CRACKS ON THE WALL: WHY STATES SHOULD BE ALLOWED TO LEAD ON CLIMATE CHANGE

William R. Montalvo *

INTRODUCTION

When it comes to tackling climate change, the policies pursued will have a profound impact on the kind of world that future generations will inherit.[1] The recent debate about climate change has mostly centered on measures to be taken on the national stage,[2] but state and local governments present other avenues for environmental leadership. State and local governments have the ability to tackle climate change much faster and can implement environmental policies that are stronger and more effective than the compromises reached at the national level.[3] Often, setting a plan into action is more important than perpetually seeking to develop the perfect plan. This note seeks to show how and why state policies have had a significant impact on the climate change debate, and why those policies should continue to be allowed by avoiding preemption at the national level.

---

* J.D., Fordham University School of Law.

1. "There is broad scientific consensus that the greenhouse gases (GHGs) must be reduced 60 to 80 percent relative to 2000 levels by 2050 to avoid dangerous anthropogenic climate change, including sea-level rise of 3 ft or more." STEPHEN MULKEY, CLIMATE CHANGE AND LAND USE IN FLORIDA: INTERDEPENDENCIES AND OPPORTUNITIES 5 (2007) (citations omitted).

2. Posting of John Lorinc to Green Inc., http://greeninc.blogs.nytimes.com/2009/11/02/winners-and-losers-of-cap-and-trade (Mar. 8, 2010).

3. Ann E. Carlson, *Iterative Federalism and Climate Change*, 103 NW. U. L. REV. 1097, 1098-99 (2009) ("Many states have enacted renewable portfolio standards, created inceptives for carbon capture and sequestration, mandated energy efficient standards, and established public benefit funds to support energy efficiency and renewable energy. Other states have gone further, adopting overall greenhouse gas emissions caps, crafting greenhouse gas emissions standards for new automobiles, and capping utility emissions.").

Part I of this note deals with the need for quick action on climate change, given the dangers posed by hesitation on this issue. Part II considers the stake states have in dealing with climate change. Part III discusses the benefits of state level action. Part IV details some of the problems and pitfalls of state action, but explains why these should not discourage the federal government from allowing states to continue to experiment with their own climate change policies.

I. THE NEED FOR DRAMATIC SPEED IN TACKLING CLIMATE CHANGE

If you had ten minutes to get from Point A to Point B, it is likely that you would rather take a seven minute cab ride for $5.00 than a fifteen minute subway right for $2.50, especially if being late would be disastrous. Man-made greenhouse gas emissions increased by fifteen percent between 2000 and 2005.[4] One major reason to set emissions limits (be they international, national or state) is that they allow governments to set up a climate budget and allocate that budget between countries of the world.[5] Avoiding the worst effects of climate change will require limiting temperature rise to two degrees Celsius.[6] In order to achieve that target, leading scientists argue that global emissions of all green house gases [GHGs] must peak by no later than 2015 and global emissions must be reduced at least fifty percent below 1990 levels by the year 2050.[7] Developed countries "have to aim for a 25-40% reduction by 2020."[8] The Energy

8. *Id.*

Information Administration predicted in 2009 that world energy consumption will increase forty-four percent from its 2006 level by 2030.[9] The journal, *Science*, predicted that the potential for growth in energy consumption from China alone could reach eight gigatons of carbon dioxide emissions per year by 2030, which equals the output of the entire world today.[10] Taking such dramatic rises in energy consumption and expected global economic growth into consideration, the long-term challenge posed by climate change will only grow larger the longer the world waits to act.

II. CLIMATE CHANGE IS ALSO A STATE ISSUE

Enacting a strong federal program would be a major achievement and the preferred course of action in dealing with climate change.[11] A strong federal program, as part of a broad international climate change treaty, could be very cost effective, and, provided its adequacy, it would present the best chance of achieving the GHG emission peaks, temperature targets and deadlines set forth by prevailing scientific opinion.[12]

ADMIN., INTERNATIONAL ENERGY OUTLOOK 2009 1 (2009), http://www.eia.doe.gov/oiaf/ieo/world.html; *see also* INT'L ENERGY AGENCY, WORLD ENERGY OUTLOOK 2009 FACT SHEET 1 (2009), *available at* http://www.worldenergyoutlook.org/docs/weo2009/fact_sheets_WEO_2009.pdf (predicting energy demand in 2030 to be 40% higher than in 2007).

10. Alexis Madrigal, *China's 2030 CO2 Emissions Could Equal the Entire World's Today*, WIRED SCIENCE, Feb. 8, 2008, http://www.wired.com/wiredscience/2008/02/chinas-2030-co2.

11. *See generally* STAFF OF H. COMM. ON ENERGY AND COM., 110TH CONG., CLIMATE CHANGE LEGISLATION DESIGN WHITE PAPER: APPROPRIATE ROLES FOR DIFFERENT LEVELS OF GOVERNMENT (2008) (concluding that a federal program would be preferable over many state programs); Meghan McGuinness & A. Denny Ellerman, *The Effects of Interactions Between Federal and State Climate Policies*, SP028 A.L.I.-A.B.A. 175, 180 (2008) (indicating a number of reasons why having a federal program would be important, the main reasons being efficiency and the scale of the climate change problem); Doug Struck, *Local Climate Solutions Constrain Federal Options*, THE DAILY CLIMATE, Feb. 10, 2010, http://wwwp.dailyclimate.org/tdc-newsroom/federal-constraint/local-climate-solutions-constrain-federal-options (noting the divided opinion among economists).

12. If the United States, by itself, substantially reduced its emissions it could put the world closer in line with the requirements noted in Part I of this paper, given that the United States emitted 5,746 million metric tons of carbon dioxide in 2003 compared to total global emissions of 24,405 million metric tons. The 2010 projections estimate the U.S. carbon dioxide emissions at 6,365 million metric tons

Although many Americans would like to see stronger action on climate change from the national government, meaningful movement is unlikely in the near future,[13] even with the current political leadership which favors stronger environmental policies.[14] Factors, like the economic crisis that began in 2008, continue to hamper climate reform efforts.[15] Additionally, many people benefit from the current situation in which there is no substantive federal program in place to tackle GHGs emissions.[16]

The United States' geography, economy and population density is very diverse.[17] Different states and regions have different

Campbell, Comment, *The Employer Trip Reduction Program: Driving Restrictions Arrive In Pennsylvania Via The Clean Air Act*, 3 DICK. J. ENVTL. L. & POL'Y 71, 86 (1994) (noting how automobile travel is subsidized in the United States).

17. *See* ENERGY INFO. ADMIN., STATE ENERGY DATA 2007: CONSUMPTION 3 (2007), *available at* http://www.eia.doe.gov/emeu/states/sep_sum/html/pdf/sum_btu_1.pdf (providing comparisons of state energy consumption); JONATHAN L. RAMSEUR, CONG. RESEARCH SERV., STATE GREENHOUSE GAS EMISSIONS: COMPARISON AND ANALYSIS 14, 22 (2007), *available at*

dependencies on industries and infrastructure with high GHG emissions; those states that require a high amount of energy and do not have very diversified sources for that energy, or have large industries devoted to the production of natural gas, oil, or coal, have a lot to lose from a federal program on GHGs (in the short term).[18] For example, Vermont derives one hundred percent of its energy from renewable sources, while West Virginia derives ninety-eight percent of its energy from coal.[19] In those states that have much to lose, the general population and the local political establishment will certainly be against any strong action from the federal government.[20] However, regardless of local policies, all states have cause for climate change concerns, as was noted by the Environmental Protection Agency's (EPA's) Analysis of the Effects of Global Change on Human Health and Welfare and Human Systems,[21] and could substantially benefit from moving towards green energy.[22]

http://www.au.af.mil/au/awc/awcgate/crs/rl34272.pdf (providing a comparison of state greenhouse gas emissions).

18. *See* ENERGY INFO. ADMIN., *supra* note 17 (for a comparison of different states sources of energy, as can be noted from these charts); *see also* RAMSEUR *supra* note 17, at 18 (noting vast disparities in the sources of energy in states).

19. RAMSEUR, *supra* note 17, at 14. There are also many other examples of the differences in state energy profiles. *See* ENERGY INFO. ADMIN., *supra* note 17 (providing a very detailed list).

20. In fact, a number of the states that have not joined regional agreements get over ninety percent of their energy from coal, while a number of the states with strong renewable energy portfolios have joined regional agreements. *Compare* RAMSEUR, *supra* note 17, at 14 *and* Pew Ctr. on Global Climate Change, Regional Initiatives (last visited Dec. 2, 2009), http://www.pewclimate.org/what_s_being_done/in_the_states/regional_initiatives.cfm (note the map showing membership in regional climate agreement), *with* New York Times, *Election Results, President Map*, N.Y. TIMES, Dec. 9, 2008, http://elections.nytimes.com/2008/results/president/map.html (providing a map of the 2008 presidential election, which seems to indicate more acceptance of regional agreements when compared with the previous Pew Research Center map about membership in regional climate agreements).

21. *See generally* U.S. CLIMATE CHANGE SCI. PROGRAM, ANALYSES OF THE EFFECTS OF GLOBAL CHANGE ON HUMAN HEALTH AND WELFARE AND HUMAN SYSTEMS, July 17, 2008, *available at* http://www.climatescience.gov/Library/sap/sap4-6/final-report/default.htm.

22. *Id.*; *see also A Long Game*, ECONOMIST, Dec. 3, 2009, *available at* http://www.economist.com/specialreports/displaystory.cfm?story_id=14994880 (noting China's opinion on the value of green technology); *Wanted: Green Engineers*, ECONOMIST.COM, NOV. 13, 2009,

Yet, the federal government may continue to face popular skepticism on the existence and danger of climate change.[23] Furthermore, recent national events demonstrate that many Americans' interest and concern for environmental problems wanes when compared to other national crises.[24] However, there is no need to lose all momentum on climate change mitigation. Even in difficult times, states could continue, as they have in recent years, to take the lead in tackling climate change with tough state legislation.[25] For this to happen, state legislative action depends upon on how future environmental policies are structured at the state, regional and national level, especially when it comes to GHG emissions controls.

State governments represent fewer people, and often there is a much more coherent, entrenched and dominant political faction or philosophy in state politics.[26] Individual states also have vastly

23. Lydia Saad, *Increased Number Think Global Warming Is "Exaggerated"*, GALLUP DAILY NEWS, Mar. 11, 2009, http://www.gallup.com/poll/116590/increased-number-think-global-warming-exaggerated.aspx ("[T]he global warming message may have lost some footing with Americans over the past year."); *see also* Nathanial Gronewold & Christa Marshall, *Rising Partisanship Sharply Erodes U.S. Public's Belief in Global Warming*, N.Y. TIMES, Dec. 3, 2009, http://www.nytimes.com/cwire/2009/12/03/03climatewire-rising-partisanship-sharply-erodes-us-public-47381.html (noting that just fifty-one percent of Americans now believe that GHG emissions could lead to increased temperature compared to seventy-one percent two years ago).

24. Saad, *supra* note 23 ("Gallup has documented declines in public concern about the environment at times when other issues, such as a major economic downturn or a national crisis like 9/11, absorbed Americans' attention.").

25. Jared Snyder & Jonathan Binder, *The Changing Climate of Cooperative Federalism: The Dynamic Role of the States in a National Strategy to Combat Climate Change*, 27 UCLA J. ENVTL. L. & POL'Y 231, 232 (2009) ("[A] silver lining of the federal inaction on climate change over the past eight years has been that it fostered the development of innovative and pioneering efforts by state and local governments to combat climate change."); Carlson, *supra* note 3 ("While the federal government has remained idle, as numerous commentators have observed, a surprisingly large number of states have stepped in to fill the policy void.").

26. Posting of Tom Schaller to FiveThirtyEight, http://www.fivethirtyeight.com/2009/08/state-legislative-partisan-gains-since.html (Aug. 21, 2009, 10:33) (showing how many states have strong partisan majorities, some of which have been widening, which helps explain why environmental policies in some states might be stronger than others).

different breakdowns in terms of energy consumption, energy sources and net importation versus exportation of energy.[27] States that require a large amount of energy, like Texas, which consumed 11,834.5 British Thermal Units (BTUs) of electricity in 2007,[28] mostly from non-renewable sources,[29] and states which have very high carbon intensity, such as Wyoming,[30] will probably be less flexible in pursuing regulatory strategies. Other states, however, feature different energy situations. Some states, such as Alabama, have well diversified energy sources.[31] While states such as California do not have well diversified energy sources or such low emissions levels,[32] they have the political will to enact policies that seek reductions in GHG emissions.[33] States more vulnerable to the dangerous effects of climate change—such as coastal and grain belt states—have greater incentives to move faster on emissions regulations than other states or the federal government.[34]

Throughout history, states have acted before the federal government in implementing difficult reforms.[35] Long before the Thirteenth Amendment to the United States Constitution was enacted

TIMES, Dec. 11, 2003, at A32 (noting that in the Bush Administration, as the government slowed its efforts to tackle climate change it was the states that began to take strong actions).

in 1865,[36] several states had already abolished slavery.[37] Slavery was abolished in Vermont (1777), Pennsylvania (1780), Massachusetts (1783), Connecticut (1783), Rhode Island (1784), New York (1799), and New Jersey (1804).[38] States also beat the federal government in granting women's suffrage.[39] The first state to grant women's suffrage was New Jersey, which, in its first constitution of 1776, included the women's right to vote.[40] Additionally, it was the states (or territories) of Wyoming (1869), Utah (1870), Colorado (1893), Idaho (1896), Washington (1883), California (1911), Kansas(1912), Oregon(1912), and Arizona (1912) that first gave women the right to vote.[41] Federal action on women's suffrage did not occur until the enactment of the Nineteenth Amendment in 1920.[42] Indeed, states have taken the lead on almost every major question that the nation has ever faced.[43] Often this is because state politicians have to respond to the local beliefs of their constituents, which may favor

greater and more radical reform than that desired at the national level.[44]

A. Federal Attempts at Regulation of Climate Change:

On November 25, 2009, the White House outlined expected federal targets for emissions reduction of "17% below 2005 levels in 2020."[45] However, to date, most attempts at federal regulation on climate change, like the British Thermal Unit Tax proposed under the Clinton Administration,[46] have failed to pass.[47] In 1993, the British Thermal Unit Tax attempted to reduce pollution and promote conservation equitably.[48] The tax proposed effected varied carbon producing products differently and was dependent on output and exempted several renewable energy sources.[49] Even today, a national carbon tax approach would face a significant uphill battle.[50]

On June 26, 2009, the United States House of Representatives narrowly approved H.R. 2454, the "American Clean Energy and Security Act," by just seven votes.[51] There was much criticism of the

50. *See id.* ("Many economists believe a carbon tax . . . would be a superior policy alternative to an emissions-trading regime. The irony is that there is a broad consensus in favor of a carbon tax everywhere but on Capitol Hill, where the 'T' word is anathema." (citation omitted)).

51. Open Congress, H.R.2454 - American Clean Energy And Security Act of 2009, http://www.opencongress.org/bill/111-h2454/actions_votes (last visited Feb. 1, 2010).

bill and the support for it has been lukewarm.[52] Carroll Muffett, the USA Deputy Campaigns Director for Greenpeace, noted that the bill had essentially been a "victory for coal industry lobbyists, oil industry lobbyists, agriculture industry lobbyists, steel and cement industry lobbyists, among many others" because "to avoid the worst effects of global warming, we must reduce emissions by 25-40% below 1990 levels by 2020, and the short-term target of this bill is a paltry 4%."[53]

The Waxman-Markey bill, because of the compromises needed for it to pass through Congress, would not have been nearly as strong as required—especially according to the estimates of the highest authorities on climate change.[54] Some commentators have even gone

52. Posting of Teryn Norris to Breakthrough Blog, http://thebreakthrough.org/blog/2009/06/critics_condemn_aces_climate_b.shtml (June 30, 2009, 19:51).

53. Dan Shapley, *House Cap-and-Trade Bill: The Good, the Bad and the Ugly*, THE DAILY GREEN, June 6, 2009, http://www.thedailygreen.com/environmental-news/latest/house-cap-and-trade-bill-47062902. In fact, in the IPCC's 2007 Synthesis Report, the IPCC showed that the reductions in GHG emissions would have to be far higher than even the percentages noted by Carroll Muffett. Under the IPCC's models, even with a reduction of more than thirty percent, there could still be global temperature rises of 2.8–3.2 degrees Celsius. INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE, CLIMATE CHANGE 2007: SYNTHESIS REPORT 6, *available at* http://www.ipcc.ch/pdf/assessment-report/ar4/syr/ar4_syr.pdf (last visited Feb. 1, 2010); *see also* Shapley, *supra* ("[t]his bill will produce nowhere near the emissions reductions that are needed to solve global warming, and – astonishingly – it will eliminate existing EPA authority to fight pollution from coal-fired power plants." (internal quotation marks omitted) (quoting Brent Blackwelder, president of Friends of the Earth)); Press Release, Greenpeace, Greenpeace Opposes Waxman-Markey: Climate Bill not Science-Based; Benefits Polluters (June 25, 2009), http://www.greenpeace.org/usa/press-center/releases2/greenpeace-opposes-waxman-mark (noting Greenpeace's criticism of the Waxman-Markey Bill, in particular that "the Waxman-Markey bill sets emission reduction targets far lower than science demands, then undermines even those targets with massive offsets . . . . To support such a bill is to abandon the real leadership that is called for at this pivotal moment in history. We simply no longer have the time for legislation this weak."). Even if the White House's announced target of seventeen percent reductions below 1995 levels by 2020 could be reached, President to Attend Copenhagen Talks Press Release, *supra* note 45, it would still not reach the levels of reductions that experts say are required, the levels which have informed Carol Muffett's statement. Press Release, *supra*.

54. Like the chairman of the UN's Intergovernmental Panel on Climate Change (IPCC), Dr. Rajendra K. Pachauri, who noted that even a two degree rise in temperature could have serious consequences. Murray, *supra* note 6.

so far as to say that the House cap-and-trade bill "rewards polluters with massive giveaways that can be gamed by Wall Street" and it provides an incentive for companies to continue to use outdated, unsustainable technology and business models.[55]

There have been several other proposals at the federal level, as well.[56] For example, the Kerry-Boxer bill recently passed through committee without Republican support.[57] Like the Waxman-Markey bill, the Kerry-Boxer bill appears likely to stall in Congress, given the lack of moderate support.[58] Nonetheless, only time will tell what the final composition of federal legislation will be; until then, however, state governments will be the best vessels to take action on climate change.

B. Effects of Climate Change on States:

Taking New York State as an example, climate change has the potential to produce noticeable, if not considerable, effects that its state government should be concerned with.[59] According to the New York State Department of Environmental Conservation:

> Average temperatures in the state are 2 degrees Fahrenheit higher than they were as recently as 1970. New York's winter temperatures are almost 5 degrees higher than in 1970. Plants in New York now bloom as much as 8 days earlier in the spring than they did in 1970. Birds that traditionally breed in New York have moved their ranges northward by as much as 40 miles in the past two decades.

59. New York State Department of Environmental Conservation, Climate Change: New Yorkers are Working on Many Fronts, http://www.dec.ny.gov/energy/44992.html (last visited Feb. 1, 2010).

> Diseases from the tropics, such as West Nile disease and Lyme disease, are appearing further north.[60]

If climate change continues unabated, New Yorkers could expect to see:

> Additional warming, estimated at 2 to 3 degrees Fahrenheit, because of greenhouse gases already in the atmosphere. Dry spells of several weeks' duration, punctuated by extreme rains and storms. Winter snow cover reduced enough to affect the recreation industry. Loss of cool-weather plants and animals that have traditionally lived in New York, such as sugar maples and some marine species. Sea levels rising by between 4 inches and 33 inches (or even more if the earth's large ice sheets are destabilized).[61]

Among other things, there is also the potential for dramatic rises in sea level.[62] With twenty-five percent of U.S.'s population living just ten meters above sea level, even a small sea level rise could have a big impact.[63] In Florida and Louisiana, there is a great risk of danger because of sea level rise, given the states' low altitude near the coast.[64] Some studies project that average temperatures in New York State could increase by as much as two to eight degrees Fahrenheit by 2100, "with the largest increases in the coastal regions such as New

York City."[65] In addition, long-term temperature increases in the Midwestern states could be dramatically high in the long term, according to the Nature Conservancy.[66]

III. BENEFITS OF A STATE LEVEL APPROACH

As Justice Brandeis once noted "[i]t is one of the happy incidents of the federal system that a single courageous state may, if its citizens choose, serve as a laboratory; and try novel social and economic experiments without risk to the rest of the country."[67] States have the advantage of speed, a track record of proven policy implementation, and the ability to plan strategies tailored to the individual needs of their constituents based on their differing economies, geography, and resources.[68] So far the states have taken substantial steps in battling climate change.[69] They have essentially been fighting a guerrilla war against apathy, entrenched interest groups, inaction by the federal government, and misinformation on climate change at all levels of

society.[70] They have had many successes that, while looked at individually may seem small, taken together they amount to something larger.[71]

A. What States Have Done and What They Are Doing

Since the federal government has dragged its collective feet in producing substantial climate change regulation, it has been the states that have moved in with tough reforms.[72] For instance, California was given special regulatory power by the federal government

70. *See* Janet Larsen, *Mayors Respond to Washington Leadership Vacuum on Climate Change*, 66 THE HUMANIST 4, 5 (2006) ("Response to the Washington climate action void isn't limited to cities. States and businesses also are taking part."); *U.S. States Go It Alone on Climate Change*, ECOLOGIST, Oct. 2005, at 8 ("Unwilling to wait on the recalcitrant president, nine states . . . are developing a scheme to cap and then reduce the level of greenhouse gas emissions from power plants[.]"); *see also* Revkin & Lee, *supra* note 35, at A32 ("The states are taking action for one simple reason: because the federal government is not[.]" (internal quotation marks omitted) (quoting Gov. through the Clean Air Act to regulate automobile emissions.[73] New Jersey, in particular, passed the New Jersey Global Warming Response Act, which seeks to reduce New Jersey's GHG emissions down to 1990 levels by 2020 and by eighty percent of 2006 levels by 2050.[74] In the northeast, there is the Regional Greenhouse Gas Initiative ("RGGI"), a state-level regional greenhouse gas reduction agreement.[75] California, Maryland, Minnesota, Oregon, Texas, and Vermont have all considered carbon taxes as an option in dealing with climate change[76] and New York has an existing gasoline tax.[77] Many western states are members of the Western Climate Initiative (WCI), a collaboration of several states to reduce aggregate GHG emissions "by 15 percent below 2005 levels by 2020."[78]

States have even gone to the courts to pursue climate change offenders, with California and Connecticut suing major emitters of GHGs.[79] As a result of *Connecticut v. American Electric Power Co.* (brought by Connecticut, New York, California, Iowa, New Jersey, Rhode Island, Vermont, Wisconsin, and New York City), the U.S. Court of Appeals for the Second Circuit held on appeal that states

79. *See* California v. Gen. Motors, No. C06-05755 MJJ, 2007 WL 2726871 (N.D. Cal. Sept. 17, 2007); Connecticut v. American Elec. Power Co., 406 F. Supp. 2d 265 (S.D.N.Y. 2005). Both suits were dismissed because the courts held that climate change implicated "nonjusticiable 'political questions.'" Joo, *supra* note 34, at 698, n. 160.

have standing to bring actions against major emitters under common law public nuisance.[80] The court remanded the case to the lower courts to for further proceedings.[81]

In *Massachusetts v. EPA*, the State of Massachusetts filed a lawsuit against federal agencies for not taking action on climate change.[82] In that case, the U.S. Supreme Court held the following: that Massachusetts had standing to petition for review; that the Clean Air Act authorized the EPA to regulate greenhouse gas emissions if it could form a judgment that those emissions were contributing to climate change; and that the EPA could avoid taking action with respect to GHG emissions from motor vehicles only if it determined that GHG's do not contribute to climate change or if it could provide a reasonable explanation as to why it could not or would not exercise its discretion to determine if they do.[83] Taken together, these efforts illustrate that while the states have done much to tackle the climate change problem, the federal government has been sleeping on the issue.

B. Analogy To Smaller Nations

U.S. states have land areas and populations that are comparable to those of states in the European Union and to other nations abroad that have implemented policies on climate change. To illustrate, consider the following table:

80. Conn.v. Amer. Elec. Power Co., 582 F.3d 309, 392 (2d Cir. 2009).
81. *Id.* at 393.
82. Mass. v. EPA, 549 U.S. 497 (2007).
83. *Id.* at 518-34.

Comparison of Emissions Between States and Countries		
Nation	***Population***[84]	***GHG emissions (MMT CO^2 Eq.)***[85]
UK	61,113,205	636.7
Poland	38,482,919	398.9
Spain	40,525,002	442.3
State	***Population***[86]	***GHG emissions (MMT CO^2 Eq.)***[87]
California	36,553,215	453
New York	19,297,729	244
Texas	23,904,380	782

In Europe, although there is a broad Emissions Trading System implemented at the European Union level, there are also a multitude of "state" level programs that have been implemented individually by European member states.[88] Small European nations have set up

88. *See* European Commission, Climate Action: The Climate action and renewable energy package, Europe's climate change opportunity, Jan. 1, 2008, http://ec.europa.eu/environment/climat/climate_action.htm (detailing some of the European top-level initiatives on climate change); *see also* NORWEGIAN MINISTRY OF THE ENVIRONMENT, NORWEGIAN CLIMATE POLICY 5 (2006-2007), *available at* http://www.regjeringen.no/pages/2065909/PDFS/STM200620070034000EN_PDF

national emissions trading programs, caps, carbon taxes and a large number of other policies.[89] The actions of these smaller nations should not be dismissed just because they are small, since they have acted as a valuable "laboratory" for environmental policies and neither should the actions of a state.

Based on the numbers, the contribution that states can make is not small; the top ten GHG emitting states accounted "for almost 50% of total U.S. GHG emissions in 2003."[90] According to the U.S. Energy Information Agency (2007), the top twenty energy consuming states in the country accounted for 69.5% of all energy consumed in the United States in 2007 and the top ten states accounted for 47.3%.[91] Therefore, there is a significant amount of progress that could be made if the top ten emitting states or the top ten energy consuming states were to enact strong policies on climate change. Furthermore, of the top ten emitting states (Texas, California, Pennsylvania, Ohio, Florida, Illinois, Indiana, New York, Michigan and Louisiana)[92] many have either enacted local programs on climate change and

GHG reduction, are members of regional agreements or have a large incentive to act, as they are either coastal or Midwestern states.[93]

IV. PROBLEMS WITH A STATE LEVEL APPROACH

A. Generally

There are several problems with adopting a state-based approach. Climate change is the kind of issue where not just a national, but a global plan should be enacted; one that would organize all of the resources of the world in a coordinated fashion to tackle the issue of climate change in an intelligent manner.[94] It is a problem that encompasses many people, across traditional borders, and the effects will not be evenly felt.[95] However, there is also a need for speed in tackling climate change, since waiting too long to take action could be disastrous, even in a country like the United States, which is and has been one of the per capita leaders on climate changing emissions.[96] That is why state regulation, which can come into effect faster, stronger and be more effectively than federal action, should not be discouraged.[97]

However, one of the major concerns with state-by-state regulation is that, if permitted, it could result in several, disparate policies that would affect people differently, making it harder for companies to do business.[98] This is a legitimate drawback to having a state approach

to regulation. On the other hand, national proposals have been much weaker than what some of the states have been willing to implement.[99] The chance of enacting a national program, which is likely to be a weak program, is not an effective argument against permitting state action. Furthermore, allowing states to adopt individual climate policies does not prevent future federal action. Such federal legislation could be implemented in a way that allows states to go beyond what the federal approach might dictate, using the federal requirements as a minimum.[100] Additionally, companies often manufacture their products taking into account economies of scale.[101] If these companies find themselves priced out of certain states, they can decide to: (1) not to sell products in those states, (2) design a separate product line just for those states, or (3) raise the standard of all of their products to avoid future problems with tough state climate change regulation.

B. Preemption

Another problem that arises when states choose to act before the federal government is that preemption issues arise.[102] What happens

Carlson, *Federalism, Preemption, and Greenhouse Gas Emissions*, 37 U.C. DAVIS L. REV. 281, 299-303 (2005) (discussing potential Clean Air Act preemption of California's regulatory efforts toward addressing greenhouse gas emissions).

if and when the federal government enacts legislation that deals with climate change after states have already adopted their own policies? The issue of preemption between federal and state regulation is extremely broad. There are solutions to this problem, however, because the majority of federal environmental laws do not "invoke explicit preemption"[103]; state regulations can be designed to address preemption before it becomes an issue.[104] Congress often encourages states to enact their own, stricter legislation.[105] In addition, there are often savings clauses in federal environmental law which preserve certain areas of regulation to the states or leave states free to regulate beyond what the federal government would be able to do on its own.[106]

RGGI provides in its Memorandum of Understanding for what to do in the event of friction between the states and the federal government.[107] RGGI determines questions of federal preemption based on "(1) whether or not the federal bill allows for established state programs to remain in existence; and (2) the degree to which a federal program is comparable to RGGI."[108]

The issue of preemption was raised, and ultimately decided, in the discussion draft of the Waxman-Markey bill. The bill allows states to implement tougher standards on GHG emissions, but state programs will be suspended for the period between 2012-2017 so that federal carbon markets have time to develop.[109] Additionally, the Clean Air

Henry Waxman (D-Cal.) and Rep. Edward Markey (D-Mass.)).

Act, as noted earlier, specifically designated certain areas where the state of California would be allowed to regulate vehicle emissions.[110]

Thus, preemption issues can be anticipated and prevented through creative language in the legislation. All that is required for state regulations to avoid preemption issues is insertion of provisions similar to those included in RGGI.[111] With regards to federal legislation, it must account for the existence of prior state regulation, as was done in the Waxman-Markey bill.[112] Despite this, there is some doubt as to whether the design of the RGGI will be enough to avoid problems with preemption when it comes to due process claims.[113]

C. Claims Against States for Climate Initiatives

Because there is still some uncertainty as to the legality of state actions on climate change, there is a risk that entities that stand to lose from state level regulations will sue the states, under various legal doctrines and theories.[114] For instance, one risk for states is that local businesses negatively affected by regulation will bring due process claims against the regulating state, claiming it exceeded its authority by enacting local legislation that is beyond their constitutional power.[115] However, the most significant legal challenges to state programs and regional agreements will be brought under the following constitutional doctrines: the Supremacy Clause, the Compacts Clause, and the Commerce Clause.[116]

115. *Id.*

116. *Id.* Although that is just a sampling of the kinds of claims that could be brought against state regulations, claims could have also been brought under, *inter alia*, the Sherman Act and the Dormant Commerce Clause. Cent. Valley Chrysler-Jeep v. Witherspoon, 456 F. Supp. 2d 1160, 1183-86 (E.D. Cal. 2006).

1. The Supremacy Clause

The preemption doctrine is the ordinary way in which the Supremacy Clause questions are analyzed,[117] but it must be balanced against historic and constitutional precedent that recognizes the states' ability to govern their individual territories.[118] The actions states have taken have pushed the limits of what is constitutionally permissible. While the preemption concerns raised by the existence of state environmental programs have yet to be fully answered, the initial cases that have been brought against California, Vermont and Rhode Island have had promising results for proponents of state level regulation.[119]

However, in the case of *Central Valley Chrysler-Jeep v. Witherspoon*, California was sued by automobile manufacturers claiming that California GHG regulations were preempted by the federal government (and the President's power over foreign policy).[120] The Eastern District Court of California held that California's GHG regulations were preempted by the Energy Policy and Conservation Act (EPCA),[121] reasoning that California's policies were an obstacle to the accomplishment of the EPCA.[122]

When Vermont adopted California's carbon dioxide regulations, it resulted in another lawsuit, *Green Mountain Chrysler-Plymouth v. Crombie*.[123] In this case, the plaintiffs were a group of automobile dealers, who sought declaratory and injunctive relief from Vermont's

117. This is why the design of regional and state level programs must be done in a way that avoids preemption as much as possible. *See supra* Part IV.C.

118. *See* Rice v. Santa Fe Elevator Corp., 331 U.S. 218, 230 (1947) (explaining that a Supremacy Clause analysis begins "with the assumption that the historic police powers of the States [are] not to be superseded by the Federal Act unless that [is] the clear and manifest purpose of Congress"); *see also supra* Part IV.B. (for a discussion of the design problems when facing federal preemption).

119. *See* Green Mountain Chrysler Plymouth Dodge Jeep v. Crombie, 508 F. Supp. 2d 295 (D. Vt. 2007) (holding that the Vermont's automobile emission standards were not in violation of express preemption, field preemption, conflict preemption, or foreign-policy preemption); *see also Cent. Valley*, 456 F. Supp. 2d at 1163 (case brought under the preemption doctrine in California); Lincoln-Dodge, Inc. v. Sullivan, 588 F. Supp. 2d 224 (D. R.I. 2008) (case brought under the preemption doctrine in Rhode Island).

123. Joo, *supra* note 34, at 700.

climate change regulations that established GHG emissions standards for automobiles.[124] The Federal District Court of Vermont held that Vermont's regulations were not preempted by federal law.[125] The court noted that state policies are assumed to not be superseded by a federal act unless it is "the clear and manifest purpose of Congress."[126] The court also referred to earlier acknowledgements by Congress that the regulation of "mobile sources" of air pollution was traditionally the responsibility of the states.[127]

2. The Compacts Clause

The Compacts Clause could also be an obstacle to state action. The Compacts Clause of the U.S. Constitution, states that "[n]o State shall, without the Consent of Congress . . . enter into any Agreement or Compact with another State, or with a foreign Power[.]"[128] In Compacts Clause cases, interstate agreements that increase the power of the states at the expense of the federal government fall within the scope of this clause, while those agreements that do not, do not fall within its scope.[129]

In reviewing the applicability of the Compacts Clause, courts first determine whether the agreement is a "compact," which would require: (1) "some sort of joint organization or body to govern the agreement, if necessary,"[130] (2) that it is binding, and (3) that it requires "reciprocity of the regional limitation, meaning that one party cannot agree to a nationwide program while another believes the agreement only covers a handful of states."[131] When regional programs allow member states to leave at any time, these regional programs should not be considered compacts.[132]

However, in order for regional agreements linked into the international system, like the RGGI, to be effective, they should not

124. *See Green Mountain*, 508 F. Supp. 2d at 300, 302.

132. *See id.*

allow member states to abandon easily. Internationally linked climate change agreements could be considered compacts if the states are not allowed to back out of the agreement because then it starts to look a lot more like what was not permitted in *Bancorp*.[133]

However, even if an agreement is found to be a compact, it can still be approved by Congress. After such approval it "reaches the level of federal law" and no longer presents a problem.[134] Therefore, there are two simple solutions to the Compacts Clause problem: either sacrifice efficiency by allowing states to back out, or have the state agreements authorized by Congress.

3. The Commerce Clause

Another area of potential litigation, especially against regional agreements, is the Commerce Clause.[135] The Commerce Clause states that Congress has the power "[t]o regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes."[136] Under the Dormant Commerce Clause theory, the Supreme Court has read the Commerce Clause in a negative sense to mean that because Congress has the aforementioned power, the states do not.[137] The Dormant Commerce Clause will not be violated by state action "merely because it affects in some way the flow of commerce between the States."[138] Generally it is a matter of whether the state action is protectionism.[139] If the action is determined not to

133. *See id*, at 11.

134. *Id.* at 10; *see also* U.S. Const. art. 1, § 10, cl. 3 (containing the language "without the Consent of Congress," meaning that if Congress has consented there should not be a violation of the Compacts Clause).

be protectionist, then the *Pike* test is applied.[140] It is not entirely clear what the result of the *Pike* test would be for regional greenhouse gas initiatives, although at least one case has upheld regional agreements under a Dormant Commerce Clause attack.[141]

Regardless of the challenge of legal suits, however, states should continue to push the boundaries of climate change regulation. Not every policy will be perfect since the legality of many of these issues remains unresolved, but not every policy will be defeated either.[142] If the dangers of climate change are as great as some forecast, and if green industry becomes the next great market, then it is better to risk facing and overcoming a few obstacles on the path to adopting an environmental program, even one that is not prefect or ideal, than it is to remain paralyzed. Until some of these legal questions are settled, states have an open window to enact more regulation, allowing for emissions reductions where they are politically feasible and providing Congress an opportunity to watch and consider various climate change regulation models.

D. Leakage And The Race To The Bottom

If environmental regulation is taken at the state level, one of the most serious issues would be a "classic collective action problem" because climate change is a global problem.[143] "Carbon leakage is defined as the increase in emissions outside a region as a direct result of the policy to cap emission in this region."[144] As some states reduce their emissions and enact tougher climate legislation, states that have yet to take action would continue to allow for high carbon emitting industries to operate in their borders, potentially resulting in a migration of companies from those states which enact tougher standards to those with lower standards.[145] In fact, some states might

140. Pike v. Bruce Church, Inc., 397 U.S. 137, 142 (1970) ("Where the statute regulates even-handedly to effectuate a legitimate local public interest, and its effects on interstate commerce are only incidental, it will be upheld unless the burden imposed on such commerce is clearly excessive in relation to the putative local benefits.").

even be incentivized to allow for greater emissions since there is potential for large monetary rewards.[146]

While carbon leakage is a serious concern, there are several responses to the question of whether it is sufficiently detrimental to make a state-based approach economically and environmentally unsound. First, federal action on climate change could also result in carbon leakage, now at a national level, since companies could shift intensive GHG emitting operations out of the U.S.[147] Few environmentalists, however, consider that sufficiently strong grounds to forego implementing a federal climate regime. Thus, the same argument can be made with regards to a state-based approach—the prospect of leakage should not obstruct state action.

Second, other nations have enacted climate legislation that is considerably stronger than what has been done in the U.S.[148] In many cases, these programs have served to provide momentum on the issue of climate change, offering the U.S. insight into effective and ineffective regulatory schemes. As noted earlier, some of these countries have populations and geographical dimensions no larger than U.S. states.[149] Therefore, the effect of regulations of GHG emissions in a high emission U.S. state can be as great as that of a comparably sized foreign nation.[150]

Another potential problem is that states might actually take advantage of having the ability to go beyond federal regulations by adopting tough standards, knowing that they can externalize the costs to other states.[151] This results in what appears to be reverse leakage—where states would want to have strong environmental regulation in areas where it might confer an economic or social advantage. A state that is a producer of a particular product, for example, which competes with products manufactured in other states, could chose to strengthen environmental standards within its borders in a way that benefits local producers at the expense of out of state producers.[152]

This can also upset manufacturing of products that rely on economies of scale.[153] But a disruption to economies of scale might actually be an argument in favor of state level regulation. If a car manufacturer is faced with a significantly large group of states implementing tough emissions standards, they could be essentially regulated out of certain markets, providing a stimulus for having their automobiles meet the highest possible energy standards, so that they can continue to expand their brand everywhere.

The RGGI Emissions Leakage Multi-State Staff Working Group looked into possible mitigation strategies in dealing with carbon leakage.[154] They came up with several strategies that could be pursued by RGGI member states to reduce leakage.[155] In particular, they recommended that participating states should pursue aggressive investment in "energy efficiency market transformation programs," and "implementation and expansion of complementary policies such as building energy codes and appliance and equipment efficiency

standards" that could speed the development of "end-use energy efficiency technologies and measures."[156] The study cautioned that the potential for leakage was still uncertain and that waiting for further evidence as to whether carbon leakage was actually occurring was warranted.[157]

E. Efficiency

If and when the federal government does implement a federal program to tackle climate change, existing state programs will have to be aligned with the new federal emissions trading program.[158] Here, actions by the states that intersect with those of the federal government could have additional efficiency costs.[159] However, there are some methods states could utilize to continue to implement policies more stringent than a federal program. One of these techniques, is a state level "carve-out" that maintains links to the federal program.[160] That is, a state could have its own system of tackling climate change that leaves an option for transferring credits or other methods of abatement into the national program.[161] However, even if there are additional costs at the state level, climate risks are predicted to worsen if preventative action is not taken soon. Furthermore, as noted earlier, as long as states take action faster than the federal government, they can test out tough economic policies and generate momentum for tackling climate change while federal programs try to catch up.[162] The relative efficiency costs of state plans might pale in comparison to the costs of letting the climate continue to deteriorate.[163]

162. *Id.* at 179 ("Since marginal costs are not equalized among all sources nationally, economic efficiency is sacrificed and total compliance costs for achieving the national cap are greater than they would be under the national program alone.").

163. Steve Connor & Michael McCarthy, *World on Course for Catastrophic 6° Rise, Reveal Scientists*, THE INDEPENDENT, Nov. 18, 2009, at 1, *available at*

State actions will not prevent the federal government from also taking action; much of the action already taken by states has fallen within the framework set up by the federal government.[164] As mentioned earlier, the federal government often drafts legislation in a way that allows states to go beyond the measures taken at the federal level.[165] Therefore, state action should be supplemental to federal action, as an additional layer of regulation.[166] As President Barrack Obama said, "[t]he federal government must work with, not against, states to reduce greenhouse gas emissions."[167]

Finally, preserving the states' ability to regulate climate change will allow for "tailoring" environmental policies at the local level.[168] Geography, climate, and industry needs might be different in each state, providing further incentive to allow states to continue to develop their own environmental policies and provide innovative climate initiatives.[169] Furthermore, there are benefits to having a decentralized democratic process which allows people to have more control over how their lives are run.[170] States are the backdoor for tougher climate standards that cannot get through on the national level.

V. CONCLUSION

The ultimate goal in permitting states to create their own environmental policy goals is for states to have the ability to go

An unexpected drop in U.S. electricity consumption has utility companies worried that the trend isn't a byproduct of the economic downturn and could reflect a permanent shift in consumption that will require sweeping change in their industry.

—Rebecca Smith, Wall Street Journal[1]

Good for you, bad for us.

—Electric Utility Official[2]

INTRODUCTION

Energy policy debates often focus on increasing the supply of renewable energy, but energy demand merits equal attention. Low-carbon energy sources will not be able to displace fossil fuels at the levels necessary to achieve climate goals if global demand continues to grow at projected rates.[3] To meet the widely endorsed goal of 50% global carbon emissions reductions by 2050, including 80% reductions from developed countries, global emissions from fossil fuel use will need to decline by more than seven billion tons from projected levels by 2050.[4] Major new sources of low-carbon energy will become available, but it is unrealistic to assume that new low-carbon sources will expand quickly enough to displace existing fossil fuel sources if

2. The electric utility official made this comment at a recent installation of a household solar photovoltaic system. Email from Linda Breggin, Senior Att'y & Dir., Nanotechnology Program, Envtl. Law Inst., to Michael Vandenbergh (on file with author) (quoting the utility official). Although this example involves household energy supply, not demand, a utility's gatekeeping role and incentives regarding household solar programs are often similar to those regarding household energy efficiency and conservation programs.

3. Nathan S. Lewis & David G. Nocera, *Powering the Planet: Chemical Challenges in Solar Energy Utilization*, 103 PROC. NAT'L. ACAD. SCI. 15729, 15730 (2006); Nathan S. Lewis, *Powering the Planet*, ENGINEERING & SCI., No. 2, 2007, at 12, 16, *available at* http://www.ccser.caltech.edu/outreach/powering.pdf. By low-carbon, we mean sources that generate little or no carbon emissions (e.g., solar, wind, and nuclear energy) or that capture and store the emissions (e.g., fossil fuel plants with effective carbon capture and storage). We use the term "carbon" as shorthand for the six greenhouse gases included in the Framework Convention on Climate Change ("FCCC") and typically expressed as carbon dioxide equivalents ("CO_2e"). *See Fact Sheet: The Need for Mitigation*, UNITED NATIONS FRAMEWORK CONVENTION ON CLIMATE CHANGE (November 2009), http://unfccc.int/files/press/backgrounders/application/pdf/press_factsh_mitigation.pdf. Our focus here is on energy demand, and we do not take a position on the optimal mix of energy sources.

4. *See, e.g.*, S. Pacala & R. Socolow, *Stabilization Wedges: Solving the Climate Problem for the Next Fifty Years with Current Technologies*, 305 SCIENCE 968, 968 (2004) (identifying strategies that would enable emissions to "be held near the present level of seven billion tons per year (GtC/year) for the next fifty years, even though they are currently on course to more than double" by 2054).

global demand doubles as projected.[5] In fact, although the percentage of global electricity generation from fossil fuels has decreased in recent years, the total amount of fossil fuels consumed has increased.[6] The same analysis holds true for energy supply and demand in the United States: the supply of low-carbon energy is projected to grow, but without a substantial reduction from projected levels of demand, it is difficult to imagine how low-carbon sources can supply enough energy to enable the United States to achieve its share of global carbon emissions reductions.[7]

Recognition of the need to reduce energy demand has spawned a vast literature on energy policy measures that will increase efficiency and conservation at the industrial, commercial, and household levels.[8] Although the precise magnitude of the opportunity is the subject of debate, the literature has identified large, low-cost opportunities to reduce energy use and carbon emissions from these sectors.[9] For example, recent research in the social and behavioral sciences suggests that the use of information and other nonintrusive interventions could achieve a "behavioral wedge" of carbon emissions reductions at the household level.[10] Behavioral wedge strategies

The wedge concept was introduced in Pacala & Socolow, *supra* note 4, at 968–69. *See also* JASON CZARNESKI, EVERYDAY ENVIRONMENTALISM: LAW, NATURE AND INDIVIDUAL BEHAVIOR 1–4 (2011); Dernbach,

reduce carbon emissions by reducing household energy demand through improved efficiency (e.g., purchase of less energy-intensive appliances) and conservation (e.g., reduced use of existing appliances).[11] Any one strategy could have a small effect on its own, but aggregate behavioral efforts have the potential to produce reasonably achievable reductions in total U.S. emissions of 7% by 2020. This amount exceeds the total emissions of many major industrial sectors and is larger than all of the emissions from France.[12]

Notable reductions in the growth of household energy use have occurred in recent years,[13] but the United States is not on track to achieve a behavioral wedge.[14] Although many scholars have emphasized demand reduction as an important area for new legal and policy tools,[15] few have focused on the institutional barriers to its achievement.[16] In this Article, we identify the incentives of electric distribution utilities as a frequently overlooked barrier to achieving household energy demand reductions in the United States, examine the conceptual obstacles to overcoming this barrier, and explore a range of potential responses.[17] Although we focus on U.S. household

17. We focus on the demand for electricity in the United States at the household or residential level, but our analysis is also relevant to other energy users (e.g., small businesses) and to other energy sources (e.g., natural gas). *See* discussion *infra* Part II.A; *see also* Daniel A. Farber, *Controlling Pollution by Individuals and Other Dispersed Sources*, 35 ENVTL. L. REP.

demand, global household demand is projected to increase dramatically over the next several decades, and utilities' incentives to reduce household demand are important at the global level as well.[18]

The incentives of retail electric distribution utilities are essential because these utilities are critical gatekeepers for household demand reduction programs. This is an important but easily overlooked point. Retail electric distributors, both public and private, interact regularly with consumers, and they control much of the flow of information to and from households and the access to opportunities for demand reduction. They can act aggressively to induce widespread adoption of new practices and more efficient equipment. Or they can conduct widely publicized programs that comply with applicable mandates and generate goodwill without actually generating major reductions in demand. In addition, by controlling access to information and connection with the grid, they can encourage or discourage other firms from selling goods and services that may reduce household demand.[19] All of this can occur with little transparency to regulators and the public.

Despite the gatekeeping role of electric distribution utilities and the importance of reducing household energy demand, distributors in most jurisdictions do not have incentives to ensure that demand reduction strategies succeed on a wide scale.[20] In fact, under the regulatory regimes in most states, utilities would suffer revenue erosion if they induced substantial reductions in demand. Instead, the rate structure in most jurisdictions creates incentives for utilities to promote demand growth. If an essential gatekeeper has financial incentives to increase aggregate demand, it should not be surprising that large-scale demand reduction is not occurring.

10745, 10745 (2005) (noting the importance of behavioral interventions for small businesses). Reductions in U.S. energy demand from projected levels are necessary whether nuclear power or coal with capture and storage are part of the energy supply mix.

18. For example, China is expected to add as many new households between 2005 and 2030 as existed in the Western Hemisphere in 2000. Jianguo Liu & Jared Diamond, *China's Environment in a Globalizing World*, 435 NATURE 1179, 1184 (2005), *available at* http://archive.csis.msu.edu/Publications/JLiu_2005_Nature.pdfhttp://archive.csis.msu.edu/Publications/JLiu_2005_Nature.pdf. A recent study suggests that fifty million new household air conditioning units were added in China in 2010 alone. *See* Stan Cox, *Cooling a Warming Planet: A Global Air Conditioning Surge*, YALE ENV'T 360 (July 10, 2012), http://e360.yale.edu/feature/cooling_a_warming_planet_a_global_air_conditioning_surge/2550/.

19. For example, Carbon Salon, through online carbon emissions tracking, has provided individuals with carbon reduction strategies and data if the local utility allows disclosure of electric bills. CARBON SALON, http://www.carbonsalon.com (last visited Sept. 6, 2012).

20. *See* discussion *infra* Part II (noting the lack of incentives for utilities to achieve an NDR).

Two conceptual barriers undermine efforts to create incentives for electric distribution utilities to sell less of their product. The first is the use of policy efforts known as "demand-side management" ("DSM"), which we discuss in Part II. On the surface, DSM appears to address all forms of demand management, including demand reduction, but DSM efforts have focused on shifting the timing of demand, not on reducing the total amount of demand. DSM efforts typically involve reducing electricity generation costs by shifting demand from peak to off-peak periods. This shift allows utilities to fully deploy their lowest-cost sources of electric power, while under-deploying or under-investing in higher-cost sources, including renewable energy. For example, in areas where air conditioning is a large component of total electricity use, peak summer use occurs during the late afternoon and early evening. Utilities have generating units standing by to provide the additional electricity necessary at peak times. These "peaker" units are often natural gas turbines that are more expensive to operate than the coal-fired units that supply base load electricity for about half of the country.

If the costs of operation captured all of the important considerations, this approach to demand would not be problematic. But the social costs of carbon are externalized, and coal-fired units generate roughly twice the carbon emissions of natural gas units. As a result, in many areas, DSM programs that shift electricity use to off-peak periods may increase total carbon emissions from electricity generation.[21] DSM efforts thus may be working at cross-purposes with efforts to reduce carbon emissions. With increasing concerns about the carbon emissions of electricity generation, policymakers have begun to emphasize demand response options, renewable or clean power standards, and other measures. DSM programs may undermine these efforts, however, by increasing carbon emissions in those areas dependent on high-carbon base load units. DSM thus has facilitated a subtle shift in energy debates and policies from how much electricity is used to when it is used, yet DSM can actually increase carbon emissions by increasing overall electricity use and by shifting the mix of base load and peak generation sources.

To address the conceptual confusion caused by the use of the term DSM, in this Article we advance "net demand reduction" ("NDR") as an important, but oft-overlooked, concept. By NDR, we mean

21. As used in this Article, "base load" refers to the minimum amount of power that a utility must make available to meet its customer demand by providing reliable electricity during "peak" periods. Base load plants are plants that are dedicated to the production of base load power supply. Such plants typically are characterized by efficiencies that favor operating at or near capacity and very stable and predictable fuel availability and operational characteristics.

reductions in the total demand for energy, including electricity. Part II defines the problem by examining how carbon constraints affect projected energy supply and demand, and by highlighting the potential carbon emission reductions from NDR. It shows how well-entrenched policy instruments such as DSM mask NDR's benefits by assuming a demand curve that is largely fixed. This conventional approach to demand reinforces the strategic business purposes of a utility, whose regulatory incentives lead it to view NDR as revenue erosion. We argue that the conventional approach is not likely to yield long-term energy demand at levels that can be satisfied by low-carbon energy sources.

Part II also demonstrates how utilities' financial incentives, reinforced by state regulators, sustain this NDR blind spot, despite many laudatory federal goals. In theory, DSM and NDR are fully compatible, or at least are not inconsistent. Any effort to manage demand, however, should include careful attention to total energy demand—not merely to the timing of demand or industry efforts to expand total customer usage. This is consistent with many of the stated goals of DSM, and perhaps even with its conservation roots as endorsed in statutes such as Public Utility Regulatory Policies Act ("PURPA").[22] However, given the financial incentives faced by firms, as reinforced by the treatment of price and risk in the regulatory process, DSM has failed to meet its promises. For utilities in many jurisdictions, efficiency and conservation promotion make good business sense to a point, especially where firms are guaranteed compensation for investing in these efforts, but aggressive implementation of sophisticated NDR efforts could lead to revenue erosion and financial hardship.[23] The incentive to shift energy usage from peak to off-peak periods but not to achieve NDR affects a wide range of household efficiency and conservation programs on the ground, including the design and implementation of smart meter programs, electric car recharging programs, and others.[24]

A second conceptual barrier makes shifting the regulatory regime for utilities particularly difficult. For almost a century, the principal focus of energy regulation has been to keep per-unit rates for consumers as low as possible. The goal under the dominant approach

22. Public Utility Regulatory Policies Act, Pub. L. No. 95-617, 92 Stat. 3117 (1978).

23. *See* AM. PUB. POWER ASS'N, THE EFFECT OF ENERGY EFFICIENCY PROGRAMS ON ELECTRIC UTILITY REVENUE REQUIREMENTS 1–2 (2010), *available at* http://appanet.cms-plus.com/files//PDFs/EffectofEnergyEfficiency.pdf.

24. *See, e.g.*, Michael P. Vandenbergh, Amanda R. Carrico & Lisa Schultz Bressman, *Regulation in the Behavioral Era*, 95 MINN. L. REV. 715, 766–73 (2011) (discussing electric car recharging).

has been to ensure efficient supply in the face of a limited monopoly for electricity distribution and, to an extent, generation. This goal assumes that market prices are the best indicator of the true costs of production. Under this approach, externalities are largely ignored, and policymakers instead focus on various ways that competition can yield lower-cost supplies of energy through innovations such as wheeling power, deregulation, and unbundling generation from distribution.[25] We demonstrate, however, that although pursuing low rates is politically convenient for regulators, utilities, and consumer advocates, it is acceptable to utilities for precisely the reason that it is often not in consumers' long-term interest: by discouraging efficiency and conservation and encouraging additional energy use, it leads to overall demand increases that yield higher total energy costs to the consumer. If a low-rate approach did not achieve this outcome, in most areas of the country, utilities would suffer revenue erosion and would have strong incentives to oppose the low-rate approach. Instead, emphasizing low rates allows each participant in regulatory debates to take a popular position, but at the cost of ever-increasing energy use and total energy costs.

In Part III, we argue that large-scale NDR will not occur without specific policy instruments that address the financial incentives of electric distribution utilities. We evaluate how those incentives must change to produce effective demand reduction policies. We then survey how options such as carbon pricing, performance mandates, and decoupling might be used to advance NDR. Ultimately, we conclude that widespread demand reduction is not likely to occur until utilities shift from viewing NDR as revenue erosion to viewing it as a financial opportunity. Achieving this shift will require a more aggressive commitment by utilities, regulators, and consumer groups to a different business model—one that treats prices and risks in a fundamentally different manner from traditional ratemaking.[26]

Part IV concludes. We note that our goal in this Article is not to explore the specific options necessary to achieve NDR but rather to emphasize the importance of NDR and the conceptual barriers that

25. For a discussion describing how deregulation has made it more difficult to get an accurate price signal given the externalities, see, for example, Richard J. Pierce, Jr., *Natural Gas Regulation, Deregulation, and Contracts*, 68 VA. L. REV. 63, 90–99 (1982) (discussing the likely inefficiencies in natural gas markets resulting from deregulation in 1978).

26. *See* Ronald Brownstein, *The California Experiment*, THE ATLANTIC, Oct. 2009, at 66, 70 (quoting Peter Darbee, Pacific Gas and Electric's Chief Executive Officer, for the proposition that customers sometimes tell him that "you would love us" because they are using large amounts of power, but, due to California's decoupled rates, he responds, "Well, actually I'd prefer that you use a lot less. . . . We actually make more money if we sell you less power, and we make less if we sell you more power.").

must be overcome to achieve it. Moving forward, reducing net demand is an important goal alongside increasing the efficiency of supply. Regardless of the precise regulatory instrument selected, achieving NDR will require laws and policies that create incentives for electricity distributors to implement demand reduction programs with the same vigor as they implement programs to sell power. Pricing carbon could shift utilities' incentives, but the adoption and implementation of laws requiring electricity prices to reflect the social cost of carbon will not occur for some time. Direct regulatory commands to adopt programs or spend specific amounts will have some effect, but these efforts will not be implemented as a strategic priority and may fail for many nontransparent reasons. Major reductions in demand, in contrast, will require the creation of ongoing, genuine incentives for utilities to sell less of their product.

II. UTILITY INCENTIVES

We begin by briefly examining why NDR is an important social goal and by addressing the conceptual and practical barriers to achieving NDR. Policies and programs that achieve NDR decrease the need for power supply and thus can directly reduce carbon emissions. Equally important, NDR reduces the need for power supply infrastructure,[27] thus creating system-side benefits that can improve the viability of renewable power supply options. Yet the predominant industry initiatives and policy instruments aimed at addressing demand assume that energy usage levels will grow. These efforts view total customer demand as largely fixed, focusing on exploiting differences in demand across time or fuel types. Despite laudatory federal efforts beginning in the 1970s to make efficiency and conservation the thrust of a nationwide demand response initiative, demand regulation has deviated from a demand reduction path. The financial incentives of both utility firms and customers, along with the approach of state public utility laws, create an NDR blind spot in U.S. energy policy.

A. The Carbon Reduction Benefits of NDR

A starting point for our analysis is the widely held view that substantial reductions in carbon emissions from the domestic and global energy sectors will be a necessary part of any successful climate

27. Such infrastructure includes base load power generation facilities, as well as transmission and distribution facilities built to serve peak demand.

change mitigation effort.[28] Global carbon emissions are projected to double by 2050.[29] To reduce the likelihood that global average temperature increases will exceed two degrees Celsius, however, global emissions will need to be reduced by 50% or more.[30] For developed countries, the common target is 80% to account for greater contributions to existing carbon stocks and ability to pay for reductions.[31]

Despite the need for 50 to 80% emissions reductions by 2050, the business-as-usual projection of the U.S. Energy Information Administration ("EIA") suggests that electricity use in the United States will increase by 45% by 2030 (the EIA does not publish projections for 2050).[32] Global electricity use is projected to increase by over 300% by 2030.[33] Increases in energy demand at these levels will make it very difficult to reduce overall carbon emissions from the energy sector. Even if new sources of low-carbon energy are brought online at extraordinary rates, these new sources will be necessary just to meet the increases in projected demand, and it will be very difficult to replace existing fossil fuel–based sources with low-carbon sources.[34]

28. To reduce the risk of catastrophic climate change, a consensus has emerged that temperature increases should not exceed two degrees Celsius over pre-industrial levels, and that to reduce the risk of exceeding two degrees Celsius, atmospheric concentrations should not exceed 550 ppm of CO_2e. INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE, SUMMARY FOR POLICYMAKERS (2007). The views of the Intergovernmental Panel on Climate Change ("IPCC") represent mainstream thought among climate scientists. *See* William R. L. Anderegg et al., *Expert Credibility in Climate Change*, 107 PROC. NAT'L ACAD. SCI. 12107, 12107 (2010); Naomi Oreskes, *Behind the Ivory Tower: The Scientific Consensus on Climate Change*, 306 SCIENCE 1686, 1686 (2004). A growing literature suggests that there is a substantial risk of reaching a climate tipping point even if CO_2e levels do not exceed 550 ppm. *See, e.g.*, Michael Vandenbergh & Jonathan Gilligan, *Macro Risks: The Challenge for Rational Risk Regulation*, 21 DUKE ENVTL. L. & POL'Y F. 401, 403 n.8 (2011) (reviewing tail risk literature).

33. *Id.* at tbl.D1.

34. *See id.* at 86 (demonstrating a projected increase in utilization for various types of energy). Under a business-as-usual scenario regarding energy use, we will need ten terawatts

In short, meeting widespread carbon targets will be difficult even with major reductions from projected levels of demand, but it will be almost impossible without them.[35] Although remarkable advances in low-carbon technologies are likely over the coming decades,[36] there is some maximum amount of renewable or low-carbon energy that can reasonably be expected to be produced in any given year or over this period as a whole.[37] In the absence of near-miraculous new technologies or major efficiency gains, high carbon-emitting sources will step in to fill the gap.

Extraordinary efforts will be required to achieve even modest annual reductions in net energy demand. Professor Nathan Lewis has examined the role of energy supply and demand in light of the need for climate change mitigation, and his analysis provides a good example of the extent of the demand reductions necessary by 2050 if low-carbon sources are to displace fossil fuels, not just meet new demand. His business-as-usual scenario assumes that the ratio of energy consumption to GDP, which has been declining at about 1% per year,

---

(i.e., ten trillion watts) of carbon-free power. Lewis, *supra* note 3, at 17. Current global energy use is now roughly thirteen terawatts. Nathan S. Lewis, *Powering the Planet*, 32 MRS BULL. 808, 808–09 (2007), *available at* http://authors.library.caltech.edu/9302/1/LEWmrsb07.pdf. More than 80% of that energy demand is supplied by fossil fuels, which contribute roughly two-thirds of anthropogenic greenhouse gas emissions. Thus, even with a 1% efficiency gain per year assumption, carbon-free sources will need to supply fifteen to twenty terawatts of energy by 2050. These types of efficiency gains and deployment of carbon-free sources must continue for the foreseeable future after 2050, leading to a carbon-free supply of almost all energy by 2100. Lewis, *supra* note 3, at 14, 16. Not all commentators agree that carbon emissions goals cannot be achieved in the United States or globally without a reduction in energy demand growth at less than business-as-usual rates. Jeff Goodell, *Q&A: Bill Gates on How to Stop Global Warming*, ROLLING STONE (Dec. 9, 2010, 11:05 AM), http://www.rollingstone.com/politics/news/the-miracle-seeker-20101028 (noting Gates's view that the climate problem arises from supply—not consumption—issues).

35. Scott Barrett, *The Coming Global Climate-Technology Revolution*, 23 J. ECON. PERSP. 53, 54 (2009); *cf.* Tim Foxon & Peter Pearson, *Overcoming Barriers to Innovation and Diffusion of Cleaner Technologies: Some Features of a Sustainable Innovation Policy Regime*, 16 J. CLEANER PRODUCTION S148, S151 (2008) (discussing advances in energy technology from an innovation-systems perspective).

36. The IPCC assumes a substantial amount of "spontaneous" technological development leading to reduced energy intensity. *See* Roger Pielke, Jr., Tom Wigley & Christopher Green, *Dangerous Assumptions*, 452 NATURE 531, 531–32 (2008).

37. Peak renewable energy is a subset of peak low-carbon energy. The concept of "peak oil" has been discussed at length, and Peter Gleick has applied the concept to "peak renewable water." *See* Peter H. Gleick, *Global Freshwater Resources: Soft-Path Solutions for the 21st Century*, 302 SCIENCE 1524, 1525 (2003). It is notable that there are significant differences with how "peak" is used by economists and policymakers in different contexts. Within the context of "peak oil," the term signifies the historical point at which there are diminishing returns to extracting more of a supply resource. In the context of electric power generation, the term describes the power supply deployed to meet total "peak" demand forecasts, regardless of whether there are diminishing returns to any particular type of electric power generation source.

globally averaged, will continue until 2050.[38] As Lewis notes, this would mean that in 2050 each person around the world would demand on average only two kilowatts a year.[39] Currently, the average demand per person in the United States is ten kilowatts.[40] According to Lewis, to achieve this two kilowatt demand in the United States, "we would need to start today to do everything possible—including using 100 mpg cars and zero-energy homes—to conserve energy."[41] Furthermore, food production alone in Western societies requires one kilowatt per person.[42] Reducing net energy demand thus is an essential element of successful climate mitigation efforts.[43]

B. Existing Demand-Related Policy Instruments and NDR

When energy demand is at issue, energy policy debates have largely ignored NDR and instead focused on a policy tool known as demand-side management ("DSM"). Beginning with PURPA in the

38. Lewis, *supra* note 3, at 16. This assumption has also been made by the IPCC. Lewis also notes that the United States "actually saves energy at a faster rate, about two percent per year" because of the high per capita energy baseline consumption in the United States, relative to developing countries. *Id.*

39. Lewis, *supra* note 34, at 812.

40. *Id.*

41. *Id.* at 812–13.

42. *Id.* at 813.

43. Although our primary focus is on NDR through increases in household efficiency and conservation, many of the same opportunities for demand reduction may exist in the small business sector. To date, energy and climate scholars have not focused on the small business sector as a separate category of analysis. The Environmental Protection Agency does not distinguish between small and large businesses in its annual greenhouse gas inventory. *See* U.S. ENVTL. PROT. AGENCY, INVENTORY OF U.S. GREENHOUSE GAS EMISSIONS AND SINKS: 1990–2010, at 1-9–1-12 (2012), *available at* http://www.epa.gov/climatechange/Downloads/ghgemissions/US-GHG-Inventory-2012-Main-Text.pdf . Similarly, the Department of Commerce categorizes small business emissions by the economic sector in which the business operates, despite including household emissions as a separate category of analysis. *See* U.S. DEP'T OF COMMERCE, *supra* note 14, at 7. For the purposes of reducing energy use and carbon emissions, however, a small business often resembles a household more than a multinational corporation. More than twenty million Americans work for small businesses that employ fewer than twenty people, a category constituting 18% of the total private sector workforce. U.S. SMALL BUS. ADMIN., OFFICE OF ADVOCACY, SMALL BUSINESS PROFILE: UNITED STATES 2, tbl.1 (2012), *available at* http://www.sba.gov/sites/default/files/us11.pdf (calculating percentage from "Total" row (20,738.3 / 114,509.6 = 0.181)). If these businesses are responsible for 18% of the total private sector emissions, then they are responsible for 711 million metric tons of carbon dioxide emissions. *See id.* (multiplying total private sector emissions, GRANADE, *supra* note 9, at 7, by the percentage of small businesses employing fewer than twenty people, U.S. SMALL BUS. ADMIN., *supra* at 2 tbl.1). Given the minimal number of employees, these businesses are likely to produce emissions that more closely resemble a large household than a small factory, and if these small businesses often resemble households, then they are ripe for efficiency gains.

1970s, federal law envisioned a conservation direction for DSM.[44] But PURPA and later amendments did not mandate the adoption of conservation-minded DSM and left most implementation of federal goals to the state and local authorities that regulate distribution utilities. PURPA also emphasized utility rate design only, and it did not purport to regulate how states provided for overall cost recovery to produce revenue for utilities.

For firms in the industry and many state regulators, DSM seems to have long left the conservation path that PURPA envisioned. Although DSM policies might have held some promise for electric power demand reduction in theory, as implemented, the policies often led only to load shifting and even increased total energy usage and electricity production. For example, many in the industry define DSM to mean active efforts by utilities to modify use patterns in the consumption of energy, conceding that the total level of use is not of concern to DSM.[45] DSM appears to conflate many different concepts, but it often emphasizes two narrow goals: (1) load shifting, or changing the timing of energy use within one energy type (e.g., electricity);[46] and (2) fuel substitution, or shifting between different energy sources (e.g., petroleum to electricity).[47]

45. *See* JOSEPH ETO, LAWRENCE BERKELEY NAT'L LAB., THE PAST, PRESENT, AND FUTURE OF U.S. UTILITY DEMAND-SIDE MANAGEMENT PROGRAMS 1 (1996) ("DSM refers to active efforts by electric and gas utilities to modify customers' energy use patterns."); MICHAEL F. HORDESKI, NEW TECHNOLOGIES FOR ENERGY EFFICIENCY 105 (2003) ("DSM involves peak clipping, strategic conservation, valley filling, load shifting, strategic load growth and flexible load shaping."). Others define DSM more expansively to emphasize conservation—a goal that seems quite consistent with federal policies to promote DSM under statutes such as PURPA, but that we argue is hobbled by the financial incentives faced by firms in the industry and state public utility laws. *But see* Bernard S. Black & Richard J. Pierce, Jr., *The Choice Between Markets and Central Planning in Regulating the U.S. Electricity Industry*, 93 COLUM. L. REV. 1339, 1354–55 (1994) (noting that utilities consider DSM to include load shifting).

46. The EIA defines DSM as "[a] utility action that reduces or curtails end-use equipment or processes," but emphasizes that "DSM is often used in order to reduce customer load during peak demand and/or in times of supply constraint." *See Glossary*, ENERGY INFO. ADMIN., http://205.254.135.7/tools/glossary/index.cfm?id=D (last visited Sept. 6, 2012).

47. A classic example is utility-sponsored electric lawn mower exchange programs, which would reduce emissions from combustion lawnmowers in certain areas but increase the amount of electricity used. *See* LeRoy C. Paddock, *Green Governance: Building the Competencies Necessary for Effective Environmental Management*, 38 ENVTL. L. REP. 10609, 10622 (2008) (describing exchange program implemented by Clean Air Minnesota, a program managed by the Chamber of Commerce via the Minnesota Environmental Initiative). DSM for natural gas utilities has also encouraged switching from electric to natural gas water heaters and stoves. *See* Steven D. Czajkowski, Note, *Focusing on Demand Side Management in the Future of the Electric Grid*, 4 PITT. J. ENVTL. & PUB. HEALTH L. 115, 132 (2010).

Contemporary energy policy proposals at the national level highlight this problem. For example, so-called "Smart Grid" programs, a major funding priority of the Department of Energy ("DOE") under the Obama Administration, emphasize load shifting through critical-peak, time-of-day, and real-time pricing.[48] Electric car programs, another major DOE priority, emphasize fuel substitution by shifting the automobile fleet from petroleum to electricity.[49] The carbon reduction benefits of shifting from petroleum to electricity vary based on the timing of vehicle recharge. In many areas of the country, utilities have incentives to shift recharging to off-peak, low-cost times. The effect is to shift the electricity source from natural gas turbines to coal-fired units, however, and in many areas this shift will increase the carbon emissions attributable to use of the electric vehicles. In these situations, the time-shifting form of DSM may actually increase total carbon emissions.[50]

Smart meter programs also reflect the focus of DSM on shifting electricity use from peak to off-peak hours rather than on reducing total energy demand. Smart meter programs, which provide immediate information on household electricity use, are often used to shift household energy demand from peak to off-peak periods (e.g., by facilitating variable rate pricing schemes or allowing remote shutdown of air conditioners or pool pumps at peak periods). These programs could give customers real-time information about the price and amount of electricity used in the household. Although over the long run retail electricity prices can be expected to have a substantial effect on household energy demand, rate regulation of electric power in most states has kept consumers from having experience with electricity price fluctuations. Research suggests that people often have limited or incorrect information about what activities use the most electricity.[51]

Mansur, *Spatial and Temporal Heterogeneity of Marginal Emissions: Implications for Electric Cars and Other Electricity-Shifting Policies* (Nat'l Bureau of Econ. Research, Working Paper No. 18462, Oct. 2012) (noting that in the upper Midwest charging electric vehicles during recommended nighttime hours increases electric car emissions to levels that are higher than the average gas-powered vehicle on the road); *see also* Vandenbergh, Carrico & Bressman, *supra* note 24, at 766–68 (examining research on the implications of peak versus off-peak electricity generation for the carbon emissions associated with recharging electric cars).

51. Shazeen Attari et al., *Public Perceptions of Energy Consumption and Savings*, 107 PROC. NAT'L. ACAD. SCI. 16054, 16057 (2010). This is true about other forms of energy use as well. *See, e.g.*, Amanda R. Carrico et al., *Costly Myths: An Analysis of Idling Beliefs and Behavior*

Not surprisingly, consumer responses to variable or dynamic pricing have been disappointing.[52] Notably, just providing real-time information in homes about costs and impacts associated with electric power usage, without introducing price variations, can reduce electricity use by roughly 5 to 15%.[53] Yet from the perspective of utilities in many parts of the United States, this kind of demand reduction, when not tied to dynamic pricing, might occur at times when electricity production is low cost, leading to utility revenue erosion. Not surprisingly, utilities have focused less on using smart meters and other devices to provide households with information that would reduce overall household electricity use than on shifting use to off-peak periods. Shifting use to off-peak periods will reduce the need for firms to invest in new base load plants and will save money by allowing them to deploy their existing base load resources at capacity. But this timing shift often can increase carbon emissions. The focus on load shifting has induced utilities to link smart meter programs to dynamic pricing schemes, even though the higher rates at peak periods have often been very unpopular with customers.[54]

DSM that is directed toward shifting peak use to off-peak use is popular with utilities, and as we discuss below, policies that follow this view of DSM seem especially attractive to incumbent firms to the extent they help firms maximize their revenues from energy sales. Utilities often have an incentive to shift demand from high-cost natural gas turbines at peak load periods to lower-cost coal-fired or

ENVTL. PSYCHOL. 1, 10 (2011).

54. *See* Vandenbergh, Carrico & Bressman, *supra* note 24, at 730–40 (discussing consumer responses to dynamic pricing).

nuclear base load units at off-peak periods because deploying resources in an off-peak period can lead to overall increases in total kilowatt-hour sales of electricity without any need for any additional capital investment.[55] At the extreme, DSM can increase a utility's strategic overall load, increase the overall demand for electricity, and maximize its revenues—a profitable strategy some in the industry call "strategic load management."[56] Although approaches vary from state to state, because of the failure to fully embrace NDR, DSM programs have had only a modest impact on the total demand for electricity—decreasing less than 2% of demand over the long term.[57]

The carbon implications of shifting the timing of energy demand or the source of energy supply are also very different when NDR is emphasized as an independent goal. NDR does not assume energy usage is constant, that the shape of the demand curve is fixed over time or across fuels, or that the demand curve is inevitably shifting outward. Instead, NDR also emphasizes reducing aggregate demand by changing the shape of the demand curve or shifting it inward. We focus here on reductions in aggregate demand.[58] By subtly shifting the debate from reducing the amount of energy used to the timing of the use, many DSM policy initiatives claim to focus on demand but only do so in a way that focuses on timing of use, not reducing overall consumption.

Less explored, but equally important, DSM policies may lead to increases in carbon emissions by increasing the importance of high-carbon base load units to the utility. DSM can shift load to avoid deployment of gas peakers, but this might cause total demand to increase. Even if total demand does not increase, DSM may increase

REP. 10825, 10825–33 (2008) (discussing the need to address aggregate consumption of energy and goods and the reluctance of the Supreme Court to interpret the National Environmental Policy Act to require evaluation of consumption reduction as opposed to the effects of building new generation units).

dependence on the lowest-cost base load plants, which are often coal-fired units.[59] In fact, emphasizing peak capacity as a way of allocating energy usage over time may be pushing demand to base load through DSM. This focus on peak capacity feeds on itself, as more consistent demand over time means that base load units become even more important to a utility's system. The more that a utility invests in base load generation units, the more electricity it needs to sell to pay for them.

More recent federal policy efforts also do not require DSM to address NDR and may even undermine it. In 2005, Congress passed legislation that required DOE to evaluate the impacts of demand response.[60] DOE reported to Congress on demand response initiatives in 2006, finding that limited demand response opportunities currently exist and that "[s]tates should consider aggressive implementation of price-based demand response for retail customers as a high priority."[61] DOE found that demand response potential in 2004 was "about 20,500 megawatts (MW), 3% of total U.S. peak demand, while actual delivered peak demand reduction was about 9,000 MW," or 1.3% of total peak demand.[62] These initiatives conflate DSM and NDR, however, rather than address the distinct challenge of NDR.

In addition, two aspects of DOE's recent push towards DSM further entrench the NDR blind spot in energy demand policy. The first is DOE's emphasis on reducing peak consumption as its primary demand response goal. This is consistent with the dominant approach to DSM and to preserving a focus on regulation designed to ensure revenue recovery for capital costs associated with a peak that is defined with respect to individual base load plants. Second, DOE continues to look to states, rather than the federal government, as the primary innovators for demand response policies. DOE's emphasis on states for demand response solutions is not surprising, given that the Federal Power Act protects state jurisdiction over retail rates.[63] But this also means that the ultimate responsibility for demand initiatives that flow through to the customer level will remain with state

59. Clean Air Act standards might help to soften this effect to some extent regarding coal if the standards regulate hourly emissions rather than average or daily, weekly, or monthly emissions. For example, this may be effective for sulfur dioxide.

regulators, rather than the federal government, and that their regulatory approach will be important to meeting federal goals related to DSM.

C. Distribution Utilities as NDR Gatekeepers

Electric distributors are perhaps the most important actors for demand reduction. The traditional electric utility provides bundled generation, transmission, and distribution services to retail customers under rates regulated based on the cost of service, as determined based on the costs of producing electricity. Such firms set or affect retail prices in most jurisdictions; have monthly communications with retail consumers; control access to efficiency, conservation, and renewable energy generation options; determine the transaction costs households will occur in adopting new technologies or participating in conservation programs; and lobby for and against demand-related measures with federal, state, and local governments.[64] Electric distributors also set standards and require approvals for connecting with the local grid, such as the approvals necessary for installation of solar photovoltaic systems. They provide information through bills and advertising that can promote[65] or discourage[66] demand reduction. They also maintain large staffs of technicians that interact with households on a frequent basis.

In these ways, the distribution utility serves as an intermediary and gatekeeper between the consumer and the electric grid. A utility that has incentives to reduce household or other demand for electricity can play its information, service, and access roles in ways that will induce widespread uptake of efficiency and conservation measures. A utility that does not can discourage widespread uptake of these measures and can do so in a variety of nontransparent ways, whether by increasing consumers' transaction costs (e.g., by requiring numerous or slow approvals for household solar photovoltaic installation, by understaffing key positions necessary for promotion of efficiency and conservation programs, and

L.J. 1, 62 (2010) (noting that if private utilities can be properly incentivized to maximize energy efficiency, they can be "particularly effective delivery mechanisms for energy efficiency programs," and that "utilities are perceived to be a trusted source of information on efficiency and energy use . . . [and] that information provided by utilities will often have more impact than information provided by other sources").

65. An example would include switching incandescent bulbs to compact fluorescent lamps.

66. Examples include encouraging the purchase of larger electric water heaters, or electric as opposed to gas water heaters.

by imposing stringent requirements on grid access), or by limiting the extent or efficacy of information provided to consumers (e.g., by not making prompt, in-home energy use feedback easily available).[67]

D. Regulatory Incentives for Efficiency and Conservation

Whether a public entity (such as a municipal utility) or a private firm, the distribution utility historically operated as a monopoly and was (and in many respects largely remains) regulated by a state regulatory commission whose mission emphasizes protection of consumers from abuses by the monopolist. In the early era of energy regulation, efficient supply was the goal, so protecting consumers became a priority. Importantly, protecting consumers was framed as providing low rates for customers, not necessarily low total consumer expenditures on electricity. Regulators used ratemaking as the principal tool to provide low electric rates for consumers. Low electric rates resonated politically with many consumers and consumer advocacy groups, and this "low rate mindset" continues to resonate, even if it is not always in the interest of consumers.

Although low rates have obvious appeal to consumers and consumer advocates, the impacts of low rates on consumers are mixed. To the extent they enable increased energy use, low rates allow consumers to satisfy preferences for more energy-using services, such as the additional cooling provided by lowering the thermostat in the summer or the entertainment from new electronic equipment. At the same time, low rates undermine incentives to acquire information about energy use, to purchase more efficient appliances, and to reduce waste, such as by taking simple behavioral steps that have very small pecuniary or cognitive costs but large effects on the quantity of electricity used (e.g., turning up the thermostat when leaving the home for long periods in the summer). In addition, by creating incentives for utilities to increase the overall quantity of electricity that customers purchase, low rates create hydraulic pressure in the system for increasing supply, undermining the ability to substitute low-carbon for high-carbon sources. Low rates thus can lead to higher total consumer costs in the long run by undermining incentives for efficiency and conservation and can undercut efforts to reduce the carbon emissions from electricity generation.

Less obvious is why the low-rate mindset found favor with regulated utilities. A monopoly firm with market power typically will

67. As discussed above, such feedback has been shown to reduce residential electricity use by 5% to 15%. EHRHARDT-MARTINEZ ET AL., *supra* note 53, at 39.

favor charging higher rather than lower per-unit prices, but rate regulation guaranteed cost recovery for capital investments associated with generating electricity while also ensuring a high volume of power sales. Volumetric pricing—selling more units at lower cost—remains the dominant business model for electric utilities. The NDR blind spot can be traced to the incentives under which both firms and regulators operate with volumetric pricing and its related approach to investment risks. To the extent the dominant approach to utility rate structures favors volumetric rates, utilities are encouraged to offer low per-unit rates while increasing their total sales. This allows them to recoup the business costs associated with their capital investments in base load power and transmission, and to increase net revenues over the long term.

Low rates are not problematic to a utility so long as the volume of power sold increases sufficiently to make up for the lost revenue from the low rate. If low rates undermine incentives for consumers to invest in more energy efficient technologies or to avoid waste, and thus increase total consumer expenditures on electricity that exceed the revenue loss from low per-unit rates, the utility prospers. So long as consumer advocates focus on low per-unit rates as the goal of ratemaking proceedings, rather than consumers' total electricity costs, consumer advocates can achieve their goal in a way that the utility is happy to accommodate. Consumer advocates can announce success in holding down rates, and utilities can increase their revenue each year as low rates induce increased consumption and undermine incentives to invest in efficiency and conservation.

Thus, although often against consumers' long-term interests, consumer advocacy groups often take the bait offered and focus on low rates, and utilities are quite happy to feed it to them. On the surface, both groups win: utilities increase revenues, and consumer groups report success to their stakeholders on lower rates, even though consumers' total costs will go up in the long run. The total costs to consumers are more important but less obvious to consumers and voters. In addition, the regulator is in a sweet spot, since both utilities and consumer advocacy groups are placated. The losers in this arrangement are consumers, who end up spending more money each year on electricity, as increased usage outstrips low rates, and everyone who is adversely affected by an electricity generation and distribution system that is constantly in need of increasing supply.

The incentives of consumer advocates, utilities, and regulators in the low-rate regime are reflected in the dominant approach to DSM. The shift in timing of consumption that many energy policies seek to achieve under current conceptions of DSM promises firms enhanced revenue with their current business model under the rate structures applicable in most states. By focusing on shifting the timing of demand, not on reducing net demand with efficiency and conservation programs, DSM programs offer the near-term appeal of less costly power, but they miss the opportunity to enable customers to use less electricity overall and to spend less on electricity in the long run. So long as consumer advocates, utilities, and regulators focus on low per-unit rates, however, it should not be surprising that utilities favor DSM over NDR and view efficiency and conservation as revenue erosion; effective overall demand reduction programs will lead to less total electricity use and thus less total revenue from consumers.

Given electric distribution utilities' incentives in most jurisdictions, it is hardly a surprise that utilities' implementation of demand reduction measures has been inconsistent. Serious initiatives to reduce demand have occurred on a one-off, local basis, not with the aggressive, widespread implementation necessary to achieve a behavioral wedge. As a general matter, state regulators have not been very effective at changing firms' financial incentives. In fact, DSM policies were adopted in most states under the cost recovery model of traditional rate regulation, which sees stabilizing and increasing the sales of energy as the main business model for generating revenue—a strong business incentive that is at direct odds with efficiency and conservation goals. Of course, efforts to manage demand produce costs for electric utilities, just as new generation facilities can produce costs. If deemed prudent by regulators, these costs are typically built into the approved rates for regulated utilities. Yet the kinds of DSM programs that regulated firms have sought, and that regulators tend to approve, emphasize load-shifting and fuel substitution along with marketing and strategic load growth, and they ignore, or at least underemphasize, NDR. An Electric Power Research Institute–sponsored report bluntly highlights the problem: "The heart of a DSM program is a series of measures intended to encourage one or more specific groups of customers to modify their energy usage patterns *in a manner consistent with the utility's objectives*."[68]

Empirical analysis has determined that utility estimates of the actual conservation savings associated with DSM investments to date are often overstated.[69] One reason is that DSM's emphasis on load

68. AHMAD FARUQUI & JOHN H. CHAMBERLIN, ELEC. POWER RESEARCH INST., PRINCIPLES AND PRACTICE OF DEMAND-SIDE MANAGEMENT, at ES-1 (1993) (emphasis added).

69. *See* Maximilian Auffhammer, Carl Blumstein & Meredith Fowlie, *Demand-Side Management and Energy Efficiency Revisited*, ENERGY J., No. 3, 2008, at 91, 91 ("The key finding of Loughran and Kulick (2004) . . . is that utilities have been overstating electricity savings . . .

management, fuel substitution, and strategic load growth has masked the impacts of energy policies on total demand. NDR emphasizes the need to confront these impacts. NDR therefore captures an important goal that DSM, in its practical implementation, fails to emphasize, and that merits attention in its own right as a regulatory tool in discussions regarding efficiency, conservation, and demand reduction.

Even in states with traditional rate structures, utilities may feel some public pressure to promote conservation and efficiency. For a firm that is rewarded on a volumetric sales basis, demand shifting to off-peak periods can lower costs and produce some limited efficiencies. For these firms, however, aggregate demand reduction also comes at a significant cost. In retail rate–regulated environments, utilities can be expected to seek demand reduction only if regulators offer to provide them a guaranteed return for it. Similar incentives can be expected for gas and water utilities.

In sum, so long as volumetric pricing and guaranteed cost recovery through regulated rates leads utilities to view efficiency and conservation as revenue erosion, they will have incentives to create an appearance of demand reduction (e.g., to maintain reputation, satisfy regulators' demands, etc.), but under the existing approach neither utilities nor customers can be expected to be firmly committed to reducing the aggregate usage of electricity. In fact, many utilities would be lowering their short-term return on investment and risking their ability to recover the capital costs of their investment in generation plants if they induced meaningful aggregate demand reduction among their residential or business customers. Aware of this implication of NDR, the American Public Power Association has warned, "[a] reduction in sales . . . leads to a greater reduction in revenues than in costs, and potentially can threaten a utility's financial health."[70] The history of utility efficiency and conservation programs around the country—highly touted programs that are not designed or implemented to exploit the full potential for household demand reduction, as opposed to programs and innovations designed to "go viral" among customers or reduce electricity use on a widespread basis—reflects this mixed incentive.[71]

---

associated with energy efficiency . . . (DSM) programs."). *But see id.* ("Our results suggest that the evidence for rejecting utility estimates of DSM savings and costs should be re-interpreted.").

E. NDR and Incentives for Alternative Supply Options

Similar issues arise regarding generation of electricity at the household level. Penetration of renewables into power supply is unlikely to occur if electric distributors lack incentives to permit, much less actively encourage, substantial increases in the supply of household-generated electricity.[72] As a general rule, investments in alternative supply options are not consistent with volumetric rates, such as investments in distributed renewable generation by either consumers or nonutility firms. The historic emphasis on promoting low rates influences how regulated utilities and regulators view the risks associated with infrastructure investments in power production and delivery, reinforcing an industry-wide approach to planning and building power generators that favors base load plants over renewable projects.

Small-scale, low-carbon energy projects (such as household solar photovoltaic installation) share many characteristics with household efficiency and conservation since they reduce the demand for centralized generation and transmission by supplying energy onsite. As with efforts to reduce demand, renewable energy scholars have noted that the process of installing household renewable generation systems must become routine if these systems are to make a substantial contribution to the supply of low-carbon energy.[73] Yet firms and regulators have a strong preference for base load generators over renewable plants, because investments in base load plants (which tend to be large-scale nuclear and coal plants, or hydro facilities) can be justified as providing power on a reliable basis twenty-four hours a day.[74]

Diversification of electric power generation towards renewable resources is especially responsive to reductions in demand because most renewable resources deploy at a smaller scale and do not immediately scale up the way traditional fossil fuel plants do. To the extent these renewable sources reduce a customer's demand and this effect is multiplied across all customers on a utility's network, this

72. *See generally* Joel B. Eisen, *Residential Renewable Energy: By Whom?*, 31 UTAH ENVTL. L. REV. 339, 339–40 (2010) (discussing the importance of incentives to overcome the current distributional status quo of utilities).

73. *See, e.g.*, *id.* at 340 (discussing the need for "routinization" of household solar services).

74. Fuel storage *after* generation, a serious problem that plagues nuclear generation, is an issue beyond the scope of this Article.

total reduction in demand can offset the need for larger scale investments in base load fossil plants and transmission facilities.[75]

A formidable obstacle to this kind of penetration for renewable energy is that the conventional approach to planning and building base load power plants assumes that the statistical certainty that customers are able to receive reliable power twenty-four hours a day is a requirement for every generation unit. That approach keeps both regulators and distribution utilities from valuing smaller-scale distributed renewable facilities. Once built, a base load unit will operate most efficiently at or near its capacity level. The large capital investment in a base load plant can crowd out alternative sources of electricity supply as utility engineers make decisions to dispatch individual plants to meet demand at the margin, and operation of a base load plant will typically be most efficient where it is working at or near capacity. Also, expanded transmission, once built, creates an incentive for utilities to wheel in the lowest-cost power options from the wholesale market, which will tend to be from base load plants. Although some of these plants are low-carbon nuclear plants, most of the power generated at these plants is drawn from coal-fired generators.

Instead of evaluating the statistical certainty of reliability plant-by-plant, an alternative approach views reliability as a characteristic of the power system as a whole. For example, a widespread network of renewable resources could provide a stable and predictable source of electricity without expanding transmission or the number of base load power plants.[76] Interconnected and redundant smaller-scale generators, including distributed renewable projects, can serve as a type of insurance against reliability interruptions. Moreover, viewing reliability at the systems level allows demand reduction to play a role as a mechanism for enhancing reliability. Power engineers who operate the grid on a daily basis for regional transmission systems already see their risk management challenge from the perspective of the complete mix of power generation options, rather than focusing on reliability as a feature of an individual power

75. Terms such as "demand" and "energy" are terms of art among utility regulators, especially in the ratemaking process. For them, "demand" frequently refers to the capacity designed to meet customer peaks. "Energy" often refers to the fuel costs associated with deploying demand to serve particular customers. In this Article we use the terms in a more conventional manner, consistent with lay and economic understandings of demand.

76. For an example of how a combined heat and power natural gas distributed generation can produce similar system benefits, see DRAGOLJUB KOSANOVIC & CHRISTOPHER BEEBE, CTR. FOR ENERGY EFFICIENCY & RENEWABLE ENERGY, SYSTEM WIDE ECONOMIC BENEFITS OF DISTRIBUTED GENERATION IN THE NEW ENGLAND ENERGY MARKET (2005), *available at* http://ceere.org/iac/pubsdownloads/DG%20Benefits%20Report.pdf.

plant. Despite this, for the firm, rather than a larger regional system operator, the dominant approach to building and planning power plants conflates an individual firm's business risks with the risks of reliability interruptions, leading firms to invest in overcapacity, large-scale power plants, and transmission as the main mechanisms for reliability enhancement. This preference for overcapacity fits with the history of most electric power investments in the twentieth century, which were primarily base load plants. Low customer rates financed these investments, as accompanying demand growth provided a predictable source of revenue to protect the firm's large-scale investment risks and encouraged firms to conflate minimizing reliability risks with minimizing business risks associated with potential revenue decreases. As wholesale markets have evolved, and day-to-day operation decisions about the grid are increasingly made by power system operators, the separation between the operational decisions regarding the grid as a system and the investment decisions of the firm have become even greater.

The preference for low rates and their accompanying base load plant investment cycle is not a purely private phenomenon. By emphasizing volumetric rates, public regulators' ratemaking practices for most distribution utilities reinforce a consumption mentality that takes supply for granted. By focusing primarily on low per-unit rates, utilities can get what they are incentivized to want: the appearance of responsiveness to consumers along with growing total payments from consumers to utilities. And the public utility commissions ("PUCs") and consumer groups can say they are delivering what consumers want, but that is only true if the issue is framed as low rates, not low bills. Volumetric rates help keep per-unit prices low and encourage firms to sell as much electricity as possible, rather than increase price and decrease unit sales. They are also consistent with the idea of keeping per-customer demand charges low; investing in base load capacity leads to high "demand" charges on bills (the portion of fixed costs allocated to customers), so that once such investments are made, the base load cycle is reinforced by regulators allocating demand charges plus energy charges on a per-unit basis. By keeping energy charges low, this increases per-unit consumption and also increases overall bills.

III. POTENTIAL SOLUTIONS

This is a propitious time for state and local regulators to take the aggregate demand for electricity seriously in their policy initiatives and to examine new approaches to overcome the conceptual and practical barriers to NDR. In 2011, five years after DOE's initial report on demand response, DOE and the Federal Energy Regulatory Commission ("FERC") issued a new report calling for a national demand response policy, responding in part to Congress's request in the Energy Independence & Security Act ("EISA") in 2007.[77] In contrast to previous demand response efforts, in the new report DOE and FERC promote a greater federal role in demand response efforts, including development of tools and templates to assist states in demand response initiatives.[78]

Memorializing such efforts, FERC's landmark new rule on demand reduction provides wholesale utilities with incentives to reduce their demand for electricity,[79] an approach that FERC Chairman Wellinghoff has referred to as the "killer application" for the electric power industry.[80] This approach could introduce incentives for demand reduction for the largest-scale transactions, but whether it will lead to reductions in actual customer demand will depend on the responses of individual utilities in the pricing of retail sales to customers. We see two particular impediments, however, to current federal demand response policy fully realizing its potential. The first is a lack of a carbon-pricing apparatus, which we discuss further below. The second is that, even if federal efforts to address demand are well intended, the retail sales of electric distribution utilities remain regulated by states, not FERC. To the extent retail utilities still have strong volumetric sales incentives, as they do in most jurisdictions, any attempt at wholesale demand reduction will be muted. The scope of the federal jurisdiction to address demand for electric power is limited,[81] and many demand response solutions remain vague.

We examine three policy options that are being deployed to address the demand growth problem: (1) social cost approaches such

79. Demand Response Compensation in Organized Wholesale Energy Markets, 76 Fed. Reg. 16,658, 16,678 (Mar. 24, 2011) (to be codified at 18 C.F.R. pt. 35).

80. Kate Galbraith, *Dimming the Lights to Meet Demand*, N.Y. TIMES GREEN BLOG (Apr. 17, 2009, 8:02 AM), http://green.blogs.nytimes.com/2009/04/17/dimming-the-lights-to-meet-demand/.

81. The FERC's jurisdiction extends only to wholesale power supply transactions, and states retain jurisdiction over retail sales to customers. For discussion of the limited jurisdiction FERC has in implementing demand response, see Richard J. Pierce, *A Primer on Demand Response and a Critique of FERC Order 745*, 3 GEO. WASH. J. ENERGY & ENVTL. L. 102, 105–06 (2012) (noting that the FERC has limited ability to overcome the reluctance of states to adopt retail systems that will create appropriate incentives and pass the savings of demand response on to customers).

as carbon pricing; (2) performance standards such as demand reduction mandates; and (3) decoupling initiatives. We conclude that a combination of all three approaches will be necessary to overcome the long history of financial incentives created by volumetric pricing and the accompanying mindset that limits utility, consumer, and PUC commitment to NDR. Embracing all three policies would recognize that electricity distribution utilities should not be viewed as simply selling electricity to customers, but as providing a service that produces positive social and economic value for the energy system. Energy services may actually include selling technologies or services that enable the sale of less electricity. Such a model holds promise to induce demand reduction, in the form of both improved efficiency and conservation, by creating positive value for firms. Large, sophisticated customers, such as large industrial consumers of electricity, already know that it is in their interest to focus on demand reduction. They have strong incentives to invest in demand reduction, and many have already taken the initiative to reduce their demand.[82] Smaller-scale household customers achieve less obvious benefits (they have lower energy costs), but as the discussion in Part II.A demonstrates, the collective benefit of all customers reducing demand is substantial. The energy services business model would have far-reaching implications for utility decisions that affect NDR.

A. Carbon Pricing and Social Cost Approaches to Demand Reduction

The emphasis of volumetric pricing on low rates provides little incentive for utilities and customers to pay attention to the carbon impacts of energy use. The commonplace policy solution to environmental externalities such as carbon emissions focuses on internalizing social costs by making them private. In theory, the optimal policy instrument is a carbon tax. Such a tax would increase the cost of producing and selling electricity from high-carbon fuels, encouraging firms and customers to adjust their energy production and use in response to prices that fully reflect the social cost of carbon emissions. In the electricity context, high prices for electricity generated from high-carbon fuels would make alternative supply options, such as renewable energy, more attractive, and would lead to reductions in demand by consumers. Yet a national carbon tax or cap-and-trade system is unlikely to be adopted and implemented in the

82. This is because energy costs for larger customers will be greater, producing greater dollar savings per individual customer. Any expensive meters or energy audits will be more affordable to larger customers with cash flow, such as businesses, which also face competitive pressure to reduce their energy costs as much as possible.

United States in the near term. Failure to bend the carbon curve during this time will mean not only greater stocks of carbon in the atmosphere, but substantial growth in annual carbon emissions and the possibility of passing tipping points in the climate system.[83]

Even though adoption of a national carbon tax or cap-and-trade system is unlikely in the near term, however, state regulators may be able to internalize the social costs of carbon indirectly if they reengineer the ratemaking process to emphasize the actual costs of carbon emissions rather than the private market costs of supplying electricity. A social cost approach could readily fit within the existing process by which state regulators determine utility rates based on the cost of service. Now that the Office of Management and Budget has established a range for the social cost of carbon,[84] designing an electricity rate to be welfare enhancing could readily incorporate the social cost of the carbon emitted from the generation of the electricity.[85] If state utility regulators were to price carbon emissions and build them into utility rates as a cost, it would produce higher per-unit rates.

The effect would be twofold: customers would have incentives to use less electricity as the per-unit price goes up, and utilities would have incentives to invest in reducing demand for fossil fuel–generated electricity. Even if the current measure of carbon costs is not precise, utility regulators have mechanisms at their disposal to true up adjustments as new information is gathered in the future. For

83. *See* Vandenbergh & Gilligan, *supra* note 28, at 403–04 (discussing tipping points and feedback effects in the climate system).

84. The social cost of carbon is the present value of future damages caused by one metric ton of greenhouse gas emissions; the working group that calculated the social cost of carbon produced a range of $5 to $65 per metric ton, with $21 per metric ton as the central figure of analysis. INTERAGENCY WORKING GRP. ON SOC. COST OF CARBON, U.S. GOV'T, APPENDIX 15A, SOCIAL COST OF CARBON FOR REGULATORY IMPACT ANALYSIS UNDER EXECUTIVE ORDER 12866, at 3 (2010), *available at* http://www1.eere.energy.gov/buildings/appliance_standards/commercial/pdfs/smallmotors_tsd/sem_finalrule_appendix15a.pdf. There is reason to believe that the range of social costs of carbon generated through the OMB process does not fully reflect the tail risks that many climate scientists have identified. *See* Jonathan S. Masur & Eric A. Posner, *Climate Regulation and the Limits of Cost-Benefit Analysis*, 99 CALIF. L. REV. 1557, 1581 (2011) ("[T]he IWG's recommendations are not adequately defended. Many of its errors are likely errors of underestimation: it is likely that the IWG does not incorporate all the potential harms of global warming, and thus underestimates the benefits of curbing emissions.").

85. For commentary on the working group results and process, see Jody Freeman & Andrew Guzman, *Climate Change and U.S. Interests*, 41 ENVTL. L. REP 10695, 10721–23 (2010); Douglas A. Kysar, *Politics by Other Meanings: A Comment on "Retaking Rationality Two Years Later"*, 48 HOUS. L. REV. 43, 57–66 (2011); Vandenbergh & Gilligan, *supra* note 28, at 406–07. For a discussion on the prevalent approach to evaluating discount rates for cost-benefit analysis of climate change mitigation efforts, see generally Richard L. Revesz & Matthew R. Shahabian, *Climate Change and Future Generations*, 84 S. CAL. L. REV. 1097 (2011).

example, based on the likelihood of error in carbon cost calculations, regulators could contribute a percentage of the cost to a trust fund, which would allow for adjustments in the future as new information about carbon impacts is processed.

We favor such an approach, but we think it also is not politically feasible in the near term and is unlikely to be a complete solution to the problem. Increasing utility rates to reflect social costs, rather than business costs, is likely to be politically unpopular at the state and local level, where a populist consumer protection message dominates in the rate-setting process and focuses on near-term consumer pecuniary interests, not long-term consumer welfare. The political appeal of a decentralized, state-centric approach to adopting implicit carbon pricing in ratemaking varies geographically, and opposition to carbon regulation appears strongest in states that use the most carbon-intense fuels.[86] Moreover, using a state ratemaking process to impose a carbon tax implicitly does not guarantee changes in generation choices if utilities simply pass that cost through to customers and increase their own profits rather than invest in lower-carbon power sources. Given the strong financial incentives that attract firms to large-scale base load sources of energy, use of carbon-intensive fuels is likely to continue at high levels without some kind of supplemental regulatory approach designed to change firm investment decisions. A carbon-pricing approach, if adopted in isolation, thus does not guarantee changes in the supply of new low-carbon electricity sources and places its bet almost entirely on a hope that the demand for electricity is elastic.

A more feasible approach would be for PUCs to be more mindful of social costs in evaluating utilities' investments in NDR during the ratemaking process. Efforts to reduce demand may require the expenditure of dollars by utilities, and thus regulators will need to determine whether NDR investments (e.g., investments in infrastructure such as metering and other energy efficiency services) are prudent or cost effective. A social cost approach to evaluating NDR would not only be attentive to NDR's costs but also would recognize its benefits, including its potential for reductions in carbon emissions over the fuel cycle of various sources of electricity. This would require regulators to take a broader approach to assessing the cost effectiveness of various utility investments and fuels than occurs with the current emphasis on volumetric rates and near-term consumer protection goals. Many states use a rate impact measure ("RIM") test

86. *See, e.g.*, Felicity Barringer, *Climate Legislation Sends Chill Through Areas Fueled by Coal*, N.Y. TIMES, Apr. 9, 2009, at A17.

to evaluate the prudency of investments in DSM, examining the overall effect of DSM investments on customer rates. The RIM approach encourages overinvestment in the kind of DSM that is at odds with NDR and with carbon-pricing strategies that may be adopted in the future.[87]

States should consider and evaluate the use of alternative tests for investments in NDR, focusing on total resource costs or societal costs in comparing NDR investments to their alternatives.[88] Such approaches might assess the cost effectiveness of NDR from a larger system perspective, taking into account positive environmental externalities associated with these investments, including the cost of the full fuel cycle for alternative approaches to generating electricity.[89] Even if regulators do not price carbon in ratemaking, if they begin to look at carbon impacts in evaluating the cost effectiveness of various investments, this could improve firms' ability to evaluate the risks of reliability from a systems perspective, could provide a way out of the current overemphasis on base load plants, and could make NDR a more appealing option to utilities.[90]

---

87. As discussed in Part II, it is important to highlight that the current energy policy emphasis at the federal and state levels on smart meters does not adequately confront the problem, and may even reinforce it. Smart meter technology holds promise to give customers information about their power usage to influence when and how they use energy. *See* Vandenbergh, Carrico & Bressman, *supra* note 24, at 739 ("Behavioral research on household responses to energy information suggests that a proposal to install smart meters that simply provide feedback to household energy users might have yielded substantial use reductions . . . ."). Many smart meter discussions to date are limited to load-shifting strategies such as critical-peak pricing, however, and do not focus on communicating real-time information to customers about electricity use and its carbon implications. *See id.* at 739, 739 n.97 (discussing the rejection of a smart meter program in Maryland linked directly to demand peak pricing and the recognition that the success of such initiatives depends on customer education and communication). Research shows that the types of information that can be gathered and disclosed to the consumer through smart meter programs can reduce electricity use by 5.5% to 14%. *See* EHRHARDT-MARTINEZ ET AL., *supra* note 53, at 48 ("[M]edian household savings vary from 5.5% for programs that employ enhanced billing strategies to 14% for those that provide real-time feedback disaggregated by energy end use."). *See generally* Ahmad Faruqui & Jenny Palmer, The Discovery of Price Responsiveness—A Survey of Experiments Involving Dynamic Pricing of Electricity 1, 11 (Mar. 12, 2012) (unpublished manuscript), *available at* http://ssrn.com/abstract=2020587 (surveying 126 pricing experiments with dynamic pricing and time-of-use pricing of electricity to show that "the presence of enabling technology allows customers to increase their peak reduction").

88. For example, Florida law requires the Florida Public Service Commission to contract for an independent evaluation of the Florida Energy Efficiency and Conservation Act ("FEECA") to determine if the Act remains in the public interest, including whether it is cost effective in reducing peak demand and overall consumption. 2012 Fla. Laws 117.

B. Performance Standards for Demand Reduction

Another option for state regulators is to mandate that the electric distribution utility reduce demand by specific amounts or that it spend specific amounts on demand reduction activities.[91] Roughly twenty states have mandated reductions in overall demand, including Maryland and New York.[92] Many of these mandates emphasize efficiency improvements, which can be realized in power supply investments or at the customer level, but they also include efforts to encourage conservation. The strength of these approaches is that they provide clear, unequivocal direction to a utility that might otherwise be tempted by volumetric rates to favor investing in large-scale base load plants over reducing demand.

These approaches do not confront the underlying problem of utility incentives, however, and thus are unlikely to lead to widespread change. Under the mandated reductions approach, utilities may comply with the mandate at the cost of pursuing other desirable goals such as investment in renewable projects. Perhaps most important, utilities may have incentives to lobby against large mandated reductions and may lack incentives to exceed the mandates. As a result, utilities cannot be expected to be subject to aggressive targets or to exceed the targets that are set. Similarly, under the mandated spending approach, to the extent the utility's revenues are derived from its volume, it does not have an incentive to spend more than the mandated amount or to spend the funds any more effectively than necessary to satisfy regulatory oversight. In short, utilities lack incentives for innovation and for exceeding minimum standards.

As a modest alternative, state policymakers might consider merging demand reduction performance standards into other policy tools to promote innovation in NDR at the state and local level. A clean energy standard, such as that favored by the Obama Administration, differs from a state renewable power standard ("RPS") in that it does not focus entirely on power supply but allows efficiency and conservation to compete with energy supply options on a one-to-one basis. Many states already allow conservation and efficiency savings to qualify as a type of renewable energy for an RPS or renewable energy credit purposes, although some of these states

---

COMMISSIONERS AND ADVOCATES 25–27 (2012) [hereinafter ENERGY EFFICIENCY HANDBOOK], *available at* http://www.smartgridnews.com/artman/uploads/1/PUC_Handbook_August_2012.pdf (contrasting rate impact measures with other approaches to analyzing energy efficiency programs, including the total resource cost test).

