the case.

This is -- I -- I don't know if this is

going to be included in your argument at the end of the case, but it may very well be, but it's just not appropriate for -- for redirect.

MS. PATTI RAMAGE: We will -- if I can have a moment with Mr. McCallum to...

(BRIEF PAUSE)

MS. PATTI RAMAGE: In light of your comments, Mr. Chair, we'll just -- we'll come -- we'll open Mr. McCallum up to any questions that he has on his comments.

MR. CHAIRPERSON: Does Panel have any questions?

(BRIEF PAUSE)

MR. CHAIRPERSON: Nope. I think we're fine.

BOARD MEMBER MCKAY: Can I make one (1) comment?

THE CHAIRPERSON: Sorry, Ms. McKay, yes.

BOARD MEMBER MCKAY: It's nice to know that the position has changed from the opening answer

-- the -- last week from Mr. McCallum and not knowing what Bonbright -- what I thought -- since he was dead by the time that second edition came out. So, it's good that you read the book.

MR. JAMES MCCALLUM: Just for the record, I didn't read all of it.

MR. CHAIRPERSON: Well, Mr. McCallum, if you wanted I have it and God bless you if you can -- it's a -- it's a well-written book in a few pages at a time.

Anyways, if we're -- we're done. We will adjourn and reconvene at 9:00 a.m. with panel 3 tomorrow. Thank you.

--- Adjourned at 3:04 p.m.

Certified Correct,

____

Sean Coleman, Mr.

Tab 159

PUB MFR 122 (Revised)
Keeyask

Provide a description outlining the reasons for the increased Keeyask budget of $8.7 billion and explain what Manitoba Hydro is doing to ensure the project is completed according to the revised budget and schedule.

It was announced in February, 2017 that the Keeyask control budget was increased to $8.7 billion and the first unit in-service date has been revised to August 2021. The revised control budget reflects a detailed review by Manitoba Hydro that considered the current state of project's progress and costs incurred to date, including the results of the first full year of structural concrete work in 2016.

At the end of the 2016 construction season, concrete placement was only at approximately 40% of plan while earthworks were only at approximately 60% of plan. The full impact of these challenges were only realized at the end of the 2016 construction season. Manitoba Hydro and the General Civil Contractor assessed the underlying causes of the challenges experienced with the Keeyask Project. The main contributing factors to the underperformance included:

- BBE's bid was based upon labour productivity rates that proved to be unachievable in the current market,
- Slower than planned progress in ramp-up on site, and,
- Actual experience with geotechnical and geological conditions.

Generally speaking, all other components of the project remain on track but have now been affected due to a longer schedule and increased workforce to accommodate a recovery plan.

Figure 1 below provides a summary of the cost increases.

Figure 1. Keeyask Budget Summary

Keeyask Budget Summary (in Billions $)				
Item #	**Item**	**Previously Approved Budget (2014$)**	**Current Approved Budget(2016$)**	**Variance**
1.1	Generating Station	4.046	5.948	1.902
1.2	Generation Outlet Transmission (GOT)	0.164	0.202	0.038
1.3	Escalation @ CPI	0.244	0.249	0.005
1.4	Interest (including Interest on Equity)	1.343	1.749	0.406
1.5	Contingency	0.307	0.578	0.271
1.6	Labour Management Reserve	0.304	0.000	-0.304
1.7	Escalation Management Reserve	0.088	0.000	-0.088
1.8	**Total**	**6.496 B**	**8.726**	**2.230**
1.9	First in-service Date	Nov-2019	Aug-2021	21 months.

To ensure that cost increases and schedule delays are minimized, Manitoba Hydro developed a recovery plan which incorporates a number of features. The recovery efforts include understanding the root causes of underperformance and defining actions that can lead to positive change. Implementation of these changes began in the fall of 2016 and continues into the 2017 construction season. The primary activities in recovery planning include:

- An amended contract between Manitoba Hydro and the General Civil Contractor to align interests and provide incentives for meeting performance objectives (completed);
- Implementing revisions to the General Civil Contractor organization structure to increase supervision and improve the management of work processes (in progress);
- Implementing an improved cost and schedule control system (completed);
- Development and deployment of an issues management system (completed);

- Development of refined processes, systems, and tools based upon the findings of the root cause analysis (in progress);
- Implementation of a change management program to enable a culture shift within the project team (in progress);
- Development of key performance indicators to report on all deliverables (in progress);
- Management of respectful workplace concerns (in progress); and
- Continued implementation of the PR280/290 task force to work with Partners, stakeholders and Manitoba Infrastructure (in progress).