91. This approach is discussed in ENERGY EFFICIENCY HANDBOOK, *supra* note 90, at 46–47.

92. *See* ARIMURA ET AL., *supra* note 57, at 2.

discount the value of conservation and efficiency.[93] If the goal is NDR, there is no reason for discounting the value of conservation and efficiency, given that these can be even more valuable than investments in renewable projects. Indeed, such an approach could have broader appeal than an RPS, and it may be attractive to some additional state legislatures for the same reasons that an RPS originally was—the promise of jobs and new technologies.

However, any benefits of these more modest approaches as compared to a stand-alone NDR mandate would be limited. Even if NDR is compared one to one with investments in renewable energy, this will place NDR in direct competition with renewable investments, which will undermine the ability to reduce overall fossil fuel use. Perhaps there is a natural limit on the combination of NDR and renewable energy that any jurisdiction will tolerate, but this seems unlikely, at least in the near term. Moreover, since many renewable resources also qualify for both state and local tax credits, and few NDR initiatives enjoy such subsidies, unless these programs focus heavily on explicit NDR goals they are likely to produce underinvestment in NDR.

C. Revenue Decoupling and Shared Savings in Demand Reduction

Neither the social cost of carbon nor the performance mandate approach acknowledges the principal issue of how the distribution utilities sell power. Addressing how utilities sell power is the only solution that simultaneously confronts how volumetric pricing has contributed to utilities' strong preference for investments in base load and to the preference among policymakers for low rates and increasing use. This is also the only approach that has the prospect of inducing levels of management attention, staffing, innovation, and investment in demand reduction that are comparable to the utilities' investments in increasing revenue under a volumetric-pricing regime. "Revenue decoupling" initiatives separate a distribution utility's revenues from its incentives to increase the amount of power it sells to customers.[94] These decoupling programs may be the best way to

---

93. For a discussion on the need for a national RPS, see generally Lincoln L. Davies, *Power Forward: The Argument for a National RPS*, 42 CONN. L. REV. 1339 (2010). *See also* American Clean Energy and Security Act, H.R. 2454, 111th Cong. § 610(f)(1)(A) (2009) (calling for the FERC to "specify the types of energy efficiency and energy conservation measures that can be counted" when defining and measuring electricity savings).

94. The term "decoupling" is loaded with different meanings depending on the policy context. In discussion about competition in electric power, "decoupling" might be taken to mean the separation of distribution and generation. "Bundled" rates, reflecting the costs of generation, transmission, and distribution are offered in many states (e.g., Tennessee and Florida). These

ensure that utilities have ongoing incentives to develop, fund, and implement highly effective efficiency and conservation measures. Decoupling has been adopted, in varying forms and degrees, by roughly twenty states, although many of these states have not adopted decoupling in a form that is likely to create ongoing incentives for NDR.[95] The American Recovery and Reinvestment Act also included language that promoted but did not require state adoption of revenue decoupling.[96]

Revenue decoupling can be implemented through a variety of policy instruments.[97] A common approach is a type of "decoupling lite" that provides for lost revenue adjustments designed to compensate utilities for lost revenue and presumably make them neutral between lost sales and new investments.[98] These approaches remove disincentives for NDR, but they do not create incentives to achieve NDR. More proactive approaches to decoupling offer utilities affirmative incentives for retail demand reduction. For example, some regulators offer utilities incentives by rewarding them post sale for NDR savings associated with conservation and efficiency. If a utility

differ from the unbundled prices customers are offered in states with retail choice (e.g., Texas), where an electric distribution utility provides distribution lines and the meter, and it simply passes through the cost of the power from generators. In these types of jurisdictions, in a sense the distributor has been "decoupled" from the generator. We choose to call this unbundling, and our emphasis is on a different kind of decoupling, what we call "revenue decoupling." For a discussion on the different degrees of decoupling, see THE REGULATORY ASSISTANCE PROJECT, REVENUE REGULATION AND DECOUPLING: A GUIDE TO THEORY AND APPLICATION 11–13 (2011). For a recent analysis of decoupling in the economics literature, see TIMOTHY J. BRENNAN & KAREN PALMER, RES. FOR THE FUTURE, ENERGY EFFICIENCY RESOURCE STANDARDS: ECONOMICS AND POLICY (2011), *available at* http://www.rff.org/RFF/Documents/RFF-DP-12-10.pdf.

95. *See Decoupling Policies*, CTR. FOR CLIMATE AND ENERGY SOLUTIONS, http://www.c2es.org/sites/default/modules/usmap/pdf.php?file=7016 (last updated July 5, 2012) (identifying the states that have adopted decoupling measures); *see also Decoupling in Detail*, CTR. FOR CLIMATE AND ENERGY SOLUTIONS, http://www.pewclimate.org/what_s_being_done /in_the_states/decoupling_detail (last visited Sept. 6, 2012) (explaining the general issues of revenue decoupling in energy markets using electricity-specific examples). For a recent article that is skeptical of decoupling approaches, see Brian S. Tomasovic, *Revenue Decoupling for Electricity Distributors: Current Approaches and Future Outlook*, 6 TEX. J. OIL, GAS, & ENERGY L. 176, 180–82 (2010-2011). *See also* Shannon Baker-Branstetter, *Distributed Renewable Generation: The Trifecta of Energy Solutions to Curb Carbon Emissions, Reduce Pollutants, and Empower Ratepayers*, 22 VILL. ENVTL. L.J. 1, 19 n.113 (2011); Davies, *supra* note 93, at 1356. Both show a lack of enthusiasm for the effects of decoupling measures.

96. American Recovery and Reinvestment Act, Pub. L. No. 111-5, § 410, 123 Stat. 115, 147 (2009); *see also* Tomasovic, *supra* note 95, at 177 (noting that the final version of the bill softened any pressure on states to "adopt or experiment with decoupling measures" in order to receive $3.1 billion in state grants).

97. For further discussion of revenue decoupling, see ENERGY EFFICIENCY HANDBOOK, *supra* note 90, at 31–35.

98. *Id.* at 33 (noting that this approach has been critiqued for failing to remove utility incentives to invest in supply-side resources and being subject to strategic gaming by utilities).

meets some annual NDR target, regulators might provide that firm a more beneficial rate of return in approving its rates. Or if the utility fails to meet an annual NDR target, regulators might penalize the firm by reducing its rate of return. This approach directly incentivizes the firm to focus on NDR in its business decisions.[99]

Another approach, akin to the social cost approach discussed above, is to build the benefits from NDR more directly into the pricing of electricity by directly decoupling revenue from sales prior to the point of sale. For example, firms could explicitly propose to produce "negawatts" (basically, a reduction in capacity corresponding to a decrease in demand) and could be compensated for the costs of the negawatts in the same way they are compensated for building a new power plant or expanding the plant's operation. The costs might include the opportunity cost of lost sales, since the firm might suffer some short-term financial losses due to demand reduction. The basic point is that if negawatt investments are built into a utility's rate base, competing side by side with alternatives such as building a new power plant, this will challenge the firm to consider NDR along with base load power options in its business decisions.

Whatever policy instrument is chosen as a vehicle for implementing it, revenue decoupling rejects the conventional emphasis on volumetric rates. Decoupling also has important implications for changing firm behavior and consumer perceptions; when revenue is decoupled from sales, it can be recoupled to some other goal, such as improved efficiency or the climate change benefits from NDR. With decoupling, firms are less likely to focus on investing in base load power plants and allocating these costs among customers, a cycle that volumetric rates reinforce. For electric distribution utilities, building new base load capacity would no longer be seen as the only guaranteed revenue source. Investing in conservation and efficiency programs would now be seen as equally significant to the bottom line of the firm.

With revenue decoupling, customers also are less likely to focus on low rates, especially if firms offer incentives to reduce energy usage in order to share in the rewards of NDR. This can be viewed as a type of "decoupling-plus."[100] Shared savings programs such as the decoupling-plus approach adopted in California have analogues in

---

99. For an example based on an experience in Idaho, see Ralph Cavanagh, *Graphs, Words, and Deeds: Reflections on Commissioner Rosenfeld and California's Energy Efficiency Leadership*, INNOVATIONS, Fall 2009, at App. (paid subscription required).

100. *See* Sachs, *supra* note 8, at 316 (discussing California's efforts to supplement decoupling and characterizing this effort as a type of shared savings).

health care regulation and can take many forms.[101] For example, a decoupling approach might invite nonutility energy services firms to sell demand reduction or efficiency directly to consumers (e.g., Energy Service Companies or "ESCOs" at the industrial, small business, and household scales). Large industrial and commercial customers have achieved substantial savings from the use of ESCOs. A collective action problem, however, discourages the spread of the ESCO approach to small businesses and residential customers. Once the savings are aggregated, they may be large enough to make it attractive to invest in the services they provide, which again highlights the significance of the utility's selling power.

Revenue decoupling has strengths and weaknesses in terms of political viability and policy implications. Many details need to be resolved, including how incentives are allocated between utilities and customers and who will pay for NDR. Still, revenue decoupling ultimately merits serious consideration alongside both social cost and performance standard approaches to demand reduction. It also has advantages over alternative approaches. One advantage is that it is the only option that directly confronts both the low-rate approach of volumetric pricing and the reliability approach that favors investments in base load plants by utilities. Revenue decoupling

101. Health care regulators confront a comparable problem: how to create incentives for hospitals and doctors to sell less of their product—health care. They have turned to the shared savings model as well. For example, the Accountable Care Organization Demonstration Project ("ACO"), established by the Patient Protection and Affordable Care Act, is a new Medicare program designed to achieve quality and savings improvements in healthcare by efficiently coordinating primary care doctors, specialists, hospitals, and other providers. News Release, Dep't of Health and Human Servs., HHS Announces New Incentives for Providers to Work Together Through Accountable Care Organizations When Caring for People with Medicare (Oct. 20, 2011), *available at* http://www.hhs.gov/news/press/2011pres/10/20111020a.html. The coordinating providers are encouraged to participate in the program through a shared savings model. *See* Mark McClellan et al., *A National Strategy to Put Accountable Care into Practice*, 29 HEALTH AFF. 982, 983–84 (2010), *available at* http://content.healthaffairs.org/content/29/5/982.abstract (noting that the ACO model builds on similar shared savings initiatives that Medicare has implemented in the past several years). The Patient Protection and Affordable Care Act states that "the Secretary shall establish a shared savings program . . . that promotes accountability for a patient population and coordinates items and services . . . and encourages investment in infrastructure and redesigned care processes for high quality and efficient service delivery." 42 U.S.C. § 1395jjj(a)(1) (2011). Eligible providers may opt into the ACO program but they must "be willing to become accountable for the quality, cost, and overall care of the Medicare fee-for-service beneficiaries assigned to it." *Id.* § 1395jjj(b)(2)(A). Under the ACO program, the Secretary sets savings benchmarks based on "average per capita Medicare expenditures . . . adjusted for beneficiary characteristics" and also sets "quality performance standards to assess the quality of care furnished by ACOs." *Id.* § 1395jjj(b)(3)(c)–(d)(1)(b). However, "ACOs will only share in savings if they meet both the quality performance standards and generate shareable savings." 76 Fed. Reg. 67,801, 67,804 (Nov. 2, 2011) (to be codified at 42 C.F.R. pt. 425).

provides an opportunity to address incentives for some customers and to allow them to share in the savings. Decoupling also may be the only option that is likely to overcome utilities' emphasis on volumetric rates and on investment in base load plants, as well as the emphasis among PUCs on low consumer rates, as opposed to low total consumer expenditures.

IV. CONCLUSION

For many decades, the goal of efficient provision of supply based on an assumption of continued demand growth was considered sacrosanct in utility regulation. An emerging new approach focuses on reducing externalities from supply, challenging the longstanding assumption of demand growth on which many regulatory solutions have been built.[102] Assumed growth in demand limits how firms and regulators see their options in approaching low-carbon sources of supply.

A full transformation in the scholarship and the industry may not occur until a new generation of scholars and decisionmakers are in place who view the electricity regulatory goal not simply as a matter of efficient supply, with efficiency narrowly defined to exclude consideration of effects that are not priced, such as carbon emissions. But initial movement is underway. In recent years, a growing literature has examined how a combination of legal, economic, and social influences can reduce the growth in energy demand.[103] This literature suggests that the demand side of the equation is as important as the supply side, but this literature has focused largely on the incentives of households and other consumers, not on the incentives of utilities, the key gatekeepers for demand reduction.

Our logic is simple. The scientific consensus is that catastrophic climate change poses a genuine threat and that substantial reductions in global carbon emissions are necessary over the next several decades. Energy supply accounts for by far the largest source of carbon emissions. Energy experts project that global energy demand will double by 2050 if we follow the business-as-usual path.

---

102. This is occurring with water supply and demand as well. *See* Gleick, *supra* note 37, at 1525–26 (discussing a new approach to water services that shifts focus away from decades of inconsistent demand projections to one that relies on the users' needs).

103. *See generally* Dernbach, *supra* note 8, at 10003 (evaluating a range of legal and policy tools to promote greater efficiency and conservation of energy in the United States); Vandenbergh & Steinemann, *supra* note 8, at 1674–75 (relying on norms theory and empirical studies to propose legal reforms for reducing individual contributions to greenhouse gas emissions).

Energy experts also suggest that major carbon emissions reductions are possible from a variety of low-carbon and non-carbon-emitting sources, but that it is unrealistic to assume that these sources will be able to displace existing fossil fuel sources and keep up with the anticipated growth in energy demand. Some miraculous technological fix could solve this problem, but energy experts are doubtful that this will occur. The physics of energy and the scope of the energy infrastructure are such that a single miraculous breakthrough or group of breakthroughs is unlikely to occur and to be deployed at the scale and in the time necessary.[104]

Something has to give. Countries will either miss their carbon emissions targets (and hope the consensus targets were too conservative), or they will need to invest in reducing demand as well as increasing the supply of low-carbon energy sources. For the most part, the United States has focused on the supply side. Regulators and firms have made some investments in low-carbon energy supply and have taken occasional steps to reduce demand, but they have not treated demand reduction as a priority at the federal level or in many states and localities.

We argue not only that legal and policy interventions can affect demand growth, but also that policymakers should recognize the important gatekeeping role that utilities play for the uptake of various efficiency and conservation measures. Electricity distributors alone probably cannot induce households to achieve an adequate level of NDR, but they are an essential intermediary. Yet in most U.S. jurisdictions, electricity distributors lack the financial incentives to achieve widespread success with NDR programs. Instead, the regulatory structure induces these utilities to view NDR as revenue erosion. Programs that provide financial or social incentives for households to reduce demand will not achieve their potential if electricity distributors do not consistently face incentives to sell less electricity—or at least no longer face incentives to sell more electricity to finance their base load plant investments.

Many law and policy options are available for shifting utilities' incentives to induce reduced household energy demand. We do not believe the choice of a specific regulatory intervention is as important as the conceptual shift toward recognizing the need to treat NDR as an important goal and to provide ongoing incentives for utilities to pursue NDR with gusto. Once regulators and firms begin to make the conceptual shift, the policy debate is more likely to yield productive

104. *See, e.g.*, Nathan Lewis, *Toward Cost-Effective Solar Energy Use*, 315 SCIENCE 798, 798–801 (2007) (discussing the challenges facing the widespread implementation of solar energy).

regulatory changes. To the extent regulatory changes are possible, some mix of shared savings and other approaches may create sufficient incentives for utilities to view demand reduction not as "good for you, bad for us," but as "good for you, good for us."

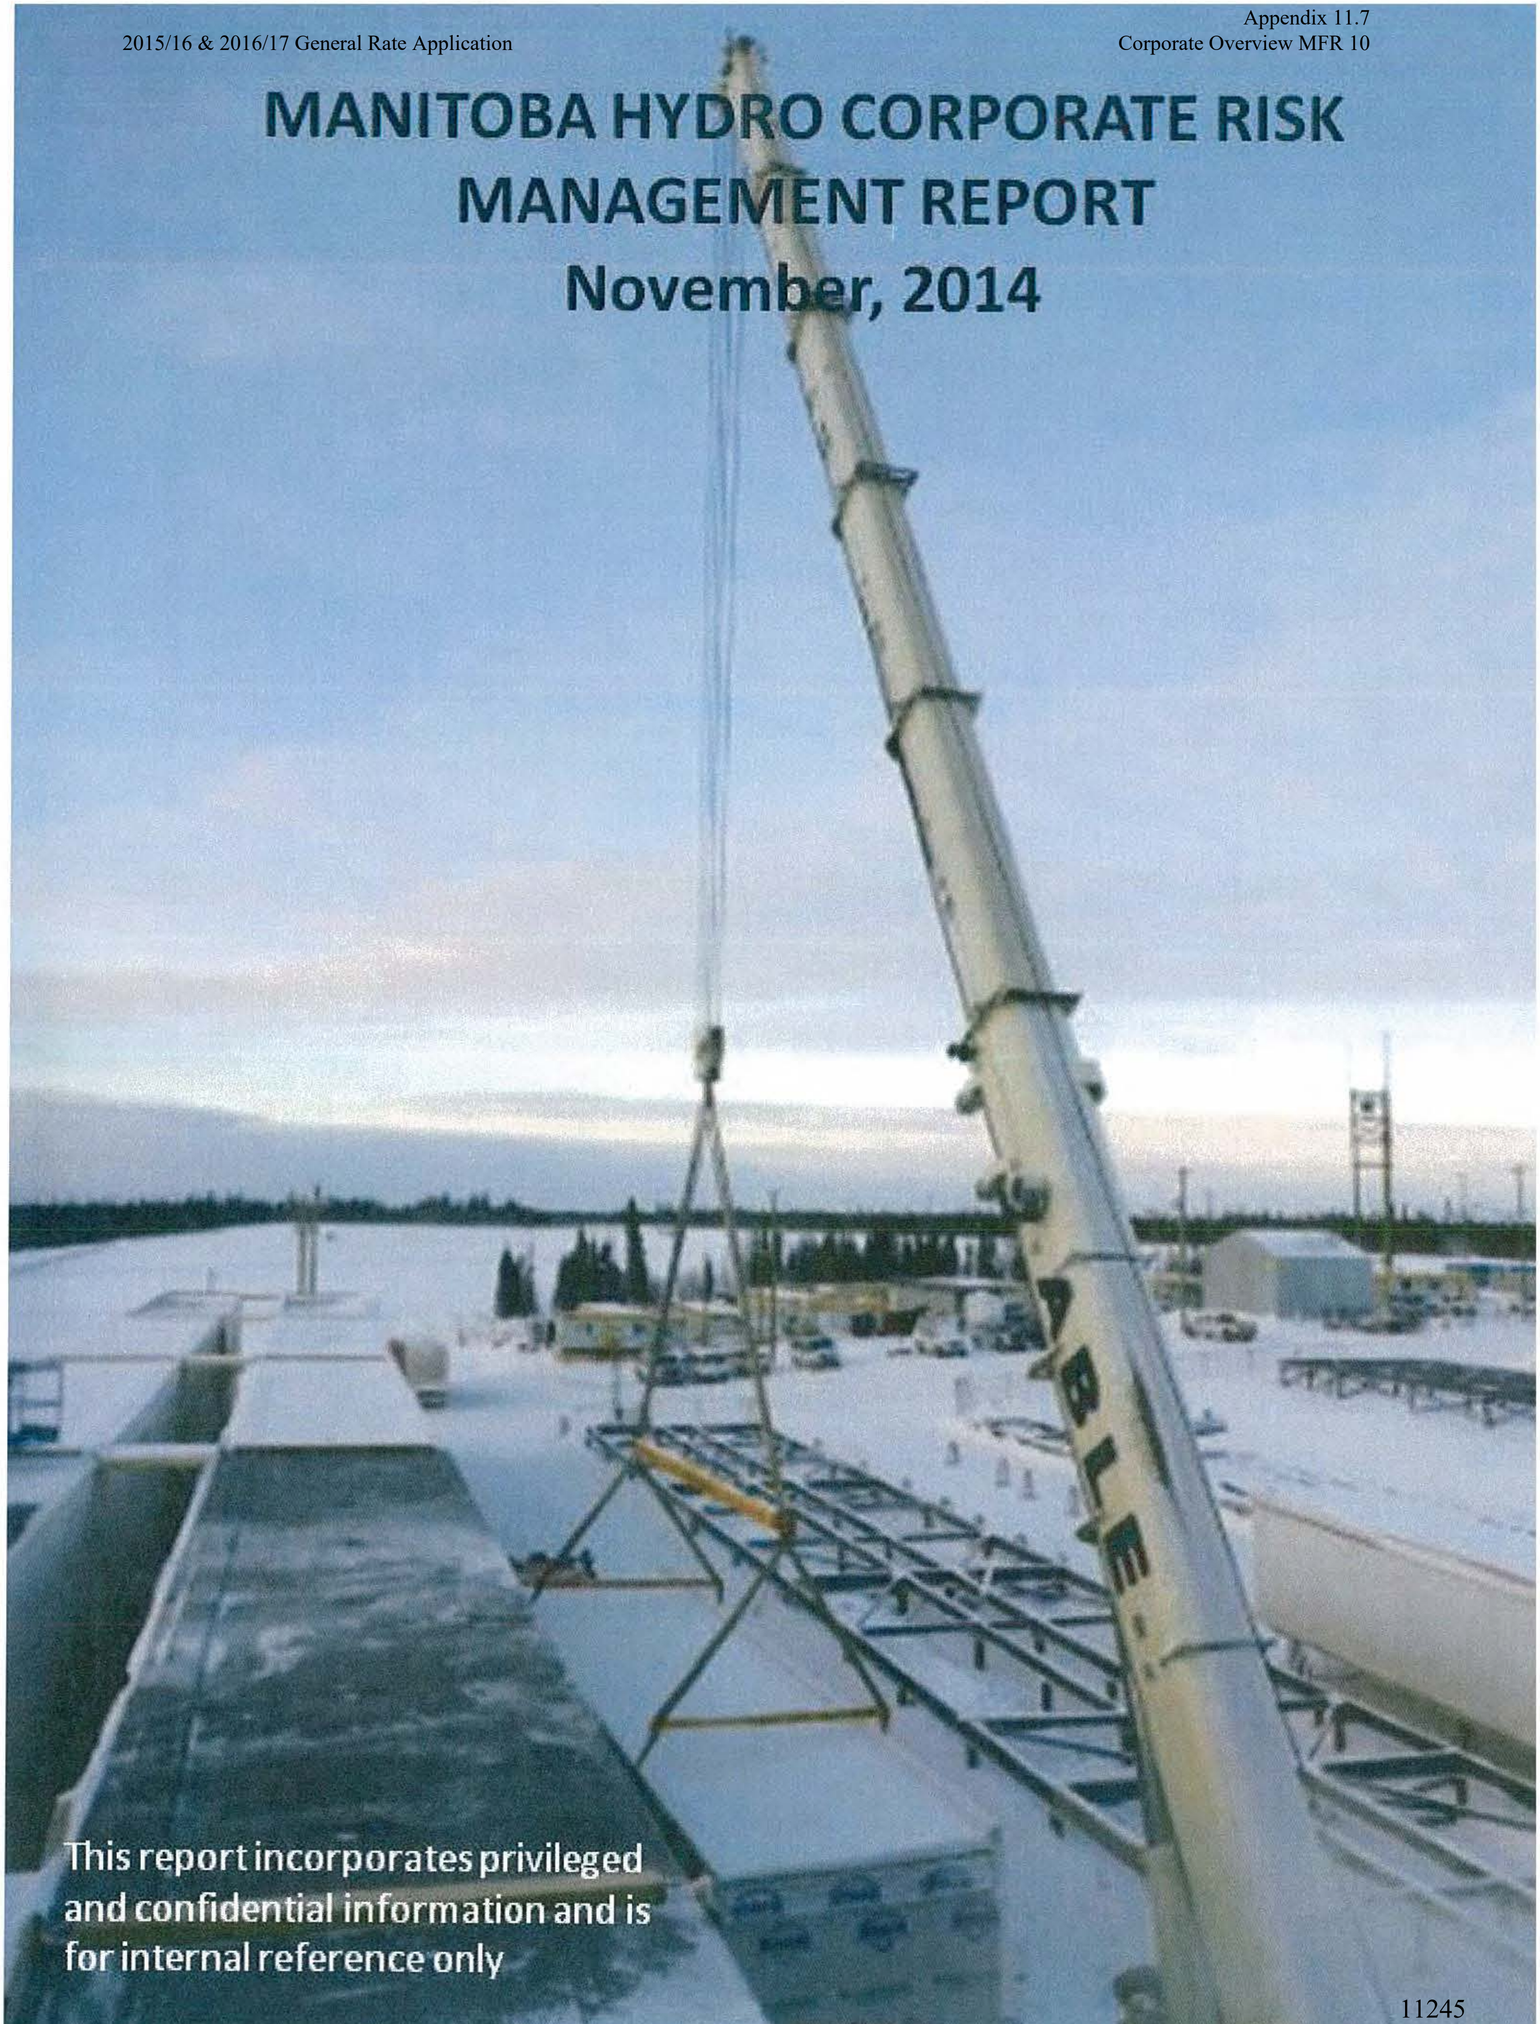
Corporate Overview MFR 10

Corporate Risk Analysis Report and Specific Risk Management Plans for all Major Risks including Drought.

Please find attached the redacted version of Manitoba Hydro's Corporate Risk Management Report.

In addition, Manitoba Hydro has provided a full copy of its Corporate Risk Management Report to the PUB, in confidence, as requested in PUB/MH I-84b.

MANITOBA HYDRO CORPORATE RISK MANAGEMENT REPORT
November, 2014



This report incorporates privileged and confidential information and is for internal reference only

Cover: Keewatinohk Construction Camp
When completed the Keewatinohk Converter Station will improve power reliability and expand exporting capabilities.

TABLE OF CONTENTS

I. INTRODUCTION

The Corporate Risk Management Report is normally updated on an annual basis to provide Manitoba Hydro's stakeholders with information on the status of major risks facing the Corporation as it carries out its mandate. The report identifies and assesses each risk, describes activities used to manage the risk and provides estimates of the potential residual impact to the Corporation in terms of likelihood and consequence after mitigation actions have been taken. The Corporation's tolerance for each risk and an assessment of whether the risk is within or outside the desired tolerance level is also provided.

As a Crown-owned utility providing an essential and life-sustaining energy service to Manitobans, Manitoba Hydro has a relatively low tolerance for risk. However, because Manitoba Hydro is also an important economic driver for the Province, some risks are necessary in order to take advantage of opportunities to maximize value for stakeholders. These risks are managed through a systematic, proactive and integrated process which is designed to balance the objectives of:

- identifying threats that affect the achievement of the Corporation's mission and mandate;
- mitigating the consequences of negative occurrences; and
- taking advantage of opportunities to provide benefits to all stakeholders.

Most risk management efforts are focused on reducing the occurrence of negative events. However, the Corporation also has plans in place to reduce the impacts should a negative event occur. These plans are under continual assessment. In addition, all safety and reliability risks are managed through strict adherence to design, construction and operating standards and practices together with extensive public education and employee training programs. A comprehensive Emergency Response Program is also in place to ensure an effective and coordinated response to possible emergencies or disasters.

The financial and operational risks associated with the management of an integrated electricity and natural gas utility are significant. These risks include the impacts of weather on supply and demand, price and market uncertainties, interest, inflation and foreign exchange rates, skilled labour availability and costs, aging infrastructure maintenance and replacement, increasing regulatory, environmental and legal requirements, and accelerated technological change. Manitoba Hydro manages these risks through an integrated control framework and through the maintenance of an adequate level of retained earnings.

Manitoba Hydro's Corporate Risk Management Report is structured to provide the following:

- A summary of the high consequence risks including:
  - Loss of major infrastructure
  - Drought
  - Loss of export markets
- An overview of significant and emerging risks and actions taken to address those risks.
- A Corporate Risk Map providing a visual depiction of Manitoba Hydro's risks categorized into high, medium and low likelihood of occurrence and the corresponding consequences.
- A Corporate Risk Tolerance Assessment of each risk.
- Corporate Risk Profiles - one page summaries of each of Manitoba Hydro's risks.

II. HIGH CONSEQUENCE RISKS

The most significant risks facing Manitoba Hydro are those rated as high consequence due to the potential magnitude of impact on the Corporation's ability to achieve its mandate and strategic goals and are quantified in the following table:

RISK	POTENTIAL FINANCIAL IMPACT
INFRASTRUCTURE Prolonged loss of supply	> $2 billion
DROUGHT Water Supply Variation / Drought	>$1.7 billion for a 5 year drought commencing in 2017 (IFF 14)
LOSS OF EXPORT MARKET ACCESS	> 30 % of electricity revenue

Infrastructure Risk (Category D)

A catastrophic infrastructure failure continues to be the most significant risk facing the Corporation and its customers. Potential impacts include prolonged loss of system supply, the inability to maintain minimum energy services, loss of life, severe environmental damage and significant costs to the Manitoba economy. Failure can be caused by a number of factors including an extreme weather event, sabotage, fire, human error, or technical malfunction.

By the nature of its business, Manitoba Hydro has an especially low tolerance for infrastructure risk. Significant efforts are expended on managing this risk in a manner that avoids the occurrence of a catastrophic event and minimizing consequences should a catastrophic event occur.

Risk Treatment

In the short term, actions are continually being taken to enhance emergency response and disaster management processes. In the longer term, major investment in renewal and expansion of the infrastructure system are underway to maintain and improve system reliability, energy security and safety. Key management plans and projects include:

- Construction of Bipole III with a planned in-service date of 2018.

- Re-termination of the 500 kV Interconnection at Riel (2014).

- Renewal and replacement of aging electric and gas infrastructure over a long term period to improve system capacity and reliability. This includes critical distribution assets and stations, rehabilitation of existing generators, wood poles, cable and gas pipe replacement, cyber and physical security upgrades, and changes to gas distribution operations and pipelines to respond to changes in geographic gas production and shipment patterns. These changes to gas distribution operations also include lessons learned from a four day loss of gas supply to a large number of customers as a result of an explosion of the TransCanada main gas pipeline.

- Moving forward with implementation of Manitoba Hydro's Development Plan to meet export sales and forecasted domestic load growth. The provincial government and Public Utilities Board endorsed proceeding with the Keeyask Generating Station, the new 500 kV line to Minnesota and increased levels of Demand Side Management activity. In addition to meeting domestic demand, these projects will allow the Corporation to increase firm export obligations and access greater amounts of energy with additional import capability provided by the new interconnection.

- Water retaining structures and flow control management, including: surveillance inspections, instrumentation monitoring, and engineering analyses of dams and dykes including emergency plans for individual facilities; systematic utilization of failure modes-based condition assessment techniques; and rehabilitation of the Pointe du Bois spillway facility.

- Continual improvement of the Corporate Emergency Management Program that includes a long term plan for managing the available resources, load and system supply following the loss of infrastructure; development of business continuity plans; constructing an emergency fuel depot; spare infrastructure material and equipment inventory to enable timely re-building and restoration of potentially affected assets. The corporation also has short term emergency energy and mutual aid agreements with Ontario, Saskatchewan and U.S. Utilities.

Water Supply Variation / Drought Risk (C.1 and D.2)

On average, there is a high likelihood of a drought occurring about once in every ten years. In the circumstances of an extreme drought that is more severe than the worst on record, there is a possibility of insufficient energy supplies being available to meet firm load demands. This would result in extreme financial and reputational impacts on the Corporation. The cost of a five year drought similar to the worst on record is estimated to be $1.7 billion (IFF 14) for a drought commencing in 2017.

Risk Treatment

There are several measures in place to manage the impacts of a drought, as follows:

- Manitoba Hydro's current generation and transmission facilities are designed and operated to ensure firm demand can be supplied given a repeat of the lowest river flows since 1912. A drought more severe than the worst on record could occur and would require non-normal operations. This may include operating reservoirs outside of the normal range for power production. Non-normal operation may also include demand reduction measures such as public appeal for conservation, enforced conservation, or rotating reductions of non-essential load. Actions to manage drought will depend on its duration and severity and any other conditions that prevail at the time.

- Once built, the new interconnection with the U.S. in combination with additional long term exports in the Development Plan will provide the Corporation with increased ability to access additional amounts of energy through higher imports than planned and through financial settlement of firm export contracts.

- Adequate retained earnings are required to protect against a repeat of the worst drought on record. At March 31, 2014 retained earnings totaled $2.7 billion. It should be noted, however, that while drought is a major quantifiable risk, an adequate level of retained earnings is required to recover from other significant risks such as a prolonged loss of supply or the loss of export market access.

Export Market Access Risk (Category A.2)

On average Manitoba Hydro derives a significant portion of its revenue from export sales to U.S. and Canadian markets. The prime impact of restricted market access would be significantly reduced net export revenues which are fundamental in keeping domestic rates low and offsetting the upfront costs of capital investments. Market access risk also includes restrictions on Manitoba Hydro's ability to import which could increase the cost of droughts, and degrade system reliability.

Risk Treatment

Manitoba Hydro continues to actively work to mitigate and manage market access uncertainties, as follows:

- In alliance with other industry participants such as the Canadian Electricity Association, and other stakeholders, Manitoba Hydro continues to lobby MISO, IESO and FERC for the development or elimination of market rules that affect electricity trade and facilitate full participation of Manitoba Hydro in US and Canadian electricity markets.

- Manitoba Hydro also engages in extensive lobbying efforts in the US to promote waterpower as a clean, reliable and renewable source of energy and to counter anti-hydro special interest group lobbying.

- The Corporation also engages with environmental, consumer and business stakeholder groups to discuss and promote its development plans.

- Market access risk is also reduced by having long term contracts and strong relationships in place with major export counterparties.

III. SIGNIFICANT AND EMERGING RISKS

While loss of infrastructure, drought and potential loss of export markets remain as the highest consequence risks for the Corporation, there are other significant and emerging risks that can affect the achievement of the Corporation's mission and mandate. These are:

Infrastructure Investment (Category D / A.2.6)

Manitoba Hydro is moving forward with a number of major initiatives (e.g. construction of Bipole III, replacement of aging infrastructure, Keeyask generating station, a new interconnection to the U.S and increased Demand-Side Management activities) in order to further improve electrical and gas system reliability, meet the future energy needs of the province, and take advantage of export opportunities. These plans will require the investment of approximately $18 billion (CEF 14) over the next 10 years.

There are a number of risks associated with such large initiatives that will challenge the Corporation's ability to meet Manitoba's energy needs while keeping customer rates affordable, and maintaining the Corporation's financial strength. These challenges include managing the costs of Bipole III, Keeyask and the new interconnection project; [redacted] Mitigation measures to address these cost risks include the use of best practices in cost estimating, contracting practices, the inclusion of appropriate contingencies and management reserves. [redacted]

With regard to Conawapa, the Corporation has suspended the majority of expenditures associated with that project consistent with government direction following the PUB's NFAT report. Conawapa is now seen as an opportunity that will only proceed if sufficient additional profitable export sales materialize that will shoulder most of the financial risk associated with building Conawapa much earlier than needed for domestic purposes. Without those contracts further expenditures to protect an early in-service date for Conawapa will not be made. The consequences of that will be a lost opportunity resulting in higher rates in the very long term, reduced near term provincial economic activity and reduced socio-economic benefits to northern aboriginal communities who would partner with Manitoba Hydro on the project.

Financial Strength (B.7)

Maintaining financial strength is essential in order to make the necessary investments in infrastructure, to continue to provide safe and reliable service to customers, financially withstand the risks and uncertainties that are inherent in the Corporation's operations and to provide customers with long-term rate stability and predictability and avoid the need for large or sudden rate increases in the future. The required investment in new and existing infrastructure is expected to place a certain degree of pressure on the Corporation's key financial targets, and if not carefully managed, there is a risk of higher required future rate increases or potential negative impacts to the credit rating of the Province.

Key areas of focus to maintain financial strength include:

- Continuing cost containment measures. This includes utilizing resources effectively and efficiently while diligently managing capital projects to be on time and on budget. Management continues to evaluate the need to fill positions vacated as a result of attrition, considering opportunities for process improvement, technological enhancements and organizational restructuring. This also involves leveraging experience from the development of new tools and past projects to improve upon capital cost estimating, project and contract management.

- Aggressively pursuing a balanced portfolio of domestic and profitable export sales to provide the highest financial benefits to ratepayers and all Manitobans over the long term.

- Managing and mitigating financial risk by closely monitoring economic factors, financial markets, and energy markets.

- Implementing modest, regular domestic electricity rate increases necessary to achieve financial targets over the long term.

Domestic Electricity Rate Increases (B.7)

The infrastructure system that served Manitoba well for decades now needs significant re-investment to continue meeting the province's needs. Electricity rates in Manitoba must rise to ensure the ongoing safety and reliability of the electricity supply and delivery system. This is an issue that is present across North America, as other utilities address aging infrastructure and growing demand.

Manitoba's electricity rates continue to be among the lowest overall in North America, due in large part to past investments in hydroelectric generating stations and the contribution to earnings from the sales of surplus energy into the export market. However, Manitoba Hydro's plan for re-powering the province requires a significant capital investment. This investment in the replacement and refurbishment of plant will require increased revenues, which must be obtained from a series of future electricity rate increases, at levels higher than the historical average.

It is a significant challenge to convince stakeholders that higher rate increases are in the best long-term interests of all ratepayers to ensure ongoing safe and reliable service. Significant efforts will need to be focused on delivering compelling and convincing arguments before the PUB to obtain the required level of rate increases going into the future. Even with the projected rate increases, it is expected that Manitoba Hydro's domestic customers will continue to have electricity rates that are affordable and competitive.

Offering new and expanded Power Smart programs aggressively targeting additional electricity and natural gas savings, as outlined in the Corporation's development plan, will aid customers in managing their overall energy costs.

Export Sales (Category A.2)

As was previously mentioned, increased export sales are fundamental to achieving the Corporation's strategy of reducing the costs of building new generation supply for Manitoba ratepayers.

Key factors affecting the ability to increase export volumes and revenues are:

- **Export Market Prices -** In recent years export prices for electricity have been affected by the economic slowdown in the U.S. and the availability of low-cost natural gas made possible by new production techniques. The corporation has endeavored to reflect these factors as accurately as possible in its forecasts of future export market prices. Based on the input of external industry specialists, the corporation is forecasting a moderate rise in export prices over the long term, restrained by the continued impact of natural gas pricing. There is a residual risk that export prices could be lower than industry experts are predicting, and that would be a downside risk that could hamper the Corporation's ability to achieve forecasted export revenues and other financial targets with projected rate increases.

- **Cost of New Hydraulic Generation** – The resources in the Corporation's development plan are supported by a number of export agreements, including a 250-megawatt sale to Minnesota Power, a 125 MW sale to Northern States Power and a 108–megawatt sale to Wisconsin Public Service. [redacted]

  Commencement of construction of Conawapa is not required in the near term to serve Manitoba load. As a result resumption of planning and capital expenditures for Conawapa will only proceed if sufficient firm export interest materializes in the next two years that convince the Corporation that there are significant benefits with proceeding and that the risks of the project will not be borne by Manitoba ratepayers. To date only the 308 MW Power Sale Agreement with Wisconsin

Public Service has been signed. By itself that sale only requires 30% of Conawapa's output until 2035. Commitments tied to a large portion of its remaining output will be necessary before resumption of expenditures can be justified.

- **Market Access -** Manitoba Hydro's development plan includes the construction of a new 500 kV interconnection with the U.S. The interconnection will increase export capability by 883 MW and import capability by 683 MW. These increases in transfer capability will increase the amount of firm load that can be served by the Manitoba generating system, will enhance the value of new DSM initiatives and will result in Manitoba Hydro achieving higher export prices and lower import prices. The line will increase export volumes by reducing water spillage in high water years.

  Critical to receiving regulatory and political approval to build the US portion of the interconnection is having a US utility who will champion and build the line in the US. The risks of this project not moving forward are significantly reduced this year as Manitoba Hydro and Minnesota Power have now signed several agreements which establish the business arrangements necessary for the Minnesota Power to proceed with the permitting, and route selection processes. These permitting processes are underway and MP expects to receive approval by the end of 2015 with actual construction of the Great Northern Transmission Line commencing in 2016.

  In addition, Manitoba Hydro's subsidiary (6600271 MB. Ltd), Minnesota Power and MISO have signed a Facilities Construction Agreement. These agreements are subject to several conditions and regulatory approvals which still must be satisfied before construction can commence.

Gas Price Volatility (B.5)

There is significant upward cost pressure for transportation services on the TCPL Canadian Mainline (the "Mainline"), to which Centra is currently captive in bringing natural gas to its load centre. The Mainline is significantly underutilized resulting in less revenue than that which is required to cover the Mainline's relatively high embedded cost structure. As a result, the pipeline has been seeking regular toll increases since 2010, which costs are passed through to Manitoba natural gas ratepayers. Tolls on the Mainline also affect transportation services that Centra obtains from third parties.

This market circumstance was recently compounded by a proposal by TCPL to segment the Mainline's cost allocation and tolls post-2020 between the under-utilized Western Mainline (on which Centra moves gas) and the highly utilized Eastern Ontario Triangle, which would facilitate the avoidance of cost responsibility for under-utilized or stranded assets on the Mainline by eastern shippers at the expense of Centra and other captive shippers on the Western Mainline. Centra is the largest captive shipper on the Western

Mainline. The proposal, if approved by the National Energy Board ("NEB"), is expected to result in significantly higher costs and risk for Centra than it would bear if the Mainline were to remain integrated.

Centra actively intervened to oppose Mainline segmentation in the recent Oral Hearing RH-001-2014 before the NEB regarding the Application by TCPL for Approval of Mainline 2015-2030 Tolls & Restructuring. Interested parties are awaiting a Decision by the NEB, which is expected in November, 2014. In the event that the Decision is unfavourable for Centra, work will be undertaken to explore alternatives to continuing to move gas on the Mainline.

Interest Rates (B.2)

As a result of the intensive capital investment period, it is projected that Manitoba Hydro's level of debt will significantly increase and financial results will be affected by market interest rates. Over the next 10 years the potential cumulative financial impact of a one-percent change in interest rates is estimated at $1.1 billion (IFF 14).

Manitoba Hydro's interest rate policy on its existing debt portfolio is to limit the aggregate of short term debt, floating rate debt and debt to be refinanced within the subsequent 12 month period to a maximum of 35% of the total debt portfolio. When selecting terms for its new borrowings, Manitoba Hydro gives careful consideration to the debt maturity schedule and the total level of annual financing requirements. The debt management strategy guidance is to have less than 15% of the long term debt portfolio maturing within a fiscal year. In order to mitigate refinancing risk, to maintain financing flexibility during the intensive capital investment period, and in keeping with the concept of matching the Corporation's long-lived assets with long term debt, Manitoba Hydro will continue to favour long term financings with maturities of 10+ years, while maintaining short term debt and floating rate long term debt within policy limits.

As a result of the low interest rate environment over the past several years Manitoba Hydro has been able to reduce its net weighted average interest rate by approximately 2.0% since 2006/07 and increase its weighted average term to maturity by over three years during the same period.

Environmental (Category C)

There are a number of environmental issues currently facing the Corporation that could impact operations if they are not addressed.

A potentially significant environmental issue arises as a result of the 2013 Clean Environment Commission (CEC) recommendation to have both the Province and Manitoba Hydro conduct a Regional Cumulative Environmental Effects Assessment (RCEEA) of all Manitoba Hydro projects in the lower Nelson River sub-basin before any more projects are licensed for construction. [redacted] Manitoba Hydro has completed Phase I of the Study and submitted it to the government. Phase II is now underway and a new committee has been formed with the Province.

Another significant environmental issue deals with the listing of Lake Sturgeon under the Species at Risk Act (SARA). Almost all of the Corporation's hydroelectric generating stations are located where Lake Sturgeon are found and it is likely that at most sites the infrastructure and operations have negatively affected the fish and/or its habitat. Due primarily to historical commercial overharvest, plus additional stressors including hydroelectric development and ongoing [redacted] Lake Sturgeon populations have been severely depleted over the past 100 years and the species is currently under review for listing as endangered under SARA at most locations in Manitoba. If Lake Sturgeon is listed as "Endangered" under the SARA, the Corporation could face restrictions on current operations, structural modifications to infrastructure, delays in developing new generation due to difficulties with securing permits, and high costs of recovery measures that are potentially mandated. There is also a remote chance that new projects could be cancelled. The Corporation continues to take significant action to minimize the need for and likelihood of listing Lake Sturgeon under SARA, however uncertainty remains.

Regulation and Licensing (H.1)

The Corporation requires a variety of regulatory approvals and licenses to carry out its activities. Key approvals and licenses include the National Energy Board, water power and environmental approvals to build new generation or transmission facilities or to maintain or improve the efficiency of existing facilities. Failure to obtain approvals and licenses on favourable terms or in a timely fashion could have significant financial, operating and water regime impacts. These could result in increased costs, reduced hydraulic generation, capacity and export sales. Expiration of a license without renewal could expose the Corporation to embarrassment and loss of reputation and cancelation of a license could expose the Corporation to the possibility that a third party could acquire the water power rights at a location and Manitoba Hydro would lose the asset and associated capacity and generation.

There are several measures in place to manage these risks. These include:

- Incorporating regulatory/licensing concerns into the planning of new rate programs and facilities (e.g. low-head Wuskwatim to minimize environmental impact).

- Pursuing regulatory/license approvals with appropriate diligence and explaining the merits of the corporate position at any public proceedings where the scope of regulation is under debate.

- Maintaining systems to ensure ongoing compliance with regulatory/license requirements and focusing attention on overall corporate image.

- Making recommendations for an efficient and streamlined regulatory framework.

- With respect to Water Power Licenses: (1) Manitoba Hydro has a strong working relationship with the WPA Licensing Section at Water Stewardship. This ensures proper understanding of licensing condition implications and to ensure timely licensing activities; (2) Manitoba Hydro monitors compliance with its WPA licenses and self reports annually on compliance; (3) Manitoba Hydro applies for short term license extensions when licenses would otherwise expire. Historically Manitoba Hydro had several WPA licenses that had expired. Although this was a potential source of embarrassment, it did not result in a disruption of operations; and (4) Manitoba Hydro operates its facilities within the limits established in the WPA licenses. To the extent that deviations are necessary or occur, authorization is requested when possible from Water Stewardship. As a result there is no risk of license cancelation as a result of non-compliance.

Workforce (Category E)

Attracting, developing and retaining a highly skilled and motivated workforce that reflects the demographics of Manitoba is critical to the Corporation's success. Key factors that impact the ability to achieve this are the number of employees that are eligible for retirement, competition for highly skilled workers, and the ability to keep up with technological and other changes. Manitoba Hydro's contractors will also be impacted by the same competition.

The Corporation is looking at the demographic shift that is occurring in its workforce as a challenge as well as an opportunity. Nearly 900 employees are eligible for retirement in 2014. With years of accumulated experience and knowledge, many of those nearing retirement age are key contributors to the Corporation's success. It is important therefore that appropriate succession planning, recruitment and retention activities are in place to maintain safe and reliable service and to manage the loss of valuable experience and knowledge that can result from the retirement of key contributors. At the same time there is opportunity to achieve efficiencies and cost reductions by evaluating the need for positions that are vacated.

Infectious Disease – Ebola Virus (E.1.1)

In June 2014 an outbreak of the Ebola virus occurred in West Africa that could potentially impact Manitoba Hydro operations if the virus is not contained. A number of Hydro employees seconded to the subsidiary company Manitoba Hydro International, as well as several MHI Independent contractors, were working in West Africa during the time of this outbreak and were relocated to various other countries in order to continue their work remotely. None were affected by this virus and they will not return to the area until such time that it is considered safe.

As is the case with any infectious disease, the Corporation needs to be ready and respond appropriately to the events as they occur. The developing and changing nature of this Ebola crisis is being assessed and any changes to established practices and/or policies will be performed to meet the declared requirements of the health authorities. A communication strategy to employees is also under development.

Cyber Security (F.2.1)

The growth of electronic communication and automation, while delivering significant benefits to Manitoba Hydro, has also increased risk to the Corporation. This risk includes any cyber attack that could impact the resiliency, reliability, confidentiality, availability or the integrity of Manitoba Hydro Information and Operational Technology assets, including the theft of personal and or business information, and or the disruption/misuse of critical operations/assets. Any computer or control system if not secured properly may be considered a potential target. These cyber attacks could have a significant impact on Manitoba Hydro operationally and financially, and may have a rippling effect on the Manitoba economy.

Countermeasures, management controls and processes are in place to mitigate this risk. The corporation is also developing a series of measures to further augment cyber-security efforts consistent with recommendations of the Office of the Auditor General. Steps to address the recommendations include establishing an Enterprise Security Council comprised of senior executives to provide oversight for all physical and technology security. The Auditor General's report consisted of eight recommendations and the Corporation has developed action plans to address each.

Reputation (G.1)

The Corporation has recently completed a number of significant regulatory hearings, including the Clean Environment Commission and Needs For and Alternatives To (NFAT) Manitoba Hydro's Preferred Development Plan. [redacted] Similar to other Canadian electric utilities, the Corporation's customer satisfaction ratings have been recently declining below its typical range.

A Public Communication Plan continues to be developed to aid in managing customer perceptions of the Corporation's efforts to meet their mandate as outlined under the Manitoba Hydro Act while balancing the need for future domestic rate increases. A component of the plan will use the Corporation's existing communications channels, stakeholder engagement and media relations efforts to address issues that may continue to arise. [redacted]

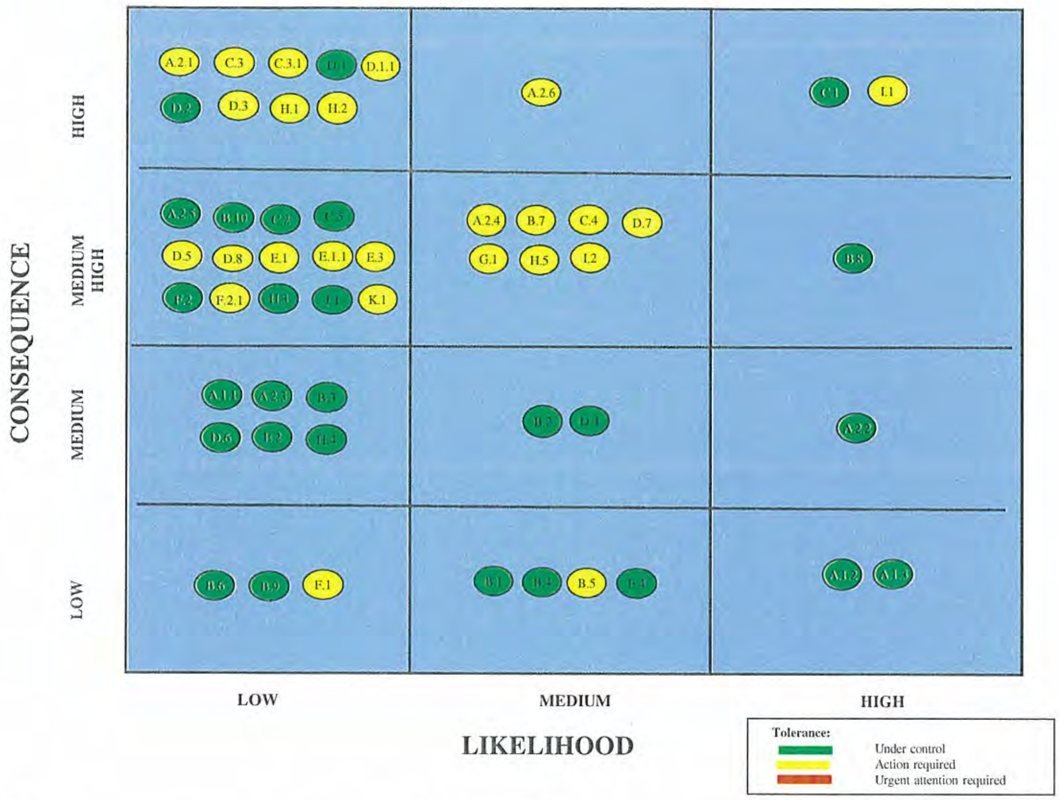
[redacted] The Corporation will take all steps possible to try to ensure that its customer satisfaction rating and current positive reputation are maintained.

IV. CORPORATE RISK MAP

Corporate Risk Profiles (see Appendix B) identify and assess each risk facing the Corporation, describe activities used to manage the risk, and provide estimates of the potential residual impact to the Corporation in terms of likelihood and consequence after mitigation actions have been taken. The Corporation's tolerance for each risk and an assessment of whether the risk is within or outside the desired tolerance level is also provided. The risk rating and tolerance criteria are provided in Appendix C. As well, further detail of the risk tolerance assessment for each risk is provided in Appendix A.

The following Corporate Risk Map illustrates the results of a residual risk assessment for all risks facing the Corporation.

CORPORATE RISK MAP



A. Market
1. Domestic
   1. Competition
   2. Uneconomic Loads
   3. Load Growth Uncertainty

2. Export
   1. Regulatory Environment
   2. Long Term Price Uncertainty
   3. Transmission
   4. Special Interest Groups
   5. Protectionism
   6. Major Export Contracts Requiring Early Conawapa ISD

B. Financial
1. Exchange
2. Interest Rates
3. Credit
4. Inflation
5. Gas Price Volatility
6. Gas Derivative Instruments
7. Financial Targets
8. Energy / Fuel Price Volatility
9. Power Financial Instruments
10. Liquidity

C. Environmental
1. Water Supply Variation / Drought
2. Climate Change
3. Operational Impact and Infrastructure
   1. Legal - Species at Risk Act
4. Reliability of Supply
5. Upstream Regulation and Water Withdrawals

D. Infrastructure
1. Loss of Plant (all property, all perils)

1.1. Water Retaining Structures and Flow Control

2. Extreme Drought – Shortfall Energy
3. Prolonged Loss of System Supply
4. System Shutdown (Short Term)
5. System Shutdown (Natural Gas)
6. Technology
7. Special Interest Groups
8. Emergency Management Program

E. Human
1. Safety and Health
   1. Infectious Disease
2. Union / Employee Issues
3. Workforce
4. Technology

F. Business Operational
1. Supply Chain
2. Operational Controls
   1. Cyber Security

G. Reputation
1. Reputation

H. Governance / Regulatory / Legal
1. Regulation and Licensing
2. Export Market Access
3. Legal Compliance
4. Contracts and Ventures
5. NERC/MRO Reliability Standards

1. Emerging Energy Technologies

K. Strategic
1. Strategic Direction and Implementation

Risks that are coded yellow on the risk map indicate that some emerging issues need to be monitored and additional action may be required. A summary of the yellow coded risks that are not discussed in the previous sections of this report is provided below.

- [redacted] **A.2.1 Export Regulatory Environment –** Export market rules continually evolve with new rules being imposed that could impact future access to export markets. [redacted]

  [redacted]

  [redacted]

  Manitoba Hydro collectively manages its market access risks through a comprehensive set of activities to monitor and address any potential threats to market access.

- **A.2.4 Export Special Interest Groups –** A positive corporate and product image enables the Corporation to maximize export sales opportunities and to develop generation and transmission projects required for both domestic needs and exports. Negative lobbying efforts by Special Interest Groups can tarnish the Corporation's image or the image of hydropower, limiting its marketability. Manitoba Hydro is managing this risk by: (1) Continuing to promote waterpower as clean, reliable and a renewable source of electricity; (2) Aggressively countering Special Interest Group activities with Manitoba Hydro's perspective; and (3) Expanding engagement with groups who may lobby for or against Manitoba Hydro.

- **A.2.6 Major Export Contracts Requiring Early Conawapa ISD -** There is a lost opportunity to Manitoba Hydro if it's export customers do not commit to additional large power sales agreements [redacted] These new agreements will justify an early in-service date for Conawapa, otherwise spending on Conawapa will end.

  Several actions are being taken to manage this risk, including: (1) Aggressively pursuing discussions with export customers to ensure that they understand that their [redacted] commitment is required if they are counting on purchasing generation from Conawapa, and (2) Advocating with US legislative and regulatory bodies to provide incentives for US utilities to contract for new hydro from Manitoba as part of their plans to address emerging carbon regulations and generation retirements.

- **C.4 Reliability of Supply –** The Corporation is at risk that environmental licensing concerns could obstruct the Corporation's ability to build the necessary transmission facilities required to provide a reliable supply of energy. The Corporation will continue to be proactive in addressing these concerns and ensuring adequate lead times to resolve issues.

- **D.1.1 Water Retaining Structures and Flow Control** – Dam or dyke structures can fail resulting in impacts ranging from insignificant to catastrophic. [redacted]

- **D.7 Special Interest Groups –** [redacted]

- **D.8 Emergency Management Program -** As discussed throughout the Category D Infrastructure section, the Corporation's energy infrastructure is highly exposed to events that can have impacts ranging from insignificant to catastrophic. These include prolonged loss of system supply, the inability to maintain minimum energy services, loss of life, severe environmental damage and significant costs to the Manitoba economy. To ensure that appropriate plans and programs are in place, there are: (1) policies and procedures to guide actions, (2) staff training and emergency preparedness exercises on a regular basis, (3) actions to follow up on and address identified deficiencies, and (4) continual enhancements to the program to ensure the state of readiness. Initiatives currently underway include developing a corporate plan for business continuity for continuation of critical operations and constructing an emergency fuel depot. Several other initiatives are being considered.

- **E.1 Safety and Health –** Employee safety is always a key concern to the Corporation due to the inherent nature of the operational work performed by Manitoba Hydro. To date a focus on continuous safety improvements has resulted in a steady decline in workplace accident severity and frequency rates. The Corporation will continue to focus on making improvements to the safety program.

- **F.1 Supply Chain –** The Corporation requires a variety of critical goods and services to achieve its objectives. [redacted]

- **H.5 NERC/MRO Reliability Standards –** Achieving the highest level of reliability is one of the core tenets of Manitoba Hydro's Vision statement. In support of this vision, Manitoba Hydro is a member of the North American Electric Reliability Corporation (NERC) and has been legally required to comply with nearly 100 of its reliability standards since 2007. These standards specify requirements for planning, operating and maintaining the bulk electric system. The Corporation has developed a Corporate NERC Reliability Compliance Program to manage the demands of compliance.

- **K.1 Strategic Direction and Implementation –** Manitoba Hydro continues to be at a critical point in renewing and expanding Manitoba's electrical and gas system. Major strategic decisions, plans and assumptions are subject to significant internal and external review and approval processes. Decisions for future power generation, transmission and distribution will depend on the best information at the time, and plans will be modified at key decision points if circumstances warrant.

PUB MFR 9 (Revised)
Corporate Overview

Corporate Risk Analysis Report and Specific Risk Management Plans for all major risks including drought. [Appendix 11.7, 2015/16 GRA]

The response to PUB MFR 9 has been updated to include the redacted version of Manitoba Hydro's Corporate Risk Management Report Appendices.

Public disclosure of the response to this MFR (or portions thereof) would result in the release of information considered to be confidential and commercially sensitive. As directed by the PUB, Manitoba Hydro has filed a motion seeking confidential treatment of the redacted information contained in the attachment to this response pursuant to Rule 13.

Manitoba Hydro Corporate Risk
Management Report
December 2015
THIS REPORT INCORPORATES
PRIVILEGED AND CONFIDENTIAL
INFORMATION AND IS FOR INTERNAL
REFERENCE ONLY

TABLE OF CONTENTS

1.0 INTRODUCTION

The Corporate Risk Management Report is normally updated on an annual basis to provide Manitoba Hydro's stakeholders with information on the status of major risks facing the Corporation as it carries out its mandate. The report identifies and assesses each risk, describes activities used to manage the risk and provides estimates of the potential residual impact to the Corporation in terms of likelihood and consequence after mitigation actions have been taken. The Corporation's tolerance for each risk and an assessment of whether the risk is within or outside the desired tolerance level is also provided.

As a Crown-owned utility providing an essential and life-sustaining energy service to Manitobans, Manitoba Hydro has a relatively low tolerance for risk. However, because Manitoba Hydro is also an important economic driver for the Province, some risks are necessary in order to take advantage of opportunities to maximize value for stakeholders. These risks are managed through a systematic, proactive and integrated process which is designed to balance the objectives of:

- identifying threats that affect the achievement of the Corporation's mission and mandate;
- mitigating the consequences of negative occurrences; and
- taking advantage of opportunities to provide benefits to all stakeholders.

Most risk management efforts are focused on reducing the occurrence of negative events. However, the Corporation also has plans in place to reduce the impacts should a negative event occur. These plans are under continual assessment. In addition, all safety and reliability risks are managed through strict adherence to design, construction and operating standards and practices together with extensive public education and employee training programs. A comprehensive Emergency Response Program is also in place to ensure an effective and coordinated response to possible emergencies or disasters.

The financial and operational risks associated with the management of an integrated electricity and natural gas utility are significant. These risks include the impacts of weather on supply and demand, price and market uncertainties, interest, inflation and foreign exchange rates, skilled labour availability and costs, aging infrastructure maintenance and replacement, increasing regulatory, environmental and legal requirements, and accelerated technological change. Manitoba Hydro manages these risks through an integrated control framework and through the maintenance of an adequate level of financial reserves through retained earnings.

Manitoba Hydro's Corporate Risk Management Report is structured to provide the following:

- A summary of the high consequence risks including:
  - Loss of major infrastructure
  - Drought
  - Loss of export markets
- An overview of significant and emerging risks and actions taken to address those risks.
- A Corporate Risk Map providing a visual depiction of Manitoba Hydro's risks categorized into high, medium and low likelihood of occurrence and the corresponding consequences.
- A Corporate Risk Tolerance Assessment of each risk.
- Corporate Risk Profiles - one page summaries of each of Manitoba Hydro's risks.

2.0 HIGH CONSEQUENCE RISKS

The most significant risks facing Manitoba Hydro are those rated as high consequence due to the potential magnitude of impact on the Corporation's ability to achieve its mandate and strategic goals and are quantified in the following table:

RISK	POTENTIAL FINANCIAL IMPACT
INFRASTRUCTURE	
Prolonged loss of supply	> $2 billion
DROUGHT	
Water Supply Variation / Drought	>$1.9 billion for a 5 year drought commencing in 2017/18 (IFF 15)
LOSS OF EXPORT MARKET ACCESS	> 30 % of electricity revenue

2.1 Infrastructure Risk (Category D)

A catastrophic infrastructure failure continues to be the most significant risk facing the Corporation and its customers. Potential impacts include prolonged loss of system supply, the inability to maintain minimum energy services, loss of life, severe environmental damage and significant costs to the Manitoba economy. Failure can be caused by a number of factors including an extreme weather event, sabotage, fire, human error, or technical malfunction.

By the nature of its business, Manitoba Hydro has an especially low tolerance for infrastructure risk. Significant efforts are expended on managing this risk in a manner that avoids the occurrence of a catastrophic event and minimizing consequences should a catastrophic event occur.

Risk Treatment

In the short term, actions are continually being taken to enhance emergency response and disaster management processes. In the longer term, major investment in renewal and expansion of the infrastructure system are underway to maintain and improve system reliability, energy security and safety. Key management plans and projects include:

- Major New Generation & Transmission projects which increase capacity and energy or provide increased reliability. These include building the Bipole III Reliability project with a planned in-service date of 2018/19 and construction of the Keeyask Generating Station with a planned in-service date of 2019/20. Manitoba Hydro is proceeding with the Manitoba-Minnesota Transmission Project, a transmission interconnection into the U.S. which supports enhanced export capability, reliability and drought risk mitigation.

- Renewal and replacement of aging electric and gas infrastructure through execution of a long term plan to improve system capacity and reliability. This includes critical distribution assets and stations, rehabilitation of existing generators, wood poles, cable and gas pipe replacement, cyber and physical security upgrades, and changes to gas distribution operations and pipelines to address emerging issues with respect to pipeline integrity and load growth. In response to the 2014 rupture of the TransCanada main gas pipeline, the Corporation is constructing a compressed natural gas facility to help mitigate small scale outages during a natural gas supply interruption.

- Water retaining structures and flow control management, including: surveillance inspections, instrumentation monitoring, and engineering analyses of dams and dykes including emergency plans for individual facilities; systematic utilization of failure modes-based condition assessment techniques; and rehabilitation of the Pointe du Bois spillway facility.

- Continual improvement to enhance and strengthen the Corporate Emergency Management Program. In 2015, the Emergency Preparedness Policy was revised, and an Executive Emergency Management Committee was created to provide oversight of the program and to directly support the Corporate Emergency Center during an emergency event. In addition the Corporation continues to develop and maintain emergency preparedness and response management plans.

2.2 Water Supply Variation / Drought Risk (C.1 and D.2)

On average, there is a high likelihood of a drought occurring about once in every ten years. In the circumstances of an extreme drought that is more severe than the worst on record, there is a possibility of insufficient energy supplies being available to meet firm load demands. This would result in extreme financial and reputational impacts on the Corporation. The cost of a five year drought similar to the worst on record is estimated to be $1.9 billion (IFF 15) for a drought commencing in 2017/18.

Risk Treatment

There are several measures in place to manage the impacts of a drought, as follows:

- Manitoba Hydro's current generation and transmission facilities are designed and operated to ensure firm demand can be supplied given a repeat of the lowest river flows since 1912. A drought more severe than the worst on record could occur and would require non-normal operations. This may include operating reservoirs outside of the normal range for power production. Non-normal operation may also include demand reduction measures such as public appeal for conservation, enforced conservation, or rotating reductions of non-essential load. Actions to manage drought will depend on its duration and severity and any other conditions that prevail at the time.

- Once built, the new Manitoba-Minnesota Transmission interconnection with the U.S. will provide the Corporation with increased ability to access additional amounts of energy through higher imports and through financial settlement of firm export contracts.

- Adequate financial reserves are required to protect against a repeat of the worst drought on record. At March 31, 2015 retained earnings totaled $2.8 billion. It should be noted, however, that while drought is a major quantifiable risk, an adequate level of retained earnings is required to recover from other significant risks such as a prolonged loss of supply or the loss of export market access.

2.3 Export Market Access Risk (Category A.2)

On average Manitoba Hydro derives a significant portion of its revenue from export sales to U.S. and Canadian markets. The prime impact of restricted market access would be significantly reduced net export revenues which are fundamental in keeping domestic rates low and offsetting the upfront costs of capital investments. Market access risk also includes restrictions on Manitoba Hydro's ability to import which could increase the cost of droughts, and degrade system reliability.

Risk Treatment

Manitoba Hydro continues to actively work to mitigate and manage market access uncertainties, as follows:

- In alliance with other industry participants such as the Canadian Electricity Association, and other stakeholders, Manitoba Hydro continues to lobby MISO, IESO and FERC for the development or elimination of market rules that affect electricity trade and facilitate full participation of Manitoba Hydro in US and Canadian electricity markets.

- Manitoba Hydro also engages in extensive lobbying efforts in the US to promote waterpower as a clean, reliable and renewable source of energy and to counter anti-hydro special interest group lobbying.

- The Corporation also engages with environmental, consumer and business stakeholder groups to discuss and promote its development plans.

- Market access risk is also reduced by having long term contracts and strong relationships in place with major export counterparties.

3.0 SIGNIFICANT AND EMERGING RISKS

While loss of infrastructure, drought and potential loss of export markets remain as the highest consequence risks for the Corporation, there are other significant and emerging risks that can affect the achievement of the Corporation's mission and mandate. These risks include:

3.1 Infrastructure Investment (Category D)

As noted above, Manitoba Hydro is making significant investments in a number of major new Generation and Transmission projects and initiatives in order to increase capacity and energy or provide increased reliability. These projects include construction of Bipole III and the Keeyask generating station, development of the Manitoba-Minnesota Transmission Project, replacement of aging infrastructure, and execution of new, more aggressive demand side management initiatives which target a significant increase in energy consumption savings. These plans will require the investment of approximately $17 billion (CEF 15) over the next 10 years. These projects are well into their construction cycles and any significant delays or cancellations would have significant financial, reputational and contractual consequences.

There are a number of very significant risks associated with such large initiatives that will challenge the Corporation's ability to meet Manitoba's energy needs while keeping customer rates affordable, and maintaining the Corporation's financial strength. These challenges include completing the projects on time and on budget, maintaining relationships with all stakeholders that could affect execution of these projects, and funding the investments while preserving the financial integrity of the Corporation.

Mitigation measures to address cost risks include the use of best practices in cost estimating, contracting practices and the inclusion of appropriate contingencies and management reserves. Preserving financial strength and managing stakeholder relationship issues are discussed below.

3.2 Financial Strength (B.7)

Maintaining financial strength is essential in order to make the necessary investments in infrastructure, to continue to provide safe and reliable service to customers, financially withstand the risks and uncertainties that are inherent in the Corporation's operations and to provide customers with long-term rate stability and predictability and avoid the need for large or sudden rate increases in the future.

The extensive capital investment in new and existing infrastructure will significantly weaken the Corporation's key financial ratios given that these investments will be largely funded through increased borrowing. Careful management of the Corporation's financial position is necessary in order to mitigate the risk of leaving customers exposed to sharp rate increases in the event of a prolonged drought or catastrophic outage. As well, there could be negative impacts to the credit rating of the Province if credit rating agencies were to deem Manitoba Hydro to no longer be financially self-supporting.

The Corporation has a solid plan to balance the need for investment to maintain safe and reliable service with the need to provide stable and predictable rates for customers. Key areas of focus and associated challenges are:

3.2.1 Continuing Cost Containment Measures

The Corporation continues to find and implement innovative ways to control costs without compromising the ability to deliver safe and reliable service. For example, since over 75 per cent of operating costs are comprised of wages and benefits, Manitoba Hydro has committed to reducing over 300 positions through attrition by 2016-17, resulting in annual savings of approximately $30 million. Manitoba Hydro is also targeting to limit increases in operating costs to 1% to 2021/22, excluding the impacts of accounting changes.

Other initiatives include a multi-year program to review and improve supply chain performance. The initial phase of the program has identified opportunities to reduce costs and increase operational efficiencies in materials management, fleet services and purchasing. In addition, the Corporation continues to effectively manage costs associated with its sustaining capital investment requirements by engaging in a number of asset management strategies in order to prolong the economic life of its assets and replace assets in poor health in the most cost-effective manner.

3.2.2 Pursuing Export Sales (A.2)

Net extraprovincial revenues have enabled Manitoba Hydro to maintain low electricity rates for Manitobans and as such, the Corporation will continue to aggressively pursue a balanced portfolio of profitable export sales to provide the highest financial benefits to ratepayers and all Manitobans over the long term.

Key factors affecting the ability to increase export volumes and revenues are:

- **Export Market Prices** - In recent years export prices for electricity have been affected by the economic slowdown in the U.S. and the availability of low-cost natural gas made possible by new production techniques and wind generation. The Corporation has endeavored to reflect these factors as accurately as possible in its forecasts of future export market prices. Based on the input of external industry specialists, the Corporation is forecasting a moderate rise in export prices over the long term, restrained by the continued impact of natural gas pricing and other generation options. There is a risk that export prices could be lower than industry experts are predicting, and that would be a downside risk which could hamper the Corporation's ability to achieve forecasted export revenues. This would put pressure on financial ratios and result in the requirement for higher projected rate increases.

- **Cost of New Hydraulic Generation** – The resources currently in development are supported by a number of export agreements, including a 250-megawatt sale to Minnesota Power, a 125 MW sale to Northern States Power and a 108–megawatt sale to Wisconsin Public Service. [redacted] Should their costs exceed those forecasted, the

Corporation's ability to achieve forecasted financial targets with projected rate increases would be challenging.

- **Market Access -** The new Manitoba – Minnesota transmission interconnection will help increase export revenues by increasing export capability by 883 MW and import capability by 683 MW. These increases in transfer capability will increase the amount of firm load that can be served by the Manitoba Hydro's generating system, will enhance the value of new DSM initiatives and will result in achieving higher export prices and lower import prices. The line, while increasing export volumes, will also reduce water spillage in high water years.

3.2.3 Controlling Finance Expenses

In order to maintain business continuity in times of drought or catastrophic system outage, bridge cash flow financing will be required. Therefore, it remains critically important to maintain access to sufficient market liquidity through the use of the Corporation's short term debt credit facility, as well as ready access to the debt capital markets.

Projected finance expense is expected to double over the first ten years of the IFF15 forecast, due mainly to the borrowing requirements arising from the planned capital expenditures required to meet the growing energy needs of Manitoba and to replace aging infrastructure. In addition, the potential cumulative financial impact of a one-percent change in interest rates over the next ten years is estimated at $1.0 billion (IFF 15).

Manitoba Hydro will endeavor to manage financial expense exposure by continuing to closely monitor financial markets and take action to reduce costs where prudent and feasible. As a result of the low interest rate environment over the past several years Manitoba Hydro has been able to reduce its net weighted average interest rate by approximately 2.0% since 2006/07 and increase its weighted average term to maturity by over three years during the same period.

3.2.4 Implementing Domestic Sales Rate Increases (B.7)

Manitoba Hydro's financial forecast projects the requirement for reasonable and predictable domestic rate increases of 3.95 per cent per year over the next decade.

Implementing these rate increases to ensure ongoing safe and reliable service continues to be a significant challenge in convincing stakeholders that the projected level of rate increases are in the best long-term interests of all ratepayers. Significant efforts have, and will continue to be focused on delivering compelling and convincing arguments before the PUB to obtain the required level of rate increases going into the future. Even with the projected rate increases, it is expected that Manitoba Hydro's domestic customers will continue to have electricity rates that are affordable and competitive. As well, offering new and expanded Power Smart programs are aggressively targeting additional electricity and natural gas savings, which will aid customers in managing their overall energy costs.

3.3 Regulation and Licencing (H.1)

The Corporation requires a variety of regulatory approvals and licences to carry out its activities. Key approvals and licences include those issued under the National Energy Board Act, Water Power Act and Environment Act either to build new generation and transmission facilities or to maintain the operation of existing facilities. Failure to obtain approvals and licences on favourable terms or in a timely fashion could have significant financial, operating and water regime impacts, increasing costs, and reducing hydraulic generation, capacity and export sales. Expiration of a licence without renewal will expose the Corporation to embarrassment and loss of reputation. Although highly unlikely, cancelation of a licence could expose the Corporation to the possibility that a third party could acquire the water power rights at a location and potentially the loss of the asset.

There are two significant issues currently facing the Corporation that could have significant impact on operations and reputation if they are not addressed. These are:

3.3.1 The Listing of Lake Sturgeon under the Species at Risk Act (C.3.1)

Almost all of the Corporation's hydroelectric generating stations are located where Lake Sturgeon are found. It is possible that at most sites the Department of

Fisheries and Ocean could determine that the stations are negatively affecting the fish and/or its habitat. Due primarily to historical commercial overharvest, plus additional stressors including hydroelectric development and ongoing Indigenous domestic harvest, Lake Sturgeon populations have been severely depleted over the past 100 years and the species is currently under review for listing as endangered under SARA at most locations in Manitoba. If Lake Sturgeon is listed as "Endangered" under the SARA, the Corporation could face restrictions on current operations, structural modifications to infrastructure, delays in developing new generation due to difficulties with securing permits, and high costs of recovery measures that are potentially mandated. The Corporation continues to take significant action to minimize the need for and likelihood of listing Lake Sturgeon under SARA (see detail of risk treatment on profile C.3.1), however uncertainty remains.

3.3.2 Environmental and Social Impacts of Legacy Facilities

Many of Manitoba Hydro's legacy facilities such as Grand Rapids, Kelsey, Churchill River Diversion (CRD), Lake Winnipeg Regulation (LWR), Kettle G.S., Long Spruce G.S. and the HVDC facilities were constructed without the benefit of modern environment reviews and community and Indigenous consultations.

Manitoba Hydro is now having to deal with the impacts of these legacy projects in the context of modern societal and environmental values. This is unlike recent projects such as Wuskwatim, Bipole III and Keeyask where the impacts were studied, understood and communicated up front and consultations were held. So although legacy projects have all the necessary permits and are legally compliant, the expectations of Manitobans for legacy projects reach beyond what was legally required in the past. This gap in expectations exposes the Corporation to controversy whenever it is seeking a new licence or a change to an existing licence unless it proactively addresses all legacy issues before a licencing decision is required.

This situation arose during both the Wuskwatim and BiPole III Environment Act licencing processes where the public had opportunities to express concerns associated with the environmental and social impacts of CRD and LWR projects.

In these processes the fact their Water Power Act licences were not finalized after 30 years became a point of issue leading to the Clean Environment Commission (CEC) making a non-licencing recommendation on the need to acquire final licences.

Similarly in the BiPole III process the fact that legacy hydro projects in northern Manitoba had not undergone modern environmental reviews lead the CEC to make a non-licencing recommendation that both the Province and Manitoba Hydro conduct a Regional Cumulative Environmental Effects Assessment (RCEEA) of all Manitoba Hydro projects in the lower Nelson River sub-basin before any more projects are licenced for construction.

In the recently completed LWR Final Licence hearing the CEC went even further and recommended that all legacy hydro projects in the Province should be licenced under the Environment Act.

The issue of reviewing the environmental and social impacts from legacy projects is problematic in several ways for the Corporation. Base line data is lacking, the reviews are very costly, they take many years to complete and they can lead to delays in re-licencing existing facilities or constructing future facilities.

Over the next ten years, twelve of Manitoba Hydro’s Water Power Act licences will have to be renewed. Although legally this should be a relatively simple process as prescribed under the Water Power Act regulations, public expectations, the requirement for the Province of Manitoba to consult under Section 35 of the Constitution with Indigenous peoples on all licencing decisions and the recent recommendations from the CEC on re-licencing that includes full environmental assessments and public reviews will expose Manitoba Hydro to significant costs, and potential operational restrictions. Manitoba Hydro is currently in discussions with the Province on how to proceed with re-licencing.

3.4 Indigenous Relationships and Legal (Section I)

Manitoba Hydro’s relationships with Indigenous peoples and communities are complex and have been identified as one of the key areas of focus in Manitoba Hydro’s Corporate Strategic Plan, where it is acknowledged that, “engaging impacted Indigenous communities in a positive way is vital to enhance working relationships.”

While Manitoba Hydro has made extensive efforts to address impacts arising from its existing development, some legacy issues still remain. These issues remain a negative influence on Manitoba Hydro's ongoing relationships and engagement with communities, as well as on public perception of Manitoba Hydro's role in that relationship.

Recent judicial decisions, notably the Supreme Court of Canada decisions in the Manitoba Métis Federation and Tsilhqot'in Nation cases, provide additional complexity and have the potential to impact Manitoba Hydro's relationships with First Nation and Métis peoples in terms of the specific legal principles flowing from the decisions, and from the increased confidence communities might have to explore and assert their rights.

The recently elected federal government included the acceptance of the UN Declaration on the Rights of Indigenous Peoples (the UNDRIP) in its platform. The full adoption and implementation of UNDRIP is also included in the Truth and Reconciliation Commissions Calls to Action. The current movement towards acceptance of the UNDRIP, including its references to "Free, Prior and Informed Consent" (FPIC), has the potential to affect new project development and, potentially, changes to current operations. This may include increased process, negotiation and development costs, as well as enhanced prospects for impact benefit agreements (IBAs) on all projects (generating and transmission). How the concept of FPIC will be interpreted and approached by regulators and the courts going forward is also not known.

Risk to the Corporation from the issues noted above include the potential for strained relationships, prolonged negotiations, legal challenges, work stoppages, blockades, demonstrations and other forms of civil disobedience. Each of these in turn has the potential to impact project costs and schedule, adversely affect corporate financial strength, reduce export sales, lengthen the time and increase the cost of regulatory approvals, and damage the Corporation's reputation.

The Corporation has a number of measures in place to manage these risks. These include:

- continuing to work with Indigenous communities, groups and individuals to resolve outstanding issues and grievances to the extent possible and reasonable;

- pursuing enhanced working relationships through mutually beneficial arrangements with Indigenous groups when developing new hydro facilities;

- the development, use and/or enhancement of management systems to flag obligations and to follow up on compliance;

- where faced with legal challenges, responding with appropriate legal defences; and to this end, monitoring developments in the field of Aboriginal law to ensure ongoing awareness of evolutions in jurisprudence on Aboriginal and Treaty rights and other Aboriginal law issues;

- ongoing engagement with government to identify appropriate strategies for managing challenges in the relationships, particularly in cases where acts of civil disobedience are being used as a response to relationship impasses;

- consistent with recent Clean Environment Commission and Provincial recommendations, and the Truth and Reconciliation *Calls to Action*, shifting the corporate focus to reconciliation efforts and the development of a strategy to work with communities towards reconciliation.

3.5 Emerging Energy Technologies (J.1)

Improvements and production cost reductions are occurring in competing supply options that have set a trajectory where commercial viability of these supply sources will influence decisions of future alternative resource options. At the present time these competing options do not face the same environmental, regulatory and stakeholder challenges as constructing new hydro facilities.

Emerging technologies have also put downward pressure on export market prices and this could continue well into the future. Continued low export prices could affect the viability of new future hydro-electric generation and may also reduce a portion of existing generating facility values due to the long life spans of these facilities.

Manitoba Hydro’s current resource plans indicate that no new generation is required until 2033. This requirement is based on current load forecasts that include new DSM targets that are updated annually to reflect information that is available. This time frame allows the Corporation to assess new alternative energy technologies and work towards an integrated resource plan which determines the appropriate combination of resources to meet multiple objectives (technical, environmental etc) at the lowest cost to Manitobans.

3.6 Human Resources

Attracting, developing, retaining and protecting a highly skilled and motivated workforce that reflects the demographics of Manitoba is critical to Manitoba Hydro's success. Key risks related to human resources are as follows:

3.6.1 Safety in the Workplace (E.1)

Employee safety is always a key concern to the Corporation due to the inherent nature of the operational work performed by Manitoba Hydro. To date a focus on continuous safety improvements has resulted in a steady decline in workplace accident severity and frequency rates. The Corporation is committed to continuously improving safety performance and focusing on strategies to instill a safe and health culture in all Corporate activities. Strategies include implementing a seven point safety enhancement strategy that includes annual executive site safety reviews, developing Corporate Rapid Response Teams for various issues, and moving the Corporation beyond compliance by forming a new high performance Risk Prevention Services team.

Manitoba Hydro's international operations in developing countries exposes employees and their families to increased risk of disease, crime, or injuries from political, ethnic or religious conflict. A number of measures are taken to mitigate these risks, including providing employees with medical advice and medi-vac transportation, specialized location security advice, secure accommodations and having emergency response and evacuation plans.

3.6.2 Workforce Management (E.3)

Attracting, developing and retaining a highly skilled and motivated workforce that can effectively carry out the very important, complex and new corporate initiatives are critical to the Corporation's success. Key factors that impact the ability to achieve this are the number of employees that are eligible for retirement, competition for highly skilled workers, and the ability to keep up with technological and other changes. Manitoba Hydro's contractors will also be impacted by the same competition.

The Corporation is looking at the demographic shift that is occurring in its workforce as a challenge as well as an opportunity. Nearly 900 employees are eligible for retirement in 2015. With years of accumulated experience and knowledge, many of those nearing retirement age are key contributors to the Corporation's success, and that knowledge can be lost with little notice. It is important therefore that appropriate leadership, management, succession planning, recruitment and retention activities are in place to maintain safe and reliable service and to manage the loss of valuable experience and knowledge that can result from the retirement of key contributors. Given that business needs are changing and new technologies are available, there is an opportunity to achieve efficiencies and cost reductions through attrition.

3.7 Other Significant and Emerging Risks

Other significant and emerging risks that can affect the achievement of the Corporation's mission and mandate are as follows:

3.7.1 Reputation (G.1)

The Corporation's reputation has been impacted by issues related to trust and transparency, rate increases, labour relations, and major projects (e.g. need, financial management, local reaction). Many of these challenges are likely to continue and others may emerge (e.g. new licencing requirements and Power Smart arrangements). As a result, there is a continuing need to focus on sustaining and enhancing corporate reputation. Accordingly, the Corporation will continue to take steps to enhance its reputation through all its daily actions, including comprehensive, timely communications, respectful interactions with stakeholders, and provision of safe, reliable, and affordable energy services to customers.

3.7.2 Upstream Gas Cost Uncertainty (B.5)

There is significant upward cost pressure for transportation services on the TCPL Canadian Mainline (the "Mainline"), to which Centra is currently captive in bringing natural gas to its load centre. The Mainline is significantly underutilized resulting in less revenue than that which is required to cover the Mainline's relatively high embedded cost structure. As a result, the pipeline has been seeking regular toll increases since 2010, which costs are passed through to Manitoba natural gas ratepayers. Tolls on the Mainline also affect transportation services that Centra obtains from third parties.

This market risk is compounded by a proposal by TCPL to segment the Mainline's cost allocation and tolls post-2020 between the under-utilized Western Mainline (on which Centra moves gas) and the highly utilized Eastern Ontario Triangle, which would facilitate the avoidance of cost responsibility for under-utilized or stranded assets on the Mainline by eastern shippers at the expense of Centra and other captive shippers on the Western Mainline. Centra is the largest captive shipper on the Western Mainline. The outcome is highly uncertain at this time. The NEB has approved segmentation in principle and intends to review it and other pricing issues in future proceedings. Centra will mitigate TCPL tolls risk by actively participating in TCPL's regulatory proceedings before the NEB as appropriate in order to ensure that Manitoba natural gas consumers' interests are adequately represented.

3.7.3 Cyber Security (F.2.1)

The growth of electronic communication and automation, while delivering significant benefits, has also increased risk to the Corporation. This risk includes any cyber attack that could impact the resiliency, reliability, confidentiality, availability or the integrity of Manitoba Hydro information and operational technology assets, including the theft of personal and or business information, and or the disruption/misuse of critical operations/assets. Any computer or control system if not secured properly may be considered a potential target.

Countermeasures, management controls and processes are in place to mitigate this risk. The Corporation has implemented a series of measures to further augment cyber-security efforts consistent with recommendations of the Office of the Auditor General. Concurrently, to meet current NERC security standards Manitoba Hydro has also undertaken several projects targeted at increasing safeguards over critical cyber assets.

Ongoing assessment and enhanced mitigation strategies are required as the sophistication of external cyber threats increases, and as more computer and control systems are inter-connected. The Enterprise Security Council comprised of senior executives provides oversight for all aspects of physical and technology security including NERC related projects and the implementation of the Auditor General's eight recommendations, of which four have now been completed.

To protect Manitoba Hydro's information technology environment an advanced corporate firewall is in place to protect the data network. Additionally, anti-virus software and security patches are closely monitored and updated immediately to prevent data corruption. The Corporation is finalizing the implementation of a Security Information & Event Management (SIEM) tool to further raise the level of protection. It will be fully operational by spring, 2016.

3.7.4 Wholesale Electricity Markets Compliance Program (A.2.1 / H.3)

To maintain market access and mitigate exposure to market manipulation risk, the Corporation is in the process of implementing a Wholesale Electricity Markets Compliance Program to establish policies, procedures and guidelines pursuant to anti-market manipulation laws in place in the U.S. and Canada. This program will outline roles and responsibilities of those identified in the program, provide direction to employees transacting in the export markets, identify permissible and prohibited trading considerations and specify policy with respect to potential violation investigations, disputes and reporting, training requirements, record retention practices and compliance monitoring related to the Corporation's participation in the wholesale electricity markets.

3.7.5 NERC/MRO Reliability Standards (H.5)

Achieving the highest level of reliability is one of the core tenets of Manitoba Hydro's Vision statement. In support of this vision, Manitoba Hydro is a member of the North American Electric Reliability Corporation (NERC) and has been legally required to comply with nearly 100 of its reliability standards since 2007. These standards specify requirements for planning, operating and maintaining the bulk electric system. The Corporation has developed a Corporate NERC Reliability Compliance Program to manage the demands of compliance, however uncertainty continues to exist with respect to the interpretation of some standards. As well existing standards are also continually being revised and new ones are being adopted on a regular basis.

3.7.6 Supply Chain (F.1)

The Corporation requires a variety of critical goods and services to achieve its objectives. [redacted] Action is being taken to review [redacted] requirements and contingency plans.

3.7.7 Strategic Direction and Execution K.1)

Manitoba Hydro continues to be at a critical point in renewing and expanding Manitoba's electrical and gas system. Major strategic decisions, plans and assumptions are subject to significant internal and external review and approval processes. Decisions for future power generation, transmission and distribution will depend on the best information at the time, and plans will be modified at key decision points if circumstances warrant.

4.0 CORPORATE RISK MAP

Corporate Risk Profiles (see Appendix B) identify and assess each risk facing the Corporation, describe activities used to manage the risk, and provide estimates of the potential residual impact to the Corporation in terms of likelihood and consequence after mitigation actions have been taken. The Corporation's tolerance for each risk and an assessment of whether the risk is within or outside the desired tolerance level is also provided. The risk rating and tolerance criteria are provided in Appendix C. As well, further detail of the risk tolerance assessment for each risk is provided in Appendix A.

The following Corporate Risk Map illustrates the results of a residual risk assessment for all risks facing the Corporation.

APPENDIX A

CORPORATE

RISK TOLERANCE

ASSESSMENT

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
A. MARKET				
1. Domestic				
1.1 Competition	Medium	Natural gas market share, greater than or equal to 60%.	Manitoba Hydro's natural gas market share is currently at approximately 60%.	Manitoba Hydro intends to continue offering fixed-price primary gas products to small volume consumers compatible with product demand as well as Power Smart programs and services to meet customer needs.
1.2 Uneconomic Loads	Medium	Intensive loads do not materially exceed 25 MWs.	Substantial expansion of energy intensive industry at current rates has the potential for adverse impact on financial strength.	Continue to explore rate concepts based on marginal cost. Advance Time of Use proposal for regulatory approval.
1.3 Load Growth Uncertainty	Medium	Variations in load growth from forecast are manageable.	An extensive load growth forecast that includes DSM actions and IFF update are completed annually. Development plans to meet resource requirements are revised as necessary.	Update load forecast and resource development plans as required. Implement integrated resource planning.
2. Export				
2.1 Regulatory Environment	Medium	Unfettered market access.	Market rules are continually evolving with new rules being imposed that could impact future access. These include jurisdictional overreach by FERC and MISO Tariff changes including changes to PPA requirements. Ontario recently implemented a General Conduct Rule which will potentially sanction otherwise legitimate market behaviour.	Manitoba Hydro collectively manages its market access risks through a comprehensive set of activities to monitor and address any potential threats to market access. The Corporation is in the process of implementing a Market Compliance Program to manage the risk of any potential market manipulation activities in the wholesale electricity markets.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
2.2 Long Term Price Uncertainty	Medium	Downward price pressure due to new technologies limited to $100 million per year.	Technological developments for natural gas production & policy for wind incentives for wind development are occurring but are within tolerance limits.	Manitoba Hydro maintains a balanced portfolio with long-term contracts to reduce exposure to price variation.
2.3. Transmission Interconnection Capacity	Low	Maintain adequate transmission interconnection capacity.	Manitoba Hydro influences ratings through a cooperative process with MISO, and tie line partners. The Corporation also participates in reserve sharing agreements to maximize transfer capability. Ratings have not changed.	Maintain current efforts. To further mitigate risk, Manitoba Hydro is proceeding with a second 500 KV interconnection to the US and an additional 230 kV interconnection with Saskatchewan.
2.4 Special Interest Groups	Low	No negative image impact that materially affects opportunities for long-term firm power sales or the price that can be obtained.	Some residual risk remains. In spite of best efforts to counter anti-hydro lobbying, legislators and customers may still be negatively influenced. Regulators decisions may extend the regulatory process, deny approval or require onerous terms.	Continue to promote waterpower as clean, reliable and a renewable source of electricity. Aggressively counter Special Interest Group activities with Manitoba Hydro perspective. Expand engagement with groups who may lobby for or against Manitoba Hydro.
2.5 Protectionism	Low	Full participation in export markets	Manitoba Hydro offers a carbon-neutral energy alternative which many states will require in order to meet recently announced EPA rules requiring states to reduce CO2 emissions and develop plans as to how it will achieve those goals. MH is a sought after supplier and imports of hydropower into the US have recently been accepted as a qualifying resource in the US Clean Power Plan.	Maintain industry and regulatory representation. Continue monitoring and lobbying efforts in US and Canada for energy policy and market rules.

(green)	Risk is being managed appropriately and is not expected to materially change.
(yellow)	Some emerging issues need to be monitored and additional action may be required.
(red)	Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
B. FINANCIAL				
1. Exchange	Medium	As defined in the Foreign Currency Exchange Risk Management Program.	Current exposure falls within the target. As well a $0.10 change in FX rate results in less than a $7.6M change in net income.	Continue to monitor USD cash forecast and take appropriate actions to stay within the risk targets.
2. Interest Rates	Medium	The aggregate of: i) floating rate debt, ii) short term debt, and iii) fixed rate long term debt to be refinanced within the subsequent 12 month period; is limited to a maximum of 35% of the total debt portfolio.	Within established policies and guidelines.	Continue to monitor economic and financial market conditions, while undertaking appropriate debt management strategies and operating within policy limits.
3. Credit	Medium	As defined by counterparty credit rating, limits and arrears policy.	Within established policies and guidelines. .	Maintain existing controls, closely monitor global credit issues, establish enhanced credit risk measurement capability to quantify credit risk exposure and ensure use of consistently applied practices to mitigate exposure.
4. Inflation	Medium	Sales rate increases within justifiable and acceptable limits.	Prolonged high levels of inflation could begin to jeopardize the achievement of Manitoba Hydro financial targets and necessary capital program. Cost constraint measures have been further implemented.	Continue to monitor inflation impacts, insert inflation adjustments into export contracts if possible, ensure all costs fully justified and monitor effectiveness of cost constraint measures.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
5. Upstream Gas Cost Uncertainty	Medium	Sales rate increases due to increases in upstream gas commodity, transportation and / or storage costs within acceptable limits. Financial impacts from Fixed Rate Program also within acceptable limits.	There is the potential for significant future upward cost pressure for transportation services on the TCPL Canadian Mainline to which Centra is currently captive, as well as the ANR and GLGT systems which are wholly owned by TCPL. Gas cost rate uncertainty for the primary gas service is mitigated through a Rate Volatility Management Program, a fixed rate service or a third party marketer, and an equal payment plan. A self insurance risk premium and risk thresholds will mitigate financial impacts and trigger a review of the program.	Participate in NEB and FERC regulatory proceedings on matters related to the TCPL mainline and the ANR and GLGT systems in the U.S. Explore alternatives as required, such as the development of local underground natural gas storage.
6. Gas Derivative Instruments	Medium	Gas derivatives will not be used in the normal course.	Changes to the program were approved by the PUB and derivatives will not be used in the normal course.	Further use of derivatives justified and approved as required.
7. Financial Targets	Medium	Maintain adequate capital structure and other financial targets	Significant progress has been made toward achieving financial targets; however targets are expected to deteriorate for several years due to new major generation and transmission facilities and other significant capital expenditures. Targets are expected to recover towards the end of the 20 year IFF period.	Manage by adopting and updating appropriate targets, making annual contributions to retained earnings, achieving annual contributions through a combination of cost controls, high export revenues, and regular reasonable domestic rate increases.
8. Energy / Fuel Price Volatility	Medium	Included in drought tolerance for power purchase requirements.	Good water conditions currently exist, however volatility in prices has increased with the development of competitive energy markets.	Diverse sales portfolio and effective use of the MISO day ahead market. Hedging is a possibility. Retained earnings sufficient for any variations.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
9. Power Financial Instruments	Low	As defined in the Wholesale Export Power Policy.	Within established guidelines.	Corporate Risk Management is finalizing the installation of risk software that will provide enhanced risk measurement capability.
10. Liquidity	Low	As per the Manitoba Hydro Act, the temporary borrowing limit shall not exceed in the aggregate the sum of $500 million.	Within established guidelines.	Cash receipts and disbursements are closely monitored on a daily basis. Short term debt balances and forecasted cash requirements are also monitored, with short term debt converted to long term debt as required. Fund three months in advance of requirements.
C. ENVIRONMENTAL				
1. Water Supply Variation / Drought	Medium	Operation Planning Criteria and adequate financial reserves. Potential 5 year drought impact is $1.9 billion for a drought commencing in 2017/18 (IFF 15)	Good water conditions that could change within a year. Sufficient retained earnings to withstand extended drought. Natural gas and power prices are expected to be low for the near-term.	Retained earnings sufficient for reduced flow/revenue due to drought.
2. Climate Change	Low	Climate change impacts expected to occur gradually	Climate change issues on water supply are being studied. Any required adaptation to operations and resource plans will be made as information becomes available.	Continue to monitor progress on determining climate change impacts and respond accordingly.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
3. Operational Impact and infrastructure	Medium	No unplanned environmental impacts, ISO 14001 compliant, CSP environmental targets met.	There are a number of environmental issues that are or could affect future operations of the Corporation. The most significant include the potential of Lake Sturgeon being listed as endangered (see 3.1 below), and the need to address environmental and societal impacts and expectation for legacy facilities. See risk profile H.1.	Complete the RCEEA and continue discussions with the Province on how to proceed with re-licencing.
3.1 Legal - Species at Risk Act	Medium	No undue restrictions on current operations and ability to build future projects.	The Corporation has taken significant action to minimize the need for and likelihood of listing Lake Sturgeon under SARA. However uncertainty remains regarding whether the Federal Government will decide to list Lake Sturgeon under SARA.	Continue actions to minimize the need for listing Lake Sturgeon under SARA.
4. Reliability of Supply	Low	No major obstruction to plans and operations to build necessary facilities.	Enhanced scrutiny and regulatory oversight of proposed system improvements and the added time and cost needed to obtain licences and permits.	Be proactive in addressing concerns and ensure adequate lead times to resolve issues.
5. Upstream Regulation and Water Withdrawals	Low	Changes in water supply expected to be gradual.	Good water conditions exist reducing pressure on water supply diversions in the short term.	Continue monitoring responsible entities.

(green)	Risk is being managed appropriately and is not expected to materially change.
(yellow)	Some emerging issues need to be monitored and additional action may be required.
(red)	Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
D. INFRASTRUCTURE				
1. Loss of Plant (all property, all perils)	Low	No major facility loss. CSP reliability targets and contingency standards. Max insurance coverage is $7.0 billion.	Maintain Reliability, Dam Safety and Insurance programs including annual reviews.	Continue to assess exposures of loss and develop appropriate risk reduction alternatives and emergency plans.
1.1. Water Retaining Structures and Flow Control	Low	No water retaining structure failures, following Canadian Dam Association guidelines, maintain appropriate emergency preparedness plans.	The risk of dam breach is addressed by ensuring the integrity and reliability of water control equipment and structures through diligent maintenance and vigilant surveillance, as well as preparing for emergencies, as per Cdn Dam Assoc guidelines. Residual risk of dam failure can be mitigated but not eliminated.	Maintain Dam safety program and improve structures where deficiencies are known.
2. Extreme Drought - Shortfall of Energy Supply	Low	Historical low flows determine firm supply and operating reservoir levels.	Current water conditions suggest that loads will be met.	Maintain current water resource management systems.
3. Prolonged Loss of System Supply	Low	. No long term system outages, compliant with reliability standards, appropriate continuity plans in place.	No long term events have been experienced recently. However, an aging system has areas of significant concern.	Several capital items have been approved which will reduce exposure to a catastrophic event. Regularly maintain, review and update business continuity plans.

Green: Risk is being managed appropriately and is not expected to materially change.
Yellow: Some emerging issues need to be monitored and additional action may be required.
Red: Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
4. System Shutdown (Short Term)	Low	No major system outages, CSP targets for reliability of service (e.g. SAIDI, SAIFI), compliance to reliability standards, emergency response plans in place.	Manitoba Hydro's reliability performance shows an increased trend of outage frequency and duration, and generation forced outage rates have increased in the last four years. The Corporation is continually upgrading the system.	Maintain reliability standards and ensure system reliability through planned maintenance and upgrades. Regularly maintain, review and update emergency preparedness plans for system restoration and response.
5. System Shutdown (Natural Gas)	Low	Gas supply is available to meet the needs of the province. No undue impact on electrical grid due to gas system failure.	TransCanada Pipelines has incorporated design practices to minimize the possibility of a catastrophic event occurring. The design practices have been effective over the course of several incidents in past decade with the exception of the 2014 Otterburne pipeline rupture that resulted in a loss of service to a number of communities. MH has retained standby services to provide compressed natural gas (CNG) for small scale outages during a supply interruption for the 2015/16 winter.	Ongoing monitoring to ensure that TransCanada Pipelines maintains a safe and secure natural gas transmission system. Maintain and review emergency response procedures and conduct exercises. CNG equipment and facilities are being purchased and constructed.
6 Technology	Low	Computer operations will not be compromised. Compliance with all security standards.	Highly complex area that is constantly changing and operations have not been compromised.	Continuous review and updating of the comprehensive disaster recovery plans. Complete actions to address security risks in the Enterprise IT Security Assessment

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
7. Concerned Stakeholders	Low	No restrictions to infrastructure requirements, particularly projects that are required for safety and reliability reasons.	Lobbying has caused delays and resultant impact on reliability in a number of projects, including BiPole III.	Proactively identify and address issues to ensure construction schedule.
8. Corporate Emergency Management Program (CEMP)	Low	Ability to provide emergency response to maintain or restore minimum acceptable energy services to protect human life and the environment. No undue financial consequences to the Corporation and Manitoba economy.	The CEMP continues to be enhanced with the revision of the Emergency Preparedness Policy and the establishment of the Executive Emergency Management Committee (EEMC). Initiatives currently underway include developing a corporate plan for business continuity for continuation of essential services and critical functions (electrical and gas restoration, bill collection, power trading) and constructing an emergency fuel depot.	Continuous oversight by the Executive Emergency Management Committee (EEMC) to confirm Business Continuity Plans (BCP), Hazard Risk Assessment (HRA), Preparedness, Response and Recovery Plans are reviewed and tested to ensure Manitoba Hydro has the ability and can respond to emergency events.
E. HUMAN				
1. Safety and Health	Low	Within CSP targets for high-risk accidents accident severity and frequency.	Focus on continuous safety improvements has resulted in a steady decline in workplace severity and frequency rates. MH is committed to continuously improving safety performance and instilling a safe and health culture in all activities.	Continue to focus on continuous safety improvements and instilling a safe and health culture. Strategies include implementing a seven point safety enhancement strategy and developing programs with an internal Rapid Response Team for various issues.
1.1. Infectious Disease	Low	Effective response to disease outbreak.	An Influenza Pandemic Plan was reviewed and updated in September, 2009. Monitor health authority requirements and make changes as required.	Continue to monitor and make any required changes to meet health authority requirements.

Green	Risk is being managed appropriately and is not expected to materially change.
Yellow	Some emerging issues need to be monitored and additional action may be required.
Red	Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
2. Union / Employee Issues	Low	Continued positive relations and contract settlements.	A new three year agreement negotiated between the Corporation and IBEW was ratified in early January, 2016. The other three agreements were renewed in 2013 and expire in 2016.	Continue to address employee issues in good faith to ensure that relationships remain positive.
3. Workforce Management	Low	Key vacant positions filled with qualified people. Continue strong relationships and enhance partnerships with post secondary institutions.	Significant retirements in the near future combined with a shrinking labour pool. Implementation of a comprehensive succession planning program.	Completion and maintenance of detailed succession plans for all key strategic & critical positions. Continuous update of retirement forecasts and recruitment plans. Continued redeployment training programs.
4. Technology	Low	Technology issues fully understood and effectively incorporated into existing systems.	Several different technologies exist within Manitoba Hydro's infrastructure and staff have been able to keep up to both older and newer technologies. This risk will increase with time.	Maintain an appropriate level of resources to manage this increasing risk.
F. BUSINESS OPERATIONAL				
1. Supply Chain	Low	Established 90 day supply for critical items. Emergency spares maintained. Materials available when needed.	Material and services delivered within policy however the demand for construction services in some trades is still a concern. In some cases have exceeded budget expectations. .	Continue risk management protocol, including monitoring market trends, sourcing strategic alliance partners, reducing single source provider and stocking emergency spares of critical items.
2. Operational Controls	Low	Adherence to all established guidelines, procedures, policies and programs.	Adequate control structures in place and working. Exceptions reported and appropriate corrective action taken.	Maintain effective control mechanisms.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
2.1 Cyber Security	Low	No undue impacts from cyber attacks on information or critical operational assets.	Controls and processes are in place to mitigate risk. Further measures are being developed and implemented to augment efforts, consistent with recommendations of the provincial Auditor General.	Continue to develop and implement further measures under the governance of the Enterprise Security Council.
G. REPUTATION	Low	No negative image impacts. Meet CSP customer service and public attitude index targets.	Manitoba Hydro's customer satisfaction rating is just above its five year average and is well above the average for Canadian utilities. Reputation could be impacted by issues related to construction of major projects, labour relations, new Power Smart arrangements, new licencing requirements, rate increases, and corporate trust and transparency.	Continue to take steps to enhance the Corporation's reputation, through all its daily actions, including comprehensive, timely communications, respectful interactions with stakeholders, and provision of safe, reliable, and affordable energy services to customers.
H. GOVERNANCE / REGULATORY / LEGAL				
1. Regulation and Licencing	Low	Current restrictions and licences maintained. New facilities receive favourable licencing.	Issues that could have significant impact on operations and reputation include Lake Sturgeon being listed as endangered (see profile C.3.1) and addressing environmental and societal impacts and expectations for legacy facilities. These include addressing CEC recommendations for completion of a Regional Cumulative Environmental Effects Assessment (RCEEA), as well as that all legacy hydro projects be licenced under the Environment Act.	Continue to take action to minimize the need for and likelihood of Lake Sturgeon. Complete the RCEEA and continue discussions with the Province on how to proceed with re-licencing.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
2. Export market Access	Low	Current capacity to export continues (100%)	Rules are constantly changing in export markets. Corporation vigilant in monitoring changes, assessing possible impacts and advocating resolution consistent with corporate interests.	Actively participate in organizations and processes related to rule development and application. Ongoing assessment.
3. Legal Compliance	Low	Compliant with all laws and regulations.	For a large diverse company it is not realistic to reduce the risk of non-compliance to zero. Actions are intended to provide realistic assurance that compliance risks are being addressed.	Ongoing actions to address compliance issues at various levels of the Corporation.
4. Contacts and Ventures	Low	Adherence to all terms and conditions. High risk agreements appropriately reviewed and executed.	Corporation ensures adherence through an effective contract and venture control system.	Maintain control systems.
5. NERC/MRO Reliability Standards	Low	Full compliance to all applicable NERC / MRO standards.	Uncertainty continues to exist with respect to interpretation of some standards. Existing standards are also continually being revised and new ones are being adopted on a regular basis.	Continue to build a strong culture of compliance where all staff understand the impact of day-to-day activities and make corresponding decisions that support on-going compliance.

Risk is being managed appropriately and is not expected to materially change.
Some emerging issues need to be monitored and additional action may be required.
Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
I. INDIGENOUS				
1. Relationships	Low	Workable impact management frameworks or reasonable offsetting arrangements in place with all Indigenous communities adversely affected by Manitoba Hydro operations. Indigenous employment targets achieved. No Strained relations.	Reasonable arrangements are in place with the communities that do not have workable management frameworks. If a community raises an adverse effects concern, Manitoba Hydro will endeavour to investigate and address the concern. Employment numbers are generally exceeding targets. There are strained relations with many communities and resource user groups, including groups who have impact arrangements in place with Manitoba Hydro.	Continue working with indigenous communities to resolve outstanding issues to the extent possible and reasonable. Engage with government to identify appropriate strategies for managing challenges in the relationships, particularly in cases where acts of civil disobedience are used as a response to relationship impasses.
2. Legal	Low	No unfavourable rulings, Compliant with all existing legal requirements.	Demands exist from several sources which could ultimately result in unfavourable rulings. Management systems have not identified any compliance concerns that are not being addressed. Statements of Claims have been filed against Manitoba Hydro.	Measures include (1) Legal responses to legal challenges. (2) Maintain and continuously improve compliance management systems (3) Filing statements of defence, and (4) Monitoring developments in the field of Indigenous law, including Supreme Court decisions.

(green)	Risk is being managed appropriately and is not expected to materially change.
(yellow)	Some emerging issues need to be monitored and additional action may be required.
(red)	Urgent attention required

RISK	RATING	TOLERANCE	STATUS	MGMT ACTION
J. EMERGING ENERGY TECHNOLOGIES	Low	Develop integrated resource plan which uses appropriate combination of resources to meet MH objectives.	Significant improvements and cost reductions in new emerging energy technologies could put downward pressure on market prices and affect MH marketing opportunities, thus reducing revenues from existing assets. MH is actively assessing and working towards an integrated resource plan that determines the appropriate combination of resources to meet objectives.	Continue to assess new technologies and develop integrated resource plan that determines the appropriate combination of resources to meet objectives.
K. STRATEGIC	Low	Long term goals are pursued. No missed opportunities. No unfavourable business decisions.	High level strategic considerations include large scale capital projects to meet future needs of the province and re-investment of the existing energy system. Major strategic decisions, plans and assumptions are subject to significant internal and external review and approval processes.	Decisions for future power generation, transmission and distribution will depend on the best information at the time, and plans will be modified at key decision points if circumstances warrant.

APPENDIX B

CORPORATE

RISK PROFILES

RISK PROFILE INDEX

Likelihood	Low
Consequence	Med
Tolerance	Med

CATEGORY: A. Market

TITLE: 1.1 Domestic – Competition

RISK: Increasing competition may result in a reduction of domestic market share.

DESCRIPTION:

Over the past few decades, the energy utility industry has seen some structural changes with these changes varying somewhat throughout North America. Within these changes, there has been some movement towards creating a more competitive energy services environment with customers having a choice of energy supplier and more choice in energy products (e.g. time of use rates/green energy with electricity, customer self-generation, fixed price products with natural gas and a carbon neutral option).

In Manitoba, customers have a choice in their Primary Gas supplier and no choice with all other system supply electricity and natural gas related services. In the early 2000's, some regions including Manitoba reassessed their respective market structures involving primary natural gas services. In Manitoba, competition in the supply of primary natural gas is quite limited with only two brokers (Just Energy Manitoba and Planet Energy) offering service within the SGS Residential market and six offering services to Commercial and Industrial customers. Currently, a declining number of natural gas residential customers (approximately 6%) have entered into contractual arrangements with brokers involving four to five year terms to deliver their primary gas needs. The number of SGS Commercial and LGS customers combined in contractual arrangements with brokers has also declined (approximately 5%).

During 2007, following a review of the competitive landscape of the natural gas market in Manitoba, the PUB concluded that it was not satisfied with the service options and pricing currently available to Manitoba consumers for Primary Gas service. As a consequence, the PUB ordered Centra, a subsidiary of Manitoba Hydro to file a comprehensive proposal to enter the fixed-price primary gas market. In 2009, Manitoba Hydro started offering consumers the choice of 1, 3 or 5 year fixed-price primary gas products with the price and offering terms varying during various marketing periods. As of November 2015, less than 1% of SGS and LGS customers have entered into fixed rate contracts with Manitoba Hydro.

Although Manitoba Hydro enjoys a significant monopoly environment within the electricity and natural gas utility market, pressures may arise in the future which could change this situation. For this reason, the Corporation is exposed to risks associated with market share loss.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Enhanced competition in the natural gas business would impact Manitoba Hydro's strategic goal of providing customers with exceptional value and meeting its target market share in natural gas (i.e. greater than or equal to 60% of commodity sales). Loss of market share would have a negative impact on the Corporation in terms of realizing the benefits and synergies associated with serving a larger customer base. Introduction of competition in the electric business would impact Manitoba Hydro's position of being the sole supplier of electricity in Manitoba. This would result in the loss of synergies associated with being an integrated company and those benefits provided through economics of scale.

RISK TREATMENT:

The risk associated with this category is managed through all of the Corporation's strategic goals and actions. These initiatives are dynamic in nature and are outlined within the Corporation's Strategic Plan.

Likelihood	Med
Consequence	Low
Tolerance	Med

CATEGORY: A. Market

TITLE: 1.2 Domestic – Uneconomic Loads

RISK: Manitoba Hydro's low electricity rates could attract energy intensive industries which may impact short term export revenue and cause the advancement of new generation.

DESCRIPTION:

Manitoba Hydro's rates to Manitoba consumers are based on the embedded cost of its operations less a credit for net export revenues. Manitoba Hydro is one of the lowest cost producers in the world, with substantial sales into export markets at prices which reflect the real value of electricity. As a result of this export revenue subsidy, domestic loads could be considered "uneconomic" in the sense that absent the subsidization by export revenues, domestic rates do not recover the full embedded cost to serve.

While the decisions of most new businesses or residents to locate to Manitoba are not driven substantially by electricity rates, there are some energy-intensive industries that may be attracted by the low electricity rates. In some cases, it is not apparent that other benefits to the province, such as taxes and employment derived from energy-intensive industry, outweigh the losses due to foregone export revenue.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Substantial expansion of energy intensive industry at current rates has the potential for adverse affects on attainment of the Corporation's strategic objective to protect and improve its Financial Strength, as it may affect our ability to:1) Utilize resources efficiently and effectively to fulfill our mandate and provide maximum value to our stakeholders and ratepayers, and 2) Aggressively pursue a balanced portfolio of domestic and profitable export sales to provide the highest financial benefits to ratepayers and all Manitobans over the long term.

RISK TREATMENT:

Manitoba Hydro supports Time of Use rate concepts as well as rate concepts based on marginal cost which could be generally applicable to all major loads, not just energy intensive industrial loads. These types of rates have the virtue of being applicable to much more usage as well as being more specific with respect to time periods of usage.

As directed by the Public Utilities Board, a review of the Time of Use proposal and proposed changes to the Corporations Cost of Service Study will be addressed at a regulatory proceeding to be scheduled in 2016.

Likelihood	High
Consequence	Low
Tolerance	Med

CATEGORY: A. Market

TITLE: 1.3 Domestic – Load Growth Uncertainty

RISK: Variation in the domestic load from forecast can impact when new resources are required and the quantity of surplus available for export.

DESCRIPTION:

There is financial risk associated with uncertainty in the domestic load forecast. Lower than forecast domestic load will result in lower net revenues as unit revenues from the domestic market generally exceed those from the export market.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The prime impact of this risk is reduced corporate net revenues. To some extent this risk may be mitigated by an increase in MH's export sales activities. If additional long term firm sales can be arranged this may offset the decline in domestic revenues. If not, additional export market sales may be insufficient in offsetting the domestic revenue reduction

RISK TREATMENT:

The Corporation can manage load forecast uncertainty by appropriately distributing export sales commitments over the complete range of power sales time horizons from long-term down to real time. If the Manitoba load growth is higher than expected, then long term export sales commitments can be reduced over the long term. Similarly, if the Manitoba load growth is less than expected, additional long term export sales can be committed.

The Manitoba load forecast, power resource plan and IFF are updated annually to reflect any changes in long-term domestic demand due to factors such as energy pricing, economic activity, population and housing, among others. The Corporation also considers higher and lower load forecast scenarios along with the base load forecast when preparing resource development plans or long-term contract recommendations.

Likelihood	Low
Consequence	High
Tolerance	Med

CATEGORY: A. Market

TITLE: 2.1 Export – Regulatory Environment

RISK: Changes in regulation could restrict access to the export market.

DESCRIPTION:

Unfettered market access is key to the Corporation's ability to maximize export revenues. Regulatory and/or industry change both in Canada and the US is considered to be a fundamental export market risk. These changes may lead to increased costs for the Corporation or limit its access to, the US and Canadian markets as market rules may conflict with the legal requirements governing the Corporation or because they lead to discriminatory treatment of Manitoba Hydro. Entities that may contribute to or influence market access risks include MISO, IESO, AESO, FERC, NERC, MRO, NAESB, State governments (Wisconsin and Minnesota), Provincial and Federal Industry and Trade departments and the Canadian Electricity Association (CEA).

This risk profile is related to Export Market Access, Governance / Regulatory / Legal (H.2). Collectively, market access risks are legal, regulatory, or structural issues which could prevent or restrict Manitoba Hydro's surplus power from reaching a competitive marketplace.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The prime impact of restricted market access is reduced net revenue from the export power market. Similarly, the business case for building new hydro generation would also be at risk. Furthermore, changing market structure and access rules may require both legal and organizational change (e.g. adherence to reciprocity requirements of the export market).

RISK TREATMENT:

The Corporation, and when appropriate, in alliance with other industry participants such as the CEA, MISO, Transmission Owners, and other stakeholders, continues to lobby entities including MISO, IESO, AESO and FERC to develop market rules that support the elimination of barriers to trade and facilitate full participation by Canadian electrical energy producers within the US and Canadian markets. The Corporation has entered into a specialized agreement with MISO, which allows for the co-ordination and comparability in operations and tariffs, while minimizing impacts on corporate structure and maintaining Manitoba Hydro's sovereignty requirements.

Likelihood	High
Consequence	Med
Tolerance	Med

CATEGORY: A. Market

TITLE: 2.2 Export – Long Term Price Uncertainty

RISK: The average price received from future export sales may differ from forecast.

DESCRIPTION:

New technology, cost reductions or potential subsidies to various competing generation resources in Manitoba Hydro's export market may put downward pressure on the market price and result in reduced demand for the Corporation's export products.

This risk profile is related to J.1 Emerging Energy Technologies

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The impact of this risk is reduced net revenue from the export power market. Downward pressure on the market price will also negatively impact the business case for the advancement of new generation.

RISK TREATMENT:

By maintaining market intelligence associated with many factors, including resource plans in other jurisdictions and developments in technology, policy and market design, the Corporation ensures that business case analyses for the advancement of new generation or for new contracts reflect a reasonable range of possible pressures on market price.

The Corporation continues to promote waterpower as a clean, reliable and renewable source of electricity. By maintaining a positive image for its hydroelectric power, Manitoba Hydro's intention is to be seen as a responsible, competitive alternative to other renewable energy sources available in the market.

The Corporation advocates both within Canada and the US for equitable treatment for hydropower relative to other renewable sources and advocates hydropower's role in addressing climate change and air quality.
.

Likelihood	Low
Consequence	Med
Tolerance	Low

CATEGORY: A. Market

TITLE: 2.3 Export – Transmission Interconnection Capacity

RISK: Reduction in transmission interconnection capacity will reduce export revenue.

DESCRIPTION:

Maximizing export revenues and reducing import purchase costs is directly linked to available interconnection capacity and maintaining market access. Changes to reliability standards, public policy, infrastructure, load growth, and operating reserve requirements on the interconnected grid can lead to the degradation of available interconnection capacity over time. Reduced export capacity limits the volume of sales during high value times. Furthermore, limited export capability results in an increase in the volume of spilled energy during higher water years. Reduced import ratings would cause significant increased costs during low flow or high demand periods. Under these conditions, the Corporation would be forced to import energy during higher priced or on-peak periods.

Entities that influence this risk include NERC, IESO, HydroOne, SaskPower, MISO and other non-MISO Transmission Owners.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

A reduction in transmission interconnection capacity will decrease potential net revenue from the export power market.

RISK TREATMENT:

The Corporation endeavors to maintain a leadership role in and influence the policies and processes of the organizations and bodies in the USA involved with congestion management and regional transmission operations as well as those involved with transmission planning approvals. Manitoba Hydro staff also takes a leadership role in the activities associated with the formulation of transmission transfer limits for those facilities that affect Manitoba Hydro transfers with the USA. This activity occurs in a cooperative fashion (peer reviewed) with MISO and our tie line partners. Manitoba Hydro mitigates this risk by having skilled, knowledgeable staff representing the Corporation's interests at industry meetings.

In order to maximize transfer capability for commercial use, Manitoba Hydro participates in reserve sharing agreements (currently with MISO through its Coordination Agreement). The benefits of reserve sharing agreements to Manitoba Hydro include increased transmission and generator availability for commercial use.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: A. Market

TITLE: 2.4 Export – Special Interest Groups

RISK: Successful negative lobbying will result in reduced exports.

DESCRIPTION:

A positive corporate and product image enables the Corporation to maximize export sales opportunities and to develop generation and transmission projects required for both domestic needs and exports. Negative lobbying efforts by Special Interest Groups can tarnish the Corporation's image or the image of hydropower, limiting its marketability. Target groups of negative lobbying include [redacted] These Special Interest Groups can also intervene directly in capital and environmental regulatory processes (e.g. Clean Environment Commission).

Aspects of this risk profile parallel Achievement of Strategic and Operational Goals, Reputation / Image (G.1).

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Successful anti-hydro lobbying could result in fewer opportunities for long-term firm power sales or affect the price that can be obtained. Another example of a negative outcome would be the adoption of state implementation plans under the American Clean Power Plan that discriminate against Canadian hydro projects. Such discrimination could result in reduced net export revenues. In addition merchant plant decisions based upon the potential sale of firm power would be less attractive, with potential negative effects on any associated First Nation partnership (e.g. income sharing). If successful, regulatory and government approvals (e.g. environmental licences) required for export sales, generation and transmission initiatives could experience significant delays or even be denied.

RISK TREATMENT:

The Corporation continues to promote waterpower as clean, reliable and a renewable source of electricity. It engages with environmental, consumer and business stakeholder groups to discuss and promote its development plans. It is active directly and indirectly through industry groups such as CHA, IHA, and CEA and through hiring representative firms in the USA and Canada.

The Corporation aggressively counters Special Interest Group activities by sharing Manitoba Hydro's perspectives with government and community leaders, regulators, customers, industry associations, and business groups.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: A. Market

TITLE: 2.5 Export – Protectionism

RISK: Customer sentiment towards imports may negatively impact Manitoba Hydro's export sales.

DESCRIPTION:

Manitoba Hydro's energy competitors in the US may attempt to have limits or protective tariffs placed on imports of electricity from Canada for local economic benefit e.g. job creation. Alternatively, subsidies to US producers may add downward pressure on the market price.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The impact of this risk would be reduced net revenue from export power sales. The business case for building new generation would also be at risk.

RISK TREATMENT:

The Corporation actively lobbies, in alliance with other Canadian industry representatives via trade organizations such as the Canadian Electricity Association as well as US federal and state governments and regulatory bodies for full and unfettered access by Canadian power producers to the US markets. In addition, Manitoba Hydro conforms to the same Standards of Conduct as American competitors to avoid accusations of unfair trade advantage.

The Corporation supports efforts to counter US federal and state legislation that would disadvantage Canadian producers through the CEA, direct lobbying of governments and if necessary, through legal (NAFTA) avenues. In addition, the Corporation engages the services of external legal and public relations entities to stay apprised of trends and legislative activities which might threaten its export activities in the US.

Manitoba Hydro actively participates in the development of market rules in MISO and Ontario through the stakeholder process and through its customers to ensure that market rules enhance or at the very least, do not discriminate against the Corporation's export activities in those jurisdictions.

Likelihood	High
Consequence	Low
Tolerance	Med

CATEGORY: B. Financial

TITLE: 1. Exchange

RISK: Fluctuations in foreign currency impact financial performance.

DESCRIPTION:

The risk of the potential for economic gain or loss due to foreign exchange movements for any transaction denominated in a currency other than Canadian (CAD) funds. This exposure is predominantly in United States dollars ('USD') resulting from U.S. electricity exports, electricity imports, and USD long-term debt.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Manitoba Hydro has exposure to U.S. dollar foreign exchange rate fluctuations primarily through the sale and purchase of electricity in the U.S. and through borrowing in the U.S. markets.

In the current year's offset strategy, temporary fluctuations in net USD electricity exports create the risk of having a USD short or long position in which USD cash outflows will exceed or be less than USD cash inflows. These net short or long positions would be exposed to fluctuations in the USD/CAD exchange rate.

RISK TREATMENT:

Manitoba Hydro's exposures to foreign currency rate fluctuations are managed with the combination of natural and accounting hedges, along with applicable financial instruments. A natural hedge for USD is established by balancing USD cash inflows (primarily U.S. export revenues) and USD cash outflows (primarily U.S. debt coupon and principal payments). In order to bridge the actual timing of cash flows within a 12 month period, the Corporation may also execute applicable foreign currency financial instruments at appropriate times, such as spot, FX forward and FX swap transactions. As well, USD temporary investments and USD commercial paper can be utilized to bridge timing differences. Should the imbalance of USD inflows and USD outflows persist beyond the forecasted near term, Manitoba Hydro may adjust the volume of USD outflows; for example by issuing new USD long term debt to create USD coupon payments or by executing a cross-currency debt swap.

The Corporation has accounting cash flow hedging relationships between U.S. long-term debt balances and future U.S. export revenues as well as between U.S. interest payments on dual currency bonds and future U.S. export revenues. Accordingly, foreign exchange translation gains and losses for U.S. long-term debt obligations in effective hedging relationships with future export revenues are recorded in Other Comprehensive Income (OCI) until future hedged U.S. export revenues are realized, at which time the associated gains or losses in Accumulated OCI (AOCI) are recognized in net income.

Manitoba Hydro has conducted sensitivity analysis in IFF15 with respect to +/- $0.10 change in the USD/CAD exchange rate. As the incremental cumulative increase or decrease in retained earnings over a six year period to 2021/22 is only +/- $22 million, the Corporation's net exposure to USD/CAD currency fluctuations during this timeframe is largely eliminated.

Likelihood	Med
Consequence	Med
Tolerance	Med

CATEGORY: B. Financial

TITLE: 2. Interest Rates

RISK: Changes in interest rates impact financial performance.

DESCRIPTION:

Interest rate risk is the risk that the future cash flows will fluctuate due to changes in market interest rates. There are a number of forms of interest rate risk affecting the existing debt portfolio. Floating or variable rate debt is subject to interest rate reset risk during the life of the debt as the interest rate becomes adjusted at the periodic reset dates. Refinancing risk pertains to the interest rate exposure that exists upon refinancing a short or long term debt issue at its maturity. On a prospective basis, there is also interest rate risk on borrowings for new cash requirements.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

A one-percent increase in interest rates on Manitoba Hydro's existing floating rate and short term debt portfolio at March 31, 2015, offset by a change in the interest capitalization rate, would impact net income by approximately CAD $11.0 million (a 1% interest rate increase on a floating rate debt portfolio of $1.3 billion at March 31, 2015 is $13 million, less a $2 million offset from the change in the interest capitalization rate).

On a consolidated basis, risk sensitivity analysis in IFF15 shows that a +/- 1% change in interest rates may result in an incremental change to retained earnings of approximately $26 million to 2017/18. However, given the large size of the existing debt portfolio, as well as the need to add further debt to support the capital investments, the incremental change to 2024/25 arising from a +/- 1% change in interest rate rises is forecasted to be nearly $1 billion.

RISK TREATMENT:

Manitoba Hydro's interest rate policy on its existing debt portfolio is to limit the aggregate of: i) floating rate debt, ii) short term debt, and iii) fixed rate long term debt to be refinanced within the subsequent 12 month period; to a maximum of 35% of the total debt portfolio. Manitoba Hydro's interest rate risk guidelines for its existing debt portfolio include maintaining an aggregate of floating rate debt and short term debt within 15 – 25% of the total debt portfolio, and having the fixed rate long term debt to be refinanced within a 12 month period being less than 15% of the total debt portfolio.

Against the backdrop of unprecedented capital borrowing requirements and potentially rising interest rates, Manitoba Hydro is in a period of elevated sensitivity to interest rate changes. In order to mitigate this risk, the interest rate risk on the existing debt portfolio has been reduced by decreasing the percentage of floating rate debt within the existing debt portfolio and by selecting debt maturities, that upon refinancing will not compete with new borrowing requirements. Manitoba Hydro will continue to favor long term fixed rate financing at low interest rates.

Likelihood	Low
Consequence	Med
Tolerance	Med

CATEGORY: B. Financial

TITLE: 3. Credit

RISK: The Corporation is exposed to financial loss through credit default.

DESCRIPTION:

Credit risk is the risk that one party to a financial instrument will cause a financial loss to the other party by failing to discharge an obligation. Manitoba Hydro is exposed to credit risk related to sinking fund investments, short term investments and pension fund investments. Manitoba Hydro's gas and electric operations are exposed to credit risk related to domestic and export energy sales, and physical gas supply activities.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Credit risk on sinking fund investments, short-term investments, and pension fund assets is minimized as the Corporation invests exclusively in government-guaranteed bonds, highly rated investments and well-diversified investment portfolios. The majority of the Corporation's accounts receivable is owed from domestic consumers who are in diversified industries. Credit risk exists from wholesale export power transactions with bilateral counterparties and within markets (ISOs).

During the period, total credit exposure due to export power transactions peaked at approximately $54 million in August. Export power bilateral transactions peaked at $39 million in August. On average, approximately 60% of the credit settlement exposure to bilateral counterparties each month is from Northern States Power (NSP). NSP had a peak credit settlement exposure of $24 million in August. Export market transactions peaked at $28 million in April.

Manitoba Hydro's accounts receivable for energy bills outstanding in excess of 60 days is approximately $16.9 million. Of this amount, $15.8 million relates to electric operations and $1.2 million to gas operations. For the electric operations $10.8 million is associated with amounts outstanding in Northern Manitoba.

Derivative instruments will no longer be used in the normal course to manage natural gas market price risk for the Fixed Rate Primary Gas Service. The Credit-Value-at-Risk limit for the gross provincial derivative exposure is $100 million per counterparty. The Province of Manitoba will act to mitigate Manitoba Hydro's risk exposure per counterparty in the context of the gross exposure per counterparty.

RISK TREATMENT:

Credit risk for physical gas supply counterparties and derivative counterparties is mitigated by establishing credit requirements, conducting standard credit reviews of all counterparties and setting and monitoring exposure limits for each of these counterparties. Financial security (letters of credit etc) and contract provisions are also in place to provide further credit risk mitigation. Credit risk resulting from export power transactions is mitigated by aligning credit limits with counterparty creditworthiness using approved credit policies and procedures. Counterparties are assigned unsecured or secured credit limits, based on generally accepted industry standards, which are monitored and reported on a regular basis. Credit risk for domestic energy sales is managed through various reporting, control and collection procedures for overdue accounts. In addition, Manitoba Hydro continues to negotiate with northern communities to resolve the outstanding accounts receivable balance in conjunction with mitigation issues. Manitoba Hydro's First Nation Accounts Department works with Manitoba's First Nation communities to establish manageable ways for the communities to get their accounts paid in full.

Likelihood	Med
Consequence	Low
Tolerance	Med

CATEGORY: B. Financial

TITLE: 4. Inflation

RISK: Increases in inflation rates result in cost increases which the Corporation is forced to recover through increases in domestic customer rates.

DESCRIPTION:

In addition to the capital costs associated with major capital projects, Manitoba Hydro expends approximately $2.0 billion annually for its routine ongoing operating and capital expenditures including fuel and power purchases. Inflationary increases to these costs result in higher costs to the Corporation. Prices charged for the sale of electricity and natural gas within Manitoba are subject to review and approval by the PUB. The Consumer Price Index (CPI) for Manitoba is often used by stakeholders as a benchmark to determine the reasonableness of proposed Manitoba Hydro general rate increases for electricity and for the non-commodity portion of natural gas rates. Manitoba Hydro uses projections of the U.S GDP implicit price deflator to forecast future electricity export prices in the opportunity market. Other, more specific, inflation indices are also used in purchasing and sales contracts negotiated by Manitoba Hydro. In addition to CPI, composite inflation indices associated with generation resources are developed and used to reflect the forecasted costs of specific commodities that are not included in the CPI basket of goods and services.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The impact of a short duration period of inflation on the achievement of Manitoba Hydro's financial objectives and on the priority of providing excellent customer value which includes affordable rates for all Manitobans has historically been relatively small as a large portion of costs are capitalized, spreading the impact out over a longer period of time. However, as capital requirements grow for system improvements and expansion, the effects of sustained high inflation, especially with specific commodities associated with new generation or transmission construction, are more marked.. Moreover, as inflation changes, the monetary policy response from the Bank of Canada may result in impacts on Manitoba Hydro.

Current indications for Canada and the United States are that inflation expectations in the general economy are low and stable With respect to near-term outlooks of inflation for specific commodities that are significant inputs to Manitoba Hydro's capital projects, IHS Global Insight expects base metal prices to remain within a relatively tight range for the foreseeable future due to reduced demand. There has been a clear slowdown in metal and other commodity consumption growth in emerging economies such as Brazil, India, China and Indonesia and this slowdown has created an oversupply of steel products. IHS attributes the shift from strong economic activity in Asia to sluggish emerging-market demand growth and a tighter U.S. monetary policy that has weakened investor interest in commodities. In addition, sustained low oil prices over the past 18 months has caused activity in the Alberta oil sands to slow down resulting in a tempering of construction labour costs throughout western Canada. With that said, experience from the recent past has proven that sustained higher costs display resiliency to downward pressures such as reduced electricity consumption. Higher construction and operating costs driven by increases in aggregate demand both domestically and internationally may have substantial impacts on the costs and economic benefits of capital projects. Prolonged higher levels of inflation will begin to have a more significant impact if export prices do not reflect the same inflationary trends in concert with rising expenses and the costs of new plant coming into service. Inflation rates in Canada and in the US, the main export market, tend to follow similar long-run patterns, but can deviate in the short-term. Higher levels of inflation for Manitoba Hydro's costs which are not offset by similar increases in export revenues could place pressure on domestic rates for electricity and/or gas. Further, as inflation increases, there is also a risk that interest rates will be increased by the Bank of Canada, which can compound the effect cost increases will have on the Corporation.

RISK TREATMENT:

To the degree that export revenues rise as a result of corresponding increases in inflation in export markets, they can provide an offset to the higher costs of labour and materials. The Corporation's budgeting process typically imposes limits of inflation or less on baseline spending plans. With the continued downward pressure on export revenues, the Corporation has further implemented cost constraint measures. During the period of cost estimating and budgeting for major capital projects, the Corporation does not have an offset or hedge to manage the risks associated with increases in specific commodities which emphasize the need for continued cost constraint measures. Once the Corporation is in the process of negotiating contracts for major capital projects, mitigating accommodations such as including specific escalators can be incorporated. The future impacts on consumer rates due to higher capital costs will depend in part upon the long term price growth of energy exports.

Likelihood	Med
Consequence	Med
Tolerance	Med

CATEGORY: B. Financial

TITLE: 5. Upstream Gas Cost Uncertainty

RISK: A significant increase in the cost of natural gas could result in an adverse reaction from customers.

DESCRIPTION:

The cost of the physical natural gas commodity, transportation and underground gas storage represent approximately 60% of the Company's total overall annual natural gas revenue requirement in a normal weather year. Manitoba Hydro buys Primary Gas from the Western Canadian Sedimentary Basin ("WCSB") at a fairly constant level over the course of the year, with winter purchases flowing directly to customers, while a significant portion of summer purchases flow to storage. In the winter months, gas purchases flowing from the WCSB are supplemented by gas withdrawn and transported from storage. In addition, Supplemental Gas supplies are also purchased throughout the year for both immediate consumption in Manitoba and for replenishing storage inventories for use the following winter. The Corporation is currently prohibited by regulatory order from the PUB from hedging customers' exposure to volatile natural gas market prices.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Financial - The financial exposure of significant gas cost increases to the Corporation is minimal as long as gas costs are considered to be prudently incurred. This is because the cost of gas for the quarterly rate primary gas service is considered a flow-through for rate-setting purposes and follows a prescribed regulatory process. There is some market price risk associated with the Fixed Rate Primary Gas Service whereby commodity gas is acquired at market prices while selling to customers at fixed rates for a given contract duration. If the self insurance premium imbedded in the fixed rate is insufficient and residual market price risks are not properly managed, there could be program losses.

Reputation – Although natural gas market price volatility has generally been greatly reduced during the past few years, there was a short term sharp increase in Supplemental Gas costs in the first quarter of 2014 due to the extreme cold winter and the need to purchase additional supply If the extreme upward price volatility experienced during this period continued or the 2000 through 2008 period were to return and continue, the Corporation could experience an adverse reaction from customers because of their exposure to a sharp increase in their cost of gas. In addition there continues to be significant upward cost pressure for transportation services on the TransCanada Pipelines Ltd. ("TCPL") Canadian Mainline, to which Centra is currently captive, due to underutilization of the pipeline. This market risk is compounded by a proposal by TCPL to segment the Mainline's cost allocation and tolls post – 2020 between the underutilized Western Mainline (on which Centra moves gas) and the highly utilized Eastern Ontario Triangle. The outcome is highly uncertain at this time however. The National Energy Board has approved segmentation in principle and intends to review it and other pricing issues in future proceedings.

RISK TREATMENT:

The Corporation has a number or risk measures in place to manage gas cost increases, including: (1) The Rate Volatility Management Program which includes setting quarterly Primary Gas rates based on the 12-month forward average of futures prices to remove seasonality from rates; disposing of Gas Purchase Variance Account ("PGVA") balances over the coming 12-month period; the physical price hedge provided by filling underground storage inventory during the seven-month summer period and then providing this gas to customers during the five winter months at a single average inventory value; and the management of all other non-Primary Gas PGVA's over the November through October gas year period to further reduce the rate volatility associated with bringing forward large residual balances for disposition in future periods. (2) Giving customers who are concerned about potential future rate volatility the option of either subscribing to MB Hydro's Fixed Rate Primary Gas Service ("FRPGS") or contracting for a fixed Primary Gas rate with a third-party marketer under the Western Transportation Service. (3) Mitigating market price risk associated with the Fixed Rate Program by charging an 8% self insurance risk premium in rates and establishing risk thresholds (customer migration, volumes, risk margins) that will trigger a review of the FRPGS program. (4) Providing all customers, whether on the Corporation's default Primary Gas rate, or on a fixed Primary Gas rate under either the FRPGS or with a marketer, with the option to fix the amount of their overall monthly natural gas bill by enrolling in the Equal Payment Plan. (5) Participate in TCPL's. regulatory proceedings before the National Energy Board ("NEB") as appropriate in order to ensure that Manitoba natural gas consumers' interests are adequately represented., as occurred at the NEB RH-001-2014 proceeding.

Likelihood	Low
Consequence	Low
Tolerance	Med

CATEGORY: B. Financial

TITLE: 6. Gas Derivative Instruments

RISK: By their nature, derivatives have various risks (e.g. Regulatory, market, operational) associated with them which must be managed.

DESCRIPTION:

Manitoba Hydro utilized financial gas derivatives to manage market price associated with the Fixed Rate Primary Gas Service from the inception of the program until August, 2011. Changes to the program were approved by the PUB whereby derivatives will not be used in the normal course and a self insurance premium will be employed to manage market price risk. There are however some derivative positions outstanding that will not fully expire until 2016.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES

The Corporation continues to be exposed to the risk of financial losses for outstanding positions in cases where market prices fell significantly after the placement of past hedges in support of FRPGS offerings and customer demand for those offerings was materially less than that forecast. This could result in excess out-of-the-money hedges on unsubscribed volumes having to be written off against Manitoba Hydro's retained earnings. The key operational risk borne by the Corporation with respect to gas hedging activities relates to the execution of the hedge purchase transactions. Similarly, if credit limits are not established and managed, and the appropriate legal documentation is not put into place, a credit default could give rise to a financial loss. Credit risks must be identified, measured and managed.

RISK TREATMENT:

The Gas Supply Risk Management Committee in coordination with the Executive Committee has oversight over all derivative related transactions and practices. A well structured control framework continues to be in place; however no further derivative transactions will be entered into in the normal course and the exposure to current derivatives is low.

Likelihood	High
Consequence	M High
Tolerance	Med

CATEGORY: B. Financial

TITLE: 7. Financial Targets

RISK: Weak financial ratios may impede the opportunity to adequately address aging infrastructure and invest in new major generation and transmission.

DESCRIPTION:

The Corporation is subject to increased risk if it fails to maintain an adequate capital structure. This is defined, under revised financial targets approved in December 2015, as maintaining a minimum debt/equity ratio of 75:25, an annual Earnings Before Interest, Taxes and Depreciation and Amortization (EBITDA) interest coverage ratio with a minimum target of 1.80 and a capital coverage ratio (excluding major new generation and transmission) of greater than 1.20. It is recognized that financial targets may not be achieved during years of major investment in the generation and transmission system.

The current 20-year Integrated Financial Forecast (IFF15) projects that the equity ratio deteriorates to 12% by 2021/22, largely due to capital investments in generation, transmission and distribution, as well as softened export market prices before recovering to the target 25% by 2031/32. Reduced income levels also weaken the interest coverage below the 1.80 target for a period of 9 years until income levels are sufficient for the target to be met in the remaining years of the forecast as a result of the 3.95% even annual rate increases and additional export revenues following the in-service of Keeyask. Capital coverage is below target for the first 6 years of IFF15 due to capital requirements to replace aging infrastructure and address capacity constraints. Thereafter, cash flows are sufficient to enable this target to be met in the remaining years of the forecast.

Manitoba Hydro is prepared to accept weaker financial ratios during the period of significant capital investment in order to spread the recovery of costs from customers over a longer period of time and minimize the impacts to customer bills. However, it will be necessary for Manitoba Hydro to demonstrate progress towards attaining its financial targets to credit rating agencies and other stakeholders over the long-term.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

An inadequate capital structure could jeopardize the self-supporting naturkae of Manitoba Hydro’s debt and negatively impact the credit ratings of the Province. As well, an inadequate capital structure could lead to the need for higher rate increases and volatility in rates.

RISK TREATMENT:

The risk of an inadequate capital structure is mitigated by: (1) formally adopting and periodically updating appropriate financial targets such as the debt/equity ratio, interest coverage and capital coverage; (2) making annual contributions to retained earnings sufficient to maintain these targets; and (3) achieving these annual contributions through a combination of cost controls, export revenues and regular reasonable domestic rate increases even in years with favourable water conditions. The latter is necessary, recognizing the unpredictability and potentially severe impacts of individual drought years.

Likelihood	High
Consequence	Low
Tolerance	Med

CATEGORY: B. Financial

TITLE: 8. Energy / Fuel Price Volatility

RISK: Market energy / fuel prices are high when Manitoba Hydro requires additional energy supply or low in adverse economic cycles resulting in low export prices.

DESCRIPTION:

Manitoba Hydro is subject to significant price risk on power sales and power and gas purchases as a result of energy price volatility. Recent history has demonstrated that energy prices in the short term are volatile. There is a risk that the price of purchased energy and natural gas will be high due to energy price and/or due to limitations in the mid-western United States transmission system (i.e. congestion). The impact of the energy price volatility is the greatest in a drought where under lowest flow conditions the Corporation may have to generate about 3 million MWh from gas-fired generation and purchase in excess of 7 million MWh from the market. Conversely, even under more favourable water flow conditions, opportunity sales revenues may be lower than forecast because of lower opportunity prices due to factors such as adverse economic conditions and / or low fuel prices. Such economic cycles may last several years and could result in lower than forecast revenues. This risk profile is related to Commodity Availability (C.5) and Water Supply Variation/ Drought (C.1)

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

While there is no risk of a significant drought in the current year, Manitoba Hydro continues to experience lower than forecast export prices that despite favourable water conditions, is resulting in a significant reduction in revenues compared to previous long term export revenue forecasts. It is very difficult to hedge the price risk for opportunity energy on a long-term basis due to the uncertainty as to whether this energy will be available in any given year.

The risk resulting from high fuel / purchased energy prices would significantly reduce the Corporation's ability to maintain stable rates for Manitoba customers were it to materialize during severe drought. Maximum exposure to this risk occurs during the winter demand period when gas-fired generation is required to meet peak loads and year round during drought conditions when gas-fired generation is required for energy supply. The risk from low prices for opportunity export energy would reduce Manitoba Hydro's equity compared to forecast and could result in rate increases.

Should a severe drought occur in 2015/16, the Corporation is exposed to a risk from energy price volatility estimated to be on the order of $200 million per year should fuel prices double compared to the prices assumed in the IFF. This $200 million figure is on top of reduced revenue of $300 million at expected export prices due to reduced flows in a severe one year drought. Past volatility in natural gas prices indicates that a doubling of gas prices compared to forecast is quite possible, but given the current supply situation appears to be unlikely in the near term. The overall cost of a drought has been reduced significantly since 2008/09 as a result of the economic decline and low natural gas prices.

RISK TREATMENT:

The Corporation's strategy in managing risk due to an adverse cycle of low export prices is largely based on having sufficient retained earnings. A number of changes in the power and energy market design over the last 10 years have improved the market liquidity and helped to reduce Manitoba Hydro's exposure to short-term energy price volatility and congestion pricing. The creation of an open, competitive market in the US has resulted in mechanisms for financial settlement, financial transmission rights and the use of brokers, which allow Manitoba Hydro to obtain more competitive pricing on imports. Since the 2003/04 drought, Manitoba Hydro has also secured almost 100% of the firm import transmission from the US, which will allow Manitoba Hydro to import power with lower risk of curtailment while not exposing Manitoba Hydro to non-competitive pricing for the use of another party's firm transmission. One objective of Manitoba Hydro's export strategy is to maintain a diverse portfolio of export products to mitigate exposure to price volatility.

Likelihood	Low
Consequence	Low
Tolerance	Low

CATEGORY: B. Financial

TITLE: 9. Power Financial Instruments

RISK: By their nature, financial instruments have various risks associated with them which must be managed.

DESCRIPTION:

Manitoba Hydro participates in the MISO and IESO standard markets. Prior to the advent of these standard markets, all of Manitoba Hydro's export sales and purchases were executed via physical bilateral transactions with inter-connected customers and utilities. With the introduction of these markets, Manitoba Hydro gained the capability to utilize financial instruments to settle contracts and hedge physical flow. Approved financial instruments are: (1) Contracts for Differences and/or Swaps (including MISO FinScheds); (2) MISO Auction Revenue Rights (ARRs) MISO Financial Transmission Rights (FTRs) or IESO Transmission Rights (TRs); (3) Virtual Bids and Virtual Offers; and (4) Put and Call Options for electricity and natural gas.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Inappropriate use of financial instruments would expose Manitoba Hydro to costs beyond those necessary for the prudent management of its assets or load obligations.

RISK TREATMENT:

Manitoba Hydro has a Board approved Wholesale Export Power Policy that governs Manitoba Hydro's export market activities including the use of financial instruments. In addition an Export Power Risk Management Committee provides executive oversight of the management of the energy supply and financial risks as a result of Manitoba Hydro's participation in the export market. In addition, a management committee approves bid/offer strategies and oversees all major transactions.

The Wholesale Export Power Policy governs the use of all financial instruments related to the purchase or sale of power/natural gas. The Approval Authority for Wholesale Power Related Transactions (P190-1) sets out volume limits, approval and execution authorities and limits by transaction type in accordance with the Wholesale Export Power Policy. Front, middle and back office duties are segregated. Manitoba Hydro uses a state-of-the-art trading, scheduling, billing and settlement system to record all physical and financial transactions.

Manitoba Hydro ensures that appropriate master agreements are in place to govern all financial instrument transactions.

As per the Wholesale Export Power Policy and the Approval Authority for Wholesale Power Related Procedures, financial instruments are required to have a high level of certainty that they will be backed by energy supplies at the time the contract is entered or the transaction is executed. This restriction ensures that financial instruments are supported by Manitoba Hydro's underlying physical power position and that financial instruments are not utilized in a speculative manner.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: B. Financial

TITLE: 10. Liquidity

RISK: Having sufficient cash or cash equivalents to meet financial obligations as they come due.

DESCRIPTION:

Liquidity risk refers to the risk that Manitoba Hydro will not have sufficient cash or cash equivalents to meet its financial obligations as they come due. Liquidity risk can generally be subdivided into two categories: 1) operational liquidity risk and 2) market liquidity risk.

Operational liquidity risk arising from the availability of internally generated cash flow from operations is most pronounced for Manitoba Hydro during drought conditions as cash shortfalls occur.

Market liquidity risk has become elevated due to the high levels of required debt financing and evolving investor responses to changing financial market conditions. During 2015, issuance was characterized by periods of volatility and uneven market tone.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Liquidity challenges arising from cash shortfalls would have potentially significant business and reputational consequences.

RISK TREATMENT:

The Corporation closely monitors its cash receipts and disbursements on a daily basis as part of regular cash balancing activities, and also monitors short term debt balances and forecasted cash requirements.

To support the Corporation’s temporary cash requirements, the Manitoba Hydro Act grants the Corporation the power to issue short term borrowings in the name of the Manitoba Hydro-Electric Board up to a limit of $500 million and to have this debt unconditionally guaranteed as to principal and interest by the Province of Manitoba. With the high levels of Manitoba Hydro’s cash requirements in the next few years, this short term facility provides less than two months of cash requirements.

To ensure smooth business continuity and financing flexibility during periods of intensive capital expenditures and uneven market tone, Manitoba Hydro has expanded its practice of maintaining positive cash balances. Manitoba Hydro’s liquidity guideline is to be funded approximately three months in advance of the Corporation’s cash requirements. Sinking fund balances, used to accumulate cash to repay future debt maturities, are another source of cash but are a restricted source of liquidity as the balances can only be withdrawn for debt maturities. In the next few years, in order to optimize the Corporation’s liquidity practices and to reduce finance expense, Manitoba Hydro will seek to minimize its sinking fund balances where feasible.

Likelihood	High
Consequence	High
Tolerance	Med

CATEGORY: C. Environmental

TITLE: 1. Water Supply Variation / Drought

RISK: Reduced water supply impacts generation output

DESCRIPTION:

Variation in water (fuel) supply is a fundamental characteristic of a predominately hydro system. Actual annual hydraulic generation will vary from the long term average of all flow conditions assumed in the planning process with lower than average flows occurring approximately 40% of the time. Reduced water supply has a direct financial impact through reduced hydro generation and in turn reduced export revenues and/or the need for more expensive replacement of supply

Water Supply Variation/Drought risk is defined as a change in revenue due to deviations from average flows, under expected export market prices. The overall cost of a drought to the Corporation is a combination of this Water Supply Variation/Drought risk (i.e. volumetric risk) and the Short-Term Energy Price Volatility / Fuel Price Volatility (B.8). The possibility of a drought more severe than the drought of record is discussed in Extreme Drought-Shortfall of Energy Supply (D.2).

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Reduced water supplies impact the Corporation's ability to maximize net export revenues and maintain the projected electricity rates for Manitoba customers. The severity of impacts ranges from relatively modest costs due to subtle change in the timing of inflows, up to extreme financial losses as a result of a multi-year drought. The lost revenue due to a five year drought at expected export prices was estimated to be $1.9 billion (IFF 15) including financing costs. Risk due to Energy / Fuel Price Volatility (B.8) would be in addition to this amount.

Regulation changes that limit hydraulic operating flexibility may reduce dependable energy and, consequently, reduce net export revenue and add costs due to advancement of the in-service date for new generation. Similar effects may be realized if regulation changes upstream of Manitoba or climate change impacts alter the timing or supply of flows entering the province.

RISK TREATMENT:

The Corporation intends to have adequate retained earnings to protect against a repeat of the worst recorded drought. In addition, the Corporation constantly monitors supply conditions, updates inflow forecasts, and reviews long-term weather forecasts.

At least quarterly, the Export Power Risk Management Committee (EPRMC) reviews a quantitative assessment of the current water supply conditions and any potential financial impacts resulting from variations in market prices and water supplies including the consequences of extreme drought. During periods of increased risk, the EPRMC increases the frequency of its meetings to review and approve risk tolerances, risk mitigation strategies and significant operational decisions. The Manitoba Hydro Electric Board is also kept updated in periods of increased drought risk. Energy purchase decisions are timed and distributed appropriately to protect against price risk of electricity purchases. To protect against gas price risk, purchases are structured such that a portion of the gas needs are purchased in advance, with the option to take, store or sell the fuel.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: C. Environmental

TITLE: 2. Climate Change

RISK: A changing climate can impact hydro-electric generation, Manitoba load and export revenues.

DESCRIPTION:

There is a risk that climate change impacts could result in reduced overall hydroelectric production due to lower annual runoff, changes to the variability of the water supply, and/or extreme flooding. There is also a financial risk that climate change will increase temperatures in Manitoba which will result in increased air conditioning loads in the summer and reduced heating loads in the winter and thereby displace export sales and potentially reduce overall revenues.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Reduced hydroelectric generation would lead to a reduction in overall energy supplies to meet firm load and reduced surplus energy available for export resulting in lower export revenues to the Corporation. Extreme flooding would increase spilling at the generating stations and raise challenges for the operation which could lead to loss of potential energy supplies.

An increase in average temperature due to climate change has the potential to increase cooling loads in the summer and reduce heating loads in the winter. Increased summer loads will potentially displace on-peak export sales. Reduced heating loads in the winter will increase on-peak and off-peak export sales which will offset some of the revenue losses in the summer. In addition, reduced winter loads could delay the in-service date of future generation options if the requirement for new resources is driven by a shortage of winter peak capacity.

RISK TREATMENT:

Manitoba Hydro is currently engaged in understanding climate change processes and is actively pursuing studies to develop future climate change scenarios for its power system. These climate scenarios are being developed by using the direct outputs from an ensemble of international Global/Regional Climate Models and by using post-treatment methods to scale the information to match Manitoba Hydro’s hydraulic system. These climate scenarios can then be used in combination with hydrological and load forecast models to develop an ensemble of future conditions, which can be tested in Manitoba Hydro’s generation system models as a step towards reducing the uncertainties regarding future water supply, power demands and corporate finances.

Manitoba Hydro collaborates with a number of national and international bodies involved in climate change including the Ouranos Consortium, University of Manitoba, and the Center for Energy Advancement through Technological Innovation to ensure its studies meet the industry standards and to stay informed about the latest advances in the climate change field. Manitoba Hydro expects to have sufficient lead time to adapt its operations and resource plans to accommodate long-term impacts of climate change.

Likelihood	Low
Consequence	High
Tolerance	Med

CATEGORY: C. Environment

TITLE: 3. Operational Impact and Infrastructure

RISK: Environmental concerns real or perceived can negatively impact corporate operations.

DESCRIPTION:

The Corporation operates its existing electricity supply facilities and systems on a continuous basis to meet the energy needs of its customers. While the Corporation goal is to minimize operational impacts on the environment there still remains a certain amount of negative impact. The principal risks the Corporation is faced with are interruption of operations, and/or, restrictions on how operations are carried out. These risks arise as a result of pressure from changes in stakeholder sentiment, changes to licences and/or legislation and high profile noncompliance(s) and/or environmentally damaging event(s).

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The implications of imposed restrictions on facility and system operations can vary considerably and if significant could ultimately impact the operations of the Corporation. These restrictions could impact hydraulic/thermal generating facilities, water management programs, transmission facilities and distribution infrastructure. These restrictions could impact the costs/revenues of the Corporation and force future domestic rates to increase.

RISK TREATMENT:

Manitoba Hydro utilizes many different types of controls and tools to manage the environmental risk to its operations and infrastructure. These include but are not limited to:

- Management and staff whose primary responsibility is to help address environmental issues and risks that the Corporation is facing.
- An ISO 14001 registered Environmental Management Systems covering all corporate activities.
- Agreements with stakeholders suffering adverse affects from some of the Corporation’s developments.
- Identification of and responsiveness to stakeholder concerns.
- Water regime monitoring and communication with affected communities about forecasted water regimes.
- Conducting environmental research and monitoring programs that address societal expectations and meet corporate environmental management practices.
- Shaping and responding to public policy and keeping abreast of and influencing regulatory and licence changes.
- Continuously improving and implementing best management practices to anticipate and address environmental concerns.
- The development and implementation of Corporate policies and procedures intended to address environmental concerns
- Training of staff whose jobs may result in impacts to the environment.
- Emergency prevention and response planning.

Likelihood	Low
Consequence	High
Tolerance	Med

CATEGORY: C. Environment

TITLE: 3. Operational Impact and Infrastructure

SUBTITLE: 1. Legal - Species at Risk Act (SARA)

RISK: If Lake Sturgeon is listed as "Endangered" the Corporation could face restrictions on current operations, structural modifications to infrastructure, significant delays and high costs of development at Keeyask , and possible cancellation of new projects.

DESCRIPTION:

Almost all of the Corporation's hydroelectric generating stations are located where Lake Sturgeon are found. It is likely that at most generating sites infrastructure and operations have negatively affected the fish and/or their habitat to some degree. Due primarily to historical commercial overharvest, plus additional stressors including hydroelectric development and ongoing Indigenous domestic harvest, Lake Sturgeon populations have been severely depleted over the past 100 years and the species is currently under review for listing as endangered under the Species at Risk Act (SARA) at most locations in Manitoba. Decisions for Churchill River, Nelson River, Saskatchewan River, Winnipeg River, Red-Assiniboine Rivers and Lake Winnipeg populations are expected in early 2018, at the earliest.

If listed under the SARA, harm to individual fish will automatically be prohibited and protection of critical habitat will be required, once it is identified. The Corporation will immediately be at risk of non-compliance with the SARA at most of its facilities due to ongoing risk of harm to individual fish as they pass through facilities. The most likely protection measures that would be required by DFO are fish screens, provisions for upstream fish passage and flow modifications at existing generating stations. There would also be a possibility that the commissioning of Keeyask would be delayed while incidental take permits are secured. There could also be high costs for recovery measures potentially mandated under the SARA.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Affects: (1) The revenues the Corporation will receive from existing operations; (2) The ability to build future projects and meet future requirements for electricity supply; (3) The goal to strengthen working relationships with Indigenous peoples; and (4) The goal to maintain financial strength. It could entail increased mitigation costs to Manitoba Hydro and its First Nations partners on Keeyask (and potentially Conawapa were it to proceed), although it is expected that these would not be sufficient to make the project uneconomic.

RISK TREATMENT:

The Corporation is proactive in addressing this risk by: (1) Conducting a Lake Sturgeon Stewardship and Enhancement Program to assist in recovery of the species., (2) Negotiating and implementing a Memorandum of Understanding on Lake Sturgeon with the Manitoba Government to guide cooperation on Lake Sturgeon stewardship and research in the province. (3) Regular coordination with the Manitoba Department of Conservation and Water Stewardship (Fisheries Branch (4) Regular communication with staff from DFO to keep them informed about Manitoba Hydro's approach to Lake Sturgeon stewardship, current activities, progress and outcomes. (5) Establishing a process with DFO and MCWS for negotiating a Lake Sturgeon Conservation Agreement under the SARA, (6) Working with the CHA and CEA in pursuing changes to the SARA and/or its implementation (7) Informing newly elected Manitoba Members of Parliament, who will be involved in the listing decision, that the social and economic costs and risks of listing Lake Sturgeon far outweigh any potential benefits and is not needed to provide stewardship necessary for Lake Sturgeon recovery. (8) Encouraging the Province to continue to take action with the DFO (9) Expanding its long-term commitment to the recovery of the species through the membership in, and funding for the Kischi Sipi Namao (formerly the Lower Nelson River Sturgeon Stewardship Committee) (10)Working to establish Lake Sturgeon stewardship arrangements for the lower Churchill River.

Likelihood	Med
Consequence	M High
Tolerance	Low

--

CATEGORY: C. Environmental

TITLE: 4. Reliability of Supply

RISK: On-going public scrutiny and further environmental licencing regulatory oversight could obstruct the Corporation's ability to build the necessary facilities required to provide a reliable supply of energy in a timely and cost effective manner.

.

DESCRIPTION:

Concerns over the environment will influence the Corporation's future facility requirements by either placing highly restrictive conditions on their operations, altering the design specifications, delaying or ultimately denying their construction.

The environmental review process could result in excessive time and cost that would result in the commissioning of facilities well after their required in service dates. Time delays will expose the system to increased reliability issues.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

This risk will cause the system reliability to degrade by delaying project in-service dates, thus causing more service interruptions. The Corporation will face increased costs to satisfy these environmental concerns as more costly alternatives and mitigation measures will be required to meet these higher standards.

RISK TREATMENT:

The Corporation is proactive in addressing this risk by:

- Ensuring environmental implications of its actions are understood.
- Possessing the knowledge and skills to make the right decision that minimizes the environmental impact of these facilities.
- Being proactive in the sharing of information with stakeholders
- Increasing dialogue with government early on and throughout the process
- Promoting efficient use of resources.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: C. Environmental

TITLE: 5. Upstream Regulation and Water Withdrawals

RISK: Upstream regulation, water withdrawals or climate change may reduce water supplies and hydraulic generation.

DESCRIPTION:

Reduced water supply is a fundamental risk to the financial position of the Corporation. The peril associated with this risk is that future water supplies are on average lower as a result of upstream reservoir regulation changes and water diversions for irrigation or other purposes. Water supply may also be reduced as a result of climate change.

This risk profile is related to risk profile C.2 Climate Change.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Upstream regulation that affects the timing of inflows and diversion or extraction of water for irrigation or other purposes can limit the Corporation's ability to generate hydroelectric energy thereby increasing operating costs and reducing net revenues. Climate change may also cause similar effects if the consequence is reduced water flows or changes in the timing of flows that result in negative consequences for hydroelectric generation. In addition, these events can make the development of new hydraulic generation less economic and cause the advancement of future generation in-service dates.

RISK TREATMENT:

Since the upstream regulation is often influenced by outside entities such as Canadian Provincial and Federal Government, U.S. State and Federal Government, and other water resource management entities, Manitoba Hydro participates in providing input, where possible, to these entities. Manitoba Hydro participates in the Lake of the Woods Control Board process and can influence decisions of the Prairie Provinces Water Board. Manitoba Hydro is also a member of the Canadian Hydropower Association and participates in other organizations that have hydroelectric affiliations that can lead to discussions and cooperation.

The Corporation maintains a record of long-term streamflow data from 1912 to present which has been modified to reflect current use patterns accounting for increased consumption and regulation strategy changes upstream. This record is used for resource planning purposes. Manitoba Hydro is also engaged in developing an understanding of the potential impacts on water supply due to climate change in its watersheds. This activity is described in more detail in risk profile C.2 Climate Change.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 1. Loss of Plant (all property, all perils)

RISK: Loss of plant can affect the Corporation's finances, reputation and impact human life.

DESCRIPTION:

The Corporation is subject to a variety of scenarios whereby physical plant is exposed to loss. The types of value exposed to loss include property, net income, liability and personnel. Loss from a property value perspective includes equipment breakdown, loss of facility, dam failure, and other property damage.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Potential impact from a loss of plant infrastructure will affect the Corporation's ability to: continuously improve safety performance, provide excellent customer service from a reliability perspective, maintain our financial strength due to reduced revenues and increased costs, and maximize export power net revenues due to reduced availability.

RISK TREATMENT:

A risk management decision-making process is used to manage each exposure (identify exposure, examining feasibility of alternative techniques, selecting best technique, implement and monitor chosen techniques). Equipment failure, for example, is identified at the department level. Alternative techniques to deal with exposure include preventative maintenance (loss prevention), Reliability Centered Maintenance (RCM) and loss reduction (fire sprinkler systems, fire brigades). Alternative techniques to finance the property loss include risk retention and commercial insurance. Equipment failure from a net income exposure to loss is recognized at the department level and alternative risk control techniques are used such as spare equipment, replacement contracts for equipment or replacement energy.

The loss of a facility from a property value aspect is identified at the division/department level. Perils are identified and treatment determined. Risk control techniques include loss prevention and loss reduction. Examples include fire and wind resistive construction materials, smoke and heat detection units, and automatic sprinkler protection, dyking and other measures. Property insurance is purchased to finance losses to high valued locations. The loss of a facility from a net income exposure aspect is identified at the corporate/division level. Loss prevention and reduction control techniques includes duplication and segregation of exposure units, automatic sprinkler systems, emergency response plans and replacement contracts. The Corporation retains the risk financing cost of net income losses resulting from the loss of a facility.

The impact of loss of a facility from the perspective of safety and customer service is identified at the corporate/division level. Loss prevention and reduction control techniques in place to mitigate other impacts are also designed to mitigate the impact on safety and customer service. Techniques include duplication and segregation of exposure units, emergency response plans, automatic sprinkler systems, and replacement contracts.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 1. Loss of Plant

SUBTITLE: 1. Water Retaining Structures and Flow Control

RISK: The failure of water retaining structures could have impacts which range from insignificant to catastrophic, and could include loss of life, financial/economic costs, damage to the environment, and loss of system reliability, reputation, public confidence and heritage resources.

DESCRIPTION:

Manitoba Hydro operates 17 major facilities for hydro power generation and water storage, comprising an inventory of some 220 individual dams and dykes with a net asset value exceeding $4 billion and an installed generating capacity of approximately 5000 MW. The facilities were designed to meet established standards at the time of their construction and are systematically maintained and upgraded to ensure they meet current standards and operate safely. The facilities are the major source of system supply for Manitoba Hydro.

Water retaining structures are vulnerable to different “failure modes” including external erosion (wave attack), internal erosion (piping), sliding or overturning, inability to pass sufficient water during floods resulting in overtopping of water retaining structures, or inability to pass sufficient water due to spillway equipment failure or personnel errors resulting in overtopping of water retaining structures. Terrorism is also a recognized risk to the safety of water retaining structures. Each facility’s location, its proximity to other Manitoba Hydro facilities, the closeness of human settlement and environmental factors are some of the major considerations determining the extent of impacts of a dam or dyke failure. Water retaining structure failures cannot generally be controlled once they are initiated and mitigation/remediation is only feasible once flows have abated following the flood event or once the forebay has emptied. Hence, downstream effects and damage can be catastrophic.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Possible consequences include loss of life, financial/economic costs, environmental damages, reduced system reliability (worst case scenario is a maximum loss of over 70% of Manitoba Hydro’s generating capacity for years), and loss of reputation and public confidence.

RISK TREATMENT:

The risk of dam breach is addressed by ensuring the integrity and reliability of water control equipment and structures through diligent maintenance and vigilant surveillance, as well as preparing for emergencies, as per the Canadian Dam Association (CDA) Dam Safety Guidelines. The Corporation has established a Dam Safety Program based on the CDA Dam Safety Guidelines. The principal activities for managing risks include:

- Surveillance inspections, instrumentation monitoring, and engineering analyses of water retaining structures and related flow control equipment within a consequence category framework.
- Systematic utilization of failure modes-based condition assessment techniques.
- Preparation, maintenance, training and testing of Emergency Preparedness Plans (EPPs).
- Periodic Dam Safety Reviews by independent consultants to examine the adequacy of the design, construction, operation, maintenance, surveillance, and emergency preparedness plans

Water retaining structures and flow control equipment are designed and assessed according to the CDA Guidelines and maintenance programs address dam safety deficiencies of existing in a prioritized manner. Operating guidelines for each facility are established with inherent dam safety considerations.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 2. Extreme Drought – Shortfall of Energy Supply

RISK: Extreme drought with a severity worse than the drought of record has the potential to cause a shortfall in energy supply.

DESCRIPTION:

The Corporation's generation and transmission facilities are designed and operated to ensure firm demand can be supplied given a repeat of the lowest river flows since 1912. Since the Manitoba Hydro system is comprised primarily of hydroelectric resources, the design criterion translates into a requirement for power resources that will be able to supply sufficient energy under the condition of a repeat of the lowest river flows on record. In the circumstance of an extreme drought that is more severe than the worst on record, there is the possibility of insufficient energy supplies being available to meet firm load demands, which will in addition, result in extreme financial and reputational impacts to the Corporation. This risk profile is related to risk profiles Energy / Fuel Price Volatility (B.8) and Water Supply / Drought (C.1).

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The peril of an extreme drought, one that is more severe than the worst on record of approximately 100 years, may limit the Corporation's ability to provide dependable power to its customers especially those served under long term export contracts. There is the potential that some portion of the firm domestic load would have to be curtailed through enforced conservation. In addition to service limitations, there would be severe financial impacts to the Corporation in excess of those estimated for the worst drought on record (ref. profiles C.5, B.8 and C.1). Financial impacts would extend to the Corporation's domestic customers through rate increases and the Province by requiring debt financing.

RISK TREATMENT:

Water flows worse than the drought of record would be deemed to be a force majeure event under Manitoba Hydro's long term export contracts. Therefore to the extent that Manitoba Hydro needed to curtail export deliveries to serve domestic load, Manitoba Hydro anticipates that it would have the right to curtail without penalty. To the extent that these actions were insufficient and domestic energy shortages were occurring in spite of maximum imports, partial curtailment of domestic load may be required.

Non-normal hydraulic operations could also be required during a drought more severe than the drought of record. This may include operating reservoirs outside of the normal range for power production. For example, the Lake Winnipeg Regulation Water Power Licence provides for operation below the minimum level for power production limit with approval from the Minister of Conservation. Non-normal operation may also include demand reduction measures such as public appeal for conservation, enforced conservation or rotating reductions of non-essential load (e.g. street lighting). To better quantify this risk, the Corporation has participated in a number of research initiatives, using both statistical techniques and techniques that employ indicators of past extremes such as tree-rings and lake sediments. Both initiatives are aimed at defining the probability of recurrence of the worst drought on record and the likelihood of more extreme drought events. However, the results of these research initiatives to date have not been able to provide definitive conclusions on the probability of drought. The best estimate is that the Manitoba Hydro system is designed for a 1 in 100 year drought event based on the fact that the design condition occurred once in the last 100 years of record.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 3. Prolonged Loss of System Supply

RISK: The Corporation is exposed to a catastrophic event resulting in prolonged loss of system supply and therefore not able to meet its energy supply requirements.

DESCRIPTION:

System Blackout due to the loss of key infrastructure, specifically: Dorsey Converter station or HVDC corridor and 500 kV line.. Reason for loss could be severe weather events such as tornado/downburst (Dorsey 1996, Elie 2007), wide front wind, combined wind and icing, lightning (Dorsey August 2007), sabotage, flood or fire.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Key potential impacts of a prolonged loss of system supply are:

- Unable to serve Manitoba load continuously (approximately 42% of the time based on 2013 calendar year loading profile). Depending on time of day and time of year, a deficiency of up to 1550 MWs resulting in rotating blackouts throughout the province. Deficiency increases with time due to load growth and assumes the availability of maximum energy imports from neighboring regions.
- Severely impact business operations and the Manitoba economy.
- Unable to provide customers with exceptional value due to high infrastructure replacement costs.
- Threat to public safety due to an inability to supply energy needs during the coldest months of the year.
- Prolonged rolling blackouts affecting customer service and potentially damaging corporate assets such as breakers.
- Potentially weaken the Corporation's financial strength due to reduced revenues from domestic and export energy sales, and increased costs for infrastructure replacement and the purchase of import energy.
- Loss of reputation as a dependable source of supply in the export market.
- Potential political and legal consequences for the Corporation.

RISK TREATMENT:

Key risk treatment activities are:

- System expansion involving Bipole III (2018) re and a new 500 kV Interconnection to the U.S (2020)
- Additional AC network generation (Keeyask 2019)
- Hardening of Dorsey facilities
- Implementation of physical and cyber security upgrades
- Emergency Preparedness initiatives - Long term deficiency plan for managing the available resources, load and system following loss of infrastructure.
- Spare infrastructure material and equipment inventory to enable timely re-building and restoration of potentially affected assets.
- Short term emergency energy agreements with Ontario, Saskatchewan and U.S. utilities
- Mutual aid agreements with Ontario, SaskPower and U.S. utilities for labour, materials, and equipment.
- Corporate Emergency Response Program.

Likelihood	Med
Consequence	Med
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 4. System Shutdown (Short Term)

RISK: The Corporation is vulnerable to an event(s) that would cause a short term loss of system supply (electricity) resulting in the inability to meet its energy supplies requirements**.**

DESCRIPTION:

Partial or total system blackout for 8 hours or as long as several days, caused by extreme weather events, sabotage, human error, equipment failure, or an inability to import energy from the market.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

- Unable to meet customer load serving obligations and expectations.
- Threat to public safety due to inability to supply energy needs.
- Threat to Corporate reputation.

RISK TREATMENT:

- System expansion involving Bipole III (2018), an additional 500 kV interconnection to the US (2020), St. Vital – LaVerendrye 230kV transmission line (2021), and AC breaker enhancement projects (2016-2018).
- Additional AC network generation (Keeyask 2019)
- Standard Operating Practice agreements with Ontario and SaskPower for short term emergency energy.
- Restoration Plan, which includes local station restoration procedures (with/without communications) and restoration diagrams, that identify step by step restoration procedures.
- Annual participation in MISO's regional restoration drills and the development of its regional restoration plans.
- Semi-annual restoration training for System Operators.
- Annual restoration training for field staff.
- Disturbance Scenario training, such as annual ice melt training for System Operators.
- Station battery bank upgrade program.
- Regular testing of regional staffing plans that supports System Control Centre operation upon the loss of RTU communications.
- Annual black start testing at each black start facility.
- Compliance with NERC reliability standards
- Redundant communication systems (PAX, VHF, MSAT) in addition to the public telephone system.
- Storm tracker application and installed ice detection stations in ice prone areas of the province.
- Corporate Emergency Response Program.
- Actively participate and provide leadership in Congestion Management forums to exert influence on parties, such as MISO and other Congestion Process Management Council members, to ensure fair treatment of Manitoba Hydro in the formulation of industry congestion management practices.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 5. System Shutdown (Natural Gas)

RISK: Catastrophic system failure could result in an interruption of the supply of natural gas to approximately 267,000 customers in Manitoba. An associated risk is the impact on the electrical grid due to increased loading.

DESCRIPTION:

A secure and continuous supply of natural gas is critical, particularly during the coldest months of the year. TransCanada Pipelines ("TCPL") has five high-pressure lines entering Manitoba (with a couple of sections looped making some areas six lines on its Canadian Mainline. Manitoba Hydro's meter stations are tied into two of these five lines. At Ile des Chenes, MB (Station 41 on the Mainline), three pipes divert south to Emerson through which gas interconnects with Great Lakes Gas Transmission Company and Viking Gas Transmission Company in the U.S. The three remaining pipes continue through Manitoba in an eastward direction into Northern Ontario. Separate from TCPL and on a much smaller scale, Manitoba Hydro also relies on the TransGas Limited ("TransGas) and Many Islands Pipe Lines (Canada) Limited ("MIPL") systems for delivery of natural gas supply to the Swan Valley area of the province. Gas supply to the Swan Valley area of MH's distribution system via MIPL is from the TransGas system in Saskatchewan. Gas from one or more of three storage caverns in Melville, Regina and Moosomin can deliver gas that will flow to the Swan Valley area, depending upon the requirements and operations of the TransGas system.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

A catastrophic event could occur, resulting in a total or partial loss of supply of natural gas from the Mainline, TransGas or MIPL to the respective service areas of Manitoba for a period of four to six weeks. The potential impact could be significant. Manitoba natural gas customers could be left without natural gas for heating purposes, resulting in significant collateral damage. As well, an inordinate number of workers would need to visit each and every home at least two times before service could be restored. Gas supply connections would first have to be shut-off at all homes and then the homes would have to be entered when the lines are re-energized to ensure the appliances are re-lit and working properly. There could be substantial economic losses for customers and businesses arising from such a catastrophic event.

RISK TREATMENT:

TCPL has incorporated design practices to minimize the possibility of a catastrophic event occurring. While their large diameter, high pressure pipelines are all contained within the same right-of-way, there is physical separation between the pipes. The failure of any one segment of pipe is likely to have limited impact on the system. This design practice has proven to be effective during the course of several incidents over the past decade with the exception of the 2014 rupture of one of the Emerson laterals of the Mainline near Otterburne MB, which resulted in a loss of service to a number of communities in the south-east corner of the province.

In addition, TCPL has developed and employs a rigorous safety and inspection program. Regulatory oversight is provided by the National Energy Board. MIPL relies on a single pipeline and therefore does not have the same level of redundancy built into its system as the Mainline. MIPL does, however, employ a rigorous safety and inspection program. Regulatory oversight for MIPL is provided by the NEB.

As a result of the 2014 Mainline rupture, Manitoba Hydro has determined that Compressed Natural Gas should be used to help mitigate small scale outages during a natural gas supply interruption. For the 2015-2016 season, standby services have been retained from a supplier who has the proven capability and availability to supply requirements during a supply interruption for small scale outages. For the longer term CNG equipment and facilities are being purchased and constructed. The equipment being purchased will consist of two 170 mcf CNG trailers (capable of supplying small communities or critical loads), a decanting unit for off loading the CNG and a compressor station to allow for refilling the units locally.

An emerging risk in the coming years relating to the TCPL Mainline is that of the potential for significantly reduced physical redundancy and excess capacity on the prairies segment of the Mainline. TCPL appears to be taking steps to prepare for the decommissioning of two of the six lines currently running through Manitoba. In addition, TCPL plans to convert a third line to oil transportation as part of its Energy East project proposal. If these changes are undertaken, natural gas transportation capacity and redundancy on the TCPL Mainline will be reduced by approximately 50% relative to today.

Likelihood	Low
Consequence	Med
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 6. Technology

RISK: Unforeseen physical events could impact computer operations and this would affect business processes.

DESCRIPTION:

The Corporation develops, implements and manages information systems to support core business processes and provides a secure, stable computing infrastructure to support non core business processes.

Manitoba Hydro's Corporate IT environment is housed in 2 data centres, one located at 820 Taylor, one located at 360 Portage.

The factors that could lead to a loss of all or part of our computing environments are either physical such as fire, flood, HVAC or power failure, and major weather related disasters or human in nature resulting in sabotage to key IT system components. Specifically, Manitoba Hydro has no diesel backup for the 820 Taylor Data Centre.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The extended loss of Manitoba Hydro's computing environment may limit the Corporation's ability to provide customers with exceptional value (rates, service, public safety, reliability and power quality). A physical-event of significance could negatively impact all Hydro systems, with the exception of Energy Trading and the EMS/SCADA systems.

RISK TREATMENT:

Physical risks have been mitigated through the utilization of multiple computing facilities interconnected with high-speed data lines to reduce the risk of the failure of a single data centre. Improved data backup, recovery, and restore procedures have also mitigated risk. The two Winnipeg Computing centres are equipped with fire protection systems and are secured from unauthorized access. IT Services continues to work with Facilities, System Control and Station Design to investigate the costs and options of using the existing Diesel at 700 Harrow.

An initiative to formalize and harmonize the disaster recovery plans for key Information Technology Infrastructure components and Information Systems is currently underway.

A Corporate IT Security Assessment was done in 2014 on key IT functions and operations. It identified security gaps, level of risk and recommended mitigating actions to be undertaken.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 7. Concerned Stakeholders

RISK: Successful lobbying efforts by concerned stakeholders could restrict implementation of the Corporation's infrastructure requirements.

DESCRIPTION:

Increased concerns voiced publically (directly or through media) may influence regulatory bodies and Governments to place restrictions on and in some cases deny the infrastructure needs of the Corporation. As well, the review process over new facilities could become excessive in regards to time and cost due to the intervention of these stakeholders. This could result in commissioning of facilities after their required in-service dates.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Successful lobbying efforts by concerned stakeholders could result in adverse impacts on the infrastructure needs of the Corporation. These impacts could be financial and system operational and may ultimately have a negative effect on the Corporation's image, on degrading the reliability of supply from Transmission systems, and the ability to satisfy export sales agreements.

The impact of lobbying on higher profile projects such as BiPole III where delays have been imposed on the project and a resultant negative impact to reliability of supply to southern Manitoba is recognized. Lobbying also has an impact on other projects and some examples include Kilkenny Drive, Sage Creek, and now the Manitoba Minnesota Transmission Project (MMTP). In the instance of Kilkenny Drive, local lobbying resulted in delays on a subtransmission line that was required for reliability of supply. In the instance of Sage Creek, local residents raised concerns about a future Manitoba Hydro facility planned in a Manitoba Hydro owned right-of-way, which resulted in changes to the project. In both examples, local residents were objecting to Manitoba Hydro facilities being developed in their neighbourhoods. With respect to MMTP lobbying by various stakeholders could result in relocation of parts of the project, extra expense, and/or project delays.

RISK TREATMENT:

The Corporation addresses the concerns of stakeholders, where feasible, through mitigation measures. Manitoba Hydro encourages stakeholder participation in its projects early in the process which permits the identification of concerns and provides the opportunity to mitigate these concerns before they become larger issues.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: D. Infrastructure

TITLE: 8. Emergency Management Program

RISK: The Corporation is exposed to a catastrophic event, likely weather induced, that results in an extended outage of the electric and natural gas infrastructure with a limited ability to restore damaged infrastructure.

.

DESCRIPTION:

System failure caused by an extended severe weather event similar to an ice storm challenges the Corporation's ability to respond and to maintain a minimum continuity of business operations

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

In today's interconnected world, all institutions depend on others to perform their daily activities. Manitoba Hydro provides essential services and has critical functions that must be maintained in the face of disruptions, emergencies, and catastrophic events

Since the creation of the Corporate Emergency Management Program in 2008, Manitoba Hydro has responded to many large scale power and natural gas outages. Manitoba Hydro infrastructure continues to be impacted by natural, manmade, accidental and deliberate events.

.

RISK TREATMENT:

Manitoba Hydro revised the Emergency Preparedness Policy in 2015 to enhance and strengthen the Corporate Emergency Management Program. Also, the Executive Emergency Management Committee was created to provide oversight of the program and to directly support the Corporate Emergency Center during an event. Manitoba Hydro continues to develop and maintain emergency preparedness and response management plans for reasonably foreseeable emergencies and risks arising from natural or man-made events that pose a real or potential threat to:

- the safety and health of employees, contractors, and the general public
- the physical assets of the Corporation and related environmental protection
- the ability to generate, transmit and distribute electricity and distribute natural gas and provide related services, and
- the ability of the Corporation to continue business in the normal course

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: E. Human

TITLE: 1. Safety and Health

RISK: An accident will occur that will result in loss of life or significant injury.

DESCRIPTION:

Due to the inherent nature of the operational work performed by Manitoba Hydro employee safety is always of key concern to the Corporation. Beyond the human suffering element, are the tangible and intangible costs of incidents to the Corporation for compensation and benefits, lost productivity, loss of equipment, loss of revenue, and loss of public confidence.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Safety is the Corporation's principal goal. As such, safety is reflected in the Corporate Strategic Plan to ensure the Corporation has measures that safeguard the safety and health of Manitoba Hydro employees. The Corporation is focused on activities that promote accountability, safety and health leadership, safe work practices, strict compliance with environmental regulations, and preservation of employee health. These programs are put in place to reduce risk to a tolerable level and address any potential risk to the operations side of the business.

RISK TREATMENT:

The opportunity for an incident in the workplace is high. The Corporation has built upon the recommendations of the 2006 and 2015 Safety Improvement Process Teams to further address workplace risk and to change the safety culture to positively affect the resulting safety performance of Manitoba Hydro.

Significant changes planned for the 2015/16 year include: (1) Implementing a seven point safety enhancement strategy which includes annual executive site safety reviews; in-person reporting of serious incidents at EC meetings, and a modified safety stand downs as examples; (2) Developing corporate programs with an internal Rapid Response Team on Safe Driving, Close Call Reporting, and Human Error Reduction; (3) Promoting Manitoba Hydro's safety culture through research and recommend a strategy for a safety branding, marketing, promotion and recognition program; (4) Moving the Corporation beyond compliance by forming a new high performance Risk Prevention Services team (under Workplace Safety) dedicated to working with line management to proactively identify and eliminate risk; a forensic audit of operations/incidents with the intent to define improvement opportunities; and benchmark to industry standards for safety assessments of operations; (5) Implement a SAP Environmental Health & Safety module to address technical currency issues with the data management surrounding hazardous materials, as well as streamline and enhance the processes involved with incident management, analysis and reporting; (6) Managing Contractor Safety by revising contractor safety guidelines and incorporating the guidelines into the procurement tendering process to further development the contractor safety model; (7) Developing a program to identify arc flash and clothing ignition hazards and tasks and ensure that proper communication (including labeling of equipment) and protective measures are in place throughout the Corporation; (8) Safe Work Procedures program enhancement to ensure that employees have the safe work procedures that they need to assist in planning of work, reduce incidents and increase legal compliance with MR217; (9) Updating Safety Publications; and (10) Medical Screening improvements in the hiring process to analyze, evaluate, and modify current health evaluation steps in hiring process to ensure potential employees are fit for the work, reducing potential for on-the-job injuries.

Manitoba Hydro's international operations in developing countries exposes employees and their families to increased risk of disease, crime, or injuries from political, ethnic or religious conflict. A number of measures are taken to mitigate these risks, including providing employees with medical advice and medi-vac transportation, specialized location security advice, secure accommodations and having emergency response and evacuation plans.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: E. Human

TITLE: 1. Safety and Health

SUBTITLE: 1. Infectious Disease

RISK: A significant disease outbreak will impact a large number of employees resulting in major disruptions to business operations.

DESCRIPTION:

In response to the influenza A, H1N1 (Swine Flu) outbreak in April 2009 and the World Health Organization setting the pandemic alert level globally to phase six, Manitoba Hydro formed a task force on H1N1 to address the impact an infectious outbreak would have on the Corporation. The June 2014 outbreak of the Ebola virus in West Africa also had the potential to directly impact Manitoba Hydro's operations, as a number of Hydro employees seconded to the subsidiary company Manitoba Hydro International were working in West Africa at the time.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

While neither the H1N1 nor Ebola situations resulted in large scale outbreaks in North America, the impact of such a pandemic could be significant. There are predictions that suggest that up to 35% of the population could be impacted by the next global pandemic, or over 2,000 Hydro employees.

It is expected that a pandemic will result in significant and prolonged shortages with regard to the availability of employees, supplies and services. This may be enough to possibly compromise Manitoba Hydro's ability to provide safe, reliable service to customers. These impacts could further result in financial losses as revenues diminish putting added pressure on business operations. The inability to respond to system outages and customer requests could further impact the Corporations reputation. In addition, if the Corporation is unable to meet its export commitments, the utility could face potential liabilities.

RISK TREATMENT:

A pandemic is much more than just a problem for the health care system. It is a societal problem and is best managed by the coordinated participation and cooperation of governments, businesses, organizations and citizens. All parties need to be prepared for the potential outbreak of a pandemic. Manitoba Hydro monitors Health Canada briefings and directives, along with announcements from the World Health Organization (WHO) and local health publications. Employees that returned from West Africa were instructed by Hydro's Occupational Health Nurse to see their local doctor and report any symptoms.

Likelihood	Low
Consequence	Med
Tolerance	Low

CATEGORY: E. Human

TITLE: 2. Union/Employee Issues

RISK: Employee and union demands may not be satisfied which could result in inability to attract and retain skilled workers and / or possible labour disruption.

DESCRIPTION:

Interaction between the Corporation and its unions remain positive and co-operative. The IBEW collective agreement expired on December 31, 2015. A new three year renewal agreement negotiated between the Corporation and IBEW was ratified by the IBEW membership in early January.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Employee and union demands may not be satisfied which could result in strained relationships and potential strike.

RISK TREATMENT:

Minor issues and disputes arising during the year are resolved through informal discussions, or occasionally via the grievance and arbitration process.

A comprehensive bargaining framework has been developed that includes an early start to the process and agreement to limit the number of issues at the table.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: E. Human

TITLE: 3. Workforce Management

RISK: The Corporation will not be able to attract and retain the necessary qualified workforce to meet its operational needs.

DESCRIPTION:

The electricity and gas industry will be facing significant labour force challenges in the years ahead. For Manitoba Hydro, the workforce will be impacted by the following factors: retirements; new requirements resulting from major construction and technology changes; and, a changing labour market. Retirement will have the most significant impact on Manitoba Hydro's human resource requirements due to the movement of the large cohort of "Baby Boomer" employees into retirement. Retirements have shifted from a long-term average of approximately 80 employees per year to a new long-term average of approximately 190 per year. Approximately 1000 employees are expected to leave within five years.

Voluntary resignations at Manitoba Hydro are still fairly low (< 1% of the workforce annually) when compared to the industry average (>2%). More recently, as a result of our demographic shift and cyclical economic conditions, voluntary resignations have risen over the last two years (>1%).Despite Manitoba Hydro's low rate of attrition, utilities across Canada are experiencing the same Baby Boomer retirement phenomena. Manitoba Hydro employees possess skill, education and experience valuable to other utilities. The need to retain knowledge and ensure the right employees are ready to fill key positions at Manitoba Hydro is essential for long term success.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

A loss of knowledgeable and experienced employees has significant effects on all the areas of the Corporation including reduced reliability, increased cost of production, infrastructure project delays and decreased safety and productivity. By way of example, a reduced skill base in Major Capital Projects or Transmission would negatively impact the Corporation's ability to plan, construct, commission and put into service the significant projects currently underway. In the Gas Supply area, capacity management and gas supply strategies would be impaired as it could diminish Manitoba Hydro's ability to deliver reliable, safe, sustainable and competitively priced gas.

RISK TREATMENT:

To ensure knowledge retention and transfer and the supply of qualified candidates, the completion and maintenance of detailed succession plans for all key strategic and critical positions is necessary. The Corporation has implemented a comprehensive executive and senior management succession planning program including the identification of key positions and high potential employees. In addition, the Corporation is conducting succession planning at lower levels in order to identify high potential candidates earlier.

Manitoba Hydro continuously updates retirement forecasts and recruitment plans. This provides the multiple benefit of an accurate corporate-wide forecast of recruitment needs, the ability to respond to changing labour market conditions and the integration of this information into related financial forecasts and budgets. The Corporation has undertaken a more systematic approach to workforce planning and its ability to respond to the changing internal and external workforce environment. Training programs continue to be deployed to existing staff resulting in the development and improvement of technical skills in key areas. This assists in providing an adequate supply of qualified internal applicants to fill most vacancies. In addition, individual development is a priority for all staff through the completion of personal development plans on an annual basis. Although recent resignation rates at Manitoba Hydro have increased they still remain below normal rates however we continue to monitor departures and conduct exit interviews to collect information and make recommendations to address any concerns identified by departing individuals.

Likelihood	Med
Consequence	Low
Tolerance	Low

CATEGORY: E. Human

TITLE: 4. Technology

RISK: The rapid change in technology and work requirements may present challenges to system reliability, safety or productivity.

DESCRIPTION:

The pace of change in the workforce has never been as rapid as it is today with new technologies being developed that require staff to study and assess these technological changes and their usefulness within the current business and energy systems. This situation is further compounded by maintaining systems that are older which require appropriate interfaces with these new technologies and having fewer capable resources to analyze their impacts on the Corporation's present systems. The demographics of the workforce suggest that this risk will only increase in the future.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The Corporation's energy systems are both reliable and safe and its business systems are effective in meeting the Corporation's present day requirements. However, it is also important to adapt to technological advances that are required to meet changing conditions. It is conceivable that decisions or the lack of a decision in the future could reduce system reliability, safety or productivity.

RISK TREATMENT:

Manitoba Hydro has a research and development program that will help meet the needs of its business and operations, using both internal and external personnel and facilities. The primary thrust of this program will be the creation of new or significantly improved products and processes so as to obtain operational and economic benefits that will increase efficiency, reduce costs and improve the quality of service to the Corporation's customers.

The Corporation supports research and development projects carried out by students at Manitoba universities. The Corporation also supports research chairs, in collaboration with other industrial partners and with the Natural Sciences and Engineering Council (NSERC), or equivalent funding agencies at Manitoba universities, where the area of research is of direct and continuing interest to the Corporation.

New technologies are assessed to determine whether they will meet the further anticipated needs of the Corporation and detailed studies are performed when significant changes are planned so that negative outcomes are minimized. The current wind integration project which assesses the impacts of various levels of wind generation on system operations is an example of these types of studies.

All staff are encouraged to maintain their professional standards which includes keeping abreast of changes occurring within their discipline.

Likelihood	Low
Consequence	Low
Tolerance	Low

CATEGORY: F. Business Operational

TITLE: I. Supply Chain

RISK: Goods and services may not be available when required resulting in potential reliability issues, major delays, disruptions or complete loss of service to customers.

DESCRIPTION:

Managing the Supply Chain ensures the supply of goods and services are obtained in order to maintain and upgrade the current infrastructure and capital project work. The supply chain is critical in maintaining service to customers. Manitoba Hydro is dependent upon a variety of suppliers. Market trends impact the economical and financial aspects of business and the ability of suppliers to provide required goods and services on a timely basis.

The risk to Manitoba Hydro includes:

- Increased costs and lead-times due to supplier capacity, quality of workmanship and the global demand for raw materials and finished products,
- A limited diversity of supply due to company mergers, acquisitions or insolvency and a shortage of skilled labour in some trades,
- Loss and / or inability to restore service to customers due to poor supplier delivery, availability or quality of workmanship.
- Public perception and financial implications related to fraud, corruption and unethical business transactions stemming from tendering/contracting processes.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

A disruption in the supply chain impacts a majority of Manitoba Hydro's strategic goals and objectives. The Corporation requires a variety of critical goods and services to meet its obligations and commitments. An effective supply chain contributes to the Corporation's financial strength through cost minimization, planned upgrades and maintenance and the reduction in the downtime of our major assets.

Although the market has improved, the demand for construction services, particularly skilled labour, in some trades, is still a concern. In addition, recent tenders for construction have resulted in higher levels of participation, however in some cases tenders have exceeded budget estimates.

[redacted] Lead time is approximately 18 months and growing. Equipment failure may result in an extended period of reduced transmission capability of northern generation.

RISK TREATMENT:

The supply chain will continue to be managed by monitoring all market trends, identifying critical products and services, sourcing Strategic Alliance Partners, evaluating and tracking vendor performance, performing reference checks and validating vendor credentials, reducing single sources of supply, maintaining optimum inventories and identifying alternate sources of supply in case of emergency.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: F. Business Operational

TITLE: 2. Operational Controls

RISK: Unexpected operational outcomes adversely impact the Corporation's performance.

DESCRIPTION:

The Corporation has defined a vision, mission, operating principles and goals that are supported by measures, targets and strategies to direct corporate efforts toward common strategic achievements. The only manner in which the Corporation can be certain that its efforts are intended to result in a preferred outcome is to ensure that adequate controls are built into its processes. All efforts to direct, promote, restrain, govern and check progress can be described as a control. Where an operation is subject to adequate control, the odds of a positive outcome are enhanced. Where inadequate control is practiced, the result is less certain to be as intended. Where operational controls are ineffective the chance of the Corporation achieving its vision, or a subcomponent thereof, is reduced. Some of the types of operational risks that the Corporation faces include ineffective and inefficient operations, unreliable reporting and modeling systems and technology, non-compliance with applicable laws, regulations and internal policies, inability to attract and retain knowledgeable human resources and inadequate maintenance and replacement of infrastructure, to name a few.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES

The essential purpose of operational control is to encourage the accomplishment of the goals or objectives for which each employee or manager is responsible. Ineffective operational control increases the likelihood of an adverse outcome which could mean that a goal or objective is not met. The potential impacts of ineffective operational control are many and varied. They can range from infrastructure failure due to ineffective maintenance programs or systems to fraudulent activity to lawsuits and jail.

RISK TREATMENT

The governance process designed by the Corporation has objectives inclusive of promoting appropriate ethics and values; ensuring effective organizational performance management and accountability; effectively communicating risk and control information to appropriate responsibility areas; and effectively coordinating the activities of and communicating information among the Board, external and internal auditors, and management. This framework has been adopted with the intention of ensuring reliability and integrity of financial and operational information; effectiveness and efficiency of operations; adequate safeguarding of assets; and compliance with laws, regulations and contracts. The design of operational controls rests with line management. The effectiveness of control systems are subject to ongoing monitoring through the corporate governance process (inclusive of various committees, regulatory review, the Board, etc.) and are tested through an internal audit program and an annual external attestation audit. The Internal Audit Division Charter has been approved by the Audit Committee of the Board as is the annual audit program. Line management also engages consultants and experts as deemed appropriate to aid in the design of operational control systems and practices as well as to test the effectiveness of the implemented design. The Corporation also has an integrity program which complies with the requirements of the Provincial Whistleblowing legislation. The program provides a mechanism for anyone to report a situation in which operational controls are not functioning at any level.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: F. Business Operational

TITLE: 2. Operational Controls

SUBTITLE: 1. Cyber-Security

RISK: Cyber Security incidents that could result in the theft of information and / or the disruption or misuse of critical operations / assets

DESCRIPTION:

The growth of electronic communication and automation, while delivering significant benefits, has also increased risk to the Corporation. This risk includes any cyber attack that could impact the resiliency, reliability, confidentiality, availability or the integrity of Manitoba Hydro information and \operational technology assets, including the theft of personal and or business information, and or the disruption/misuse of critical operations/assets. Any computer or control system if not secured properly may be considered a potential target.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES

These cyber attacks could have a significant impact on Manitoba Hydro operationally and financially, and may have a rippling effect on the Manitoba economy.

RISK TREATMENT

Countermeasures, management controls and processes are in place to mitigate this risk. The Corporation is has implemented a series of measures to further augment cyber-security efforts consistent with recommendations of the Office of the Auditor General. Concurrently, to meet current NERC security standards Manitoba Hydro has also undertaken several projects targeted at increasing safeguards over critical cyber assets.

Ongoing assessment and enhanced mitigation strategies are required as the sophistication of external cyber threats increases, and as more computer and control systems are inter-connected. The Enterprise Security Council comprised of senior executives provides oversight for all aspects of physical and technology security including NERC related projects and the implementation of the Auditor General's eight recommendations, of which four have now been completed.

To protect Manitoba Hydro’s information technology environment an advanced corporate firewall is in place to protect the data network. Additionally, anti-virus software and security patches are closely monitored and updated immediately to prevent data corruption. The Corporation is finalizing the implementation of a Security Information & Event Management (SIEM) tool to further raise the level of protection. It will be fully operational by spring, 2016.

The Industrial Data Network has measures of protection and is being assessed to identify any required actions necessary to raise the levels of protection.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: G. Reputation

TITLE: 1. Reputation

RISK: The occurrence of a negatively public perceived event which receives significant attention and affects the Corporation's operations in a significant negative manner.

DESCRIPTION:

Reputation risk exposes Manitoba Hydro's ability to achieve its overall strategic and operational goals in an effective and efficient manner.

The impacts of reputation cover a broad range of activities at Manitoba Hydro and include many significant initiatives, including:

- Obtaining approvals and constructing new generating stations, both hydraulic and other types;
- Renewing licences (e.g. Lake Winnipeg Regulation, Churchill River Diversion, and various generating stations);
- Obtaining approvals and constructing new transmission lines and maintaining existing transmission lines;
- Extending export opportunities and protecting access to export markets;
- Maintaining market share in the domestic retail natural gas market;
- Receiving favorable regulatory (e.g. PUB) approvals;
- International operations in developing countries and emerging economies where corrupt or unethical practices are common to varying degrees, and
- Other activities.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The significance of the impact varies depending on the strategic or operational goal, however the impact can range from having insignificant costs to significant costs (e.g. the potential impact can result in the Corporation not achieving its strategic goals or achieving significant objectives such as constructing a new generating station or a major transmission line). As a publicly owned entity, Manitoba Hydro cannot under any circumstances operate outside the laws of Canada, internationally accepted standards of conduct, or the laws of the countries in which it does business.

RISK TREATMENT:

To support fulfillment of its mandate, Manitoba Hydro has identified key areas of focus which are directly related to enhancing its Corporate reputation including:

- Customer Value
- Indigenous Relations
- Financial Strength
- Protect the Environment
- Demand Side Management

Manitoba Hydro has developed and is undertaking a range of comprehensive communication actions to protect and enhance its reputation to secure trust in its ability to serve customer energy needs and gain acceptance for corporate activities. This includes effective engagement with stakeholders.

For all domestic and international operations, the Corporation requires that employees are aware of and comply with all applicable laws, regulations, standards of conduct and policies.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: H. Governance / Regulatory / Legal

TITLE: 1. Regulation and Licencing

RISK: The Corporation could face regulatory and licencing issues that restrict its operations.

DESCRIPTION:

The Corporation requires a variety of regulatory approvals and licences to carry out its activities. Key approvals and licences include those issued under the National Energy Board Act, Water Power Act and Environment Act either to build new generation and transmission facilities or to maintain the operation of existing facilities.

There are two significant issues currently facing the Corporation that could have significant impact on operations and reputation if they are not addressed. These are the risk of Lake Sturgeon being listed as endangered under the Species at Risk Act (see risk profile C.3.1) and addressing environmental and societal impacts and expectations for legacy facilities. Specifically the Clean Environmental Commission (CEC) made a non-licencing recommendation that both the Province and Manitoba Hydro conduct a Regional Cumulative Environmental Effects Assessment (RCEEA) of all Manitoba Hydro projects in the lower Nelson River sub-basin before any more projects are licenced for construction. In the recently completed Lake Winnipeg Regulation (LWR) Final Licence hearing the CEC went even further and recommended that all legacy hydro projects in the Province should be licenced under the Environment Act.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Failure to obtain approvals and licences on favourable terms or in a timely fashion could have significant financial, operating and water regime impacts, increasing costs, and reducing hydraulic generation, capacity and export sales. Expiration of a licence without renewal will expose the Corporation to embarrassment and loss of reputation. Although highly unlikely, cancelation of a licence could expose the Corporation to the possibility that a third party could acquire the water power rights at a location and potentially the loss of the asset.

RISK TREATMENT:

With respect to the Lake Sturgeon issue, the Corporation continues to take significant action to minimize the need for and likelihood of listing Lake Sturgeon under SARA (see detail of risk treatment on profile C.3.1), however uncertainty remains.

Over the next ten years, twelve of Manitoba Hydro's Water Power Act licences will have to be renewed. Although legally this should be a relatively simple process as prescribed under the Water Power Act regulations, public expectations, the requirement for the Province of Manitoba to consult under Section 35 of the Constitution with Indigenous peoples on all licencing decisions and the recent recommendations from the CEC on re-licencing that includes full environmental assessments and public reviews will expose Manitoba Hydro to significant costs, and potential operational restrictions. Manitoba Hydro is currently in discussions with the Province on how to proceed with re-licencing.

Likelihood	Low
Consequence	High
Tolerance	Low

CATEGORY: H. Governance / Regulatory / Legal

TITLE: 2. Export Market Access

RISK: The Corporation loses its legal capability to sell power outside the province due to legal and industry change issues.

DESCRIPTION:

The energy industry in North America has undergone fundamental restructuring. There are now in place market-based approaches to generation, transmission, distribution and sale of energy in the Midwest region of North America in which Manitoba is located, and new industry bodies have been formed to facilitate these activities. Opportunities for the Corporation include (1) Opportunities to export power to new markets or further develop existing markets, and (2) Opportunity to define new roles for the Corporation in the delivery of gas services in Manitoba to better serve consumers.

Manitoba Hydro's access to the U.S. market is to an extent conditioned on the adoption of measures in Manitoba to level the playing field e.g. transmission tariff, standards of conduct. Risks include: (1) Measures adopted in Manitoba to level the playing field could affect rates to Manitobans or quality of service. (2) Risk of Manitoba Hydro losing functional control of its transmission facilities in Manitoba to U.S.-based transmission operators (i.e. loss of sovereignty, lose control of transmission facilities). (3) The risk of losing market access or receiving access on adverse terms (e.g. transmission pancaking, less competitive, more costly).

As well, the Corporation requires the legal ability to sell power into other provinces and the U.S. on favourable terms. Risks include: (1) The Corporation may be prevented from selling into a particular market or obtaining transmission or ancillary services that are necessary for the sale to take place. (2) Unfavourable terms may be imposed on sales, by U.S. regulators or trading partners (3) May affect amount of power Manitoba Hydro can be assured of importing during times of drought.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The above opportunities and risks may affect the amount of revenue from export sales and could impact the reliability of supply and service to Manitobans. They might also impact Manitoba Hydro's mandate, control over facilities and raise issues of Canadian and Manitoba sovereignty.

RISK TREATMENT:

The rules are constantly changing in export markets. Accordingly, corporate strategies for ensuring market access will continue to require ongoing management. Strategies (all subject to change) include: (1) Ongoing development and assessment of strategic plans. (2) Ongoing alignment of strategic plans and participation by Manitoba Hydro personnel in export based operations. This includes: coordination agreement with MISO; membership in Midwest Reliability Organization; active input into MISO committees and bodies; FERC filings; Ontario marketing licence; adoption in Manitoba of transmission tariff, standards of conduct, reliability, security and operating procedures consistent with U.S. requirements; promotion of the corporate image in export markets; and active engagement with Manitoba Hydro's principal export customers to confirm they are able to obtain needed regulatory approvals.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: H. Governance / Regulatory / Legal

TITLE: 3. Legal Compliance

RISK: The Corporation does not comply with legal requirements

DESCRIPTION:

The Corporation must comply with a broad variety of legislation, regulations, common law and other legal requirements.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Depending on the type of legal requirement the consequences of non-compliance may include:

- Financial penalties for the Corporation.
- Fines / imprisonment for individual directors, officers or employees.
- Impact on corporate reputation.
- Restrictions on corporate operations.

RISK TREATMENT:

The Corporation fosters a positive culture of compliance through measures such as a Corporate Code of Ethics, periodic messages from the President to all employees emphasizing the importance of compliance with the Law, and an Integrity Program to enable employees to report any violations of the Code of Ethics without fear of reprisal.

Management has identified a short list of compliance risks that pose the most material risk to the Corporation. Management has developed for the Audit Committee of the Board profiles of the compliance programs for these risks and provides to the Committee annual updates and metrics associated with them.

An Integrity Officer coordinates the investigation of all Integrity Program reports. Summaries and analysis of reports received pursuant to the Integrity Program are shared with the Audit Committee annually (with identifying details removed to protect confidentiality). Summaries of all material litigation, communications with licensors and other potential indicia of compliance or non-compliance are also reviewed by the Audit Committee on an annual basis.

In order to mitigate exposure to market manipulation risk, the Corporation is in the process of implementing a Wholesale Electricity Markets Compliance Program to establish policies, procedures and guidelines pursuant to anti-market manipulation laws in place in the U.S. and Canada. This program will outline roles and responsibilities of those identified in the program, provide direction to employees transacting in the export markets, identify permissible and prohibited trading considerations and specify policy with respect to potential violation investigations, disputes and reporting, training requirements, record retention practices and compliance monitoring related to the Corporation's participation in the wholesale electricity markets.

In all cases it is the responsibility of management to ensure compliance with the law. The generally accepted elements of a corporate compliance program are:

- Standards and procedures that are reasonably capable of reducing non-compliance.
- Assign specific high-level personnel to oversee compliance.
- Prevent delegation of discretion to individuals likely to engage in non-compliance.
- Effectively communicate standards and procedures to relevant employees.
- Implement monitoring, auditing and reporting systems.
- Use disciplinary measures to enforce standards and procedures.
- Respond to breaches that are detected including modification for systemic problems.
- Continually evaluate the risk of non-compliance.

Likelihood	Low
Consequence	Med
Tolerance	Low

CATEGORY: H. Governance / Regulatory / Legal

TITLE: 4. Contracts & Ventures

RISK: Contracts are not fulfilled or business ventures expose the Corporation to undesirable events.

DESCRIPTION:

The Corporation engages in a variety of commercial activities. It purchases goods and services, sells its own goods and services, purchases and sells land and intellectual property and signs a variety of other contracts and agreements. The Corporation also purchases businesses such as Centra and Winnipeg Hydro, and sets up subsidiaries and joint-ventures to pursue particular opportunities. Some of the risks include:

- Failure to comply with contract obligations and contract law (e.g. anti-corruption law).
- Acceptance of unfavourable contract risk, liability clauses or indemnity requirements.
- Failure to obtain property rights and easements needed for corporate activities.
- Failure to obtain software licences or other intellectual property.
- Failure to secure sufficient audit rights to protect the corporate interest.
- Entanglement in foreign legal proceedings.
- Failure to exercise appropriate governance over joint-ventures / subsidiaries.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Management of the above risks will impact the revenues or other advantages that the Corporation is seeking to achieve, and the potential lawsuits and financial liabilities that the Corporation may be exposed to.

RISK TREATMENT:

The Corporation has risk management programs in place for particular, high risk commercial activities such as the purchase of gas hedges and power trading.

Board approval is required for all contracts of first importance to the Corporation (meaning contracts with high impact on the Corporation's ongoing operations over the long term (e.g. Northern Flood Agreement, Joint Keeyask Development Agreement, Winnipeg Hydro Purchase Agreement), contracts introducing fundamental change to the Corporation and purchases beyond specified signing limits and discretionary payments over $5 million. There are Board guidelines for the creation of subsidiaries and joint-ventures.

The majority of commercial risks are managed within the Business Units. Management is responsible to manage the opportunities, obligations, adherence to contract law (e.g. anti-corruption law), and risks in all documents that are signed. Policy requires the approval of a Division Manager for any contract containing non-standard risk, liability or indemnity provisions. Contracts and ventures of first importance to the Corporation are coordinated at the executive level with Board reporting and approvals. Policy requires legal approval of all contracts of first importance to the Corporation. Policy requires legal approval of all consulting contracts, with any exceptions approved by a Vice-President and reported to the Audit Committee.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: H. Governance / Regulatory / Legal

TITLE: 5. NERC/MRO Reliability Standards

RISK: The Corporation could face negative consequences if it does not comply with mandatory NERC/MRO reliability standards.

DESCRIPTION:

NERC/MRO standards identify specific reliability requirements for the planning, design, reliable operation, and maintenance and security of the North American bulk power system. NERC reliability standards are binding on the Corporation pursuant to the Reliability Standards Regulation under the Manitoba Hydro Act. The National Energy Board, which regulates international power lines also requires Manitoba Hydro to comply with applicable Reliability Standards under its General Order on Mandatory Reliability Standards.

A finding of non-compliance to these standards could result in the following potential consequences: (1) Financial penalties up to $1 million per day per violation; (2) Increased regulatory scrutiny by the PUB and NEB as a result of violations; (3) Public disclosure of non-compliances, which may result in a negative impact on the Corporation's reputation and its exceptional standing in the industry; (4) Immediate Remedial Action Directives imposed by NERC/MRO on the Corporation; (5) Negative impact to Manitoba Hydro's export capability; and (6) Monetary penalties to both employees and the Corporation up to $100,000 pursuant to the NEB's Administrative Monetary Penalties (AMPs) Regulation

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The violation of mandatory standards could threaten the reliability of the bulk power system. Manitoba Hydro recognizes reliability as an important priority; one which provides exceptional value to customers. Public disclosure of non-compliance on a single significant matter, or numerous times on points of lesser significance, could put negative pressure on the Corporation's image. Furthermore, financial penalties imposed on the Corporation could be substantial.

RISK TREATMENT:

To mitigate the risks of non-compliance to reliability standards, the Corporation has developed a Corporate NERC Reliability Compliance Program to manage the demands of compliance. The role of the program is to promote a culture of compliance, act as the primary contact with external entities, manage the flow of information both internally and externally, and provide high level support for corporate compliance-related activities. A decentralized approach to the assignment of responsibility for each standard has placed accountability for the Corporation's compliance squarely in the hands of subject matter experts who can assess current practices against the requirements of the standards and take action to ensure compliance. These subject matter experts (generally Department Managers) are designated as either standard owners or requirement owners depending on their level of involvement relative to the specific requirements of the standards. The Program has created clearly defined roles and responsibilities for both standard owners and requirement owners. In addition, standard owners and requirement owners are expected to participate in the MRO/NERC standards development process, through commenting periods, voting strategies, and/or as members of standard drafting teams, to influence the development of a standard before it becomes mandatory and enforceable.

Under the Reliability Standards Regulation, the Corporation works collectively with the Province to update the list of reliability standards applicable in Manitoba as well as the NERC Rules of Procedure applicable in Manitoba, providing flexibility to deal with future events and changing circumstances.

CATEGORY: I. Indigenous

TITLE: 1. Relationships

RISK: Poor relationships will have negative impacts on future Corporate activities.

DESCRIPTION:

Manitoba Hydro ("MH") has a goal in its Corporate Strategic Plan to " Engage impacted communities in a positive way to enhance working relationships". Effective working relationships adhere to the basic principles of mutual recognition, mutual respect, sharing and mutual responsibility Working relationships encompass activities in the areas of employment, training, environmental stewardship, purchasing, contract work, customer service, business opportunities and addressing adverse effects.

Working relationships exist with Indigenous individuals, communities and organizations. In managing relationships Manitoba Hydro takes into consideration issues and concerns raised by the community, Indigenous and Treaty rights, impacts of hydro-electric development, employment equity and human rights concerns, and the societal need to move towards reconciliation.

The risks in this area include both substantive and process issues such as disputes arising in relation to: adequacy and continuation of process funding; adequacy and eligibility for compensation arising from existing and future development; eligibility for and adequacy of corporate programs and initiatives; equitable allocation of programming dollars and opportunities; and the representative capacity with respect to Indigenous interests. Any of the above can result in legal action.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

- Lack of trust on the part of many Communities which were impacted by hydro-electric development.
- Continued existence of ongoing impacts that cannot be totally eliminated even with decommissioning of the project which would have other impacts.
- Significant needs of many Indigenous communities that have resulted from numerous social, political and economic issues most of which are not related to hydro development.
- Need to create a level playing field in dealing with Indigenous communities requiring significant expenditures for the Corporation for consultants, lawyers and capacity building.
- Widely different views on respective obligations. Compensation paid under settlement agreements that does not address ongoing impacts leave future groups dissatisfied.
- Dissatisfied groups and/or their supporters damage Manitoba Hydro's image with export customers in particular and domestic stakeholders generally.
- Requests for financial donations and sponsorships increase, while fiscal constraints minimize the amount of discretionary funding available..
- Intervention by disaffected Indigenous entities adversely affects the outcome of regulatory processes.
- Significant reduction in process funding may impact communities' ability to manage their relationships with Manitoba Hydro.
- Dissatisfied groups and/or their supporters may take legal action and/or engage in acts of civil disobedience resulting in financial, operational and reputational impacts.

RISK TREATMENT:

- Behave in ways that earn trust and respect and contribute to mutual gains.
- Build on the mutual interests in the land and water that Manitoba Hydro shares with Indigenous peoples and seek to understand and accept different world views.
- Continue to design and deliver meaningful programs, projects and activities to address NFA obligations.
- Encourage fair public comment on hydropower issues and facilitate open communication with customers and government entities.
- Operate in compliance with corporate goals, operating principles and sustainable development principles.
- Agree on work plans and budgets for negotiating processes that include community assurances that a local expenditure control system exists, with expenditure control procedures in place, for both internal and external service providers.