MANITOBA HYDRO
CAPITAL PROJECT JUSTIFICATION ADDENDUM

Project Name

Keeyask Generating Station

Recommendation

That the project estimate be increased by $2,230 million to a revised total of $8,726 million.

Project Scope

A new control budget of $8.7 billion and revised first unit in-service date of August 2021 have been established for the Keeyask Generating Station, currently under construction on the Nelson River in northern Manitoba. This is an increase from the previously approved control budget of $6.5 billion and a delay of 21 months from the previous in-service date of November 2019.

Background

The potential for the increased cost estimate was first identified in the Manitoba Hydro-Electric Board's review of the capital projects completed in the fall of 2016. That analysis, conducted by the Boston Consulting Group, identified costs for Keeyask were expected to rise from the 2014 control budget of $6.5 billion up to a possible $7.8 billion, along with a potential delay in completion of up to 31 months.

The revised control budget of $8.7 billion reflects a more detailed review conducted by Manitoba Hydro. The revised control budget considers the current state of the project's progress including actual results of the first full year of concrete construction (2016), and allows for $900 million in contingency to account for risks that still remain on the project.

At the conclusion of 2016, the first full year of concrete construction of the principle structures and permanent earthworks, progress of the concrete structures was roughly 40 percent and progress of the earthworks was roughly 60 percent of the plan for the year. As a result, a recovery plan was developed and implemented for the General Civil Works contract and the overall Keeyask project. The recovery plan includes a comprehensive amendment to the General Civil contract, a re-organization of the project execution team and the development of a Step Change Program that is tasked with increasing production rates.

Justification

Manitoba load is growing. Updated electric growth forecasts indicate the province is going to need a new source of generation to meet domestic load by approximately 2033. Keeyask will provide a reliable, renewable source of energy to meet that demand then and into the future. Completing Keeyask will also allow Manitoba Hydro to fulfill export contracts worth approximately $4.5 billion, offsetting some of the costs of the project.

ANALYSIS OF ALTERNATIVES:

Economic Analysis		
Discount Rate	%	

Recommended Option	**NPV Benefits/(Costs)**
Despite the increased cost to complete construction of the Keeyask Project, stopping now is not an economically viable option as the significant costs of cancellation - together with lost revenues - more than offset any potential savings.	

Other Alternatives Considered	**NPV Benefits/(Costs)**
Cancellation of the Keeyask Project	

Risk Analysis

The new control budget includes contingency of an additional $900 million in funds to help address potential cost and schedule risks still present in the project such as:

- the ability to successfully achieve and improve upon General Civil Works production rates;
- the potential for delays caused by interface hand-offs between the General Civil Works and other contractors;
- delays arising during the turbine and generator installation, balance of plant and commissioning;
- delays caused by geotechnical conditions in the south dam and south dyke (two areas that have not yet been excavated);

The new control budget does not include allowances for the following risks:

- the potential for capitalized interest rate changes where a one percentage increase in interest rates equates to approximately $215 million;
- severe event risk that has a high impact but low likelihood of occurrence - examples of severe events include a loss of site access (ie. extended blockade), severe weather event (fire or flood), and severe safety/environmental incident that would cause a work stoppage of up to a year.

Labour:

No labour reserve has been carried forward.

Total Budget

The impact on annual budget requirements is as follows (in thousands of dollars):

Fiscal Year	Prev. Approved CPJ/Addendum	Proposed CPJ Addendum	Increase (Decrease)
Prev. Actuals	$ 1,693,518	$ 1,693,518	$ -
2015/16	$ 676,333	$ 665,675	$ (10,658)
2016/17	$ 962,189	$ 914,219	$ (47,971)
2017/18	$ 1,351,297	$ 1,077,483	$ (273,814)
2018/19	$ 927,908	$ 1,290,484	$ 362,576
2019/20	$ 616,472	$ 1,116,741	$ 500,269
2020/21	$ 208,578	$ 867,942	$ 659,364
2021/22	$ 55,193	$ 707,069	$ 651,876
2022/23	$ 4,470	$ 329,896	$ 325,426
2023/24	$ 103	$ 58,189	$ 58,086
2024/25	$ -	$ 2,382	$ 2,382
2025/26	$ -	$ 1,509	$ 1,509
2026/27	$ -	$ 920	$ 920
Total	$ 6,496,061	$ 8,726,026	$ 2,229,965

Proposed Schedule

The first unit in-service date was November 2019 in CPJA #4, and is revised to August 2021. The last unit in-service date was December 2020 in CPJA #4, and is revised to August 2022.