Likelihood	Med
Consequence	M High
Tolerance	Low

CATEGORY: I. Indigenous

TITLE: 2. Legal

RISK: Unfavourable relationships and rulings could negatively impact Corporate operations.

DESCRIPTION:

Manitoba Hydro facilities can adversely affect Indigenous people with rights and interests in the area of the facilities. Interactions with Indigenous people and organizations are undertaken within a unique framework created by the following factors:

- Canada's constitution and legislation recognizes rights and provides protections to Indigenous peoples and Indian Reserve land in particular.
- Manitoba Hydro has significant contractual obligations under the NFA, the related NFA Implementation Agreements and other agreements with First Nations, the Manitoba Metis Federation (MMF), northern Indigenous communities and resource users.
- Manitoba Hydro's issues are often interwoven with broader federal and provincial responsibilities and Indigenous Self-Government issues.
- Indigenous concerns frequently command a high public profile.
- The Corporation is committed to enhancing working relationships with Indigenous peoples.
- There is often a lack of legal clarity, agreement, or common understanding with First Nations or Metis regarding the nature of Treaty and Indigenous rights (including Indigenous Title) and the obligations that arise for the Crown or proponent of a project in relation to such rights.

The risks in this area include:

- Inadvertent breach of legal obligations under contracts, legislation, regulations and constitutional requirements
- Restrictions on the use of land and water for energy production.
- Imposition of post project environmental reviews and assessments.
- Claims (e.g. breach of contract, interference with the exercise of rights, trespass, negligence) resulting in adverse orders including orders for damages or injunctions
- Delayed government approvals and unfavorable licence conditions for new projects
- Operating restrictions placed on existing projects
- Political interventions and civil disobedience (e.g. blockades)
- Lack of suitable judicial remedies
- Loss of export market opportunities
- Project delays and cost escalation.
- Competing interpretation of contractual arrangements.
- Long and costly arbitration processes and/or litigation.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Damage claims and operating restrictions have monetary implications. In an extreme case there could be risk to persons or property. Depending on the management of the risks, there is potential for damage to the corporate reputation and export market opportunities.

RISK TREATMENT:

Management systems exist or are being developed to flag obligations and to follow up on compliance which reduce the likelihood of inadvertent non-compliance with legal obligations. The Corporation is pursuing enhanced working relationships through mutually beneficial arrangements with Indigenous groups when developing new hydro facilities and is continually seeking improvements to its relationship with Indigenous peoples. The Corporation monitors developments in the field of Indigenous law to ensure ongoing awareness of evolutions in jurisprudence on Indigenous rights.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: J. Emerging Energy Technologies

TITLE: 1. Emerging Energy Technologies

RISK: New technology renders current facilities cost excessive.

DESCRIPTION:

Significant breakthroughs or improvements involving large scale mass production of new emerging technologies (energy storage, bioenergy, solar, wind, etc.) could result in lower electricity capital or production costs. Such technology breakthroughs could impact both Manitoba Hydro's export revenue and domestic revenue. The potential impact on export revenue is one of the factors discussed in category A2.2 Export - Long Term Price Uncertainty. Emerging renewables put downward pressure on export market prices along with providing more fixed price/non-emitting resource options to counterparties which affects the export marketing opportunities and related long term pricing premiums available to Manitoba Hydro. New small scale domestic emerging technology resources such as solar could reduce expected load growth, and reduce energy revenue in Manitoba over the long run, if the cost of the resources becomes low enough to become economic.

Alternative generation technologies, without tax incentives or subsidies, are currently more expensive than conventional generation. Generally the more mature alternative technologies, such as utility scale wind power, are closer to commercial parity even without subsidy as their costs continue to decrease slowly. With subsidies, new wind power in the Midwest US is currently being contacted at below market prices, creating substantial challenges for merchant generators. There remains substantial uncertainty around the availability of these subsidies (specifically for wind power) post-2015. Less mature technologies, such as solar photovoltaics, have costs which are decreasing more quickly, but costs would still need to decrease by at least a factor of two for them to be commercially viable without subsidy or mandate. However drastic technology cost reductions in the past few years has set a trajectory where commercial viability in many medium/higher cost regions of the US within the next five to ten years.

Manitoba has biomass resources, primarily from crop residues, but individual utility scale generating plants would be small (<30 MW) and disbursed. Costs associated with biomass fuel collection and transportation continue to limit the development potential for this option in Manitoba. Utilization of biomass resources would also be subject to competition from other bio-product demand such as heating.

Energy storage technology is predicted to play a significant role in future electrical grids with distributed generation components by helping to manage intermittency, which could enable the integration of more non-dispatchable energy sources such as wind or solar. The historical price drop for lithium-ion batteries has accelerated with the recent expenditures of multiple billions of dollars on new higher-scale manufacturing facilities and larger battery chemistry research laboratories.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

The impact of this risk is reduced revenue from both domestic and export energy sales from existing assets while also impacting the business case for new hydro-electric generation. Development changes in emerging energy technologies have tended to be more evolutionary than sudden, which means that relative value thresholds between conventional and emerging generation are likely to be approached gradually.

RISK TREATMENT:

Manitoba Hydro retains expertise and keeps well informed of the direction occurring within the industry. The current resource plan indicates that no new generation is required until 2033. This requirement is based on current load forecasts that include new DSM targets both of which are updated annually to reflect information that is available. This time frame allows the Corporation to assess new alternative energy technologies and work towards an integrated resource plan which determines the appropriate combination of resources to meet multiple objectives (technical, environmental etc) at the lowest cost to Manitobans.

Likelihood	Low
Consequence	M High
Tolerance	Low

CATEGORY: K. Strategic

TITLE: 1. Strategic Direction and Execution

RISK: Missed opportunities, unfavourable business decisions.

DESCRIPTION:

Strategic planning is the overarching methodology by which the Corporation sets direction and aligns corporate priorities and resources.

POTENTIAL IMPACT ON ACHIEVING CORPORATE OBJECTIVES:

Establishing, communicating and implementing strategic direction is essential in managing threats and opportunities. Strategic decisions have the potential to significantly impact corporate performance and the achievement of financial targets, either positively or negatively, pertaining to any of the Corporate Strategic Plan (CSP) goals and/or identified risk categories. High level strategic considerations may include: large scale capital projects to meet the future needs of the province, re-investment in the existing energy system to maintain high reliability, attraction and retention of a high caliber workforce, stakeholder and indigenous relationships, implications of evolving power markets including access to export markets, potential industry-wide implications of shale gas, prioritization of capital projects and resource optimization, performance management and process improvement.

RISK TREATMENT:

Manitoba Hydro’s integrated planning cycle commences annually with key inputs such as: economic variables and energy price forecast, load forecast, demand side management forecast, export price assumptions, capital costs and OM&A forecasts. These inputs drive the Integrated Resource Plan (IRP), capital expenditure forecasts and ultimately the Integrated Financial Forecast (IFF). The CSP is a companion document for consideration throughout the planning cycle.

Major strategic decisions and strategic, plans are subject to an internal review and approval process. Many strategic decisions are also subject to external review and approval through regulatory processes.

Senior management is responsible for communicating and ensuring the implementation of strategy throughout the Corporation. Manitoba Hydro’s Vision, Mission and corporate targets are communicated to employees via the CSP.

Business units incorporate the CSP into their respective business plans as appropriate. Applicable goals, measures and strategies become increasingly oriented to operations as the process moves downward through the organization.

APPENDIX C

CORPORATE

RISK MANAGEMENT

FRAMEWORK

APPENDIX C - CORPORATE RISK MANAGEMENT FRAMEWORK

The Corporation has adopted the following six step Risk Management Process, Risk Rating Criteria and Risk Tolerance Rating Criteria to consistently identify, assess and manage risks:

Six Step Risk Management Process

1) **Mission / Mandate**
The process of identifying and managing risk is initiated at the Corporate, Business Unit, Division, Department, or project level by focusing on the underlying mission / mandate and specific strategic goals established for that particular area of the Corporation.

2) **Risk Identification**
Risks are identified based on the factors that influence the performance of the area of the Corporation being assessed.

3) **Potential Impact**
Risks are analyzed for potential impact and measured in terms of consequence and likelihood. Consequence is quantified in terms of system reliability, safety, finance, environmental impact and customer satisfaction. For each consequence identified, the likelihood (probability) is determined of the event occurring.

4) **Risk Treatment**
Actions are taken to reduce the likelihood of a negative event occurring or to reduce the negative consequences should a negative event occur. Risk treatment can include a reduction of the risk through modification of operational activities, a sharing of the risk through external insurance or acceptance of the risk as a normal consequence of the business and/or operations. The acceptance of risk is subject to that risk being within the approved tolerance levels of the Corporation.

5) **Residual Risk**
Certain levels of residual risk may remain even after actions have been taken to reduce their likelihood and consequences. An assessment is performed to confirm that the residual risk levels are within approved tolerances.

6) **Reporting and Monitoring**
Systems are implemented to monitor key risks, and information provided by these systems are used to facilitate management actions. Reporting systems ensure that senior management and other stakeholders are appropriately informed and risks are managed within the Corporation’s approved risk tolerances.

Corporate Risk Rating Criteria

CORPORATE RISK PROFILE
RATING CRITERIA

	MEASURES	RATING		
		Low	Medium	Medium High
ANNUAL CONSEQUENCE -				
Financial	Net income / capital investment	$0 - $50 million	$51 - $150 million	> $150 million
System Reliability	Domestic Customers	Outage affecting 50 customers for 4 hours Not life threatening	Outage affecting 500 customers for up to 24 hours. Have ability to serve critical loads. Not life threatening as critical loads served.	Do not have capacity to serve Manitoba load for extended period of time. Life threatening. Loss of public confidence.
	MW generation or interconnection capacity	NERC level 1 In compliance with industry reliability standards.	Loss of 2000 MW. NERC level 2 - load management procedures in effect. In compliance with industry reliability standards.	Loss of > 2000 MW. NERC level 3 - firm load interruption imminent or in progress; and / or non-compliance with industry reliability standards.
Safety - Employee and Public	High risk accidents, severity rate, frequency rate and public contacts.	Minor injuries. In compliance with laws and industry standards.	Disabling injuries. In compliance with laws and industry standards.	Severe injuries and fatalities; and / or non- compliance with legislation and industry standards resulting in imprisonment for MH mgmt, significant fines and loss public trust.
Environment	Environmental impact - air emissions, water mgmt, spills, land & habitat disturbances, etc.	Minor impact to environment. In compliance with stakeholder expectations and laws and regulations. Ability to obtain / renew environmental licensing and operating approvals.	Local and contained damage to environment. In compliance with stakeholder expectations and laws and regulations. Ability to obtain / renew environmental licensing operating approvals.	Severe widespread and uncontained damage to environment; and / or non-compliance with stakeholder expectations, laws, and regulations resulting in imprisonment for MH mgmt, significant fines, loss of public trust and long term operating restrictions
Customer Value	Customer perception service with regard to:			
	Retail electricity rates	No rate increase	Annual increase < 10%	Annual increase > 10%
	Reliability and quality service	Restoration service within 4 hours, no threat to public safety,. < 1.3 outages/customer/ year, provision energy related services.	Restoration service within 24 hours with no threat to public safety. 2 outages/customer/year,	Outage for extended period of time. Life threatening. Loss of public confidence.
	Reputation	Local media coverage with negligible impact on stakeholders.	A highly visible event attracting national media coverage or environmental concern; and /or a moderate negative impact on stakeholders.	A highly visible event attracting international media coverage or environmental concern; and / or a significant negative impact on stakeholders such as breach of privacy, contractual obligation or environmental stewardship.
LIKELIHOOD		Event is not likely to occur within 10 years.	Event is likely to occur within 5 - 10 years.	Event is likely to occur within 1 to 10 years.

Note: While risk impact ratings are outlined for low, medium and medium-high those considered more significant than others in the medium-high category are elevated to a high category to signify their potential higher impact on the Corporation.

Corporate Risk Tolerance Definition / Rating Criteria

Tolerance is defined as the allowable or permissible variation from a standard. For Manitoba Hydro's purposes, tolerance is further defined as the extent to which the amount of residual risk is deemed to be reasonably acceptable within the resources available to the Corporation. To the extent that tolerances fall beyond reasonably acceptable levels, actions have been taken (or are being taken) to mitigate that risk.

Typically, risks with high consequence have corresponding low tolerances. Safety and Health (E.1) and Reliability of Service (C.4) are examples where the Corporation has a low tolerance for risk due to the severe consequences of negative events.

Tolerance is rated as either, low, medium or high based on the following parameters:

- Low – Zero or limited variability is accepted. Low tolerance is usually associated with an area where the consequences of negative events are significant and the Corporation has the ability to control the risk.
- Medium - Some variability is accepted. Medium tolerance may also be associated with high risk but the ability of the Corporation to control the risk may be limited.
- High – Significant variability is accepted. Consequence is always low.

To ensure adequate control and monitoring of risk, management establishes rules, limits, targets and guidelines and continually monitors these indicators and responses accordingly. The Corporation has created three levels to illustrate this:

- Green: no additional action required at this time as the risk is under control and is not subject to significant change.
- Yellow: there are or appears to be some emerging issues that need to be closely monitored and addressed. Additional action is required to bring the risk back to the established tolerance. Management has time to respond in an orderly manner.
- Red: the risk has become critical to business operations and requires day to day senior management attention. If not resolved quickly, it could have catastrophic impacts on the organization.

Tab 119

Table of Contents

15 Implementation and Risk Management Plan for Preferred Development Plan

15.0 Chapter Overview

The Preferred Development Plan was created to serve the growing electricity demand in Manitoba and to take advantage of new export sale opportunities, including the 250 MW MP sale, the 125 MW NSP sale, the 100 MW WPS sale and the potential 300 MW WPS sale.

As described in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***, the Preferred Development Plan includes four main components:

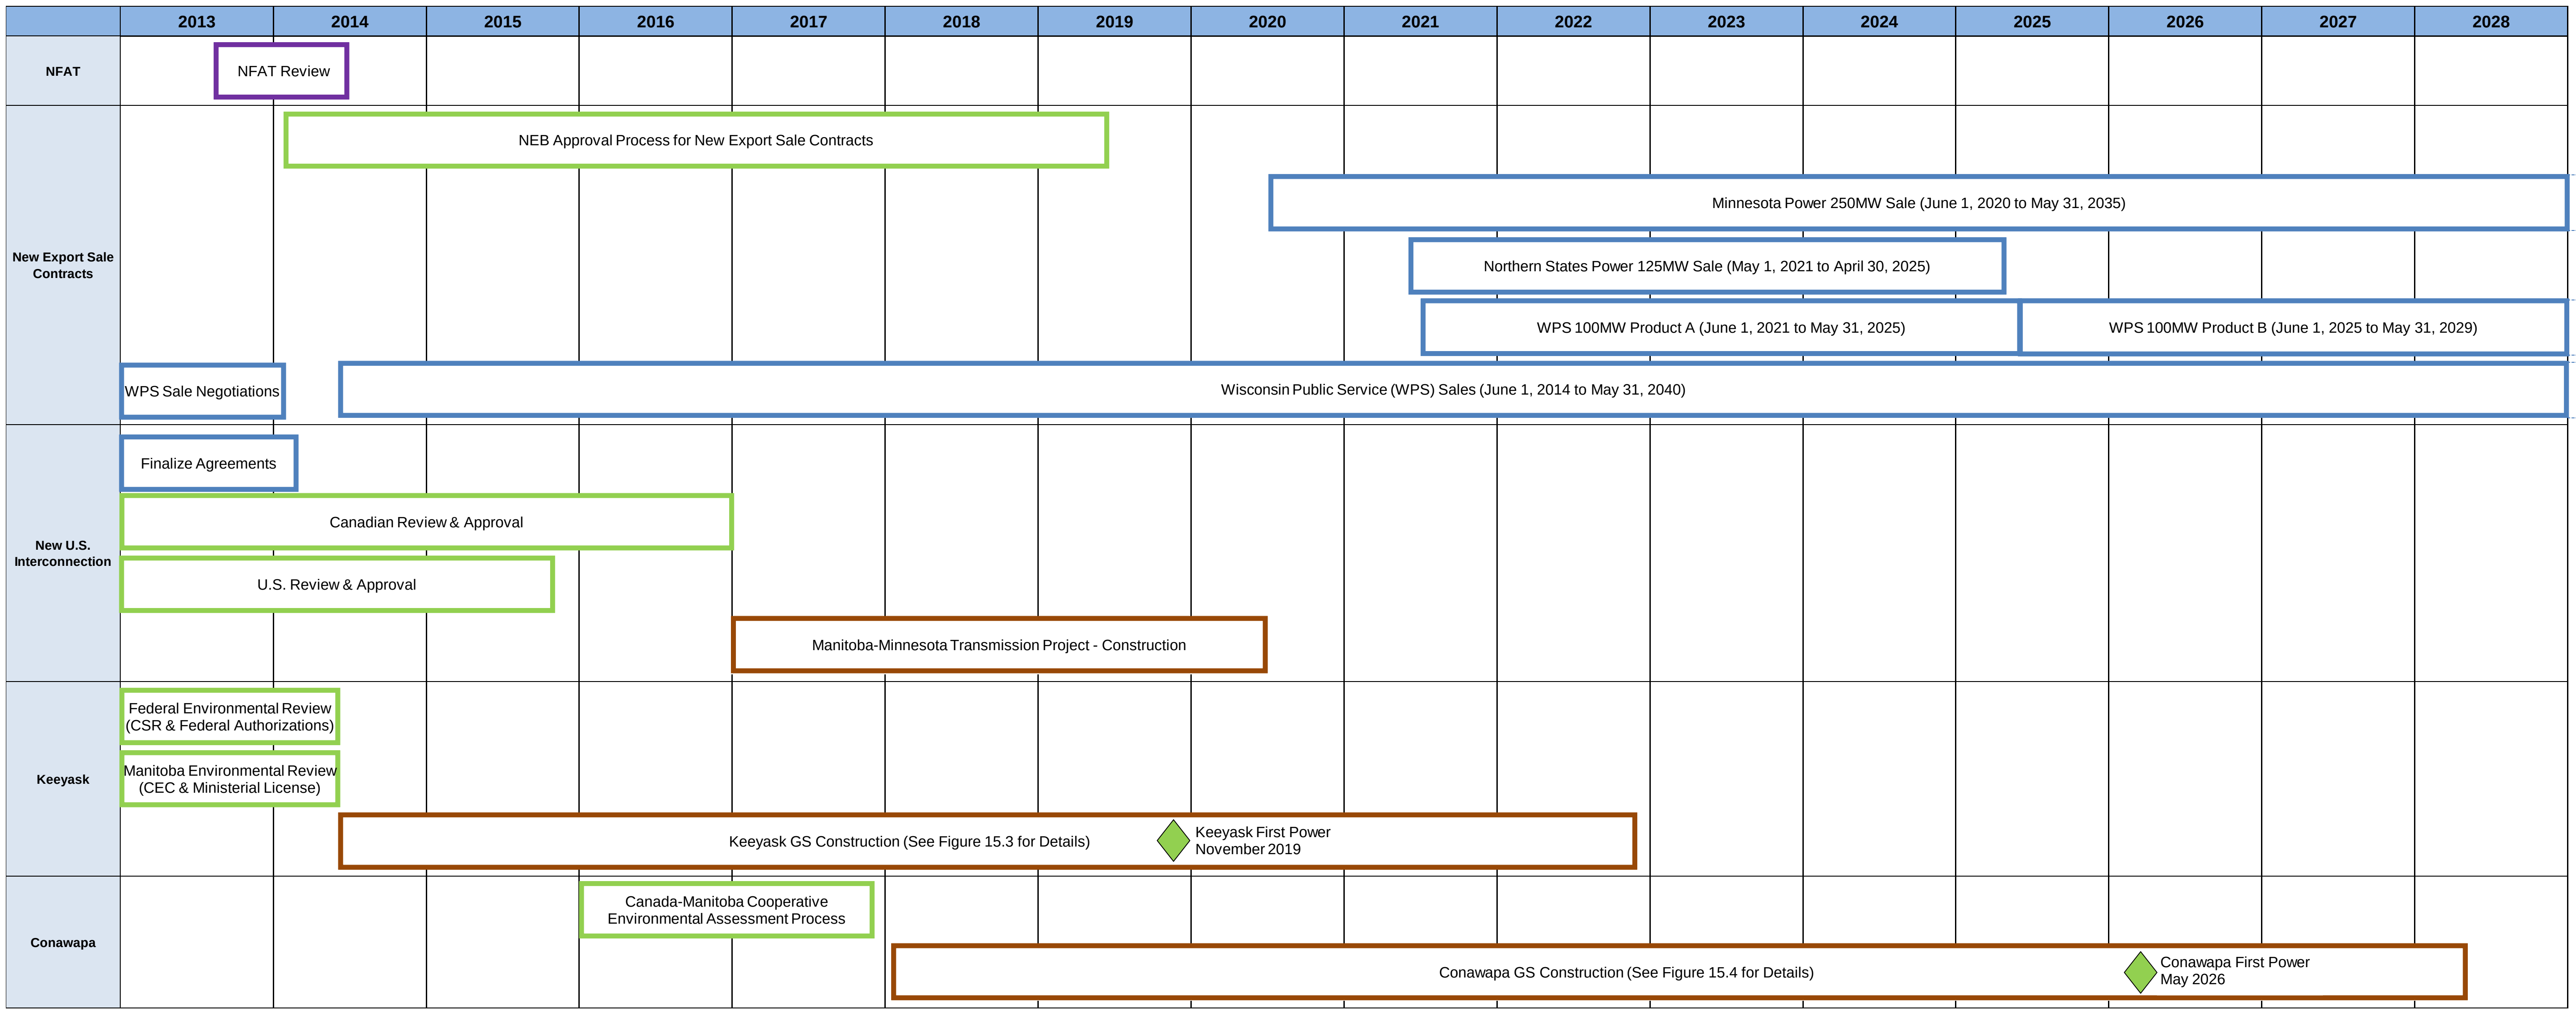
- 695 megawatt (MW) Keeyask Project with a November, 2019 in-service date (ISD)
- 1,485 MW Conawapa Project with a May, 2026 ISD (the ISD is subject to revision)
- 185 MW North-South Transmission Upgrade Project, with an ISD to coincide with Conawapa
- 750 MW/500 kV Manitoba – Minnesota Transmission Project with a June, 2020 ISD.

This chapter explains how Manitoba Hydro intends to implement the Preferred Development Plan and manage the associated risks. Implementation includes the finalization of all required agreements, including the export sale contracts; submission of regulatory applications and participation in regulatory review processes; and project delivery.

Figure 15.1 shows a schedule of the main activities and key dates related to implementation of the Preferred Development Plan that are discussed in this chapter.

The schedule represents the period from 2013-2028, inclusive. Please note that some of the sale agreements extend beyond 2028.

Figure 15.1 MANITOBA HYDRO IMPLEMENATION SCHEDULE – PREFERRED DEVELOPMENT PLAN



15.1 Pathways Associated with the Preferred Development Plan

Chapter 14 – Conclusions, Section 14.2 presents five distinct pathways for new resource development currently being considered by Manitoba Hydro. Each pathway is based on a specific commitment decision to be made regarding the next new resource and represents a range of alternative development plans that could unfold thereafter.

Chapter 14 – Conclusions concluded that Manitoba Hydro should proceed with the Preferred Development Plan and its associated pathways.

The immediate commitments in June 2014 are:

- start construction of Keeyask G.S. for a 2019 ISD
- proceed with the 250 MW export agreements with Minnesota Power(MP)
- proceed with the 100 MW export agreement with Wisconsin Public Service (WPS)
- proceed with the 750 MW/500 kV U.S. interconnection subject to regulatory approvals
- proceed with the 300 MW export agreements with WPS subject to satisfactory conclusion of negotiations currently underway.

As both Pathways 4 and 5 are based on developing Keeyask G.S. for an ISD of 2019 in conjunction with a new 750 MW U.S. interconnection, they will be the focus of this chapter.

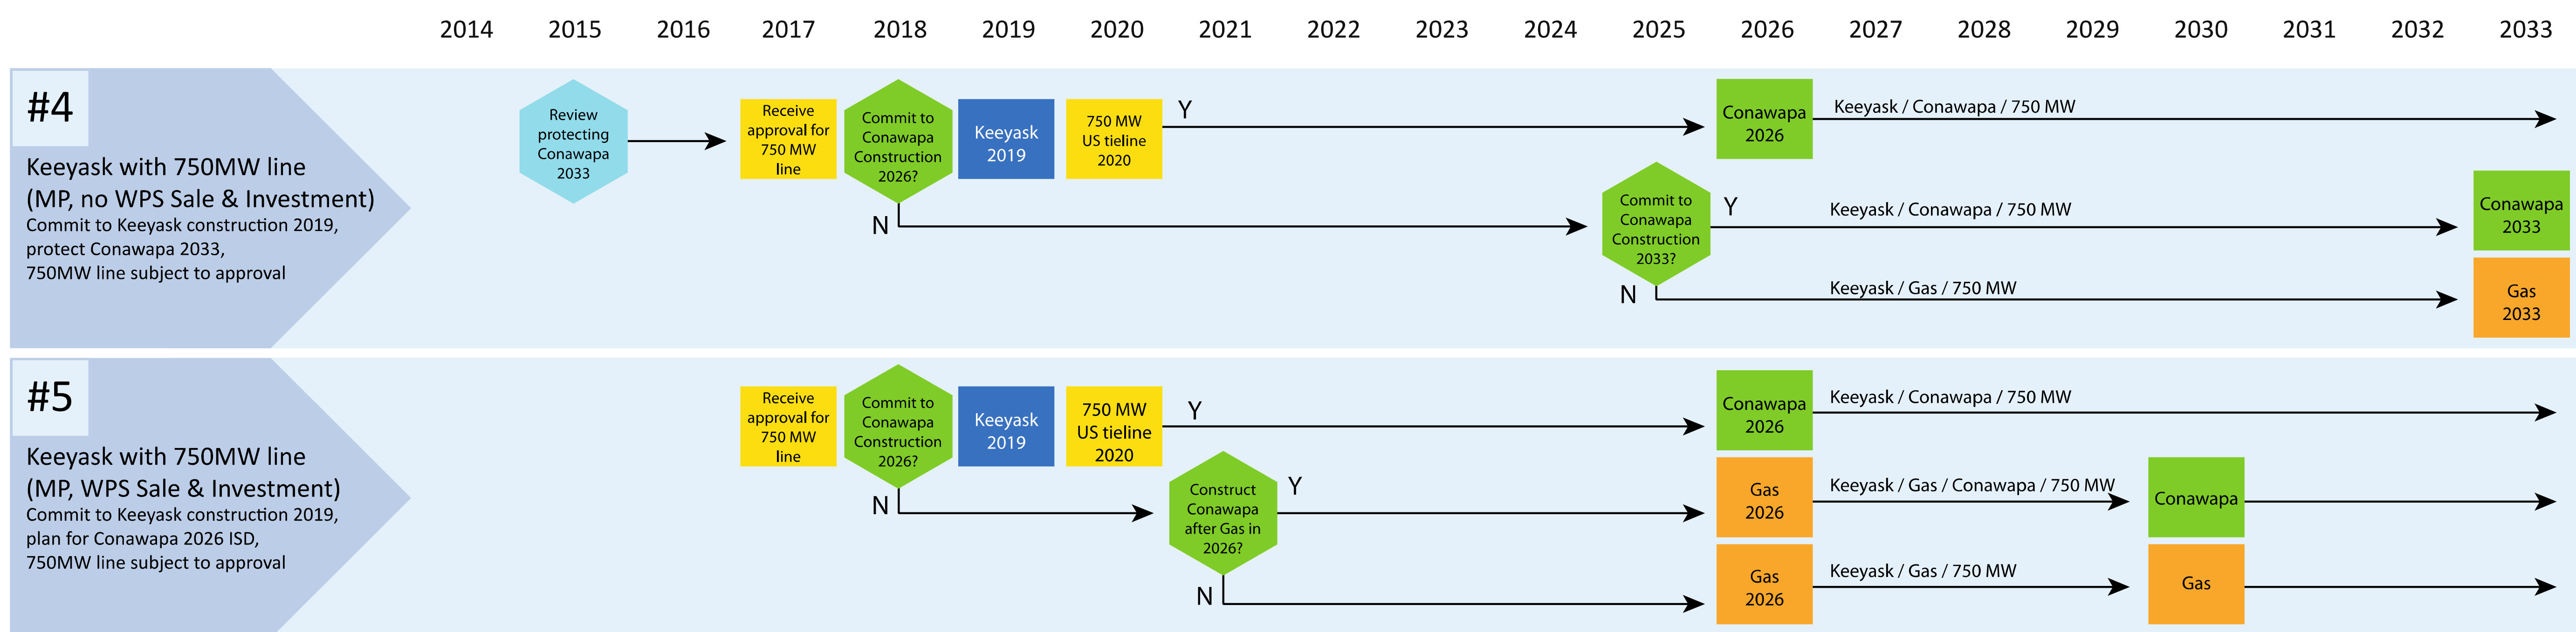
Figure 15.2 illustrates Pathways 4 and 5 and shows the development plans that are represented by these pathways. The majority of the development plan analysis throughout this submission utilizes resource in-service dates based on the 2012 load forecast; however, Figure 15.2 is based on the 2013 Load Forecast resource in-service dates.

Both Pathways 4 and 5 include Conawapa G.S. and have flexibility as to its ISD. Manitoba Hydro will continue to evaluate the Conawapa Project through the annual Power Resource Plan and otherwise as required. Should conditions not be favourable to constructing Conawapa for a 2026 ISD, a decision could be made as late as 2018 to defer its ISD or displace Conawapa with other resources such as gas. Displacing Conawapa G.S. by an alternate resource would reduce some of the benefits associated with the plan as described in this report, but this would be offset by a corresponding reduction in downside risk.

There is a risk the 750 MW interconnection may not receive regulatory approval; however, this risk can also be mitigated because the Conawapa G.S. construction commitment in 2018 falls one year after the scheduled approval date for the interconnection. Conawapa G.S. could therefore be deferred or cancelled should the interconnection approval be delayed or denied.

With all required approvals in place, construction can begin on the Keeyask Project without having received the final approval for the interconnection. In the event that the interconnection does not proceed and the 250 MW MP Power Sale Agreement (PSA) is cancelled, Keeyask G.S. is still the logical choice for a new resource option to meet Manitoba's growing electricity needs. With sufficient notice, the Keeyask G.S. construction timeline could be adjusted to correspond to a later ISD if conditions so indicate, likely around 2023, and the value of all Keeyask G.S. efforts and expenditures would still be retained.

Figure 15.2 PATHWAYS ASSOCIATED WITH THE PREFERRED DEVELOPMENT PLAN (PATHWAYS 4 AND 5)



15.2 New Long-Term Export Contract Agreements

Manitoba Hydro sale commitments that are contingent upon construction of the Preferred Development Plan are at risk of not commencing if the new generation and transmission projects are not completed. Refer to ***Table 6.4 - Long Term Export Commitments Contingent Upon New Hydro Development*** which summarizes the new long-term export contract agreements that are contingent on new hydro development and the new U.S. interconnection: agreements with Minnesota Power, Northern States Power and Wisconsin Public Service. A summary of the major terms and conditions for these contracts is contained in ***Appendix 6.1 - Summary of Terms and Conditions of Export Contracts.***

15.2.1 Long-Term Export Contracts Associated with the Preferred Development Plan

The 250 MW MP sale and the MP Energy Exchange have been signed by both parties and are dependant on the construction of Keeyask generating station (G.S). The Keeyask G.S. ISD of November 2019 in the Preferred Development Plan is a function of the export contracts start dates of June 2020. In addition, MP and Manitoba Hydro have agreed to construct a new transmission interconnection through the 250 MW MP sale.

The 125 MW NSP sale has been signed and is contingent on new hydro development. The start date for this sale is May 2021.

There are three agreements with WPS, of which two are signed agreements that are contingent on development of the Keeyask G.S. These signed agreements start in June 2021 and June 2025.

The third WPS agreement for up to 300 MW remains under negotiation. In the event that no agreement is reached with WPS, Manitoba Hydro will continue to pursue export sales with other utilities. A Conawapa G.S. ISD of May 2026 is based on serving the 300 MW WPS sale.

An interconnection with a transfer capability larger than 250 MW is required to accommodate new sales to MP and WPS (beyond 100 MW). In the event that the 300 MW sale to WPS does not materialize, a 250 MW transmission interconnection would be sufficient to meet the 250 MW Minnesota Power sale, although MP and Manitoba Hydro prefer a 750 MW interconnection as explained in ***Chapter 14 – Conclusions.*** The 100 MW WPS and 125 MW NSP sales will utilize existing transmission service and are not dependant on a new interconnection.

15.2.2 Managing Export Contract Risk

Manitoba Hydro's export sales associated with the Preferred Development Plan involve physical delivery risks and financial risks from a multitude of factors such as delays in placing the new generation and/or transmission facilities in service, increases and decreases in the domestic load forecast, water supply variability, facility outages, customer creditworthiness, etc. Manitoba Hydro manages these physical and financial risks through a variety of means, including specific long-term export contract provisions, transmission access, and customized market products.

15.2.2.1 Long-Term Export Contract Provisions

Manitoba Hydro enters long-term export contracts for the sale of capacity, dependable energy and opportunity energy in excess of the requirements for domestic customers. These export sales can be dependant on the construction of interconnecting transmission facilities. Export sales provide financial benefits to Manitoba Hydro, but also involve additional risks related to the physical delivery and the financial obligations associated with these sales. Manitoba Hydro's long-term export contracts contain numerous provisions that are designed to mitigate the risks associated with these contracts. The following sections describe these provisions.

Market Access

A common provision contained in Manitoba Hydro's export contracts that improves market access for sales is the right to use the firm transmission service that is not being utilized for the sale of must-take energy under the contract. This right to use the firm transmission service allows Manitoba Hydro to maximize the value of additional energy that may be available from time to time, avoiding the risks of non-firm transmission service—which is frequently not available or subject to interruption, preventing the corporation from maximizing additional opportunities.

Curtailments and Curtailment Priority Criteria

Manitoba Hydro's service to domestic customers is protected under the curtailment provision incorporated into export sales agreements. Manitoba Hydro can curtail energy deliveries to the export customer without penalty if there is a physical problem on the Manitoba Hydro generation or transmission system that prevents continued deliveries. If a curtailment event does occur, then Manitoba Hydro is entitled to curtail energy deliveries according to a curtailment priority stack. Manitoba domestic load is at the highest priority, which means all export contracts would be curtailed before affecting Manitoba Hydro's domestic load in Manitoba.

Alternative Supply

Manitoba Hydro's service to domestic customers and export sales obligations are protected under the alternative supply provision. Manitoba Hydro has the right to meet contracted energy obligations from more than its own generating stations. Flexibility to meet contracted energy obligations from energy markets (i.e. Midwest Independent System Operator, Inc. (MISO)) and third-party purchases allows Manitoba Hydro to meet its sale obligations at lowest cost and during circumstances when all Manitoba Hydro generating resources are needed to serve domestic load in Manitoba.

Adverse Water Conditions

Manitoba Hydro's service to domestic customers is protected under the adverse water conditions provision. Manitoba Hydro utilizes adverse water provisions in long-term export contracts to reduce the volume of contracted energy to be delivered if Manitoba Hydro anticipates conditions where it cannot meet its energy supply obligations from its own generating resources. These adverse water provisions provide the corporation with physical and financial protection in event of drought conditions.

Creditworthiness

Financial risks related to Manitoba Hydro's export sales are mitigated by the creditworthiness provision. Manitoba Hydro's export contracts are executed with bilateral customers who are financially strong and creditworthy based on the financial metrics, investment grade credit ratings, and the regulatory support that the customers receive from their respective regulatory commission to ensure their continued financial integrity. However, if a customer's creditworthiness becomes unsatisfactory to Manitoba Hydro at any point during the term of the sale, Manitoba Hydro's export contracts contain provisions that allow Manitoba Hydro to request performance assurance from the customer. The performance assurance is typically in the form of a letter of credit issued by an investment-grade bank and can be drawn upon by Manitoba Hydro to ensure collection on any amounts owing under the export contract.

Conditions and Options

Flexibility is needed to address the uncertainties associated with the timing of regulatory approvals and permitting for large generation and transmission facilities. Export contracts that depend on new generation or transmission facilities contain conditions and options that allow for a potential delay in the start of the sale or the termination of the sale. In the case of the 250 MW MP sale and the 100 MW WPS sale, there are provisions for up to two years delay in the start of the contracts if regulatory approvals are delayed. It is anticipated that the 300 MW WPS sale will have the same regulatory delay provision.

Conditions Precedent

Conditions precedent ensure that Manitoba Hydro's obligations under export sale contracts do not take effect unless specific key conditions are met. These include receipt of all needed approvals and authorizations (i.e. Orders in Council, licences, permits and National Energy Board authorization) for the contracts by specified dates.

Conditions precedent in favour of Manitoba Hydro can also protect Manitoba Hydro should financial or economic circumstances materially change.

15.2.3 Transmission Rights

Manitoba Hydro currently has the rights to 1,850 MW of export and 750 MW of import capacity to and from MISO. In addition, the 500 kilovolt (kV) Great Northern Transmission Line (GNTL) is expected to provide an additional 750 MW of firm import and export capacity, bringing total capabilities to 2,600 MW export and 1,500 MW import. These transmission rights will be used to market all energy produced by Manitoba Hydro's generating resources in excess of Manitoba domestic load and to purchase energy when needed to meet Manitoba Hydro's domestic and export commitments. Manitoba Hydro's ability to sell and/or purchase energy from the MISO market using existing and future firm transmission service gives Manitoba Hydro the flexibility to export and/or import electricity to address any over- or under-supply or reliability risks associated with the Preferred Development Plan.

15.2.4 Market Products

Manitoba Hydro's participation in the MISO market provides an opportunity to utilize various market related products to manage the physical and financial risks associated with the Preferred Development Plan and the associated export contracts. Market-related products that can be utilized to manage these physical and financial risks include the day-ahead and real-time markets (to sell or purchase energy), financial transmission rights (to manage congestion cost risks), and financial swaps.

Manitoba Hydro's participation in the MISO market has provided an opportunity to develop and/or utilize a number of unique customized market products. These products include:

- Module E[1] - use limited capacity (capacity sales with a daily four-hour energy offer obligation that recognizes that hydraulic generation facilities can have limited water supplies)
- Module B[2] energy sales (utilized by Manitoba Hydro for surplus energy sales)
- system participation sales
- seasonal diversity agreements.

Manitoba Hydro will continue to utilize these products to manage the capacity and energy associated with the Preferred Development Plan.

[1] Module E is a product of the MISO Tariff that provides mandatory requirements to be met by the transmission provider, load serving entity and other market participants to ensure a load-serving entity has sufficient access to deliverable, reliable and adequate capacity resources to meet its anticipated peak demand requirements plus an appropriate reserve margin.

[2] Module B is a product of the MISO Tariff that provides details on a host of transmission-related issues, including the types of service (Network and Point-to Point), procedures and rules for requesting transmission service, and the treatment of grandfathered transmission service.

15.3 New U.S. Transmission Interconnection Project

As introduced in ***Chapter 2- Manitoba Hydro's Preferred Development Plan Facilities***, the proposed new transmission interconnection is an international transmission line with two distinct components – the Manitoba-Minnesota Transmission Project (MMTP) in Manitoba (a 500 kV/750 MW transmission line between Dorsey and U.S. border) and the GNTL in Minnesota (Manitoba Hydro would contribute financially to the U.S. component of the interconnection to be built by MP). The interconnection would have an incremental transfer capability of 750 MW for both exports from and imports into Manitoba. For a more detailed description of the interconnection projects, refer to ***Chapter 6 – The Window of Opportunity,*** section 6.5.3.

Actual transmission line routing in Manitoba will be the subject of subsequent environmental and technical studies which started in May 2013. No preliminary routes or corridors have been identified for the MMTP.

15.3.1 Related Agreements

There are several agreements being developed in relation to the construction of the new transmission interconnection. A Memorandum of Understanding (MOU) was entered into between Manitoba Hydro and MP on January 25, 2013 for the purpose of outlining a framework for further discussions between Manitoba Hydro and MP regarding:

- the general line route and arrangement for a 500-kV interconnection and
- an agreement to work towards both a term sheet relating to the development of the 500-kV interconnection and a cost sharing agreement for development expenses.

A Cost Sharing Agreement between Manitoba Hydro and MP was subsequently signed on March 31, 2013. In order to realize the target ISD of the GNTL, MP has incurred development expenses in advance of having executed a MISO Facilities Construction Agreement. Manitoba Hydro has committed to funding a portion of planning and engineering expenses as outlined in ***Chapter 6 – The Window of Opportunity,*** Section 6.5.3.3.

In addition, the following agreements are under development in relation to the construction of the new transmission interconnection:

- MISO Facilities Construction Agreement
- Manitoba Hydro Facilities Construction Agreement
- Transmission Service and Generator Interconnection Agreements
- Letter of Intent and Term Sheet (providing a framework for agreements required to proceed through the construction phase of the interconnection project)
- Project Development Agreement, scheduled for completion February 28, 2014.

For more details pertaining to these agreements, refer to ***Chapter 6 – The Window of Opportunity,*** section 6.5.3.

15.3.2 Reviews and Approvals

The new 750 MW U.S. interconnection is subject to regulatory review in both Canada and the U.S. With each regulatory hurdle, there is a risk that approval may not be granted. Without a new U.S. interconnection, neither the 250 MW MP sale nor the proposed 300 MW WPS sale would proceed.

Canadian Approvals

On the Canadian side, federal permitting is required from the National Energy Board for the MMTP interconnection project. Permitting is anticipated to be received by December 2016.

The Manitoba Hydro Act requires the corporation obtain approval of the Lieutenant-Governor in Council in order to develop new power generation stations. By Order In Council 00128/2013 dated April 17, 2013, the Government of Manitoba directed the PUB to conduct an Needs For and Alternatives To (NFAT) review and provide a report outlining its recommendations. The Government of Manitoba will make its determination as to what orders will be issued following consideration of the report.

The MMTP will require an environmental assessment and review under *The Environment Act.* At the conclusion of that process, the Minister of Conservation and Water Stewardship will determine if a licence will be issued. The assessment and review process, including the Minister's decision, is expected to be completed by June 2016.

U.S. Approvals

The major permits required on the U.S. side of the border are a Certificate of Need and a Route Permit—both granted by the Minnesota Public Utilities Commission—and are anticipated to be received by October 2015. Other required approvals include a Presidential Permit from the United States Department of Energy and a Wetland Permit from the U.S. Army Corps of Engineers. During the certification phase, additional state and federal approvals are also required.

15.3.3 Project Delivery — MMTP

The ISD of the new 750 MW interconnection is planned to coincide with the start of the 250 MW MP export sale beginning June 1, 2020. The engineering phase of this project will begin in 2015 and continue to the end of the project. Construction is scheduled to occur from 2017 to 2020, subject to all of the required agreements and regulatory approvals discussed earlier.

During the engineering and construction phase of this project, project risks will be identified in a project risk registry. This registry, which is an industry best practice, will serve as a project management tool to aid in managing the construction and decision making and in ensuring that the overall project remains within schedule and budget.

Manitoba Hydro will have to begin Keeyask G.S. construction before it receives National Energy Board approvals (for the export sales and the MMTP interconnection) or a *Manitoba Environment Act* licence for the MMTP. Manitoba Hydro expects to receive transmission interconnection approvals from the NEB by the spring of 2016. Complete applications to the NEB are expected to include evidence that environmental approvals have been received to construct Keeyask G.S.

Under the 250 MW MP sale and the 100 MW WPS sale, Manitoba Hydro assumes Keeyask G.S. construction schedule risk on the date when Manitoba Hydro starts constructing the Keeyask cofferdam. The 125 MW NSP sale provides Manitoba Hydro with the option of not proceeding with the PSA up to 2018 should circumstances warrant. The agreements protect Manitoba Hydro from uncontrollable events during this construction period via the force majeure provisions, with the exception of Manitoba Hydro labour strikes. If Keeyask G.S. construction schedule is delayed, Manitoba Hydro would, if necessary, be required to purchase energy/capacity from the market to fulfill its contractual obligations to MP, WPS and NSP. If the transmission interconnection construction schedule is delayed, Manitoba Hydro has the option, but not obligation, to fulfill the MP sale through existing transmission service.

15.4 Keeyask and Conawapa Generation Projects

This section discusses two categories of risks: those risks associated with Manitoba Hydro's agreements to engage Cree Nations in the planning and development of the Keeyask and Conawapa Projects; and those risks associated with gaining regulatory approval for the projects.

15.4.1 Agreements for Aboriginal Participation

Under existing agreements stemming from the settlement for adverse effects of the Churchill River Diversion and Lake Winnipeg Regulation projects, Manitoba Hydro is obligated to achieve adverse effects agreements with Tataskweyak Cree Nation (TCN), War Lake First Nation (WLFN), York Factory First Nation (YFFN); and Fox Lake Cree Nation (FLCN). Agreements may be arbitrated if negotiations are not successful.

There is no similar legal requirement to achieve benefit-sharing agreements. Nevertheless, Manitoba Hydro was at the forefront of such agreements in Canada when it began negotiations for the Wuskwatim and Keeyask Projects, and it views benefit-sharing as a foundational element to the successful development of its next major hydroelectric generation project on the Nelson River, Conawapa G.S.
There are risks associated in the process to develop an agreement, and there are risks once an agreement is reached. The following sections discuss the risks associated with the Keeyask and Conawapa Projects.

15.4.1.1 Keeyask Hydropower Limited Partnership

Manitoba Hydro and the four Keeyask Cree Nations (KCNs) – TCN and WLFN, working together as the Cree Nation Partners; YFFN; and FLCN – have ratified the Joint Keeyask Development Agreement (JKDA) under which the Keeyask Hydropower Limited Partnership was established. In the agreement the KCNs and Manitoba Hydro have explicitly committed their support to the project.

The process of negotiating the agreement, and the agreement itself, address potential risks. In this regard, Manitoba Hydro shared financial projections with the KCNs while the JKDA was being negotiated. These included many different assumptions, resulting in low, medium and high estimates. The KCNs are thus aware there is a wide range of potential returns from their investments, and that the Keeyask financial results modelled during negotiations used the forecasting information available at that time. Manitoba Hydro has continued to keep the KCNs informed of the Keeyask Project economics.

The economic circumstances of Hydro's major projects have changed during the past several years, due in part to lower energy prices. Manitoba Hydro and Nisichawayasihk Cree Nation, its partner in Wuskwatim, G.S. are currently negotiating amendments to the Wuskwatim Development Agreement to deal with this issue.

Manitoba Hydro believes adjustments it has made to its development plans for Keeyask, G.S. in part through learnings from the Wuskwatim Project, will assist in managing risks related to project costs, revenues and schedule. The JKDA includes two investment options, common and preferred. The availability of these two options provides each of the KCNs with an investment choice depending upon their risk tolerance.

For more discussion about risks associated with this partnership model, see ***Appendix 15.1 - Keeyask Aboriginal Partnership Business Risks***.

15.4.1.2 Conawapa Project Agreements

Manitoba Hydro and the five Cree Nations on or in the vicinity of the lower Nelson River (FLCN, YFFN, TCN, WLFN and Shamattawa First Nation) have protocols to discuss benefit agreements related to the Conawapa Project. These processes are ongoing.

It is expected that without adverse effects and benefit-sharing agreements, and the corresponding support of the local First Nations, there could be significant challenges to achieving the required licences and approvals for Conawapa G.S.

15.4.2 Reviews and Approvals

The federal and provincial governments each have regulatory regimes that must be satisfied before the major projects in the Preferred Development Plan can be constructed. Each jurisdiction has foundational legislation for its environmental reviews: the *Canadian Environmental Assessment Act* and *National Energy Board Act* for federal authorizations and *The Environment Act* and *The Water Power Act* for provincial authorizations. Without successful conclusions under these Acts, the Keeyask Project, Conawapa Project, North-South Transmission Upgrade and, as noted in Section 15.3.2, the Manitoba-Minnesota Transmission Project, will not be developed.

The potential listing of Lake Sturgeon under the *Species at Risk Act (SARA)* also poses a significant regulatory risk. *SARA* could impose restrictions on the potential development (and operations) of the Keeyask and Conawapa Projects.

The following sections discuss the risks associated with *The Environment Act* (Manitoba), *Canadian Environmental Assessment Act,* and *SARA.*

15.4.2.1 The Environment Act (Manitoba)

The Keeyask Generation and Transmission projects are currently being reviewed under *The Environment Act.* The Minister has asked the Clean Environment Commission (CEC) to hold hearings and provide recommendations regarding the generation project. The Minister will determine if a licence should be issued and, if so, what conditions should apply. Appeals of the Minister's decision are made to the Lieutenant-Governor in Council. The Director of Environmental Assessment and Licensing will determine if a license will be issued for the transmission project; appeals of the Director's decision are made to the Minister.

To manage the licensing risk, Manitoba Hydro and its Cree Nation partners, through the Keeyask Hydropower Limited Partnership, have undertaken a thorough environmental impact assessment using technical sciences and Aboriginal traditional knowledge. As recorded in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***, potential adverse effects have been identified and then avoided, reduced or mitigated; and potential benefits have been enhanced.

Manitoba Hydro also undertook a complete environmental assessment of the Keeyask Transmission Project, a process which included engagement with the local Cree Nations. Manitoba Hydro has a long, successful record of planning, assessing and licensing transmission projects.

Before the Province issues licences, it will also consult with First Nations and Métis people. The four KCNs have adverse effects agreements which they acknowledge address impacts to the exercise of their Treaty and Aboriginal rights. The Province has initiated consultations with the KCNs and other aboriginal communities.

The CEC, in its report on the Bipole III Project, proposed as a non-licensing recommendation that “Manitoba Hydro, in cooperation with the Manitoba Government, conduct a Regional Cumulative Effects Assessment for all Manitoba Hydro projects and associated infrastructure in the Nelson River sub-watershed” before any additional projects after Bipole III are licensed. If the Government of Manitoba were to adopt this recommendation and require such an assessment be carried out prior to licensing the Keeyask Generating Project, a delay could ensue.

It should be noted that the Keeyask Environmental Impact Statement (EIS) was filed in July 2012. Consistent with the EIS Guidelines issued by environmental regulators, the environmental impact statement includes a cumulative effects assessment, and, where appropriate, takes a regional perspective to assess cumulative effects on specific Valued Environmental Components. The ultimate decision whether the CEC’s recommendation be adopted rests with the same party with approval power for the Keeyask Project, i.e. the Government of Manitoba. While adoption of the CEC recommendation is a risk to the Keeyask Project, it is not a third-party risk that is outside the control or consciousness of the decision maker, the Manitoba Government.

The Conawapa Project, as well as the North-South Transmission System Upgrade and the Manitoba-Minnesota Transmission Projects, are still under study and no applications have been filed for regulatory review.

15.4.2.2 Canadian Environmental Assessment Act

The Canadian Environmental Assessment Agency is leading the development and production of a Comprehensive Study Report (CSR) of the Keeyask Generation Project. If the CSR determines the project will not causes a significant adverse effect, the Minister of Environment may inform federal departments with regulatory functions to issue authorizations for the project. If the CSR determines Keeyask G.S. will cause a significant adverse effect, the Minister may inform departments to issue authorizations only if the federal Governor-in-Council concludes the adverse effect is justified in this circumstance.

As noted previously, Manitoba Hydro and its Cree Nation partners, through the Keeyask Hydropower Limited Partnership, have undertaken a thorough environmental impact assessment using technical sciences and Aboriginal traditional knowledge. As explained in ***Chapter 2 – Manitoba Hydro's Preferred Development Plan Facilities***, potential adverse effects have been identified and then avoided, reduced or mitigated; and potential benefits have been enhanced. As such, Manitoba Hydro does not believe the project will cause a significant adverse effect. However, should the CSR arrive at that conclusion, the many socio-economic benefits (e.g., reductions in greenhouse gases; increases in Lake Sturgeon populations; training and employment for northern Aboriginal workers; Cree Nation business opportunities; capacity building and profits for the Keeyask Cree Nations; and clean renewable energy for Manitobans and export markets) may lead to a conclusion that the adverse effect is justified in the circumstance.

As with the provincial process, the federal government must also conduct Aboriginal consultations in accordance with section 35 of the Constitution.

The Conawapa Project will also require federal authorizations. This project is still under study and applications have not been filed for regulatory review.

15.4.2.3 Species at Risk Act

As discussed in Section 10.6.5, the federal government is considering whether to list Lake Sturgeon in the Nelson River as endangered under the *SARA.* Manitoba Hydro is proactively engaging in discussions with both provincial and federal regulators on its Lake Sturgeon stewardship plans. Activities include coordinating with the Manitoba Department of Conservation and Water Stewardship (Fisheries Branch) to ensure that stewardship activities are consistent with the provincial Lake Sturgeon Management Strategy. Manitoba Hydro is also communicating with staff from DFO to keep them informed about its approach to Lake Sturgeon stewardship, current activities, progress and outcomes. Manitoba Hydro's commitment and approach to Lake Sturgeon stewardship, with examples of stewardship activities, are explained in detail in ***Appendix 2.1 - Lake Sturgeon: Mitigation and Enhancement***.

If Lake Sturgeon were to be listed under *SARA*, provisions would be implemented to protect individual fish and critical habitat. Fisheries and Oceans Canada (DFO) would develop a Recovery Strategy for Lake Sturgeon, followed by an Action Plan setting out the activities that would have to be undertaken to prevent harm to Lake Sturgeon and protect their habitat. If Manitoba Hydro (and, in the case of Keeyask, the partnership) wished to proceed with the Keeyask and/or Conawapa Projects, federal permits would have to be secured under the *SARA* in order to build and operate any new hydroelectric generating stations on the waterways where Lake Sturgeon were listed as endangered. The Keeyask and Conawapa Projects could be delayed or possibly cancelled if Lake Sturgeon are listed under *SARA*.

The federal decision may not occur until after June 2014, when construction on Keeyask is schedule to begin. If this were to occur, Manitoba Hydro would evaluate the situation at the time, including the likelihood of a future listing under *SARA*, and the costs and risks of delaying construction versus proceeding with construction.

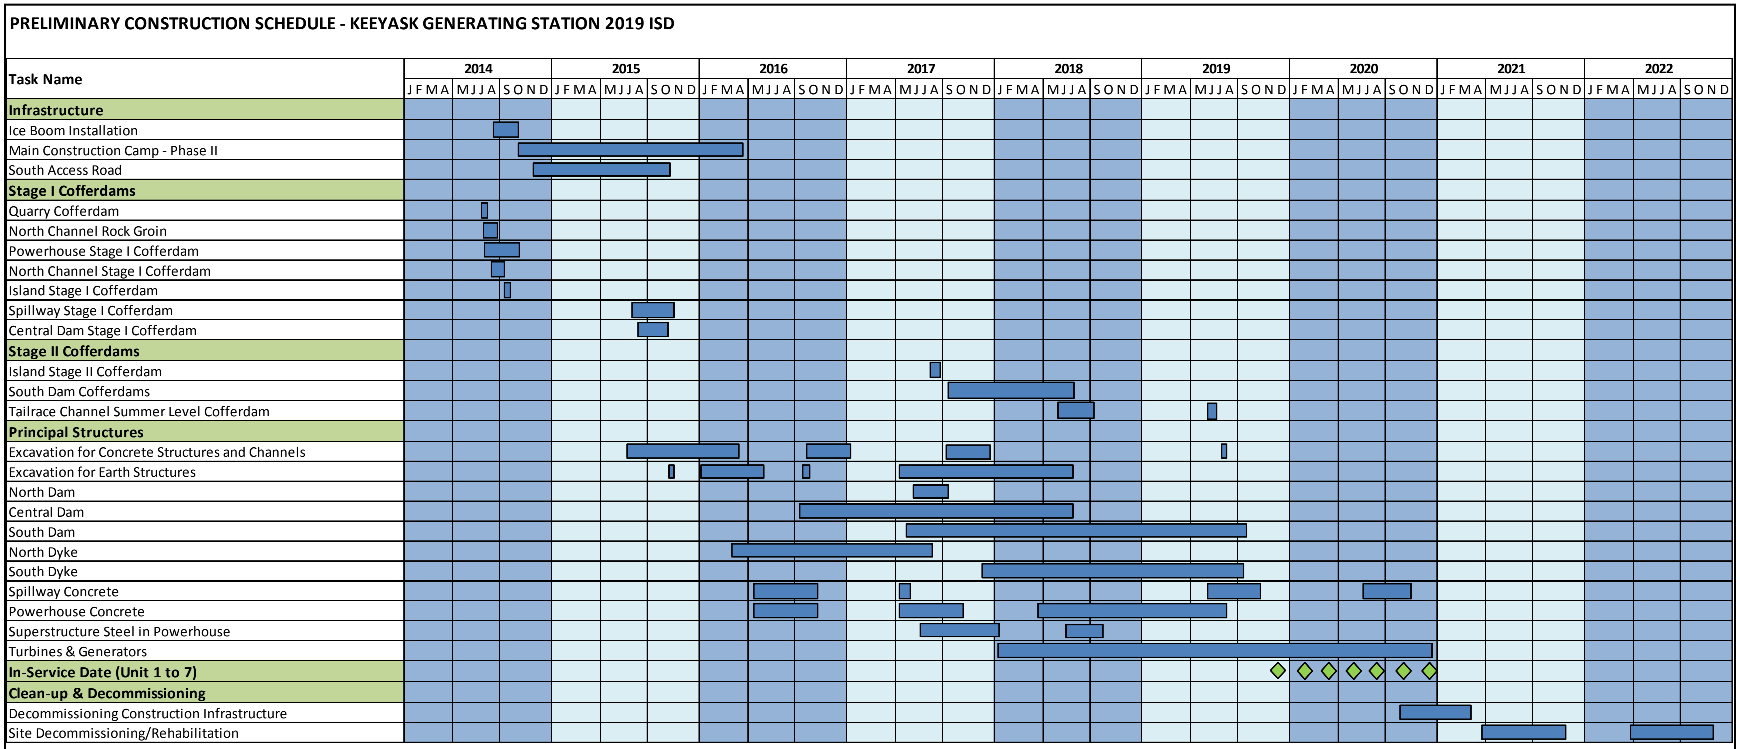
15.5 Generating Station Project Delivery

This section outlines the methodology Manitoba Hydro follows in selecting a delivery model and contract packaging for a project and outlines how this has been done on the Keeyask Project. Additionally, the section provides an overview of Manitoba Hydro's key project management plans/processes used to successfully deliver major generation projects.

As detailed Stage V Engineering[3] on Conawapa G.S. has not yet begun, a formal project delivery strategy has not yet been established. Manitoba Hydro will continue to monitor the attractiveness of Conawapa's 2026 ISD. The EIS will be needed to be filed in 2015 and construction will need to begin in 2018 to meet the 2026 ISD. At any point, Manitoba Hydro may decide to defer the Conawapa G.S. ISD based on the evolution of conditions including export sale agreements, domestic energy requirements and other factors. Based on this approach, a decision on project delivery strategy for Conawapa G.S. is not anticipated until the project has progressed to Stage V—anticipated to occur around 2016, based on a 2026 ISD.
Constructions schedules for Keeyask G.S. 2019 ISD and Conawapa G.S. 2026 ISD are shown in Figures 15.3 and 15.4, respectively:

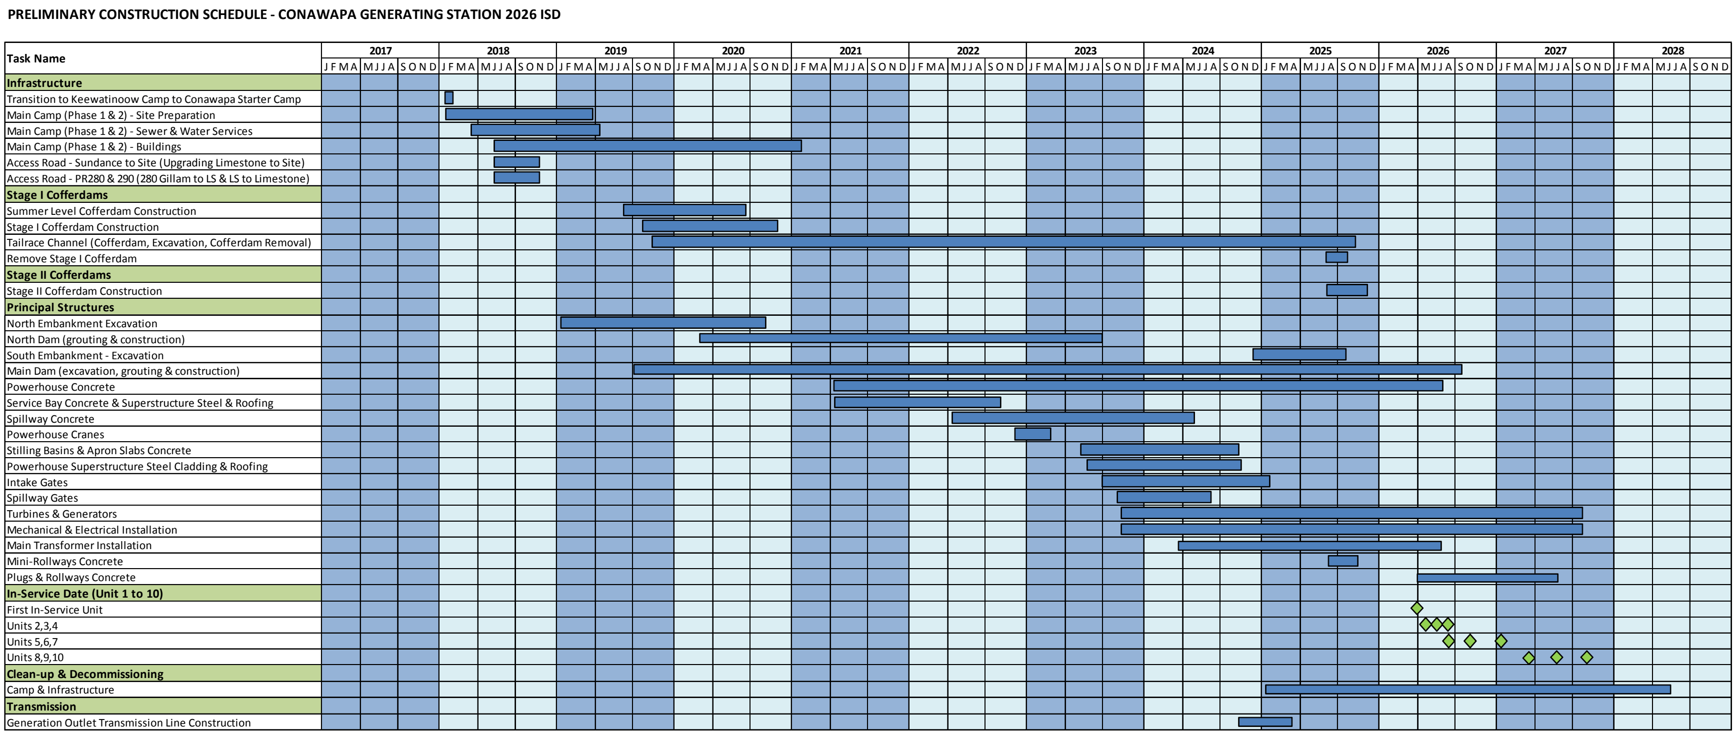
[3] Refer to Appendix 7.2 Resource Options Report for a detailed explanation of Manitoba Hydro's project development stages.

Figure 15.3 **KEEYASK 2019 ISD PRELIMINARY CONSTRUCTION SCHEDULE**



NOTE: The timelines above show the start and end dates of each activity, but do not reflect the downtime periods that may occur throughout the activity.

Figure 15.4 CONAWAPA 2026 ISD PRELIMINARY CONSTRUCTION SCHEDULE



NOTE: The timelines above show the start and end dates of each activity, but do not reflect the downtime periods that may occur throughout the activity.

15.5.1 Selection of Project Delivery Strategy

A project delivery strategy refers to the model or approach that will be followed to execute a project. As such, the project delivery strategy is a critical factor in successful project implementation. Selection of a project delivery strategy is based on numerous factors that include the project objectives, its key success factors and project risks. Project delivery strategies typically considered for the construction of major hydroelectric generating stations include the following:

- **Design Bid Build (DBB)** – A staged contracting approach whereby Manitoba Hydro as the owner contracts the design and then competitively tenders the work to a contractor who constructs the work.
- **Construction Management (CM)** – The owner contracts the design and, in parallel, contracts a Construction Manager who may act as the owner's agent in managing the construction, or is considered "at risk" and assumes the majority risk by guaranteeing the schedule and budget, and who contracts all of the trades to construct the work. In either case the Construction Manager provides essential design input from the beginning of the detailed design phase.
- **Design Build (DB) or Engineer Procure Construct (EPC)** – The owner contracts a single entity that is responsible for both the design and construction of the work. This entity holds the majority of risks related to both design and construction. However, this type of risk allocation is reflected in the entity's pricing of the work.
- **Integrated Project Delivery (IPD)** – The owner contracts a designer to carry out detailed design and, in parallel, contracts a contractor to provide early contractor input to the detailed design. The owner creates a multi-party contract (or teaming agreement) between the owner, designer, and contractor to undertake the collaborative approach to the design with an opportunity to award the construction phase to the contractor (the term "Integrated Design-Build" was used for the Pointe du Bois Spillway Replacement Project). This model provides a

more collaborative structure than a typical Design Build, which allows for more equitable risk allocation.

- **Alliance** – The owner contracts the designer and contractor under a single unifying teaming or partnership agreement to execute all phases of the project. Project risk and opportunities are shared equitably and project management decisions are made by the alliance. All parties share in the financial stake success or failure of the project (i.e. share in the cost overrun or underrun from the budgeted amount).

Contract Packaging

As a result of the broad type of work (i.e. civil, mechanical, electrical) required in the construction of a hydroelectric generating station, work is generally divided into defined contract packages. The contract must properly allocate the risk to the contractor and fit with other contracts within the project delivery system. Additional considerations in the development of the contract packaging include contractor capabilities, general construction market conditions and the ability to meet obligations to project partners. Typical major contract packages include:

- General Civil Contract
- Turbines and Generators Contract
- Electrical and Mechanical Contract
- Construction Camp Contract
- Camp Operation and Services Contracts and
- Stage V Detailed Design Contract.

15.5.2 Keeyask Project Delivery Strategy and Contract Packaging

The Keeyask Project delivery strategy will employ a hybrid Design Bid Build model utilizing Integrated Project Delivery and Engineer Procure Construct approaches that best suit certain portions of the project. This delivery model is structured as follows:

- Manitoba Hydro acts as the Project Manager and Construction Manager responsible for the overall project costs, schedule and quality. Manitoba Hydro holds separate contracts with each contractor and has overall responsibility for interface management.
- A single project designer is responsible for the majority of the project design. This design team is lead by Hatch and includes SNC Lavalin and KGS. Internal Manitoba Hydro resources provide design and define performance specifications for some of the specialized EPC contracts.
- An Engineer, Procure, Construct model has been selected for the turbine and generators contract, with the contractor being responsible for design, manufacturing and installation. The performance specification is defined by Manitoba Hydro's design team. In addition, this model will be utilized for the spillway gates, intake gates, cranes, and majority of the electrical equipment contracts.
- An integrated design build approach with a target price model will be implemented for the General Civil Contract, which is described further in the section that follows.

Keeyask General Civil Contract (GCC)

The GCC will be the largest contract on the Project and is made up of a range of work packages including excavation, cofferdam construction, river management, dams, dykes, and electrical and mechanical works, as well as construction of the powerhouse and spillway structures. Design Build, Design Bid Build and Integrated Design Build project delivery methods were considered for the delivery of the Keeyask GCC. Other project delivery methods including turnkey options were not considered as they remove Manitoba Hydro from the project execution phase, jeopardizing both budget and quality goals. Prior to selecting a delivery strategy for the project, critical success factors were identified including safety and environment considerations; ability to meet approved budget and in-service dates; maximizing opportunities for KCN partners where capacity exists; developing project and construction management expertise within Manitoba Hydro; and obtaining early constructability input to maximize value to the project. Project delivery methods were ranked against one another based on these critical success factors.

The GCC for the Keeyask Generation Project will be executed using an Integrated Design Build or Early Contractor involvement process. In this model, the designer carries out the detailed design and the contractor provides constructability input as the design is developed. Involving the contractor early in the detailed design phase helps to ensure that the contractor's extensive construction knowledge is incorporated into the design and the opportunity for cost savings in the form of value engineering is increased. Since the contractor is involved in the process nearly two years before major GCC construction begins, they have the opportunity to refine the schedule, secure the necessary labour and form alliances with Manitoba suppliers and sub-contractors. Once construction starts, it is likely that claims will be minimized and costly disputes avoided because the contractor will have all available information and an opportunity to provide input into the final design.

To help reduce scheduling risk and potential interface issues, a number of contracts will be bundled with the GCC, including the Electrical and Mechanical contract, excavation, cofferdams and draft tube forms. The reduction of interface risk was a lesson learned from the Wuskwatim project, which had several different contracts. Other construction contracts for the Keeyask G.S., such as the turbines and generations, will be executed by the Design Build method.

Selection of the contractor is based on target prices submitted through a Request for Proposal process and assessment of the best value offered to Manitoba Hydro. Determining best value includes consideration of the contractor's ability to reduce risks to the schedule and increase the possibility of early in-service dates, as these outcomes have substantial financial benefits.

Project Management Roles and Responsibilities in Keeyask Delivery Strategy

Manitoba Hydro acts as the Project Manager and Construction Manager responsible for the overall project cost, schedule and quality. Manitoba Hydro holds separate contracts with each contractor and has overall responsibility for interface management. Additionally, Manitoba Hydro holds project responsibility over environmental, stakeholder and partnership issues. The contractors are responsible for managing their specific scope of work and the Stage V Design consultant is responsible for the majority of engineering and design for the project. The respective responsibilities are outlined further in Figure 15.5 below.

Figure 15.5 PROJECT MANAGEMENT RESPONSIBILITIES

Project Management Responsibilities

OWNER – MANITOBA HYDRO:

- The Owner provides the overall direction and governance on the project.
- The Project Owner has responsibility for overall performance of the project. Specific areas of project responsibility include: financial, regulatory, environmental, stakeholder management, partnership, etc.

DESIGNER ENGINEER – HATCH:

- The project Designer is a 3rd party Engineer firm hired by the Owner (Manitoba Hydro) who is responsible for the majority of the project design
- The Design Engineer also plays a support role during construction

CONTRACTORS AND VENDORS:

- Contractors and Vendors carry out the actual construction and supply of equipment
- Each Contractor manages their own work with overall coordination between Contractor managed by the Owner
- Includes GCC, T & G Contractor, etc.

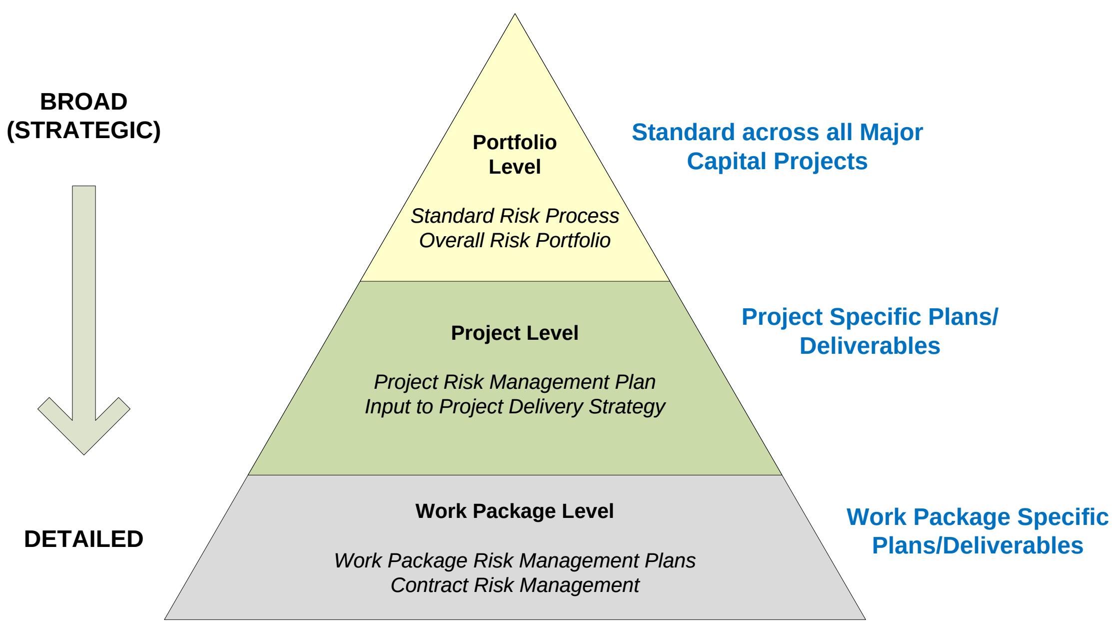
15.6 Project Management and Control for Generation Projects

The following sections outline key project management plans/processes that enable successful project implementation.

15.6.1 Risk Management

Effective risk management is a critical aspect of Manitoba Hydro's project management practices and is necessary to ensure the required project objectives are achieved. The risk management process implemented on capital projects considers three levels of risk: i) portfolio, ii) project, and iii) work package. Risk management is driven from the portfolio level. Project-level risk documents are developed based on the portfolio-level documents and likewise work package-level risk documents are developed based on both portfolio and project-level documents. A top-down approach ensures approaches followed on portfolio-level risk documents are applied to all detailed risk documents, and strategies for risk management are driven down into the development of the detailed documents/plans (see Figure 15.6).

Figure 15.6 STAGES OF RISK MANAGEMENT PROCESS



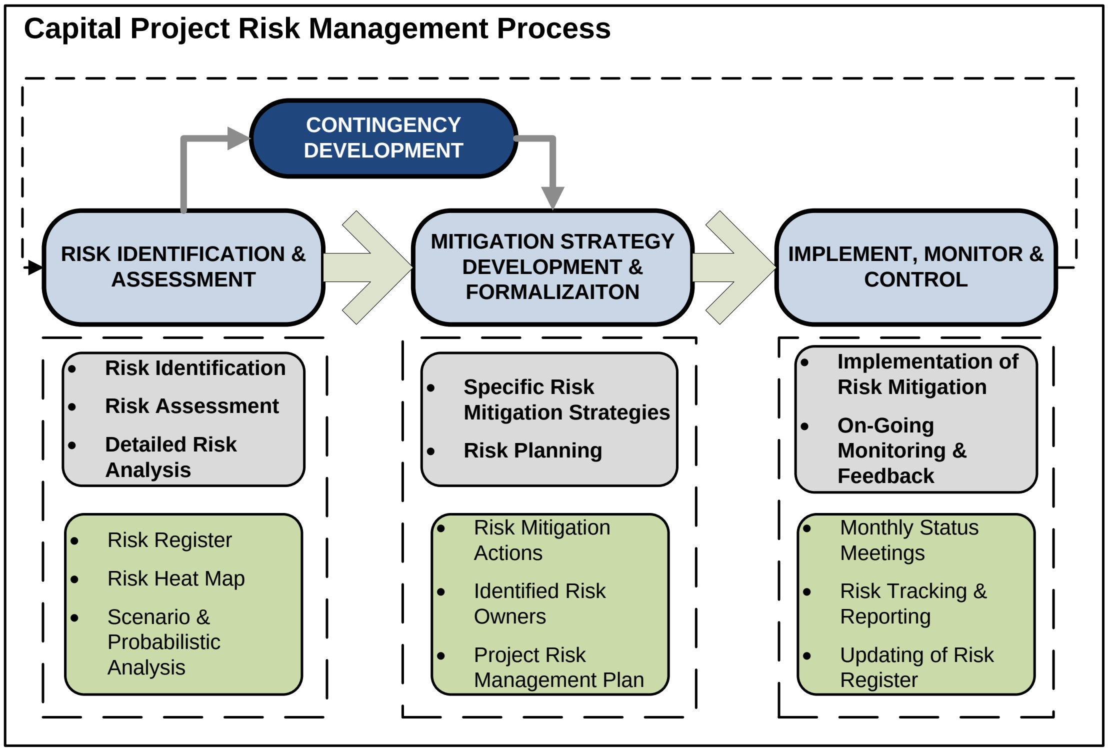
Risk Management through Project Progression

Risk management is an iterative process and occurs frequently from early design through completion of construction. The end of Stage IV Engineering or the beginning of Stage V Engineering are the typical points for implementing the first detailed risk management activities. At this stage of project development the desired output of the risk management process is a detailed, actionable risk management plan for the entire project. As the project progresses through Stage V Engineering, risk management activities become specific to the project's work packages (contracts). These activities are described in more detail below.

Project Risk Management Process

The basic project risk management process applied to Keeyask G.S. and Conawapa G.S. follows recognized project management best practices. The process includes risk identification, quantification, mitigation planning, mitigation, implementation, and monitoring and tracking. This process is shown below and described in the sections that follow:

Figure 15.7 CAPITAL PROJECT RISK MANAGEMENT PROCESS



Risk Assessment

Risk assessment is the process of identifying risk items that influence/drive uncertainty on the project; these risk items are captured in a project risk register, a living document that acts as the repository for all identified project risks throughout the life of the project. The impact and probability for each risk event is scored, allowing identified risks to be prioritized based on a risk score (impact x probability) to help focus risk management activities on the most critical items.

Detailed Risk Analysis

Detailed risk analysis involves developing a quantitative assessment of each risk's impact and probability. The key output of this stage is a detailed profile of each risk event in order to facilitate development of a detailed risk mitigation strategy. Actions taken during this stage include activities such as development of schedule "what if" scenarios, probabilistic (Monte-Carlo) analysis and constructability reviews.

Risk Mitigation Development

Risk mitigation strategies are developed specific to each identified risk. Mitigation strategies include: acceptance, elimination, mitigation or transfer. Selection of the appropriate strategy will depend on numerous factors and is assessed on a risk-by-risk basis.

Risk Tracking

Risk tracking involves establishing metrics that allow the project team to assess the level of success of risk mitigation actions. Information from this step feeds back into the risk management process for future analyses.

Contingency Development

Contingency development is a subset of risk mitigation and is both a part of the risk management process and the cost estimate development process. Methodologies used to determine contingency are described further as part of the description of Manitoba Hydro's cost estimating methodology described in ***Appendix 2.4 – Developing the Keeyask and Conawapa Capital Cost Estimates***.

15.6.2 Key Lessons Learned from Wuskwatim

Manitoba Hydro undertook "lessons learned" reviews during the pre-construction and construction phases of Wuskwatim and has applied these lessons to the Keeyask and Conawapa planning and cost estimating processes as a key additional risk management step. Specific actions taken from these lessons learned in the pre-construction phase are:

- development of a comprehensive master pre-construction schedule

- early inputs from and engagement with stakeholders (regulators and affected communities) to ensure the project scope is well defined, understood and agreed to by all parties and
- more engineering and environmental information developed earlier in the planning process to support partnership and regulatory work.

Specific actions taken from these lessons learned in the construction phase are:

- moving supporting infrastructure design and construction activities (such as those for access roads and camps) out of the generation project and into separate earlier projects. This allows for increased benefits to First Nations and reduces construction delay risks associated with infrastructure work
- ensuring the construction camp provides craft workers with remote-site living conditions of the highest quality that are on par with other remote major project sites across Canada
- consideration of new approaches to contract frameworks (e.g., "target price" contracts) to improve alignment with prevailing market conditions, attract contractor interest, and provide incentives for contractor performance
- early input from contractors to maximize opportunities for optimization of design cost-effectiveness and constructability. Also, to allow for development of a detailed labour plan for the project
- work packaging and contract scoping optimized to mitigate schedule and contract risks. Specifically, eliminating interfaces between the General Civil Contractor and the Electrical and Mechanical Contractor.

15.6.3 Risk Management on Keeyask and Conawapa

Risks to the Keeyask and Conawapa Projects will be managed following the previously described capital project risk management process. The general categories of risk that each project is exposed to and that must be managed during the pre-construction and construction phases are as follows:

- Regulatory: Includes risks related to regulatory approvals, SARA, on-going environmental protection, etc.
- Stakeholder: Includes risks related to negotiated agreements, stakeholder engagement, etc.
- Execution: Includes risks related to procurement, design, construction and installation
- Safety: Includes risks related to ensuring safe operations during construction
- Labour: Risks related to attraction and retention of labour and overall productivity of labour
- Cost Escalation: Risk related to adverse changes in the marketplace resulting in increased cost escalation.

A number of risk mitigation measures have already been implemented for Keeyask and Conawapa Projects to address the above risks. The following are some of the key actions being taken on the Keeyask Project:

- Early Contractor Involvement: The General Civil Contractor will be brought on nearly two years before major GCC construction is scheduled to begin. The primary advantage of such an approach is that it allows the GCC to incorporate constructability into the project design and optimize the project construction schedule to mitigate construction risks. Additionally, it allows the GCC to work with Manitoba Hydro in addressing labour attraction, retention and productivity risks.
- Contract Packaging: The work on the Keeyask Project has been packaged to minimize contractor interfaces that could affect project schedule. The most notable instance of this is the inclusion of the Electrical & Mechanical work in the

General Civil Contract, which, as noted, was a key lesson learned from Wuskwatim.

- Regulatory and Stakeholder Engagement: Manitoba Hydro is actively engaged with key regulatory bodies and project stakeholders to manage the pre-construction process. This engagement is intended to help ensure the project can move forward and all groups benefit from construction of the project.
- Sufficient Project Contingency Fund: Contingency is the primary financial measure applied in managing project risks. Carrying a sufficient project contingency ensures funds have been planned for and are available to address the uncertainties that exist in the construction of a hydroelectric generating station.

15.6.3.1 Application of Labour and Escalation Reserves in Managing Risk

The additional requirement of management reserve funds was identified as required to properly address both labour and cost escalation risks, based on current market conditions and labour restrictions. The use of these reserves and mitigation of the associated risks are discussed below.

Labour Reserve

As outlined, the potential impact of labour availability and productivity issues is anticipated to exceed what is included in the P50 contingency in the Base Estimate. This issue is largely due to the restrictions that could be placed on the projects' ability to address the current and expected state of the Canadian construction labour market.

The labour risk has been calculated based on a series of correlated and cumulative impacts that together act as a single major event. As a result, it is difficult to say what portion of this risk would apply at different probabilities. The use of a labour risk is similar to a scope change in which, if that scope change occurred, the associated cost would be added to the estimate.

A number of steps are being taken by Manitoba Hydro to mitigate labour risk and the need to draw from the labour reserve. Key steps that have been or are being taken related to the Keeyask Project are as follows:

- *High-Quality Construction Camp*: The camp currently in construction for the Keeyask Project has seen a significant increase in the level of quality compared to the camp that was in place at the Wuskwatim project. Feedback to-date from both contractor and union groups on camp quality has been very positive.
- *Changes to Isolation Leaves and Travel Costs in the Burntwood Nelson Agreement*[4]: The isolation-leave provisions in the BNA have been successfully changed from five weeks in and one week out for craft workers to three weeks in and one week out. This change aligns the projects more closely with other remote projects across Canada, improving the ability to attract and retain labour.
- *Stakeholder Engagement*: Discussions are being held with both the Construction Labour Relations Association of Manitoba (group representing the contractors) and the Allied Hydro Council (group representing the unions) to collaborate on identifying opportunities to address craft labour supply concerns on the projects.
- *Early Contractor Involvement*: As already outlined, the General Civil Contractor will have the time to take critical steps to improve the recruitment of labour on the project.

[4] The Burntwood Nelson Agreement (BNA) is a no-strike, no-lockout collective bargaining agreement which applies to major northern Manitoba Hydro projects. The BNA defines items such as hiring preferences, wage rates, overtime provisions etc. for “on the tools” (or “craft”) workers. Supervisory employees (e.g. superintendents, engineers, management) are not included under the BNA.

- *Labour Strategy Development*: In addition to the items above, Manitoba Hydro continues to develop a strategy related to improving labour attraction and retention as well as labour productivity. This strategy considers both short- and medium-term actions to be taken. In developing this strategy, Manitoba Hydro is working with owner groups across Canada to learn what has been successful in those provinces.

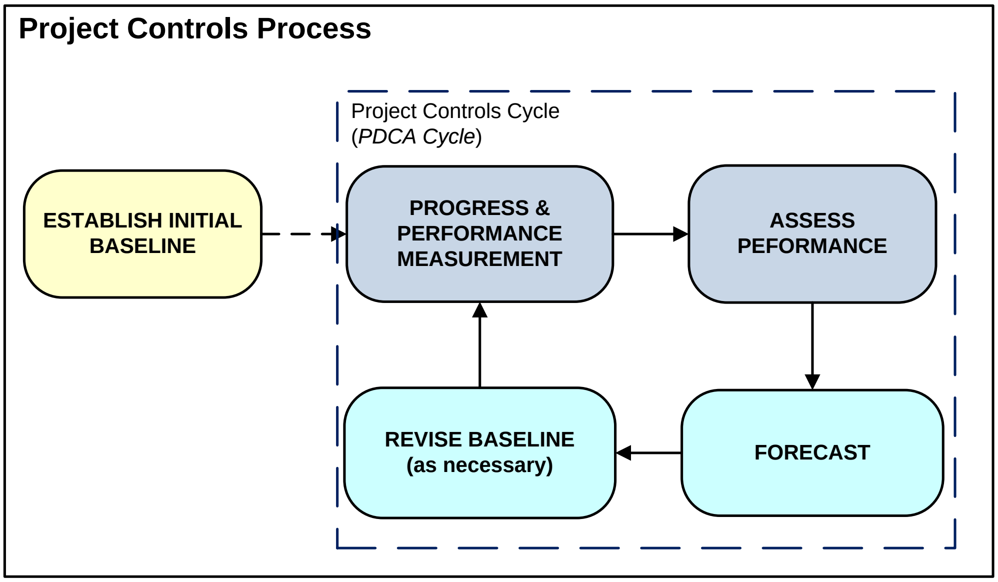
15.6.4 Project Controls

One of the critical roles of Manitoba Hydro's project management team is the monitoring and control of project scope, schedule and budget on the Keeyask and Conawapa Projects through a project controls process. As such, the purpose of the project controls process is to provide timely and accurate information and forecasts that allow project scope to be managed to the approved budget and schedule.

The project controls process applied on the Keeyask and Conawapa Projects is based on the Plan-Do-Check-Act cycle, which is a well recognized continuous improvement management model. The project controls process is intended to answer the questions below and is outlined further in the figure that follows:

- How does actual performance compare to planned (baseline) performance?
- What is the forecast for future performance based on performance to-date?
- What are the areas requiring action to bring actual performance in-line with expected performance?
- What are the results of any corrective actions taken?

Figure 15.8 PROJECT CONTROLS PROCESS



The general principles of the above process are as follows:

- The approved project scope, schedule and budget together form the baseline for performance measurement and control.
- Monitoring and control activities occur on all costs items, with the greatest degree of focus on large dollar or high-risks portions of the work (e.g., the General Civil Contract).
- Monitoring and control is the responsibility of the Project Manager and all work package leads on the projects. Project controls staff support the Project Manager and his/her team by helping facilitate the controls process.
- Outputs from the project controls process support both the contingency management and change management processes.

Specific to the Keeyask General Civil Contract, the target price provided by the contractor will include a detailed breakdown of the cost to execute the work (e.g. labour, equipment and material costs, overhead, profit, etc.) for each component of the work. This cost structure will be used to manage changes to the target price as the project progresses.

Change Management

Project changes are managed closely on the Keeyask and Conawpa Projectss following established change management processes. Processes for managing change are needed to ensure approved changes are clearly communicated and managed in a consistent manner. The scope of the change management process covers from the design phase through the close of construction. Specific items covered under the change management process include:

- Identification of potential changes
- Assessment of the need for the identified change
- Assessment of budget impact of the change, including the impact on project contingency
- Assessment of the impact of the change to the baseline schedule
- Process to approve changes
- Mechanisms to execute approved changes
- Documentation of the executed change.

The change management process ensures someone is identified to execute the required change, all documents are updated appropriately to account for the change, and the change itself is documented appropriately.

The approval level for a project change follows a hierarchical structure and is dependent on the size of the change. As the cost and schedule impact of a change increases, the approval level required increases. Significant changes will require the approval of the Manitoba Hydroelectric Board.

Other Management Processes

There are a number of other management processes that are being implemented on the Keeyask and Conawapa Projects. These additional management processes include:

- Quality Management – The quality management process is in place to manage quality at all levels in the project to ensure all deliverables meet or exceed requirements. Quality management applies continuous improvement practices to all project work to minimize the risk of not meeting requirements. Quality management involves planning, doing, checking, and acting to improve both project and product quality. Quality management is generally divided into three key activities: quality planning, quality control and quality assurance.
- Health and Safety Management – The health and safety management plan ensures that all actions undertaken as part of the project are done so in a safe manner. More specifically, the plan outlines how contractor safety plans will interact with Manitoba Hydro's safe work procedures and processes. It is expected that every contractor will operate safely and participate in ensuring overall safety throughout the project work.
- Human Resource Management – The human resources management process manages the overall staffing needs required for construction including: Manitoba Hydro internal project staff, Manitoba Hydro support services (e.g. legal, purchasing, etc.), external consultants and contractor workforce.
- Communications Management – The communications management plan outlines the methods for ensuring all stakeholders and project team members remain informed of the progress of the work. Requirements for information distribution and reporting performance are found within the project communication plan.
- Document Management – The document management plan is in place to identify the appropriate classification and storage location of drawings and documents associated with the project.

15.7 Summary of Risk Mitigation Actions

The following table summarizes the risk mitigation actions that have either already been implemented by Manitoba Hydro or will be implemented once the projects are committed. These include risks and mitigation actions described in this chapter, as well as other chapters in the NFAT submission. The content is grouped using the same key risk factors as presented in ***Chapter 10 – Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities,***

Table 10.15 Economic Evaluation - Uncertainty Matrix.

1 **Figure 15.9** **SUMMARY OF MANITOBA HYDRO'S RISK MITIGATION ACTIONS FOR THE PREFERRED DEVELOPMENT PLAN**

Driver	Description	Potential Risk to Preferred Plan	Risk Mitigation Actions: Pre-commitment	Risk Mitigation Actions: Post-commitment (Planned)
Key Risk Factor - Energy Prices				
Electricity Price Forecast	Lower electricity prices than forecast	Lower export revenues	Utilize a concensus-based forecast of five independent consultants to produce high, expected and low forecasts Negotiate term sheets and contract agreements prior to committing to hydro development	Conawapa development will continue to be re-assessed prior to project commitment in 2018
Natural Gas Price Forecast	Lower natural gas prices than forecast	Lower export revenues and lower thermal operating costs in the long run	Negotiate term sheets and contract agreements prior to committing to hydro development	Conawapa development will continue to be re-assessed prior to project commitment in 2018
MISO Load	Diminished sale opportunities in the export market (firm and opportunity)	Lower export revenues	Negotiate term sheets and contract agreements prior to committing to hydro development	Conawapa development will continue to be re-assessed prior to project commitment in 2018
Carbon Policy	Uncertainty towards implementation, timing and level of carbon pricing	Lower export revenues	Negotiate term sheets and contract agreements prior to committing to hydro development	Conawapa development will continue to be re-assessed prior to project commitment in 2018
Other U.S. Environmental Policies	Uncertainty towards implementing a series of proposed U.S. environmental policies, their stringency and overall impact. (MATS, ash lagoon, CO2 for new coal, CASPR, US RPS)	Lower export revenues	Negotiate term sheets and contract agreements prior to committing to hydro development	Conawapa development will continue to be re-assessed prior to project commitment in 2018

2

Driver	Description	Potential Risk to Preferred Plan	Risk Mitigation Actions	
			Pre-commitment	Post-commitment (Planned)
Key Risk Factor - Capital Cost or In-Service Date				
Keeyask and Conawapa	Labour escalation, labour shortages, low productivity rates and associated increased indirect costs.	Higher capital costs and potential for ISD delays	Labour and Escalation Management Reserve Fund created for budgeting purposes High quality camp accommodations to aid in attracting workers, comparable to other northern remote Canadian project camps Modifications to isolation leaves in the BNA Early Contractor Involvement contractor for the General Civil Contract	Increased staff-to-craft ratios and turnarounds relative to Burntwood Nelson Agreement Implementation of labour strategy
	Higher commodity prices, equipment and material costs (direct costs)	Higher capital costs	Escalation Management Reserve Fund created for budgeting purposes	Transfer of portion of commodity price risk to contractors through contract terms
	Delays incurred after start of construction	Higher capital costs, delay to ISD	Utilizing contracting strategies that involve contractors in the design phase and minimize Contractor interfaces	Input from General Civil Contractor to maximize constructability and optimize schedule
	Lack of competitive bidding on contracts	Higher capital costs, limited contractor availability, potential for schedule delays	Consulted with potential bidders for major contracts in the design phase to gauge interest (vendor development) Contract packaging that aligns with prevailing market conditions, attracting contractor interest Improved engineering process	Improved contract management process and coordination
	Contract estimate accuracy	Higher capital costs	Adjusted contract estimates based on Wuskwatim experience and prevailing market conditions	Effective management of contracts and project schedule

1

Driver	Description	Potential Risk to Preferred Plan	Risk Mitigation Actions	
			Pre-commitment	Post-commitment (Planned)
Thermal Generation	Commodity escalation, schedule overruns and environmental legislation	Higher capital costs	Thermal resources have been minimized in the Preferred Development Plan	
Transmission in Manitoba	Final routing, commodity escalation, schedule overruns and environmental legislation	Higher capital costs, lower export revenues if export sales cannot be served	The approval process for the interconnection has been initiated and sale contracts provide for up to two year delay. Community consultations on the Keeyask Generator Outlet Transmission are completed and the licensing process is underway. Planning is underway for North-South Manitoba transmission; signed and proposed firm contracts can proceed without this infrastructure.	Generation ISDs could be adjusted if transmission is delayed.
Key Risk Factor - Economic Factors				
Exchange Rate (CAD/USD)	Future exchange rates	Higher volumes of export sale revenues and U.S. denominated debt exposed to U.S. exchange rate risk	Manitoba Hydro maintains a natural hedge with U.S. dollar cash flows, including outflows from US denominated debt. The U.S. debt portfolio may occasionally be rebalanced in accordance with US dollar cash flows.	
Inflation Rates (U.S. & Cdn)	Future inflation rates	Erosion of export revenues from long term contracted sales due to inflation. High upfront capital investment and commodity / labour cost increases subject to inflation	Price escalators are included in export contract terms and conditions. Construction contracts share escalation risk with the contractor by indexing the supply price of major commodity based materials (e.g. reinforcing steel, copper, cement etc.) to market indices and allowing for pre-purchase of materials to take advantage of lower market prices if and when they exist. Capital costs include an allowance for real escalation as described in Appendix 9.3, Section 2.1.3, Table 2.4.	
Interest Rates	Future interest rates	Interest rates would affect capital cost and finance expense	Manitoba Hydro manages the aggregate level of interest risk rate within the debt portfolio arising from short-term debt, floating rate long-term debt, as well as the amount of long-term debt to be refinanced. When selecting terms for its new borrowing, Manitoba Hydro gives careful consideration to the debt maturity schedule and the total level of annual financing requirements.	

Driver	Description	Potential Risk to Preferred Plan	Risk Mitigation Actions: Pre-commitment	Risk Mitigation Actions: Post-commitment (Planned)
Specific Risk Factor - Drought				
Multi-year drought	Extended periods of low flows in the hydraulic system	Preferred Development Plan is not sufficient to meet load commitments	Under drought conditions, Manitoba Hydro has the contractual right to curtail firm export deliveries in order to serve Manitoba load first. Retained earnings are being maintained to protect against the financial impact of potential droughts. Equity provides buffer to absorb adverse events so that compensating rate increases can be smoothed out over a period of time.	
Drought worse than drought of record used for system energy planning occurs	Extreme low flows for one season	Preferred Development Plan is not sufficient to meet load commitments		
Specific Risk Factor - Climate Change				
Long-Term Climate Change	Impact on precipitation and temperature	Lower export revenues or inability to meet load commitments	Monitoring potential impacts of climate change scenarios on NPV of Preferred Plan and All Gas plan.	Climate change will continue to be studied. New interconnection capacity will provide enhanced ability to adapt to load changes.
Specific Risk Factor - Manitoba Load/ DSM				
Manitoba Load Growth	Potential for higher/lower than expected load Also potential for large industrial load addition or subtraction	Potential impact to the need date for new resources Higher load could require new thermal generation Lower load would increase surplus energy and capacity which in turn would increase export revenue potential and may defer in-service dates	Manitoba Hydro's NFAT analysis and pre-construction planning consider varying levels of load growth and the Preferred Development Plan provides the most flexibility to adapt to changing load (See Chapter 14)	Utilize imports or may need to build thermal as a short term solution. Conawapa development will continue to be re-assessed prior to project commitment in 2018. New interconnection capacity will provide enhanced ability to adapt to load changes.
Manitoba DSM	Potential for higher/lower than expected load due to Future Power Smart programs and/or customer response		Manitoba Hydro's NFAT analysis and pre-construction planning consider varying levels of load growth and the Preferred Development Plan provides the most flexibility to adapt to changing load (See Chapter 14) Engaged EnerNOC to work with Manitoba Hydro to assess the 20-year potentials of energy efficiency for electricity (See Appendix 4.3)	Continual review and pursuit of new program opportunities and current program effectiveness. Conawapa development will continue to be re-assessed prior to project commitment in 2018. New interconnection capacity will provide enhanced ability to adapt to load changes.
Driver	**Description**	**Potential Risk to**	**Risk Mitigation Actions**	

		Preferred Plan	Pre-commitment	Post-commitment (Planned)
Other Risk Factors				
Export Contract Terms	Final terms of WPS sale not determined Other future firm contract terms subject to future contract negotiations	Lower export revenues	Firm export contracts signed prior to project commitment including provisions that exempt Manitoba Hydro in the case of regulatory delay or cancellation. New, additional contracts are being pursued with both existing and new customers. Ongoing efforts to maintain existing and establish new relationships to meet customer needs.	Conawapa development will continue to be re-assessed prior to project commitment in 2018.
New U.S. Transmission Interconnection Capacity and Ownership	Final design and capital allocation among proponents	Higher Manitoba Hydro capital cost contribution and higher ongoing operating costs	Minnesota Power is the proponent for the new U.S. portion of the interconnection and sales agreements are contingent on required approvals. Conawapa development will continue to be re-assessed prior to project commitment in 2018.	
Market Access	Potential for legal or regulatory restrictions which would prevent Manitoba Hydro's surplus power from reaching the competitive marketplace free from unreasonable legal, regulatory, structural or tariff barriers	Lower export revenues	Ongoing efforts to maintain existing and establish new relationships to meet customer needs. Pursuing large tie line to expand ability to serve new markets with firm transmission access. Continue participation in MISO tariff task forces. Ensure legal requirements are understood and Manitoba Hydro legal interests are represented in establishing tariffs.	

Driver	Description	Potential Risk to Preferred Plan	Risk Mitigation Actions	
			Pre-commitment	Post-commitment (Planned)
Species at Risk Act (SARA)	The federal government is considering listing Lake Sturgeon under SARA.	If Lake Sturgeon are listed, the projects could be delayed or cancelled; if the projects proceed, they will require permits	Manitoba Hydro is working with northern communities and resource managers to develop and implement programs to benefit Lake Sturgeon (Appendix 2.1); recent studies have indicated results from these programs, some of which go back two decades.	Manitoba Hydro will continue to work on Lake Sturgeon management and enhancement programs. For the Keeyask and Conawpa Projects, habitant will be enhanced to address the loss of existing sturgeon habitat, and stocking will be implemented to increase regional populations.
Legislation for Environmental Reviews	The federal and provincial legislation require public reviews of the potential environmental effects of the projects	If approval is not receive, the project(s) cannot proceed	A thorough environmental assessment using “Western” science and Aboriginal traditional knowledge has been completed for the Keeyask Project and is underway for the Conawapa Project. During the process, many potential adverse effects are avoided and extensive mitigation measures address other potential adverse effects (section 2.1.3).	Once regulatory approval is received, monitoring will be undertaken to determine if predictions in the assessment are correct and, if not, to help inform the development of adaptive management measures. The Keeyask G.S. will be designed to enable it to be retrofitted should monitoring determine that a fish passage structure is required.
Aboriginal Participation and Support	Manitoba Hydro is seeking Aboriginal support for northern hydroelectric projects	If support is not forthcoming, the projects could face challenges in getting regulatory approval and in marketing product in the U.S.	Negotiate agreements with Cree Nations prior to start of construction. Benefit-sharing (i.e. the Joint Keeyask Development Agreement) and adverse effects agreements have been negotiated with the four Keeyask Cree Nations. Process protocols have been established for negotiating Conawapa agreements (section 2.1.3.1).	While there are risks inherent to a business partnership, the Joint Keeyask Development Agreement incorporates a variety of terms intended to eliminate, mitigate, or provide mechanisms to deal with risks associated with developing the Keeyask Project as a partnership.
Socio-economic impacts to Gillam			Collaboration between Manitoba Hydro, Town of Gillam, Fox Lake Cree Nation, Northern Regional Health Authority, RCMP and others Harmonized Gillam development

Mr. D. Christle
Secretary and Executive Director
Public Utilities Board
400-330 Portage Avenue
Winnipeg, Manitoba R3C 0C4

Dear Mr. Christle:

RE: MANITOBA HYDRO 2017/18 & 2018/19 GENERAL RATE APPLICATION – REDACTIONS FOR MANITOBA HYDRO'S REBUTTAL EVIDENCE ON THE MGF REPORT AND COALITION/IEC (MGF) - 3

On January 16, 2018, Manitoba Hydro filed its written Rebuttal Evidence with respect to the written evidence of MGF Project Services Inc ("MGF"). In its letter, Manitoba Hydro requested that the Public Utilities Board of Manitoba ("PUB") receive and hold in confidence the proposed redactions contained within its Rebuttal Evidence pursuant to Rule 13 of The Public Utilities Board Rules of Practice and Procedure.

On January 29, 2018, the PUB directed Manitoba Hydro to release on the public record the redacted information contained in rows one, three and four of the table on page 27 of its Rebuttal Evidence. In addition, the PUB directed Manitoba Hydro to release on the public record the first three words of the first redacted section, and the first word of the last redacted section, of the response to the Information Request Coalition/IEC (MGF) – 3. Accordingly, please see attached the updated public versions of these two documents.

If you have any questions or comments with respect to this submission, please contact the writer at 204-360-3946 or Odette Fernandes at 204-360-3633.

Yours truly,

MANITOBA HYDRO LEGAL SERVICES DIVISION

MANITOBA HYDRO PUBLIC UTILITIES BOARD

IN THE MATTER OF *The Crown Corporation Public Review and Accountability Act*

AND IN THE MATTER OF Manitoba Hydro's 2017/18 & 2018/19 General Rate Application

REBUTTAL EVIDENCE OF MANITOBA HYDRO

WITH RESPECT TO THE WRITTEN EVIDENCE OF:

MGF Project Services Inc., Independent Expert Consultant for the Public Utilities Board, on the Manitoba Hydro Capital Expenditure Review for the Keeyask Hydroelectric Dam, the Bipole III, Manitoba-Minnesota, and GNTL Transmission Lines

Manitoba Hydro

January 16, 2018

Table of Contents

In its 2017/18 & 2018/19 General Rate Application ("Application") filed on May 12, 2017, Manitoba Hydro provided a brief description of its Bipole III Reliability Project ("Bipole III"), its Keeyask Generating Station Project ("Keeyask"), and the U.S. Tie-Line Project made up of the Manitoba-Minnesota Transmission Project in Manitoba ("MMTP") and the Great Northern Transmission Line in Minnesota ("GNTL"). Included in those descriptions were the budget estimates in place as at that time, and the projected In-Service Dates for each as of May, 2017. The Application also made reference to the review of those projects by the Boston Consulting Group.

On December 8, 2017, Manitoba Hydro was provided with a copy of the Report from MGF Project Services Inc. ("MGF"), an entity retained by The Public Utilities Board of Manitoba ("PUB") to review Manitoba Hydro's capital expenditure program in relation to the above projects and to provide its opinion on Manitoba Hydro's updated costs for each. Manitoba Hydro has had the opportunity to review that report, to put forward its Information Requests, and to review the answers provided by MGF on or about January 5, 2018, to all of the Information Requests it received.

In order to provide background and context to the remarks made in the Report of MGF, and to fully respond to the opinions expressed therein, Manitoba Hydro has prepared separate rebuttal for each of Bipole III, Keeyask and MMTP. It was not felt necessary to provide rebuttal on GNTL and the Manitoba-Saskatchewan Transmission Project.

1. KEEYASK GENERATING STATION PROJECT

The Keeyask Generating Station is a 7 unit 695-megawatt hydroelectric generating station situated at Gull Rapids on the lower Nelson River in northern Manitoba. Keeyask will be the fourth largest generating station in Manitoba and the sixth generating station located on the Nelson River. The Keeyask Project is owned by a partnership between Manitoba Hydro and four Manitoba First Nations, known as the Keeyask Hydropower Limited Partnership ("KHLP"). Manitoba Hydro has been tasked with the responsibility of managing the construction of the Keeyask Project and the operation of the facility when it enters into service on behalf of the KHLP. Construction of the Keeyask Project consists of the construction of the generating station as well as construction of supporting infrastructure and the Keeyask Transmission Project which will transport the power produced at Keeyask onto the Manitoba Hydro system when the generating station enters into service.

MGF was retained on Keeyask to review and explain the increases in cost estimates and capital cost increases, as well as project cost overruns. It was to determine and assess the reasonableness of the updated forecast and to identify aspects of the updated cost estimate and schedule that are at risk. It was also to recommend risk mitigation strategies and, further, to review and make recommendations with respect to Manitoba Hydro's:

- practices on its pre-construction design and engineering work;
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling;
- its choice of contract types;
- geotechnical analysis; and
- the governance structure.

Manitoba Hydro staff received dozens of requests for information and data, and staff was fully transparent in sharing more than 1,900 documents including contracts, cost estimates, schedules and various other project management documents.

Key Manitoba Hydro project staff had more than two dozen meetings by phone and in person with MGF representatives and hundreds of emails were exchanged between the parties over the course of the review. MGF also met with senior staff from the General Civil Contractor BBE Hydro Constructors Ltd ("BBE"), and the project design engineer ("Hatch"). MGF personnel attended the Keeyask site on three separate site visits.

In MGF's *Report for Manitoba-Hydro Capital Expenditure Review for The Keeyask Hydroelectric Dam, The Bipole III, Manitoba-Minnesota and GNTL Transmission Line* report dated December 8, 2017 ("MGF's Report or the Report"), MGF and their sub-consultant Klohn Crippen Berger ("KCB"), provide a number of observations, findings, recommendations and conclusions related to Keeyask. Manitoba Hydro has grouped a majority of these items into three major themes which Manitoba Hydro will comment on in the subsequent sections of this rebuttal. The three major areas which Manitoba Hydro will address are as follows:

1) The contract model selected for the General Civil Contract ("GCC");
2) The people and the competency of the people managing the construction of the Keeyask Project; and
3) MGF's findings related to the forecasted cost and schedule of the Keeyask Project.

The key responses to those three major areas (detailed more fully below) are:

1) The contract model selected for the General Civil Contract;

- The GCC is being managed under a target price contract where the contractor is reimbursed for actual costs. The contractor is incentivized to perform and minimize cost and schedule as their profit and General Administration and Overhead are at risk if they exceed their target price. The contractor is also subject to liquidated damages for delays to the project schedule.
- The decision to proceed under the cost reimbursable target price contract model was made in 2012/2013 and was part of a larger Project Delivery Strategy for the Keeyask Project. This decision was informed by lessons learned on the recently completed Wuskwatim Generating Station Project and prevailing market conditions at the time.
- The North American major capital project market around the time of the GCC procurement was extremely competitive. Contract models that transferred additional risk to the contractor including fixed price and unit price would have been cost prohibitive as contractors were not willing to accept additional risk in a competitive environment.
- An extensive 24 month, three phase procurement process was undertaken to select a General Civil Contractor. BBE was the selected contractor as they were determined to be the best value contractor based on the evaluated criteria.

2) The people and the competency of the people managing the construction of the Keeyask Project.

- The Manitoba Hydro team delivering the Keeyask Project is comprised of project management and construction management professionals with experience in managing some of the largest construction projects in Manitoba over the past decade.
- Manitoba Hydro has contracted BBE as the GCC to serve as Construction Manager for General Civil scope of work. Manitoba Hydro taking over the role of Construction Manager as implied by MGF throughout their report would expose Manitoba Hydro to additional risk and claims from the contractor.
- From the start of construction, Manitoba Hydro has continually attempted to undertake actions to progress the work while not crossing the line of explicitly directing the means and methods of the contractor. Crossing this line will expose Manitoba Hydro to interference claims from the contractor and increase the level of risk assumed by Manitoba Hydro.

3) MGF's findings related to the forecasted cost and schedule of the Keeyask Project.

- MGF does not provide data to support its conclusion that the expected cost of Keeyask will be $9.5 B to $10.5 B. Manitoba Hydro and the PUB submitted Information Requests to MGF requesting the details underpinning these calculations; however, MGF failed to provide the requested backup.
- Without the backup to substantiate MGF's claims, Manitoba Hydro reviewed the data in an attempt to understand how MGF arrived at their conclusions. From the information available, it is Manitoba Hydro's opinion that MGF has likely overstated the range of potential costs as they incorrectly applied General Administration and Overhead and indirect costs to their estimated cost overruns.
- MGF's forecasting methods are overly simplistic and do not consider the efforts undertaken by Manitoba Hydro and BBE to reduce cost and schedule outcomes.

1.1. The General Civil Contract, Contracting Strategy, and Selection of the Contractor.

<u>GCC Contracting Strategy:</u>

<u>MGF Report:</u>

Section 1 - Executive Summary, page 1

Scope Item 5: Finding # 1 page 50; Finding # 5 and 6 page 56; Finding # 12 page 62

Scope Item 9: Finding #10 page 80
Section 8 – Conclusion, page 161

<u>KCB Report:</u>
Section 5 page 33 – 35
Section 7 Pages 39 -40

Recognizing that the GCC was the largest and most important contract on Keeyask, in 2012 Manitoba Hydro developed and executed a detailed project delivery strategy which included a procurement strategy for the General Civil Contractor. The project delivery strategy was provided to Knight Piésold ("KP") (the independent expert consultant retained by the PUB) during the Need for and Alternatives To ("NFAT") review in 2014 and more recently to MGF in July 2017 during the current review of the Keeyask Project. On Executive Summary page II of IV of Knight Piésold Independent Expert Consultant Report Rev.1 dated January 23, 2014, in reference to construction management, schedule and contracting plans, KP stated that:

> *"The overall approach follows well documented internal standards developed by Hydro's NGCD. The contracting method varies by project component but the principal civil works contracting strategy is an Early Contractor Involvement (ECI) Project Delivery Strategy. Overall the project delivery strategy has been to transfer risk away from Contractors and to Hydro in order to better understand and share the risks and obtain a better contract price as a result."*

Manitoba Hydro's selection of a contracting strategy was informed by a number of factors including, but not limited to, the following:

- Market conditions that influence the availability of major contractors willing to bid on the work;
- Allocation of risk to the party best suited to manage the project's most significant risks;
- The project schedule;
- Completeness of engineering at the time of tender;
- Lessons learned from past projects including Wuskwatim and Pointe du Bois; and

- Internal expertise and resource availability. Manitoba Hydro evaluated its internal expertise, resource availability and corporate structure as part of its analysis of an appropriate contracting strategy. It was recognized that although Manitoba Hydro had significant and expert resources required to function as the overall project and site manager, it lacked the experience necessary to manage the day-to-day activities typically performed by the general civil contractor. To perform this role would require significant changes and the addition of considerable construction and support staff to Manitoba Hydro's organization.

KCB states:

> *"While we were not part of the process that selected the contracting model, we surmise that MH either had success with this model elsewhere, or there were significant reasons to push the project into construction quickly relying on the early contractor involvement, the expectations of a quality design from Hatch and an experienced contractor with a realistic target price to make the project a success."* (Page 39)

KCB is correct in its assumption that Manitoba Hydro was applying lessons learned from previous major capital projects that it had managed, including the recently completed Wuskwatim Generating Station and Pointe du Bois Spillway Replacement Project. It is not accurate in its assumption that the contract was impacted by any desire or need to push the project into construction quickly.

The lessons learned by Manitoba Hydro that led to its selection of the cost reimbursable target price contract for the GCC are explained below. Lessons learned from past projects were also previously discussed at a high level during the NFAT in 2014 hearings as well as during the 2015/16 and 2016/17 General Rate Application (Manitoba Hydro Exhibit #104 – Undertaking #44).

> *"Manitoba Hydro originally tendered the General Civil Contract for the Wuskwatim Generating Station in 2007 as a unit price contract using the design, bid, build model. This resulted in receiving only one bid from the market with a price nearly double the Engineer's Estimate and well beyond the expected value*

of the work. After suffering schedule delay because of the lack of reasonable bids, the work was re-tendered and four competitive proposals were received with a cost-reimbursable, target price contract awarded to the successful proponent in November 2008.

Based on the Wuskwatim Project experience, Manitoba Hydro also chose to include the river management, rock excavation, and electrical/mechanical scope into the Keeyask GCC to reduce the interface risk between contractors otherwise held by Manitoba Hydro. The rock excavation and electrical/mechanical work were packaged as separate contracts on the Wuskwatim Project leading to many challenges in interface management between the various contractors. On Keeyask, this work is bundled together within the GCC's scope.

At the time when Manitoba Hydro was developing the contracting strategy for the GCC, potash was increasing in demand, oil prices were more than $100/barrel and any available forecasts anticipated continued price increases. As a result, there was a boom in the major capital project market in North America, particularly in the energy industry including the Northern Alberta oilfields as well as many oil and natural gas projects within the Bakken Formation underlying portions of Saskatchewan, Montana and North Dakota and the Muskrat Falls project in Labrador, which resulted in increased competition for skilled labour (See for example http://publications.gov.sk.ca/documents/310/81353-2014-MPI.pdf). In this 'hot' construction market, many of the major contractors had already committed experienced personnel and resources to the other projects and were not as hungry for opportunity. In this type of economic environment, Manitoba Hydro's experience was that contractors were also not as willing to accept risk in a job and their pricing reflects this reality. Economic conditions were similar for the procurement phase of Keeyask as they were for procurement during Wuskwatim when the original General Civil Contract was unsuccessfully tendered as a unit priced contract and then re-tendered competitively as a cost reimbursable target priced contract.

> *Labour productivity (amount of hours per unit of work) has been one of, if not the largest risk for contractors since the early 2000's across Canada, particularly in remote, fly-in fly-out operations such as Keeyask. As was learned on Wuskwatim, this caused contractors to avoid or submit extremely high bids for any contract that transferred this risk to them (such as fixed cost or unit price contracts). For Canadian hydro, the absence of large scale projects from 1990 to the mid-2000's magnified the productivity issue creating a skilled labour shortage across the country and a shortage of qualified supervision. Manitoba Hydro was well aware that many contractors were wary to provide competitive estimates for hydro work."*

In 2012, Manitoba Hydro selected a cost-reimbursable target price model with Early Contractor Involvement ("ECI") that balances project risk between two parties. If the contractor completes the work under the target price, they earn profit plus a share of the savings. However, if the contractor exceeds the target price, they forfeit a substantial portion of their profit for every dollar of overrun, up to the value of their total profit amount. A contractor will not go bankrupt on the job, but they are at risk of not earning any profit if they exceed the target price by a certain threshold. No return (i.e. profit) on a 5+ year investment of resources by a major contractor is not what shareholders want to see and thus the contractor is incentivized and motivated to perform.

A fixed price model was considered but would have necessitated a contractor bidding higher to factor in risks over which they have no control (e.g. geological conditions, interest rates, commodity price escalations over the duration of the work, labour skill and availability, etc.). This would have raised the initial cost of the project and limited the number of parties interested in proposing on Keeyask, thus driving up the project cost.

Another reason the target price model was chosen was because it allowed for an opportunity to leverage ECI. As the final design engineering was not yet complete, there was an opportunity to engage a contractor early to help influence the design from a constructability standpoint. Engaging a contractor earlier also allowed the contractor more lead time to establish project process and work plans, understand the labour agreement and understand the local labour and supplier market.

Manitoba Hydro also had experience with the target price model having recently completed Wuskwatim in 2012 ($1.4B) and Point du Bois in 2014 ($0.6B).

KPMG, a consultant experienced in the management of major capital projects, was engaged by Manitoba Hydro in May 2016 to undertake an independent review of the current status of Keeyask. KPMG subsequently provided advice on the development and implementation of a Recovery Plan for Keeyask and has provided project management support since that time for the Manitoba Hydro project delivery team. Manitoba Hydro requested KPMG to provide commentary on the following three topics:

1. Provide commentary on the contract model and any incentives included.
2. Define Manitoba Hydro's role in the GCC contract. Define the role of the Contractor and comment on Manitoba Hydro's ability to manage the Contractor in this role.
3. Provide commentary on Manitoba Hydro acting as the builder and taking on a Construction Management role.

KPMG's response to these items is attached as Keeyask – Appendix A. In terms of contract type, KPMG's response indicates the incentives used in this contract have been used in other cost reimbursable contracts as well as other forms of contracts. The incentives align the owner's and contractor's interests and help to mitigate the exposure the owner has to poor performance by the contractor.

<u>General Civil Contract Procurement:</u>

MGF Report – Scope Item 5: Finding #12, page 62
KCB Report – Section 5: page 33

Manitoba Hydro undertook an extensive three phase procurement process for the GCC beginning in 2012. This included a six month market-sounding exercise where 21 major international contractors were contacted to determine their level of interest in the

Keeyask Project. This process served as a marketing effort to generate interest for Keeyask in the marketplace with the intent of maximizing the number of capable contractors responding to the Request for Pre-Qualification to obtain competitive pricing. This process also served to inform Manitoba Hydro on the factors that were of interest to the potential contractors. Feedback on contracting models was also solicited from these organizations. Many of these experienced companies indicated they would not bid on a project the size and remoteness of Keeyask on a fixed price model due to the risks involved.

The second phase of procurement was the prequalification phase. Seven contractors submitted proposals in response to Manitoba Hydro's call for submissions. The contractor submissions were evaluated on 17 different criteria including demonstrated experience in remote, arctic heavy civil construction projects with an emphasis on concrete, earthworks and river management. Other factors that were considered in the evaluation included schedule, risk mitigation and safety. Four contractors that Manitoba Hydro believed were capable of building the work were pre-qualified and were provided the opportunity to bid on the Keeyask General Civil Works Contract in a competitive, cost-based evaluation.

The proposal stage was the third and final step in the procurement process. Manitoba Hydro engaged a third party ("Chant Construction") to provide their estimated price for the work as an additional pricing comparator (in addition to Manitoba Hydro's Engineer's Estimate). The pricing proposed by Chant Construction was generally in line with the Engineer's Estimate and was within the range of bids received from the four Proponents. A summary of the pricing information from the GCC proposals was provided in confidence to MGF as part of their review, and to the PUB and its independent expert KP during the NFAT hearings as exhibit NFAT CSI Manitoba Hydro-3.

As part of the evaluation of the contractors' proposals, Manitoba Hydro evaluated the initial target price proposed by the contractors based upon a number of pre-defined factors that were valued by Manitoba Hydro including potential schedule advancements, size of workforce against available camp capacity, and quantity change sensitivities to ensure that the contractor who provided the best value was selected.

The bids were also compared against one another and against the estimate provided by Chant Construction for reasonableness. After nearly a two year procurement process to conduct the market sounding, prequalify capable proponents and evaluate proposals to select the best value for Manitoba Hydro, the General Civil Works Contract was awarded to BBE, a limited partnership between Bechtel Canada Co., Barnard Construction of Canada Ltd. and EllisDon Civil Ltd. in March 2014.

Throughout its report, MGF is critical of the form of contract selected for the GCC. On page 80, MGF states:

> *"The GCC Contract strategy of adopting a cost reimbursable commercial arrangement for this project was flawed from the outset, with a predictable outcome, i.e. it promotes and rewards inefficient work and doesn't encourage efficient work."*

MGF fails to identify and understand the factors that led to Manitoba Hydro proceeding with the selected form of contract for the GCC. MGF's comment also does not address the target price aspect of the contract that puts the contractor's profit and General Administration & Overhead ("GA&O") at risk. The opportunity for profit and maintaining the GA&O incentivizes the contractor to attempt to meet or beat its target price. Manitoba Hydro provided MGF with the procurement documents for the GCC, evaluation matrix and criteria, related recommendations and presentations to the Manitoba Hydro Electric Board, the awarded contract with BBE and all seven amending agreements. These documents provide the rationale for selecting BBE as the GCC and clearly articulate the incentives that are intended to motivate contractor performance.

The Keeyask Project standards and procedures referenced on pages 50 – 53 of the MGF report were used to support the development of the contracting strategy and throughout the procurement process for the GCC. On page 53 of the report, MGF states that *"the standards, procedures and processes supporting Contracting Strategy, Contractor Prequalification, Individual Contract Plans and Tender, Evaluate, Negotiate and Award are sufficient and well documented."*

The contracting strategy, the GCC contract documents and a summary of proposal was reviewed with KP as part of the NFAT process. KP did not raise any significant concerns with the contracting strategy at the time of their review and the benefits and risks of the contract model were understood and communicated during the NFAT hearings.

It is not clear to Manitoba Hydro whether MGF and KCB were aware of the information provided to the PUB during the NFAT, or of the NFAT conclusions. As seen below, Manitoba Hydro addressed the contracting strategy with the PUB's independent expert in the NFAT process and the PUB's decision reflects that this, along with the risks, were discussed and reviewed.

On page 132 of the PUB's final NFAT report dated June 20, 2014, section 7.6.0 Conclusions of the Panel, the PUB stated the following regarding the Keeyask Project:

> *"The actual construction cost of Keeyask will increase beyond Manitoba Hydro's currently projected capital cost of $6.5 billion. Budgeting at least for Manitoba Hydro's "high" estimate of $7.2 billion would be prudent. This conclusion is not reached as a result of the history of past capital cost increases. The Panel accepts Manitoba Hydro's argument that the past is not necessarily a predictor of the future. Rather, the Panel bases its conclusion on its review of the Keeyask general civil contract, which is a cost-reimbursable contract that leaves a significant portion of cost risk with Manitoba Hydro. It would be a fallacy to assume that the contract provides anywhere near the same level of cost certainty as a fixed-price contract, which would be more expensive. This is not a criticism of the Keeyask general civil contract or Manitoba Hydro's approach to contracting. The Panel is satisfied that Manitoba Hydro's approach to developing and negotiating the contract, as well as its approach to managing risk, has been appropriate to date. Rather, it reflects the general nature of a large infrastructure project with inherent risks that can be mitigated, but not avoided."*

1.2. The People and the Competency of the People Managing the Construction of the Keeyask Project

MGF Report: Section 1 – Executive Summary, page 1

On page 1 of MGF's report, MGF states that:

> *"There is an opportunity for Manitoba Hydro to implement contract management improvements, take ownership for the GCC and drive the GCC contractor to higher levels of predictable performance, to accelerate project schedule and to lower the likely forecast cost at completion".*

MGF goes on to say that:

> *"Manitoba Hydro staff are competent and professional but they are not a construction manager with the experience and skills to direct the GCC. As such, its project management and control effectiveness is low."*

MGF makes these assertions without describing the skills and experience of Manitoba's senior team managing Keeyask, the roles and responsibilities under the General Civil Works contract, or even the actions that Manitoba Hydro has taken to improve outcomes from this contract. As MGF has failed to address these points in its report, the following section describes Keeyask's governance structure, an assessment of skills and experience of Manitoba Hydro's senior project team from a third party and a description of some of the key actions Manitoba Hydro has taken to enhance performance.

Governance:

Manitoba Hydro is experienced in the execution of major capital projects having delivered some of the largest capital projects in Manitoba over the last 10+ years.

In early 2016, Manitoba Hydro established the Major Projects Executive Committee ("MPEC") which is chaired by Manitoba Hydro's President & CEO and consists of five Vice Presidents who have accountability over the areas of the company responsible for the execution of major capital projects. MPEC is an executive management forum that provides oversight, direction and executive/strategic decision making with respect to major capital projects (i.e. Keeyask, Bipole III, MMTP and the GNTL Project in Minnesota). MPEC meets every two weeks or as required.

The Manitoba Hydro executive team is ultimately accountable to the Manitoba Hydro-Electric Board ("MHEB"). Periodically (and conforming to the corporate approval authority levels), major project decisions are reviewed and approved by the MHEB. The Keeyask Project team also provides project update reports and presentations to the MHEB on a regular basis. Site visits by both the Manitoba Hydro executive team and MHEB members have taken place.

As Keeyask Project is owned by the KHLP, there are additional accountabilities beyond the Manitoba Hydro organization structure. The Keeyask Project team is also accountable to the KHLP Board that is comprised of representatives from each of the four Keeyask Cree Nation ("KCN") Partner Communities and Manitoba Hydro. The KHLP Board is chaired by the Manitoba Hydro Vice President of Generation and Wholesale. The Keeyask Project team provides monthly update reports to the KHLP, as well as makes quarterly update presentations at the Board meetings.

The Keeyask Project team is comprised of project management and construction professionals with significant experience in the execution of major capital projects. As stated, Manitoba Hydro requested that KPMG review and comment on the experience of Manitoba Hydro's senior leadership team responsible for delivering Keeyask, and those comments are also found in Keeyask – Appendix A.

Management of the General Civil Contract:

MGF Report: Section 1: Executive Summary – page 1.

On page 1 of their report, MGF states that Manitoba Hydro's *"project management and control effectiveness is low".* MGF does not recognize the efforts of the Manitoba Hydro team in helping to manage the GCC.

Manitoba Hydro has been pushing, and will continue to aggressively push, the General Civil Contractor to perform. To be successful, this will require that Manitoba Hydro and BBE work together. After the award of the GCC in March 2014, work commenced on July 16, 2014 following receipt of all required regulatory approvals. Work by the GCC for the remainder of 2014 and all of 2015 was focused on establishing infrastructure including temporary buildings, haul roads, rock quarries as well as temporary river management structures (cofferdams) to control the flow of the Nelson River. These cofferdams allowed for the areas to be dewatered and rock excavated to allow for the construction of the permanent structures. In early January 2016, work on the North

Dyke commenced representing the milestone of the first permanent earthworks on the project.

At the beginning of the 2016 construction season, the project was generally on track and the project team was forecasting that the control budget and schedule of $6.5B and November 2019 unit 1 ISD (established during the NFAT hearings) would be achieved.

Manitoba Hydro reported to the PUB on March 2016 that the project was on schedule and on budget. Manitoba continued to actively monitor the progress of the GCC through the beginning of the construction season as it has throughout the project. Concrete work on the principle structures (Spillway, Intake, Powerhouse, Service Bay and Tailrace) began in early May 2016.

<u>2016 Issues:</u>

In early June 2016, approximately 6 weeks into concrete activities it was evident that the contractor's actual volume of concrete completed to date was significantly less than the contractor's plan. On June 19, 2016, Manitoba Hydro formally requested that the Contractor develop a recovery plan to increase their manpower ramp-up and concrete production in order to bring their production back in line with the 2016 plan. Manitoba Hydro staff continued to monitor the progress carefully during this time.

By July 2016, it was apparent that that the initial recovery efforts by the contractor were not going to be impactful enough to recover to the original plan. As well, both the GCC and Manitoba Hydro were becoming aware that the work could not be built as it was originally planned. As work continued to progress, the need for a new execution plan crystallized and required the team to understand the issues and problems and address them going forward. This led to the Recovery Plan described below.

By the end of the 2016 construction season, concrete placement was at 41% complete of the original plan for the year while earthworks were at 65% complete of the original plan. The concrete plan was to complete nearly 200,000 cubic metres of the 360,000 cubic metres required for Keeyask in the first year, while only 77,000 cubic metres were completed in the first year of concrete (2016). The production rates accomplished during the first concrete construction season saw the project schedule rapidly change from having a potential 6-month advancement opportunity at the start of the year shift to a potential of up to 2+ year delay by the end of the year. At this time it was also apparent that the $304M Labour Management Reserve in the $6.5B control budget to help offset productivity risk would not be sufficient. The large variance between actual and planned production also resulted in the Contractor having no opportunity to earn profit for the remainder of the project under the existing contract structure. This was already making for disengagement and the risk of worsening performance could occur for the remainder of the project if not addressed.

Recovery Plan:

Manitoba Hydro could not wait until the end of the 2016 construction season to begin to address the issues and plot a new path forward. Manitoba Hydro, with the assistance of industry experts KPMG, developed a Recovery Plan in September 2016 that covered both short and long term issues. The Recovery Plan incorporated a number of key features required to address the trajectory of the Project in order to achieve successful completion. The Recovery Plan needed to improve production and remove inefficiencies, and included:

- The development of a plan for the continuation of concrete through the winter months (previously not included in the original schedule);
- Identification of root causes of performance issues;
- Engagement of senior leadership, Executive Sponsors and CEOs;
- Development of refined processes, systems and tool based upon the findings of the root cause analysis;
- Implementation of a change management program to enable a culture shift within the project team;
- Initialization of activities to reforecast the cost and schedule for the project;
- Analysis of the Contractor's claims; and
- Supplementing of the commercial expertise of the Manitoba Hydro team.

Manitoba Hydro and BBE assessed the underlying causes of the challenges experienced to date. The main contributing factors to the underperformance included:

- Unachievable labor productivity rates in the current market which were contained within the contractor's bid;
- Slower than planned progress in ramping-up the on-site labour force in preparation for the concrete works beginning in 2016. This ramp up required a doubling of the labour force of roughly 1,000 workers to 2,000 workers in a period of roughly three months.

- Geotechnical and geological conditions different than anticipated based upon the extensive pre-construction geotechnical testing, resulting in additional effort to "get off the rock" to allow for construction of the concrete and earthworks structures off of the bedrock.

As part of the Recovery Plan, Manitoba Hydro, leveraging support from third party experts, including KPMG (Recovery Plan support), Revay (claims valuation and management), Borden Ladner Gervais LLP (legal support) and Validation Estimating (contingency development) undertook a thorough process to evaluate alternatives for, and impacts, to the GCC. The review demonstrated that the best course of action was to amend the existing contract with BBE, specifically to lower the overall cost and schedule risk for Manitoba Hydro and permit BBE an opportunity to re-establish a reasonable profit level. All other alternatives introduced significant additional risks to the Project as well as guaranteed impacts to cost and schedule that were greater than the selected alternative of amending the contract with BBE.

General Civil Works Contract Amendment:

In early 2017, Manitoba Hydro and BBE were able to achieve the mutual agreement that was required to amend the contract. The negotiation required 'gives and takes' from both parties and the outcome was a contract that lowered the overall cost and schedule risk for Manitoba Hydro and allowed the Contractor an opportunity to re-establish a reasonable profit level if they are able to perform relative to their revised target price. This aligned the interests of both parties to deliver a "Best for Project" approach.

The details of the amendment to the contract are formalized in Amending Agreement #7 between Manitoba Hydro and BBE. Amending Agreement #7, in addition to all previous versions of the agreement between Manitoba Hydro and BBE were provided to MGF in support of their review. The key features of the amendment include:

- Cost and schedule incentives providing motivation for BBE to earn profit by delivering the work to Manitoba Hydro with minimum cost and best schedule;
- Outstanding contractor claims were reconciled;
- GA&O mark-up was capped at target price;
- Narrowed ability for future claims;
- New liquidated damages provisions were established for late delivery;
- Productivity rates in line with 2016 actual performance used to inform the estimate of remaining costs on this contract.

Both MGF (MGF Report page 80) and KCB (KCB Report page 34-35) are critical of the contract model for the GCC. In Keeyask-Appendix A, KPMG describes the original and the amended contract for the GCC. KPMG describes the challenges inherent in attempting to renegotiate a contract in a non-competitive environment on page 2 of their submission:

> *"The amended contract continues to be a Target Price Cost Reimbursable contract, fundamentally the same as the original contract. The ability to transfer additional risk, such as geotechnical, hydrology, labour, extreme weather, and northern logistics to BBE by changing the contract to a Unit Rate or Lump Sum contract, would have required directly negotiating a new form of contract with BBE in a non-competitive environment or descoping/terminating BBE and going back to the market for a Unit Rate contract. It was expected that in a non-competitive environment and given BBE's performance in 2016, the costs of transferring this risk to BBE would have been prohibitive and/or not achievable."*

<u>New Control Budget and Schedule Established:</u>

With the General Civil Works Contract amended, further efforts were required to re-establish a new control budget and schedule for Keeyask. Manitoba Hydro reviewed the impact of the delay, along with known trends for the impacted work packages. The outcome of the review process was a revised control budget of $8.7B with a P50 contingency and a first unit in service date ("ISD") of August 2021. The revised control budget and schedule was formally approved by the MHEB in February 2017. The following table from PUB/MH MFR-122 highlights the major changes between the control budget established at the NFAT in 2014 and the revised control budget:

Figure 1.0

Keeyask Budget Summary (in Billions $)				
Item #	**Item**	**Previously Approved Budget (2014$)**	**Current Approved Budget(2016$)**	**Variance**
1.1	Generating Station	4.046	5.948	1.902
1.2	Generation Outlet Transmission (GOT)	0.164	0.202	0.038
1.3	Escalation @ CPI	0.244	0.249	0.005
1.4	Interest (including Interest on Equity)	1.343	1.749	0.406
1.5	Contingency	0.307	0.578	0.271
1.6	Labour Management Reserve	0.304	0.000	-0.304
1.7	Escalation Management Reserve	0.088	0.000	-0.088
1.8	**Total**	**6.496 B**	**8.726**	**2.230**
1.9	First in-service Date	Nov-2019	Aug-2021	21 months.

<u>2017 Performance:</u>

The 2017 construction season saw improved performance over the 2016 season with approximately 12% more concrete placed in 2017. This improvement is significant as the work done in 2017 was more complex, specifically, most of the placements in 2017 were generally smaller, required more formwork and were greater complexity pours (such as draft tubes) and concrete at height (head blocks and piers).

For the earthworks, productivity rates improved by 15% and the total of material placed in permanent structures in 2017 was 1.03 M cubic metres, an improvement of roughly 90%.

Contributing factors that influenced performance in 2017 included:

- Improved contractor leadership/management and their ability to plan and manage the work;
- More complex and better developed sequencing of concrete work and interfaces with earthworks;
- Learning curve to perform "first" work on the concrete in the Intake, Powerhouse and Service Bay;
- Challenges with the craft labour including maximizing work time at the work front.

Despite the improvements over 2016 described above, the target quantities for concrete and earthworks were not fully achieved. By the end of the 2017 construction season, while the Contractor had achieved considerably more concrete and earthworks volume than the previous year, concrete was approximately 20% less than planned and earthworks was 25% less than planned. Despite these shortfalls in volume, the key milestones for the year were achieved allowing the Keeyask project to remain on schedule. Achieving the following major milestones in 2017 ensures that the project will be delivered within the shortest duration schedule possible and protect the opportunity for schedule advancement of the unit 1 ISD:

- Completion of the Spillway concrete and handoff of the Spillway to the Gates, Guides and Hoists Contractor (Canmec) on November 15, 2017 (on schedule);
- Installation of the Powerhouse Cranes in the Service Bay in November (on schedule);
- Enclosure of Powerhouse Units 1 and Service Bay completed by December 31, 2017 (on schedule);
- Enclosure of Powerhouse Units 2-3 by February 2018 is on track to allow for the start of turbine and generator work;
- Significant progress on earth structures (dams and dyke) such that Keeyask is on track to divert the river through the Spillway in July/August 2018

As a consequence of the above milestones being met the project is still on track to be completed on or below the revised budget with the first turbine coming in service in or before August 2021.

<u>Management of the GCC:</u>

MGF Report – Section 1: Executive Summary, page 1

It was suggested by MGF on page 1 of their report that "*There is an opportunity for Manitoba Hydro to implement contract management improvements, take ownership for the GCC and drive the GCC contractor to higher levels of predictable performance, to accelerate project schedule and to lower the likely forecast cost at completion*". This statement appears to suggest that MGF is recommending that Manitoba Hydro should take over the role of Construction Manager from BBE. MGF goes on to soften this recommendation in MH/MGF I-2j and state that "*the recommendation is not for*

Manitoba Hydro to become the construction manager and replace BBE, but for Manitoba Hydro to exert more control and hold BBE accountable for its performance."

Manitoba Hydro is not a general contractor, nor does it have on hand the necessary personnel to manage and build Keeyask as the general contractor. If it were to undertake some or all of this task as recommended by MGF, it would have to retain significantly more staff with sufficient experience and expertise to take on the work without any delays. Such personnel are not readily available and, as outlined in more detail in Appendix A, there would be risk to the schedule because of the time it would take to find the personnel, to give them time to get up to speed on the project, and to develop a team to surround themselves with whom they would have confidence. As stated by experts KPMG and Hatch, this would simply introduce more risk to the project at this stage.

Hatch has been involved in Keeyask as the detailed design engineer and as an organization, has considerable experience in the delivery of major capital projects. Hatch was asked to provide commentary around expanding Manitoba Hydro's role with the GCC, as recommended by MGF. Hatch's response can be found in Keeyask - Appendix B, and like the response from KPMG, Hatch did not recommend such action.

According to Hatch (page 3 of Keeyask - Appendix B), Manitoba Hydro taking a greater role in the construction is of equal or greater risk to the project than the status quo. Hiring a Construction Management team to manage the construction on behalf of Manitoba Hydro would also carry risk until proven. Some of the risks identified in the Hatch review that informed their opinion include:

- Lack of availability of qualified professionals required to staff an entire team;
- Time to recruit, hire and mobilize a team;
- The new team would have a steep learning curve which would add risk to the successful execution of the project;
- Manitoba Hydro would lose leverage within the BBE contract.

BBE was hired by Manitoba Hydro as the Construction Manager to complete the General Civil Works scope. Keeyask – Appendix A provided by KPMG defines Manitoba Hydro's role in the GCC contract and provides commentary on the expected implications of Manitoba Hydro acting, instead, as the builder and taking on a Construction Management role, rather than acting in its capacity as owner.

MGF states on page 1 that Manitoba Hydro is "*not a construction manager with the experience and skills to direct the GCC"*. However it fails to address the activities Manitoba Hydro has undertaken to progress the work, without crossing the line of explicitly directing the means and methods of the Contractor, and without exposing Manitoba Hydro to interference claims. If Manitoba Hydro did step into the role of Construction Manager, it would be likely that the Contractor could claim for their entire performance bonus(es) regardless of the final cost and in-service date of the project. This would also inhibit ownership/accountability of the Contractor to perform.

KPMG was asked to provide commentary on Manitoba Hydro acting as the builder and taking on the Construction Management role. KPMG has indicated that they are unaware of any Canadian public sector owner with the skill-set required to directly manage a multi-billion dollar construction project (Keeyask – Appendix A).

In an attempt to better understand MGF's perspective, Manitoba Hydro requested additional information related to this conclusion in MH/MGF I–2. Specifically, Manitoba Hydro was interested in understanding if other owners/utilities have successfully taken ownership in the middle of a major capital project and the outcomes of those interventions. Manitoba Hydro was also interested in the Corporation's exposure to risks arising from undertaking such a change however MGF did not provide a response to MH/MGF I–2 that provided an answer to these questions. Manitoba Hydro posed this question to KPMG and requested their professional assessment. This information can be found in Keeyask – Appendix A. Hatch also provided commentary on the potential liabilities associated with taking over the role of Construction Manager in Keeyask - Appendix B.

Throughout 2017, Manitoba Hydro has increased the pressure on the Contractor to perform, and to have its workers become more productive. Some of these areas include:

- Contractor's management of the trades;
- Travel logistics for the contractor's workforce;
- Site wide respectful workplace campaign;
- Contractor's revised organizational structure and increased supervision capacity and experience;

- The development of an effective monitoring and control system to provide daily feedback to contractor workforce;
- Combining and streamlining BBE's and Manitoba Hydro's quality control and assurance teams and processes;
- Establishment of single mission and team ethics for the Manitoba Hydro and BBE teams.

Manitoba Hydro has also been leading efforts to gain efficiencies, improve methods/processes and achieve cost and schedule savings. A few examples of key initiatives where Manitoba Hydro spearheaded efforts that led to significant cost and/or schedule benefits:

- The decision to procure a new draft tube formwork system to utilize on the remaining 5 units. This decision shortened the schedule to install the bottom portion of the draft tube and improved cost performance.
- The decision to utilize column extenders in the Powerhouse and Intake allowed for structural steel to be installed at lower elevations. This provided an opportunity to enclose the Powerhouse and Service Bay earlier. A schedule savings of over 1 year resulted.
- Advancement of the south dyke in 2018 and supporting design changes. This will allow for additional quantities to be placed during the winter 2018 and reduce risk to the project schedule.

<u>2018 Plan:</u>

In 2018, a 10% increase in performance by the GCC is required to meet control budget ($8.7B) and achieve IDS's for the units that are in advance of the control schedule of August 2021. This also assumes that no significant risks materialize with other contracts or risks that could impact the critical path. Manitoba Hydro is confident that this rate of improvement is attainable as the year-over-year improvement between 2016 and 2017 was similar. In addition, much of the remaining concrete work in 2018 is similar to the work completed over the previous year and lessons learned over the last year and the inherent repeatability of seven nearly identical units is expected to improve productivity. Manitoba Hydro and BBE are currently working on their planning for 2018. Some of the key initiatives in 2018 include:

- 2018 winter work (placement of additional concrete over the 2018 winter months);
- Building a high performance culture at site;

- Cold eyes review;
- Manitoba Hydro and BBE leads identifying efficiencies and improvement;
- Improved management of indirects;
- Productivity studies and planning.

Third Party Reviews and Involvement:

Continuous improvement is ingrained in the culture of the Keeyask team but can always be improved. Prior to, and during the construction of Keeyask, external experts have been engaged to support and, in some cases, augment the skills of the existing project team. The project recognizes that the decision to manage the project using a team with strong internal expertise and knowledge brings both benefits and risks. To reduce the risk of an internal-only perspective, external expertise from across the utility and construction industries was retained and reviews were completed in the areas noted below. In addition, a handful of experts/consultants are used on a regular basis to support the project. Key reviews and supports external to Hydro alone include:

Figure 1.1

Third Party	Scope	Date
KPMG	KPMG was engaged due to their industry expertise in the areas of project management and contract administration to assess the health of the Keeyask Project. KPMG has since been regularly involved in helping to augment Manitoba Hydro's project management expertise.	2016 - current
Boston Consulting Group	In spring 2016, the Manitoba Hydro Electric Board retained Boston Consulting Group (BCG) to among other things, undertake a review of the Keeyask Project. The report of BCG's findings was released in September 2016.	2016
BBE/MH Cold Eyes Review	BBE & MH jointly carried out a review of BBE's operations on April 25 – 28, 2016. Teams consisted of 3 individuals from Bechtel and 3 individuals from MH (2 of which are Hydro-X and 1 construction management expert consultant). The purpose was to review BBE's operations and to ensure readiness of site project team for the upcoming first season of concrete.	2016
KPMG	In early 2016, KPMG carried out an independent review of the catering contract and the Keeyask Project Safety Management Plan. The purpose of the catering review was to ensure quality of service is sustained and to develop strategies to provide this level of service at the least cost. The purpose of the safety review was to ensure the Keeyask Project Safety Management Plan was	2016

	focused on the right things to achieve our safety goals with all contractors.	
Hatch	Quality Management support for Hatch's quality lead from the Mississauga office supports the project through the preparation of key Quality Program documents and the review of quality initiatives for the project. This support is especially strategic at this time given work underway to reset BBE's focus on its strategy for meeting quality requirements for the GCC.	2015 - current
Nalcor and BC Hydro	On-going informal dialog is taking place with Nalcor's Lower Churchill Project team and BC Hydro's Site C team to exchange ideas and lessons learned. Muskrat Falls is about one year ahead of the Keeyask schedule and their 824 MW project is similar to Keeyask's scope.	2015 - current
Validation Estimating	John Hollman of Validation Estimating is retained for assistance in the development of the project control budget, contingency pool, and management reserves. The risk profile for the project is reviewed at regular intervals in comparison to projects of similar size and complexity.	2012 - current
Hatch	A panel of Hatch senior engineers/managers from outside the Keeyask Project was retained to conduct a "cold eyes" review of the management of the engineering in an effort to identify gaps in the scope and quality of the engineering design, and ability to deliver the required product.	2014/2015
Knight Piésold	Knight Piésold (KP), the independent expert consultant retained by the PUB during the NFAT process in 2013/2014 reviewed project processes, the estimate, and contingency, KP was generally satisfied with these practices and methodologies stating that they were consistent with industry best practices.	2013/2014

1.3. MGF's Findings Related to the Forecasted Cost and Schedule of the Keeyask Project

MGF Report: Scope Item 5 – Finding #13, pages 63 – 64

In its report, MGF states that the expected cost of Keeyask will be \$9.5 B to \$10.5 B (MGF report page 63 & 64). However, MGF did not provide or substantiate how it arrived at these values. Manitoba Hydro (MH/MGF I-26), as well as the PUB (PUB/MGF–14), requested a breakdown of how MGF arrived at these values. MGF provided the following in response (MH/MGF I-26a):

> *"MGF used MH's spent to date and cost to go figures, on top of these MGF applied additional costs for items such as earthwork productivity; concrete productivity; additional scaffold & crane costs; additional indirect costs; etc.*
>
> *In addition, MGF applied interest and escalation in line with MH's percentage.*
>
> *Finally, MGF applied a 10% contingency to take into account project risk and uncertainty."*

Manitoba Hydro has attempted to understand how MGF came to their expected cost of Keeyask of $9.5 B to $10.5 B. Manitoba Hydro does not know exactly how MGF developed the values as they have failed to provide the requested supporting information (MH/MGF I-26).

Manitoba Hydro notes that the range of values identified by MGF happen to align with the potential range of outcomes identified in Manitoba Hydro's own analysis done when the Keeyask project budget was revised early in 2017. At that time, the potential cost of the project with P90 contingency was identified to be $9.6 B which roughly aligns with the lower end of MGF's range. The sum of a potential management reserve budget to cover severe event risk (that would result in a one-year delay and costs between $500M to $800M) added to the potential P90 budget would closely align with the $10.5B upper end of the range identified by MGF.

In early 2017, when Manitoba Hydro revised the control budget, the Keeyask Project budget with P50 contingency was selected. This established the $8.7B control budget to ensure Manitoba Hydro was proceeding with the lowest cost execution for the project. Other alternatives were considered at the time; however considering the level of completeness of the project (roughly halfway through with many key risks still remaining) the P50 contingency balances the potential costs from the remaining risks and provides a challenge to the execution team. This approach drives the lowest cost delivery and the most efficient outcome.

The following is a summary of items that MGF states will result in additional costs to the Project:

Figure 1.2

MGF Scope #	MGF Finding #	MGF Report Page	Description of Finding	MGF Order of Magnitude Estimate
5	9	60	Increased use of overtime and double time	$40.9 M
5	10	61	BBE indirect costs	[redacted]
9	3	74	Earthworks productivity	$88.4 M
9	5	76	Scaffold and crane costs	$103M
9	7	78	Concrete productivity direct costs	[redacted]
9	7	78	Concrete productivity indirect costs	[redacted]
			Total	**$678M**

1a

In the MGF report, the sum of the estimated value of the Findings that MGF states will result in an increase to the cost of Keeyask of approximately $678 M. By applying the methodology described by MGF in their response to MH/MGF I-26a, it could be assumed that applying interest, escalation and a 10% contingency to the $678 M and adding the value to the $8.7B control budget would arrive within MGF's expected cost of $9.5 B to $10.5 B. For most of their Findings, MGF included a factor for GA&O and Indirect Costs. GA&O and Indirect Costs as they relate to the GCC are described below:

General Administration & Overhead - GA&O is intended to cover support to the project from the Contractor's home offices including but not limited to expenses such as Human Resource Management, Corporate Procurement, and I.T support.

Indirect Costs – Costs that are required to support the direct work at site including temporary buildings, small tools, and worker transportation expenses.

It is Manitoba Hydro's opinion that these "order of magnitude" costs are overstated in the MGF report and result in an inflated forecasted cost for the following reasons:

1) MGF has incorrectly applied the GA&O mark-up percentage to potential cost increases.

As part of Amending Agreement #7, GA&O has been capped at the target price to disincentive the Contractor for exceeding the revised target price established in AA#7. This also encourages the Contractor to complete the work at the lowest cost. It appears that MGF did not account for this GA&O cap in their values, but rather applied the full amount on all of the forecasted increased costs disregarding the cap. This results in an over-estimate of at least $26 M.

2) MGF has overstated their forecasted indirect costs for BBE by simply extrapolating the current spend.

MGF Report: Scope Item 5, Finding #10, page 61

On page 61 of their report, MGF provided a forecasted value for an increase to the indirect costs. It appears to Manitoba Hydro that MGF used the overall physical percent complete from the Bill of Quantities for their estimate and assumed that the indirect costs from the BBE Cost Report will continue similarly for the remainder of the work (i.e. they extrapolated these values for the remainder of the contract on a straight line basis).

The forecasting method used by MGF is overly simplistic and flawed as it does not consider upfront costs that will not occur again in the future such as temporary buildings, and roads (i.e. fixed indirect costs) and progress on areas of the work that may incur more (or less) indirect costs than others. The values also do not consider the efforts that Manitoba Hydro is undertaking with BBE to manage BBE's indirect costs. Managing BBE's indirect costs is a key area of focus for Manitoba Hydro in 2018. Manitoba Hydro hired an Indirects Lead with over 19 years of related experience in project controls, project management and accounting in the major capital project environment to help manage BBE's indirect costs. These factors are considered in Manitoba Hydro's forecasting methodology. However, they do not appear to be considered in MGF's cost estimate, as they should.

In addition to the specific forecasted indirect cost value presented on page 61 of its report, in other findings including: Scope Item 9: Finding 3, page 74; Scope Item 9: Finding 5, page 76; Scope Item 9: Finding 7, page 78, MGF has added a factor for indirect costs calculated by dividing the total direct costs by total indirect costs. This suggests that MGF double counted indirect costs by identifying indirect costs related to earthworks productivity, concrete productivity, and scaffolding/crane costs beyond the values MGF provided on page 61 of its report in the calculated "BBE Indirect Costs" value.

Manitoba Hydro is of the opinion that utilizing this indirect to direct cost ratio for potential cost increases is inappropriate as this ratio includes both **variable indirect costs** such as maintenance costs, transportation costs for workers, additional supervision, and consumables/small tools, as well as **fixed indirect costs** such as installation of temporary buildings and roads. These fixed indirect costs would not be impacted by changes in directs work. For example, if concrete productivity is worse than expected and additional labour hours are required (i.e. direct work); costs that were originally incurred to build the carpentry shop **(i.e. fixed indirect cost)** would <u>not</u> be incurred again. It appears as though MGF has failed to account for this reality in its report, resulting in an overestimate of future costs.

Manitoba Hydro has conducted a line by line analysis of the cost accounts to determine which indirects could be affected by direct work and has concluded that a lower ratio is more appropriate. However, the nature of the direct work in question is important. For example, if concrete productivity would cause the project to be extended, it is likely that most indirects would be impacted and therefore a ratio on the higher end of Manitoba Hydro's range would provide a reasonable estimate of the associated indirect costs. In contrast, if the craft-to-foreman ratio were to change, it would not impact as many indirect cost accounts and the ratio of indirects could be significantly lower. In its analysis, MGF failed to recognize that the relevant indirect costs need to be considered when estimating the cost impact associated with a potential increase to direct costs rather than using a broad ratio of total indirect to direct budgets.

<u>The following are additional miscellaneous points that Manitoba Hydro would like to rebut that fall outside the 3 main areas addressed:</u>

<u>1) Selection of the Contractor:</u>

Scope Item 5, Finding #12, page 62

On page 62 of their report, MGF states that they *"were advised by Manitoba Hydro that Bechtel were self-performing Contractor's on Limestone and this predicated their decision to appoint BBE"*. Manitoba Hydro provided MGF with the documentation related to the procurement of the GCC including the RFPQ and evaluation criteria. Manitoba Hydro did not select BBE, a limited partnership that included Bechtel, strictly on the basis of Bechtel's Limestone experience as it is implied in the MGF report. In addition to considering the work self-performed by Bechtel, the pre-qualification process described above also considered the experience with self-performed work by both Barnard and Ellis Don. It is the combination of experience and knowledge across all three partner companies that informed the decision to select BBE as one of the four contractors that would ultimately compete on a cost basis for the work during the final phase of the three-phase competitive tendering process.

A strength of the joint venture was that each partner would lead different areas, but would still share overall responsibility. The division was as follows: Bechtel for concrete structures, Barnard for earthworks, and Ellis Don for their infrastructure work and knowledge of the Canadian labour marketplace. Each proponent offered key personnel that had experience in all of these areas.

<u>2) Earthworks Embankment Fill Measurement</u>

Scope Item 9, Finding 2, and page 73

On page 73 of their report, MGF describes a site visit to Keeyask on November 9 and 10, 2017 where the two MGF staff who attended the site visit performed a survey of the earthworks to compare to the value reported by BBE. From this assessment, MGF concluded that the embankment fill claimed by BBE is approximately 10% higher than the quantity assessed by MGF.

During this site visit, MGF representatives spent approximately 12 hours in the field which included safety orientations, a site tour, and meetings with Manitoba Hydro staff, in addition to their time surveying quantities. In MH/MGF I–28, Manitoba Hydro requested that MGF describe the methodology used to calculate this value. MGF provided the following description of the methodology they employed:

> *"Average end area method was used to calculate the volume. Heights of existing embankment and remaining fill heights were determined by referencing the existing known elevation point at concrete structures, survey stakes and speaking with MH site personnel. Survey profiles of existing embankment and center line profiles provided to MGF staff on site by MH were also used in the calculation of the volumes."*

Manitoba Hydro was present during this survey and reports that the review was rudimentary and involved measuring the structures with no equipment but a borrowed measuring tape and 100 metre chain. While these methods are appropriate for checks to determine approximate quantities, they are not as reliable as the detailed methodology employed by Manitoba Hydro numbering thousands of checks on BBE's performance over the course of the last three and a half years, described below.

In their report, MGF did not refer to the actual methods used by Manitoba Hydro and BBE to measure quantities for the earth structures on the Keeyask site. In addition to the Manitoba Hydro earthworks inspectors that monitor performance of the Contractor, Manitoba Hydro has a survey crew of seven full time staff dedicated to earthworks with at least four staff on site at all times (2 on day shift, 2 on night shift). BBE also employs an earthworks survey crew of 12 staff with at least 8 staff on site at all times (4 day shift, 4 night shifts). There are additional surveyors from both organizations dedicated to the concrete structures as well (e.g. Powerhouse and

Spillway). Manitoba Hydro and BBE earthworks surveyors take independent measurements before, during and after the placement of material on each earth structure. Both crews use a combination of Trimble GPS and total station survey equipment to measure quantities. The survey data is used to develop detailed 3D models using AutoCAD 3-D for modeling and calculating quantities. These models are updated weekly and quantity runs by both Manitoba Hydro and BBE are generated to report on weekly production. Typically, the difference between the survey data captured by Manitoba Hydro and BBE surveyors is between 3-5% and is reconciled regularly. Manitoba Hydro and BBE meet to review these numbers and agree upon the final installed quantities.

On page 73 of their report, MGF recommends that Manitoba Hydro performs "spot checks" on the quantities claimed by BBE to ensure the quantity progress being relied upon for scheduling is accurate. Manitoba Hydro and BBE are continuously measuring quantities via their respective survey teams. As an example of the degree of rigor with respect to the survey process, on a portion of the Central Dam, 104,820 survey points were collected for the foundation (bedrock and back slopes) and 127,729 survey points were collected for the fill (including dental concrete). This methodology is superior to spot checks because data is gathered continuously at every stage of construction to ensure quantity measurements are accurate. The suggestion that the methods employed by the MGF employees on the two-day site visit are superior to the methods employed by Manitoba Hydro's constant and continuous surveillance of the work site are nothing short of ridiculous.

<u>3) Issues with methodology employed on Keeyask</u>

Scope Item 9, Finding 10, and page 81

On page 80 and 81 of their report, MGF provides a picture of earthworks from summer 2016 from a Manitoba Hydro report and has overlaid a number of notations. In addition to this picture, MGF states that:

> *"The application of incorrect machinery and work methods causes delay and additional cost. The following picture depicts an example where both Schedule*

and Cost are pushed out in favour of the Contractor and at the expense of the Client.

While the above is an example, the poor productivity achieved on site reflects poor Supervision and Management by the Contractor. If Manitoba Hydro wants to reduce cost and schedule overruns they should have a more hands on approach."

The date stamp on the photo is July 28, 2016, approximately 1 year prior to MGF first attending the Keeyask site. In MH/MGF I-32a, MGF has confirmed that their notations are based on the photo and personal experience, and therefore, not as a result of directly observing the work taking place or speaking to Manitoba Hydro staff at the Keeyask site who were involved in the specific work depicted in the photo.

In MH/MGF I-32e, MGF states that a technical specification does not necessarily need to be followed in instances where there are opportunities to improve productivity and cost. MGF goes on to say a test program may be implemented.

The scope of work depicted in the photo occurred on the North Dyke and when the excavation occurred in this area, four distinct areas of saturated clay material were discovered requiring additional excavation. The resulting excavation of the localized area was 1-2 metres lower than the surrounding areas and susceptible to ground water infiltration. In this case, BBE attempted to follow the Technical Specification but found it challenging due to the prevailing ground conditions. The Manitoba Hydro Earthworks and Excavations Resident Engineer and the BBE earthworks team worked together to engage in a test program which was successful in keeping the work moving. In the case of the photo on page 81 of MGF's report, MGF has taken a situation with limited context, without speaking to Manitoba Hydro to understand the situation, and applied the finding in an attempt to substantiate an unfounded conclusion.

<u>4) Extended Overtime:</u>

Scope Item 9, Finding #8, page 79

On page 79 of its report, MGF states that, upon reviewing BBE's progress payments from May and June 2017, there were 73 instances of individuals working over 16 hours in a day during that 2 month period. MGF goes on to state that these extended hours will not be as productive as straight time hours and will result in diminishing output for every hour worked, in addition to raising concerns about potential personnel safety. Manitoba Hydro reviewed these 73 instances and found that a majority of the records were either supervisory staff or craft workers performing concrete-related work. In most cases, when a concrete placement is started, it needs to be taken to conclusion to avoid a cold joint (which is a potential water pathway through the concrete structure). During larger concrete placements, additional overtime is periodically warranted meaning that some of these cases where individuals were required to work extended hours were justified. However, safety was not sacrificed as supervisors were on hand to ensure the work was performed safely and in accordance with the established procedures.

To put these 73 instances of individuals working over 16 hours in a day into perspective, in May and June 2017 there were a total of 61 days worked. Considering that BBE had an onsite workforce on average of approximately 1,500 individuals, this would result in more than 90,000 days worked by the contractor's workers. These 73 instances account for less than 0.08% of the total days worked by the contractor's workforce during that 2 month period, and are the exception rather than the rule.

Manitoba Hydro reviewed the May and June 2017 progress payments and found that the average hours worked by the entire field workforce is approximately 10.7 hours per day and 10.5 hours per day for the field workforce for all of 2017. This average does exceed the standard onsite working day of 10 hours. Manitoba Hydro agrees that extended overtime could impact worker productivity and could have cost implications. As such, it will continue to work with the contractors in 2018 to more effectively manage overtime. These changes will help to minimize the need for additional overtime and is expected to increase productivity.

Manitoba Hydro also prides itself on its safety record and works diligently in this regard. From project commencement to November 30, 2017, there have been approximately 15 million person hours worked on the project and only 22 lost time incidents averaging slightly over 6 lost time days per incident. In addition, BBE has gone more than 14 months (over five million person hours worked) without a lost time incident. This safety record is impressive given the size and remoteness of the project, but Manitoba Hydro and BBE will continue to focus on eliminating safety incidents until the goal of "zero hurts" is reached.

<u>5) Inconsistencies in Estimate Documentation:</u>

Scope Item 3, Finding #2, page 36

MGF reviewed Manitoba Hydro's estimate documentation on Keeyask and stated the following on page 36 of their report:

> *"CEF 2016 Estimate Sheets were provided in the Basis of Estimate appendices as supporting details to the cost estimate, however, the values included within these estimate sheets did not align with the values carried in the actual estimate. In the 2014 Capital Project Justification Addendum, Basis of Estimate variances occur because of SAP's use of a more accurate treatment of overhead. It was also noted through conversations that these variances are the result of updated labour rates themselves which are to be applied throughout the next fiscal year. Rates current at the time the CEF 2016 Estimate Sheets were generated, and then adjusted prior to being carried in the final estimate. This was not specified within the 2017 Capital Project Justification Addendum, Basis of Estimate and the reconciled estimate sheets that were provided in 2014 were also neither provided nor developed for the 2017 Estimate. This made one-for-one reconciliations difficult to perform."*

Manitoba Hydro has calculated the approximate "discrepancy" between the estimate sheets (item 1.0 below) and the Capital Expenditure Forecast ("CEF") 2016 Plan in SAP (item 2.0 below) referred to on page 36 of MGF's report. The total variance (item 3.0 below) is under $500K on a total value of almost $3.5B resulting in a difference of 0.013%.

To understand this statement, in MH/MGF I-13, Manitoba Hydro requested that MGF provide the specific networks which are misaligned along with the dollar value and what percentage of the CEF2016 estimate the value of the total misalignment represents. MGF did not provide this detail in their response to MH/MGF I-13. Manitoba Hydro reviewed the total budget values found in the available CEF2016 estimate sheets and compared to the values in SAP, and focused on networks valued over $1M. The outcome of the analysis is listed below:

Figure 1.3

Item	Description	Value
1.0	CEF2016 estimate sheets	$3,488,545,769
2.0	CEF2016 Plan in SAP	$3,489,007,738
3.0	**Variance**	**$461,969**
4.0	**% difference**	**0.013%.**

As part of the estimating process that feeds into Manitoba Hydro's CEF, the Work Package Leads on the Keeyask Project who are responsible for managing the scope, schedule and budget for their respective work packages, complete estimate spreadsheets where they estimate the costs of managing their scope of work (i.e. work packages). As part of this exercise, the Work Package Leads estimate the level of effort (labour hours) in managing their work package. These hours are multiplied against a labour rate that is extracted from SAP, the corporation's cost management system (item 1.0 above). After a verification process, the estimated hours from the Work Package Leads are then loaded into SAP to form the CEF Plan in SAP (item 2.0 above). In some cases it may take 1-3 months for this process to be completed. Some of the labour rates that were taken from SAP and included in the estimate spreadsheets may change slightly from the time they are extracted for the spreadsheet and the labour hours are uploaded to SAP. The labour rate in SAP multiplied by the labour hours provided by the Work Package Leads is the value that becomes part of the CEF plan (item 2.0 above). The labour rates carried in SAP trump the labour rates in the spreadsheets. The labour hours captured in the spreadsheet by the Work Package Leads (and subsequently uploaded into SAP) is the key deliverable. The labour rate in the spreadsheet that may have changed in SAP since it was originally extracted is not updated on the spreadsheet (because the labour hours have already been entered into SAP to form the Plan).

While there is technically a minor difference in the values referenced above, MGF has failed to recognize if this difference is a material one. Manitoba Hydro is alert to any changes which might impact the estimates and monitors these factors. In the context of the budget the issue raised by MGF does not materially impact the estimates.

6) Cash and Trade Discounts

Scope item #5, Finding #8 – Keeyask Cash and Trade Discounts (page 59 and 60)

MGF reviewed progress payments for BBE for the months of October 2016 and June 2017 and noted that trade discounts were "negligible" and no cash (prompt payment) discounts were identified. MGF goes on to recommend that all contractors negotiate trade discounts with their subcontractors and suppliers.

In MGF's observations and findings, MGF implies that BBE could achieve 10% savings from their suppliers and pass this savings on to Manitoba Hydro. When considering BBE's total purchases for the entire Keeyask project, MGF believes this equates to a potential savings of approximately $115.8 million for Manitoba Hydro.

Manitoba Hydro provided MGF with a copy of the General Civil Works Contract with BBE. In the contract, Section 7.8 Process of Selection of Subcontractors outlines the process that BBE is required to follow for the award of major subcontracts (includes contracts for both subcontractors performing work under BBE and suppliers of equipment/material). BBE is required to solicit three competitive bids for every contract valued over $500,000. The contract also provides Manitoba Hydro the ability to review and sign off on procurement over $500,000. If the contractor does not follow this procedure and subcontracts work without receiving the required approval from Manitoba Hydro, the work is not eligible for reimbursement under the contract. Therefore it is in the contractor's best interest to follow the terms of the contract. BBE has operationalized this section in the contract as a Desktop Procedure for

Subcontractor Selection Process. Manitoba Hydro provided MGF this document on October 7, 2017.

In MGF's conclusion regarding cash and trade discounts, MGF fails to mention how BBE can realistically achieve this 10% savings from their suppliers and if this is even possible under the existing agreements BBE has with their suppliers and subcontractors. Since BBE is required to competitively tender work valued over $500,000, the vendor selected should already provide the lowest cost or best value proposal. Manitoba Hydro reviews these tenders to ensure that this philosophy is maintained. Manitoba Hydro is skeptical that a further 10% savings as implied by MGF could be achieved as the major subcontracts are already competitively tendered by BBE.

7) Hatch Schedule

Scope Item #4, Finding #2 – Hatch Schedule (page 41)

MGF reviewed the schedule for the detailed design engineer Hatch and concluded that while the schedule is well-developed, many activities are behind schedule.

Manitoba Hydro and MGF had a number of discussions regarding the engineering schedule and the status of engineering deliverables. During these discussions, Manitoba Hydro described that during the time of Amending Agreement #7 with BBE, the decision was made to manage engineering deliverables based on Construction Work Packages (the pieces of work to be undertaken by the GCC) rather than on the specific engineering deliverables that were incorporated into Hatch's baseline schedule (i.e. on a drawing by drawing basis). This ensures that the contractor has all the drawings they require to build a specific piece of work (such as a Powerhouse Unit 1 base slab) with the required lead time to plan and procure materials.

Since neither Manitoba Hydro, Hatch nor BBE are no longer managing their respective work to Hatch's baseline schedule, efforts have not been expended to update the Hatch baseline schedule.

On page 33 of MGF's report (Scope Item #2, Finding #1), MGF confirms that on October 23, 2017, in a video conference with senior representatives from BBE, BBE advised MGF that construction had not been delayed on account of the issue of Issued for Construction drawings. This informed MGF's conclusion that "*The production of Issued for Construction drawings has not impacted BBE's progress*".

<u>8) BBE Schedule – Negative Float</u>

Scope Item #4, Finding #3 - Keeyask – BBE Schedule: Negative Float (page 42)

In reviewing BBE's schedule, MGF identified a number of activities in BBE's schedule that have negative float. MGF concludes that until these deficiencies are reviewed and corrected, Manitoba Hydro cannot have confidence in BBE's schedule. Manitoba Hydro was aware of the presence of negative float in BBE's schedule and its significance and has been working with BBE over the last few weeks to develop a valid recovery schedule. This recovery schedule recovers the delays in BBE's baseline schedule and eliminates negative float. This recovery schedule was submitted to Manitoba Hydro in 2017.

<u>9) BBE Forecast at Completion Date</u>

Scope Item #4, Finding #6 – BBE Forecast at Completion Date (page 44)

MGF reviewed Manitoba Hydro's schedules and methodologies and believe the first unit ISD will be approximately 3 months later while the last unit will be 4 months late. MGF goes on to context this finding stating that no mitigation strategies or schedule recovery options have been added to this forecast. In MH/MGF I-19F, MGF confirms that the forecasted delay could be reduced using schedule mitigation activities and successful improvements at site. Some of these mitigation activities are referenced previously in this report.

On page 78, MGF indicates that actual average concrete productivity is likely to worsen, as there are more complicated pours to come and three more winter seasons to work through. Manitoba Hydro expects that concrete productivity to improve. A majority of the progress to date on the Powerhouse structure has been on units 1, 2 and 3. There has been a learning curve for the contractor and the craft labour who are building the work on these first three units. Given that a generating station is comprised of seven nearly identical units, it is expected that performance on the remaining units will be improved. It should be noted that on page 78, MGF states that the expected cost increase due to lower than planned productivity on the concrete structures is approximately $136.5 M. In MH/MGF I-30c, MGF indicates that they have not included factors such as improvements due to repeatability into their estimated costs. It could also be assumed that this factor was also not considered in the finding related to schedule.

2. Bipole III Transmission Reliability Project

The Bipole III Transmission Reliability Project, currently under construction, is a high-voltage direct-current ("HVDC") transmission project that will enhance the reliability and increase capacity of Manitoba's electricity supply. More than 70 percent of electricity generated in Manitoba is delivered to customers on the two existing HVDC transmission lines (Bipole I and Bipole II). These lines run alongside each other for much of their route and end at the same point in southern Manitoba at the Dorsey Converter Station. Due to their proximity to each other and the single terminus point for both lines, damage to Bipole I and II or Dorsey Converter Station could mean Manitoba Hydro cannot carry enough electricity to meet its customers' demand. Bipole III will add 2,000 megawatts to Manitoba Hydro's HVDC transmission capacity.

MGF was retained by the PUB on Bipole III to review and explain the increases in cost estimates and capital cost increases, as well as project cost overruns. It was to determine and assess the reasonableness of its updated forecast and to identify aspects of the updated cost estimate and schedule that are at risk. It was also to recommend risk mitigation strategies and, further, to review Manitoba Hydro's:

- practices on its pre-construction design and engineering work; and
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling.

MGF's evidence was that Bipole III Transmission Line is generally well organized and managed efficiently. It stated that it was on schedule and had used contracting strategies that were commercially astute, allocating risk appropriately. It also stated that Manitoba Hydro was managing a key risk, cause by poor performance of a contractor. MGF, in its Executive Summary on page 1 of its report, have highlighted that the HVDC Converter Stations "are well managed by Manitoba Hydro and the potential for cost over-runs is low."

Manitoba Hydro generally agrees with the MGF findings related to the Bipole III Project. Manitoba Hydro continues to manage the project appropriately, and maintain and affirm that Bipole III will be in service by the end of July 2018. This will be achieved within the approved $5.04 billion control budget.

Manitoba Hydro agrees with MGF that there remains risk to completing Bipole III on time. Specific risks related to Transmission Line contractor Rokstad's performance have been highlighted. As noted in the MGF report, Manitoba Hydro is managing this risk by de-scoping work from Rokstad and awarding it to another contractor. Manitoba Hydro was in the process of taking the action independently from this review. However, as noted on page 112 of MGF's report, the contingency amount for the Transmission Line will be sufficient to address this mitigation action and remaining risks on the work.

Despite Manitoba Hydro's general agreement with MGF's findings on Bipole III, there remain some areas within MGF's report that Manitoba Hydro disagrees with, and some areas in which it would like to provide clarifying information. There are also a number of instances where MGF has misunderstood the information provided, or drew an incorrect assumption that Manitoba Hydro would like to clarify on the record. In some of these instances, MGF was provided clarifications by Manitoba Hydro prior to the report being completed. However, it did not incorporate those into its final report.

2.1. Additional information to provide some clarity on the MGF report.

There are a number of items on which Manitoba Hydro would like to provide some additional information to provide some clarity on the MGF report.

Scope Item 10, Finding 2, page 84

MGF recommends that "the Manitoba Hydro Estimating Team prepare the overall estimate with input from each department." Manitoba Hydro can advise that approach to managing the estimate update process through the Estimating Team was in place prior to the MGF review. The Estimating Team coordinates all inputs from contributing areas/Departments. The Estimating Team also conducts reconciliations and confirmation of values for items input and updated within SAP.

Scope Item 15, Finding 2, page 99

On page 99 of its report MGF concludes that the 2014 pre-construction Basis of Estimate was extremely well done, however recommends further improvements in the supporting backup documentation to align costs captured within the SAP accounting software used by Manitoba Hydro and the project Work Breakdown Structure.

A Basis of Estimate document details the scope of the project on which the estimate is developed, the estimating methodologies applied and key assumptions upon which the estimate is based. As noted by MGF, the 2014 Basis of Estimate document was extremely well done. Part of the Basis of Estimate is to document project costs entered directly into Manitoba Hydro's SAP accounting system. These costs would include internal labour hour estimates, expense estimates and similar internal costs. In contrast to MGF's recommendations, Manitoba Hydro considers the backup documentation included within the Basis of Estimate document associated with these costs to be aligned with the Work Breakdown Structure and considers the level of documentation of these costs included within the Basis of Estimate document to be sufficient.

Scope Item 17, Findings 5 and 6, page 105

MGF has correctly identified that Rokstad Power's work remains one of the critical risks to the on-time completion of the Bipole III Project. Manitoba Hydro would like to clarify the following regarding this scope item:

- The report notes an end date of April 21, 2018 for Rokstad's work. In IR MH/MGF I – 44 MGF clarified that the activity considered the end date "Final Record and As Built Submissions" is in fact a trailing /post-construction activity and does not correspond directly with the completion of construction work. Construction work will be completed in March 2018.
- MGF correctly states on page 106 of its report that "A recovery plan has been developed and submitted by Rokstad Power Company to Manitoba Hydro, but has not been approved at this time." Manitoba Hydro continues to work with Rokstad to develop a sufficient recovery plan for their remaining scope and Rokstad's progress will be closely monitored to determine whether any further actions are required. .
- Manitoba Hydro agrees with MGF that removal of scope from Rokstad and placement of this work with another contractor does not guarantee the project will finish on schedule. However, Manitoba Hydro can advise that the new contractor has mobilized and has begun construction on this removed scope. The new contractor has committed to a schedule that will ensure on-time completion of the transmission line and they are currently on-track to this schedule. As such, this risk is substantially mitigated.

Scope Item 20, Finding 3, Page 117

MGF recommends that Manitoba Hydro properly record costs associated with placing the removed scope with another contractor and record the extra over costs it has incurred in having the new contractor in place. Manitoba Hydro agrees with MGF and is in the process of recording these costs appropriately and taking the appropriate steps contractually to recover any additional costs from Rokstad that are associated with the scope removal and Rokstad's lack of performance.

There is a finding on page 111 of the report regarding the Bipole III Project cost estimates for the Rokstad contract and a recommendation that the estimate be updated to reflect this change. Manitoba Hydro's estimate has already been updated with these costs. All reductions to the contract budget are returned to the project control budget, Transmission Line Contingency, as part of ongoing change management on the project.

2.2. Areas of the report that Manitoba disagrees with the conclusions drawn by MGF

There are a few areas of the report that Manitoba disagrees with the conclusions drawn by MGF.

Scope Item 18, Finding 1, page 108

On page 111 of its report, when determining the reason for project cost overruns since the final pre-construction control budget, MGF concludes that "Many of the additional costs appear to be a result of a project that was perhaps not at a stage of readiness at the time of project approval in terms of permit approvals, design development, land acquisitions and execution planning (i.e. procurement cycle and delivery time, market underpinned costing based on a tested and firm strategy, etc.)." Manitoba Hydro does not agree with this assessment.

The project was at an appropriate stage of "readiness" to proceed recognizing that the environmental License had been received and a sufficient number of winter construction seasons were necessary to execute the work. Specifically, as the transmission line work proceeds sequentially from clearing, to anchors and foundations, to tower erection and stringing, it was appropriate that clearing, work began immediately after the Licence was obtained and the tower erection and stringing contracts proceeded later. The project correctly identified uncertainty in the transmission line construction marketplace and carried both contingency and management reserve related to this. Events related to weather and material procurement that transpired were not an issue of "readiness", but rather general and typical areas of uncertainty and specific contractor issues/challenges.

Scope Item 10, Finding 1, page 83

MGF identified Manitoba Hydro as having internal labour costs budgeted beyond the project in-service date that are being incorrectly applied to capital expenditures as opposed to operating expenditures. Manitoba Hydro provided clarification and, through the IR process, MGF responded that it was their "..opinion these costs should not be part of a capital budget." Manitoba Hydro disagrees with the treatment of all costs immediately after the ISD being classified as operating expenses (as opposed to capital). After the ISD, there are still significant construction activities to be completed; such as:

- completion of synchronous condensers 3 and 4 at Riel,
- demobilization and clean-up by Contractors at each construction site,
- decommissioning of the camp infrastructure at Keewatinohk, and
- deficiency clean-up and commercial contract close-out.

All of these activities will require Manitoba Hydro labour after ISD that is directly attributable to capital construction costs associated with the asset. To ensure appropriate allocation of costs to capital or operating expenses, all project costs are carefully scrutinized by Manitoba Hydro accounting professionals to ensure that costs meet the criteria for capitalization as set out in International Financial Reporting Standards. When costs are deemed not to be eligible for capitalization, they are charged directly as an operating expense to the Corporation. Additionally, the allocation to capital or operating is considered in the annual external accounting audit that the Corporation undertakes as part of preparing its yearly financial statements.

Scope Item 13, Finding 3, page 95

On page 97 of their report MGF states "The current value of contingency at a P75 confidence level does not appear to be based on a current or updated Contingency review. As such, this would not take into consideration the events and updated risks that the project has been or may be exposed to. Manitoba Hydro's corporate standard states that contingency is set at a P50 or 50% confidence level." Manitoba Hydro disagrees with this statement. The current P75 contingency value for the Converter Stations was developed based on the 2014 risk and contingency assessment as the general risk profile of the project was unchanged. This approach does appropriately account for risks realized to-date.

Scope Item 19, Finding 3, page 112

MGF further concluded on page 114 when reviewing the Bipole III transmission line that the current P80 confidence level does not appear to be based on a current or updated review. The current P80 contingency value for the Transmission Line was also developed based on the 2014 risk and contingency assessment as the general risk profile of the project was unchanged. This approach does appropriately account for risks realized to-date. It was also reviewed against the Risk Register at the time, contrary to MFG's finding that it does "not appear to be based on current or updated review." The Risk Register is a document used as a tool to track issues and address problems as they arise. It acts as a repository for all risks identified and includes additional information about each risk such as the nature of the risk, the owner of the risk, and mitigation measures.

The decision to increase the P-value of the contingency for the Bipole III Project (transmission line and converter stations) in 2016 from a P50 to an overall P75 contingency level on the project was based on a number of anticipated risks having been realized and the desire to have an increased confidence level in the Bipole III control budget recognizing that there was only 2 years remaining on the work before the project was brought into service. With construction work on the project now largely complete, the project has progressed to a point where budget risks are largely reduced and the primary risk relates to schedule. This is supported by MGF's findings that the contingency on both the transmission line and converter stations are sufficient to complete the work on-budget.

It is the project management team's responsibility to recommend the appropriate P-level for contingency on a project. While this can be a P50 contingency, the project management team may alternatively recommend a different P-value (e.g. P75 contingency) based on factors such as: realized risks, project status, remaining work-to-complete, and remaining risks. The recommended P-level of the contingency together with the project estimate is reviewed and approved at the Executive level.

2.3. Misinterpretations, errors and incorrect characterizations in the MGF findings.

MGF provided many of their findings to Manitoba Hydro in advance of issue the report as drafts and Manitoba Hydro advised MGF that, in its opinion, there were a number of misinterpretations, errors and incorrect characterizations in the findings.

It also suggested corrections. However, based on the MGF responses obtained through the Information Requests process, MGF did not include any of these suggested corrections within its final report. As such, Manitoba Hydro will provide this information directly to the PUB through this Rebuttal.

Scope Item 10, Finding 3, page 86

MGF has incorrectly stated a risk identified in the June 2017 Bipole III Converter Stations Project Controls Report was repeated/again identified in the September 2017 Controls Report, although the wording in the report was in no way the same. The risk from the June 2017 report addressed both concerns related to the on-time completion of work by the Keewatinohk 230kV AC Switchyard contractor and the commissioning schedule for the Riel Converter Station Synchronous Condensers, whereas The risk from the September 2017 report identified concerns related to the overall complexity of interface work between the major contractors, potential delays to commissioning due to HVDC equipment damaged during installation, the risk of commissioning delays on the AC Switchyard and equipment delivery delays potentially impacting commissioning schedules.

Based on MGF's interpretation that the identified risks were identical, they incorrectly concluded that Manitoba Hydro did not mitigate the risk originally identified in June 2017. These two risk items were, in fact, different issues. Regarding the June 2017 risk, Manitoba Hydro took specific actions, including taking-over the work in parts from the contractor to ensure the AC Switchyard work was completed and handed over to Manitoba Hydro in time to accommodate commissioning. Similarly, Manitoba Hydro has required the Riel Synchronous Condenser Contractor to review its commissioning plan and ensure it is achievable. The risks noted in the September 2017 report were addressed as follows:

The "complexity of interfaces" risk relates to schedule risks on the overall interface work that is to be executed to "connect" or "link" the major components of work on the converter stations (for example linking the HVDC station to the Synchronous Condensers). Manitoba Hydro is actively managing and mitigating this risk through execution of its interface contracts and interface schedule management

The damaged HVDC equipment identified as having the potential to impact commissioning, relates to damage that occurred to Converter Transformer turrets during installation. The Contractor has addressed this risk by obtaining replacement turrets. There will be no impact to schedule.

The delays related to commissioning of the Keewatinohk AC Switchyard, related to new delays that had arisen in the completion of installation and finalization of equipment. These items were addressed and recovered by the contractor and the final handover of the switchyard to Manitoba Hydro for commissioning occurred on schedule.

The risk related to delayed equipment delivery potentially impacting commissioning schedules, related primarily to remaining (minor) equipment deliveries on the HVDC contract and remaining equipment deliveries on the Riel Synchronous Condensers. These delays are both being actively managed and mitigated by the Contractors and both are not anticipated to have any impact to schedule and the in-service date of the project

Scope Item 11, Finding 3, page 90

MGF has misinterpreted the application of mark-up on several of the lumps sum Variations reviewed. MGF have indicated that the contractor improperly applied mark-up to lump sum Variation values already including mark-up (i.e. double application of mark-up). This double application of mark-up did not occur. The instances identified by MGF only included a single markup of 15% as part of the total lump sum pricing. This mark-up happens to be the same as prescribed for on Actual Cost Variations but was not additional application (or double counting) of mark-up. As such, in the identified Variation, the amount paid by Manitoba Hydro was equal to the agreed upon lump sum price included in the approved variation.

Scope Item 15, Finding 1, page 98

MGF stated "CEF 16 carried a cost of [redacted] Manitoba Hydro wishes to clarify that the entire Rokstad Contract budget has been adjusted for reduced scope (primarily foundations scope removed in N4) and updated unit rates once the contract was awarded in December 2016, which was post the finalization of CPJA 08a (2016). All reductions to the contract budget are returned to the project control budget, Transmission Line Contingency as part of the ongoing budget alignment process for changes. 1a, 7a, 8a

Scope Item 15, Finding 3, page 100

MGF has incorrectly identified that the CEF2016 estimate failed to include costs for Distribution Line Crossings and the Transmission Line Construction Yard. These costs were included in the CEF2016 and current CPJA 08a approved control budget in the 2016 estimate and summaries provided to MGF. Bipole III – Appendix A is a summary of an extensive spreadsheet that was provided to MGF with relevant items expanded that summarizes the approved budgets and that these items were in fact included in the control budget.

Scope Item 17, Finding 1, page 102

MGF alleged that there were several missing attributes to the Bipole III Risk Register. These attributes are actually addressed in the Risk Register and have been missed by MGF. MH wishes to clarify that the Risk Register was originally developed through SharePoint and as such there is an identified creation date for each risk. However, in the spreadsheet output of the Risk Register provided to MGF a column outlining the creation date of each risk had not been included.

Scope Item 20, Finding 1, page 115

On page 115 in its review of the Risk Register, MGF recommended that the Risk Register be updated to include the date the Register was last updated and the date the risk ID was last updated. In fact, the Risk Register is actively and properly managed and the Risk Register information suggested by MGF to be collected is already captured within the SharePoint document management and collaboration tool where the Risk Register is held and is updated regularly.

Scope Item 17, Findings 2, 3 and 4, page 102

On page 103 and 104 of its report, MGF states that the Variation Summary only records those variations that are "approved." Manitoba Hydro does maintain variation log/summaries with all variations, and further reviews those for cost impact through the "Project Change Authorization" or PCA process, which is a document that authorizes and documents the use of contingency or return of contingency on the project budget and is key component of the change management process that Manitoba Hydro follows on Bipole III.

On page 102 of its report, MGF identifies Contract 031074 with Valard Construction as open, with a contingency remaining of [redacted]. This contract is shown as closed in 1a, 7a the Contracts Listing. All un-used Purchase Order funds that were held in budget and/or in allocated contingency for the Order are returned to the project control budget, Transmission Line Contingency, as part of the ongoing budget alignment process for changes.

While Manitoba Hydro generally agrees with the MGF findings related to Bipole III and agrees that construction of the project is tracking on budget and on schedule with all equipment installations nearing completion, and commissioning of the project underway, it did want the record to accurately reflect the facts above. Manitoba Hydro will continue to manage the project appropriately and is committed to meeting the scheduled ISD of July 2018 and completing within the $5.04 billion control budget.

3. MANITOBA-MINNESOTA TRANSMISSION PROJECT

The Manitoba-Minnesota Transmission Project consists of a 500 kV transmission line from the Winnipeg area to the U.S. border in southeastern Manitoba, as well as upgrades to three existing electrical stations in southern Manitoba. If the Project receives environmental licences and approvals from both the Provincial and Federal Governments, it will transport power to the United States to meet sales contracts, improve reliability of the transmission system, and bring electricity to Canada from the United States in emergencies.

MGF was retained by the PUB on MMTP to review Manitoba Hydro's:

- practices on its pre-construction design and engineering work;
- its methodologies for costing, for tendering and contracting, for management of construction, contractors and construction risk management, and for scheduling; and
- capital cost estimates.

MGF's review was generally favourable, indicating that MMTP was currently on schedule and that Manitoba Hydro's estimating methodology is consistent with industry standard. Manitoba Hydro does wish to respond to three areas contained within the MGF Report, as set out below.

3.1. Acumen Fuse

Acumen Fuse is a software tool used for reviewing the quality of schedules prepared in Primavera. Primavera is a scheduling tool that Manitoba Hydro uses to create project schedules.

Project schedules are comprised of activities associated with the work involved to construct the project, such as designing towers, ordering materials, constructing foundations, etc.

Manitoba Hydro links these activities together within Primavera using "schedule logic" to ensure that changes to durations and start dates are reflected in the schedule as the project progresses. An example of this "schedule logic" would be a link between a tower steel delivery activity and an installation of the tower steel activity. The tower can't be installed until the material is delivered, thus these activities would be linked in the scheduled using finish to start "schedule logic".

On the MMTP Manitoba Hydro also used Primavera to schedule the spending on the project. Activities in Primavera were also linked to the budget for the project and spending associated with activities was distributed from the start of the activity until the end of the activity. Using this technique Manitoba Hydro creates two types of activities, those that impact the duration of the project, and those that are solely used to record labour charges against the project, which Manitoba Hydro refers to as "Charging Activities". An example of this would be an activity used by our material procurement staff to record their time against while they answer questions about delivery dates, Manitoba Hydro would refer to this activity as a "Support" activity.

In the case of the 500kV Transmission Line schedule MGF stated the following (Reference: On page 125 of the MGF report):

> *"Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Dorsey Stn: Manitoba – US 500kV baseline schedule scored 42, giving it a 30% probability of success."*

In addition, MGF responded the following with respect to Manitoba Hydro's information request pertaining to Acumen Fuse (In response to MH/MGF I-4 on page 13 and 11 respectively):

> *"MGF agrees that activities within the schedules that are used for capturing internal labour expenses significantly reduce the Acumen Fuse score. MGF disagrees they would have no actual impact to the project schedule success."*

In essence, MGF is stating that missing "schedule logic" is impacting the Acumen Fuse score which is reducing the project success rate.

Manitoba Hydro is of the opinion that its scheduling methodologies are appropriate and accurate. Manitoba Hydro has successfully used these scheduling practices to deliver numerous transmission line projects in the past and have refined our scheduling practices and templates based on our experience on previous projects, most recently the Bipole III, Lake Winnipeg East 115kV line, and two 138kV transmission lines built for Keeyask.

Manitoba Hydro is of the opinion that Acumen Fuse has a number of limitations with regards to scoring the success rate of the project. These include:

- Acumen Fuse cannot recognize if "schedule logic" between activities is correct, for example if the activity to install the material was linked to start before the material delivery activity Acumen Fuse would not penalize the schedule rating.
- Acumen Fuse doesn't recognize if there are missing activities.
- Acumen Fuse penalizes the project success rating for missing logic, even if the logic is associated with activities that are not influential in the project schedule.
- Acumen Fuse doesn't measure the typical duration of a transmission line schedule in comparison to the time allotted by Manitoba Hydro.
- Acumen Fuse does not consider any other factors that contribute to project success beyond the quality of scheduling practices used to create the schedule.
- Acumen Fuse rates project success on schedule quality, and has no measure for a project team's ability to execute a project, their past experience, or if the current schedule has activities in the correct sequence.

Manitoba Hydro is of the opinion that MGF has overstated the relevance of the Acumen Fuse score with respect to missing "schedule logic" and project success. In Manitoba Hydro's opinion, the activities identified by MGF will not impact the schedule because of the nature of the activities with missing "schedule logic". The majority of these activities are not used by Manitoba Hydro to control the start and finish dates of activities within the schedule and therefore don't impact the duration of the project schedule. Instead they are used for accounting and reporting purposes only.

For example a "Support" activity is scheduled during the procurement and construction of the transmission line, which is used by procurement staff to record their labour against the project while they provide support to design and construction staff, such as answering questions pertaining to material delivery. If this activity is late to start in the schedule it won't prevent the procurement staff from answering questions and providing support and since it's not linked to other activities it will have no impact on project duration or success. This is a standalone activity that spans a long duration of work and its purpose is only to schedule the spending budget for the support work. Normally these activities are omitted by the Acumen Fuse analysis however a certain activity type needs to be assigned within the Primavera software for this to occur automatically, which was not done by Manitoba Hydro. Not assigning the activity type doesn't change the intent of these activities, it just lowers the result of the Acumen Fuse output, which is not a tool that Manitoba Hydro uses.

Manitoba Hydro believes these activities are of little relevance to the project success because these activities are not used by Manitoba Hydro to control the duration of the project schedule. These activities do not influence start and finish dates of other activities in the schedule and whether or not they have started is irrelevant to when actual critical activities would start. Tangible events are more likely to have impacts on the project success, such as delivery delays or incremental weather, than missing "schedule logic" on activities used to record labour

Acumen Fuse is a tool to help improve the quality of the project schedule but can't be used to evaluate the success rate of a project. While poor scheduling can have negative effects on the project outcome, scheduling errors which Acumen Fuse can't identify such as missing activities, overstated durations, and incorrect logic would have more substantial impacts than missing "schedule logic" on activities not used to control the project's duration. The Acumen Fuse tool can't take away from the experience of the project team and their ability to execute the project.

3.2. Industry Standard Costs

MGF (Stanley) has compared the MMTP estimate for the Transmission Line portion of the project to a white paper prepared by the Western Electricity Coordinating Council ("WECC") and a report prepared by the Midcontinent Independent System Operator ("MISO") in which an "Industry Standard" cost per kilometer of transmission line was developed. MGF believes that Manitoba Hydro's estimate is lower than the industry standard and that Manitoba Hydro should revise its cost estimate.

Through the information request process Manitoba Hydro questioned, whether or not the "industry standard" costs took into account the tower type used on each project when developing the measure, to which MGF (Stanley) responded there was no significant impact on the costs based on tower type.

More specifically, in response to MH/MGF IR I-47, MGF (Stanley) has stated:

"WECC and MISO data have indeterminate structure design. Calculated data projects included self-supporting lattice tower (1 project) and tubular steel structures (5 projects). None of the projects included guyed tangent lattice towers. It is worth noting that type of transmission structures does not have a significant impact on overall cost per mile for comparison purposes."

Manitoba Hydro disagrees with this position as it previously stated in its Information Request Round 2 response in the Clean Environment Commission Hearing, Question #MWL-IR-89:

"based on an internal cost comparison for transmission structures in southern Manitoba, installed construction cost (not including line hardware) for a single tubular tower is approximately 70% of the installed cost for a single self supporting lattice tower. However, with the increased number of tubular structures required, the total cost of a tubular line is higher. Assuming 500m spans for lattice and 250m spans for tubular structures, a line constructed with tubular towers would increase the cost of the line by as much as 40%. This is based on 240 kV structure costs in southern Manitoba."

The Western Electricity Coordinating Council ("WECC") white paper on Capital Costs for Transmission and Substations developed by Black & Veatch in 2014 which Stanley Consultants has used in preparing the industry standard comparison states on page 2-4 that there is a 1.5 multiplier for using tubular steel compared to lattice as shown in the figure below.

Figure 3.0

2.2.3 Transmission Structure Type

In 2012, Black & Veatch quantified the capital cost multipliers associated with each type of transmission support structure. Structure types included lattice towers and tubular steel.

Table 2-3 below shows the transmission structure type cost multipliers for all voltage classes. An additional voltage class was added for the 600 kV HVDC bi-pole alternative based on the 500 kV HVDC bi-pole multiplier. The 500 kV HVDC bi-pole multiplier was originally developed based on the relative costs of lattice structures and tubular steel at very high voltage.

Table 2-3 Transmission Structure Type Cost Multipliers

STRUCTURE	230 KV SINGLE	230 KV DOUBLE	345 KV SINGLE	345 KV DOUBLE	500 KV SINGLE	500 KV DOUBLE	500 KV HVDC BI-POLE	600 KV HVDC BI-POLE
Lattice	0.90	0.90	1.00	1.00	1.00	1.00	1.00	1.00
Tubular Steel	1.00	1.00	1.30	1.30	1.50	1.50	1.50	1.50

This multiplier is used in the Transmission Calculation Methodology stated on page 2-8 of the WECC white paper.

Figure 3.1

2.6 TRANSMISSION CALCULATION METHODOLOGY

Multiplying the right of way acres per mile by the land cost per acre yields the total right of way cost per mile of transmission line. This value was added to the base transmission costs discussed in Sections 2.2, 2.3, and 2.4 to develop the total transmission line capital cost.

Total Transmission Line Cost = [(2014 Base Transmission Cost) x (Conductor Multiplier) x (Structure Multiplier) x (Re-conductor Multiplier) x (Terrain Multiplier) + (ROW Acres/Mile) x (Land Cost/Acre)] x (# of Miles)

It is clear from the equation that the WECC agrees with Manitoba Hydro's assessment that the structure type does have an impact. In the equation above, the base costs would be multiplied by a factor of 1.5.

In summary, Manitoba Hydro is of the opinion that structure type does have an impact on the costs per kilometer, and that using tubular steel towers typically increases the project costs. This could explain why Manitoba Hydro's estimates are lower than industry standard costs which seem to be determined mainly from tubular steel projects as stated above in the response to MH/MGF IR I-47. Manitoba Hydro's current estimates are based off of recent construction bids that were provided for the Bipole III Project which Manitoba Hydro believes is the best source of comparison as it reflects current market conditions for 500kV towers in the Manitoba market place, compared to historical industry costs in differing market conditions. Manitoba Hydro is committed to keeping the costs of capital work as low as possible and is confident in its estimating process.

3.3. Internal vs. External Design

MGF (Stanley) has stated that the project delivery model, with respect to internal compared to external designs have no significant impact on the overall cost per mile of transmission line.

In response to MH/MGF IR I-47, page79 MGF (Stanley) states,

> *"WECC and MISO project delivery methods are indeterminate. Calculated data projects were design-build with mixture of internally designed (2 projects) and contracted design (4 projects).*
>
> *It is worth noting that internal vs. externally contracted design does not have a significant impact on overall cost per mile for comparison purposes."*

Manitoba Hydro is of the opinion that its approach to tower design is appropriate and cost effective. It disagrees with MGF's position regarding the impact of internal or external design on project costs. While the labour costs associated with internal design and contracted design firms are negligible in terms of the overall project budget, the indirect benefits of the internal design approach are significant.

The internal design approach protects Manitoba Hydro from design firms and material vendors "over designing" towers in order to protect themselves from risk, such that the costs of materials on the project could increase.

Manitoba Hydro's design approach is to design towers all the way to fabrication drawings, which prescribes to vendors exactly what is to be built. In addition, Manitoba Hydro arranges for tower testing which verifies the minimum amount of steel required on each tower and allows Manitoba Hydro to optimize its design and reduce costs.

Manitoba Hydro generally agrees with the MGF findings related to the MMTP. Manitoba Hydro continues to manage the project appropriately and is committed to continuing efforts to secure the June 2020 ISD. MGF recommends that Manitoba Hydro should update the project estimate and include awarded contracted values instead of estimates whenever possible. Manitoba Hydro intends to do so at an appropriate time when those contract values become available.

RE: Response to Manitoba Hydro's Questions

KPMG was engaged by Manitoba Hydro ("MH") on May 2, 2016 to undertake an independant review of the current status of the Keeyask Generating Station ("Project") and subsequently provide advice on the development and implementation of a Recovery Plan for the Project. The Recovery Plan was approved by the Manitoba Hydro Executive Board ("MHEB") in February 2017 and the implementation of the Recovery Plan has been the focus of the Project Team throughout 2017. In mid-December 2017, as part of MH's information gathering related to the Public Utility Board General Rate Application, MH requested KPMG to provide comments on the following matters:

1. Provide commentary on the contract model and any incentives included.
2. Define MH's role in the GCC contract. Define the role of the Contractor. Comment on MH's ability to manage the Contractor in this role.
3. Provide commentary on MH acting as the builder and taking on a Construction Management role.

In responding to the three matters in this letter, KPMG reviewed the documents provided by Manitoba Hydro as well as incorporated leading industry practices from both the Hydro industry and public sector projects greater than $1 billion. The documents provided by MH were: Recovery Plan Strategy (undated), the Capital Project Healthcheck, Cost and Schedule Assessment (July 2016), monthly Manitoba Hydro Status Update and Step Change Incentive Profit reports, the amended Keeyask Generating Station General Civil Works Contract #016203 (Feb 28, 2017), and weekly Issues Logs.

The response to Manitoba Hydro's questions was led by Gary Webster, National Lead for KPMG Global Infrastructure Advisory. Gary has more than 30 years of experience as a Professional Engineer specializing in the organization, procurement and implementation of large scale infrastructure projects.

Please note that this letter is subject to KPMG's engagement terms dated December 2015 with MH related to its work on the Keeyask Project. This letter is provided to MH and based on the review of the documents provided by MH and KPMG experience with industry leading practices. KPMG does not accept any liability or responsibility to any third party who may use or place reliance on this letter.

Question 1: Provide commentary on the contract model and any incentives included

MH awarded the General Civil Works Contract ("GCC") to a limited partnership between Bechtel Canada Co., Barnard Construction of Canada Ltd and Ellis Don Civil Ltd. ("BBE"), three recognized, experienced and well established companies. The contract was a Target Price contract, where payment to BBE was on a cost reimbursable basis with a gain share/pain share incentive formula. The gain share/pain share formula was introduced into the contract to incent BBE to deliver the Project under or on the target price.

KPMG

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

There was no early delivery incentives in the original contract but liquidated damages were included for late delivery.

As a cost reimbursable contract, the owner was responsible for all of BBE's actual costs. However, with the inclusion of the incentives, it ensured that the contractor's profit (and to a limited extent their general administration and overhead ("GA&O")) was at risk based on their performance. The incentives used in this contract have been used in other cost reimbursable contracts as well as other forms of contracts. The incentives align the owner's and contractor's interests and help to mitigate the exposure the owner has to poor performance by the contractor.

The gain share/pain share formula was structured as follows:

- The gain share formula for cost savings was 80% for MH and 20% for BBE. If BBE delivered a project under the Adjusted Target Price (as defined in the contract), their profit increased from 1[redacted]% by [redacted]% of the additional savings. 1a
- The pain share formula, however, was more punitive to the contractor. If the costs went over the adjusted target price, BBE was responsible for 80% of the cost overruns and their [redacted]% profit could erode to zero profit based on the amount of cost overrun. 1a

Additionally, once the actual costs exceeded the target price by 1.3 times, BBE would no longer receive their [redacted]% GA&O. The objective of this cap on GA&O was to ensure that the contractor would not benefit from escalating project costs and removed the incentive for the contractor to increase project costs to improve their overall position. 1a

By fall of 2016, MH realized that BBE's opportunity for profit would likely be eroded and that there were no longer any achievable incentives remaining in the original contract. The result was a mis-aligned relationship between MH and BBE where BBE could be motivated to regain their profit to the detriment of the Project. During this period, MH developed and implemented a Recovery Plan. As part of the Recovery Plan, MH addressed a number of root causes that led to cost and schedule overruns that were being incurred. They also negotiated an amended contract with BBE.

The amended contract continues to be a Target Price Cost Reimbursable contract, fundamentally the same as the original contract. The ability to transfer additional risk, such as geotechnical, hydrology, labour, extreme weather, and northern logistics to BBE by changing the contract to a Unit Rate or Lump Sum contract, would have required directly negotiating a new form of contract with BBE in a non-competitive environment or descoping/terminating BBE and going back to the market for a Unit Rate contract. It was expected that in a non-competitive environment and given BBE's performance in 2016, the costs of transferring this risk to BBE would have been prohibitive and/or not achievable. Additionally, in its Recovery Plan, MH analyzed the impact of terminating or descoping BBE's work. MH analysis shows that the additional delay to the project required for the re-procurement of this work along with additional risks associated with re-procurement, would have resulted in an additional increase to the Adjusted Project Budget.

The amended contract remains a Target Price Cost Reimbursable contract with limits on GA&O and performance incentives tied to achieving the target price. The amended contract was designed to achieve the following:

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

- Reset the target price and schedule milestones;
- Improved gain share/pain share incentive formula. The new incentive program is now structured around cost, schedule and management performance;
- Limited BBE's right to claim for additional adjustments to the target price;
- Improved the relationship with BBE that allows for a more collaboration on site; and
- Allow MH, as they deem necessary, to alter the scope of BBE.

The amended contract now includes incentives for not only cost, but also schedule and management performance. The balance of the incentives is now [redacted]% of any cost savings that it may generate capped at [redacted]M and [redacted]M based on meeting schedule milestones. Cumulatively, BBE could earn up [redacted]M 1a
profit for meeting all their cost, schedule and management targets, conversely they risk losing not only all their profit and GA&O expenses above the capped amount but an additional [redacted]M for poor project performance. The amended incentive pool was designed to further motivate BBE to perform and take day to day responsibility for the work it has been contracted for.

It should be noted that in contract management, a high risk exists when cost performance incentives are entirely disconnected from schedule. Namely, a perverse incentive could exist for a contractor to forsake schedule in an effort to maintain a low cost position. To address this risk, the amended contract contains a deduction associated with very strong cost performance and very weak schedule performance. This incentive structure is designed to eliminate the incentive to ignore schedule performance in order to capitalize on cost incentives.

The amended contract also has a component where BBE can gain an additional [redacted]M (included in the [redacted]M referred to above) for improved management performance ("Step Change Incentive") based on 1a
their ability to better perform their construction management responsibilities. This includes improvements such as site leadership, planning and scheduling, reporting and better coordination with MH.

Finally, the general administration and overhead ("GA&O") is [redacted]%. The provision of GA&O expenses, 1a
which are standard in the construction industry for any contractor, affords for cross-functional and project-wide resources to be accessed throughout the initiative and allows for ease and efficiency in administration without the need for micro-management. MH was able to cap the GA&O at the Final Target Price versus the original 1.3x the target price.

MH has taken reasonable steps to renegotiate the contract. The amended contract addressed a number of concerns MH had with BBE and their performance. It includes multiple systems of financial incentives and disincentives to mitigate risks associated with cost reimbursable contracts. The contract amendments were designed to promote better alignment of BBE and MH objectives, and create a collaborative environment that allows MH to take on a more proactive management style with BBE.

Question 2: Define MH's role in the GCC contract. Define the role of the Contractor. Comment on MH's ability to manage the Contractor in this role.

MH's Role in the GCC Contract.

Manitoba Hydro's Role in the GCC Contract is to function as the overall Project and Site Construction Manager. As Project Manager, MH is responsible to ensure integration, alignment and quality of the

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

project as a whole. As Site Construction Manager, MH is responsible for the overall coordination and oversight of site work, while delegating the construction planning, management of labour and construction means and methods (along with other responsibilities) to the contractor. It should be noted that construction management is a term used which can cover a wide range of responsibilities and functions. From public sector owners' perspective, construction management is often the term used to oversee the construction of the project. Canadian public sector owners do have experience managing construction works; however, these works tend to be routine and relatively minor. KPMG is unaware of any Canadian public sector owner who would have the capabilities, systems and processes to allow for direct management of complex multi-billion construction projects.

In its role, Manitoba Hydro provides oversight and approval of BBE's activities by providing channels for controls, as well as strategic level issue and risk management. Their general duties would include:

- Overall responsibility to complete the planning, design and engineering and to oversee the construction and commissioning of the proposed Keeyask Generating Station which includes the General Civil Works contract;
- Overall responsibility of the site and coordinating the interfaces with the various contractors and suppliers they enter into contracts with;
- Approving contract changes;
- Agreeing to the Contract Schedule, and all amendments thereto, in the course of BBE's performance;
- Providing oversight and surveillance audits of BBE's processes;
- Reviewing any potential changes to the overall work plan, that could alter the target price and/or construction schedule;
- Addressing stakeholder issues;
- Acquiring Project permits; and
- Providing access to the Site and timely payment to the contractor.

Ongoing monitoring and collaboration by MH continues to be essential. MH has retained an experienced construction management consortium to undertake the direct management of the construction works. If MH drives for more aggressive involvement in the direct construction management, MH could be potentially frustrating BBE in their execution of the work. This could result in a number of reactions from BBE including claims for lost profit if the project does not meet the performance requirements associated with the gain share/pain share incentives. Furthermore, it may also result in MH unintentionally taking on additional risk with respect to performance results that are currently under BBE's control that MH does not have the experience to manage.

The Role of the Contractor

MH has a contract with BBE to manage the construction of the general civil works. As per their contract, BBE is obligated to construct and commission the GCC work. This would include providing the material, labor, construction planning and supervision expertise to construct an end product that meets the cost, schedule and specifications outlined in the contract. The general responsibilities of BBE include:

- Working with MH to deliver their work;
- Executing site safety processes and procedures as outlined in the project safety plan;

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

- Providing construction planning expertise and collaborating with MH (and other parties), throughout the design development phase (in particular reviewing constructability and completeness of detail of the design);
- Developing the contract budget and schedule;
- Procuring equipment, material and labour;
- Providing qualified management and supervision;
- Planning and supervising construction;
- Implementing quality control and assurance program and maintaining quality management records;
- Maintaining and meetings all permit and environmental requirements;
- Monitoring the costs and schedule; and
- Reporting on progress. This would include costs, productivity, down time, schedule, work plans, etc.

MH's Ability to Manage the Contractor Based on the Contract

MH and the current Project team have experience managing large complex hydro projects and have completed Pointe du Bois and Wuskwatim ($0.6B and $1.4B respectively). The table below highlights the relative experience of each of the key leadership team members.

Name	Project Role	Experience
Senior Management Team		
Dave Bowen	Project Director	20 Years
Ryan Ward	Commercial Contracts Manager	19 Years
Barry Nazar	Site Construction Manager	32 Years
Jeff Strongman	Business Manager	24 Years
Tom Tonner	Engineer Manager	25 Years
Senior Technical Team		
Terry Armstrong	Construction Quality Engineer	27 Years
Dave Little	Site Support Manager	30 Years
Gene Piasta	Head of Project Controls	27 Years
Glen Schick	Head of Infrastructure	29 Years
Charles Wright	Structures Resident Engineer	25 Years
Guy Remillard	Mechanical/Electrical Resident Engineer	32 Years
Brian Beyak	Earthworks & Excavations Resident Engineer	26 Years

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

As summarized in the above table, the Senior Management Team has 120 years of combined experience managing and overseeing large complex projects.

Over the course of 2017, Manitoba Hydro has managed their internal responsibilities while managing BBE to meet their contractual obligations. MH has demonstrated they understand their role in administering the contract with BBE as well as the risk they have to manage associated with the contract.

MH has enhanced its internal systems and processes to manage the overall project since the commencement of the project. This included initiating a “Step Change Program” that focused on their own improvement as well as that of BBE. The Step Change program was designed to address the root causes identified in the Recovery Plan and implement the following improvements for MH and BBE respectively.

Manitoba Hydro:

- Organizational structure to reflect the stage of Project;
- Leadership accountability;
- Authority residing at the Site;
- Communications between the Site and Winnipeg offices;
- Project controls function;
- Risk management and project reporting; and
- Escalation of issues to senior leadership team.

BBE:

- Organizational structure to reflect the construction management activities required by BBE;
- Alignment with MH counterparts;
- Contract reporting;
- Management of indirect costs;
- Travel logistics;
- Collaborative working environment;
- Relationship with Allied Hydro Council;
- Construction planning; and
- Construction supervision personnel.

Based on the above, the current division of roles and responsibilities between MH and BBE is appropriate and the Project team has experience and qualifications to manage and oversee the GCC Target Price contract.

Question 3: Provide commentary on MH acting as the builder and taking on construction management role

As highlighted in Question 2, we are unaware of any Canadian public sector owner who would have the capabilities, systems and processes to allow for direct management of complex multi-billion dollar

KPMG LLP
PO Box 10426 777 Dunsmuir Street
Vancouver BC V7Y 1K3
Canada

Telephone (604) 691-3000
Fax (604) 691-3031
Internet www.kpmg.ca

construction projects. The contractor brings a significant amount of skills to a project that an owner does not have. The following is a brief, non-exhaustive list of such skills:

- Construction labour recruitment and labour relations expertise;
- Corporate construction safety plan;
- Construction equipment corporate discounts;
- Extensive cost control system;
- Management, supervision and engineering personnel with construction experience;
- Access to labour; and
- Previous work experience in order to better plan and perform the work.

Some project owners do have the internal capabilities and experience to act as the builder and to take on a construction management role. Generally, this skillset is developed through experience with multiple projects and owners have gained experience in building and managing projects of scale which they regularly undertake. However, public sector owners do not perform large projects with sufficient frequency to have developed the internal skills to manage the additional complexity that are associated with multi-billion dollar projects.

MH has relied on general contractors to manage large projects in the recent past. The most recent hydro projects completed by MH are Limestone ($1.43B and 1,350MW completed in 1990), Wuskwatim ($1.37B and 211MW completed in 2012), and Pointe du Bois Spillway Replacement, ($600M completed in 2016). MH has only completed these three projects since 1990 and all of these were executed using external general contractors. This would generally not be considered adequate experience for MH to be considered a low-risk builder or construction manager.

This letter is addressed to Manitoba Hydro and in response to MH's three matters. As noted on page 1, we will not accept any liability or responsibility to any other party to whom the letter may be shown or who may require a copy of the letter.

Yours Sincerely,

Gary Webster, P. Eng.
Partner, National Lead Infrastructure Advisory

Project Memo

H341433

January 15, 2018

TO: Dave Bowen FROM: Alan O'Brien/Sylvain Laramee

cc: Ian Ainslie

Manitoba Hydro
Keeyask GS Engineering Consulting Services

MGF Report on Keeyask

1. Introduction

At the request of The Manitoba Public Utilities Board, MGF Project Services Inc have conducted an independent review of Manitoba Hydro's Capital Expenditures program. The conclusion of their finding presented in their report issued at the end of 2017 was inclusive of a certain number of recommendations especially with regard to the Keeyask Hydroelectric Dam.

Following their receiving of the said report, Manitoba Hydro has mandated Hatch to provide commentary regarding MGF's suggestion that Manitoba Hydro expand its role with the GCC. Alan O'Brien and Sylvain Laramee have reviewed MGF's report and subsequently prepared their joint response which follows their own personal bios.

2. Bios

2.1 Alan O'Brien

Alan is a seasoned project and business manager with more than forty (40) years of experience in Engineering design, project, business and commercial management. He has been involved in projects of various sizes in a variety of industries including Oil & Gas, Petrochemical, and Power (Hydro, Nuclear, Thermal and Wind). He has managed contracts both domestically and internationally.

He has worked for two major engineering Contractors (Amec/Agra and Hatch). In his capacity of Project Manager and/or Director, he has delivered projects using various execution models, such as EPCM, EPC, fixed fee, target price and cost reimbursable. As Global Director of Commercial Management he was responsible for overseeing the group that undertook commercial and implementation reviews on all major contracts. The experience gained over many years working both in the engineering office and at site has given him a broad exposure to different types of contract execution strategies and their advantages and disadvantages.

Alan is currently acting as Project Sponsor on a few Hatch projects. In this role, he works with the Project Manager and his/her team in an oversight role to provide ongoing review, guidance and support.

2.2 Sylvain Laramee

Sylvain is an experienced project professional with thirty-four (34) years' experience in project and construction management of major capital projects in the Mining and Energy sectors which have allowed him to develop a broad range of management skills that are uniquely adapted for project work. His experience, both on the EPCM and contractor's side, coupled with the diversified leadership roles (Engineering Manager, Area Manager and Construction Manager) held on major capital projects has provided him a unique perspective of innovative implementation strategies and successful project outcomes.

For the past decade, Sylvain has fulfilled the role of Managing Director, Construction Management, leading Hatch's global group of construction management professionals and taking responsibility for all domestic and international major capital project construction assignments. He has considerable experience in developing implementation strategies suited to specific project challenges including, project remoteness, complex logistics, lack of skilled labor, extreme weather conditions and security issues. During this period, he assembled and mentored a core group of competent construction professionals as well as developing and implementing construction tools and work processes targeted at addressing and overcoming the complexity of each of those projects.

3. Hatch commentary around expanding Manitoba Hydro's role with the GCC as suggested by MGF

MGF's recommendation at the end of their Executive Summary reads as follows: "The recovery of this project will require Manitoba Hydro taking a construction management, hands-on approach to design and implement a recovery plan and hold the GCC contractor to perform" (Page 3, Dec 8/17 MGF Report). There is no doubt that MH has the experience of similar major projects and could put together a team of construction managers as suggested. However, given that this was not the implementation strategy that was chosen initially to execute this project and given that MH does not have available the type of construction resources needed to take over the construction lead, one would question how viable it is to significantly change at this late stage the current approach and make MH the "Constructor". It would be our views that the proposed suggestion is of equal risk if not riskier than the status quo, as described below.

Interestingly, MGF when referring to the GCC contract points out that: "The largest single contributor to the budget increase is the sum to the original GCC on account of the Contractor's poor productivity and increased indirect costs as the GCC would take longer to perform" (Page 1, Dec 8/17 MGF Report). Unfortunately, their report fails to identify the reasons behind BBE's poor productivity performance. Hence it is unreasonable to make any recommendations for changes without the root causes being identified and solutions being proposed as well as those solutions and/or recommendations then being evaluated against the costs and risks inherent to their implementation. Naturally, MGF was unable to identify potential solutions to improve the productivity for the very same reasons.

The absence of a clear understanding of the said root causes makes it impossible to identify and implement the proper corrective measures. As an example, MGF suggest as a potential saving by modifying the ratio of craft to foreman from roughly 4:1 to 6:1. Should one of the problems be the quality of the supervision then this suggestion would in fact creates the opposite effect as there would be a further deterioration of the productivity.

Based on our experience, what MGF is suggesting, is of equal or greater risk than the status quo. Whilst MH would have the experience and capability to hire a competent CM team, such a team would carry a risk until proven. Hence to create this new CM team in the midst of this mega Project, is more likely to cause the overall Project to forecast to keep increasing because it introduces pitfalls and unknowns.

The risks associated with a major shift in the contracting strategy, especially for the single most important contract, include:

- It will remain a challenge to gather a team of construction professionals from the open market that will commit to the Project for the long haul knowing that the required caliber is typically under employment by the large constructions firms hence, and not readily available
- It will likely take several months to recruit, hire, onboard and mobilize such a team. And likely not in the optimal sequence.
- Clearly it will take some time for the new CM team with no previous working together experience, to understand the challenges, find the appropriate solutions, get efficient as a team and finally drive the performance improvement. Considering the complexity of this major Project, its remote location and its many work fronts, this team will undergo a steep learning curve regardless of their experience.
- In our experience in such drastic organizational changes, there is a fair chance of MH losing critical resources that are knowledgeable, and up to now, committed to the success of this Project.
- Until a new CM organization is in place, there would be transition period of high uncertainty that inevitably will prevent people from making decision and thus, some of the initiatives currently being developed to help driving the Project in the right direction could be lost.
- Should MH follow the recommendation, it will change the nature of BBE’s contract, leaving the contractor the freedom to maximize their revenue under a de facto time and material with fee contract. MH leverage over BBE using the pain/gain sharing and liquidated damages would not be retained.
- Once BBE would become aware of MH plan to take over the management of their contract, it is doubtful that they will remain engaged in finding ways to drive productivity or find solutions to existing challenges.

- It cannot be ruled out that BBE could walk away from the Project considering that MH would be effectively breaking the terms of their current contract thus leaving MH with an even greater challenge to overcome.

Contrary to what MGF is stating in their report, and based on our limited knowledge of the contract between MH and BBE, we understand from MH that the GCC contract is a target price with contractor's fee at risk which includes schedule incentives and liquidated damages for late delivery. It is very difficult to imagine that MH would take over as the builder as this could result in a forfeiture of their contractual rights and a forfeiture of their leverage over the contractor to get their full attention and cooperation in addressing the seriousness of the situation. We're of the opinion that enforcing the contract to force the contractor to come to the table, put its best foot forward and make available their strengths and wherewithal will produce more upside than downside.

One interesting recommendation can be found in the report under Scope Item 9, Finding No. 1: Keeyask – Structural Steel Progress which states: "*MGF recommends that Manitoba Hydro work with BBE on a recovery plan to improve BBE's construction management, construction planning, coordination and supervision of construction work.*" This in our views is the logical beginning of a solution that ought to be applied to the overall contract and is currently being pursued by Manitoba Hydro

We understand that Manitoba Hydro is actively involved with the contractor in addressing the situation and we can only encourage them to remain focused on the work at hands and continue to hold BBE accountable by working jointly with them in accomplishing the following:

- Re-assess the final forecast
- Understand the root causes behind the poor performance and identify ways to improve and/or execute the works differently
- Identify all the risks that could impact the final forecast and elaborate a mitigation plan for each one
- Find innovative ways to improve productivity using latest technology available on the market
- Develop an optimal execution schedule that could be used as a baseline moving forward
- Deliver a comprehensive recovery plan that can be easily monitored and audited on a regular basis

There is an advantage to developing a plan jointly and making sure in the process to understand the areas where the GCC contractor could try to take advantage at the end for claims. In short, by doing this, it allows MH to limit or eliminate the General Contractor's ability to make claims by removing the obstacles and ultimately leaving the GC with only the burden of performing. Even in circumstances where there may be a requirement to supplement temporarily the Owner's team with some ad hoc resources, we believe the benefits will by far outweigh the investment and bring the best value to the Project. As time is of the essence, such exercise must take place sooner rather than later and should not disrupt what is happening at site

HATCH™

In summary, the suggestion by MGF to make such a fundamental change at this stage is, in our opinion, a mistake which could lead to a serious disruption of the Project with a very high potential of adding both to the costs and the schedule.

Al O'Brien/ Sylvain Laramee

Coalition/MH I-206g

PREAMBLE TO IR (IF ANY):

Two of the top three risks identified in the response to Coalition/MH I-206g were not in the top five risks included in the Keeyask Risk Registry at the time of the NFAT.

QUESTION:

a) Please confirm whether the former top risks have been reduced, either through lower probability or lower consequence, leaving the three risks in the response to Coalition/MH I-206g as the top risks.

b) If the Keeyask Risk Registry has changed since the NFAT, please provide an updated Registry (unless provided in PUB MFR 129).

RATIONALE FOR QUESTION:

RESPONSE:

a) At the time of NFAT, the Keeyask risk register was a pre-construction assessment of the risks within the Keeyask Project. Throughout the three years of construction on the project, the register has been continually updated to reflect the current risk forecast. Updating activities include closing risks that have passed, adding any newly identified risks, and updating probability and consequence assessments to reflect changes in the project environment.

   The top Keeyask project risks identified at the time of NFAT have been updated to reflect the current status and the potential consequence and probability of occurrence. A summary of these former top risks can be found in the table below.

The three risks stated in the response to Coalition/MH I-206g are the current assessment of the top risks facing the Keeyask Project as of July 2017, and are slightly different from those identified in the pre-construction assessment below.

Risks	Status
Inability to attract/retain labour through the BNA due to competition for qualified resources from other Manitoba Hydro Projects, national projects, and aging construction workforce.	The impact and probability were reduced due to changes implemented in the Burntwood Nelson Agreement that improved attraction and retention of qualified labour since the start of construction. Market conditions have also improved thereby reducing the likelihood of competition for qualified resources from other national projects. This risk may increase in future with work beginning at Site C.
Insufficient Construction Management Resource Budget due to external resources required at a higher cost due to the inability to attract internal resources for short durations.	The impact and probability were reduced as adequate internal staffing levels have been achieved to date and external resources were acquired within budget. It is expected that this risk will continue to decrease.
Escalation exceeding G911 due to market conditions.	Escalation is a function of a number of variables, including escalation rates, and the time remaining on the project. The time remaining on the project until the first unit in-service date is reduced relative to NFAT which reduces the escalation risk. In addition, since 2013, market conditions have been favourable for some escalation indices such as fuel. Unless there is a significant upward trend in escalation rates, it is expected that this risk will continue to decrease, as the remaining to-go cost of the project decreases over time.

Risks	Status
Skilled labour shortage resulting in an increase of labour hours to complete construction activities.	The impact and probability were reduced for this risk as staffing levels were achieved during the 2017 construction season. However, there is the potential for this risk to increase in the future as skilled labour may be at risk as work begins at Site C.
Delayed start to Stage 1 Cofferdams due to Contractor unable to meet mobilization duration allowed in Project Schedule.	This risk was closed as cofferdam construction was started as planned, and Stage 1 work is completed.

b) Public disclosure of the Risk Registry would result in the release of information considered to be confidential and commercially sensitive. The Risk Registry will be filed in confidence with the PUB and has been provided to the PUB's IEC. 1a, 4b and 8

EXECUTIVE SUMMARY

Overview

Through the intermediary of the Manitoba Public Utilities Board (PUB), the Government of Manitoba is carrying out a public Needs For and Alternatives To (NFAT) review and assessment of Manitoba Hydro's (MH's) Proposed Development Plan (Plan) which includes the Keeyask Infrastructure Project (KIP) and the Keeyask Generating Station Project (KGSP).

The PUB has engaged Knight Piésold Ltd. (KP) as an Independent Expert Consultant (IEC) to review the construction management and capital and operating costs for select resource options. KP filed an IEC Report on their initial review on January 23, 2014. The PUB has asked KP to review additional information in relation to the report and Manitoba Hydro's award of the Keeyask General Civil Contract early in 2014.

This supplemental report summarizes KP findings on the additional scope of work provided by the PUB on January 10, 2014. It does not include any further review of proposals for Conawapa. The content of this report is confidential and for the PUB only as it contains references to confidential material provided by MH.

Item 1: Overall Management Strategy and Scheduling for the Tendering of Contracts for the Keeyask Generating Station.

The overall management strategy and scheduling for the Keeyask Project is following a new process within MH. This has been explained to KP in the form of confidential documents and conference calls. The approach for the tendering of contracts is deemed to be comprehensive, well documented and applied, and the timing of the tendering appears to be on track. Since MH's systems are maturing there it was not possible to observe the full effectiveness of the management strategy at this time, there remains a notable systemic risk exposure associated with the project.

Item 2: Construction Risk Management Strategy

KP has reviewed MH's construction risk management strategy in the form of the Risk Management Procedure (whose purpose is to "detail the activities of planning, identifying, evaluating, responding, and monitoring for effective risk management as well as detailing the standard risk reporting templates…"), the Project Contingency Management Procedure, the 2014 Risk Analysis and Contingency Estimate by Validation Estimating and the Keeyask Project Risk Register.

The approach to construction risk management is industry standard and consistent with best practices, with specific roles and responsibilities associated with risk management in the overall management process. As far as can be seen, the risk management strategy is well set up and is being monitored and acted upon appropriately.

It can be assumed that at this stage of project development the technical risks have been addressed or mitigated. Having chosen a suitable, reputable and experienced company for the GCC contract, remaining construction risks are associated with contractor performance, in terms of quality, cost and schedule. Portions of the overall contingency have been allocated to the individual contracts to provide allowances to cover these risks.

[redacted]

Item 3: Contract Documents for the Major Keeyask Components

Copies of various Keeyask contract documents were made available to KP as part of the original scope of work and commented upon in the earlier KP report. The contracting method varies by project component but the principal civil works contracting strategy is an Early Contractor Involvement (ECI) Project Delivery Strategy. The contract documents and drawings that KP has seen have clearly been drawn up by experienced engineers, from within MH and from reputable experienced consultants and include appropriate performance incentives.

Item 4: Construction and Equipment Procurement Bonding and Liquidated Damage Requirements

MH has made available to KP details of the bonding or letter of credit requirements for a selection of the major Keeyask contracts, in both the KIP and the KGSP. The amounts are based on risks associated with the individual contracts, past experience, and industry norms. These values are deemed by KP to be appropriate. Current practice is to strike a reasonable balance between protecting the interests of the owner and not paying an excessive premium for this insurance.

KP believes that the Liquidated Damages stated in the various contracts made available appear to be reasonable and in keeping with their purpose.

Item 5: Quality Assurance and Quality Control (QA/QC) Requirements

The most common arrangement for addressing quality in procuring hydroelectric power generating facilities is to make the Contractor responsible for Quality Control (QC) and the Owner (or his Engineer) responsible for Quality Assurance (QA). MH is conforming to this usual practice.

Quality Management in MH is specified at a high level in the various MH procedures and standards. These documents define the processes required in MH to establish and operate a quality management program, including a third main activity that takes place prior to QC and QA, Quality Planning (QP).

Items 6: Overall Civil Contract(s) Project Management Approach

The General Civil Contract (GCC) has been procured in an Early Contractor Involvement (ECI) process which provides an opportunity for MH and a selected contractor to work together to refine the contract. All aspects of the work, including design details, schedule, risk sharing and project management, are open for discussion. KP believes that this process reflects a genuine and appropriate opportunity for MH to optimise and bring as much certainty to the contract as possible. The KGSP contracts (including the GCC) have been and are being managed within a new project management system.

Item 7: Pre-Tender Construction Estimates Compared to Actual Tender Prices

MH has provided KP with summary presentation material and Bills of Quantities comparing the GCC proposals, the independent estimators estimate (by Chant), and an escalated original Engineers Estimate by KGS Acres. [redacted]

Item 8: Expected In-Service Capital Cost for Keeyask

Overall the Expected In-Service Cost for Keeyask has been prepared by MH with as much completeness as can be reasonably expected. The current estimate is no longer a bottom-up estimate as presented in 2009, but a blended estimate that includes awarded contracts. As a result of the GCC award the anticipated Direct Costs are deemed to be fairly accurate, when the risk portion is excluded. The Indirect costs include elements that were not fully described and as such are subject to possible escalation, but this amount should be reasonably captured through the project contingency.

MH was diligent in evaluating the project risk and translating these risks into monetary terms through the contingency and management reserve estimates. The risk associated with labour shortages and productivity, [redacted] all lead KP to believe that the Management Reserves will be fully utilized and that a larger Management Reserve may be desirable for a more risk adverse maker.

1 – INTRODUCTION

1.1 PURPOSE AND FORMAT OF REPORT

Through the intermediary of the Manitoba Public Utilities Board (PUB), the Government of Manitoba is carrying out a public Needs For and Alternatives To (NFAT) review and assessment of Manitoba Hydro's (MH's or Hydro's) Proposed Development Plan (Plan) for the Keeyask and Conawapa Generating Stations (GSs) and their associated transmission facilities. The PUB has engaged Knight Piésold Ltd. (KP) as an Independent Expert Consultant (IEC) to review the construction management and capital and operating costs for select resource options. KP has filed an IEC Report on their initial review of MH's proposals (KP Ref. VA103-449/1-1 Rev 1 of January 23, 2014). The PUB on January 10, 2014 asked KP to review additional information in relation to the report and Manitoba Hydro's intention to award the Keeyask General Civil Contract early in 2014 (see scope of work in Appendix A).

The following supplemental report summarizes KP findings on the additional scope of work. It does not include any further review of proposals for Conawapa. The content of this report is confidential and for the PUB only as it contains references to confidential material provided by MH.

1.2 APPROACH

1.2.1 Reporting and Outline

Except for this Section 1, which highlights the report structure and particular aspects to bear in mind, the rest of the report is structured to address each of the PUB's questions to KP in turn, as per Appendix A.

1.2.2 Source of Information (Manitoba Hydro)

The information reviewed for this supplemental report was obtained from MH, through a combination of teleconference presentations, email and hard copy transmittals - blue containing information deemed confidential by MH, and white for information not deemed confidential (that which is basically available as part of the public record).

A complete list of the material provided by MH and used in this review can be found in Appendix B.

1.2.3 Limitations

As mentioned in KP's earlier report, the Capital Cost Estimate prepared by MH for the alternatives development was based on an initial "bottom up" approach in 2009 that considered construction productivity and schedules along with the cost of materials, equipment, and labour required for construction. This estimate was revised or "Stress Tested' in 2012, with major changes as a result of the experience gained at the recently completed MH Wuskwatim Project together with adjustments for escalation and some improvements in project definition. The focus of this supplemental report has been to examine in more detail MH's estimates and processes, ultimately in order to be able to comment on the likelihood that Keeyask will end up being constructed within the current MH budget estimate (of $6.5 billion) but it should be cautioned that this examination has still been at a relatively high level, in accordance with the scope, budget and schedule available to KP, and that no guarantees can be given that the outcome will be as planned. With the award of the General Civil Contract (GCC) all parties have additional confidence in the eventual outcome than they did prior to this award, as this contract constitutes by far the largest element of the works.

2 – OVERALL MANAGEMENT STRATEGY AND SCHEDULING FOR TENDERING AND PROCUREMENT OF CONTRACTS

2.1 SCOPE OF WORK

Question 1: "Review MH's overall management strategy and scheduling for the tendering of contracts for the Keeyask Generating Station and the procurement of other major facility components such as spillways, dams, dykes, powerhouse, turbines, intake gates, generators, controls etc. Comment on the effectiveness of this management approach for minimizing capital costs, securing competitive bids, and managing construction and procurement cost escalation and construction risks."

2.2 MANAGEMENT STRATEGY FOR TENDERING

2.2.1 Hydro's Management Strategy

As mentioned in Section 4.3.2 of KP's earlier IEC Report, the Keeyask Hydropower Limited Partnership (the Partnership) who owns the Keeyask Project has contracted all the planning, construction and operation of the project to MH. MH (through the New Generation Construction Division (NGCD) acts as the Project Manager and Construction Manager responsible for the overall project cost, schedule and quality. MH subcontracts a majority of the services and supplies required to actually build the project, and therefore manages and schedules the tendering and procurement.

MH's systems are still maturing and MH has recently included an outsourcing some of the construction management as part of their estimate. As such the full management strategy is not truly finalized.

2.2.2 Manitoba Hydro Documentation

As mentioned in Section 4.4 of KPs earlier report, the NGCD has a Project Execution Plan (PEP) for the development of the Keeyask Project. The draft document seen by KP acts as a high-level guideline to manage both the Keeyask Infrastructure Project (KIP) and the Keeyask Generating Station Project (KGSP).

The document:

- Is a guideline of the means, methods, tools and techniques used by MH to manage the KIP and the KGSP
- Serves as a record of the planning effort undertaken by the NGCD for the construction phase of the project, and
- Serves as a resource for staff to ensure the project is managed consistently.

The tendering and procurement of contracts is part of the overall procedures and processes described in the PEP and the associated documents. For the purpose of this report, KP was also provided with copies of the following NGCD policy and procedure documents to illustrate parts of the PEP:

- Total Cost and Schedule Management
- Engineering Consulting Contract Monitoring and Controls
- Construction Contract Monitoring and Controls
- Contract Change Management

- Risk Management
- Project Contingency Management, and
- Project Change Authorisation.

2.2.3 Total Cost and Schedule Management (TCSM)

In order to manage the scope of work to the approved budget and schedule MH has developed the TCSM procedure. The procedure outlines the approach to coordinating all the project service functions that support the monitoring and control the projects, using an iterative management approach called PDCA (Plan Do Check Act).

- The Plan stage involves establishing the project baseline schedule and budget.
- The Do stage involves implementing the project controls plan on awarded contracts and internal labour.
- The Check stage involves retrieving actual costs from the MH management system, SAP, and the latest schedule and forecasts from project leads.
- The Act stage involves assessing performance and managing change and contingency.

2.2.4 Overall Tendering and Procurement Management Strategy

The work required to complete the Keeyask Project has been divided into work packages. A MH Project Controls Coordinator is responsible for contract monitoring and controls process from the contract drafting to early periods of the contract execution. For each contract awarded the contract value is measured up against the base estimate and the relevant amount of contingency is allocated from the contingency pool (see Section 3). The PDCA iterative management approach ensures that the project estimate and schedule are updated accordingly.

A Work Package Lead (WPL) reviews the Contractor progress reports and ensures their timely weekly submission and communicates discrepancies/issues to the Contractor. A Cost and Schedule Section (CSS) is responsible for reviewing the updated contract schedules and updating the comprehensive schedules and checking against the contractor progress reports. The Project Accounting Section (PAS) tracks project-to-date cumulative actual dollars.

2.2.5 Contracts

MH intends to form separate contracts with the various contractors and has overall responsibility for interface management. MH's management strategy for tendering is a mixture of methods, tailored to the individual contracts. Thus the strategy for tendering the supply and installation of the turbine-generating equipment (TG Supply) is essentially fixed price whilst that for procuring the main civil works is essentially design-bid-build but with a target price and a process whereby the selected contractor is engaged early so that he might be involved in helping finalise contract details. KP deems this overall approach to be appropriate in principle. Section 4 of the previous KP report gives details of the various forms of contract used by MH.

2.2.6 GCC Early Contractor Involvement Process

The General Civil Contract (GCC) for the KGSP is to be executed using an Early Contractor Involvement (ECI) Process that has now begun. Having civil contractor involvement in the process two years before major construction begins offers the opportunity to:

- Ensure the contractors construction knowledge is incorporated into the design
- Refine the delivery schedule
- Secure the necessary labour; and
- Form alliances with Manitoba suppliers and sub-contractors.

2.3 SCHEDULING FOR TENDERING

The PEP states that project execution will follow the Hydro Cost and Schedule Standard (CSS) for schedule management. The overall schedule anticipates construction starting in July 2014 and being complete in January 2021. Procurement of long lead time items of equipment is already under way, in order to ensure delivery to site in time for incorporation in the works. Schedule performance is one of the key performance indicators tracked by MH.

Detailed and complete schedules for KGSP were included in both the 2009 Basis of Cost Estimate Report and the Request for Proposals (RFP) for the Keeyask GCC. The schedules and timelines are deemed to be appropriate and realistic, except for the Stage 1 Coffer Dam which is deemed aggressive. They are consistent with the described developments and the anticipated work breakdown structures. It appears that MH has properly identified and appropriately scheduled items such as preparatory works (through the KIP) and long-lead-time items such as the supply of the turbine-generator equipment. It was not possible, however, to ascertain that adequate time has been built in to the schedule to cover MH's processes and procedures or any external owner requirements, such as reviews by Hydro or independent engineers.

The recent tenders submitted as part of this contract have validated the feasibility and reasonableness of the construction schedule. Validation Estimating has noted that the project team did find the GCC schedule to be very aggressive. See Section 7 for further discussion on this GCC.

MH has been unable to provide a comprehensive overall development schedule that includes design, procurement (all work required to prepare tender documents right to award) and construction (work after contract award to close-out). However, they believe they are presently generally on track with the projects; KP confirms this, based on the information received to date and the fact that the early development items are largely complete and the overall development schedule is now driven by construction and commissioning.

2.4 EFFECTIVENESS OF TENDERING AND PROCUREMENT MANAGEMENT APPROACH

2.4.1 Minimizing Capital Costs

MH is using an appropriate approach towards minimising capital costs by sharing risk with the contractors and suppliers through the principal measures of advancing design prior to procurement, identifying and managing risks, and detailed management of the construction process.

2.4.2 Securing Competitive Bids

The most significant contracts have been or are being procured through a competitive bid process (GCC and Equipment Supply). A number of projects have been procured through non-competitive DNCs because of a preference by MH for particular contractors to undertake specific work assignments. MH has drawn experience with this type of contract from the Wuskwatim project, which had a number of DNCs. Since these contracts are not competitively bid, their value is closely related to the leverage held by MH and the diligence associated with the negotiation.

Internal MH costs may not be deemed competitive but KP does not have sufficient data to be able to offer an opinion on this issue.

2.4.3 Managing Construction and Procurement Cost Escalation

It is difficult to measure MH's effectiveness in managing construction and procurement cost escalation as the current process is relatively new to MH and is significantly different from the old process. MH has a project controls coordinator who has constant access to such data as earned value charts, forecasts, trends and open issues that may affect the project and lead to unanticipated escalation. Opinions on MH's approach to the management of construction and procurement cost escalation are provided in the sections that follow.

2.4.4 Managing Construction Risks

The project team and risk engineer execute the contingency management process, which includes the risk management process and the contingency management process. These are covered in Section 3.

2.4.5 Procurement of other major facility components

To reduce scheduling risk and potential interface issues, a number of contracts were bundled with the GCC, including the Electrical and Mechanical Contract and excavation, cofferdams and draft tube forms. The reduction of interface risk was a lesson learned from the Wuskwatim project, which had several different contracts.

2.4.6 Overall Assessment of Effectiveness

KP is able to see that MH is following a well-documented process despite the PEP presently being in draft form only. The project generally appears to be on schedule as it relates to Tendering and Procurement.

3 – CONSTRUCTION RISK MANAGEMENT STRATEGY

3.1 SCOPE OF WORK

Question 2: "Review Manitoba Hydro's construction risk management strategy and comment on its effectiveness"

3.2 RISK MANAGEMENT STRATEGY

MH has a Risk Management Procedure (NGCD RSK-001 dated October 3, 2013) whose purpose is to *"detail the activities of planning, identifying, evaluating, responding, and monitoring for effective risk management as well as detailing the standard risk reporting templates..."* Related to this document are the Project Contingency Management Procedure (RSK-002 of November 10, 2013), and the Keeyask Project Risk Register. A Project Risk Report is also produced, showing contingency drawdown, schedule, one year look-ahead of project-specific risks based on project schedule, project risk profile, top 5 global and top 5 specific risks, and risk by phase of implementation. Confidential copies of all these documents were made available to KP.

Risks in the Risk Management Procedure are assessed on the basis of the product of Probability and Impact, broken down into the following categories:

- Technical (Requirements, Technology, Complexity and Interfaces, Performance and Reliability, Quality)
- Organisational (Project Dependencies, Resources (MH Staff), Funding, Prioritisation, Customer (Internal))
- Project Management (Estimating, Scheduling, Controlling, Communication)
- External (Regulatory, Market Intelligence, Performance and Reliability, Weather, Stakeholders), and
- Safety (Design Standards, Qualifications, Training and Awareness).

Tables 3.1 and 3.2 provide details for the assessment of Probability and Impact and Tables 3.3 and 3.4 the Risk Factor Matrix (where Probability and Impact are combined) and the Ranking system adopted. Although inevitably largely qualitative, quantitative ranges are given to guide the process. The process is deemed to very standard and appropriate overall for the KIP and KGSP.

Table 3.1 Probability (Risk Management)

Probability Rank	Description		Factor
	Threat	Opportunity	
Very Low (1)	Unlikely to Occur	Unlikely to Occur	<10%
Low (2)	May occasionally occur	Possible opportunity which has yet to be fully investigated.	10% to 30%
Medium (3)	Is as likely as not to occur	Opportunity may be achievable but will require careful management.	30% to 50%
High (4)	Is likely to occur	Clear opportunity which can be relied on with reasonable certainty	50% to 70%
Very High (5)	Is almost certain to occur	Is almost certain to occur	70% to 99%

Table 3.2 Impact (Risk Management)

Impact	Technical	Schedule	Cost
Very Low (1)	[redacted]	[redacted]	[redacted]
Low (2)	[redacted]	[redacted]	[redacted]
Medium (4)	[redacted]	[redacted]	[redacted]
High (8)	[redacted]	[redacted]	[redacted]
Very High (16)	[redacted]	[redacted]	[redacted]

Table 3.3 Risk Factor Matrix (Risk Management)

Probability Factor	>70% (5)	5	10	20	40	80
	50%-70% (4)	4	8	16	32	64
	30%-50% (3)	3	6	12	24	48
	10%-30% (2)	2	4	8	16	32
	<10% (1)	1	2	4	8	16
		Very Low (1)	Low (2)	Medium (4)	High (8)	Very High (16)
		Impact Factor				

Table 3.4 Risk Ranking (Risk Management)

Combined Risk Factor Range	Risk Level	Response for NGC
1 to 4	Minor	Acceptable level of risk. Mitigation of risks is optional.
5 to 15	Moderate	Borderline level of acceptable risk. Must be mitigated to minor in stage 5.
>15 High	Critical	Unacceptable level of risk, must be mitigated to moderate in stage 4, or low in stage 5.

Risk categories in a MH presentation at a PUB Workshop in May 31, 2010 were somewhat different, viz:

- Market (Domestic and Export)
- Financial
- Environmental (including water supply and climate change)
- Infrastructure
- Human (including safety and union and employee issues)
- Business Operational
- Reputation
- Governance / Regulatory / Legal
- Aboriginal
- Emerging Technology, and
- Strategic.

At that time risks were summarised in a Risk Map, a matrix of Consequence and Likelihood.

Categories listed on the Risk Register also do not directly follow the above definitions but are more direct and detailed. Categories include:

- Auxiliary Processes and Services
- Concrete Structures
- Earth Structures
- Electrical and Mechanical Work
- Electrical Power Systems
- Environmental
- Excavation
- Geotechnical
- Global Construction
- Global Other
- Infrastructure
- Licensing
- Logistics
- Power Generation Systems
- Project Management
- River Management, and

* Stakeholder.

The major risks in the Risk Register (total risk score of 80, see Table 3.3) were perceived in August / September 2013 to be:

* [redacted]

MH proposes to deal with these risks by mitigation, through the Contingency and/or the Management Reserve.

3.3 EFFECTIVENESS

It is apparent that the new procedures and systems set up for Keeyask and Conawapa are a direct result of lessons learned on Wuskwatim and reflect a genuine concern on the part of MH to manage the whole process better. As far as can be seen, the risk management strategy is well set up and is being monitored and acted upon appropriately. Having chosen suitable, reputable and experienced contractors, construction risks are associated with contractor performance, in terms of quality, cost and schedule. MH carries some risk for known unknowns like quantities (which risk is mitigated by advanced design, investigations, good takeoffs and the GCC ECI process), and possibly to some degree schedule impacts of inclement weather. Portions of the contingency have been added to each contract, to cover unknown unknowns.

The whole issue ultimately comes down to cost. This is discussed further in Sections 8 and 9 of this report.

3.4 REVIEW OF THE RISK ANALYSIS AND CONTINGENCY ESTIMATE BY VALIDATION ESTIMATING

KP has reviewed the Keeyask Generation Station Project Capital Cost and Schedule Risk Analysis and Contingency Estimate report dated March 9, 2014 prepared for MH by John Hollmann of Validation Estimating LLC; the document describes the updated risk analysis and contingency estimate conducted for the Keeyask Generation Station Project (Project) using Validation Estimating LLC's contingency estimating methodology. KP has not had an opportunity to review other material prepared for MH by Validation Estimating that was included in the previous cost estimates.

Validation Estimating based the review on the updated estimate and schedule prepared by MH in November 2013. The costs were updated based on General Civil Contractor (GCC) bids received in December 2013 and continued assessment of cost and risk through February 8, 2014.

MH also provided KP with some of the associated tables by Validation Estimating that define the scope development and estimate maturity as the lead into the risk analysis. One aspect of the systemic risk analysis is that it is subjective. The interviews done to rate the level of scope development and other systemic risks in view of the analysis were performed with staff internal to MH, which may bias the perspective descriptions.

3.5 HIGH, LOW AND REFERENCE CASE

As per the March 27, 2014 Manitoba Undertaking #27 (MH Exhibit 104-8) the updated Capital Cost Estimates for Keeyask used in the Economic Uncertainty Analysis are as follows:

Table 3.5 Low, Reference, High

	Keeyask 2019		
	Low	Ref	High
Capital Cost	**3.0** B 2014 $	**3.3** B 2014 $	**3.7** B 2014 $
Probability	20%	50%	30%
Capital Cost	**3.1** B 2014 $	**3.6** B 2014 $	**4.2** B 2014 $
Probability	20%	60%	20%

These numbers are in agreement with the values determined by Validation Estimating.

4 – REVIEW OF CONTRACT DOCUMENTS FOR MAJOR KEEYASK COMPONENTS

4.1 SCOPE OF WORK

Question 3: *"Review contract documents prepared by Manitoba Hydro for the major Keeyask components and comment on how such documents have been designed to secure cost effective bids from suppliers and contractors and where Manitoba Hydro may be for vulnerable for cost increases, schedule changes etc. Comment on the overall thoroughness of the contract documents and drawings."*

4.2 CONTRACT DETAILS

The earlier KP report contains a description of the various forms of contract that are typically used for projects like the KGSP and the KIP. It is important to note that the work packages, including major Keeyask component supply, may not always correspond line for line to the Work Breakdown Structure (WBS) developed as part of the bottom-up estimate. As a result it is difficult for KP to reconcile dollars spent to date and anticipated future contract expenses for each specific element of the WBS.

Copies of various Keeyask contract documents were made available to KP as part of the original scope of work and commented upon in the earlier KP report. Details of the recently awarded GCC are discussed in Section 4.5 below.

4.3 OVERALL THOROUGHNESS OF THE CONTRACT DOCUMENTS AND DRAWINGS

The contract documents and drawings that KP has seen have clearly been drawn up by competent, experienced engineers, from within MH and from reputable experienced consultants.

4.4 VULNERABILITY TO COST INCREASE

As indicated in the earlier KP report, MH has stated that as of September, 2013, 29% of the 2012 $3.05 billion Point Estimate had been covered by contracts that had already been awarded. It should be noted that award of contracts had not resulted in a change to the contingency allowance.

The earlier report essentially confirms that MH has made appropriate choices for the various Keeyask contracts – the contracts have been designed to secure the most cost effective bids from suppliers and contractors. All contracts except fixed price contracts (FPC) are somewhat vulnerable to cost increases but should still provide the most cost-effective solution by sharing risk and not insisting the contractor carry all the risk. If the contractor is made to carry all the risk he has to hedge his bets and build in to his price provision for the worst perceived possible outcome. If the worst case does not occur, the contractor pockets the unused provision as extra profit and nothing is returned to MH. Using non FPC contracts does, however, require MH to provide a contingency allowance for any unanticipated possible over-expenditure. Contingency provision is discussed in Sections 3 and 9.

Non FPC contracts have similar implications on schedule as they do on costs. It is necessary to specify the process by which schedule changes might be made if necessary. Any cost implications of schedule change should be included in the contingency.

Where possible increases can be anticipated and defined where they have been acknowledged and accounted for in a professional and competent manner that shares risks between MH and the service provider. KP has not been able to confirm that MH has an adequate level of project definition for the indirect costs (no detailed report describes these cost though KP has seen some high level detail.) in all areas and concludes that the indirects carry more risk of cost escalation than the direct works, which typically has a higher level of project definition.

4.5 GENERAL CIVIL CONTRACT (GCC)

The General Civil Works Contract (GCC) represents the most significant single expenditure on the Keeyask Project. BBE Hydro Constructors Limited Partnership has been awarded a $1.4 billion contract by Manitoba Hydro to construct the 695-MW Keeyask hydroelectric plant; the partnership includes Bechtel, Barnard Construction and EllisDon.

It is made up of a range of work packages including excavation, cofferdam construction, river management, dams, dykes, and electrical and mechanical works, as well as construction of the powerhouse and spillway structures. This contract was awarded in March 2014. MH has provided the following details of the contract document and the bids received.

4.5.1 GCC Contract Document

The GCC has been structured on an Early Contractor Involvement (ECI) model to provide “the opportunity to collaboratively assess, mitigate and then appropriately allocate responsibility for risks in a manner that will align primary participant success with project success”. A two Phase process has been adopted in which Phase I is for the provision of ECI services (ECIS) and Phase II is for the actual construction of the civil and associated works.

The ECIS Phase I comprises:

- Task #1: An initial workshop between the three main entities – MH, the Engineer and the Contractor (on or about March 18, 2014)
- Task #2: Stage I cofferdam construction management plan (to be completed by June 1, 2014)
- Task #3: Contractor to develop concrete mix designs (by April 1, 2016)
- Task #4: Contractor input to design refinement and freeze point activities (by November 1, 2014)
- Task #5: Construction planning Contractor deliverables (by August 1, 2015)
- Task #6: Contract schedule for Phase II construction (before start of rock excavation in spillway)
- Task #7: Risk mitigation plan (by August 1, 2015)
- Task #8: Permit matrix (by August 1, 2015), and
- Task #9: Submittal Schedule (by August 1, 2015).

Phase II comprises the actual construction, on the following basis:

- An Initial Target Price submitted with the Bid based on the direct costs of extending and summing the products of quantities provided by MH and their Engineer and unit rates submitted by the Contractor (as per conventional design-bid-build contracts).
- Indirect costs reimbursed by the application of percentages bid by the Contractor for general administration and overheads (GA & O), and for profit, separate percentages being applied to the direct costs.

- Provisions for the adjustment of the Initial Target Price (to produce an Adjusted Target Price), chiefly due to escalation, and possible changes in the scope of work,
- The Contractor is encouraged at any time to make Value Engineering proposals (which, if accepted by MH, do not affect the Target Price)
- Any savings in cost (Actual Final Cost is less than Final Target Price) are attributed 80% to MH and 20% to the Contractor. Any cost overrun (Actual is more than Target) is attributed 80% to the Contractor (drawn from his Profit Percentage, to the limit of that amount) and 20% to MH. If the overrun exceeds 130% of the Final Target Price the Contractor will not receive his GA & O Percentage on any costs that exceed this amount.
- The Performance Security is in the form of Letters of Credit: [redacted]

4.5.2 Comparison of Bids

[redacted]

4.6 MAJOR EQUIPMENT

Approximately [redacted] of the total costs are for Major Equipment [redacted] i.e. turbine, generator, stop logs, transformers, switchgear, etc.

[redacted]

5 – PROCUREMENT BONDING AND LIQUIDATED DAMAGE REQUIREMENTS

5.1 SCOPE OF WORK

Question 4: "*Review construction and equipment procurement bonding and any liquidated damage requirements and comment on the appropriateness of such bonding and cost implications to the project.*"

5.2 BONDING AND LETTERS OF CREDIT

Performance bonding or letters of credit are normal contract requirements designed to protect an owner/developer against the contractor failing to perform. Bonding is typically used for civil construction work at the project site while letters of credit (LoC) tend to be used to procure mechanical and electrical equipment manufactured off site. MH have advised that the GCC however uses LoCs instead of bonding because it provides more security than a performance bond, given that the GCC is a cost reimbursable contract. The primary difference between the two is that a bond guarantees work will be performed, while a letter of credit promises that payments will be made.

A letter of credit promises to cover payments on an approved project, up to the stated credit amount. A bond puts up a specified amount of money to ensure contractual work will be performed to the contract standards. Both instruments provide a sum of money to enable the owner to repeat the procurement process if the contractor defaults. MH has made available to KP details of the bonding or letter of credit requirements for a selection of the major Keeyask contracts, in both the KIP and the KGSP. This information is summarised in Table 5.1. MH has indicated that the amounts are based on risks associated with the individual contracts, past experience, and industry norms.

It can be seen that where performance bonding has been required this has typically been in the amount of [redacted] of the value of the work whereas letters of credit have typically been for [redacted] of the value of the work. These values are deemed by KP to be appropriate. Performance bonds have sometimes in the past been as high as 100% but this adds a significant amount to the contract cost (the cost of the bonding is inevitably passed on to the owner, either expressly, as with the MH contracts, or elsewhere in the bid price), for an event which is not likely to materialise, certainly not in the full amount of the contract. Current practice is to strike a reasonable balance, protecting the interests of the owner while not paying an excessive premium for this insurance.

Table 5.1 MH Procurement Bonding and Liquidated Damage Requirements

Contract	Description	Bonding or Letter of Credit Details	Liquidated Damages
16102, 16103 and 16104	North Access Road B and A and Start Up Camp (DNCs)	[redacted]	
16120	Looking Back Creek Bridge (DNC)	[redacted]	[redacted]
16121, 16122, 16123, 16124 and 16125	Catering and Janitorial, Maintenance, Security, Employee Retention and Support, Emergency Medical Services (DNCs)	[redacted]	[redacted]
16127	Main Camp Facility - Phase 1	[redacted]	
16132	Work Site Area Development	[redacted]	
16150	PR 280 Upgrades - Spot Upgrade Improvements (DNC)	[redacted]	
16203	General Civil Contract	[redacted]	[redacted]
16321	Turbines and Generators	[redacted]	[redacted]
RFP 016305	Intake Gates, Guides and Hoists (same for Spillway Gates, Guides and Hoists}	[redacted]	[redacted]
	Powerhouse Crane	[redacted]	
	Main Electrical Contracts (Transformers, etc.)	[redacted]	

5.3 LIQUIDATED DAMAGES

Liquidated damages (LDs) are intended to protect the owner from the cost implications of having to live with substandard products and/or the cost impacts of late delivery. [redacted] LDs do not have to be proved and are payable by the contractor to the owner if triggered, regardless of actual cost, in the amount specified in the contract. There is normally a maximum limit to the total LDs that may be claimed. The alternative to LDs for compensation are penalties which suffer the disadvantage that they have to be proved e.g. the owner has to substantiate the costs or revenue loss he actually suffers in the event the turbine-generators produce less power than expected or the actual cost of a delay. Details of LDs for a selection of contracts are included in Table 5.1.

LDs are sometimes associated with a Performance Bonus (i.e. the upside of performing better than guaranteed, to counter the downside of performing worse). This is in principle a more equitable arrangement than one which only contains the downside. [redacted]

KP believes that the LDs stated in the various contracts made available appear to be reasonable and in keeping with their purpose.

6 – QUALITY ASSURANCE AND QUALITY CONTROL REQUIREMENTS

6.1 SCOPE OF WORK

Question 5: "Review Manitoba Hydro's Quality Assurance and Quality Control (QA/QC) requirements for Keeyask construction and comment on the effectiveness and costs."

The most common arrangement for addressing quality in procuring hydroelectric power generating facilities is to make the Contractor responsible for Quality Control (QC) and the Owner (or his Engineer) responsible for Quality Assurance (QA). MH is conforming to this usual practice.

6.1.1 MH Quality Management

Quality Management in MH is specified at a high level in the PEP with more detail being provided in a NGCD standard. Both documents define the processes required in MH to establish and operate a quality management program, including a third main activity that takes place prior to QC and QA, Quality Planning (QP).

MH made available to KP copies of the following documents to illustrate their approach to quality:
- Quality Management Section 5 of the Project Execution Plan (PEP)
- NGCD Standard #204 Quality Management (effective date 2012 07 17)
- QA/QC Requirements for the Turbine and Generator Contract 016321, and
- QA/QC Requirements for the General Civil Works Contract 016203.

6.1.2 Turbine and Generator Contract #016321

With reference to this document, which has been awarded, it is noted in General Requirements Clause 48, Quality that:
- The Contractor's own Quality Management System must "*conform fully to the spirit and intent of* (the international quality management system) *ISO 9001 2000"*.)
- The Contractor is also obliged to have a Project Quality Plan and a Quality Team and various Inspection and Testing Plans (ITPs).
- The document is deemed to be detailed, comprehensive and appropriate for its purpose.

6.1.3 General Civil Works Contract #016203

Clause 7.14 of the General Specifications for the GCC confirms that, for this contract, QC is the responsibility of the Contractor and QA the responsibility of the Engineer. Although details (provided in an appendix) were not made available to KP, KP is of the opinion that the details are likely to be appropriate.

6.2 QUALITY CONTROL

The requirements for QC are laid down in the contract documents and/or various standards (like the Canadian Standards Association CSA A23 for the production, inspection and testing of concrete).

6.3 QUALITY ASSURANCE

QA involves checking that the specified QC has been properly carried out: that the tests have been done, proper records have been kept, the records have been inspected and checked (in real time) and that substandard results have been properly addressed. In the case of MH, QA will be performed by their site construction management team (including consultants).

6.4 COSTS

The costs for the establishment and compliance monitoring of the MH quality requirements are not expressly shown. They form part of both the Contractor's and MH's site administration and management costs.

7 – OVERALL CIVIL CONTRACT PROJECT MANAGEMEMENT APPROACH

7.1 SCOPE OF WORK

Question 6: "Review the overall civil contract(s) project management approach; comment on its effectiveness and what project management controls are in place to minimize cost escalations."

7.2 CIVIL CONTRACT PROJECT MANAGEMENT APPROACH

The General Civil Contract (GCC) is being procured in an Early Contractor Involvement (ECI) process which provides an opportunity for MH and a selected contractor to work together to refine the contract. All aspects of the work, including design details, schedule, risk sharing and project management, are open for discussion. KP believes that this process reflects a genuine and appropriate opportunity for MH to optimise and bring as much certainty to the contract as possible.

For the last year and a half, all the KGSP contracts (including the GCC) have been and are being managed within the system-wide MH accounting system, SAP. The KIP is still largely being managed in the old MH system although efforts are being made by MH to get this project into the new system as well. The change in process makes it difficult to compare the 2012 estimates with the 2009 bottoms up estimates as they are formatted and arranged very differently particularly for the indirect costs.

The basis of the SAP system is "Network" Numbers, effectively WBS line items (or rows in the previous 2009 Excel spreadsheet based estimate). Network Numbers include all costs - directs and indirects (contract items, expenses, internal MH costs, consultants, etc.) whereas these costs were set out differently in the old Excel fields. MH has a big focus on schedule, as any extension of the schedule has inevitable financial consequences.

7.3 PROJECT MANAGEMENT CONTROLS

KP and MH held a conference call to discuss details of MH's management system. The following summary comes from that call and subsequent confidential material mailed to KP.

As contracts come in, or there are other reasons to revise estimates or allocations, "PCA"s (Project Change Authorizations) are used to transfer funds to and from the project contingency, in real time. There is a person in MH responsible only for managing the contingency. All significant Network #s have a portion of the overall contingency allocated to them, and have a contingency drawdown curve against which actuals and revisions to forecast are tracked. The project team only has access to the Contingency but not the Management Reserve.

MH keep a "CRR" (Contract Revision Register) that records budget changes like PCAs. They also have "Dashboards" which are effectively reports tailored to present information to particular audiences. An example of a dashboard report is included in the MH Risk Management Procedure (see Section 3). Another example is shown in Figure 7.1.

Estimates of future expenditure are adjusted in real time by adding inflation and deducting money spent to date. A check is also made at the same time on the expected final cost of each item i.e. that the budget is still appropriate. These changes are also recorded in other parts of the estimate, to keep the overall in-service cost the same. An overall reconciliation is done at the end of March every year, with quarterly reports in interim.

[redacted]

Figure 7.1 Example of Project Dashboard

8 – PRE-TENDER CONSTRUCTION ESTIMATES AND ACTUAL TENDER PRICES

8.1 SCOPE OF WORK

Question 7: "Critically review Manitoba Hydro's pre-tender construction estimates and compare with actual tender prices. Define where significant differences are noted and rationalize the specific differences."

8.2 GCC PRE-TENDER ESTIMATES AND ACTUAL TENDER PRICES

MH has provided KP with summary presentation material and Bills of Quantities comparing the GCC proposals, the independent estimators estimate (by Chant), and an escalated original Engineers Estimate by KGS Acres. KP believes that Hydro has been diligent in their internal comparison between the four GCC tenders, their Engineers estimate and the independent Third Party Estimate.

[redacted]

Generally quantities have been confirmed by the bidding contractors and the independent third party estimator. [redacted]

[redacted]	[redacted]	[redacted]	[redacted]

[redacted]

9 – EXPECTED IN-SERVICE CAPITAL COST FOR KEEYASK

9.1 SCOPE OF WORK

Question 8: "Provide an opinion as to the expected in-service capital cost for Keeyask once all work has been completed."

9.2 EXPECTED IN-SERVICE COST

MH has indicated in the recent hearings, that based on the results of the GCC bids and the award of that contract that their estimated total in-service cost is now $6.5 billion (was $6.2 billion). Validation Estimating states that "the recent incorporation of GCC contract costs reduced the uncertainty in respect to competitiveness of the estimate." The reassessment included a reappraisal of their contingency (updating their contingency model) and management reserves; KP has no better data to offer a better estimate of the expected in-service capital cost for Keeyask and therefore generally concurs with the estimate with the following reservations:

- KP believes that there remains systemic risks to the project that cannot be easily mitigated. While the direct scope is well-defined the project implementation plan is still in progress and Hydro's management systems are not yet mature, these combined risks lower the level of project definition and could lead to increases in project risks and associated costs. As stated by Validation Estimating cumulatively the schedule risks threaten to drive the project into an additional year of construction and the seasonal nature of the work results in a greater schedule risk than a typical mega-project. [redacted]
- When determining the Management Reserve and Contingency, a more conservative approach would be to adopt a higher escalation reserve (closer to 3.1%) [redacted] A higher contingency based on the P80, as compared to Hydro's use of a P50, would also be recommended for the conservative estimate.
- The Tables 9.1 and 9.2 below compare Hydro's Contingency and Management Reserve amounts to those recommended for a Conservative View.

Table 9.1 Contingency Comparison

	Hydro	Conservative View
	P50	P80
Contingency	327 M$	691 M$

Table 9.2 Reserve Comparison

	Hydro	Conservative View
One Year Delay due to Stage One Coffer Dam Delay	[redacted]	[redacted]
Labour Reserve Case	[redacted]	[redacted]
Escalation	[redacted]	[redacted]
Total Reserve	[redacted]	[redacted]

While Hydro's Reference Cost is appropriate, a more conservative view might be warranted when considering and making allowances for the Total Project Contingency and Management Reserve.

MANITOBA PUBLIC UTILITIES BOARD
NFAT REVIEW OF KEEYASK AND CONAWAPA GS

CAPITAL EXPENDITURE FORECAST BREAK DOWN SUMMARY

07/04/2014 13 20

	Keeyask GS 2009 Estimate	CEF2010	CEF2011	CEF2012	CEF2013	March 10, 2014 Update		KP Review
BASE COST								
POINT ESTIMATE								
KEEYASK GENERATING STATION COST ESTIMATE								
DIRECTS								
Overnight Direct Cost of Generating Station								
River Management	[redacted]	[redacted]		[redacted]		[redacted]		
Earthfill Dams and Dykes	[redacted]	[redacted]		[redacted]		[redacted]		
Spillway and Transition Structures	[redacted]	[redacted]		[redacted]		[redacted]		
Powerhouse Complex	[redacted]	[redacted]		[redacted]		[redacted]		
Miscellaneous Directs	[redacted]	[redacted]		[redacted]		[redacted]		
Addition to Reflect GCC Tender						[redacted]		
Total Estimated G.S. Direct Costs (without Contingency)	[redacted]	[redacted]		[redacted]		[redacted]	√	This number has been detailed, has escalated roughly in line with what could be expected. This estimate was recently confirmed through the awarded T/G and the GCC award process, the final increase is accompanied by a decrease in the project contingency. Unknowns and risk captured under uncertainty.
Outlet Transmission Project (without Contingency)	[redacted]	[redacted]		[redacted]	[redacted]	[redacted]	√	This cost estimate is developed internally and has escalated, KP has not seen details behind this estimate (it is not developed by NGCD), but expect the increase to be associated with a clearer project definition and therefore should not increase further.
INDIRECTS								
Studies and Investigations	[redacted]	[redacted]		[redacted]		[redacted]	√	
Environmental & Mitigation	[redacted]	[redacted]		[redacted]		[redacted]	?	Inclusion of significant post-construction adverse effects as per accounting direction;
Construction Power	[redacted]	[redacted]		[redacted]		[redacted]	√	
Infrastructure	[redacted]	[redacted]		[redacted]		[redacted]		
K.I.P. (Base Estimate)	[redacted]	[redacted]		[redacted]		[redacted]	?	Has increased from the 2009 basis provided, but contracts now in place and KIP work is underway. The increases included authorisations to withdraw additional amounts from project contingency for Camps and DNC contracts. Would have liked to be able to track performance.
Service Contracts	[redacted]			[redacted]		[redacted]		
Planning / Environmental / Construction	[redacted]	[redacted]		[redacted]		[redacted]	?	
MH Office and Labour	[redacted]	[redacted]		[redacted]		[redacted]		
Expenses & External Groups	[redacted]	[redacted]		[redacted]		[redacted]	X	The decision to move to outsource some of the construction project management aspects and addition of performance bonus management include unknowns or non-defined scopes, that pose a risk of cost escalation. Rejuggling of categories makes it difficult to ascertain inclusions when compared to 2009 estimate.
Labour and Material Provisions	[redacted]	[redacted]		[redacted]		[redacted]	?	Allocations recategorized for a large part. Estimate has remained steady overall through the iterations.
Labour & Expenses	[redacted]	[redacted]		[redacted]		[redacted]	√	
Total Estimated Indirect Costs	1,071	1,141		1,323		1,298	?	Additional breakdowns and written descriptions of indirect costs would help determine adequacy. Doubts remain as to inclusiveness.
Total G.S. Point Estimate	2,705	2,806		3,049	3,060	3,357		
Total Transmission Base Estimate	93	105		137	137	138		
Total "Point Estimate"	2,798	2,911		3,186	3,197	3,495	√	
UNCERTAINTY								
P50 Based Contingency	507	518		547	540	327	X	Could Include a higher amount of contingency than the P50. Number has decreased based on updated risk model.
Management Reserve								
Labour Reserve				384	384	304	X	[redacted]
Escalation Reserve				116	116	88	X	Escalating at 2.5% - CPI when internal studies shows higher escalation. Actual escalation applied has been consistently higher in the last 5 years.
Total Management Reserve				500	500	392		
TOTAL BASE COST	3,305	3,427	3,385	4,233	4,237	4,214		
INTEREST AND ESCALATION								
Escalation at Consumer Price Index Level		459		416	330	311	√	
Capitalized Interest				673	1010	900	√	
Interest on Manitoba Hydro Equity		1347		198	200	218	√	Increase due to higher base costs; GCC cash flow is more front-end loaded

Attention: Patti J. Ramage / Marla J. Boyd

Dear Ms. Ramage and Ms. Boyd:

Re: Keeyask Tenders - Approved Scope of Work for Knight Piésold

The Public Utilities Board ('Board') is informing you that the attached Scope of Work has been approved by the Panel to be completed by Knight Piésold. As such Manitoba Hydro is asked to:

1. Place all related Contracts and Tender Documents that pertain to the Keeyask project in the CSI Rooms; and
2. Provide copies of the Keeyask Contracts and Tender Documents to Knight Piésold via the IEC SharePoint site.

The Board is requesting that the requested information be made available as soon as possible, considering that the report requested by Knight Piésold be submitted by February 4th, 2014.

Sincerely,

H.M. Singh
Secretary

Knight Piesold - Proposed Revised Scope of Work

As approved by the NFAT Panel on January 10, 2014.

Manitoba Hydro has indicated in their correspondence of December 4, 13, and 30th of Manitoba Hydro's intention to award the Keeyask General Civil Contract early in 2014. Manitoba Hydro intends to seek Manitoba Hydro Board approval of the contract in February of 2014. It is the opinion of the Public Utilities Board that the review of tendered costs for Keeyask is of significant importance for the understanding of the projected capital costs.

The overall objective of the revised scope of work for Knight Piésold (KP) would be to validate Manitoba Hydro's overall cost estimate and tendering practices for Keeyask and the accuracy of Manitoba Hydro's cost estimating approach.

The proposed scope of work for KP to complete this objective is provided below.

- Review MH's overall management strategy and scheduling for the tendering of contracts for the Keeyask Generating Station and the procurement of other major facility components such as spillways, dams, dykes, powerhouse, turbines, intake gates, generators, controls etc. Comment on the effectiveness of this management approach for minimizing capital costs, securing competitive bids, and managing construction and procurement cost escalation and construction risks.

- Review Manitoba Hydro's construction risk management strategy and comment on its effectiveness.

- Review contract documents prepared by Manitoba Hydro for the major Keeyask components and comment on how such documents have been designed to secure cost effective bids from suppliers and contractors and where Manitoba Hydro may be for vulnerable for cost increases, schedule changes etc. Comment on the overall thoroughness of the contract documents and drawings.

- Review construction and equipment procurement bonding and any liquidated damage requirements and comment on the appropriateness of such bonding and cost implications to the project.

- Review Manitoba Hydro's Quality Assurance and Quality Control (QA/QC) requirements for Keeyask construction and comment on the effectiveness and costs.

- Review the overall civil contract(s) project management approach; comment on its effectiveness and what project management controls are in place to minimize cost escalations.

...2

- Critically review Manitoba Hydro's pre-tender construction estimates and compare with actual tender prices. Define where significant differences are noted and rationalize the specific differences.

- Provide an opinion as to the expected in-service capital cost for Keeyask once all work has been completed.

- Provide a supplemental report to the Panel incorporating this work by February 4th, 2014.

Asset Management Gap Assessment

Report of Findings to Manitoba Hydro

Conducted by

UMS Group Inc.
Morris Corporate Center 1
300 Interpace Parkway, Suite C380
Parsippany, NJ 07054

December 15, 2016

Table of Contents

INTRODUCTION

Overview of Project

UMS Group was engaged by Manitoba Hydro (Hydro) in September 2016 to conduct a Gap Assessment of its Asset Management capabilities. The scope of this assessment was to evaluate the organization's current asset management capabilities and practices and make recommendations for implementing a best practice Asset Management System.

The project comprised a review of Hydro's existing corporate and business unit level Asset Management practices and comparison to industry best practices, as well as to international standards for Asset Management (PAS 55 and ISO 55000). From this review, UMS developed a detailed and prioritized listing of the gaps between Hydro's current Asset Management practices and industry best practices and identified necessary steps to bridge the gaps.

To perform the assessment, UMS collected and reviewed asset management-related process and practice documentation, as well as current plans to monitor and maintain asset performance, asset condition and risk levels. Additionally, interviews were held with the Executive team to understand their views on asset management, objectives for the assessment, and perceived issues/gaps. Following those interviews, individual interviews were held with personnel involved with asset management from across the Hydro Generation Operations, Transmission, and Customer Service and Distribution business units. The focus of these interviews was to understand current and planned asset management roles and responsibilities, practices, processes, and tools.

Finally, individual workshops were held with each of the Generation Operations, Transmission, and Customer Service and Distribution business units to discuss asset management standards and best practices and walkthrough a self-assessment of the Business Unit maturity compared to industry standards – International Organization for Standardization (ISO) 55000 and Publicly Available Specification (PAS) 55 – and best practice. Individual workshops were also held with each of the Business Units to review the Asset Lifecycle and Risk Strategy Process and gain a better understanding of how Hydro addresses the steps in the process and where gaps exist.

The Gap Assessment Methodology is described in Appendix A. Manitoba Hydro personnel who were interviewed and/or participated in workshops are listed in Appendix B.

As a definitional note, there are several terms used in the report which might not be familiar to readers. There are defined below:

- <u>Management System</u> – The set of interrelated or interacting elements of an organization (i.e., policies, processes and procedures) used to ensure that it can fulfill all the tasks required to achieve its objectives.

- Model – A high level representation of a system made up of concepts which communicate basic facts about the system
- Framework – A high level guide which identifies the key elements of a structure.

What is Asset Management?

Asset Management is a system that uses data-driven decision-making to ensure the right work is being undertaken to achieve the desired performance outcomes in the most efficient way. Its overall objective is to ensure that short term decisions meet the long term needs of stakeholders in the optimal manner.

Good Asset Management means spending limited resources in the most effective way to meet business objectives. It does so by proactively investing in the asset in a way that meets the strategic objectives of the company, rather than merely reacting to asset deficiencies as they occur. This investment is based on economic modeling of benefits versus its costs, rather than historical spend or "pet" projects. By providing the focus and accountability for the best use of its resources, Asset Management optimizes the total expenditure needed to achieve the desired business and asset performance outcomes.

Strategic Value of Asset Management

Improving its Asset Management capabilities has the potential to provide significant strategic benefit to Manitoba Hydro by ensuring that it is optimizing its capital and operating expenditures, managing risk within a set tolerance level, and delivering long-term value to customers by reliably and safely providing service in a cost-effective manner.

Specific benefits that can be achieved by Hydro through the maturation of its asset management system include:

- Improved asset productivity through life extension and reduction in failures
- Increased efficiency in asset maintenance through better targeting of needed work and elimination of non-valued added work
- Reduced uncertainty through better forecasting of failures and understanding of risk
- Ability to compare investments across asset classes through consistent approach and monetization of benefits
- Improved effectiveness of expenditure dollars through focus on performance management and continuous improvement
- Optimizes use of human resources by matching the workforce – in terms of size and composition – to the work required, rather than creating work to keep the workforce busy
- Greater transparency for internal and external stakeholders through use of data-driven decision-making and quantitative analysis

In 10 previous utility asset management transformations we have performed, we have found that utilities see significant improvements in productivity and overall cost savings of 20-30% over 5 years with the application of an asset management system.

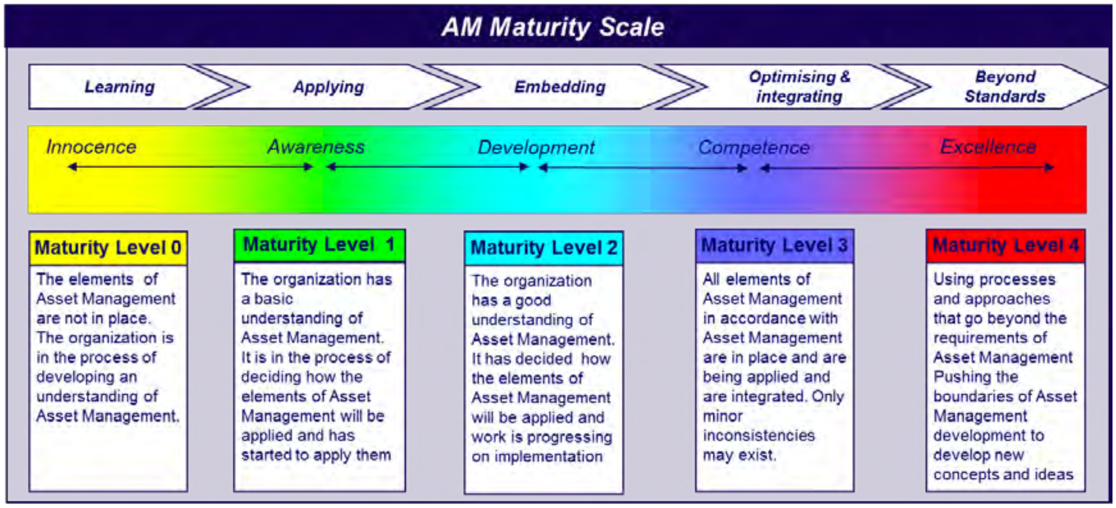
Achieving these benefits means adopting a process model whereby the responsibilities and accountabilities for the different Asset Management roles are clearly defined and understood by personnel. The three key roles in an Asset Management process model are the Asset Owner, Asset Manager, and the Service Provider.

The Asset Owner identifies needs and requirements of stakeholders and sets the business values and risk tolerance levels for the Asset Manager. The Asset Manager then determines what has to be done, when, and where to realize the objectives set by the Asset Owner and agrees on a service level for performing work with the Service Provider(s). In turn, the Service Provider determines how the work is performed while keeping costs to a minimum for the specified levels of work and quality as agreed to with the Asset Manager.

The three roles operate in a chain and need each other to work closely together based on formalized agreements.

EXECUTIVE SUMMARY

Using the methodology described in the *Introduction* above, UMS Group assessed Hydro against ISO 55000 and best practice Asset Management on the following scale:



Notes on the use of the maturity scale:
1 As indicated by the colour transitions, the boundaries of the maturity scale are not hard values
2 Compliance with the AM Standard is at Competence maturity level 3
3 There is no upper limit to excellence as defined by the red colored zone

Overall, Hydro scored a 1.5 with the individual Business Unit Scores as follows: Generation Operations (GO) = 1.7, Transmission = 1.6, and Customer Service & Distribution (CS&D) = 1.3. While these scores may seem low compared to a competence standard of 3, it is important to realize that many North American utilities would rate a 0 (unaware of major Asset Management System requirements) or a 1 (aware of, but not yet developing). In addition, the individual components which make up these average scores ranged from 0.5 to 3.0 corresponding to the fact that while Hydro is fully Competent in some areas, there are others where it is just starting to develop its capabilities.

Against the industry, Manitoba Hydro compares favorably versus North American utilities in terms of its Asset Management maturity level. However, North America lags global Asset Management best practice as embodied by utilities overseas who have been developing their capabilities for more than two decades.

Hydro has followed a typical path along the Asset Management maturity curve by starting with grassroots-led tactical solutions to solve specific problems. As with many utilities, the initial role Leadership played at Hydro with regard to Asset Management has been providing approval and direction when requested. If Hydro seeks to become an asset management-focused company, Leadership will want to place a greater emphasis on the strategic value of asset management, challenge progress within the Business Units, demand accountability for results, and commit the resources needed to achieve its objectives.

Between the three Business Units, Hydro has developed a number of the key components of best practice asset management such as:

- The development of Asset Health Indices (AHIs) and use of Condition Assessment to drive replacement decisions;
- The use of risk (likelihood x consequence), rather than just criticality (consequence) to drive some replacement decisions;
- The use of Reliability Centered Maintenance (RCM) to develop maintenance plans based on specific asset failure modes; and
- The development of Computerized Maintenance Management Systems (CMMS) to tie together asset data, maintenance data, and cost information

In addition, Hydro has already identified a number of existing gaps and plans/actions to close these gaps are underway including:

- The recent adoption of a monetized risk-based decision-support tool for capital planning -- Copperleaf's C55 and the Corporate Value Framework (CVF);
- An alliance with Siemens which aims to develop sophisticated capabilities for managing, maintaining, and evolving Distribution assets; and
- A new CMMS (SAP Plant Maintenance (PM) – Enterprise Asset Management (EAM)) to improve the ability to tie costs to assets

However, there are also a number of key gaps which UMS Group has identified and for which no current initiative is underway to close. Below is a summary of these key gaps along with corresponding key recommendations. A detailed assessment which describes all gaps and all recommendations is provided in the following *Assessment* section.

Key Gaps

The Business Units, and sometimes the functions within the Business Units, have been operating with their own objectives and limits for making asset decisions, as there is confusion over the Asset Owner role. While the Corporate Asset Management Executive Council (CAM EC) has been chartered with most of the responsibilities of the Asset Owner, this role has not been formally communicated to the organization, nor have the Business Units been provided with concise direction on Policy, Strategy, and Objectives, although the CAM does have a plan to develop these over the next few months.

Responsibilities for Asset Management are divided with a lack of clear understanding of what constitutes the Asset Manager and Service Provider roles, as well as what the responsibilities and accountabilities of each are. In addition, the fact that Asset Management has developed independently in each Business Unit and that the Asset Management functions are split within the Business Units has led to a lack of standardization of processes (and systems) and hindered the sharing of best practices.

Risk is a key basis for decision-making in best practice asset management systems and Hydro is increasingly incorporating risk in its asset-related decisions today. However, there are no corporate risk standards, tolerance levels, or risk assessment requirement to guide the Business Units leading to a situation in which risk is being avoided rather than managed.

Some of the key elements of an Asset Management System are missing from Hydro today. These include audits, controls, and performance metrics which Leadership can use to ensure the suitability, adequacy and effectiveness of the system.

Different functions within each business unit have different roles in the asset life-cycle leading to a situation where no one group or function is responsible for optimizing total asset life-cycle cost. In addition, most asset management efforts are focused on Capital spending with minimal attention given to optimizing O&M, which is a key part of the asset life-cycle.

While significant effort is being made to develop and implement sophisticated tools to support Asset Management, there is a lack of formal Data Management and Governance processes and metrics to ensure that sufficient data of sufficient quality is available to use with those tools.

Performance Management at Hydro is currently focused more on compliance than on driving improvement with few metrics available to identify opportunities to continually improve the asset management system.

Key Recommendations

Formally acknowledge the CAM EC's role as the Asset Owner by designating it such with the authority to oversee and approve the development of asset management policy, objectives, risk tolerance, and financial constraints and communicating this role to the organization.

Provide communication on acceptable risk for Manitoba Hydro by defining a risk tolerance level for key strategic objectives, defining a corporate standard for risk assessment, and creating a corporate standard risk register. Establish a formal process to regularly review risks identified by the business units and provide direction as a result of the review.

Decide on and declare the Operating Model for Asset Management – roles, decision-making processes, goals and key performance indicators (KPIs), and the timetable for implementing these changes.

Formalize the Asset Manager and Service Provider roles and clarify accountabilities with regard to responsibilities within the key asset management processes. Group the functions focused on asset management to create a life-cycle orientation in decision-making. Create an Asset Strategist role with overall responsibility for the integrated Asset Life-cycle Strategy. Use this role to develop and document Life-cycle Strategy Plans for key asset classes to optimize total cost

Develop processes and implement tools to address Operations & Maintenance (O&M) spend and the trade-off between O&M and Capital in each business unit. Establish the preeminent role of the Asset Manager in making maintenance decisions, in terms of whether the maintenance is justified by cost versus benefit.

Develop a robust data governance structure to ensure data integrity and validity, and to enable effective data analysis for making asset-related decisions. Identify needed data to support asset management decision-making and assess where data repositories, data collection methodologies, data quality, etc. are out of alignment with needs.

Refine the current Performance Management framework to align asset objectives, plans and KPIs with performance reporting and accountability. Develop metrics for monitoring asset performance, asset management performance, and asset management system performance.

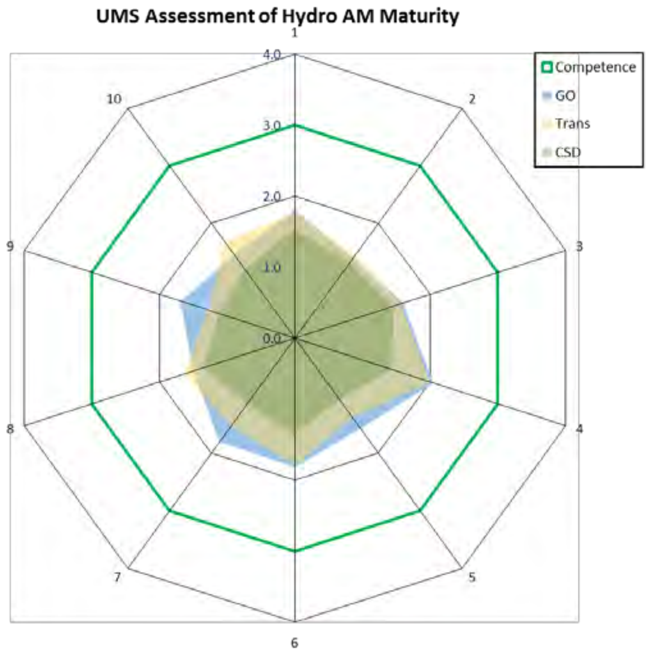
Develop controls and an internal review function for the asset management system to ensure corporate and business-unit level processes and procedures are being followed.

ASSESSMENT

Overall Assessment

UMS Group assessed Hydro against ISO 55000 and best practice asset management using a 0 to 4 scale where 0 = Innocence, 3 = Competence (in compliance with the standard) and 4 = Best Practice.

1	Context of the Organization
2	Leadership
3	Planning
4	Support
5	Operation
6	Improvement
7	Asset Life-Cycle & Risk Strategy
8	Investment Delivery Assurance
9	Performance Management
10	Data Management



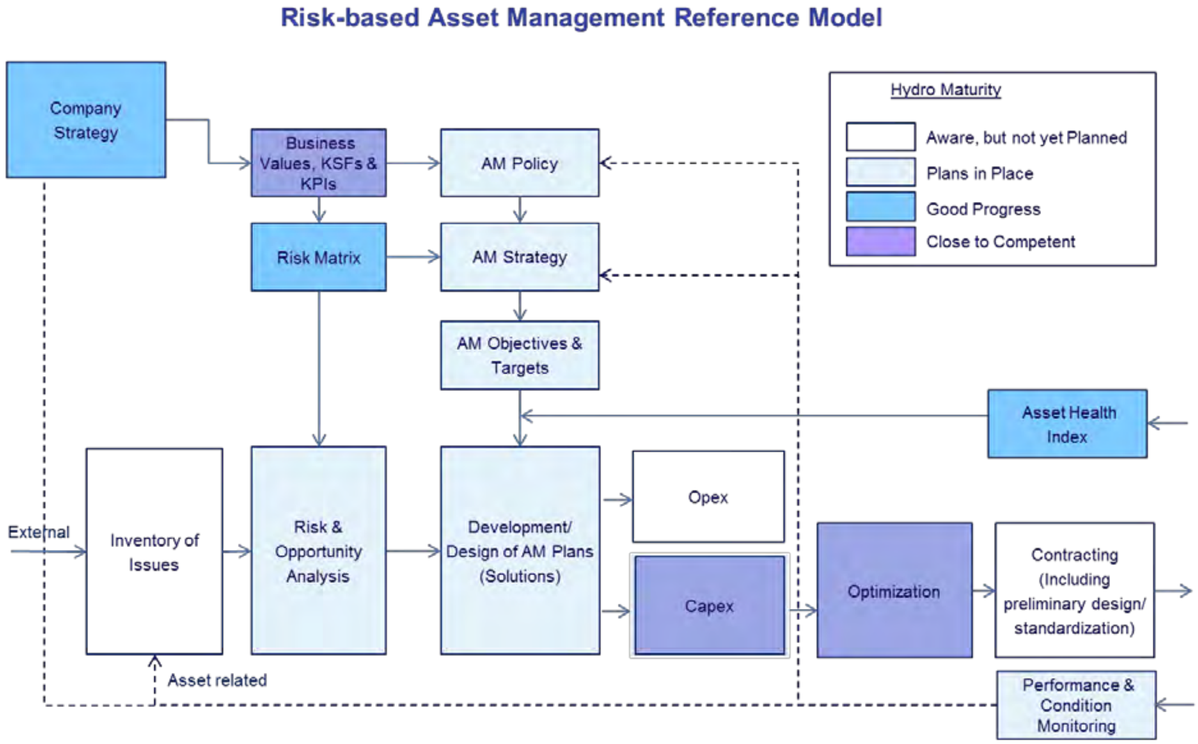
Overall, Hydro scored a 1.5 with the individual Business Unit Scores as follows: Generation Operations (GO) = 1.7, Transmission = 1.6, and Customer Service & Distribution (CS&D) = 1.3.

Each of the 10 domains evaluated has multiple components in which individual scores are averaged. These individual scores ranged from 0.5 to 3, so the averages reflect the fact that while Hydro is Competent in some areas (further described below), it also is missing some key components.

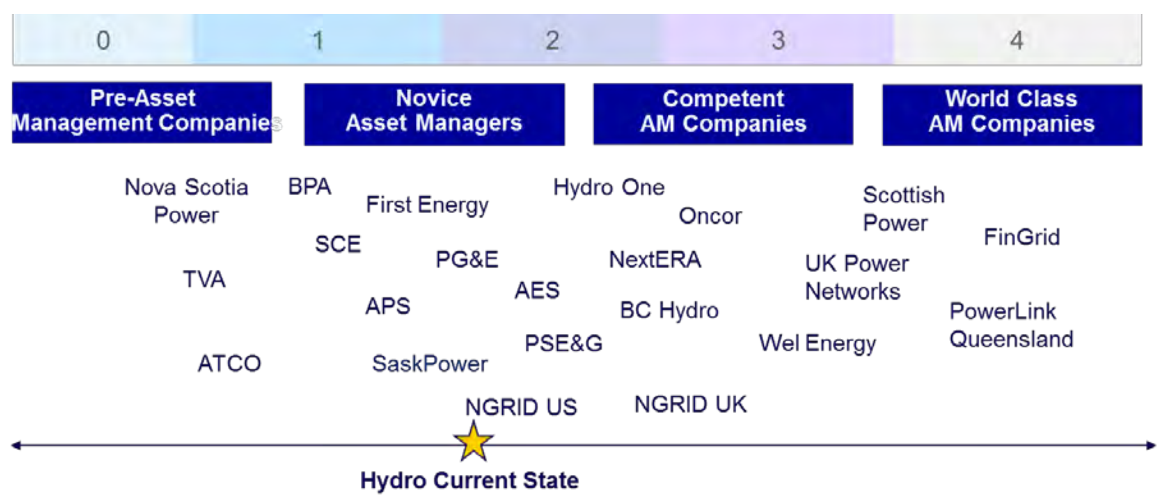
The recommendations provided in this assessment are those that are required to take Hydro to a 3 in every area, which would signify Competence with the ISO 55000 standard. Companies which reach this level, typically push forward towards Excellence (4.0) in a strategic manner where specific areas are targeted for improvement.

The specific level of competence to which Hydro should aspire is a matter for the Corporate Asset Management Executive Council (CAM EC) to determine. While, some of the benefits of Asset Management can be realized with a piecemeal approach, significant improvement only occurs when the entire Asset Management System is functioning at a high level.

The Chart below shows UMS Group's Reference Model for Asset Management. The colored boxes provide an indication of the level of maturity of specific

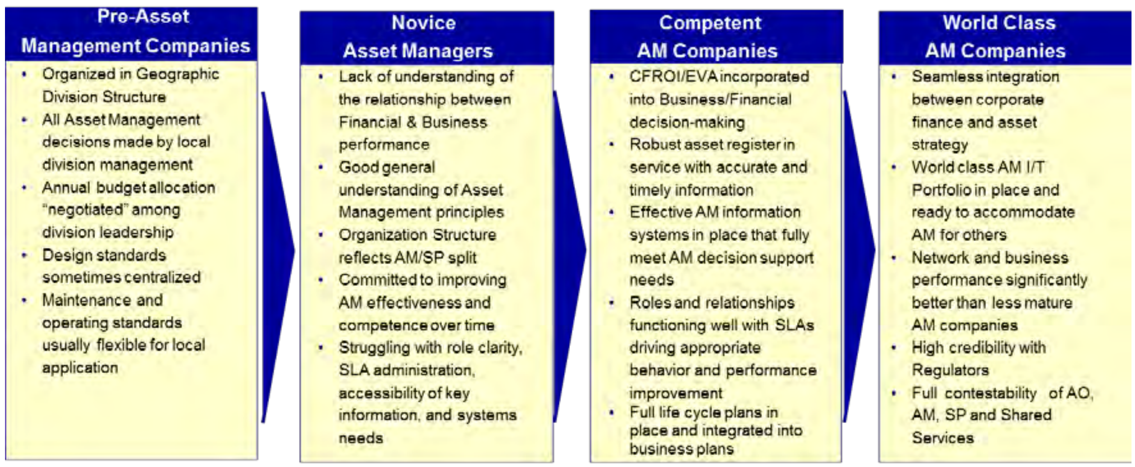


While its score may seem low compared to a competence standard of 3, it is important to realize that many North American utilities would rate a 0 (unaware of major Asset Management System requirements) or a 1 (aware of, but not yet developing). Overall, Manitoba Hydro compares favorably against North American utilities in terms of its Asset Management maturity level, largely as a result of recent progress made (e.g., Capital Investment Optimization-C55, CVF, Asset Health Indices (AHI), Reliability Centered Maintenance (RCM), Failure Curves, etc.).



Note: The above positions reflect UMS' opinion of the relative AM maturity of each company based on a range of source information.

North America lags global asset management best practice as embodied by utilities in Australia, New Zealand, UK, and Northern Europe who have been developing their asset management capabilities for more than two decades and are generally considered global best-in-class. Most North American utilities fall into the Pre-Asset Management or Novice Asset Manager classification. Hydro is on the cusp of moving from the Novice to Competent stage, a process which takes most companies 3-5 years.



As part of its assessment, UMS Group led each of the Business Units through a Self-Assessment of Asset Management Maturity (see Appendix A for details). The table below shows a comparison of the Hydro Self-Assessment scores for each Business Unit, along with the UMS Assessment scores.

	Hydro Self-Assessment			UMS Assessment		
	GO	Trans	CSD	GO	Trans	CSD
Context of the Organization	1.8	1.5	1.9	1.8	1.8	1.5
Leadership	1.8	1.3	1.6	1.4	1.4	1.3
Planning	1.8	1.8	1.3	1.6	1.6	1.5
Support	2.4	2.2	1.2	2.1	2.0	1.4
Operation	2.3	2.0	0.8	1.6	1.4	1.1
Improvement	1.9	2.1	0.8	1.8	1.8	1.4
Asset Life-Cycle & Risk Strategy	1.3	1.6	0.7	1.8	1.5	1.1
Investment Delivery Assurance	1.8	1.4	1.1	1.5	1.6	1.3
Performance Management	1.8	1.1	0.8	1.7	1.3	1.1
Data Management	1.4	1.9	1.0	1.5	1.7	1.2

Detailed Assessment

In its assessment, UMS Group identified a number of gaps in Hydro's Asset Management capabilities and developed recommendations for closing those gaps. These gaps and their corresponding recommendations have been grouped into seven major themes which provide a logical structure for understanding what best practice in that area looks like, what the gaps are for Hydro in that area, and how Hydro can close the gaps in that area. The themes are described below:

- Leadership – Addresses the elements of direction, oversight, and control which are needed to guide the development and operation of Asset Management System at Hydro
- Risk – Addresses the responsibilities of the Asset Owner to establish risk tolerance and standards for risk assessment for the company, as well as to review and direct the application of risk management by the Asset Manager.
- Roles and Responsibilities – Addresses the accountability model for the three key roles in the Asset Management System – Asset Owner, Asset Manager, Service Provider.
- Consolidation of Functions – Addresses the need for organization along process rather than functional lines, as well as the need for a bringing together all pieces of the asset management function to ensure a lifecycle focus on the assets.
- Lifecycle Optimization – Addresses the elements required to ensure that asset decisions are made based on total lifecycle costs. These elements include processes, data, and tools.
- Performance Management – Addresses the components of performance management needed to support asset management. These components include metrics on asset, asset management, and asset management system performance, as well as feedback loops to drive continuous improvement.
- Data and Technology – Addresses the systems and data requirements needed to support the Asset Management System, in addition to data governance and analytical capabilities.

The assessment detailed below is focused on a corporate level and cross-functional assessment. For the individual Business Unit assessments, please refer to Appendices C (Generation Operations), D (Transmission), and E (Customer Service & Distribution).

Leadership

Leadership throughout all levels and across all business units at Manitoba Hydro has been a substantive and critical element in the continuous development of the Asset Management system. Corporate Leadership has recognized the role that Asset Management can play in ensuring that scarce resources are optimally deployed and wishes to further leverage the already considerable progress Hydro has made in this area to achieve greater stability in financial and operational planning, more informed decision-making regarding investment in assets, and enhanced collaboration across the business units.

Best Practice
Leadership demonstrates leadership and commitment to asset management by:

- Ensuring that Asset Management Objectives, Policy, and Strategy are established and compatible with the organizational objectives
- Communicating the importance of effective Asset Management
- Promoting cross-functional collaboration within the organization and continual improvement

Leadership ensures that the responsibilities and authorities for relevant roles are assigned and communicated within the organization.

Leadership exercises control over the Asset Management system to ensure conformity and effectiveness and identify the need for corrective action.

Assessment of Hydro
Corporate Leadership has not formally communicated to the organization its role as the Asset Owner, nor yet provided the Business Units with concise direction on Policy, Strategy, and Objectives. The absence of of a clearly identified Asset Owner at Hydro has led to the Business Units (and sometimes the functions within the business units) operating on their own objectives and limits for making asset decisions, as well as created confusion as to who is being held accountable as the Asset Owner.

The Corporate Asset Management Executive Council will be an important permanent mechanism and is the natural nexus for the role of Asset Owner. It should be formally endowed with that responsibility as well as the task of translating the Business Strategy of the corporation into specific asset management goals and objectives each year.

Similarly, the Corporate Asset Management Steering Committee is an excellent multi-functional body and governance aid for driving Hydro's asset management transformation. Its existence should help channel and accelerate the progress made in Asset Management adoption in each of the three business units by assuring consistency and encouraging shared lessons learned and best practices. The membership is at the right level and has the right diversity to ensure that all required perspectives and capabilities are brought to bear on this significant set of challenges.

Key elements of a mature asset management system that should exist are missing from Hydro today. These include management system audits, controls, and performance metrics which Leadership can use to ensure the suitability, adequacy and effectiveness of the asset management system.

Hydro's assets are long-lived so decisions made today have repercussions decades into the future. The new leadership has yet to express its long-term vision for how it sees the energy industry changing over the next 10, 20, and 40 years, nor for the role that Hydro will play in the industry. Lack of this strategic direction will hamper the Business Unit's ability to develop effective asset strategies to achieve that vision.

Recommendations

1. Decide on and declare the Operating Model for Asset Management – structure, roles (i.e., responsibilities, authorities, accountabilities, internal & external relationships, etc.), decision-making processes, goals and key performance indicators (KPIs), and the timetable for implementing these changes. (Note: more detail is provided in the *Implementing an Operating Model* section below)

2. Formally acknowledge the CAM EC's role as the Asset Owner by communicating to the organization its role in overseeing and approving the development of asset management policy, objectives, risk tolerance, and financial constraints, as well as the responsibility for overseeing the development and update of the Corporate Asset Management Strategy. The Vice President of Strategy and Business Transformation should be added to the CAM EC roster and its charter clarified regarding the responsibility for setting the tolerance/limits that will drive asset-related decision-making. (Note: more detail is provided in the *Implementing an Operating Model* section below)

3. Change the focus of decision-making within the Business Units away from "being the best" towards meeting defined Asset Management Objectives in the most efficient way possible. This means assessing alternatives not solely on their performance or system impact, but also on the cost efficiency of their impact. It also implies an understanding that once an objective has been met, exceeding that objective is an inefficient use of resources that could be more productively applied elsewhere.

4. Develop a formal Asset Management Roadmap and Asset Management Strategy for Hydro. Not only would these documents assist in communicating Leadership's vision for asset management throughout the organization, but they would also provide a guide to ensure that the processes and tools being developed are effectively integrated.

5. Transition to a more competitive process for capital across the Business Units. With the implementation of Copperleaf C55 and the Corporate Value Framework (CVF, Hydro should be able to more directly compare the value of Generation, Transmission, and Distribution projects in terms of monetized risk reduction. While it would be impractical to make the entire capital budget competitive due to resourcing issues, these tools will provide the opportunity to set aside a portion of the budget for competitive projects. This portion should start small and grow over time in line with Management's comfort level with the results.

6. Once the asset management policy, vision and objectives have been clarified, develop and deliver a road show to communicate these changes and their implications for all groups across the organization.

Risk

Hydro is using risk to support its asset management decisions, mainly with regard to Capital Planning. The rigorousness of risk assessment and risk management varies both across the Business Units and within individual Business Units. In addition, risk is just beginning to be monetized (i.e., converted from qualitative impact to a quantitative cost) in most cases, although Generation Operations has been using risk of lost revenue to justify investments. No corporate level risk tolerance has been communicated leading to differing levels of risk avoidance driving decisions made in different parts of the business.

Best Practice

The Asset Owner has defined risk tolerance levels for the key strategic objectives and identified a minimum standard of risk assessment for the Asset Manager

The Asset Owner has established a formal process to regularly review and discuss risks identified by the Asset Manager, and to provide direction to guide decision-making.

A corporate standard and process exists for identifying risks, assessing them against risk tolerance levels, identifying mitigation actions, assigning ownership for mitigation, and tracking action on mitigation. This information is captured in a risk register.

Assessment of Hydro

Risk is a key basis for decision-making in best practice asset management systems. While Hydro is incorporating risk in its asset-related decisions today and implementing more sophisticated risk monetization tools (e.g., C55 / Corporate Value Framework), guidance on and attention to asset-related risk from Leadership has not been provided.

This lack of clear communication on an acceptable “risk tolerance” has led middle managers to use their individual perception of risk levels in the business to make decisions generally resulting in risk avoidance. This risk adverse posture may be too conservative and therefore push up the life-cycle cost of assets due to decisions on design, spares, and maintenance. These factors are targets of opportunity in moving to a more mature Asset Management System in which risk is proactively “managed” rather than “avoided.”

In Generation Operations (GO), outside of Dam Safety, minimal risk assessment is performed on assets. Without asset-level risk assessment, it’s difficult to determine which risks need to mitigated, what opportunities exist to accept more risk (i.e., current risk is below tolerance level), and what strategies should be adopted to manage risk. While GO capital planning processes use risk-based modeling to drive decisions, risk is essentially defined as lost revenue potential. Other types of risk (e.g., safety, environmental, etc.) are not monetized today; however, this should change with the implementation of the CVF.

In Transmission, only HVDC is currently performing risk assessments for their systems and developing mitigation strategies. However, no formal risk register or risk assessment process exists for assessing risk at the asset (rather than project) level for the other Transmission functions. Transmission has made a good start in terms of using risk and criticality in prioritizing projects through development of the System Reliability Risk Model (SRRM) and the Capital Budget Ranking Tool (CBRT). While the SRRM is a quantitative assessment of risk, the CBRT is largely based on a qualitative assessment of risk.

In general, Customer Service & Distribution (CSD) is relatively immature in the measurement and use of risk to drive decision-making. Risk assessment, in most cases, is qualitative and not quantitative. The CSD Business Plan does include a formal high level risk assessment on key threats to the system, and as part of its Asset Condition report, CS&D also has a Risk Evaluation Framework where the different types of risks have been identified, likelihoods developed and risks assessed for the major asset classes. However, this risk assessment is essentially qualitative, rather than quantitative, and does not monetize non-financial risks. Finally, while no risk register exists for electric distribution assets; there is one for gas assets.

Recommendations

7. Provide more oversight and communication on acceptable risk for Manitoba Hydro by defining a risk tolerance level for key strategic objectives, identifying a minimum standard of risk assessment for the business units, and establishing a formal process to regularly review risks identified by the business units and to provide direction as a result of the review.

8. Implement a corporate risk assessment methodology and a risk register addressing each key asset class to identify asset-specific risks, assess them against risk tolerance levels, determine which risks need to be mitigated, create mitigation actions, and track risk status and mitigation.

Roles and Responsibilities

Hydro lacks clarity around the various asset management roles mainly due to a lack of understanding of what the roles are and how they are intended to interact with each other. This lack of clarity has led to a diffusion of responsibilities resulting in a lack of accountability, as well as disagreement over whether some asset management related processes/procedures are rules or suggestions.

Best Practice

The organization has clearly delineated between the Asset Owner (AO), Asset Manager (AM), and Service Provider (SP).

The organization has defined the accompanying responsibilities, authorities, and accountabilities for each role.

Each part of the business understands and accepts the importance of its role in Asset Management.

Assessment of Hydro

The role of the CAM EC as the Asset Owner is not well understood within the organization. In addition, its responsibilities do not appear to be fully understood by all the CAM EC's members.

In each Business Unit, responsibilities for Asset Management are divided and/or unclear. There is a lack of understanding of what constitutes the Asset Manager and Service Provider roles and what the responsibilities and accountabilities of each are. This had led to an environment in which many asset management decisions tend to be made by committee/consensus. The result is that no one is ultimately accountable for the results.

Questionable clarity of goals and responsibilities for individual managers constrains the level of accountability that can be established and enforced. In addition, there is a lack of good practices for holding people accountable and imposing consequences for failure to meet performance targets. For example, measuring productivity across crews, etc. does not seem to be a priority.

Recommendations

9. Formalize the Asset Manager and Service Provider roles within each business unit and clarify accountabilities with regard to responsibilities within the key asset management processes. While the roles do not need to be identical within each business unit, they should be relatively consistent in accountabilities and relationships between key positions. (Note: more detail is provided in the *Implementing an Operating Model* section below)

Consolidation of Functions

The Asset Management functions within Hydro all exist within the business units, rather than at the corporate level. Within each business unit, the various functions are generally spread out among different groups, rather than in one department. In some cases, functions may be duplicated in different departments, to serve specific asset classes that department is responsible for.

Best Practice

The organization appoints (i.e., grants authority to) an owner for each decision and attaches full accountability for the results of the decisions made by that person.

Functional silos are broken apart and restructured into process and responsibility groups.

The organization considers the unique, environmental and political conditions in which it operates and evaluates the trade-offs in synergy and scale versus jurisdictional differences, regulatory drivers and operational uniqueness between functions.

Assessment of Hydro

Asset Management is fragmented across and within the Business Units and the nature in which these silos operate hinders standardization of processes (and systems) and limits the sharing of best practices. While the recent development of an Asset Management Governance Structure (CAM EC and CAM SC) is designed to help remedy this situation, a significant effort will be needed to overcome the existing culture (particularly at lower levels) in which functions and business units are focused primarily on their own interests and responsibilities, rather than those of the company in general.

The fragmentation of Asset Management has also resulted in a duplication of effort and inefficiencies as groups develop their own processes and tools rather than adopt (or modify) those already developed by other groups.

The use of steering committees to make decisions, is a good approach to speed agreement and strengthen ownership. But it will likely slow the rate at which Hydro can make major change in the organization, and will diminish the value Hydro will be able to extract from Asset Management. Compromise is the hallmark of steering committees and usually dilutes the power of resulting decisions. Best performing organizations tend toward decision-making systems that appoint (i.e., grant authority to) an owner for each decision, and attach full accountability for the results of the decisions made by that person.

Recommendations

10. Develop an organizational structure for Hydro which consolidates asset management functions to reduce redundancy and speed development of competency across the corporation. This can either be a centralized model with one Asset Management group serving all the business units, a decentralized model where each business unit has its own Asset Management group, or a hybrid model where some Asset Management functions are in a central group and others are in the business units. (Note: more detail is provided in the *Implementing an Operating Model* section below)

11. At either the Corporate or Business Unit level (depending on the model chosen), group the functions focused on asset management in a single group to create a life-cycle orientation in decision-making. Provide adequate resources to ensure that asset management processes can be successfully executed. (Note: more detail is provided in the *Implementing an Operating Model* section below)

Lifecycle Optimization

Hydro has few processes focused on life-cycle management or life-cycle optimization of the assets. What consideration is given to life-cycles is done in an ad hoc manner with no defined methodology or tools to support such analysis. Hampering Hydro's ability to address life-cycle costs is the fact that the various life-cycle processes are split into different functional groups within the business units. In addition, no single person or group has accountability for managing the assets' life-cycles.

Best Practice

The organization manages its assets with a view towards optimizing the total cost of the asset over its life-cycle.

The organization develops life-cycle strategies for each major asset class which detail how the life-cycle cost of the asset will be optimized while meeting the AM objectives

The organization has an Asset Strategist function which is responsible for the development of the Asset Management Plans for key asset classes

The organization utilizes asset condition data and the probability of failure to drive decision-making about use of sustaining capital.

Assessment of Hydro

There is no assigned accountability for addressing the full asset life-cycle. As different functions within each business unit have different roles in the asset life-cycle (i.e., specifications, procurement, spares, design, construction, operation, maintenance, replacement), decisions are being made to optimize only that part of the life-cycle, resulting in sub-optimization over the total asset life-cycle.

The financial focus of asset management at Hydro is on Capital spending, with minimal attention given to optimizing O&M (i.e., are we doing the right work, are we working efficiently, do we have the right resource mix, etc). This has led to a dearth of processes and tools to support effective decision-making around O&M expenditures, as well as weak productivity management. As operations and maintenance decisions have significant impacts on asset life, life-cycle optimization requires these functions to be managed with the same rigor as capital.

Asset Life-Cycle Plans have not yet been developed for each asset class. This has resulted in the lack of integrated strategies intended to optimize total life-cycle costs. As no clear accountability for Asset Life-cycle Strategy has been assigned, the current ability to generate these plans is questionable.

A relatively advanced Maintenance Engineering function exists with skills (Reliability Centered Maintenance (RCM), Root Cause Analysis (RCA), Preventive Maintenance (PM) Optimization, etc.) which will provide a solid foundation for developing Asset Life-cycle Strategies moving forward. Transmission Apparatus' RCM program is one of the most advanced that we've seen in a North American utility.

In addition, fairly comprehensive condition/inspection strategies and lifecycle approaches have been developed for some critical asset classes. While not full scope life-cycle strategies, these strategies are a step in the right direction.

While capital planning and maintenance planning processes are both strong, they are not integrated so it's difficult to optimize or even understand lifecycle costs when making capital planning decisions, or to trade-off maintenance/capital alternative solutions.

Recommendations

12. Develop and document Life-cycle Strategy Plans (also referred to as an Asset Management Plan in ISO 55000) for the key asset classes, which detail the assets and their current state, evaluate the trade-offs among Asset Management Objectives (including risk), and define an integrated strategy to be followed to optimize life-cycle costs in each area of the asset life-cycle (design, procurement, construction, operation, maintenance, replacement/retirement).

13. Review existing design specifications and maintenance plans with an eye towards life-cycle optimization. Challenge overly conservative, risk adverse standards, and consider varying application based on criticality, age, condition, etc.

14. Create an Asset Strategist with overall responsibility for the integrated Asset Life-cycle Strategy of specific asset classes. This role can be direct in the form of a person who develops the life-cycle strategy with his/her team or indirect in which a person facilitates the integration of content from the various organizations/functions.

15. Develop processes and implement tools to address O&M spend and the trade-off between O&M and Capital in each business unit. This would include establishing the preeminent role of the Asset Manager in making maintenance decisions, modeling the cost/benefit of different maintenance strategies, assessing the value of corrective maintenance vs replacement, and identifying innovative tools and practices for improving maintenance efficiency/effectiveness.

16. Integrate O&M into the existing processes used for optimizing capital spend. This would include using concepts like Asset Health Indices (AHIs), failure probability, and consequence of failure to drive maintenance decisions.

17. Increase the capabilities of processes and tools to enable assessment of the assets as a group. While this type of analysis is performed manually today, existing processes and tools should be adapted to support these analyses. For example, GO shouldn't just consider whether to refurbish a specific unit, but also whether it makes economic sense to maintain smaller and less economic hydro facilities and the dams that support them.

18. Where they don't exist today establish AHIs for all key assets and transition from technical life serving as the basis for driving replacement, to economic life driving such decisions. To the extent possible, AHIs should be based on condition data and failure curves should be based on actual failures experienced at Hydro.

Performance Management

Hydro currently has a performance management framework that is focused on ensuring that work was performed, rather than on identifying opportunities for improvement. In addition, few metrics exist to measure asset management performance or asset management system performance. There is no formal link between asset metrics and investments, so Hydro is unable to ensure that its investments are delivering the benefits promised.

Best Practice

The organization has a set of processes for consistently identifying and implementing continuous sustainable improvements across the business. A framework aligns asset objectives, plans and Key Performance Indicators with performance reporting and accountability, and drives a balance between leading and trailing operational indicators.

There are controls and an internal review function for processes to ensure they are being followed. Additionally, performance metrics are line-of-sight to ensure continuity in performance evaluation and corrective planning.

To assure that investments are meeting their objectives, there is a robust process which ensures that approved investments are delivering the benefits that they are expected to provide. In addition, the performance management framework which supports this Investment Delivery Assurance process tracks budget performance and asset management performance.

Assessment of Hydro

Performance Management at Hydro is currently focused mainly on compliance, with inadequate attention paid to driving improvement. Metrics are designed to ensure work was performed on time and that reliability/availability/safety targets were met, essentially ensuring compliance with processes and procedures. However, they do not provide the degree of insight needed to identify opportunities to continually improve the asset management system.

While a Transmission Asset Strategies function has also been created to propagate best practices across the functions and try to drive consistency across processes within the Business Unit, there is no organized process for identifying asset management best practices/ processes/tools, assessing their effectiveness, and implementing them across the business units. While individuals are participating in industry groups, attending technical conferences, and meeting with vendors, greater efficiency can be achieved with a defined process and assigned roles and responsibilities. Within best practice Asset Management organizations, this process is typically called “Industry Intelligence” and includes benchmarking, new technology monitoring, industry outreach, etc.

Performance metrics are focused mainly on reliability/availability, rather than cost efficiency, making them most effective at monitoring work rather than driving improvement. No metrics exist to measure workforce productivity, work management effectiveness, work quality, etc. Asset performance is measured at the aggregate level rather than at the asset class level and does not tie performance results back to initiatives (i.e., maintenance or replacement) to measure and assure the capture of benefits.

Recommendations

19. Develop controls and an internal review function for the asset management system to ensure corporate level and business-unit level processes and procedures are being followed. The review process should both address the sufficiency of the controls and identify any process issues that may require corrective action.

20. Improve performance accountability by refining the current Performance Management framework to align asset objectives, plans and KPIs with performance reporting and accountability, and drive a balance between leading and trailing operational indicators. Develop metrics for monitoring asset performance, asset management performance, and asset management system performance. While these metrics will differ

somewhat by business unit, they should be consistent in the type of performance they measure.

21. Create a Resource Optimization capability to measure and assure workforce operational effectiveness, efficiency/productivity, and appropriate staffing levels for each business unit and functional groupings within.

22. Create an Investment Delivery Assurance process that tracks execution of approved investments to ensure they are completed, assesses if they are delivering the benefits anticipated, prioritizes work in alignment with business objectives, exercises (or ensures) quality control / quality assurance oversight of work, and drives continuous improvement by the Service Provider.

23. Define and implement a corporate-wide process for identifying and sharing Asset Management best practices. This function would be responsible for identifying best practices in processes, tools, practices, etc. within the Business Units or from outside Hydro, sharing them, and assisting the Business Units in connecting with the right personnel to drive assessment and implementation. This role would be best performed by a corporate level entity, but could also be performed by a team made up of representatives from each business unit.

Data and Technology

Hydro currently lacks formal structures and processes around Data Governance and Data Management. Data quality varies greatly between and within the Business Units with the main driver for quality being use of the data (i.e., data not currently used tends not to be as good quality as that being used). As each Business Unit has developed their own Asset Management/Maintenance Management technology, there is a variety of systems in use with varying capabilities. While some of the systems, such as RMS, have advanced capabilities and perform as well or better than packaged software, the existence of multiple systems performing the same function implies a duplication of effort and inefficient use of resources.

Best Practice

Appropriate enabling technology has been implemented to support the decision making process by providing timely, accurate, accessible data along with tools to support the asset management analyses that need to be performed.

The organization has a data governance structure which ensures data integrity and validity to enable effective data analysis for making asset-related decisions.

There are defined processes for resolving data issues and performance metrics around data quality, consistency and availability.

The organization has a Data Architecture and Asset Register which supports condition, failure, and performance data for assets.

The organization utilizes technology to automate data collection and minimize errors.

Assessment of Hydro

There is no formal Data Governance structure or accountability for Data Quality within the Hydro business units. While efforts are being made to improve and assure data quality within the business units, formal processes and metrics still need some improvement.

Significant effort is being made to develop and implement sophisticated tools for calculating Asset Health Indices (AHIs), determine probability of failure, perform economic modeling, etc. However, it doesn't appear that sufficient condition data currently exists to support these tools on a wide-scale basis.

Current analytical processes and tools to support decision-making using "big data" are rudimentary. This lack of tools has resulted in large condition data sets (i.e., vibration analysis) not being leveraged to the extent possible due to lack of resources to perform unaided, manual analysis.

Different tools and methodologies are being used for key asset management processes. While these tools work well for their intended purpose, this replication of functionality hinders the ability to drive consistent practices across the business unit and is likely an inefficient use of resources.

While some of the Business Units have developed Asset Management Roadmaps/Strategies to guide the development of tools needed to support asset management, there is no such corporate plan to guide efforts or set boundaries for which decisions can be made at the Business Unit level and which at the Corporate level.

The role of Information Technology (IT) in supporting Asset Management is not well-defined in terms of whether it is a control function or support for the Business Units. This has led to a lack of clarity around IT decision-making and been a contributing factor to the number of different systems performing duplicate functions. Hydro has also not set a corporate standard of preference for large, permanent IT solutions that provide consistency and consolidation versus smaller, more flexible approaches which may be less expensive and quicker to implement, but lack integration and may duplicate functionality.

Recommendations

24. Develop a robust Data Governance structure to ensure data integrity and validity, and to enable effective data analysis for making asset-related decisions. The Data Governance structure should have a cross-functional steering group, assigned data stewards in each business unit, clear roles/responsibilities/accountabilities, a defined process for resolving data issues, and performance metrics reported and trended for data quality, consistency and availability.

25. Perform a Data Inventory and Gap Assessment to identify needed data to support asset management decision-making and assess where data repositories, data collection methodologies, data quality, etc. are out of alignment with needs. This will differ by business unit as each has differing levels of data quality. Assess the cost of

collecting needed data vs. the benefit of the data as a precursor to developing a plan to close gaps.

26. Improve AHIs by using more objective, rather than subjective, data; using multi-variate regression to determine weightings, and including failure multipliers (i.e., manufacturer, vintage, operating hours, etc.) as part of the algorithms.

27. Develop a plan/roadmap for improving analytical capabilities to support asset management decision-making using large data sets. The focus should be on moving away from using generic data or averages to support decisions to using very specific data to get to a greater level of granularity. This will likely require new tools as well as new skill sets and perhaps new resources (i.e., data scientists / data analysts).

28. Improve data quality by ensuring that the Field/Plant understands what the data will be used for, highlighting the importance of the data to decision-making, and providing aids to assist in providing good quality data (e.g., examples of degradation/failures, drop-down lists / check boxes, etc.)

IMPLEMENTING AN OPERATING MODEL

In the Assessment above, the first recommendation made is for Hydro to decide on and declare the Operating Model for Asset Management. Asset Management has grown organically at Hydro without a defined Operating Model. This has led to confusion over roles and responsibilities, duplication of efforts, and key gaps in capabilities. While the recommendations above are not listed in priority order (instead they are listed by theme), the Operating Model is important because it defines the key components by which Asset Management will be used to deliver value to its stakeholders. Furthermore, creation of the Operating Model, if done in a collaborative manner, helps build alignment among the Executive Team on the key components – Organization Structure, Roles and Responsibilities, Process Ownership, and Accountability.

Organization Structure

Hydro's current organization structure, with split accountabilities and responsibility for asset management functions diffused throughout the business units, does not provide the optimal platform for enhancing its Asset Management maturity. As identified in the gap assessment, there is significant value in consolidation and reorganization.

There are a number of variations in organization structure used for the Asset Management process model today as multiple approaches to organization can be implemented to successfully manage the business. Typically, the structural variations in organization revolve around the following:

- Where the asset management organization reports within the business
- The level of centralization/decentralization within the Asset Management organization
- The number and focus of groups within the Asset Management organization itself

Various combinations of these can be found within utilities today and competent Asset Management can be performed in a variety of structures as long as roles and responsibilities are clearly defined and processes are in place to support the key asset management functions. Therefore, organization structure decisions are typically driven by existing constraints, culture, and the relative priority of objectives. For example, if resources are constrained or consistency is a key priority, then a centralized model may make more sense. If a premium is placed on keeping close alignment between Asset Management and the Field or there is a desire to identify Best Practices by trialing different methodologies/tools, a decentralized model might be preferred

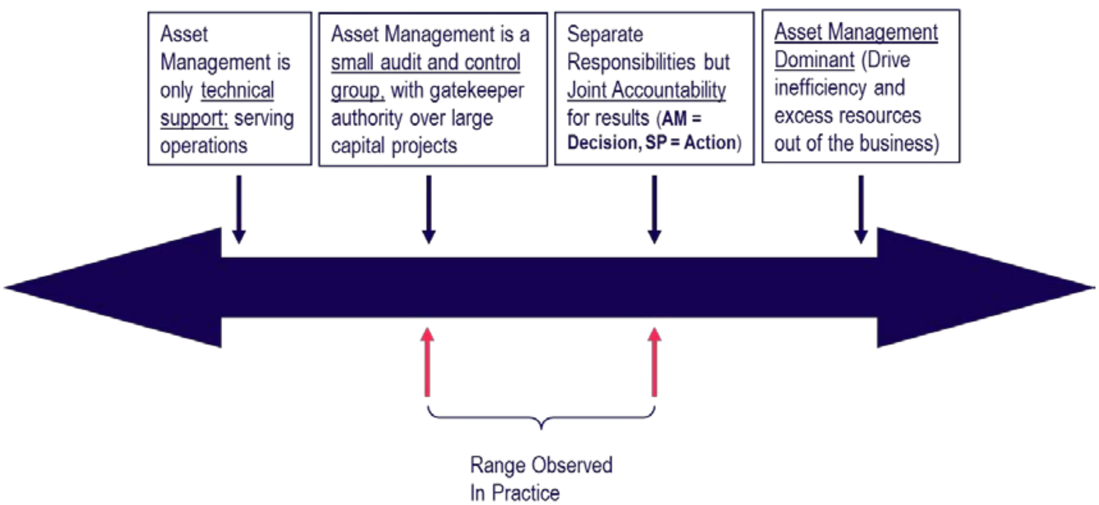
There are also variations in the split of activities between Asset Management and the Service Provider (i.e., the Plant or Field force). These typically occur in the following areas:

- Outage planning and management
- Outsourcing / Contractor Management

- Work planning and scheduling
- Equipment performance management
- Maintenance standards and program design

As with organization structure, the split of activities varies among companies. The key factor is that regardless of the split, Asset Management should have Governance and Oversight of these activities. As long as the oversight is in place, where the actual performance of the activity occurs should not have a significant impact on outcome.

Finally, there are variations in the relationship and degree of separation between the Asset Management group and the Service Provider. These range from "one side dominant" to "balance and partnership." This division is usually driven from historical relationships and authority bases. Getting this relationship correct is a significant element in making the organization work in the Asset Management process model. As with organization structure, the decision where to set this point on the continuum is dependent on the corporation's culture, management style, and objectives.



With regard to the organization itself, there are three main alternatives for an organization seeking to align its structure with best practice Asset Management – Centralized, Decentralized, and Hybrid.

In the Centralized model, there is one corporate Asset Management group which houses all the Asset Manager functions. Typically this group is led by an Executive at the same level of the leaders of the Business Units to ensure it has equal standing in corporate decision-making. The advantages of the Centralized model are as follows:

- Asset Management sponsorship by an Executive with a strong mandate from the CEO and Board can accelerate competence development
- Moving asset strategy decisions from the functional organizations into a central Asset Management group may increase ability to embrace bolder changes
- Provides more consistency in risk management, asset lifecycle strategies, and how tradeoffs are made between Capital and O&M

- Startup cost for new tools and skills development are likely to be lower

The disadvantages of the Centralized model are as follows:

- Requires one additional Executive position
- There is a risk that culture change across the organization may be less sustainable
- Functional Vice Presidents and Division Managers may be less supportive of Asset Management
- Loss of stature among functional managers may raise resistance to Asset Management
- Central group focus on highest leverage areas may disenfranchise and leave other groups behind
- Can lead to misalignment among the executive team and require more direct involvement of the CEO

In the Decentralized model, there is an Asset Management group which houses all the Asset Manager functions within each Business Unit. The advantages of the Decentralized model are as follows:

- Provides a single point of accountability for operating and business results within each Business Unit
- Enables the ability to customize Asset Management solutions to the specific assets within each business unit
- Asset Management sponsorship by functional Vice Presidents can have a larger impact on culture change than a "central program"
- Leveraging lessons learned across three separate Asset Management groups can help accelerate progress

The disadvantages of the Decentralized model are as follows:

- There is a risk of different standards for risk management, asset lifecycle strategies, and tradeoffs between OPEX and CAPEX being adopted across the Company
- Typically takes longer to drive sustainable culture change across the organization
- If Asset Management advocacy by the functional Vice Presidents is tepid, can dramatically reduce the likelihood of success
- Requires more total resources and startup cost for new tools and skills development is likely to be higher

In the Hybrid model, there is a central Asset Management group which houses some of the Asset Manager functions, while others are within each Business Unit. The advantages of the Hybrid model are as follows:

- Supports a more consistent approach than the Decentralized model while also supporting a greater degree of business unit asset strategy customization than the Centralized model
- Reduces some of the duplication of effort found in decentralized structures
- Provides more control over processes that requires greater corporate oversight
- More likely to generate support from functional Vice Presidents than Centralized model
- Having the Asset Strategy function close to the Field (i.e., under the functional Vice Presidents) is more likely to generate support and alignment from Field for Service Provider role

The disadvantages of the Hybrid model are as follows:

- More resource intensive than either the centralized or decentralized model
- Can lead to differing levels of competence in the Functional Areas
- Can lead to confusion on accountability for areas of joint responsibility
- May generate disagreements over "boundaries" between Central group and Decentralized groups

UMS Group believes that any of these models could work for Hydro; however, each comes with its own challenges. The Centralized model would be the most efficient in terms of resource use and would provide the most consistent application of Asset Management. However, it would also likely be the least effective in driving the culture change needed in the Field/Plants to successfully achieve a high level of performance.

The Decentralized model would be the easiest to implement as Asset Management functions are already in the business units today and the close link that already exists between these functions and the field would speed culture change. However, decentralization will require more resources overall and will also require additional effort to ensure consistency.

The hybrid model is a trade-off between these two. By consolidating Asset Management governance and key functions where consistency is most important, Hydro can drive faster change throughout the organization, yet still keep a close connection with the Field in functions like Maintenance Engineering and Life-Cycle Strategy. However, this is likely to be the most resource intensive model and runs the risk of confusion / loss of accountability over results.

Rather than recommend that Hydro adopt a specific model, UMS Group views its role as assisting Leadership in understanding the pros and cons of the different alternatives and facilitating a discussion of which structure makes the most sense for Hydro given its current situation and strategic objectives.

Roles and Responsibilities

Developing an Operating Model will require defining the roles and responsibilities of the Asset Owner, Asset Manager, and Service Provider, as well as designating who in the organization will fulfill these roles.

The Asset Owner's role should be to translate stakeholder needs & objectives into Asset Management business values, critical success factors and key performance indicators. The CAM EC is well positioned to fill this role and should be declared the Asset Owner, with the inclusion of the Vice President of Strategy and Business Transformation as part of this group.

The Asset Manager's role should be to translate the Asset Management business values, critical success factors and key performance indicators into asset investment and maintenance strategies and plans in keeping with the Asset Owner's capital and operating cost constraints and risk tolerance. Specifically, the Asset Manager should:

- Manage and monitor assets
  - Develop and maintain asset register
  - Monitor asset conditions
  - Develop preventive maintenance and diagnostic programs
  - Optimize PM plans based on asset condition and diagnostic program results
- Develop asset strategies and plans
  - Convert owner's needs and objectives into an asset management plan
  - Develop business cases for investments and retirements against a consistent standard
  - Prioritize asset investments given Asset Owner's capital resources and strategy
  - Develop asset life-cycle plans and risk strategies
  - Manage capital projects
- Manage service provider use of assets
  - Provide budgets to Service Provider for routine maintenance and investments
  - Define annual work program and maintenance strategy/standards
  - Monitor and manage service provider performance via Service Level Agreements (SLAs)
  - Define requirements for Service Provider reporting on asset condition
  - Respond to Service Provider's issues with assets

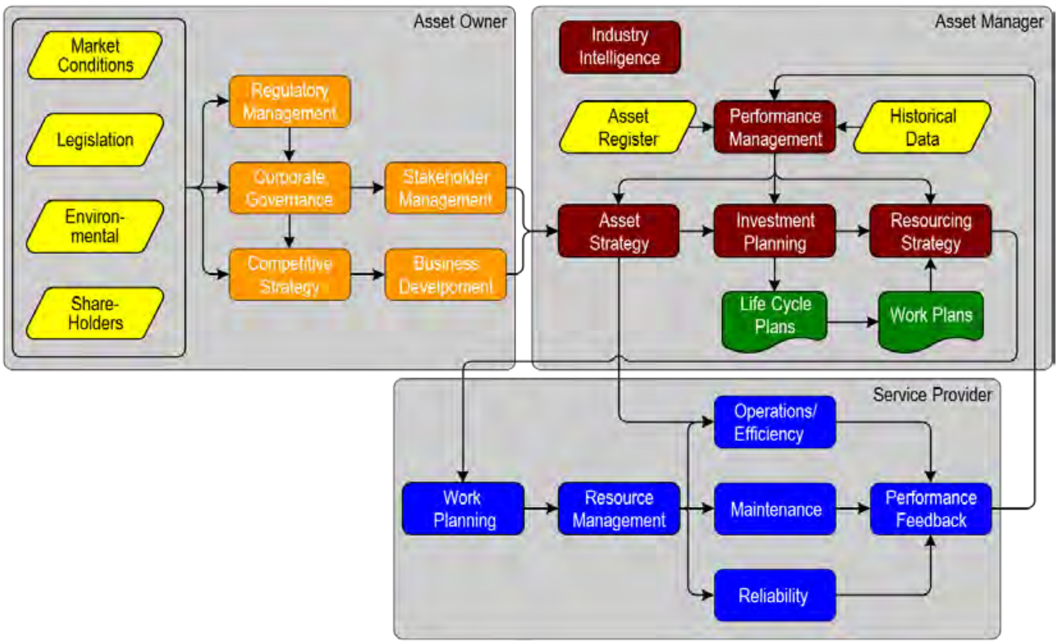
The Service Provider's role should be to operate and maintain the assets in order to achieve the Asset Owner's critical success factors and key performance indicators and within specifications, operating limits, maintenance standards and asset plans set by the Asset Manager. Specifically, the Service Provider should:

- Operate the asset
  - Deliver performance results to the Asset Manager per SLA
  - Operate the assets within specified limits
  - Provide Asset Manager with operational performance data
- Maintain the asset
  - Maintain the assets per the Asset Manager's maintenance plan
  - Provide condition information to the Asset Manager
  - Provide maintenance history and failure analysis data
- Drive continuous improvement
  - Provide recommendations to the Asset Manager and Asset Owner to improve performance and reduce operating costs
  - Manage plant/field work activities to produce results
  - Manage plant/field resources, knowledge and capabilities
  - Drive continuous improvement in safety, productivity, etc.

Identification of which groups/functions should perform which roles is dependent on the decisions made around organization structure. The Maintenance Engineering groups seem to have many of the competencies needed to develop asset life-cycle strategies and would seem to be the natural center for the Asset Manager role.

Process Ownership

As part of defining the Operating Model, there is also a need to ensure that processes are assigned consistent with roles and accountabilities. The Asset Manager has five major processes to perform: Asset and Risk Strategy, Investment Planning, Resourcing Strategy, Performance Management, and Industry Intelligence.



The organization structure which Hydro selects will drive the necessity for having common process ownership in these areas. If a centralized model is chosen, then there will only be one owner for each of these processes and responsibilities will be clear. If a decentralized model is chosen, then for processes which are owned by groups within the business units where consistency is a requirement (e.g., investment planning), Hydro will need to institute common process ownership. This process ownership could be performed by a central group, as in the hybrid model which has a central process owner and decentralized process executors.

Absent a central group to serve as a common process owner, a committee could be used. However, as noted in the gap assessment, management by committee is fraught with difficulties often resulting in compromises, rather than the best solution. In addition, committees are difficult to hold accountable for results, so Hydro should try to avoid this solution if possible.

Authority Model

One of the results of Hydro's current asset management structure is that there is a general lack of accountability for results. Because there is no one group or function with complete responsibility for the assets, there is no one directly accountable for results.

Whether or not Hydro decides to modify its organization structure for Asset Management, it should ensure that accountability for results is clearly defined in the authority model. In addition, the model should focus on establishing behavioral norms biased towards speed of decision making and coordination of action, as well as focusing on improvement rather than just measurement.

A good practice which Hydro should consider implementing is RACI charts for the Asset Management processes (see example chart below). These charts identify the key elements of the process, as well as the functions/personnel involved in the process. Each element and function is charted as either being **R**esponsible, **A**ccountable, **C**onsulted, or **I**nformed. The act of producing these charts requires thought about the Authority Model, identifies unclear or overlapping responsibility/accountability, and provides a tool for communicating roles throughout the organization.

Capital Specifics & IP BLANKETS	Asset Strategy	Investment Delivery Assurance	Transmission Engineering	Distribution Engineering	Substation Engineering	Protection & Telecom Engineering	OH/UG Construction	SPT Construction	Project Management	Project Controls	Procurement / T&D Services	External Affairs	Construction Permitting	Environmental Permitting	Safety	ESO / Operations	Planning, Surveying, Legal

[1] Inside plant for SPT construction v/s outside plant for OH/UG construction
[2] PM R/A for internal and external affairs for external stakeholders
[3] AM responsible for portfolio/program level, PM/controls for project level

Responsible: The person who does the work to achieve the task. They have responsibility for getting the work done or decision made. As a rule this is one person; examples might be a business analyst, application developer or technical architect.

Accountable: The person who is accountable for the correct and thorough completion of the task. This must be one person and is often the project executive or project sponsor. This is the role that responsible is accountable to and approves their work.

Consulted: The people who provide information for the project and with whom there is two-way communication. This is usually several people, often subject matter experts.

Informed: The people who are kept informed about progress and with whom there is one-way communication. These are people that are affected by the outcome of the tasks so need to be kept up-to-date.

CLOSING THE GAPS

Benefits from Closing the Gaps

UMS Group has identified a series of recommendation to close the gaps identified in the report. While all of these recommendations are intended to assist Hydro in improving its Asset Management capabilities, some will have a greater impact than others. The table below lists all recommendations and summarizes the benefits that Hydro can expect to achieve from each.

Number	Area	Recommendation	Benefit
1	Leadership	Decide on and declare the Operating Model for Asset Management	Drive alignment on roles and set expectations for achieving progress on improving Asset Management capabilities
2	Leadership	Formally acknowledge the CAM EC's role as the Asset Owner	Provide clarity on who is responsible for setting the parameters for Asset Management, as well as set the specific limits to bound decision-making
3	Leadership	Change the focus of decision-making away from "being the best" towards cost efficient satisfaction of objectives	Re-align culture to focus on understanding the parameters around optimization and making decisions to meet, but not exceed those parameters
4	Leadership	Develop a formal Asset Management roadmap and Asset Management Strategy	Create alignment around and provide direction to personnel on improving AM competency, as well as accelerating development of capabilities through a timetable and defined plan
5	Leadership	Transition to a more competitive process for capital across the Business Units	Maximize corporate value by increasing optimization of capital spend
6	Leadership	Develop and deliver a road show to communicate changes	Signify to the organization the importance of asset management and demonstrate Leadership's commitment to it
7	Risk	Define a risk tolerance level and establish a formal process to regularly review risks	Provide direction to the Business Units to enable them to optimize on meeting risk tolerance levels, rather than overinvesting in risk avoidance
8	Risk	Implement a risk assessment methodology and a risk register	Provide Leadership with the ability to measure and manage risk and provide the Business Units with direction to guide their decision-making
9	Roles and Responsibilities	Formalize the Asset Manager and Service Provider roles within each business unit and clarify accountabilities	Create understanding and alignment on accountability for asset and risk management decisions. Assists in building organizational alignment - vertically and and horizontally for shifts in traditional roles and authorities.
10	Consolidation of Functions	Develop an organizational structure which consolidates asset management functions	Reduce duplication of effort, eliminate inefficiencies, and drive a more consistent application of processes and tools

Number	Area	Recommendation	Benefit
11	Consolidation of Functions	Group the functions focused on asset management under a single group	Enhance ability to implement a life-cycle orientation and clarify responsibility for decision-making.
12	Lifecycle Optimization	Develop and document Life-cycle Strategy Plans for the key asset classes	Provide platform for addressing and optimizing costs across the asset's life-cycle. Ensure all parts of the organization understand the strategy for the asset.
13	Lifecycle Optimization	Review existing design specifications and maintenance plans with an eye towards life-cycle optimization.	Target spending to achieve the greatest impact on meeting objectives and avoid overspending outside risk tolerance
14	Lifecycle Optimization	Create an Asset Strategist role with overall responsibility for the integrated Asset Life-Cycle Strategy	Provide a single point of accountability for asset life-cycle decisions and ensure a coordinated approach to optimizing across the various life-cycle components
15	Lifecycle Optimization	Develop processes and implement tools to address O&M spend and the trade-off between O&M and Capital.	Provide capability to optimize O&M spend (both life-cycle cost and trade-off with Capital) and ensure clarity around role of Asset Management in making maintenance decisions
16	Lifecycle Optimization	Integrate O&M into the existing processes used for optimizing Capital spend	Optimize O&M spend in terms of efficiency and effectiveness.
17	Lifecycle Optimization	Improve processes and tools to enable assessment of assets as a group	Allow for programmatic analysis above the individual asset level and support optimization at a unit, station or system level
18	Lifecycle Optimization	Establish AHIs for all key assets and transition to economic life to drive decisions	Enable application of monetized risk assessment to large volumes of assets in a consistent and programmatic manner
19	Performance Management	Develop controls and an internal review function for the asset management system	Provide assurance to Leadership on the performance of the asset management system and identify need for corrective action
20	Performance Management	Refine the current Performance Management framework	Focus performance management on continuous improvement to enable increasing efficiency and better asset and asset management performance
21	Performance Management	Create a Resource Optimization capability	Assure workforce operational effectiveness, efficiency, and productivity and identify improvement opportunities
22	Performance Management	Create an Investment Delivery Assurance process	Ensure that approved investments are delivering the benefits that they are expected to provide and drive continuous improvement
23	Performance Management	Define a corporate-wide process for identifying and sharing best practices	Accelerate the Asset Management maturation process and increase the efficiency with which practices and processes are implemented
24	Data and Technology	Develop a robust data governance structure to ensure data integrity and validity	Ensure data integrity and validity and enable effective data analysis for making asset-related decisions
25	Data and Technology	Perform a Data Inventory and Gap Assessment	Provide a framework for developing and applying data standards, as well as for resolving data issues

Number	Area	Recommendation	Benefit
26	Data and Technology	Improve AHI algorithms to be more objective	Make decisions more data-driven improving transparency and accuracy of forecasts
27	Data and Technology	Develop a plan/roadmap for improving Operational Analytic capabilities	Improve decision-making by leveraging big data to get a more granular understanding of condition, failures, and system drivers
28	Data and Technology	Improve data quality through better communication with the Field/Plant	Improve data quality at the source to increase accuracy of data-driven decisions

Prioritizing the Recommendations

At the highest level, the recommendations fit into one of four categories along a continuum of driving performance improvement. There is a logical flow along the continuum, and while exceptions can be made, careful thought should be given to the impact of skipping a step. The categories are as follows:

- Create the Right Environment – These are recommendations which set the tone for the business and signal to the corporation the direction which Leadership wants to go and the importance of the initiative. Recommendations in this category include development of a Vision, Strategy, Objective, or similar corporate policy; declarations around roles, accountably, and controls; and communications from Leadership about the importance of the initiative.
- Design the Change – These are recommendations which focus on the design/development of new processes, structures, or technology to provide new capabilities. Recommendations in this category include organizational structure, roles and responsibilities, governance and oversight, and plans/roadmaps.
- Implement the Change and Work the New Processes - These are recommendations in which the “Design the Change” recommendations are implemented. Recommendations in this category include implementing new processes, undertaking activities to improve existing processes, and making incremental changes.
- Get Excellent – These are recommendations focused on improving already established processes or capabilities to exceed Competence in an area.

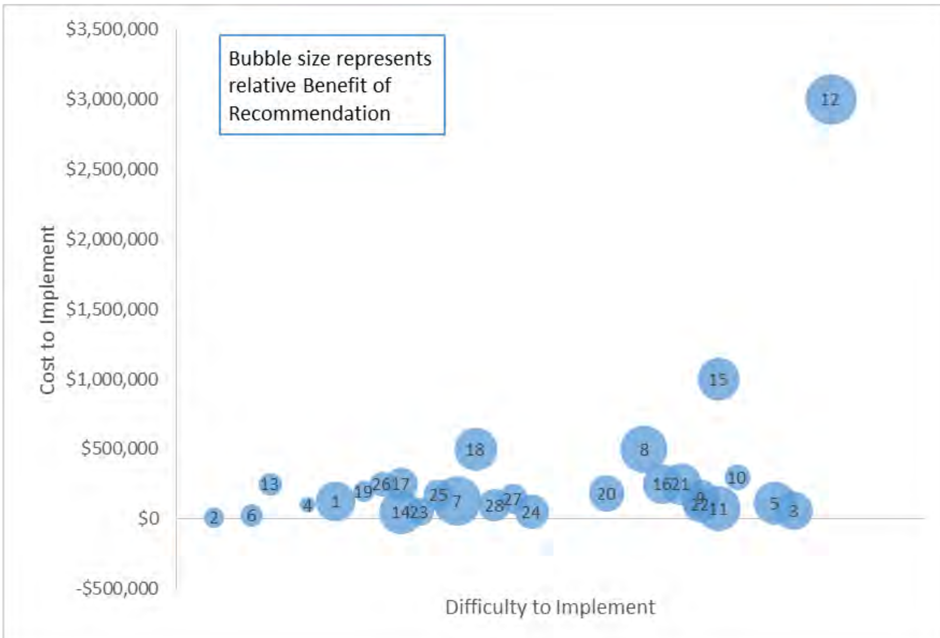
For the 29 recommendations made in the Assessment, UMS Group has designated the category for each on the following pages:

Number	Area	Recommendation	Create the Right Environment	Design the Change	Implement the Change and Work the New Processes	Get Excellent
1	Leadership	Decide on and declare the Operating Model for Asset Management	X			
2	Leadership	Formally acknowledge the CAM EC's role as the Asset Owner	X			
6	Leadership	Develop and deliver a road show to communicate changes	X			
4	Leadership	Develop a formal Asset Management roadmap and Asset Management Strategy	X			
19	Performance Management	Develop controls and an internal review function for the asset management system	X			
3	Leadership	Change the focus of decision-making away from "being the best" towards cost efficient satisfaction of objectives		X		
7	Risk	Define a risk tolerance level and establish a formal process to regularly review risks		X		
9	Roles and Responsibilities	Formalize the Asset Manager and Service Provider roles within each business unit and clarify accountabilities		X		
10	Consolidation of Functions	Develop an organizational structure which consolidates asset management functions		X		
11	Consolidation of Functions	Group the functions focused on asset management under a single group		X		
20	Performance Management	Refine the current Performance Management framework		X		
21	Performance Management	Create a Resource Optimization capability		X		

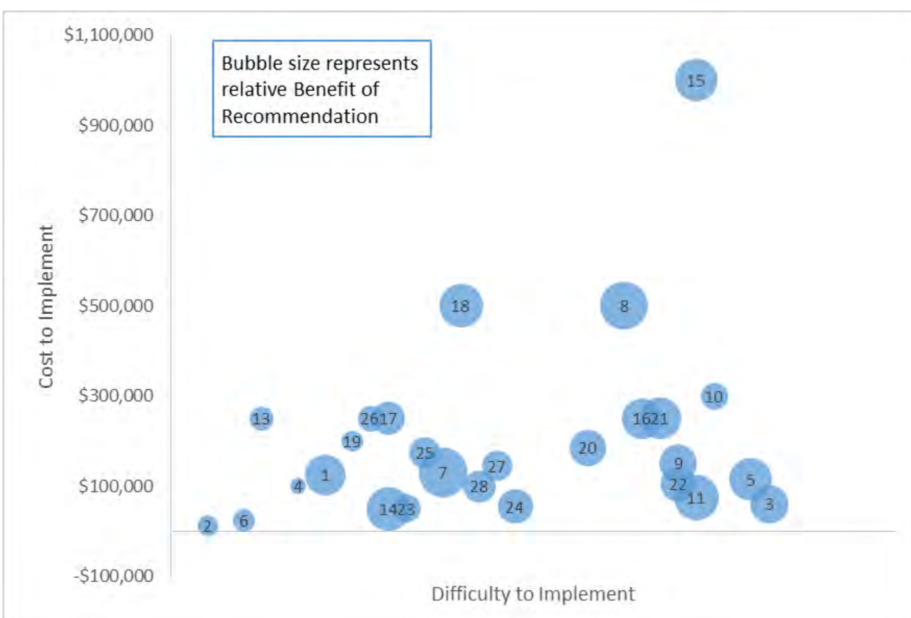
Number	Area	Recommendation	Create the Right Environment	Design the Change	Implement the Change and Work the New Processes	Get Excellent
22	Performance Management	Create an Investment Delivery Assurance process		X		
23	Performance Management	Define a corporate-wide process for identifying and sharing best practices		X		
24	Data and Technology	Develop a robust data governance structure to ensure data integrity and validity		X		
27	Data and Technology	Develop a plan/roadmap for improving Operational Analytic capabilities		X		
5	Leadership	Transition to a more competitive process for capital across the Business Units			X	
8	Risk	Implement a risk assessment methodology and a risk register			X	
14	Lifecycle Optimization	Create an Asset Strategist role with overall responsibility for the integrated Asset Life-Cycle Strategy			X	
15	Lifecycle Optimization	Develop processes and implement tools to address O&M spend and the trade-off between O&M and Capital.			X	
16	Lifecycle Optimization	Integrate O&M into the existing processes used for optimizing Capital spend			X	
17	Lifecycle Optimization	Improve processes and tools to enable assessment of assets as a group			X	
18	Lifecycle Optimization	Establish AHIs for all key assets and transition to economic life to drive decisions			X	

Number	Area	Recommendation	Create the Right Environment	Design the Change	Implement the Change and Work the New Processes	Get Excellent
25	Data and Technology	Perform a Data Inventory and Gap Assessment			X	
12	Lifecycle Optimization	Develop and document Life-cycle Strategy Plans for the key asset classes				X
13	Lifecycle Optimization	Review existing design specifications and maintenance plans with an eye towards life-cycle optimization.				X
26	Data and Technology	Improve AHI algorithms to be more objective				X
28	Data and Technology	Improve data quality through better communication with the Field/Plant				X

While this categorization provides an indication of prioritization in a logical manner, some organizations do not choose to implement all recommendations or may desire to focus in certain areas first. As the recommendations have varying levels of costs, benefits, and difficulty to implement, this decision can be made based either or implementing the "easiest / least expensive" or the "most impactful". To aid in making this decision, UMS Group has assessed each of the recommendations on these factors and created the chart below to provide a relative comparison between them (note the number can be linked to the recommendation in the table above).



The table below has recommendation "12" removed to make it easier to distinguish among the lower cost recommendations.



Potential Issues/Challenges

Asset Management is often difficult to implement and requires tackling specific barriers. These challenges include:

- Silo Thinking - Departmental, functional or regional barriers exist preventing collaboration and shared solutions. This is usually due to strong local management personalities, non-aligned performance/reward mechanisms or organization size and hierarchy
- Short Term Thinking – The total lifecycle is not taken into account, especially where success is often measured as 'on time' and 'on budget', irrespective of subsequent asset performance and value of the work
- Conflicting Performance Measures - Capital and operational spending is usually budgeted separately rather than integrated in terms of asset needs. Even 'balanced scorecards' can reinforce such competing priorities
- Business Focus - Engineers and operational management do not traditionally speak the same language as finance, executives and external stakeholders
- Risk Management - There is limited comprehension of the need for rational and consistent identification, quantification and management of commercial, technical, safety, customer/public perception and other infrastructure risks
- Data/Technology – There is not enough data or it is of inadequate quality or the wrong sort. IT software and hardware infrastructure is not aligned with the business requirements

In addition, organizational capabilities at three levels are critical for achieving world class business performance. At the Leadership level, there is a need for a clearly understood vision, agreed priorities and a well-articulated strategy on how to be a successful organization in an increasingly challenging market. At the organizational level, there is need to have effective processes, information technology, and infrastructure to support business goals. At the individual level, employees need to be able to co-ordinate work effectively, acquire new business, leadership and team practices and skills, and replace old practices and ways of working.

Finally, to fully succeed in building Asset Management competencies, Hydro needs to make changes to its culture. This will require development and implementation of a Change Management Plan designed to address the often forgotten "soft" people issues (leadership, skills, culture, etc.) related to a major business transformation. This plan (likely multiple plans to go along with different initiatives) will need to be executed in parallel with other planned implementation activities (e.g. new processes, systems, organization redesign, etc.). Key elements of the Change Management Plan should include a Vision which lays out the case for changes, an Organizational Readiness and Impact Assessment which identifies the potential enablers and barriers to change, and a Communication and Stakeholder Management plan to ensure a consistent message is put forth.

Monitoring Progress

Performance measures should be put into place in order to ensure that the recommendations are implemented effectively and that Asset Management capabilities are in fact improving. These measures should include ones to track overall progress on implementing Asset Management transformation initiatives, as well as ones to track success in performing Asset Management. Below are examples of the types of metrics that should be tracked. Specific metrics should be developed during the implementation planning phase.

Asset Management Transformation Initiative Metrics:

- Number of tasks completed on schedule
- Number of tasks completed on budget
- Number of communications to employees on Asset Management
- Number of asset life-cycle strategies completed

Asset Management Performance Metrics:

- Equipment outage rate (number of forced and fault outages as % of total asset class)
- Equipment failure rate (number of major failures as % of total asset class)
- Equipment maintenance spend rate (avg. $ of maintenance per asset – by asset class)
- Downtime as a proportion of total operating time (%)
- Number of service interruption per month (by asset class)
- % of AHI distribution good or fair (trend)
- Unplanned capital expenditure/total capital expenditures
- Corrective Maintenance cost / Preventive Maintenance cost (by asset class)
- Emergency maintenance cost / Total maintenance cost (by asset class)
- Maintenance Backlog (cost of maintenance due / average annual maintenance expenditure)
- Preventive Maintenance Compliance %
- Asset Sustainability Ratio (sustainment capital expenditure / depreciation expense)
- Asset Consumption Ratio (current value of asset class / current replacement cost of asset class)
- Percent of Assets with complete, correct demographic data in Asset Register
- Percent of Work Orders with correct failure codes entered by Field

APPENDIX A – GAP ASSESSMENT METHODOLOGY

Basis for the Assessment

The assessment of Hydro's asset management maturity was performed against both international standards for asset management systems (ISO 55000 and PAS 55) and industry best practice. The international standards are focused on the requirements for an asset management system and provide guidelines for the application of the specified requirements.

While these standards provide guidance on what is needed to set-up, operate and maintain the asset management system, they do not provide much insight or detail on how to do so. Therefore, UMS Group has also assessed Manitoba Hydro against its own proprietary Strategic Asset Management (SAM) framework which is aligned with industry best practice in application. The SAM framework is fully compliant with both ISO 55000 and PAS 55, but is more focused on the "how" of asset management, while the standards are focused in the "what." It is also focused specifically on the utility industry.

Combined, these two approaches were intended to provide a holistic view of Hydro's current level of asset management maturity and inform the gap analysis to ensure that actionable recommendations are provided to enable implementation of significant improvement opportunities

Interviews

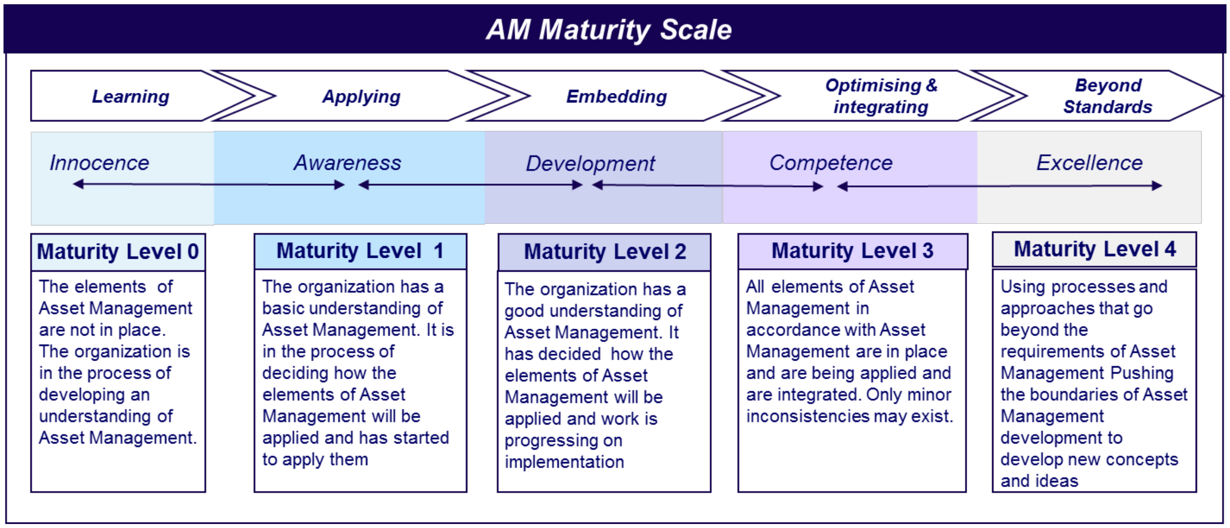
UMS Group held initial interviews with Hydro Leadership to gain some historical context on the development of asset management in the organization, understand their view on perceived gaps/issues, and ascertain their objectives for the engagement. Subsequent to the Executive Interviews, UMS held individual interviews with key personnel in the Generation Operations, Transmission, and Customer Service and Distribution business units. These interviews were designed to understand the current asset management system in terms of processes, tools, and practices. Roles and responsibilities for key asset management functions were also explored.

Workshops

UMS Group facilitated separate workshops with personnel in each of the Generation Operations, Transmission, and Customer Service and Distribution business units (25 personnel in total participated) to perform a self-assessment of Asset Management maturity. The workshops had two objectives:

- Educate personnel on the principles of best practice Asset Management per international standards
- Gain alignment around the current maturity level of Manitoba Hydro with regard to these principles

The main body of the workshop comprised of an explanation of the key requirement of an Asset Management System (per ISO 55000 and PAS 55), as well as the key Asset Management Processes. Discussion was then held with the participants on what maturity in that area meant and where the participants thought the business unit should be rated today versus the maturity standard. The scoring was based on the current level of maturity on a scale where 0=innocence and 4=excellence. Compliance with the Standard is at a competence maturity level of 3 and there is no upper limit to excellence.



The workshops were designed to provide a better understanding by the participants of not only what best practice asset management looks like, but where there is agreement (or disagreement) over where gaps exists and the size of those gaps.

- **Context of the Organization** – When establishing or reviewing the Asset Management System, the organization should take into account its internal and external contexts. External context includes social, cultural, economic and physical environments, as well as regulatory, financial and other constraints. The internal context includes organizational culture and environment, mission, vision and values of the organization.
- **Leadership** – Top leadership is responsible for developing the asset management Policy and asset management Objectives and for aligning them with the organizational objectives. Top management should create the vision and values that guide policy and promote these policies inside and outside of the organization.
- **Planning** – The organizational objectives provide the overarching context and direction to the organization's activities, including its asset management activities. They are generally produced from the organization's strategic level planning activities and are documented in an organizational plan. The principals by which AM is applied should be set out in an asset management Policy and implementation documented in a Strategic Asset Management Plan (SAMP).
- **Support** – Collaboration of resources is a critical component in an asset management System. Asset IT Systems can be extremely complex and it is vital for an organization to create, control and document the necessary information and data as a critical function.

- **Operation** – The asset management System can enable the directing, implementation and control of its asset management activities, including those that have been outsourced. Functional policies, technical standards, plans and processes for implementation of the asset management plans should be fed back into the design and operation of the asset management System. Planning changes to asset management processes or procedures are required and will introduce additional risk and must be continually evaluated.
- **Performance Evaluation** – The organization should evaluate the performance of its assets, its asset management and its asset management system. Performance measures can be direct or indirect, financial or non-financial. Asset performance evaluation is often indirect and complex and the transformation of data into information is a critical component. Monitoring, analysis and evaluation of this information should be a continuous process and the results of performance evaluations should be used as inputs into management reviews for continual improvement.
- **Improvement** – An organization's asset management system is likely to be complex and continually evolving to match its context, organizational objectives and its changing asset portfolio. Continual improvement is a concept that is applicable to the assets, the asset management activities and the asset management system, including those activities or processes which are outsourced.
- **Asset & Risk Strategy -** The decision making process that determines how assets are to be added, removed, and maintained. System Planning, Standards, and Maintenance Optimization (Condition Based Maintenance, Reliability Centered Maintenance, Economic End of Life), and Risk Assessment are all critical elements of the Asset Strategy process. Life Cycle Planning is included in this process.
- **Investment Planning -** The analysis and optimization of all capital and O&M spending. All work and investments are prioritized in this process through an evaluation of business drivers and risk (financial, technical, and socio-political) in order to ensure that projects are selected that provide the greatest financial and customer returns.
- **Performance Management -** The Performance Management framework measures the performance of assets, processes, and people, analyzes identified performance gaps and points to possible gap closure solutions.
- **Resourcing Strategy -** The activities necessary to add, remove and manage service providers, whether they be internal or external.
- **Industry Intelligence –** An organized process to identify, assess, and utilize industry best practices to continually assess and modify policies/procedures/processes to ensure improvement remains a priority throughout the organization.

UMS Group also performed a workshop with each of the Business Units which comprised a comparative walkthrough of their Asset Lifecycle and Risk Strategy process against best practice standards. Through a review of the steps in a model process and a group discussion on how the process matched up to Manitoba Hydro, areas of agreement and areas in contention regarding the current and future state of the process were identified.

APPENDIX B – LIST OF PERSONNEL INVOLVED (INTERVIEWS AND WORKSHOPS)

Corporate, HR and IT Interviews		
Kelvin Shepherd	Darren Rainkie	Lorne Midford
Shane Mailey	Brent Reed	Bryan Luce
Siobhan Vinnish	Sandy Bauerlein	Rob Lanyon
Brad Ireland	Domenic Pellegrino	

Generation Operations Interviews		
Joel Wortley	Val Yereniuk	Rejan Sayak
Hal Turner	Gary Bishop	Terry Miles
Kathy Allard	Karla Skulmoski	John Kreml
Reed Winstone	Don Ans	Krista Halayko
Dave Bowen	Brian Fox	Bob Dandenault
Transmission Interviews		
Gerald Neufeld	Derek Acres	Scott Simons
Rajitha Perera	Kyle Zevena	Joe Petaski
Kerry Walker	Bagen Bagen	David Swatek
Brent Jorowski	Dave Osmond	Glenn Penner
Mark Adamkowicz	John McNichol	Michelle Rheault
Distribution Interviews		
Mark Prydun	Owen Preston	Ken Hamilton
Corey Senkow	Dave Petursson	Jeff Shabaga
Rob Isaac	Kristin Braid	Chuck Steele
David Dudar	Graham Eason	Jesse Perry
Jared Waddell		

Generation Operations Workshop Participants		
Joel Wortley	Don Ans	Rejan Sayak
Hal Turner	Gary Bishop	Kathy Allard
Krista Halayko	Karla Skulmoski	
Transmission Workshop Participants		
Brent Jorowski	Kelvin Kent	Scott Simons
Rajitha Perera	Greg Parent	Gary Lussier
Kerry Walker	Treffle Aussant	
Distribution Workshop Participants		
Jared Waddell	Rob Issac	Dave Petursson
Graham Eason	Chuck Steele	Corey Senkow

Knight Piésold CONSULTING

NFAT REVIEW OF KEEYASK AND CONAWAPA GS

KNIGHT PIESOLD INDEPENDENT EXPERT CONSULTANT HEARING PRESENTATION

CONSTRUCTION MANAGEMENT AND CAPITAL COSTS

M J Robertson, P. Eng.

April 14, 2014

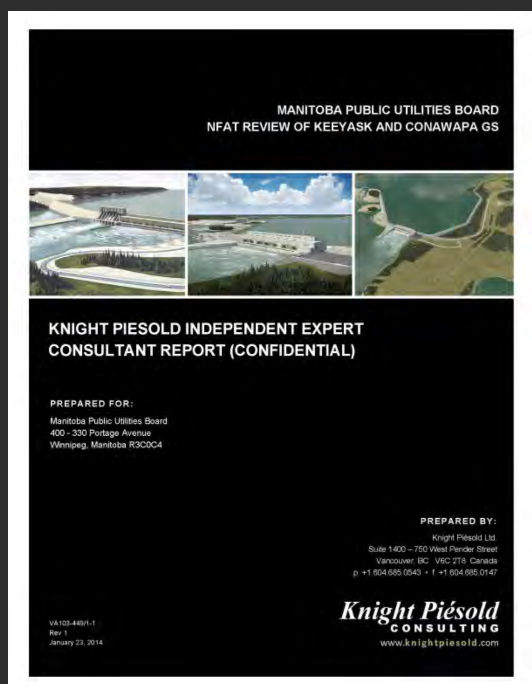
Documents

- Documents and Materials
  - KP Report VA103-449/1-1 Rev 1 of Jan 23, 2014 (CSI).
  - KP Report VA103-449/1-1 Rev 1 of Jan 23, 2014 (Redacted).
  - KP Report VA103-449/1-2 Rev 0 of April 8,2014 (CSI).
  - KP Report VA103-449/1-2 Rev 0 of April 8,2014 (Redacted).
  - KP IRs to Hydro.
  - KP responses to IRs (a few contain CSI).
  - References quoted in those reports (but not separately provided).
  - Information provided by MH (mostly CSI in hard blue paper copy and some emails).
- KP reports produced by me and Boris Fichot and other KP engineers under my supervision and control. Versions quoted are final (no revisions, updates or corrections). (Note CSI version of second report erroneously still labelled Rev A of February 18, 2014). CSI content will be provided tomorrow

Scope

- Scope of work provided by a number of questions posed by PUB. Answered in two reports – first had 9 questions (#1 to #9), second had a further 8 (#S1 to #S8).

- Some data in first 9 is updated/changed in second 8.

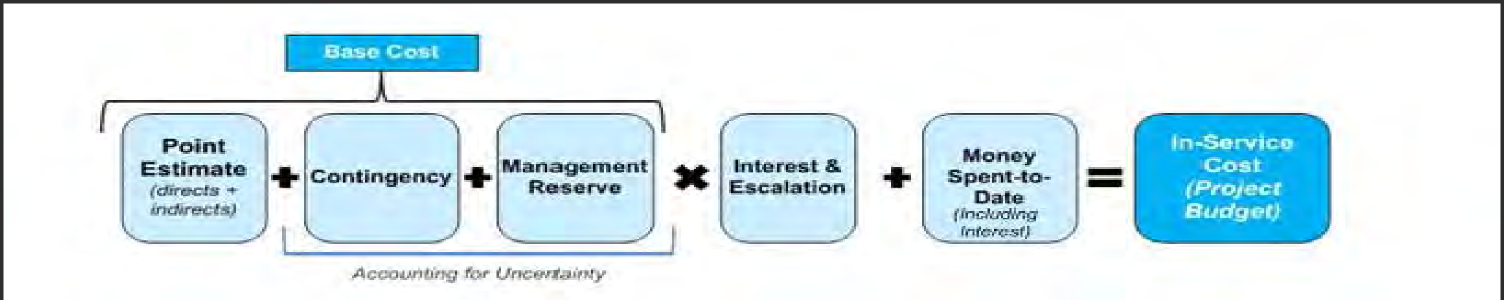


Knight Piésold

Question 1

"Review and assess Manitoba Hydro's capital and operation and maintenance (O&M) cost estimates for Conawapa GS and Keeyask GS, including the adequacy of management reserves for the projects."

General Methodology for Capital Cost Estimate **(p.11 of KP Report)**:



"Point Estimate" is essentially "Best Estimate". Comprises Direct and Indirect Costs:

- **"Direct Costs"** are those directly related to doing the generating station work e.g. labour, materials and equipment.
- **"Indirect Costs"** are all other capital costs e.g. provision of site infrastructure and services, engineering and project management and environmental activities (see detail in Question 2).

Question 1

Allowances are made for the Uncertainties (in the Point Estimate) through Contingency which includes:

- Systemic Risks (Systemic risk relates to items resulting from the project "system").
- Project Specific Risks (uncertainties specific to Keeyask and Conawapa (e.g.). Latter includes: foundation conditions, northern weather, delivery delays, Constructability, resource availability, and quality issues.

Assessed at the P50 level i.e. there is 50% probability that the final project cost will be less than the chosen number and 50% probability that it will be more **(p.24)**.

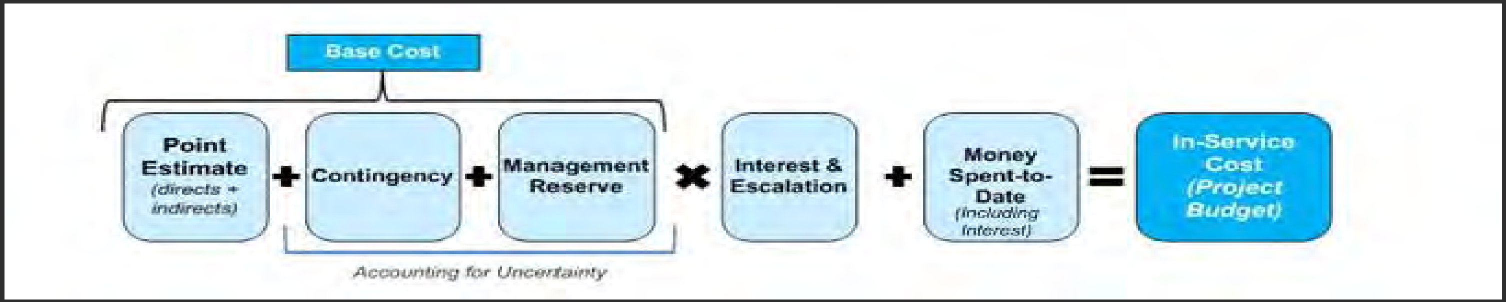
Question 1

- "Management Reserve" – Two specific risks included:
  - Escalation Reserve. Escalation at CPI is included in the Point Estimate. The reserve makes provision for escalation in excess of this amount.
  - Labour Reserve. A special pool of money has been set aside to cater for the possibility of labour costs and/or productivity being different from assumed (in the Point Estimate).

  These reserves set up as a direct result of the Wuskwatim experience (see Question 9).

"Contingency" usually includes Management Reserve but MH have chosen to split them up, if only because the two allowances are managed differently within MH.

Question 1



Point Estimate + Contingency + Management Reserve = **"Base Cost".**
Base Cost is expected final cost before adding:

- the effects of interest on borrowed capital and escalation, and
- money spent to date.

Adding these to the Base Cost provides the **"In-Service Cost".**

Question 1

High Level Comparison of Capital Cost Estimates of Similar Projects in Canada (p.8)

Name	Prov.	Proposed Installed Capacity (MW)	Estimated Average Annual Energy (GWh)	Total Estimated Capital Cost	M$ / MW	M$ / GWh	Source:
Muskrat Falls	NL	824	4,600	6.2 B$	7.5	1.35	Muskrat Falls Review
Site C	BC	1,100	5,100	7.9 B$	7.2	1.55	Site C information fact sheet.
Petit Mecatina Projects	QC	1,200	5,500	not available for review			
La Romaine	QC	1,550	8,000	6.5 B$	4.2	0.80	www.aecom.com
Keeyask	**MB**	**695**	**4,400**	**6.2 B$**	**8.9**	**1.40**	**NFAT Filing**
Conawapa	**MB**	**1,485**	**7,000**	**10.2 B$**	**6.9**	**1.45**	**NFAT Filing**
Wuskwatim	MB	200	1,520	1.78 B$	8.8	1.17	Actual Final

Question 1

Operation and Maintenance Costs have been estimated by MH as follows (p.32):

	Average Lifetime Fixed O&M Cost (2012$)/kW/year	Installed Capacity (MW)	Average Fixed O&M Cost (M 2012$)/year
Keeyask G.S.	17.86	695	12.4
Conawapa G.S.	10.28	1,485	15.3

Costs include:

- Wages, salaries and benefits and training in initial years.
- Insurance.
- Partnership expenses.
- Internal administrative costs.
- Internal and external (consulting) environmental services.
- Accommodation.
- Capital maintenance (in later years) – upgrades, replacements and refurbishments as required.

Question 1

Conclusions on Question 1 regarding capital cost estimates:

- MH's estimating process has been thorough, based on detailed design, estimation of quantities, initial bottom-up approach to unit rates (2009/2010), major updating to 2012 based on results of Wuskwatim, inclusion of allowances for uncertainty.
- There is more clarity in the MH process over direct costs than indirect (see Question 2).
- Many jurisdictions use higher value than P50 estimate to establish contingency (but a significant number of others do not: use P50).

Regarding Operation and Maintenance Costs:

- Estimated costs are commensurate with similar hydro projects elsewhere in Canada.

Question 2

"Review and assess Manitoba Hydro's construction indirect costs including access roads, campsites, and off-site mitigation costs for Conawapa GS and Keeyask GS"

- Indirect Costs include all temporary and permanent items not directly associated with the primary structures but still required to successfully implement the project **(p.34)**:
  - Preconstruction costs.
  - Site infrastructure including access roads and campsites.
  - Site services.
  - Engineering and project management.
  - Environment and mitigation activities.
  - General expenses including consultants, travel, site office, insurance.
  - First Nation participation payments.
- Much of the construction work provided in the Keeyask Infrastructure Project, KIP. KP found the information provided by MH to be sensible but could not offer an opinion on costs like internal MH project management and other costs and general expenses.
- Indirect costs exclude related costs to date (or money spent).

Indirect costs stated by MH to form approx. one third of the Point Estimate.

Question 3

"Review and assess Manitoba Hydro's construction management, schedule, and contracting plans for the design, engineering, procurement, construction, start up, commissioning, testing, and commercial operation of Conawapa GS and Keeyask GS"

MH have created a Project Execution Plan (PEP) for the Keeyask Project **(p.40)**. It is a high-level management guideline which:

- Describes the means, methods, tools and techniques used to manage the KIP and the KGSP.
- Serves as a record of the planning effort undertaken by MH for the construction phase of the project.
- Serves as a resource for staff to ensure the project is managed consistently.

Question 3

The PEP is backed by MH Corporate Policies and Standards:

- Total Cost and Schedule Management (TCSM) Standard.
- Monitor and Control of Engineering Consultants Standard.
- Preparation of Project Dashboards and Trend Analysis Standard.
- Project Change Authorization (PCA) Process.
- Work Package Change Management Process.
- Consultant Communication Plans.
- Division Plan for Managing the Consultants, and
- Engineering Work Package Scope Sheets (EWPSS).

KP is able to see that Hydro has good procedures in place for the management of the projects despite the PEP presently being in draft form only.

Question 3

Contracting methods considered by MH for the various contracts included (p.42):

- Fixed Price Contract (FPC) (or EPC – Engineer, Procure, Construct).
- Cost Reimbursable Contract (CRC).
- Direct Negotiated Contract (DNC).
- Unit Price Contract (UPC).
- Supply Only Contracts (LS).

For contracts seen by KP, apparent that MH has made appropriate choices for different contracts e.g. FPC for turbine generating equipment and CRC for main civil works.

Main civil works contract (GCC) also utilising Early Contractor Involvement (ECI) process to obtain input from chosen contractor to refine design, construction technique, schedule and risk sharing.

Question 3

The Preferred Development Plan includes an implementation schedule. Schedules are also provided in the Basis of Cost Estimate documents. The schedules are consistent with the described developments and the anticipated work breakdown structures.

A more detailed and complete schedule for Keeyask was included with the Tender Package for the GCC. All tenderers essentially confirmed the schedule as part of their bids. The construction schedule is being refined as part of the ECI process.

The schedules do not include details of time needed for input by MH, such as reviews by themselves or independent engineers.

The PEP for Keeyask states that execution will follow the Hydro Cost and Schedule Standard (CSS) for schedule management.

Knight Piésold

Question 4

"Review and assess Manitoba Hydro's capital cost and O&M cost estimates for wind, natural gas combined cycle gas turbines, and solar facilities."

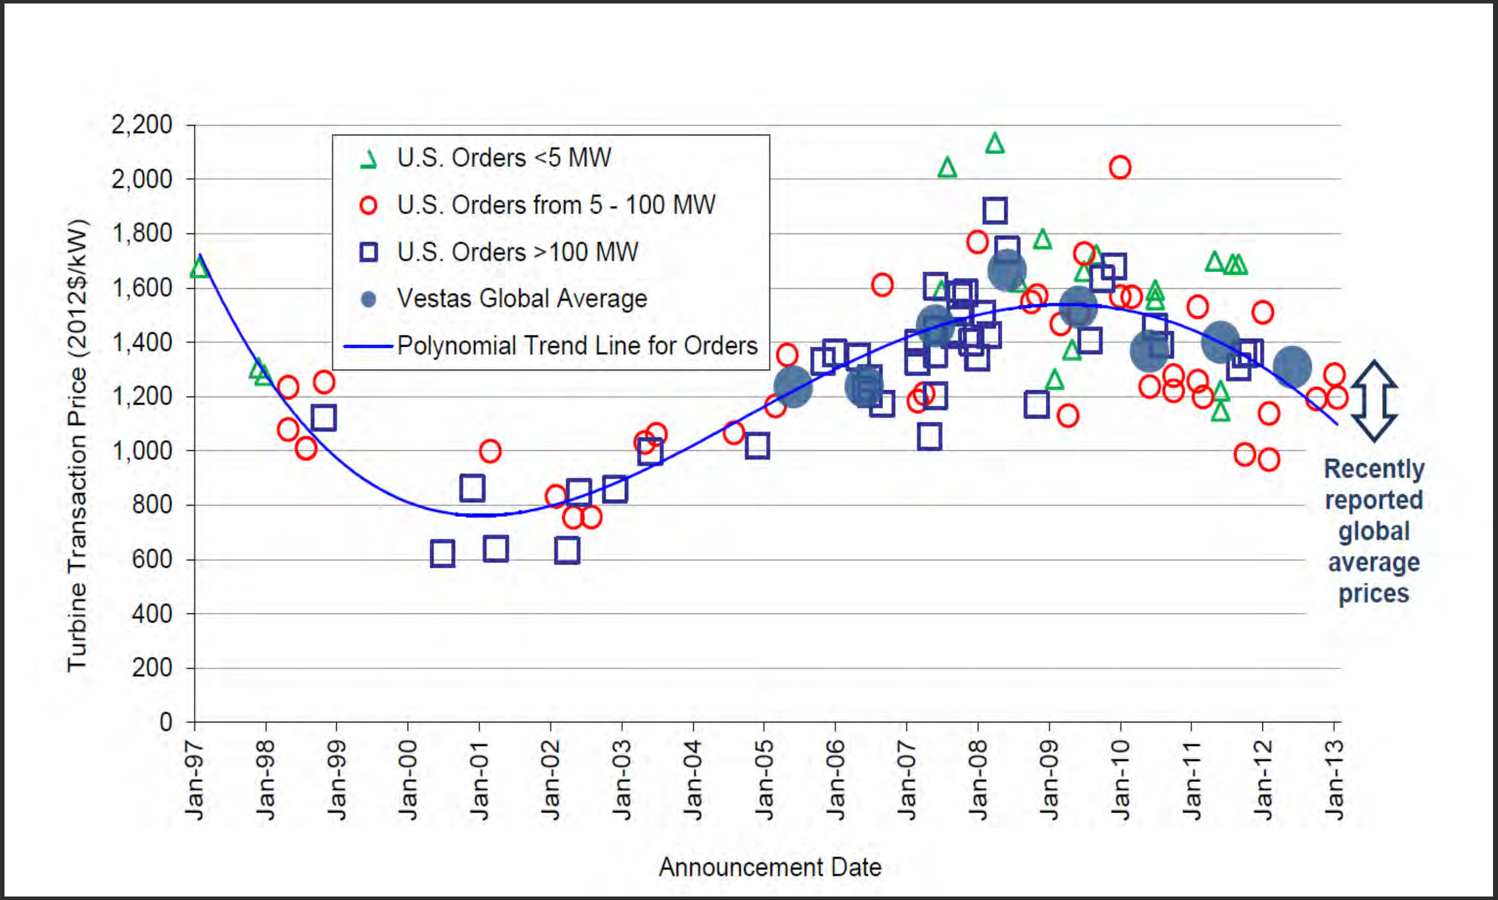
Wind **(p.50)**

Capital cost: MH has assumed an overall capital cost of $2,100/kW (excluding transmission) in the comparative exercises they have undertaken. From the data in next slide and data from other jurisdictions, $1,800/kW is deemed to be more appropriate and sufficiently conservative

O&M cost: MH's assumption of an O&M cost of $39.55/kW is deemed appropriate, with a recommended range of $35-55.

Question 4

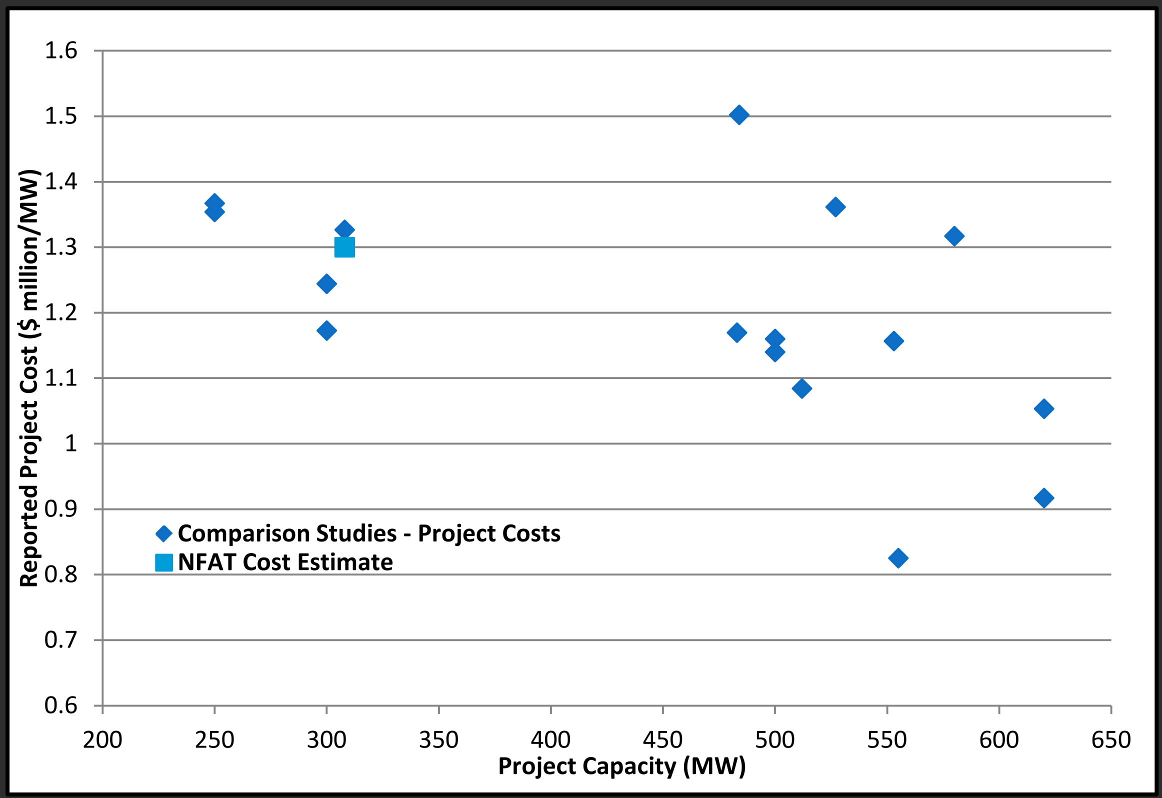
Wind Turbine Cost Trends



Question 4

Natural Gas Combined Cycle (CCGT) **(pp.53,54)**

MH's assumed capital cost of \$1.3 million/MW is deemed appropriate



MH's assumed O&M costs of \$20/kW/yr and \$3.50/kWh are also deemed reasonable, with a recommended range of \$6.30-22/kW/yr.

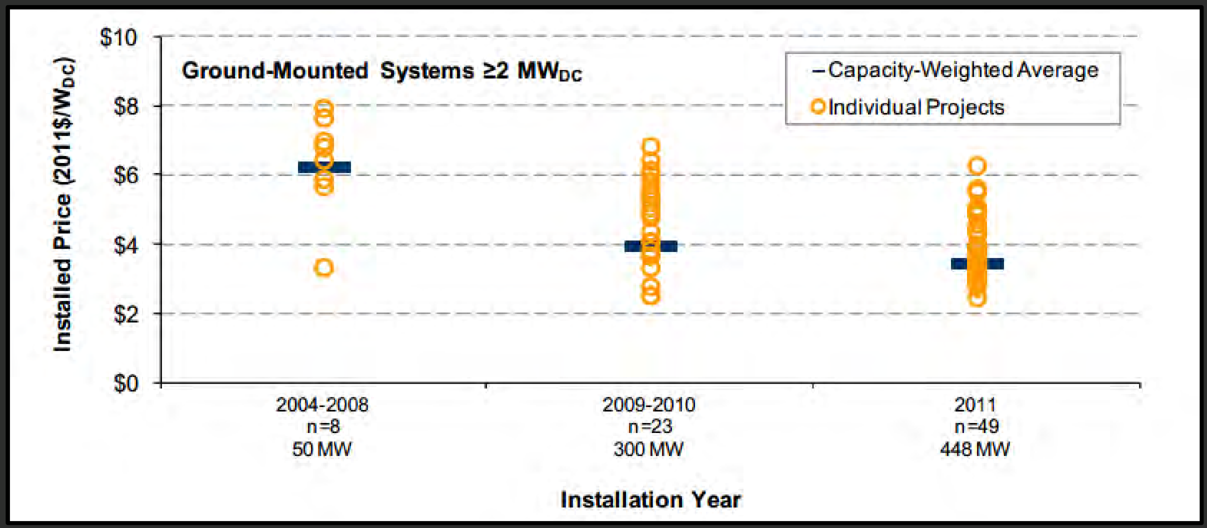
Question 4

Solar (pp.55-57)

MH's present assumptions on capital cost are deemed appropriate – but solar costs have been reducing significantly in recent years

PV System Type	NFAT Capital Cost ($/kW)	Comparison Capital Cost ($/kW)
Fixed Tilt	3,750	3,400-4,300
Single-Axis Tracking	4,500	3,900-4,700
Dual-Axis Tracking	5,000	5,100-5,500

PV System Type	NFAT O&M Cost ($/kW-year)	Comparison O&M Cost ($/kW-year)
Fixed Tilt	19.70	22-50
Single-Axis Tracking	21.10	22-50
Dual-Axis Tracking	24.60	25-50



Question 5

"Review and assess Manitoba Hydro's construction management plans, schedule, and contracting methods for the design, engineering, procurement, construction, start up, commissioning, testing, and commercial operation for wind, natural gas combined cycle gas turbines, and solar facilities."

Wind **(p.58)**

- MH assume wind power projects will be developed in-house (whereas existing Manitoba farms have been developed by IPPs)
- Time frame assumed 3 – 5 years, including resource assessment.
- Asset life ~20 years.
- No further details from MH: will be developed only if and when wind becomes cost competitive.

Knight Piésold

Question 5

Natural Gas Combined Cycle (CCGT) **(p.58)**

- NFAT assumes development by MH and construction through EPC contract.
- Time frame assumed 3 – 5 years reasonable but might be shorter (2 – 4 years, depending on turbine supply time).
- No further details from MH: will be developed as preferred development plan proceeds.

Solar **(p.59)**

- MH assume time frame of 3 years for development and construction of generic 20 MW facility. Could be reduced if/when solar perceived to be key energy resource in future.

Knight Piésold

Question 6

"Review Manitoba Hydro's capital expenditure forecasts CEF 13/CEF 12/CEF 11/CEF 10/CEF 9 and explore any significant factors that led to cost increases over successive forecasts."

Progression of Project Costs ($ Millions) **(p.60)**

	CEF09	CEF10	CEF11	CEF12	CEF13
Conawapa GS	6,325	7,771	7,771	10,192	10,492
Keeyask GS	4,592	5,637	5,637	6,220	6,220

Significant Factors in Cost Increases **(p.61)**:

- Delay of In-Service Dates (adds PM, interest and escalation costs).

	CEF09	CEF10	CEF11	CEF12	CEF13
Conawapa GS	May 2022	May 2023	May 2024	May 2025	May 2026
Keeyask GS	Dec 2018	Nov 2019	Nov 2019	Nov 2019	Nov 2019

- CEF09 to CEF10 shift due to updated detailed cost estimates by KGS-Acres.
- CEF11 to CEF12 attributed to inclusion of management reserve, increased actual escalations and changing interest rates in light of Wuskwatim experience (details in Question 9).

Question 7

"Provide a historical perspective on the construction cost components of other Lower Nelson River hydraulic generating stations (Limestone/Long Spruce/Kettle) and analyze the major components of direct cost, including (a) Spillways/dams/dikes, (b) Powerhouses, and (c) Turbines and generators, and compare these to the Keeyask and Conawapa GS costs for these components."

Meaningful assessment not possible with information made available. MH provided total but not individual component costs. MH did provide major quantities.

Significant differences between then (1992/1979/1973) and now (Wuskwatim 2012 and Keeyask/Conawapa future) **(p.64)**:

- MH now engaged in partnership framework with FNs.
- Significant increase in rigour of environmental process (came into force after Limestone). Lack of regulatory capacity in Manitoba to follow new requirements.
- Labour costs and productivity.

Question 7

Limestone example **(p.65)**:

- Completed in 1992, on time and within budget ($1.43 billion)
- Ballpark direct capital estimate would be $2.2 billion

	MH Quantity[1]	Unit	KP Unit Cost ($)	Cost ($)
Excavation (assuming 50/50 split of reported total quantity)				
Unclassified	1,600,000	m^3	20	32,000,000
Rock	1,600,000	m^3	100	160,000,000
Coffer Dam removal	3,500,000	m^3	20	70,000,000
Earth Fill	2,900,000	m^3	40	116,000,000
Concrete	650,000	m^3	1,200	780,000,000
Capacity (Generating Plant)	1,350	MW	500,000	675,000,000
				1,833,000,000
+20 % for miscellaneous items				471,380,000
				2,199,600,000

- However, escalating $1.43 billion @2.5% for 11 years yields only $1.88 billion which is short of direct costs alone let alone in-service cost which includes indirect and other costs.
- Capacity of 1,340 MW gives $1.07 million / MW (cf. 8.9 Keeyask, 6.9 Conawapa).

Question 7

Long Spruce (**p.65**):

- Constructed 1971 to 1979 for cost of $508 million.
- Capacity of 1,010 MW gives $0.50 million / MW (~cost of turbine generators alone today).
- No information provided re schedule and cost performance.

Kettle (**p.65**):

- Commissioned 1974 for cost of $240 million.
- Capacity of 1,220 MW gives $0.20 million / MW.
- No information provided re schedule and cost performance.

11620

Knight Piésold

Question 8

"Analyze Manitoba Hydro's justifications for increasing direct costs and for increasing indirect costs with respect to (a) Labour productivity and shortages, (b) Competition with other large civil projects in Canada, (c) Remote location, (d) Northern and First Nation jobs, and (e) Other contractual hiring constraints."

(a) Labour productivity and shortages (**p.66**):

- Labour productivity in construction industry documented to have decreased since a peak in the 1970s, mainly due to reduction in skill level.
- Other factors include decline in # of employees, capital-labour ratio, percentage union and average age of workers.
- Canada has experienced at least a decade of labour shortages.
- MH have attributed lack of productivity to difficulties hiring and/or retaining staff and use of inexperienced staff. As a result of the low productivity experienced at Wuskwatim, MH has, for Keeyask and Conawapa, adjusted contracting methods, added staff and invested in better camp facilities. These are deemed reasonable measures.

Question 8

(b) Competition with other large civil projects in Canada **(p.66)**:

- 40% of overall project workforce for Wuskwatim were out of province: 60% for generating station structure.
- Keeyask demand greater and situation likely to be even worse.
- Eastern labour had to be imported for recent KP hydro projects in BC.
- MH is relying on offering competitive wages and an attractive camp environment.

(c) Remote location **(p.66)**:

- Location is remote but is known and therefore factored in to cost estimates already – should be no surprises. Is factored in to estimated staff rotations.

(d) Northern and First Nation jobs **(p.67)**:

- Remote northern projects always been part of Canada's non-residential construction outlook.
- Natural resource development and mining projected to grow significantly through 2020.

Question 8

(e) Other contractual hiring constraints **(p.67)**:

- Burntwood Nelson Agreement (BNA) sets out terms for "hands-on-tools" workers (including FN) on hydro projects in N Manitoba. Collective agreement between Hydro Projects Management Association (representing Contractors) and Allied Hydro Council of Manitoba (Unions).
- GCC tenders had to include compliance with BNA requirements.
- GCC tenders will reveal large contractors' assessments of labour availability (see Question S7).

Question 9

"Please provide a high level assessment of the construction planning and management of the construction costs of the new Preferred Development Plan projects, including the experience gained from the Wuskwatim project."

See Question 3 re construction planning and management of construction costs (and also Question S1).

Experience Gained from Wuskwatim (Costs) **(p.68)**:

- Wuskwatim witnessed lower than expected labour productivity, occurred during a period of international commodity escalation, and suffered a 3 year delay of In-Service Date.
- Cost went from $988 million in CEF03 to $1,771 million in CEF12 (79% increase, details on next slide).
- Keeyask and Conawapa Cost Estimates updated for Wuskwatim labour, material and equipment rates as well as labour productivity.

Question 9

Integration of Lessons Learned at Wuskwatim (Costs) (p.69)

Cost Breakdown	Increase in Cost 2003-2012 (M$)	Explanation for change by Manitoba Hydro In Undertaking # 47	KP Designated Implications for Keeyask and Conawapa
Pre-construction 2003 to 2006	224	Extended duration of federal and provincial approvals as well as PDA and NCN ratification resulting in the deferral of the construction start date, extended duration of construction, and the 3-year in-service date deferral.	Addressed through the separation of the KIP. Project definition for pre-construction work could still be refined.
General civil contract	178	Lower trade labour productivity, higher labour rates, increased bedrock overbreak, and increased engineering	Awareness of the issue, inclusion of different staffing requirements included. Similar Risks still exist, but are addressed in part (through Labour Management Reserve)
Turbines & generators	19	Higher labor rates, extra work, claims due to schedule delays.	Considered
Site preparation	32	Increased quantities (primarily rock) due to unknown site conditions, increased camp accommodations and operation and maintenance costs.	Remain
Catering	22	Higher camp occupancy and higher offsets required for work performed through a direct negotiated contract.	Addressed through projected increased staff requirements in the 2009 and 2010 estimates.
Electrical & Mechanical	38	Additions to scope of work and engineering, and contractor cost claims due to schedule and access delays.	Risk remains due to Hydro contracting technique.
Gates, Guides & Hoists	20	Extra work and contractor cost claims due to schedule delays.	Gate guides addressed in 2009 Estimate, marginal impact.
(continued ….)			

Question 9

Integration of Lessons Learned at Wuskwatim (Costs, Continued)

Cost Breakdown	Increase in Cost 2003-2012 (M$)	Explanation for change by Manitoba Hydro In Undertaking # 47	KP Designated Implications for Keeyask and Conawapa
Staff house	30	Addition of staff house to meet staffing requirements	Addressed through projected increased staff requirements in the 2009 and 2010 estimates.
Transmission	109	Increases in market costs experienced for labour, materials and contracts partially offset by reductions in contingency, project management and contract costs nearing construction completion.	Not investigated but should be part of escalation.
Other	47	Actual escalation in excess of original estimated inflation and other cost increases	Predictable, low CPI still included in escalation rate, addressed partially with escalation reserve
Interest allocated to construction capital	64	Due to increases in costs and deferral of in-service date partially offset by lower interest rates	Justified
Total Increase	**783**		

Knight Piésold

Question 9

Experience Gained from Wuskwatim (cont'd):

Access and FN Engagement **(p.70)**:

- Advancing infrastructure work ahead of GS benefits FN through increased and advanced employment, training and capacity building opportunities. Also reduces financial risks to FN joint venture partners.
- Pursued on Keeyask to avoid repetition of difficulties experienced with FN JV partner at Wuskwatim.
- Allows developer to focus on engagement of GCC.

Knight Piésold

Question 9

Experience Gained from Wuskwatim (cont'd):

Changes to Construction Planning and Management (p.70):

- Wuskwatim originally bid as UPC in 2007 but only one bid received.
- Four bids received for subsequent CRC, with better prices.
- Provision of better camp conditions for Keeyask.
- Evidence that process review has resulted in changes:
  - Target Price contracts used for Keeyask to improve alignment with prevailing market and to share cost escalation risk.
  - Market research into craft labour and heavy construction costs and productivity and development of strategies for labour recruitment and retention.
  - Earlier scheduling for development arrangements, agreements and adverse effects and careful management through integration of engineering, regulatory and procurement processes.
  - Inclusion of Management Reserves for escalation and labour costs (on top of contingency).

Question 9

Cost Estimate Appreciation **(p.71)**:

A high quality cost estimate satisfies four characteristics:

- *Credibility* – In the case of Keeyask and Conawapa the direct point estimate is credible as it has been prepared by a reputable engineering firm with a wealth of recognised hydropower expertise (KGS-Acres).
- *Documentation* – layout and design of GSs well documented, as is makeup of direct cost estimates. Indirect cost estimates not as well documented (or not provided to KP). Project management processes and standards are well documented.
- *Accuracy* – current estimates likely as accurate as they can be prior to GCC award (see Questions S7 and S8).
- *Comprehensiveness* – KP believes estimate to be comprehensive. Includes all perceivable possible project costs and is structured in sufficient detail to insure that costs are not omitted or duplicated. Has been formulated by a suitably experienced estimating team.

Question S1

"Review MH's overall management strategy and scheduling for the tendering of contracts for the Keeyask Generating Station and the procurement of other major facility components such as spillways, dams, dykes, powerhouse, turbines, intake gates, generators, controls etc. Comment on the effectiveness of this management approach for minimizing capital costs, securing competitive bids, and managing construction and procurement cost escalation and construction risks."

Management Strategy for Tendering **(p.2)**

- MH's Project Execution Plan (PEP) is high level guideline to manage KIP and KGSP. Provides means, methods, tools and techniques used by MH to manage the projects. Serves as record of planning effort for construction phase and as resource for staff to ensure consistent project management.

Question S1

- Process of procurement of contracts detailed in PEP. KP has seen:
  - Total Cost and Schedule Management.
  - Engineering Consulting Contract Monitoring and Controls.
  - Construction Contract Monitoring and Controls.
  - Contract Change Management.
  - Risk Management.
  - Project Contingency Management.
  - Project Change Authorisation.
- Total Cost and Schedule Management (TCSM) **(p.3)**
  - PDCA Process.
  - Plan – Establish project baseline schedule and budget.
  - Do – Implement project controls on contracts and internal labour.
  - Check – Retrieve actual costs (from SAP) and latest schedule and budget forecasts from project leads.
  - Act – Assess performance and manage change and contingency.

Question S1

- Overall Tendering and Procurement Management Strategy **(p.3)**
  - Work divided into Work Packages.
  - Hydro Project Controls Coordinator responsible from contract drafting to early periods of the contract execution.
  - For each contract awarded contract value compared to base estimate and relevant amount of contingency allocated from contingency pool (see Question S2).
  - PDCA iterative management approach ensures project estimate and schedule are updated accordingly.
- Tendering mixture of methods, tailored to individual contracts. Supply and installation of turbine-generating equipment essentially fixed price whilst main civil works essentially design-bid-build but with target price and ECI process. KP deems overall approach appropriate in principle. Question 3 gives details of various forms of contract used by MH.

Knight Piésold

Question S1

- In GCC Early Contractor Involvement (ECI) process, selected contractor engaged early (2 years before major construction) so involved in helping finalise contract details. Main objectives:
  - Ensure contractor construction knowledge incorporated in design.
  - Refine delivery schedule.
  - Secure necessary labour.
  - Form alliances with Manitoba suppliers and sub-contractors.

Question S1

Scheduling for Tendering (p.4)

- PEP requires project execution to follow the Hydro Cost and Schedule Standard (CSS) for schedule management. Schedule performance one of key performance indicators tracked by MH.
- Overall schedule anticipates construction starting in July 2014 and being complete in January 2021. Procurement of long lead time items of equipment already under way, in order to ensure delivery to site in time for incorporation in the works.
- Detailed schedules for KGSP included in 2009 Cost Estimate and in GCC RFP. No details of MH contributions. GCC tenderers all confirmed schedule. First Stage Coffer Dam Aggressive.

Question S1

Procurement of Major Facility Components **(p.5)**

- Long lead time items (e.g. TG supply) procured early.
- Wrapped most mechanical and electrical equipment supply into GCC to minimise interface issues (lesson from Wuskwatim). Also included excavation, cofferdams and draft tube forms.

Question S1

Effectiveness of Tendering and Procurement Management Approach (p.4)

- MH using appropriate approach to minimising capital costs by sharing risk with contractors and suppliers through advancing design prior to procurement, identifying and managing risks, and detailed management of the construction process.

- Most significant contracts have been or are being procured through competitive bid process (GCC and Equipment Supply). Number of projects procured through non-competitive DNCs because of preference by MH for particular contractors to undertake specific work assignments - Wuskwatim experience.

- Internal MH costs may not be deemed competitive but KP has insufficient data to offer opinion on this issue.

Knight Piésold

Question S1

(p.5)

- Difficult to measure MH effectiveness managing construction and procurement cost escalation as current process relatively new and significantly different from the old.

- Project team and risk engineer execute the construction risk management process and the contingency management process during construction (see Question S2).

- As an overall assessment of effectiveness, KP able to see MH is following well-documented process (despite the PEP presently being in draft form only). The project generally appears to be on schedule.

Question S2

"Review Manitoba Hydro's construction risk management strategy and comment on its effectiveness"

Confidential copies of following documents made available to KP (p.6):

- Risk Management Procedure. Purpose is to *"detail the activities of planning, identifying, evaluating, responding, and monitoring for effective risk management as well as detailing the standard risk reporting templates..."*
- Project Contingency Management Procedure.
- (Keeyask) Project Risk Register.
- Project Risk Report (showing contingency drawdown, schedule, one year look-ahead of project-specific risks based on project schedule, project risk profile, top 5 global and top 5 specific risks, and risk by phase of implementation).

Question S2

Risks in the Risk Management Procedure assessed as product of Probability and Impact, in following categories:

- Technical (Requirements, Technology, Complexity and Interfaces, Performance and Reliability, Quality).
- Organisational (Project Dependencies, Resources (MH Staff), Funding, Prioritisation, Customer (Internal)).
- Project Management (Estimating, Scheduling, Controlling, Communication).
- External (Regulatory, Market Intelligence, Performance and Reliability, Weather, Stakeholders).
- Safety (Design Standards, Qualifications, Training and Awareness).

Knight Piésold

Question S2

(p.8)

Probability Factor	>70% (5)	5	10	20	40	80
	50%-70% (4)	4	8	16	32	64
	30%-50% (3)	3	6	12	24	48
	10%-30% (2)	2	4	8	16	32
	<10% (1)	1	2	4	8	16
		Very Low (1)	Low (2)	Medium (4)	High (8)	Very High (16)
		Impact Factor				

Combined Risk Factor Range	Risk Level	Response for NGC
1 to 4	Minor	Acceptable level of risk. Mitigation of risks are optional.
5 to 15	Moderate	Borderline level of acceptable risk. Must be mitigated to minor in stage 5.
>15 High	Critical	Unacceptable level of risk, must be mitigated to moderate in stage 4, or low in stage 5.

Question S2

Major risks in the Risk Register (total risk score of 80) were perceived in August / September 2013 to be **(p.9)** :

- Cost of labour and other associated labour issues.
- Increased costs for project management as a result of insufficient capacity in MH and consequent need to hire consultants.
- Escalation / market conditions (leading to higher tender prices).
- Inexperienced craft labour work force (leading to increased time and cost to perform construction).

MH proposes to deal with these risks by mitigation, through the Contingency and/or the Management Reserve.

Question S2

Apparent that new procedures and systems set up for Keeyask and Conawapa are direct result of lessons learned on Wuskwatim and reflect genuine MH concern to manage the whole process better. Risk management strategy appears to be well set up and being followed.

Appreciation of present risks:

- Can be assumed at this stage of project that most significant *technical risks* have been addressed (reputable experienced designers of large hydropower facilities in Northern Canada and extensive geotechnical investigations).
- A significant *financial risk* has been removed with the award of the GCC, but others still remain.

Question S2

- *Environmental risks* remain – contractor activities and impacts and remediation and/or compensation. KP has not examined Adverse Effects Agreement that has led to increase in indirect costs in successive cost estimates.
- Having chosen suitable, reputable and experienced contractors, *construction risks* are associated with contractor performance, in terms of quality, cost and schedule. MH carries some risk like quantities and to some degree impacts of inclement weather. Portions of the contingency have been added to each contract, to cover unknowns.

Whole issue ultimately comes down to cost. Discussed further in Questions S7 and S8.

Question S3

"Review contract documents prepared by Manitoba Hydro for the major Keeyask components and comment on how such documents have been designed to secure cost effective bids from suppliers and contractors and where Manitoba Hydro may be for vulnerable for cost increases, schedule changes etc. Comment on the overall thoroughness of the contract documents and drawings." **(p.11)**

- Question 3 details forms of contracts typically used to procure works like KIP and KGSP. KP confirms, based on contracts seen, MH has made appropriate choices for Keeyask contracts – contracts designed to secure most cost effective bids from suppliers and contractors.
- All contracts except FPC vulnerable to cost increases but MH has attempted to mitigate by sharing risk. Remaining risks and possible increases in cost have been acknowledged and accounted for in professional and competent manner – through contingency and management reserves; see Questions S2 and S8.

Question S3

- Non FPC contracts also have possible implications on schedule. Process of schedule changes has been defined. Costs associated with schedule risks are included in contingency and management reserve.
- Contract documents seen by KP clearly drawn up by competent, experienced engineers, from MH and reputable consultants.
- GCC contract involves ECI (to maximise benefit of Contactor input) and Target Price. Variations from Initial Target Price shared between MH and Contractor, generally to greater benefit of MH (80%) than Contractor (20%).

Knight Piésold

Question S4

"Review construction and equipment procurement bonding and any liquidated damage requirements and comment on the appropriateness of such bonding and cost implications to the project."

"Bonding" either (**p.14**) :

- Performance Bond provides assurance that the work will be done (normally used for civil site construction works).
- Letter of Credit provides assurance that MH will not be out of pocket (used to procure equipment manufactured off-site).

MH has used both, different for each contract.

KP believes MH process to be appropriate, including the required amounts - reasonable balance between protecting MH interests and paying excessive premium for this insurance.

MH have also handled Liquidated Damages appropriately.

Question S5

"Review Manitoba Hydro's Quality Assurance and Quality Control (QA/QC) requirements for Keeyask construction and comment on the effectiveness and costs." (**p.17**)

Most common arrangement in hydropower construction has Contractor responsible for Quality Control (QC) and Owner (or his Engineer) responsible for Quality Assurance (QA). MH is conforming to this practice

Quality Management in MH specified at high level in PEP with more detail in New Generation Construction Division (NGCD) standard. Also include third main activity, Quality Planning (QP). MH made available to KP copies of:

- Quality Management Section 5 of PEP.
- NGCD Standard #204 Quality Management (effect. 2012 07 17).
- QA/QC Requirements for Turbine Generator Contract 016321.
- QA/QC Requirements for the General Civil Works Contract 016203.

Question S5

Wrt Turbine Generator Contract:

- Contractor's own Quality Management System must "*conform fully to the spirit and intent of* (the international quality management system) *ISO 9001 2000"*.)
- Contractor also obliged to have a Project Quality Plan, a Quality Team and various Inspection and Testing Plans (ITPs).
- The document is deemed to be detailed, comprehensive and appropriate for its purpose.

Wrt General Civil Works Contract:

- Document confirms QC is responsibility of Contractor and QA responsibility of Engineer. Details not made available to KP but likely to be appropriate.

Costs of QA/QC not expressly shown – part of MH and Contractor overheads.

Knight Piésold

Question S6

“Review the overall civil contract(s) project management approach; comment on its effectiveness and what project management controls are in place to minimize cost escalations.” **(p.19)**

- GCC being managed with all procedures, processes and standards mentioned in earlier questions. Financial activities part of SAP, MH’s system-wide accounting system. Some processes new and still not finalised.
- Details provided to KP by MH in conference call:
  - "PCA"s (Project Change Authorizations) used to transfer funds to and from the project contingency, in real time.
  - There is a person in MH responsible only for managing the contingency. All significant Network #s have portion of overall contingency allocated to them and actuals and revisions to forecast are tracked.
  - MH keep a "CRR" (Contract Revision Register) that records budget changes like PCAs.

Question S6

- Also have "Dashboards" - reports tailored to present information to particular audiences. Example of dashboard included in KP report .
- Estimates of future expenditure adjusted in real time by adding inflation and deducting money spent to date. Check made at same time on expected final cost of each item i.e. budget still appropriate. Changes also recorded in other parts of estimate, to keep overall In-Service cost the same. Overall reconciliation done annually, with quarterly reports in interim. MH presently working to make this reconciliation possible more in real time.
- Schedule management correctly perceived to be as important as cost.

Question S7

"Critically review Manitoba Hydro's pre-tender construction estimates and compare with actual tender prices. Define where significant differences are noted and rationalize the specific differences." (**p.21**)

MH has provided KP with summary presentation material and Bills of Quantities comparing the GCC proposals, the independent estimators estimate (by Chant), and an escalated original Engineers Estimate by KGS Acres. KP believes that MH has been diligent in their internal comparison between the GCC tenders, their Engineers estimate and the independent Third Party Estimate. The tenderers have built into their bids their assessment of labour availability, productivity and costs.

Question S8

"Provide an opinion as to the expected in-service capital cost for Keeyask once all work has been completed." (**p.23**)

KP essentially confirms MH <u>expected</u> in-service capital cost of 6.5 B$ but is of the opinion that a more risk averse decision maker would incorporate a higher Contingency (e.g. P80 as opposed to P50) and a Management Reserve that incorporates greater allowances for labour and escalation, plus an allowance for schedule delay (primarily 2014 start date not achieved).

LIST OF EXHIBITS

LIST OF UNDERTAKINGS

NO.	DESCRIPTION	PAGE NO.
117	Knight Piesold to update Table 9.1 in Exhibit 3-2 to include the P90 value and the P95 values	6832

--- Upon commencing at 9:02 a.m.

THE CHAIRPERSON: Good morning. I believe that we are in a position to begin today's proceedings. And before I ask Mr. Hombach to introduce the proceedings today, I have a statement I'd like to read.

Last Friday there was a mention on the transcript that the Winnipeg Free Press had published an editorial column, and had also quoted from the executive summary of the January 24th, 2014, La Capra Associates initial expert analysis report. All parties should be advised that on Saturday, April 12th, 2014, as Chair of the Public Utilities Board I received an email from Mr. Laliberte also related to the evidence of La Capra Associates.

The email that was also sent by Mr. Laliberte to counsel for CAC, MMF, and MIPUG, as well as the -- to one of the La Capra witnesses. I've instructed the NFAT project coordinator, Madam Lemoine, to post that email on the Board's NFAT website as an additional presentation from Mr. Laliberte, should others wish to read it.

I should also remind everyone that any presentations should be sent directly to the NFAT project coordinator, Madam Lemoine, or to the panel -- or the Board's executive director, Mr. Singh, rather than directly to any panel member. Those presentations will then be posted on the Board's NFAT website.

Thank you very much. Over to you, Mr. Hombach.

MR. SVEN HOMBACH: Yes, good morning, Mr. Chairman. Good morning, members of the panel. Today is reserved for the evidence of Knight Piesold, an independent expert consultant appointed by the NFAT panel to review construction and capital cost matters.

Knight Piesold is scheduled to be on for a day and a half. Today is reserved for the public session. The morning tomorrow on April 15th is reserved for the confidential, or CSI, session. And I've been advised by Manitoba Hydro that Manitoba Hydro has retained Ms. Helga Van Iderstine to handle the examination of Knight Piesold on behalf of Manitoba Hydro. I'd welcome her to the hearing room.

At 12:45 today there will also be a presentation by Mr. David Barber, so I suggest that we break on time. Lastly, Mr. Chairman, before we get started I was advised by Mr. Bill Gange on behalf of GAC this morning that GAC will not be in attendance today and will not be taking any position with respect to the evidence of Knight Piesold.

With that, Mr. Chairman, I would suggest that we turn it over to Me. Monnin to introduce and qualify the witnesses.

THE CHAIRPERSON: Thank you, Mr. Hombach. Me. Monnin, bonjour.

MR. CHRISTIAN MONNIN: Bonjour, M. President, members of the panel. Before I move to the qualifying -- qualification questions for Mr. Robertson and Mr. Fichot, I would propose to submit some documents for filing.

Mr. Secretary, the report dated March 2014 redacted, which is the first report, should be KP-3-1.

MR. KURT SIMONSEN: All right.

--- EXHIBIT NO. KP-3-1: Redacted report, dated March 2014

MR. CHRISTIAN MONNIN: The supplemental report, which is April 2014 redacted, should be 3-2.

--- EXHIBIT NO. KP-3-2: Redacted supplement report, dated April 2014

MR. CHRISTIAN MONNIN: And earlier this morning Ms. Van -- Van Iderstine, counsel for Hydro, indicated that in the supplemental report which is now KP-3-2 there was a redacted -- or a redaction that was unredacted, and that would be found at page Roman numeral II of III, and those documents -- that document has been circulated. And I would propose that that be filed as Exhibit KP-3-3.

--- EXHIBIT NO. KP-3-3: Unredacted page II of III of Exhibit KP-3-2

MR. CHRISTIAN MONNIN: We also have a slide deck for the presentation which will be provided by KP today, and that would -- I propose that would be KP number 4.

--- EXHIBIT NO. KP-4: Slide deck for presentation

MR. CHRISTIAN MONNIN: There's the scope of work for KP dated September 20th, 2013. I would propose that that be KP number 5.

--- EXHIBIT NO. KP-5: Scope of work for KP, dated September 20th, 2013

MR. CHRISTIAN MONNIN: The supplementary scope of work, which sets out the work that -- that was done on the supplementary report that's dated January 13th, 2014, I would suggest that that be KP number 6.

--- EXHIBIT NO. KP-6: Scope of work for KP, dated January 13th, 2014

MR. KURT SIMONSEN: Thank you very much.

MR. CHRISTIAN MONNIN: Thank you, Mr. Secretary. With that, I would propose to put the qualification questions to Mr. Robertson, who's immediately to my left, and then to Mr. Fichot, and then I would ask the panel to take the next step with regards to qualifications.

THE CHAIRPERSON: Did swear these witnesses in?

MR. CHRISTIAN MONNIN: We did not. Thank you, Mr. President.

IEC KNIGHT PIESOLD PANEL:

MICHAEL ROBERTSON, Sworn (Qual.)

BORIS FICHOT, Affirmed (Qual.)

QUALIFICATION OF WITNESSES:

MR. CHRISTIAN MONNIN: Mr. Robertson, you're here on behalf on Knight Piesold, which has been retained by Manitoba Public -- by the Manitoba Public Utilities Board in order to assist the PUB to conduct a Needs For and Alternatives To review of Manitoba Hydro's proposed Preferred Development Plan.

Is that correct?

MR. MICHAEL ROBERTSON: Yes.

MR. CHRISTIAN MONNIN: Knight Piesold has prepared two (2) reports which have been filed in accordance with the terms of reference of the NFAT and in accordance with Knight Piesold's scope -- scopes of work dated September 20th, 2013, and January 13th, 2014, to critically review certain aspects of Manitoba Hydro's Preferred Development Plan and filings.

Is that correct?

MR. MICHAEL ROBERTSON: Yes.

MR. CHRISTIAN MONNIN: Were these reports prepared by you or under your supervision and control?

MR. MICHAEL ROBERTSON: The -- the reports were prepared by myself and Mr. Fichot as co-authors and co-reviewers, and I take full responsibility for the final product.

MR. CHRISTIAN MONNIN: Can you please describe for the Board the primary areas of focus in -- in your work for the PUB?

MR. MICHAEL ROBERTSON: We -- we were asked by the PUB to comment on Manitoba Hydro's proposals with regard to construction management and capital costs. In more detail, we -- we were posed in the first scope of work nine (9) questions by the -- by the Board, and in the second one, a further eight (8) questions.

The first nine (9) questions were to comment on the capital and operation and maintenance cost estimates for Conawapa and Keeyask generating station, to comment on the construction indirect costs for Conawapa and Keeyask generating stations; to assess the construction management schedule and contracting plans for Conawapa and Keeyask generating stations; to review the capital and operation and maintenan -- maintenance cost estimates for wind, natural gas, combined-cycle gas turbines, and solar facilities; comment on the construction management plan's schedule and contracting methods for wind, natural gas, combined-cycle gas turbines, and solar facilities; to look into the factors that led to the cost increases over successive capital expenditure forecasts; to provide a historical perspective of construction costs of other Lower Nelson River generating stations; to provide a justification for the increasing direct and indirect costs; and to provide a high-level assessment of the construction planning and management of construction costs of Manitoba Hydro's Preferred Development Plan.

So those were the first nine (9) questions in the -- which have been covered off in the main first report that we produced.

The second report and the second scope of work comprised eight (8) questions, which were overall management strategy and scheduling for the tendering of the contracts for the Keeyask generating station; to comment on the construction risk management strategy that Manitoba Hydro is following; to comment on the documents from the major Keeyask component; to review the construction and equipment procurement bonding and liquidated damage requirements; to comment on the quality assurance and quality control requirements; to review the overall civil contract project management approach; to comment on the pre-tender construction estimates compared to the actual tender prices; and finally, to review the expected in service capital cost for Keeyask.

MR. CHRISTIAN MONNIN: Thank you, Mr. Robertson. Your curriculum vitae has been filed with the -- the PUB as part of Exhibit Hill Co. number 9, specifically, Tab 5B.

Can you describe your qualifications and experience generally and specifically as they relate to the work undertaken by KP?

MR. MICHAEL ROBERTSON: Yes, I am -- I'm a civil engineer with a British degree. I have been in the business for forty-four (44) years, since I graduated. Pretty much all of that experience has been with water resource development, dams, large dams, irrigation schemes, hydro power, and some work on -- on mining. But most of it has been dams and hydro power schemes.

Of -- of particular relevance, I believe, to -- to today's proceedings is the work that I did with the consumer advocate for Newfoundland and Labrador in a similar process to this when the Muskrat Falls proposals were being reviewed, and we -- we were the engineers that -- that advised the consumer advocate.

And apart from that, I've been involved with any number of hydro electric power developments, primarily in British Columbia, but also looking at providing hydro power for mines around the world in remote locations, where diesel power generation is -- is very expensive. So we've -- I have worked in countries all around the world doing that.

MR. CHRISTIAN MONNIN: Thank you, Mr. Robertson. Can you generally -- can you describe generally the type of clientele that Knight Piesold does work for?

MR. MICHAEL ROBERTSON: Primarily independent commercial entities, independent power producers in British Columbia and around the world, and mining companies. As I -- as I mentioned, mining companies, we -- Knight Piesold does do a lot of geotechnical engineering for mining companies. But my experience on mine -- mining developments has been in -- in the provision of hydro power to power those mines.

We've also worked for -- for BC Hydro, in terms of detailed engineering on -- on replacement projects for them such as Aberfeldie in Southeast BC. I've done a lot of dam safety review work for people like TransAlta and FortisBC, and -- and some engineering also for -- for TransAlta replacement projects.

So -- but -- so mostly independent commercial owners, but some utilities like -- like

Manitoba Hydro.

MR. CHRISTIAN MONNIN: Thank you, Mr. Robertson. Mr. Chair, before I ask for the -- the Board to accept Mr. Robertson as a -- as an expert, I would suggest I put the same questions to Mr. Fichot.

Mr. Fichot, you're here on behalf of Knight Piesold, which has been retained by the Manitoba Public Utilities Board in order to assist the PUB to conduct a Needs For and Alternatives To Review of Manitoba Hydro's Preferred proposed -- sorry, proposed Preferred Development Plan.

Is that correct?

MR. BORIS FICHOT: That is correct.

MR. CHRISTIAN MONNIN: Mr. Fichot, Knight Piesold has prepared two (2) reports which have been filed in accordance with the terms of reference and also in accordance with the scopes of work for Knight Piesold dated September 20th, 2013, and January 13th, 2014, to critically review a certain aspect of Manitoba Hydro's Preferred Development Plan and filings.

Is that correct?

MR. BORIS FICHOT: That is correct.

MR. CHRISTIAN MONNIN: Were these reports prepared by you or under your supervision or control?

MR. BORIS FICHOT: Yes, I co-authored those reports with Mike Robertson.

MR. CHRISTIAN MONNIN: Now, you heard Mr. Robertson provide a -- a description of the primary areas of the focus in the -- in the work conducted by Knight Piesold.

Do you care to add to that?

MR. BORIS FICHOT: No.

MR. CHRISTIAN MONNIN: Mr. Fichot, your curriculum vitae has been filed with the PUB as part of Exhibit Hill Co. number 8, Tab 5A.

Can you please describe your qualifications generally and specifically as they relate to the work undertaken by Knight Piesold in these proceedings?

MR. BORIS FICHOT: Yes. I'm a civil engineer, bachelor's degree from McGill, master's degree from Colorado State 'U' in water resources planning and management. I've got over twelve (12) years' experience. I've worked for three and a half (3 1/2) years with the Lower Colorado River Authority, which is a similar entity to Manitoba Hydro. I worked in the -- the planning department there.

Then I've worked with Knight Piesold

after that, mainly working on hydro power projects in the consulting fields. I've worked on everything in hydro power from green-field assessments all the way through detailed construction, supervision, and -- and implementation.

I've worked on due diligence for a number of entities on hydro power projects. I've done due diligence on wind power -- power projects, as well.

MR. CHRISTIAN MONNIN: Mr. Fichot, you've also heard Mr. Robertson provide a description of the general clientele that Knight Piesold does work for.

Do you care to add to that?

MR. BORIS FICHOT: I'll add that Knight Piesold is a -- is a consulting firm that works a lot with mining clients. But one of the primary focus when you work with mining clients is on tailings dams, so it relates to embankment construction, as well.

I've personally worked with First Nations and INAC on some due diligence on hydro power projects, as well. We do due diligence on hydro power projects for investment firms that are looking to invest in -- in hydro power projects. So we'll write reports and do -- do an analysis on that front for them.

But the -- the bulk of the clientele, as -- as Mike Robertson said, is -- is independent power producers with some work for -- for major utilities. And the -- the mining clients that we work for typically are mines in remote places that are looking for resources to -- to supply electricity for them. So we'll do a comparative analysis of hydro power and, on occasion, wind power and some other options to -- to supply the mines.

MR. CHRISTIAN MONNIN: Merci, Mr. Fichot. Mr. Chair, with that, I would ask that Mr. -- Mr. Robertson and Mr. Fichot be accepted by the Board as experts for the purposes of giving evidence on the work performed by Knight Piesold according to their respective scopes of work under the NFAT.

THE CHAIRPERSON: Thank you, Me. Monnin. I'd like to hear from the Intervenors, starting with you, Ms. Menzies.

MS. MEGHAN MENZIES: Thank you, and good morning. CAC (Manitoba) has no objections to these qualifications.

THE CHAIRPERSON: Thank you, Ms. Menzies. Me. Hacault, s'il vous plait.

MR. ANTOINE HACAULT: On behalf of

MIPUG -- MIPUG, we have no objections to the qualifications of these two (2) experts.

THE CHAIRPERSON: Merci, Me. Hacault. Mr. Orle, please, on behalf of MKO?

MR. GEORGE ORLE: We have no objection to the witnesses being qualified as experts. Thank you.

THE CHAIRPERSON: Thank you, Mr. Orle. Could I hear from Manitoba Hydro, please?

MS. HELGA VAN IDERSTINE: We have no objection to their being qualified, as well. I would, however, just alert you to the -- during the cross of these witnesses, I may ask some questions about their qualifications, but it's not going to go towards their -- whether or not they are qualified to give this evidence. So we accept them as experts. Thanks.

THE CHAIRPERSON: Thank you, Ms. Van Iderstine. Mr. Hombach, would you like to comment or do you...?

MR. SVEN HOMBACH: I have no further comments. If the panel is satisfied with the witnesses' credentials, it is up to the panel whether or not to accept them as expert witnesses.

THE CHAIRPERSON: Thank you, Mr. Hombach. Just a second, please.

The panel is in agreement. We'll accept both Mr. Robertson and Mr. Fichot as expert witnesses for the purposes of these proceedings. So back to you, Me. Monnin.

EXAMINATION-IN-CHIEF BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Merci, Me. President. I can advise that Mr. Robertson will be doing the presentation on behalf of Knight Piesold this morning. I advised Mr. Hombach yesterday evening they are making a presentation for two (2) reports, and we expect that presentation to be about an hour and fifteen (15), an hour and twenty (20) minutes.

On the CSI portion of their presentation, I advised again My -- My Friend, Mr. Hombach, that I don't expect that to be more than fifteen (15), twenty (20) minutes, so just to give you an idea of time.

MR. MICHAEL ROBERTSON: Excuse me. Good morning, ladies and gentlemen. The presentation that is -- that I'm going to do now is formatted along the lines of the -- the nine (9) questions in the first report and the eight (8) questions in the second report. So the documents and materials that I'm relying on are those two (2) reports, both the CSI and the redacted or public versions.

There were a number of Information Requests from us to -- to Hydro, which are -- which we used in -- in producing our opinions. And there are Knight Piesold responses to the IRs, a few of which contain CSI.

We quoted a number of references in our reports, but we're not providing separate -- separately copies of those in this proceeding. And as a general comment, most of the information that we have relied upon has been provided by Manitoba Hydro, mostly CSI in hard blue paper copy, and in some emails.

And as -- as Christian has -- has allude -- has mentioned, these reports were produced by me and Boris Fichot, and some contributions obviously from other Knight Piesold engineers, but all under my supervision and control. Versions that are quoted here are the final versions. There are no revisions, updates, or corrections that we wish to make to them.

The -- we -- we need to note that the -- the CSI version of the report in -- in the bottom right-hand corner erroneously is still labelled Revision A of February the 18th, 2014. And my apologies. That should have been Revision 0 of April the 8th, 2014. And then, as you know, we will talk to the CSI content tomorrow.

Moving on to slide 3, the scope of work was provided by those nine (9) questions which I have numbered 1 to 9 in the first report, and the second set of questions I have labelled S1 to S8.

And because of the timing, some of the data that I am talking to in the first nine (9) questions was out of date by the time we did the second. And so there have been some updates and some changes, and that will be detailed in the presentation.

So slide 4, Question 1, the question was:

"Review and assess Manitoba Hydro's capital and operation and maintenance cost estimates for Conawapa generating station and Keeyask generating station, including the adequacy of the management reserves for the project."

So the general methodology for forming the capital cost estimates used by Manitoba Hydro -- and in yellow here on these -- on this slide deck I have referenced the page of the report that I am quoting for ease of reference. So that's -- this is on page 11 of the first report.

The -- the graphic there shows that Manitoba Hydro builds up their estimated in-service cost by starting with a point estimate, which comprises direct costs and indirect costs. And it essentially is the -- the best estimate.

To that is added an allowance -- two (2) allowances for uncertainty: contingency and a management reserve. And together, that is known as the base cost. That is at a particular date. And then to bring that up to any other date, like today, you multiply by the interest and escalation from that date to today, and you add the money spent to date, and you end up with the total expected in-service cost for the project.

The direct costs are those directly related to doing the generation station work; in other words, the labour, materials, and equipment involved in providing the structures.

The indirect costs are all the other capital costs; for example, the provision of site infrastructure and services, the costs of the engineering and project management, and environmental activities. And this is expanded upon in our answer to Question 2.

Moving on to slide 5, allowances are

made for the uncertainties in the point estimate through the contingency which includes two (2) types of risks: systemic risks, which are risks associated with a process that is being followed by Manitoba Hydro -- in other words, the system that they are using to manage the -- the project; and then project-specific risks, which are uncertainties specific to Keeyask and Conawapa. For example, in -- in that case, we are talking about things like foundation conditions, the weather up north, delay in delivery of items, constructability, the availability of resources, and quality.

Now, Manitoba Hydro has elected to assess the contingency at what is known as the P50 level, i.e., there is a 50 percent probability that the final project cost will be less than the number given, and there's a 50 percent probability that it'll be more, and on page 24 of our report, you can obtain more detail of that.

Slide 6. The other allowance for contingency is the management reserve, and this includes an allowance for two (2) specific risks for escalation over and above CPI. So escalation at CPI is included in the point estimate, and this reserve makes a provision for escalation in excess of CPI.

And then the second part of the management reserve is a labour reserve, which is a special pool of money that has been set aside to cater for the possibility of labour costs and/or productivity being different from what was assumed in the point estimate, and these reserves were set up as a direct result of the Wuskwatim experience, and that Wuskwatim experience is examined in further detail in question 9 that follows.

Now, in -- in my experience -- in Knight Piesold's experience, contingency usually includes the management reserve, but Manitoba Hydro have chosen to split them up, if only, we understand, because the two (2) allowances are managed differently within Manitoba Hydro.

So slide 7, just reminding you how the in-service cost is built up. You start with a point estimate. You add the allowances for uncertainty. You end -- you end up with a base cost. You then -- so the base cost is the expected final cost before adding the effects of interest on borrowed capital and escalation, and money spent to date. And you add all of those up, and you have the in-service cost.

So the first thing we did, looking at Manitoba Hydro's cost estimates for these two (2) projects, was try and ballpark them by comparing them with the capital cost estimates of similar projects in Canada. And on the table there, you can see that we looked at Muskrat Falls, and as I mentioned, we -- we were involved in that review.

Site C in British Columbia is at a similar stage of development as -- as Keeyask, although somewhat behind. Petit -- Petit Mecatina Projects in Quebec. Unfortunately we're not able to get capital costs, but it's another big project that is being developed at the moment. La Romaine in Quebec, and then to those big hydro projects in Canada being developed by others, we have compared Keeyask, Conawapa, and we put Wuskwatim in there.

The -- the two (2) yardsticks we -- we used are the capital cost in billion dollars per megawatt of capacity, and also the capital cost in million dollars divided by the average annual energy that that project is slated to produce.

And you can see that Keeyask and Conawapa are in the ballpark. They are high within that ballpark, but they are in the ballpark, and so they are not radically different.

The second part of the question, slide 9, relates to operation and maintenance costs, which I show in that table. These costs include wages, salaries and benefits, and training. In the initial years insurance, partnership expenses, internal administrative costs, internal and external consulting environmental services, accommodation, and then in later years, capital maintenance as the mechanical/electrical equipment requires upgrades, replacements, and/or refurbishments as required.

On slide 10, the conclusions on question 1 regarding capital cost estimates. We believe that Manitoba Hydro's estimating process has been thorough based on a detailed design, estimation of quantities, and initial bottom-up approach to unit rates in 2009 for Keeyask and 2010 for Conawapa, major updates to 2012 based on the results of Wuskwatim, and then inclusion of allowances for uncertainty.

We'd make the point that there is more clarity in the Manitoba Hydro process of a direct costs than an indirect. And I'll pick up on that again in Question 2. And make the comment that many jurisdictions use a higher value than a P50 estimate to establish the contingency, but a significant number of others do not. They also use the P50.

Regarding operation and maintenance costs, we believe the estimated costs are commensurate with similar hydro projects elsewhere in Canada.

So that was a long question. I don't know if there are any questions from the panel or anybody else at this stage? Okay. Moving on to Question 2 at page 11.

(BRIEF PAUSE)

MS. MARILYN KAPITANY: The capital estimates here are the -- I think we have revised information on those capital estimates. So did you look at this table in the context of the revised estimates, and would your judgment still remain the same of whether or not Keeyask and Conawapa fall into the category of high but reasonable?

MR. MICHAEL ROBERTSON: Yes, we -- we have -- we are aware, obviously, of the -- the increase in the in service estimated capital cost. And we will be dealing with that in the second set of questions, once that information became available from Hydro. And, no, I don't believe that increase changes our essential conclusion that it -- that these projects are in the ballpark, but at the high end of it.

MS. MARILYN KAPITANY: Okay.

MR. MICHAEL ROBERTSON: So moving on to

Question 2, slide 11:

"Review and assess Manitoba Hydro's construction indirect costs including the access roads, campsites, and offsite mitigation costs for Conawapa GS and Keeyask GS."

The -- a reminder, the indirect costs include all temporary and permanent items not directly associated with the primary structures but still required to successfully implement the project. And you can find details on page 34 of our report. So that includes the preconstruction costs; site infrastructure, including access roads and campsites; site services; engineering and project management; environment and litigation activities; general expenses, including consultants, travel, site office, insurance; and First Nation participation payments.

So much of the construction work, the indirect construction work, was provided in the Keeyask Infrastructure Project, KIP. In general we found the information provided by Manitoba Hydro to be sensible. But as I alluded to earlier, we could not offer an opinion on costs like the internal Manitoba Hydro project management and other costs and general expenses.

The indirect costs, just to note, exclude related costs to date, or money spent. And Manitoba Hydro has stated that the indirect costs form approximately one-third (1/3) of the point estimate.

Moving on to Question 3, slide 12: r

"Review and assess Manitoba Hydro's construction management schedule and contracting plans for the design, engineering, procurement, construction, startup, commissioning, testing, and commercial operation of Conawapa generating station and Keeyask generating station."

So Manitoba Hydro created a Project Execution Plan, PEP, for the Keeyask project. The details are on page 40 of our report. It is a high-level management guideline which describes the means, methods, tools, and techniques used to manage the KIP and the KGSP. The KGSP is the Keeyask Generating Station Project. So Keeyask comprises these two (2) projects.

It serves as a record of the planning effort undertaken by Manitoba Hydro for the construction phase of the project, and it serves as a resource for staff to ensure that the project is managed consistently.

Slide 13. The PEP is backed by a number of Manitoba Hydro corporate policies and standards, the most important of which that we have seen are the total cost and schedule management standard, monitor and control of engineering consultant standard, preparation of project dashboards and tren -- trend analysis standard, project change authorization process, work package change management process, consultant communication plans, division plan for managing the consultants, and engineering work package scope sheets.

So Knight Piesold is able to see that Hydro has good procedures in place for the management of the projects, despite the fact that the PEP is presently only in its draft form.

THE CHAIRPERSON: That last set of words, Despite the PEP pres -- presently being in draft form only, should we attach any significance to that?

MR. MICHAEL ROBERTSON: My opinion would be probably not, but it's -- it would be nice to see that finalized if that is the management tool that is being used by BC Hydro, as they -- Manitoba Hydro, forgive me. Manitoba Hydro are -- are moving into serious expenditure and construction. I believe that should be finalized.

Moving on to slide 14, contracting methods considered by Manitoba Hydro for the various contracts included -- details on page 42 -- fixed-price contract, FPC; or otherwise known as EPC, engineer, procure, construct; and also known in the trade as design bid -- design build. Essentially, they're different names for the same thing.

Second alternative would be a cost-reimbursable contract, or CRC; direct negotiated contracts, DNCs; unit price contract, UPC, which is the traditional way of procuring large civil construction works in the industry historically; and then supply-only contracts, which are lump sum.

From the contracts seen by Knight Piesold, it is apparent that Manitoba Hydro has made appropriate choices for different contracts. For example, it is using a fixed-price contract for the turbine generating equipment and a cost-reimbursable contract for the main civil works.

The main civil works contract -- the acronym is GCC -- is also utilizing an early contractor involvement process to obtain input from the chosen contractor to refine the design, the construction technique, the schedule, and risk sharing. And we believe that to be entirely appropriate.

Slide 15. The Preferred Development Plan includes an implementation schedule. Schedules are also provided in the basis of cost estimate documents. The schedules are consistent, we believe, with the described developments and the anticipated work breakdown structures.

A more detailed and complete schedule for Keeyask was included with the tender package for the general civil contract, and all tenderers essentially confirmed that schedule as part of their bids. And the -- the details of that schedule are being refined as part of the ECI process.

The one (1) omission in the schedules was the details of time needed for input by Manitoba Hydro, such as refused by them -- reviews by themselves or their independent engineers.

And then the PEP for Keeyask states that execution will follow the Hydro cost and schedule standard for schedule management.

THE CHAIRPERSON: Mr. Robertson, that reference to the fact that the schedule did not include time for review by Manitoba Hydro or the independent engineers, that suggests that the schedule could be impacted if they haven't planned for it?

MR. MICHAEL ROBERTSON: Yes, it could

be impacted. I -- we just don't know whether there is any time associated with approvals of the contractors' plans, for instance, which -- which might be significant, or whether effectively that is built into the -- into the existing bars in the Gantt shot.

I guess it's just a caution that, if Manitoba Hydro do take a long time to approve things, it could impact the schedule.

THE CHAIRPERSON: There was an earlier reference to the fact that the indirect cost represented about a third of the -- of the costs associated with the -- the Keeyask plant.

Is that unusual that it be one-third (1/3) as opposed to some other figure?

MR. MICHAEL ROBERTSON: It -- it's -- it's very much site specific, obviously, things like access and remote camps and things like that. But it is also very much a reflection of the -- the management by the developer, the management costs, internal management costs.

So I would have to say that's probably higher than our independent power plants, who -- who possibly don't spend so much money on that kind of thing.

THE CHAIRPERSON: I think that one (1)

of the questions I had -- as I recall reading in your report, there was a -- a -- sort of a side reference to the fact that this was a government-utility-run project, and kind of an allusion -- allusion to the fact it would be more expensive than a -- than a private project?

Did I misread that, or -- is that what you were trying to convey?

MR. MICHAEL ROBERTSON: You did not misread that. In my experience, that is the case. And it's not unique to Manitoba Hydro.

THE CHAIRPERSON: And -- and what is the cause of that? What -- what would be different in --

MR. MICHAEL ROBERTSON: I -- I think it's just a bigger machine that -- that needs feeding, and the -- the backup costs are -- are higher, for whatever reason.

MS. MARILYN KAPITANY: Could we just go back to the contract methods for one (1) minute?

Did I hear you say that the unit price contract would be the type of contract most usually used for this type of project?

MR. MICHAEL ROBERTSON: No. What I meant to say was that unit price contracts certainly used to be the traditional method of -- of procurement. In fact, the -- the cost reimbursable contact that Manitoba Hydro is using for the GCC is -- is a variation of -- on that.

It -- it is still based on quantities and on unit prices, but there is a target set, and there are procedures for dealing with anything over and above the target. So it -- it's like a refinement, or a halfway house, if you like, between a unit price contract and fixed price contract.

MS. MARILYN KAPITANY: Thank you.

THE CHAIRPERSON: There's also reference in your report -- and I'm not sure if this is an appropriate time to ask the question, but there was also a reference in the report -- a discussion in the report, rather, about escalation of capital costs and the appropriateness of using CPI as the measure for escalation.

I can't remember offhand; I'm just trying to recollect what -- how it concluded. But you indicated -- I believe you indicated that that is a measure used by most utilities, although it may not be the most appropriate measure. Now, you provided some data as well from another source that indicated what would represent a more appropriate inflation factor for capital projects.

Could you discuss that just for a second, please?

MR. MICHAEL ROBERTSON: We -- we do address that further down the line, but essentially historical evidence is that capital works like this have not escalated at CPI. They've -- they've escalated a higher than CPI. And therefore -- you know, and -- and Manitoba Hydro does recognize that and they have provided one (1) part of their management reserve to cater for the possibility or likelihood that, in fact, escalation is going to be higher than CPI. I'm sorry, does that answer your question?

THE CHAIRPERSON: It does in part. I'm just trying to get a sense of what factor was used by Manitoba Hydro as an escalation factor. Do -- do you recall, or do you...?

MR. BORIS FICHOT: Yes. Our understanding is that they've calculated an index based on a number of sour -- reputable sources related to materials and projected costs of materials that come up with what they called a 'Hydro index of escalation'. And then they used that number -- a variation of that number to come up with the anticipated escalation, and then calculate the difference between that number and CPI, and use that to calculate the management reserve.

The basis -- they've got a scientific basis behind that number that they -- that they've used to justify. And their internal standard dictates that when they're escalating projects, it must be accord -- in accordance with CPI.

THE CHAIRPERSON: So the figure that -- well, ultimately used, is it much different than regular capital projects undertaken by a utility?

In other words, I'm trying to get at -- trying to understand the difference between CPI appropriate to a large construction project like this one and CPI that would relate to a regular capital update program that Manitoba Hydro would undertake.

MR. BORIS FICHOT: I believe that in -- in most instances you would use the scientific number, which is the -- what you anticipate the -- the escalation to actually be, as opposed to CPI. And in the report, we refer to what's in the public domain as Muskrat Falls anticipated escalation, which is higher than CPI.

THE CHAIRPERSON: Thank you.

MR. MICHAEL ROBERTSON: And -- and we will -- Mr. Chair, we will be examining that further.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Okay, if we're moving back now to slide 16, question 4:

> "Review and assess Manitoba Hydro's capital cost and O&M cost estimates for wind, natural gas, combined cycle gas turbines, and solar facilities."

So firstly, wind, page 50 of our report, the capital cost. Manitoba Hydro has assumed an overall capital cost of twenty-one hundred dollars ($2,100) per kilowatt, excluding major transmission, in the comparative exercises they have undertaken.

From the data in the next slide and data from other jurisdictions, we believe that a figure of eighteen hundred dollars ($1,800) per kilowatt is deemed to be more appropriate, and yet still sufficiently conservative for this exercise.

I'll turn to the O&M costs. Manitoba Hydro's assumption of an O&M cost of approximately forty dollars ($40) per kilowatt is appropriate and it is within the recommended range of thirty-five (35) to fifty-five dollars ($55).

Now slide 17 shows the trend in prices of wind turbines, and -- and, essentially, the point we're making is that, whilst twenty-one hundred dollars ($2,100) per megawatt might have been appropriate in 2009 at the peak of the costs, those costs have dropped significantly since, and there is no thought in the industry that they are going to go back up again in -- in any significant manner, and therefore, in the exercise, a -- a figure of eighteen hundred dollars ($1,800) per kilowatt would have been more appropriate than twenty-one hundred (2,100).

On slide 18, to do with natural gas combined cycle turbines, the details are on page 53 and 4 of our report, Manitoba Hydro has assumed a capital cost of 1.3 million per megawatt. We've deemed that to be appropriate. On the chart there, you will see where my cursor is, that's Manitoba Hydro's point, and you can see that it's very much in the middle of the scatter of the historical record.

So in -- so in terms of capital costs, we believe they're -- they're okay. In terms of the operation and maintenance costs, they've assumed twenty dollars ($20) per kilowatt per year, and three dollars fifty ($3.50) per kilowatt hour, which we are -- which we also deem to be reasonable, and they're within the recommended range of six dollars thirty ($6.30) to twenty-two (22) kilowatts -- dollars per kilowatt per year.

Slide 19, solar on pages 55 and -- to 57 of our report. The -- Manitoba Hydro's present assumptions on capital costs are deemed appropriate, but again, solar costs have been reducing significantly in recent years, and so one could logically use a -- a lower number, and the chart basically shows how the prices have been coming down.

That's all we have to say on question 4. Moving on to question 5, slide 20:

"Review and assess Manitoba Hydro's construction management plan schedule and contracting methods for the design engineering procurement construction start-up, commissioning testing and commercial operation for wind, natural gas, combined cycle gas, turbines, and solar facilities."

Wind, on page 58, Manitoba Hydro assumed that wind power projects will be developed in-house, whereas an observation is that the existing Manitoba wind farms have been developed by independent power producers. The time frame is assumed to be three (3) to five (5) years, including the resource assessment.

Asset life is assumed to be

approximately twenty (20) years. We have no further details from Manitoba Hydro, and we understand that wind will only be developed if and when wind becomes cost competitive.

Slide 21. With regard to natural gas combined cycle gas turbines, the NFAT assumes the development by Manitoba Hydro and construction through EPC contract. The time frame is assumed to be three (3) to five (5) years, which is reasonable, but it might be shorter. It could be two (2) to four (4) years, depending on turbine supply time and how much demand there is at the time.

Again, we have no further details from Manitoba Hydro, and we understand that this energy source will be developed as the Preferred Development Plan proceeds.

Solar page 59, the Manitoba Hydro assumes a time frame of three (3) years for development and construction of a generic 20 megawatt facility. This could be reduced if and when solar is perceived to be a key energy resource in the future.

Moving on to Question 6, page 22 -- slide 22. Review Manitoba Hydro's capital expenditure forecasts, essentially from the capital expenditure forecast of 2009 through 2013. That first table, which is from page 60 of our report, shows that, for example, Keeyask has gone from 4.6 billion in 2009 to 6.2 billion in 2013, and as we know, in 2014, it went up a little bit more.

Now, the significant factors in those cost increases, which are detailed in page 61, are the delay of in-service dates, which adds project management interest and escalation costs, and you can see in the -- in the table below there that Keeyask effectively has lost a year over those four (4) -- five (5) year estimates, and Conawapa has lost four (4) years.

There was a big shift from '09 to -- to 2010 due to the update -- updated detailed cost estimates by KGS-Acres. In other words, a much better project definition in terms of design and -- and real quantities, and cost estimates from the bottom up. So I guess 2010 was the first real -- real detailed cost estimate.

And then the other big jump came from 2011 to 2012, and that essentially is the Wuskwatim experience, whereby the -- a -- a management reserve was added to deal with the -- the probability that you're going to have a -- a higher escalation than they had assumed, and changing interest rates, and that is detailed further in our reply to Question 9.

Slide 23, Question 7.

"Provide a historical perspective on the construction cost components of other Lower Nelson River hydraulic generating stations, which were Limestone, Long Spruce, and Kettle, and analyze the major components of direct costs, including: a) spillways, dams, dikes; b) power houses; and c) turbines and generators, and compare these to the Keeyask and Conawapa GS costs for these components."

At the outset, we have to say that a meaningful assessment is not possible with the information that has been made available to us. Manitoba Hydro did provide the total costs of those projects, but not the individual component costs, so we cannot comment on it component by component. They also did provide the major quantities.

As a general observation, the -- there have been very significant differences between the contracting construction environment at that time, which was 1992 back to 1973 for those three (3) projects and now. And in now, we include Wuskwatim and the estimates for Keeyask and Conawapa. Page 64 of our report is the reference.

First the -- the Manitoba Hydro is now engaged in a partnership framework with the First Nations. There has been a significant increase in the rigour of the environmental process, which came into force after Limestone, and -- and associated with that is that, certainly initially, there was a lack of regulatory capacity in Manitoba to deal with these new requirements and to ensure that proponents were following them, and labour costs and productivity.

My apology, we were -- I was going to try to move this table so that you could see what was underneath it, but... The Limestone example, page 65, this is slide 24. It was completed in 1992 on time and within budget, at a total cost of 1.43 billion. Using the quantities that we obtained from Manitoba Hydro and Knight Piesold's typical unit costs for -- or unit rates for those types of work, the excavation, the earthfill concrete, the generating plant, et cetera, we would estimate that at about 2.2 billion today. However, if you escalate the 1.43 billion at, say, 2 1/2 percent for eleven (11) years, we only get 1.88 billion, which is less than the direct cost alone, let alone adding all the other costs to provide the in-service cost.

So -- and -- and going back to that first ballparking yardstick which I showed you, with a capacity of 1,314 megawatts that gives a cost of $1 million per megawatt, which was a very traditional figure back in the day, and you compare that with eight point nine (8.9) for Keeyask and six point nine (6.9) for Conawapa, clearly things are very different now from what they were.

Slide 25. Long Spruce. Very little information. We -- we were told that it cost 508 million when it was completed in 1979, with a capacity of approximately, you know, 1,010 megawatts. That gives you a cost of point five (.5) of a million dollars per megawatt, which is about the cost of the turbine generators alone today. And we have no information regarding the schedule and the cost performance.

Kettle, even further back. Commissioned in 1974 for a cost of 240 million. Capacity of 1,220 megawatts gives this ballpark parameter of $.2 million per megawatt. And again, we have no information regarding the schedule and the cost performance.

Slide 26. Question 8:

"Analyze Manitoba Hydro's
justifications for increasing the
direct costs and for increasing the
indirect costs with respect to: a)
labour productivity and shortages,
competition with other large civil
projects in Canada, remote location,
Northern and First Nation jobs, and
other contractual hiring
constraints."

Dealing first with labour productivity and shortages, the details are on page 66 of our report. The labour productivity and the construction industry is documented to have decreased since a peak in the 1970s, mainly due to a reduction in skill level. Other factors include a decline in the number of employees, the capital to labour ratio, percentage union, and average age of workers. And Canada has experienced at least a decade of labour shortages.

Manitoba Hydro have attribulated -- have attributed the lack of productivity to the difficulties in hiring and/or retaining staff and the use of inexperienced staff. As a result of the low productivity experienced at Wuskwatim, Manitoba Hydro has, for Keeyask and Conawapa, adjusted the contracting methods, added staff, and invested in better camp facilities. And these are deemed to be reasonable measures.

Slide 27. Competition with other large civil projects in Canada. Details on page 66 of our report. Forty (40) percent of the overall project workforce for Wuskwatim was out of province; and for the generating structure itself specifically, it was more 60 percent of the labour had to come from out of province. Keeyask's demand on labour is greater, and the situation is likely to be even worse. In other words, probably going to have to find even more than 60 percent of the labour from outside of the province.

As -- as -- in support of that, we have found in British Columbia that, for our recent hydro projects that Knight Piesold has been involved with, there has had to be a significant importation of labour from Eastern Canada. And Manitoba Hydro is relying on offering competitive wages and an attractive camp environment in -- in this competitive situation.

The third point with regard to labour was the remote location, dealt with on page 66 of our report. Yes, the location is remote but it is known, and therefore is factored into the cost estimates already, and it's factored into the contractor's bid prices. So there should be no surprises. And also factored in are the fact that staff rotations are necessary to -- to get people in and out of these remote sites and to keep them happy.

Northern and First Nation jobs on page 67, similarly, yes, it's a remote Northern project, but that's always been part of Canada's nonresidential construction outlook. There are a number of other natural resource development and mining projects in the pipeline, and we expect that to grow significantly through 2020.

Slide 28, other contractual hiring constraints, details on page 67. The Burntwood Nelson agreement sets out the terms for the hands-on tools, basically, the -- the labour -- the -- the craft labour workers, including the First Nations contributors, on hydro projects in Northern Manitoba.

This is a collective agreement between the Hydro Project Management Associating representing the contractors and the Allied Hydro Council of Manitoba representing the unions.

The general civil contract tenders that were expressly included that the tenders had to comply with the BNA requirements. And then it was anticipated at the time we produced that first report that the --

the assessment of the bidders, the large contractors, they -- they would effectively provide their assessment of the difficulties of hiring and retaining labour for that work. And that's picked up further in Question S7.

Question 9, "Provide" -- this is slide 29:

"Please provide a high-level assessment of the construction planning and management of the construction costs of the new Preferred Development Plan project, including the experience gained from Wuskwatim."

So just referring back to Question 3 to do with construction planning and management of construction costs. And we'd also pick that up on -- under Question S1.

So the experience gained from Wuskwatim, in terms of costs detailed on page 68, Wuskwatim witnessed a lower than expected labour productivity. It occurred during a period of international commodity escalation, and it suffered a three (3) year delay of in-service date.

The cost went from 988 million in CEF03

to 1.771 billion in CEF12, in other words, a 79 percent increase. And the details behind that are shown on the next slide. In light of that, the Keeyask and Conawapa cost estimates were updated on -- based on the actual labour material and equipment rates, as well as labour productivity.

So on this slide 30, there is the -- the breakdown of the extra cost. The slide carries on, on -- on -- on slide 31. The table continues on slide 31. The explanation given by Manitoba Hydro in the -- part of the NFAT submittals, number 47, is in the third column. And then we have added a column on what we believe the implications are for Keeyask and Conawapa.

I don't plan to go through this table. I can if anybody would like to, but the -- the main points are picked up in other points made during the presentation. That's the -- the other half of the table on slide 31.

Continuing the experience gained from Wuskwatim on slide 32, access and First Nation enga -- First Nation engagement on page 70 of our report. Advancing the infrastructure work ahead of the generating station benefits the First Nation through increased and advanced employment, training, and capacity building opportunities. It also reduces financial risks to the First Nation joint venture partners.

And this process was pursued on Keeyask to avoid repetition of some difficulties experienced with a First Nation joint venture partner at Wuskwatim. And the other bonus of advancing this infrastructure work is that it allows the developer, i.e., Manitoba Hydro, to focus then on the engagement of the general civil contractor.

Slide 33, changes to the construction planning and management process that Manitoba Hydro uses as a result of Wuskwatim. Initially, they bid Wuskwatim as a unit-price contract in 2007, but they only received one (1) bid, which was basically too expensive.

They then went out with a -- a CRC, for which they received four (4) bids, and much -- much better prices, a cost-reimbursable contract. They -- they -- one (1) of the other changes to -- to the construction planning and management is that they will be providing better camp conditions at Keeyask.

And other evidence that the process review has resulted in changes, a target-price contract is being used for Keeyask to improve the alignment with the prevailing market and to share cost escalation risk, and that is being explored in detail with this ECI process.

Market research into craft labour and heavy construction costs and productivity and development of strategies for labour recruitment and retention -- for example, much better camp conditions.

Earlier scheduling for the development arrangements, which we dealt with in the previous slide, agreements and adverse effects and careful management through integration of engineering, regulatory and procurement processes, and then finally, inclusion of management reserves for escalation and labour costs on top of the normal contingency.

Slide 34. In terms of the cost estimate, a high-quality cost estimate has to satisfy four (4) basic characteristics. It has to be credible. In the case of Keeyask and Conawapa, the direct-point estimate is credible, as it has been prepared by a reputable engineering firm with a wealth of recognized hydro power expertise.

Documentation. The -- the layout and design of the generating stations is well-documented, as is the makeup of direct-cost estimates. The indirect-cost estimates, as I've alluded to before, are not as well-documented, or at least, they have not been provided to Knight Piesold. Project management processes and standards are well-documented.

The third characteristic that a high-quality cost estimate has to satisfy is accuracy, and essentially, we believe the current estimates are likely as accurate as they can be. This was still prior to the general civil contractor award, but we talk further about that in questions S7 and S8.

And then the estimate needs to be comprehensive, and we believe that estimate is comprehensive. It includes, as far as we can see, all the possible project costs, and is structured in sufficient detail to ensure that costs are not omitted or duplicated, and it has been put together by a suitably experienced estimating team.

So perhaps at the end of those nine (9) questions on the first report, I'll ask if there are any other questions.

THE CHAIRPERSON: The previous slide to this one, the comments that you have made apply to both the generating -- both generating stations, both Conawapa and Keeyask.

MR. MICHAEL ROBERTSON: Correct.

THE CHAIRPERSON: Is that correct? Yes. Okay.

MR. MICHAEL ROBERTSON: So if we move on to the second set of questions, which, essentially, were asked because when we -- when we produced our first report in January, we -- we had to say with regard to the cost estimate that all would be revealed, or much would be revealed, when we got the results of the general civil contract tender, which is the single biggest cost item in the -- in the makeup of the costs for -- for Keeyask. And -- and from now on, we're pretty much talking only Keeyask, not -- not Conawapa.

And so the Board came back and said, Because we had reservations or we felt we couldn't make any definite statements at that time, or -- or that it would be advisable to wait until we did get that data to make a sensible observation, we -- we were given these extra eight (8) questions, the first of which, on slide 35, Question S1 is to:

"Review Manitoba Hydro's overall management strategy and scheduling for the tendering of contracts for the Keeyask generating station, and their procurement of other major facility components such as spillways, dams, dikes, powerhouse turbines, intake gates, generators, control, et cetera. Comment on the effectiveness of this management approach for minimizing capital costs, securing competitive bids, and managing construction and procurement, cost escalation, and construction risks."

So the first point, the management strategy for tendering, this is detailed on page 2 of the supplemental report. Manitoba Hydro's Project Execution Plan is a high-level guideline to manage both the Keeyask infrastructure project and the Keeyask generating station project. It provides the means, methods, tools, and techniques used by Manitoba Hydro to manage the project. It serves as a record of the planning effort for the construction phase, and as a resource for staff to ensure consistent project management.

Slide 36. The process of procurement of the contracts is detailed in the Project Execution Plan. We have seen copies of the following documents: the total cost and schedule management; engineering consulting contract monitoring and controls; construction contract monitoring and controls; contract change management; risk management, project contingency management; and project change authorization.

And a breakdown of the total cost and schedule management document, which is detailed on page 3, it -- it follows what is -- what they describe as a PDCA process: plan, do, check, act. 'Planning' comprises establishing the project baseline schedule and budget. 'Do' is the implementation of the project controls on the contracts and internal labour. 'Check', retrieve the actual costs from SAP, which is Manitoba Hydro's proprietary accounting software, and later schedule and budget for costs from project leads. And then 'act', assess the performance, and management change and the contingency.

Slide 37. The overall tendering and project -- and -- and procurement management strategy, detailed on page 3 of our second report. The work is divided into work packages. There is a project controls coordinator in Manitoba Hydro who is responsible for the process all the way from contact drafting to the early periods of the contract execution.

For each contract, the awarded contract value is compared to the based estimate, and relevant amounts of the contingency are allocated from the contingency pool to each contract. And this is examined further in our reply to Question S2. The PDCA iterative management approach ensures that project estimate and schedule are updated accordingly.

The tendering has been a mixture of methods tailored to individual contracts. For example, the supply and installation of turbine generating equipment is essentially fixed price, while the main civil works is essentially designed bid build or unit price but with a target price and an ECI process. Knight Piesold deems the overall approach to be appropriate in principle.

And then just a reminder that Question 3 gives details of the various forms of contacts used or considered by Manitoba Hydro.

Slide 38. In the general civil contract early contract involvement process, the selected contractor has been engaged early, two (2) years before major construction, so is involved in helping finalize contract details. The main objectives are to ensure that the constract -- contractor's construction knowledge is incorporated into the design and constructability issues. It -- they -- he is helping to refine the delivery schedule, helping to secure the necessary labour, and he is forming alliances with Manitoba suppliers and subcontractors.

Slide 39. The schedule for tendering, details on page 4. The Project Execution Plan requires the execution to follow the Hydro cost and scheduling standard for schedule management. Schedule performance is one of the key performance indicators tracked by Manitoba Hydro. The overall schedule anticipates construction starting in July 2014 and being complete in January 2021.

The procurement of long lead time items of equipment is already underway in order to ensure deliver to site on -- in time for incorporation in the works.

The detailed schedules for the Keeyask Generating Station Project were included in the 2009 cost estimate and in the general civil contractor RFP, request for proposals. Again, just making the point that neither of these schedules include time for Manitoba Hydro's contributions.

All of the GCC tenderers confirmed that basic schedule. And as a general comment, Knight Piesold would say that the overall schedule is not deemed to be overly aggressive, with the singular exception that it is assumed that the first-stage coffer dam will be able to go in this year, starting in July. And you'll see later that we -- we believe there is a risk associated with that assumption.

Slide 40, procurement of the major facility components, on page 5 of our report. The long leads time items, for example, the turbine generator supply, is being procured early. And the -- the rest, the -- the balance of plant, as it is sometimes known, the remaining mechanical and electrical equipment supply has been wrapped into the general civil contract to minimize interface issues, which was another lesson learned from Wuskwatim.

There were some other activities which initially were scheduled to be outside of the GCC but have now been wrapped into it, as well. And this includes excavation, coffer dams, and draft tube forms. And certainly it is Knight Piesold's experience and mine personally that that is a very sound move.

THE CHAIRPERSON: The previous slide indicated a project completion date of 2021. Now, I was working under the assumption that it was in-service date of 2019.

Am I misreading that reference or -- or is it a matter where some of the work will be completed after the in -- the dam started generating power?

MR. MICHAEL ROBERTSON: To -- to be honest, I -- I am -- I can't from memory recall exactly when the various units were going to come online. It is -- normally, they come in on sequence, so your first unit is -- is up some months before the -- the final project is absolutely complete and -- and all the demobilization has happened.

From the slide, I don't know. Boris, can you comment?

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Yeah. So probably the first unit might come online in 2019. I don't know. We -- we could go and check if...

THE CHAIRPERSON: Perhaps Manitoba Hydro could clarify that directly instead of my stewing in this.

MR. MICHAEL ROBERTSON: They should know.

MR. DAVE BOWEN: Sure. It's -- it's Dave Bowen. So our first unit comes online in November 2019. The subsequent units come online about the two (2) month interval thereafter. So the -- the end of the project is expected in 2021, but our first unit comes in -- the 2019 date always refers to our first unit in service.

THE CHAIRPERSON: Thank you.

MR. MICHAEL ROBERTSON: Thank you, Dave. Okay, moving on to slide 41, which deals with the effectiveness of tendering and procurement management approach. The details are on page 4 of our report. We believe that Manitoba Hydro is using an appropriate approach to minimizing capital costs primarily by sharing the risk with contractors and suppliers through advancing the design prior to procurement so there is less uncertainty there, identifying and managing the risks, sharing them with the contractor, and detailed management of the construction process.

Most significant contracts have been or are being procured through a competitive bid process, basically, the GCC and the equipment supply being the -- the major two (2) contracts. A number of projects have been or are being procured through non-competitive direct negotiated contracts because of a preference by Manitoba Hydro for particular contractors to undertake specific work assi -- assignments. And we understand that is also based on the Wuskwatim experience.

And then finally, repeating that the internal management -- sorry, the internal Manitoba Hydro costs may not be deemed to be competitive, but

Knight Piesold has insufficient data to offer an opinion on this issue. And, Mr. Chair, you've -- you've picked up on that point.

THE CHAIRPERSON: The use of non-competitive DNCs is it -- is that unusual in respect of hydro projects that you've examined?

MR. BORIS FICHOT: In British Columbia we've -- we've seen that occur with a number of independent power producers where -- for initial engagement with First Nation or local communities, usually -- especially basic infrastructure costs or road construction costs, those contracts would be awarded very early on in a non-competitive process, and then the main civil works would be engaged in a -- in a competitive process.

So we -- we have seen that before.

MR. MICHAEL ROBERTSON: And it -- it also depends somewhat on the capacity of the First Nations to do that work. We -- we don't have too many First Nations with construction divisions that can do it, for instance. They can certainly provide a lot of the -- the assistance in terms of environmental data collection and survey and -- and labour of one (1) sort or another; some equipment hire. But there's -- there's not been a lot of capacity in British Columbia, certainly, the -- the projects we've been involved with.

Boris is correct, yeah.

MS. MARILYN KAPITANY: You mentioned a couple of times that there isn't time built into the schedule for Manitoba Hydro contributions.

Could you say a bit more about that and how significant that is?

MR. MICHAEL ROBERTSON: Well -- well, I guess I would say I don't know if there's time built into the schedule for Manitoba Hydro's input. It's not expressly shown, and then it sometimes is. And I don't know details of their review process.

The -- the fear might be that if -- if the contractor is required to provide details of all his plans and his drawings and everything else, and -- and that that takes time within the overall process for approval by Manitoba Hydro before he can go ahead and do it, that that might trip up the project. But I don't believe it's -- it's an issue, but I just don't know.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Now, I believe

we are halfway through slide -- no, we finished slide 41, I think. Slide 42, on page 5 of our report, it's difficult to measure Manitoba Hydro's effectiveness in managing construction and procurement cost escalation, as the current process is relatively new and it's significantly different from the old. And so they -- they are using -- they're using a new process. It seems to be well documented and -- and thorough and sensible, but I do not believe it's been tested yet with another project. So we're not really able to comment on that.

In terms of the new processes, the project team and the risk engineer execute the contract -- construction risk management process and the contingency management process during construction. And there's some more comment on that under Question S2.

But as an overall assessment of effectiveness, we are able to see that Manitoba Hydro is following a well-documented process; again, despite the fact that the PEP is presently only in draft, and that the project generally appears to be on schedule.

Moving on to Question S2, page -- slide 43: "Review Manitoba Hydro's construction risk management strategy and comment on its effectiveness."

We were given, confidentially, copies of the following documents by Manitoba Hydro, the risk management procedure. The purpose of that is to, quote:

"Detail the activities of planning, identifying, evaluating, responding, and monitoring for effective risk management, as well as detailing the standard risk reporting templates."

We also got a copy of the project contingency management procedure; a copy of the project risk register for Keeyask specifically; and project risk report, which shows the -- drawn out on the contingency; the schedule, a one (1) year look-ahead of project specific risks based on the project schedule; the project risk profile, top five (5) global, and top five (5) specific risks; and risk by phase of implementation.

Slide 44. Now, the risks in the risk management procedure are assessed as the product of probability and impact in the following categories.

Technical requirements: technology, complexity, and interfaces, performance and reliability, quality; organizational: project dependencies, resources, including Manitoba Hydro staff, funding, prioritization and customer, which includes, again, Manitoba Hydro; project management: estimating, scheduling, controlling, communication; external: regulatory, market intelligence, performance and reliability, weather, stakeholders; and safety: design standards, qualifications, training, and awareness.

So on -- sorry.

MS. MARILYN KAPITANY: You mentioned Manitoba Hydro's staff.

MR. MICHAEL ROBERTSON: Yes.

MS. MARILYN KAPITANY: What about contracted labour? Where would that fall in here?

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Not sure exactly where one would put that. Yes, clearly, the contractor has risks. To be honest with you, I'm not sure, on the fly, how I would -- how I would answer that. Boris, can you...?

MR. BORIS FICHOT: Rephrase the entire question. If you could rephrase the entire question?

MS. MARILYN KAPITANY: Sure. I was

just looking in the risks that were outlined here, and I saw resources defined as Manitoba Hydro staff.

But we had talked before about contract labour and the difficulty of finding labour and keeping labour engaged, and I wondered where that risk would fall in these items.

(BRIEF PAUSE)

MR. BORIS FICHOT: I'm sure it wouldn't be -- it's not reflected in this -- in this list here.

MR. MICHAEL ROBERTSON: I -- I think, in fact, we're -- we're not able to answer directly which of those five (5) boxes that should go in. Clearly, it is a risk. It should -- and -- and it is encompassed in the whole risk assessment, as you will see later.

But when we're talking about organization, we're kind of talking about what I had previously referred to as systemic risk. It's part of the process, and the process is driven by Manitoba Hydro.

So if we move on to slide 45, there are two (2) charts there. Essentially, this shows the -- the matrix of probability and impact, and the -- the risk is statistically always defined as the product of probability and impact.

So you can see that for those risks which are deemed to have a probability of, say, greater than 70 percent occurring, and will have a very high impact, there is a total score of 80 in the top right-hand corner, and in the second chart, there is -- there are three (3) risk ranges which dictate the defined level of risk, and the necessary response from the new generation construction division.

Anything more than fifteen (15), in other words, the -- the dark grey, is deemed to be a critical risk. It's deemed to be unacceptable, and it must be mitigated, and they say to moderate in stage 4 and low in stage 5. Well, when you're going into construction, that's -- that's the final stage, and that's low, and we will pick up on that later.

So on slide 46, the major risks in the risk -- risk register, i.e., those with a total risk score of eighty (80), were perceived in August/September of 2013 to be -- details on page 9 -- the costs of labour and associated labour issues, which is your point, madam, increased costs for project management as a result of insufficient capacity in Manitoba Hydro, and the consequent need to hire consultants to -- for construction management, escalation and market conditions leading to higher tender prices, inexperienced craft labour workforce leading to increased time and cost to perform construction. And these are all themes that we have heard on a recurring basis throughout our assessments, and -- and in my presentation today.

And Manitoba Hydro proposed to deal with these risks by mitigation, basically through the contingency and/or the management reserve.

MR. BORIS FICHOT: I was just going to anser that first question from -- from Marilyn Kapitany a little bit more clearly.

If the -- the risk associated with -- with performance and reliability was in -- in the first question there where, If productivity wasn't within what was expected, then that falls under the -- on their performance expectation.

MR. MICHAEL ROBERTSON: Thanks, Boris. So on slide 47, it is apparent that new procedures and systems have been set up for Keeyask and Conawapa as a direct result of the lessons learned on Wuskwatim and that they reflect a genuine concern on the part of Manitoba Hydro to manage the whole process better. The risk management strategy appears to be well set up, and it appears to be being followed.

So an appreciation of the present risks faced by the project -- and this is a Knight Piesold opinion -- it can be assumed at this stage of the project that most significant technical risks have been addressed. The -- they have employed a reputable experienced designer of large hydro power facilities in Northern Canada. And they have done extensive geotechnical investigations, so we should not expect significant technical risks remaining.

A significant financial risk has been removed with the award of the general civil contract, but there are still other financial risks remaining. Environmental risks remain. The contractor's activities may lead to impacts which will have consequences, in terms of remediation and/or compensation. He -- he is no doubt bound by a construction environmental management plan of some description, and a reputable contractor should not get himself into trouble, but there is a risk.

And then the other environmental consequence of the development of the project is the Adverse Effects Agreement with the First Nation. We've not examined that in any detail, but we have observed that it has led to an increase in the indirect cost estimates in successive estimates.

And then in terms of construction, Manitoba Hydro have chosen suitable, reputable, and experienced contractors, and the remaining construction risks are associated with contractor performance, in terms of quality, cost, and scheduling.

Manitoba Hydro also carries some risk during the construction phase: a risk that the quantities have not been estimated accurately, and to some degree impacts of inclement weather. And to cover those, portions of the contingency have been added to each contract to cover these unknowns.

But the whole issue ultimate comes down to cost, and this is discussed further in Questions S7 and S8. So Question S3, slide 39 -- sorry --

THE CHAIRPERSON: Excuse me, Mr. Robertson --

MR. MICHAEL ROBERTSON: -- beg your pardon.

THE CHAIRPERSON: -- I think that it's probably an appropriate time to take a break.

MR. MICHAEL ROBERTSON: M-hm.

THE CHAIRPERSON: I'd suggest we take ten (10) minutes and -- and resume the proceedings after that.

MR. MICHAEL ROBERTSON: Thank you.

--- Upon recessing at 10:35 a.m.
--- Upon resuming at 10:48 a.m.

THE CHAIRPERSON: I believe that we're ready to continue with the proceedings, so back to you, Mr. Robertson.

MR. MICHAEL ROBERTSON: Right. We're now on slide 49, Question S3:

"Review the contract documents prepared by Manitoba Hydro for the major Keeyask components and comment on how such documents have been designed to secure cost-effective bids from suppliers and contractors and where Manitoba Hydro may be vulnerable for cost increases, schedule changes, et cetera. Comment on the overall thoroughness of the contract documents and the drawings."

Reference page 11 of our report. So Question 3 provides details of the forms of contracts typically used to procure works like the Keeyask Infrastructure Project and the Keeyask Generating

Station Project.

Knight Piesold confirms, based on the contracts that they have seen, that Manitoba Hydro has made appropriate choices for the Keeyask contracts. Contracts are designed to secure the most cost-effective bids from suppliers and contractors.

That said, all contracts, except fixed price contracts, are vulnerable to cost increases. But Manitoba Hydro has attempted to mitigate these risks by sharing them -- sorry, to mitigate cost increases by sharing the risk.

Remaining risks and possible increases in costs have been acknowledged and accounted for in a professional and competent manner through the contingency and the management reserves. See Questions S2 and, further in, Question S8 to come.

Slide 50. Non-fixed price contracts also have possible implications on schedule. The process of schedule changes has been defined, and costs associated with schedule risks are included in the contingency and management reserve to a certain extent. And we'll pick up on that later.

Contract documents seen by Knight Piesold have clearly been drawn up by competent, experienced engineers from within Manitoba Hydro and reputable consultants. The general civil contract involves the earlier -- early contract involvement to maximize the benefit of input from the contractor, and it has a target price.

Variations from the initial agreed target price are shared between Manitoba Hydro and the contractor, generally, and certainly initially, to the greater benefit of Manitoba Hydro to the tune of approximately -- of -- of 80 percent, specifically, than the contractor.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXXXXXXXXXXX

Page 51 -- slide 51, Question S4:

> "Review the construction and equipment procurement bonding and any liquidated damage requirements and comment on the appropriateness of such bonding and cost implications to the project."

Well, in general terms, bonding' refers

either to -- this is on page 14 of our report -- either to a performance bond which provides assurance that the work will be done, it's normally used for a civil site construction works, in my experience; or a letter of credit which provides assurance that Manitoba Hydro will not be out-of-pocket. And that is used to procure equipment manufactured off site typically. Manitoba Hydro has used both; different requirements for each contract suited to those contracts.

Knight Piesold believes that the Manitoba Hydro process is appropriate, including the required amounts. They provide a reasonable balance between protecting Manitoba Hydro interests and paying excessive premiums for this insurance. We believe that Manitoba Hydro have also handled liquidated damages in an appropriate manner.

Slide 52, Question S5:

"Review Manitoba Hydro's quality assurance and quality control, QA/QC, requirements for Keeyask construction and comment on the effectiveness and costs."

That's dealt with on page 17 of our report. So the best common arrangement in hydro power construction has the contractor responsible for quality control, QC, and the owner or his engineer responsible for quality assurance. Manitoba Hydro is conforming to this practice.

Quality management in Manitoba Hydro is specified at a high level in the project execution plan, with more detail in a new generation construction division standard. That standard also includes a third main activity, which is called quality planning.

Manitoba Hydro made available to Knight Piesold copies of quality management section 5 of the Project Execution Plan, a copy of the NGCD standard number 20 -- 204 on quality management, QA/QC requirements built into the turbine generator contract, and QA/QC requirements built into the general civil works contract.

Slide 53. With regard to the turbine generator contract, the contractor's own quality management system, it is -- it is a requirement that the contractor's quality management system must conform fully to the spirit and intent of the International Quality Management System, ISO 9001. The contractor is also obliged to have a project quality plan, a quality team, and various inspection and testing plans.

The document is deemed to be detailed, comprehensive, and appropriate for its purpose. With regard to the general civil works contract, the document confirms that quality control is the responsibility of the contractor and quality assurance is the respol -- the responsibility of the engineer.

Details were not made available to Knight Piesold, but we believe they are likely to be entirely appropriate.

THE CHAIRPERSON: Could you draw a distinction for -- between quality assurance and quality control, very high level?

MR. MICHAEL ROBERTSON: Right. So the -- the quality control, essentially the -- the contract documents tells the contractor what the owner/engineer is expecting, in terms of evidence that the contractor has met the stated requirements. So, for example, they say that the density of the earth will -- will be no less than 98 percent of some international standard or that the strength of the concrete will be no less than a certain value.

Now, the quality control is the process of documenting proof that indeed those requirements have been met. So the documents will typically specify that for every 1,000 cubic metres of concrete that you place, you have to do these tests and they have to pass these results. And that has to be documented and so that they -- the contractor can show the owner that he has indeed met those requirements.

So that is basically providing the data. Now, the quality assurance process is one of inspecting that data to make sure that sufficient tests have been done, that they have been reported, that they have been -- that they passed the requirements, and that where they haven't, suitable processes have taken place to correct non-conforming products.

So, yes, the final point I was going to make on slide 53 is that the costs of QA/QC are not expressly shown anywhere. They are essentially part of Manitoba Hydro's overhead with regard to QA, and the contract is overhead with regard to QC.

Questionnaire 6, page 54:

"Review the overall civil contract project management approach. Comment on its effectiveness and what project management controls are in place to minimize cost escalations."

So the general civil contract is being managed with all the procedures, processes, and standards mentioned in replies to the earlier questions.

Financial activities are part of SAP,

which is Manitoba Hydro's systemwide accounting system. Some processes being used for Keeyask are new and they're still not finalized. We had a number of conference calls with Manitoba Hydro, and these details were provided to us by them. They have project change authorizations which are used to transfer funds to and from the project contingency in real time. There is a single person in Manitoba Hydro responsible for managing this contingency.

All significant network numbers. Now, network numbers are basically the work breakdown structure items within SAP. They call them network numbers. They have a portion of the overall contingency allocated to them, and actuals and revisions to forecast are tracked, and they keep a contract revision register that records budget changes like the PCAs.

Slide 55. They also have what they call 'dashboards', which are reports tailored to present the information to particular audiences, and there is an example of a dashboard included in the KP report.

Estimates of future expenditure are adjusted in real time by adding inflation and deducting money spent to date. The check is made at the same time on the expected final cost of each item; i.e., is the budget still appropriate?

Changes are also recorded in other parts of the estimate to keep the overall in-service costs the same. So, for example, if -- if the tenders come in, and they now think that a particular contract is going to cost more, they will draw from the contingency pool and allocate part of that contingency to that particular contract, and the remaining contract pool will go down by that amount. So the -- the inter -- the overall in-service cost remains the same.

They do a -- a reconciliation overall every year with quarterly reports in the interim, and they are presently working to making this reconciliation possible more in real time. They perceive that schedule management is as -- as important as costs, and this -- this is certainly true.

Question S7, slide 56. Critically review Manitoba Hydro's pre-tender construction estimates and compare with actual tender prices. Define where significant differences are noted, and rationalize the specific differences.

It's page 21 of our report. Manitoba Hydro has provided Knight Piesold with a summary presentation material and bills or quantities comparing the general civil contractor proposals, the independent estimator's estimate -- a company named Chant -- and an escalated original engineer's estimate, the original of which was produced by KGS-Acres.

We believe that Manitoba Hydro -- Hydro has been diligent in their internal comparison between the GCC tenders, their engineer's estimate, and the independent third-party estimate.

The tender -- tenderers have, and this is picking up on a point I made earlier, have built into their bids their assessment of labour availability, productivity, and costs.

Slide 57, finally, Question S8:

"Provide an opinion as to the expected in-service capital cost for Keeyask once all work has been completed."

That's on page 23 of our report.

So Knight Piesold essentially confirms that Manitoba Hydro's expected in-service capital cost of $6.5 billion, which was the March 2014 revision, but we are of the opinion that a more risk-averse decision maker would incorporate a higher contingency -- for example, a P80 as opposed to a P50 -- and a management reserve that incorporates greater allowances for labour and escalation, plus an allowance for schedule delay, primarily the risk that the 2014 start date will not be achieved.

And that, Mr. Chairman, is our presentation.

THE CHAIRPERSON: Coming back to the last -- the previous slide to this one, now, you indicated that 'P' -- a P80 as opposed to P50, are you in a position to quantify what that would mean for the contingency in terms of dollars?

MR. MICHAEL ROBERTSON: Yes.

MR. BORIS FICHOT: Tho -- those numbers are in the report.

THE CHAIRPERSON: And -- and also --

MR. BORIS FICHOT: I -- I'll add that the numbers are considered CSI material.

THE CHAIRPERSON: I'm sorry, the -- the management reserve, the -- the -- is also part of the CSI, your expectation? Okay. I have --

MR. BORIS FICHOT: Yes.

THE CHAIRPERSON: -- another question that relates to an earlier comment you made, and it's with respect of a -- an unidentified project in BC. Remember that table that indicated the -- Muskrat Falls and the other projects, and you indicated there was -- the BC project was delayed. Could you -- it was right at the outset.

MR. MICHAEL ROBERTSON: It was in that first ballparking exercise. I think --

THE CHAIRPERSON: Yes.

MR. MICHAEL ROBERTSON: -- that's the one.

THE CHAIRPERSON: And you indicated as -- as an aside that that project was delayed. Could you -- could you explain that, please?

MR. MICHAEL ROBERTSON: Oh, Site C? No -- no, sorry, I -- I think I said it -- it's not delayed, it's just slightly further back on the track than is Keeyask.

THE CHAIRPERSON: Yes.

(BRIEF PAUSE)

DR. HUGH GRANT: I'm just wondering if the big elephant, or big gorilla in the room is the fact that a -- a lot of these large construction projects seem to have a habit of going seriously wrong in terms of the cost estimate, and you referred in many cases to Hydro relying upon reputable consultants and following industry standards, but is it quite possible that those standards in the industry aren't terribly good ones in the sense that this area seems particularly plagued by cost overruns?

And I'm wondering if you could comment on why that seems to have been the case in the past?

MR. MICHAEL ROBERTSON: Well, they -- they are. They're -- they're very big projects. There are many uncertainties. Obviously, one needs to eliminate or mitigate those risks as far as possible, and -- and I -- I do believe that Manitoba Hydro has done that.

And -- and the main things that tend to go wrong is that a -- a major civil engineering project in the ground like this, you really don't know what you've got until you open it up. You -- you do investigations, and they've done a good, thorough job of that, but there are always surprises. There's always something different.

If you put a series of drill holes along a dam centerline, Murphy's Law is that you'll put them into the high points where the rock is, and you will miss the low points where the rock isn't. I mean, it just -- Murphy's Law dictates that.

But -- but at the same time, I mean, I do believe from what we've seen that that risk in this case has been mitigated as -- as well as possible. The

-- the construction climate is -- is another big factor in -- in terms of -- of prices that -- that tenders can afford to ask for. That risk is now largely removed because -- because they have the bids.

I -- I -- there is no logical reason, in my opinion, that -- and -- and as I've -- as I've said, that the 6.5 billion as an expected cost, I -- I wouldn't revise it. I -- I have no grounds to make it more or less. I mean, it -- it's a -- it's a sensible best estimate. We're -- we're just waving a couple of flags on -- on where it might go, just because of these outstanding risks.

And, yes, they do -- these -- these big projects do tend to, it seems on -- on the historical record, to -- to overrun, but you -- you -- as I say, you -- you mitigate the risks as -- as well as you can. I mean, I -- I would point out that a -- a lot of the independent power projects that we have been involved with in British Columbia with, primarily, contractor Kiewit, a big international North American company.

They've all come in early, and they've all come in on budget, because they're a fixed price, so our experiences may be very fortunate, but it's not the same as -- as we have seen elsewhere.

DR. HUGH GRANT: I -- I guess to follow

up, I -- I just wanted to clarify my question. There's really been two (2) issues, and one (1) would be the escalation in construction costs, large projects over the past 'X' number of years, and why they seem to have increased so rapidly? And the other one (1) would be, once a project is given a go-ahead, why the cost may escalate within that particular project?

On -- on the first issue, you mentioned the decline in labour productivity in the construction industry, and the only data I've ever looked at shows -- or recently, for example, the productivity -- labour productivity in construction has been increasing rapidly and dramatically in the last eight (8) years in Canada, but that may be dominated by the residential housing sector, I'm not sure. But there's -- there doesn't seem to be clear evidence of a decline in labour productivity -- physical labour productivity, so that would be one (1) sort of question, I guess, I'm putting out there.

And -- and the other thing I was wondering about, in terms of once a project is actually contracted, and quite apart from the nature of the contract, are there not always hold-up costs in these sorts of contracts? I -- I mean, no matter how thick the contract may be, there's incomplete -- and it's incompleted contracting, and it seems to be that the person doing the contracting is able to hold up, in a sense, if there's -- if there's a cost over and to pass those costs on.

Could you comment on both of those?

MR. MICHAEL ROBERTSON: Well -- well, with regard to the first one, I don't know, Boris, if you can quote that reference? I mean, maybe -- maybe we should dig back and -- and remind ourselves what that reference was that -- that basically said that labour productivity had decreased over the recent years.

I have certainly found on construction sites, supervising construction as the engineer, that even -- even a good contractor like Kiewit there, their staff has not been particularly skilled or experienced, and -- and is, therefore, not particularly productive. I have certainly seen that in the last ten (10) years.

MR. BORIS FICHOT: I couldn't quote the references outright, but I'm pretty sure that the -- the references -- all the reference material that I've seen, it's all said that labour productivity has -- has gone down. Anecdotally, it's just a -- a change in era, the -- the era where a bunch of guys would put all their stuff in a backpack and go and bunk eight (8) to a room up north and live there for two (2) years, until the -- the project was done. It's different now, and everybody expects to have their own room, to be able to go home every two (2) weeks, and that's just a major, major shift in -- in your ability to be productive.

If the guy that was doing the concrete one (1) week is different from the guy that was doing the concrete a week ago, there's a rotation, you need to allot for a lot more staff to do the same type of work. It's just a result of the --

DR. HUGH GRANT: Trying to --

MR. BORIS FICHOT: -- the conditions, and people expect that. I've worked in camps up in Alaska where you had to bunk two (2) to a room, and some guys wouldn't show up the -- the next week, because they found a job that was giving them their own room, so I've seen that firsthand.

DR. HUGH GRANT: That's interesting. The issue -- labour productivity is most closely associated with the amount of capital per worker. So if you give me a pick and shovel, I'm not so productive. You give me a tractor, I'm very productive. And so usually, it's identified with something in the nature of the technology in the organisation, economies of scale and things of that nature, as opposed to just, you know, I want my own bedroom, or something.

MR. MICHAEL ROBERTSON: Yeah.

DR. HUGH GRANT: I was just looking at STAT Canada data, and it's -- it's a bit ambiguous, and I suspect it's dominated by the residential construction industry, where we've seen housing prices surmising up -- rising dramatically that's probably driven this, but --

MR. MICHAEL ROBERTSON: Yeah.

DR. HUGH GRANT: -- in any event...

MR. MICHAEL ROBERTSON: Yeah. So -- and -- and your second question, sir?

DR. HUGH GRANT: I'm just wondering about -- I think the term is 'holdup costs' --

MR. MICHAEL ROBERTSON: Oh, yeah.

DR. HUGH GRANT: -- the nature of incomplete contracting and -- and that nature.

MR. MICHAEL ROBERTSON: Well, you -- you know, we -- we all are at -- to some extent, at the mercy of a contractor who may take a litigious approach to -- to his work. You cannot write a document that doesn't -- that -- that a smart lawyer will not find a hole in, and if -- if that is the attitude of the contractor, then you -- you would expect some claims.

Now, hopefully, the contract document is well enough written that they won't get very far. I think, in general, Manitoba Hydro have done a good job with that main civil contract. I -- I think the -- the whole idea of bringing the contractor in early -- early, getting his buy and getting him to be part of the establishment at this initial target price should diffuse a lot of his ammunition if he then comes later and wants to argue that things are different from what he assumed, because he's worked through this whole process with them for a year.

And as -- as I've tried to say that, you know, I think the information -- they have as much information as they can reasonably at this time to -- before they actually open up the ground. The weather's always something that you can't anticipate exactly how that's going to turn out.

The schedule is not unduly aggressive. I -- I don't really see any reason why, as I say, that expected value should be different. I -- I don't see any big loopholes that the jump -- the contractor can jump into. I -- I won't say I've read every word of the document, but it's -- it's -- the -- the whole idea of the target price and basing quantities and what happens if it's different from the target price is --

is well defined. And as I said, it's -- certainly initially it's -- it's to the benefit of Manitoba Hydro if there is a variation and not to the contractor.

So there's a big incentive on the -- to the contractor to performing properly. Essentially, in terms of cost overrun, it's going to be things outside of his control, like labour availability and productivity, that -- that might cause concern.

THE CHAIRPERSON: I think that's all the questions that the panel has. Mr. --

MR. SVEN HOMBACH: Mr. Chairman, before we proceed with cross-examination I've been advised that there's a matter that counsel may need to add -- address for ten (10) minutes. I'm wondering if it's possible to step down for ten (10) minutes for counsel to speak?

THE CHAIRPERSON: Yes, let's do that. Ten (10) minutes then. So back here at twenty-five (25) after.

--- Upon recessing at 11:15 a.m.
--- Upon resuming at 11:46 a.m.

THE CHAIRPERSON: I believe that we're ready to resume the proceedings. So, Ms. Menzies, do you have questions for these witnesses?

CROSS-EXAMINATION BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: I do, yes. Thank you. Bonne matin, tout le monde. Good morning, Board members, and good morning Mr. Robertson and Mr. Fichot. Before I begin today -- first of all, my name is Meghan Menzies and I represent the Manitoba branch of the Consumers' Association of Canada.

I was just recently advised that it is someone's special day today, and I just wanted to acknowledge that on the record. Apparently Patti Ramage -- Ms. Patti Ramage is turning thirty-five (35) today I figured that we should all... So happy birthday, bonne fete. Is that bonne anniversaire or -- not sure.

So many of my questions for you today are based in the original report from January 2014. However, there will be a little bit of jumping back and forth between that and then the supplemental report of April 2014. So I would just ask -- and I'm sure you -- you already have them ready, but just make sure to have both reports before you. And I ask for the forgiveness of Ms. Villegas for all the jumping back and forth, but I'll -- I'll try to stick to one (1) report at a time.

So first off, I would like to direct you to page 9 of your March 2014 redacted report.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: And so here we see Table 2.2, which is from the International Association for the Advancement of Cost Engineering.

Is that correct?

MR. MICHAEL ROBERTSON: Yes, that's correct.

MS. MEGHAN MENZIES: And I should have said before, I'll be directing my questions generally to both of you, so please feel free to answer wherever it's appropriate. And I'll just be referring to them as the AACE, as you do in your report, if that works.

Okay. And so can you please confirm that this table provides AACE's internationally recommended generic cost estimate classification matrix?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Thank you. And looking to the left-hand side of the table, what we see here are five (5) different classes.

Is that correct?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: And my understanding of these classes is that each is used to identify the level of certainty of a particular cost estimate.

Am I correct in my understanding?

MR. BORIS FICHOT: That's the intent.

MS. MEGHAN MENZIES: That's the intent. Thank you. And it appears to me that a project that has received a Class 5 would have less certainty than a project that has received a Class 4.

Is that correct?

MR. BORIS FICHOT: That's correct.

MS. MEGHAN MENZIES: This is going to move a little slow at the beginning. So the lower the number of class, the higher the certainty in cost estimates? Yes?

MR. BORIS FICHOT: That's correct.

MS. MEGHAN MENZIES: Thank you. And looking at this table, am I again correct in saying that the more developed a project is, the more certain it is likely to be? Would that be --

MR. MICHAEL ROBERTSON: Just -- just rephrase that.

MS. MEGHAN MENZIES: So looking at the

different characteristics that are considered in classifying a project, would it be appropriate to assume that the more developed a project is, the more -- the more certain it is likely to be, or the lower the class number it's likely to be given?

MR. BORIS FICHOT: What do you mean, 'to be'?

MS. MEGHAN MENZIES: So the -- the more certain it is likely to be classified as.

MR. MICHAEL ROBERTSON: I -- I think perhaps -- with respect, I think perhaps where you're going is -- is that the -- the lower the class --

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: -- the more certain you should be of what you're saying about it, in terms of cost estimates.

MS. MEGHAN MENZIES: Yes, and I was trying to move one (1) step further from that to suggest that the more developed a project ism the more likely that it is to receive a lower class.

Would that be an appropriate assumption? I'm kind of making a bit of a jump here.

MR. MICHAEL ROBERTSON: Well, the -- they've broken it up into five (5) classes. And one of the ways to help you put it in the right box is the degree of definition of the project.

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: And so, yes, the better defined the project, the lower classification that fits into this process.

MS. MEGHAN MENZIES: Perfect.

MR. MICHAEL ROBERTSON: And the more certain you are about what you're going to do.

MS. MEGHAN MENZIES: Thank you. That's exactly what I was trying to get at. Thank you. So looking at -- looking at this table, am I also -- am I correct in my understanding that within each class, there does exist a range of certainty?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: And so for instance, two (2) separate projects could be classified as a Class 3, with one being towards the lower range of certainty within Class 3 and the other towards the higher range?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Yes? Thank you. So I would now like to take you to page 10 of that report, just the next page. And here we see at the far right column that the Keeyask Generating Project and the Conawapa Generating Station Project have both been categorized as Class 2s.

Is that correct?

MR. BORIS FICHOT: In this table, that's correct.

MS. MEGHAN MENZIES: Okay.

MR. MICHAEL ROBERTSON: No. In this table, KIP is Class 1 -- oh, Class 3.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: If you look just below -- so that's the infrastructure, and then just below is the generating station project. Does that --

MR. MICHAEL ROBERTSON: The -- the Conawapa Generating Station Project is two (2).

MR. BORIS FICHOT: That -- that was our appreciation at the time, yes.

MS. MEGHAN MENZIES: Okay. And when you say, "at the time," what is your appreciation now?

MR. BORIS FICHOT: It would probably be more in the line with the Class 3, but it's with a lot of reservations. You have to see that -- if you look at what the associated accuracy of the estimate is, that doesn't necessarily have to change. Like these things are -- are kind of -- there's a range where these things go on top of each other.

MS. MEGHAN MENZIES: Okay. Fair enough. And I think -- I do think that you responded to that in an IR previously, and I'm just following up on that.

And so just to surmise what -- just to summarize what you've just said, so Conawapa could be classified now as a Class 3?

MR. BORIS FICHOT: Yes.

MS. MEGHAN MENZIES: Yes?

MR. BORIS FICHOT: Yes.

MS. MEGHAN MENZIES: Thank you. Okay. And so now if we could move to page 22 of your report. And now I would like to discuss with you the concepts of systemic risk and project specific risks, which I think you also mentioned in your presentation this morning.

So looking at page 22, and if we could just move just a little over; thank you very much. Here I see that it says -- and I'm just going to read it to you and if you could just confirm that this is what you see -- that:

"Systemic risks are those that are inherent to the project development process and are not unique to the project."

Can you confirm that?

MR. BORIS FICHOT: Correct.

MS. MEGHAN MENZIES: Thank you. And then:

"Secondly, in general, as a project advances in development, system risks are reduced or developed -- or develop into project-specific risks."

Is that correct?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Yes. Thank you.

MR. BORIS FICHOT: I would -- I would underline the 'in general'. MS. MEGHAN MENZIES: Fair enough. Thank you. And...

(BRIEF PAUSE)

MS. MEGHAN MENZIES: All right. And so according to what I've gotten from your report, and please correct me if I'm wrong, but Cona -- the Conawapa Generating Station Project is less developed than the Keeyask Generating Station Project?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: And so would I be

correct in saying that, as compared to Keeyask, Conawapa is more likely to face systemic risks?

MR. BORIS FICHOT: That's correct.

MS. MEGHAN MENZIES: And Keeyask, being further developed, is more likely to face project-specific risks?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Thank you.

MR. BORIS FICHOT: It's -- are you talking about magnitude or in terms of -- like they both face those risks.

MS. MEGHAN MENZIES: And -- and fair enough, and I take your point. More I'm just trying to get at the -- get at the point that where they are in their development right now, the types of risks that they're facing, not -- not comparing the magnitudes to each project, but just the types of risks that they will generally be facing are probably syste -- systemic risks for Conawapa and project-specific risks for Keeyask, more generally?

Did I say that wrong?

MR. BORIS FICHOT: I -- I wouldn't state -- I wouldn't say it that way. I would say they -- they both face those risks in an equal way. The systemic risks are -- are a lot more significant for

Conawapa, but since there's no -- there's no association with the actual magnitude, it's -- it's something that can be very subjective.

MS. MEGHAN MENZIES: Thank you. I appreciate that.

MR. MICHAEL ROBERTSON: I'd also say that the project-specific risks on Keeyask are now less than they are for Conawapa because there's more known about Keeyask.

MS. MEGHAN MENZIES: Okay. And that's good to know. Thank you.

THE CHAIRPERSON: Could we go back to the previous document that we were examining? I'm a little bit confused here. And I want to make sure I clarify it in my own mind. This is a table that showed the hydro classification versus the KP class -- KP classification?

MS. MEGHAN MENZIES: Yes, and that's at page 10.

(BRIEF PAUSE)

THE CHAIRPERSON: I understood you to say that the KP classification for Keeyask is now Class 3 as opposed to what's here?

MR. BORIS FICHOT: I think it's -- it reflects a little bit more of our appreciation of we've delved deeper into the material. I think the first thing, as engineers, that we've reviewed that was provided to us was the -- the estimate of the direct costs for Keeyask and Conawapa. And those were very well documented. They had a lot of backup material, engineering studies. And that gave us some confidence that the degree of definition in the project was fairly -- was -- was fairly elaborate.

I think, in -- in retrospect, especially examining the validating estimating report, which is their -- their specialized risk analysis report, the -- the overall systemic risk described, there's a lot more risk attributed to that and a lower level of -- of definition and certainty with those -- attributed to those.

So as a result, I'd probably be more inclined to classify it as a Class 3 today.

THE CHAIRPERSON: So that even now knowing the -- having seen the GCC contract or bid, that would still cause you to classify it as a Class 3?

MR. BORIS FICHOT: That -- that is the case. That is the case. And I'd highlight that the -- one of the things that we did outline in this report when we wrote is that, irregardless of the class, we still thought that the accuracy was -- did not change as a result of changing. It's really just an appreciation of what the definition of the project is.

But our appreciation is the -- of the risk and the uncertainty around the project is almost independent from whatever ball -- whatever category you want to put it in, with all respect to AACE.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Thank you. And actually just following up on the Chair's question, can I just get it confirmed for the record that you would still classify the Keeyask Generating Station Project as a Class 2?

MR. MICHAEL ROBERTSON: Okay. Can we just take that offline a second?

MS. MEGHAN MENZIES: Yes.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: No, I'm just confirming with my colleague here that, essentially, because of the reappreciation of the systemic risk, which validating, estimating did, together with Manitoba Hydro, we would go back to Class 3, essentially, as per Manitoba Hydro's original submission.

MS. MEGHAN MENZIES: For the Keeyask generating --

MR. MICHAEL ROBERTSON: For -- for both those projects.

MS. MEGHAN MENZIES: Okay. So now both -- I'm going to call them the KGSP and CGSP would be classified as Class 3?

MR. MICHAEL ROBERTSON: Yes. Well, all three (3), the first three (3) rows.

MS. MEGHAN MENZIES: So the -- the Keeyask Infrastructure Project as well?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Okay. Thank you very much.

THE CHAIRPERSON: Just to make sure that the panel members are on -- on the same wavelength, so the first three (3) listed there would be Class 3 according to KP?

MR. MICHAEL ROBERTSON: Correct.

THE CHAIRPERSON: The KIP, the KG -- GSP, and the CGSP, all three (3) will be Class 3?

MR. MICHAEL ROBERTSON: Yes.

MS. MARILYN KAPITANY: Sorry, Ms. Menzies. Could you just go over again what you said about -- even though you had decreased the level of classification that you gave these projects, that doesn't necessarily mean -- I thought I heard you say it doesn't necessarily mean you have less confidence in them, but somehow that doesn't make sense to me?

MR. MICHAEL ROBERTSON: No. I -- I think what -- what has happened is that, when we first did this, we -- we saw that Manitoba Hydro had classified all three (3) projects into Class 3.

We believed that based on the -- the level of definition, the maturity of the projects, that that class should be lower, because there was more definition than the general guidelines of AACE would indicate should be in Class 3.

So the KIP, a lot of the contracts had been awarded. There should be much better project definition and more certainty, and to -- to some extent, but not to the same extent, the KGSP had a number of contract awarded -- contracts awarded, like the turbine generator, for instance, at that time.

And we deemed that there was perhaps more definition than was implicit in Manitoba Hydro's classification, and therefore, we recommended that it should rather be Class 2.

However, the -- the validating estimating exercise that was undertaken once the -- or undertaken again once the general civil contracts came in highlighted a number of systemic risks, not the project-specific risks, which essentially drove us to reclassify KIP and KGSP, but the systemic risks are still very significant, and therefore, in the light of that, we would want to go back and classify all of those as Class 3.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: And thank you for that clarification. I might ask that -- would you be able to expand -- you -- you had just said that the systemic risks are still very significant.

Could you expand on -- on those risks? And I guess specifically for -- for the Keeyask Generating Project, but then to follow up with, specifically, the Conawapa Generation -- Generating Project.

MR. BORIS FICHOT: One of the things that we're thinking is that it ventures into CSI territory pretty readily, so.

MS. MEGHAN MENZIES: Okay. All right. But -- and you can stop me if -- if I'm venturing into CSI, but -- but today, as compared to when you originally wrote the report, your opinion is that there are -- there are more systemic -- there are more systemic risks at play than -- than you originally -- than you originally thought.

Is that correct?

MR. BORIS FICHOT: Yeah. I think a lot -- as I -- as I stated earlier, a lot of our original appreciation was -- I'd almost say, like, we hone in on the engineering aspects --

MS. MEGHAN MENZIES: M-hm.

MR. BORIS FICHOT: -- and those were clearly done out well. The -- the thing that I think took us a bit longer to -- to gain an appreciation was for all the underlying project management organisational driven type costs or -- or risks.

For example, one (1) of the -- the ones that came to light more recently was for the overall construction project management, would that be do -- done on -- in-house, or would that be done externally? To us, if they didn't have enough knowledge about whether it should be done internally before or after, that's kind of a major flag that says, Well, maybe this whole process of how it would be carried forward is not clearly defined. Therefore, lower level of project definition, therefore, lower level of certainty, and incidently, AACE classification of three (3) instead of two (2).

THE CHAIRPERSON: I think it's probably an appropriate time to -- to break for lunch. We are going to be resuming our proceedings at a quarter to 1:00. We are expecting a presenter at a quarter to 1:00, Mr. David Barber, so we will see each other again at a quarter to 1:00. Thank you.

--- Upon recessing at 12:05 p.m.

--- Upon resuming at 12:54 p.m.

THE CHAIRPERSON: I don't like to be a grinch, but we should go back to our proceedings. The cake was wonderful. Thank you very much.

MR. RICHARD BEL: Yes, thank you. Thank you.

MS. MARILYN KAPITANY: Yes, thank you for having a birthday party.

THE CHAIRPERSON: With -- with that, I'll turn the microphone over to Mr. Hombach, please.

MR. SVEN HOMBACH: Thank you, Mr.

Chairman. I note that this morning I indicated that there would be a presentation by Mr. David Barber at 12:45. Mr. Barber has not shown up yet, so it would be my suggestion that we proceed with the cross-examination of Knight Piesold by Ms. Menzies, and perhaps if Mr. Barber subsequently shows up, he could deliver his presentation after the afternoon break.

THE CHAIRPERSON: Agreed. Ms. Menzies, please...?

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Okay. Well, I'm glad that this begins before the sugar crash, so all right. Good afternoon. So the first document that I'd like to direct you to this afternoon is KP-3-3, and that's the updated Roman numeral II of the supplemental report.

And I note that this morning when I was asking about systemic risks, there was some concern about some contracting deals or -- or possibly some CSI being discussed. And so I do want to flag that again. And -- and I appreciate that you -- I appreciate your response with regard to CSI, and I do want to make sure that I don't push into CSI. So again if at any point I'm -- I'm pushing a little too far, please feel free to let me know.

So what I'm hoping is, at the beginning, at -- at the top here it says:

"The highlighted key risks confirmed by a validation estimating..."

And there's five (5) bullets, and I'm wondering if, possibly, we could walk through those bullets and you could provide a bit of a description, or -- or a -- a bit of an -- a further explanation on each of those risks to the extent that you're able, so starting with the resource challenges?

(BRIEF PAUSE)

MR. BORIS FICHOT: Yes. So the -- the main resources challenges are basically staff availability and all those. That aspect has been highlighted by -- by Hydro, and we -- we concur with that. Systemic risks associated with a Manitoba Hydro maturing system, that's again, the fact that they've recently defined a process. That process is in draft form. They -- they haven't fully fleshed out how they're actually going to manage the construction, at least, to -- to date.

So we've seen that the process is in

place. It's evolving a little bit because of the -- the recent enva -- engagement with the civil contractors. So since all that system for the management is not clearly elaborated, there's -- there's risks associated with that, that it -- and then -- that it carries through and it has an impact on the cost.

MR. MICHAEL ROBERTSON: So I just add to that, that it's -- it's a new system that has not yet been tested.

MR. BORIS FICHOT: The -- just -- just a second, here.

(BRIEF PAUSE)

MR. BORIS FICHOT: We won't go over why there's schedule risk, whether we'll -- we'll skip over that one.

MS. MEGHAN MENZIES: Okay.

MR. BORIS FICHOT: Adverse labour productivity, again, there's assumptions in the management reserve that -- which has made allowances for the productivity not being what's expected. The -- the detailed content of that is deemed CSI material, but there's reason to believe that the labour productivity assumed may not be as -- as -- may -- may or may not be adequate with the base estimate that they've provided, and they've allowed for some management reserve to deal with that.

And then the risk that could cause a year of delay associated with the -- with the stage coffer dam, that's a -- that's a risk that I'll -- I'll highlight here, is that it's a element of the risk that's not categorized in the current estimate. Some of it falls through this whole process.

And there's dollars attributed to whether or not Manitoba Hydro will be able to proceed with the whole construction development, and that's a risk that's not quite categorized in the -- in the current estimate, but that is there, and so it's highlighted in this independent report.

MS. MEGHAN MENZIES: Okay. Thank you. And I actually want to go back to the systemic risks. So part of what was stated, I believe, on systemic risks, was that the new system has not yet been tested.

And I just want to get an understanding of -- of how serious of a risk that is, or how serious of a risk does Knight Piesold see that to be?

MR. MICHAEL ROBERTSON: It -- it's an unknown. It -- it's a new process. It's patently very thorough, and so one can give a hundred percent for intent, but to the extent that it hasn't had a practical outworking, we -- you -- you don't have any kind of real experience to say, yes, this is the system that has been shown to work.

MS. MEGHAN MENZIES: M-hm. Okay. Thank you. And still on the issue of systemic risks. Previously, you had said that Conawapa has greater systemic risks than Keeyask, and so to -- to what extent are those -- are those systemic risks greater, and -- and can you elaborate on that just slightly?

MR. BORIS FICHOT: Just by virtue of the fact that they have a little bit more of appreciation of what the process may be for Keeyask than they do for Conawapa.

MR. MICHAEL ROBERTSON: Well -- well, sorry. Actually, I -- I might vary with my colleague, there. In -- in terms of systemic risk, both will be developed according to the same system, so really, there's not much difference in -- in terms of systemic risk. Project-specific risks? Yes, certainly, because Keeyask is better defined, and therefore, Conawapa has more, we would say.

But the systemic risk, it's -- it's really the process that's been followed. I guess, in a way, Conawapa will happen if it happens after Keeyask, by which time the system will have been tested. So in a way, I guess you might argue that Conawapa has less systemic risk by the time it goes for development, but it's...

MS. MEGHAN MENZIES: Thank you.

THE CHAIRPERSON: I have a question with respect to winter concrete. Very specifically, why is it that the -- this contractor would not be pouring concrete during the winter?

What -- what's unique about their process?

MR. BORIS FICHOT: That -- that'll be CSI.

THE CHAIRPERSON: Okay.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: All right. So I'd like to move to page 42 of your original report, and specifically at point -- four point six (4.6), where you discuss the contracting methods that were considered. And in particular, I think that these were highlighted in your presentation this morning, and I would like to again highlight the fixed price contract and the cost reimbursable contracts.

And so if you could have some patience with me, I would just like to walk through my understanding of these contracts, and if you could help me with that? So first of all, my understanding of a fixed price contract is that generally, the risk falls primarily on the contractor.

Is that correct?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: And often to account for this risk, the cost would be higher.

MR. MICHAEL ROBERTSON: Yes, correct.

MS. MEGHAN MENZIES: Thank you. And then my understanding with regard to the cost reimbursable contracts is that more risk is likely to be borne by the contracting party.

MR. MICHAEL ROBERTSON: Not in essence. The cost reimbursable contract seeks to share risk.

MS. MEGHAN MENZIES: Okay. So it would be more --

MR. MICHAEL ROBERTSON: In between the two (2) parties in the interests of bringing down the price.

MS. MEGHAN MENZIES: All right. And so in that case, the contracting party is bearing more risk than in the fixed price contract, but it's about equal with the contractor.

Did that make sense on this?

MR. MICHAEL ROBERTSON: Well, there are two (2) contracting parties in each case.

MS. MEGHAN MENZIES: Fair enough, yeah.

MR. MICHAEL ROBERTSON: In the fixed price contract, essentially, the -- the owner/developer, Manitoba Hydro, has very little risk.

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: And -- and all the risk is with the contractor, whereas in the cost reimbursable contract, you are sharing those risks. So Manitoba Hydro inherits some risk, takes on some risk as a tradeoff to paying probably a lower price at the end of the day.

MS. MEGHAN MENZIES: All right. And the owner and the contractor, then, have about equal risks? Are they -- are they taking on about the same level of risk with the cost reimbursable contracts?

MR. MICHAEL ROBERTSON: Depending on which part of the contact you're looking at. No, I -- I wouldn't say in general that that is the case. I mentioned that, for example, the document for the civil contract is written in such a way that any -- any or -- or the first amount by which the final contract price goes over the agreed target price is absorbed 80 percent by the contractor and 20 percent by Manitoba Hydro.

MS. MEGHAN MENZIES: Right. Okay. Yes. So it's just -- it's in the drafting of the contract. It's not particular to the type of contract.

MR. MICHAEL ROBERTSON: No. It's in the details of the contract.

THE CHAIRPERSON: Just to clarify in my own mind, so the first part is the contractor bears 80 percent of the -- of the cost of the first portion of the contract --

MR. MICHAEL ROBERTSON: Of the -- of the overrun.

THE CHAIRPERSON: Overrun. And after that point?

MR. MICHAEL ROBERTSON: Well, it -- it reaches a limit, and then there is a -- a second sum of money which is sort of set aside within the contract amount which is shared differently, but I -- I think we're getting into CSI when we're talking those differences in details.

THE CHAIRPERSON: So the -- the reference in your presentation to a 80/20 split was in ref -- in -- in relation to that first tranche?

MR. MICHAEL ROBERTSON: Yes.

THE CHAIRPERSON: Okay.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Thank you. And now I'd like to move to page 40 of your original contract -- sorry, your original report. And here, just at -- if we could go a little bit -- perfect. So here, it states, "KP further believes" -- sorry:

"KP has not been able to fully ascertain that these risks have been adequately captured in the contingency calculation."

And that was with regard to interface management.

Is that correct?

MR. BORIS FICHOT: That is correct at the time of writing it.

MS. MEGHAN MENZIES: Okay. And -- and has that changed now?

MR. BORIS FICHOT: A little bit, because some -- some portion of the -- the interface, especially between some of the electrical/mechanical subs, have been integrated in the GCC contract. So there's a little bit less in that respect, but there's still some very important risks associated with the interfaces.

MS. MEGHAN MENZIES: Okay. Thank you. And I think I'll touch on that a little further on.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: Okay. If we could go to page 23 of your supplemental report. Sorry, there will be a bit of flipping at this moment.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: So if we read -- and if we could go down just a little further, Diana. Thank you so much. I read:

> "A higher contingency based on the P80, as compared to Hydro's use of a P50, would also be recommended for the conservative estimate."

So I just want to walk through this for a moment. What I'm getting from this is that Hydro is using a P50, and a conservative position or a conservative estimate would be a higher contingency of -- based on the P80.

Can you provide for me, what is Knight Piesold's position? Is it that there should be a conservative estimate here, or is there a number that Knight Piesold is recommending specifically?

MR. BORIS FICHOT: We -- we couldn't recommend a specific number. It's very associated with who ultimately is the decision maker and how comfortable are they with the risk that they're taking. So it -- it's within each decision maker to -- to assume how much risk that they want to take. And there's no -- if you look at the standards out there, there's no -- there's no prescribed number that people should be using. There's some recommenda -- different people have differing opinions on what to use.

MS. MEGHAN MENZIES: Okay.

MR. MICHAEL ROBERTSON: And I suppose the general point though is that it's not -- it's not unduly cons -- the P50 is not unduly conservative. And -- and many would say it's not sufficiently conservative.

MS. MEGHAN MENZIES: All right. Thank you.

MS. MARILYN KAPITANY: Sorry to interrupt, but your report does say that a higher contingency, based on the P80, would be recommended for the conservative estimate. So it sounds like you're making a recommendation.

MR. MICHAEL ROBERTSON: Well, we are if -- if you want to go with a conservative estimate. It -- it's Manitoba Hydro's choice, you know, and I guess ultimately the people of Manitoba, whether they would be more comfortable with a more conservative estimate. And if they -- if they would like that, then we should be using something more like a P80, we believe.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Thank you. And could you provide -- could you provide me with some examples of what the tradeoffs would be between a conservative P80 and Manitoba Hydro's P50?

MR. MICHAEL ROBERTSON: Well -- well, there's not really a tradeoff. I mean, there -- there's just a -- an appreciation upfront that perhaps the final cost might be nearer what the P80 is -- is indicating than the P50-based estimate that is being put out by Manitoba Hydro now.

MS. MEGHAN MENZIES: I guess what I'm hoping to -- to understand is, can you say as -- in as plain language as possible, why would a decision maker want a P80 as opposed to a P50, or the opposite?

MR. MICHAEL ROBERTSON: Because he doesn't want to exceed his budget.

MS. MEGHAN MENZIES: Okay.

MR. MICHAEL ROBERTSON: And he doesn't want egg on his face or what -- whatever.

MS. MEGHAN MENZIES: That's a very helpful visual. Thank you very much.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: All right. And so I think that for those of us with hard copies, if we could go back to page 40 of your original report. So I think I had directed you there before.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: And as I'd gone over before, it says here at that KP identifies interface management by Manitoba Hydro as one of the most important systemic risks associated with the implementation of the Preferred Development Plan, correct?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: And you had

qualified before that there are some -- that there are some uncertainties that are now more certain, but generally, this is still -- would this -- would this still be the most important systemic risk for KP, or for Knight Piesold?

MR. MICHAEL ROBERTSON: Probably not. Probably -- I wouldn't say it's the most important systemic risk.

MS. MEGHAN MENZIES: Okay. And what would be the most important systemic risk now?

MR. MICHAEL ROBERTSON: Essentially, their new process.

MS. MEGHAN MENZIES: Thank you. Yes. Okay. But interface management is still a risk that Knight Piesold is concerned with?

MR. MICHAEL ROBERTSON: It -- it is a risk. I -- I wouldn't say that we're particularly concerned about it. It's -- it's not different from other developments of this nature.

MS. MEGHAN MENZIES: Okay. What I would like to do now is direct you to the response to PUB/KP I-10b. And that'll be up on the screen. Thank you very much, Diana. And so at line 18, it states:

"The more the scope of work can be wrapped up and managed by a single

responsible entity, the easier the
interface management process is and
the less likely scopes of work will
be difficult to define and administer
separately."

Can you confirm this?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Yes. And so there are two (2) places that I would like to direct you to. First of all, page 2 of your supplemental report; and just a little bit lower. Perfect. It says:

"MH's systems are still maturing, and
MH has recently included an outsource
-- outsourcing some of the
construction management as part of
their estimate."

So is -- does this outsourcing, does this play into the concern of interface management?

MR. BORIS FICHOT: In my opinion, yes.

MS. MEGHAN MENZIES: Thank you. And so that would then -- that would add to the risk?

MR. BORIS FICHOT: Yes.

MS. MEGHAN MENZIES: Thank you. And then -- or I don't want to --

MR. MICHAEL ROBERTSON: No. I mean, it

-- it was a risk. It's -- it's something that's identified. It's been dealt with. It's added to the cost. I'm not sure there's a residual risk associated with essentially using consultants to manage the construction as opposed to in-house. Maybe I better take this offline.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Okay. My response stands.

MS. MEGHAN MENZIES: Okay. Thank you. And now I would like to direct you to page 46 of your presentation this morning. I'm giving Diana carpal tunnel back there. I apologize. And here, the second bullet states:

"Increased costs for the project management as a result of insufficient capacity in MH and consequences -- consequent need to hire consultants."

So the hiring of consultants again is that interface management issue, correct?

MR. MICHAEL ROBERTSON: Yes. I -- I would say, though, that we're talking now the risks that were perceived in August/September of last year. Subsequent to that, the decision -- at that time, it was perceived there was a risk that they may have to go to consultants --

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: -- for construction management. That has materialized, and so I would say that that is no longer a major risk in their risk register because it's happened. But again... I mean, what Boris was saying is that it does produce another interface, obviously. But I'm not sure that, within Manitoba Hydro, that people on site reporting back to their people in head office is very different from the engineer -- appointed consulting engineer reporting back to Manitoba Hydro. But I -- I personally don't see that it'll be a significant issue.

MS. MEGHAN MENZIES: Okay. Thank you. And I'm soon going to leave the issue of -- of interface management. But as you can see, I'm a dog with a bone right now.

So on that issue, you had stated that Manitoba Hydro was mitigating that risk with increase costs?

MR. MICHAEL ROBERTSON: With respect to hiring consultants to do the construction management, that ended up -- resulted in an increase cost.

MS. MEGHAN MENZIES: Sorry. And previously to that, when we were discussing the issue of interface management, that perhaps an increased contin -- I -- I'm forgetting exactly what you had said.

But essentially, that was mitigated by Manitoba Hydro, those risks?

MR. BORIS FICHOT: In -- in the very original report, the interface that we had, looking at the information that we had available at the time, the concern was some of the electrical and mechanical scope, because as soon as you chop up all these little, tiny pieces of contracts and they were purchasing the material internally, then you have to subcontract all these different parties to do different pieces of that scope of work. And the you had the general civil contractor on the side doing his own work.

Our experience has been that, with all these different parties involved in the project, that there was always scopes of work that were missed and so forth, and that usually led to an increase in cost.

Now, in the new signed terms, there's a lot more inclusion of some of these little different elements which reduces the number of interfaces on that front. Where we have a slight different opinion is whether or not, once you go on the management side, because there's a different interface in managing the overall construction, if bringing in another party to the table creates some -- some schedule risk and some -- some overall risk to the project.

MR. MICHAEL ROBERTSON: Does that answer?

MS. MEGHAN MENZIES: Yes. And I'm -- I'm going to leave that for you -- leave that now, so you will all be relieved.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: Okay, if we could go to slide 26 of your presentation.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: And at the bottom, at the last bullet, it states:

"Manitoba Hydro have attributed lack of productivity to difficulties hiring and retaining staff and use of inexperienced staff. And then as a

result of the low productivity
experience at Wuskwatim, Manitoba
Hydro has, for Keeyask and Conawapa,
adjusted contracting methods, added
staff, and invested in better camp
facilities."

Do you see that there?

MR. MICHAEL ROBERTSON: Yes.

MS. MEGHAN MENZIES: Thank you. And then when we had reached slide 33 of your presentation, in discussing the issue of labour retention, I believe that you had expanded on that by stating that the much better camp conditions would assist in mitigating that.

Is that correct?

MR. MICHAEL ROBERTSON: That is certainly Manitoba Hydro's belief, and it is logical.

MS. MEGHAN MENZIES: Okay. Did you have any opportunity prior to today to review the Deloitte report -- the Deloitte report on Wuskwatim?

MR. MICHAEL ROBERTSON: Certainly not personally, no.

MS. MEGHAN MENZIES: Okay. Well, then I will leave that there.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: I will not leave that there. Just to confirm then, you are not able to confirm or to speak to any of the observations that were made by Deloitte with regard to the camp conditions in Wuskwatim?

MR. MICHAEL ROBERTSON: Correct. Everything that we have to say about Wuskwatim was based on what we were given by Manitoba Hydro.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: And Manitoba Hydro did not give you the Deloitte report?

MR. MICHAEL ROBERTSON: I don't believe so.

MS. MEGHAN MENZIES: Thank you. Subject to check, that is all that I will be saying on -- on the Deloitte report.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: All right. I have two (2) last areas to touch on, and then I -- then I will be finished with my questioning. The first is a follow-up to the question of Board member Kapitany this morning, and it was related to page 8 of your presentation.

And I believe that we had established that -- or you had established that that report is not based on the updated capital cost estimates, correct?

MR. MICHAEL ROBERTSON: Correct.

MS. MEGHAN MENZIES: And -- but you had also stated that the updated capital cost estimates would not change your conclusions in this report --

MR. MICHAEL ROBERTSON: Correct.

MS. MEGHAN MENZIES: -- in this table, sorry. In -- in the interests of being as up to date as possible, would you be willing to undertake to update this table with the updated capital cost estimates?

(BRIEF PAUSE)

MR. BORIS FICHOT: We -- we could do that. It's -- but we don't think it's really the intent of the table. The -- the overall intent is on a very, very high level. If you pull away from the whole thing, our first impression of any hydro project that we're given, or any renewable project that we're given, is usually we'll just look at, overall, here's how much it costs and what's the bang for the buck on a very, very high level.

And we're used to looking at projects and we say, Okay, wind power is between one point five (1.5) and two point five (2.5), or we'll say a hydro project is between two (2) and ten (10). And that's -- that's our first gut feel when we -- when we look at any of these projects is, Okay, well this ones around nine (9) in this case. It doesn't matter if it's eight point five (8.5) or it's ten (10), but it's around that number, and that gives us a feel that, Oh this is expensive, or if it's a dollar -- a million dollars per megawatt, Oh, let's -- I'd throw my money in there right away because it looks like it's worthwhile.

So that was the overall intent of that table. Whether the number is exact kind of defies the -- the purpose of the impression that we get firsthand of the -- the value of the project. It has a lot of catches to that. There's no attribution -- attributes, for example, of the firmness of the energy or anything like that. That's just overall our impression of the -- kind of where that project ranks in -- as an overall project in the big pool of hydro power resources.

It's -- it's on the expensive side comparatively, but that's -- it -- it doesn't give us a better indication than that. But it's not crazy out there either.

MR. MICHAEL ROBERTSON: But -- but to be specific, I mean if you take -- for Keeyask you put in six point five (6.5) instead of six point two (6.2), your million dollars per gigawatt hour will now be one point four-seven (1.47) instead of one point four-zero (1.40).

MS. MEGHAN MENZIES: Yes.

MR. MICHAEL ROBERTSON: It's -- as Boris said, It's not significant. And it's not relevant to whether or not this project is in the ballpark of experience.

MS. MEGHAN MENZIES: And that's fair. And with that caveat in mind, would you still be able to undertake to update the table? And we will keep in mind that it's from a high level.

MR. CHRISTIAN MONNIN: It seems to me that Mr. Robertson has provided a partial answer to that already by saying that Keeyask would be one point four-seven (1.47). If I can invite him to do the Conawapa calculation right now, we might be able to satisfy the undertaking right now.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: He just rightly advised me that Conawapa hasn't changed. So if I understand correctly, the -- the reboot of this table would be with the new capital costs. You would have one point four (1.4), one point four-seven (1.47), and that would be the substance of the changes.

MR. MICHAEL ROBERTSON: Well, that's the -- that's the second-last column. The -- the million dollars per gigawatt hour would go from one point four (1.4) to one point four-seven (1.47). The million dollars per megawatt would go from eight point nine (8.9) to nine point three (9.3). That's putting six point five (6.5) in instead of six point two (6.2) for the in-service cost.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Perfect. Well, undertaken now satisfied -- undertaking now satisfied. Thank you very much.

(BRIEF PAUSE)

MS. MARILYN KAPITANY: So I thought we also had a -- a change of cost for Conawapa, but maybe that was CSI.

So my understanding was that the updates we received per Manitoba Hydro were for both of the generating stations, not just for Keeyask?

MR. SVEN HOMBACH: If it's -- if it's of assistance to the panel, it may help to flash up Manitoba Hydro Exhibit 113 for a moment, that deals with the new capital costs.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Yeah, the second page of the document shows the updated capital costs.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Yes, I -- I see indeed that the Conawapa cost was updated in March 2014. So it's now 10.662 billion, where in CEF13 it was ten point four-nine-two (10.492). So that's public record from Manitoba Hydro.

THE CHAIRPERSON: Since we're there, we might as well -- can you give us the revised numbers as well for that table, the -- the impact of --

MR. MICHAEL ROBERTSON: Oh, right.

THE CHAIRPERSON: -- that change?

(BRIEF PAUSE)

MR. BORIS FICHOT: That -- that results in $7.2 million per megawatt for -- for Conawapa and then one point five-two (1.52) for -- dollars per gigawatt hours.

CONTINUED BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Thank you. That was impressively quick. And so in drafting this table, did you employ a discount rate?

MR. BORIS FICHOT: Yeah, I -- I didn't mention that, but, yeah, these -- we -- we didn't really refer to what years these dollars apply to, so there is -- there may be some differences in these numbers. As I said, the intent is really at a high level, where we -- it doesn't matter if it's 2 percent off. It's what category are we in.

MR. MICHAEL ROBERTSON: So strictly speaking, the answer is no.

MS. MEGHAN MENZIES: Thank you.

MR. MICHAEL ROBERTSON: They're essentially -- inasmuch as they're present day project projects, they're present day costs.

MS. MEGHAN MENZIES: Thank you. And

we've now reached the last area of questioning. At page 23 of your original report; and if we go down just a little bit. Thank you. Perfect.

Knight Piesold states that:

"It appears as though expected val -- value modelling of -- the expected value modelling of Manitoba Hydro is akin to what KP would call a Monte Carlo simulation."

Is that correct?

MR. BORIS FICHOT: That's correct.

MS. MEGHAN MENZIES: And so could you provide just a little more information or a little more detail on how Manitoba Hydro's process was akin to a Monte Carlo simulation?

MR. BORIS FICHOT: It's -- it's essentially the same thing, except that they -- they separate out the subsets of risk into two (2) categories, versus we would just do one (1) general thing where we would categorize all the different risks and put a statistical variation on each of those elements, and then run this through to kind of get a -- a statistical distribution of the end costs of the -- of the project.

They -- they've used an external

specialist, and we've now seen the -- the most recent report produced by that specialist, and then they go through an interview process to derive the systemic risk portion, and then the same processes we would be used to for the -- for the rest of the risk.

MS. MEGHAN MENZIES: Thank you.

And so either separately or all risk factors together, can you speak to how many risk factors were assessed?

MR. BORIS FICHOT: We do have a list of those in the material that was provided, but it's quite a number. The -- the systemic risk is, I think, the -- the more valuable to review if somebody were to review it, and I believe there was, like, twenty-five (25) assumption factors. I could be wrong on the exact number, but it's around those numbers on the systemic side.

MS. MEGHAN MENZIES: Thank you.

And are you able to speak to what types of factors were assessed?

MR. MICHAEL ROBERTSON: Well, in -- in essence, the -- the cost is broken down into a number of different items, and in this kind of simulation, whatever you call it, you -- you basically assign three (3) valuable -- three (3) values to each of those parameters --

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: -- which typically are called a reference and a low and a high, and you throw them in the box, and the box combines all possible combinations of -- of those parameters, and it spits out, essentially, a -- an expected value, and it gives you some idea of -- of the range of what it might be in terms of probability --

MS. MEGHAN MENZIES: M-hm.

MR. MICHAEL ROBERTSON: -- which gives you the P50s and the P80s and that sort of thing.

MS. MEGHAN MENZIES: Exactly. Sorry, I wasn't -- I'm not wanting a -- a description of Monte Carlo, but more just what -- what factors -- what risk factors were assessed specifically?

MR. MICHAEL ROBERTSON: Not risk factors per se. It -- it's -- it's the -- the possible range of costs of the different parts of the overall cost estimate, so, for instance, the -- the value of concrete.

MS. MEGHAN MENZIES: And precisely, that's -- so that's what I'm speaking to. So the value of concrete was one (1).

MR. MICHAEL ROBERTSON: Right.

MS. MEGHAN MENZIES: Can you speak to any other?

MR. MICHAEL ROBERTSON: Well, the other component costs. The earthfill, the -- the turbine generator, the -- the indirect costs. I mean, they're all part of the overall cost makeup.

MS. MEGHAN MENZIES: Perfect. And on that note, thank you for your patience. And those are done -- those are my questions for today.

THE CHAIRPERSON: Thank you, Ms. Menzies. Now it's your -- your turn, Me. Hacault.

MR. ANTOINE HACAULT: Can I just have a five (5) minute break? I'd like to speak to Diana on some of the documents I might be asking her to bring up, and -- and there's going to be one (1) filing when we -- that should be distributed -- or was distributed earlier this morning, will be.

THE CHAIRPERSON: So five (5) minutes it is, then.

--- Upon recessing at 1:35 p.m.

--- Upon resuming at 1:42 p.m.

THE CHAIRPERSON: I think we're ready to resume the proceedings, and I -- we just had documents distributed, so perhaps we should acknowledge them, Ms. Ramage, please?

MS. PATTI RAMAGE: Yes. Thank you. Three (3) documents were distributed. The first one on my list is the economic summary tables, assuming flat load growth beyond '22/'23, and that is marked as Exhibit Manitoba Hydro-104-13.

--- EXHIBIT NO. MH-104-13: Economic summary table assuming flat load growth beyond 2022/2023

MS. PATTI RAMAGE: Next is a -- a response to a -- to MIPUG Exhibit 21 Question 3, and that -- that would be marked as Exhibit 174.

--- EXHIBIT NO. MH-174: Response to MIPUG Exhibit 21 Question 3

MS. PATTI RAMAGE: And then lastly, Exhibit 175 is Manitoba Hydro's response to Undertaking number 67, which is a -- a detailed supporting schedule showing the calculations used to arrive at the return on equity shown on page 4 of Manitoba Hydro's Exhibit 129.

--- EXHIBIT NO. MH-175: Response to Undertaking 67

MS. PATTI RAMAGE: So those are the three (3) documents.

THE CHAIRPERSON: Thank you.. And Me. Hacault, you have a document as well to -- to --

MR. ANTOINE HACAULT: Oui, M. President. We have a Volume VIII, which I understand will be marked as MIPUG Exhibit 20-8.

--- EXHIBIT NO. MIPUG-20-8: Volume VIII

CROSS-EXAMINATION BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Good afternoon, members of the panel. My name is Antoine Hacault. I act on behalf of Manitoba Industrial Power Users Group.

And we'll start on slide 8. With respect to the projects, and let me -- I'll try to explain the context of this -- this particular line of questioning.

We have two (2) potential generating stations, Keeyask, which is well underway, and Conawapa, which is a merchant generating station whose construction date -- the earliest in-service date might be 2026.

In the context of that, could you, sir, and it doesn't matter who, advise where is Muskrat Falls in its construction project -- process in relation to this estimate?

MR. MICHAEL ROBERTSON: My -- I stand to be corrected. My understanding is that Muskrat Falls is well underway. It's under construction. I do not recall when its target in-service date is. I don't know. I know it's ahead of --

MR. ANTOINE HACAULT: Can you --

MR. MICHAEL ROBERTSON: -- Keeyask.

MR. ANTOINE HACAULT: -- can you help this Board understand whether or not the 7.5 billion doll -- sorry, $6.2 billion number is an estimate prior to awarding the general service -- or civil contract under that particular project?

MR. MICHAEL ROBERTSON: I cannot.

MR. BORIS FICHOT: The -- the number was taken straight from the similar proceeding they had to this one, where they -- they went through something similar to the NFAT process. So that -- at that stage, they -- they weren't there yet. They -- they have a process where it was Gateway 2 or 3. I don't remember what it was -- but it was at -- at a similar stage in the -- in a process prior to GCC.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: I was just confirming with -- with Boris there that at the time that that review took place, they did not have the general civil contract bids in, and therefore, to some extent, they were further behind than we are today on Keeyask.

MR. ANTOINE HACAULT: Thank you very much, sir. Now, do you have -- can you give us an answer at this point whether or not -- when this information was put on the record, how far they were away from awarding the general service contracts? Was it two (2) or three (3) years?

MR. MICHAEL ROBERTSON: No, not with any accuracy. I can't tell you that answer.

MR. ANTOINE HACAULT: Okay. Thank you very much. What about Site C? How close to construction was that $7.9 billion project?

MR. MICHAEL ROBERTSON: The $7.9 billion question. They are planning, my understanding, is to start involving contractors eminently in -- in April or May of this year. I'm sure they will go through a pre-qualification process. I don't imagine that they're going to get any real numbers in the form of bids until -- till next year, but I stand to be corrected. That's just my speculation.

MR. ANTOINE HACAULT: But we are talking in Muskrat Falls or Site C for an in-service date which is some ten (10) or twelve (12) years out, are we?

MR. MICHAEL ROBERTSON: Site C, probably; Muskrat Falls, maybe somewhat less inasmuch as they've started construction.

MR. ANTOINE HACAULT: So Site C, you think that the in-service date might be in the 2026 range for the first turbines?

MR. MICHAEL ROBERTSON: I don't know. I wouldn't say -- I would suggest probably less.

MR. ANTOINE HACAULT: Probably less? Okay. What about La Romaine? That's another one for which we have a capital cost estimate.

MR. MICHAEL ROBERTSON: That -- that is -- is well underway. It's -- it's -- it may even be ahead of -- oh, I'm not sure, to be honest. I -- I would say it's -- it's started, so it's ahead of Site C. But where it sits with regard to Muskrat, I don't know.

MR. ANTOINE HACAULT: So that capital costs estimate, when was it made in relation to the construction, which is, as you say, underway?

MR. MICHAEL ROBERTSON: I don't know.

MR. ANTOINE HACAULT: Okay. Just trying to see if we could get some sense of how close the capital cost estimates were to actual definition of the project and -- and costs of the project. With respect --

THE CHAIRPERSON: Let's just situate this table in time. This -- this is -- this table dates from what time frame?

MR. MICHAEL ROBERTSON: Well, as -- as we said to -- to Meghan, essentially, I think that table is present day over the last three (3) years. Whether the costs have significantly changed for the precise same scope of work in the last three (3) years, I don't know. I -- I think, given again, as Boris says, this is a -- really a ballparking exercise, it -- it doesn't stand up to detailed examination.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: With respect to the projects that are listed on slide 8, which of these would be built on a merchant basis as opposed to a needs basis for either capacity or energy?

MR. MICHAEL ROBERTSON: Well,

certainly, Muskrat Falls was -- is being built to serve the people of Newfoundland and Labrador. That's what it's being sold as. Site C, BC Hydro believed that that is needed for internal demand. I -- I imagine the -- the Hydro-Quebec projects would have a large element of export driver; so, by your definition, market plans. I -- I don't know for sure, but I suspect that's the case.

Boris...?

MR. BORIS FICHOT: Overall, it's not something that can easily be assessed because there's so many side attributes to -- to the value of energy there that a dollar per gigawatt hour never shows. The firmness of the value of energy is -- is something on its own that you can't compare to a renewable energy source output like a wind farm. It -- there's a different value to that energy, and it's -- it's too difficult to -- to evaluate on a simple level.

MR. ANTOINE HACAULT: Understood, but the context of my question, sir, was to see, for some of these projects -- there's a theme, at least from our perspective, that the PUB will have to make a decision whether it looks at risk in a different way when a project is constructed for needs of the residents as opposed to an opportunity on export.

So I was trying to identify which of the products -- projects that were -- potentially had more opportunity perspective. And you've answered that, Mr. Robertson. You believe that the projects in Quebec might have more kind of an export attribute than Muskrat Falls and Site C, which are being built by the utilities for the needs of the residents in those areas, correct?

MR. MICHAEL ROBERTSON: That's my opinion. I -- I might be wrong.

MR. ANTOINE HACAULT: Okay. And that leads me to slide 10 of that same presentation. The third bullet down, you make a statement:

"Many jurisdictions use higher than P50 estimate to establish consis -- contingency [and then in parentheses] (but a significant number of others do not; they use P50)."

Did I kind of interpret that correctly, that bullet?

MR. BORIS FICHOT: That's correct.

MR. ANTOINE HACAULT: Okay. Now, if we go to Exhibit 3-1 at page 24, one of the discussions on that page relates to the use of the P50 by others and the view of Knight Piesold on that particular discussion point.

Now, as I read the information under paragraph 2.9.3.3 in the second paragraph, there's a view that perhaps using a P50 might not be appropriate for large projects.

Is that correct?

MR. MICHAEL ROBERTSON: That is correct.

MR. ANTOINE HACAULT: Okay. And there's also, as I understand, the view -- and it's at the very bottom of what we see on this screen; this is in an article that you've quoted -- that the 50 percent probability guideline is not necessarily applied to very large projects or to strategic projects outside the annual capital budget.

So that also is one view, correct?

MR. MICHAEL ROBERTSON: Yes.

MR. ANTOINE HACAULT: So we do see this being used by Manitoba Hydro for capital budgets.

Why, in your view, do we have to think about the use that we're making of the budget in deciding whether to use a P50 or, as you had later explained in your slides and the cross-examination of Ms. Menzies, you may, for other purposes, wish to use a different level of probability?

MR. MICHAEL ROBERTSON: Well, as -- as we tried to explain, it -- it is very much dependent on the appetite for risk on the -- on behalf of the developer. Manitoba Hydro have chosen to go with the P50 backed up by a management reserve which, to some extent, takes it higher than that, while other jurisdictions will stick with their P50.

The argument there is that if you've got a whole suite of large projects, then it -- it makes some sense perhaps to -- to work on the P50 on the whole package. But when it comes to an individual project and you want more reassurance that you're not going to run out of budget, you should probably be working with a higher number than the P50.

MR. ANTOINE HACAULT: Now, if we turn to the next page, please, Diana, at the top of the page, this is in Exhibit 3-1, there is a table. And initially, your response to the Chair was that you believed that the contingency amounts were part of CSI. There's two (2) places, one (1) in this report and one (1) in your supplemental, where some of the 'P' values are given.

Am I understanding correctly that in this January report the probability values were not yet updated to reflect the award of the contract later in -

- and the updated capital costs?

MR. MICHAEL ROBERTSON: Correct. That was your initial -- this data came from Manitoba Hydro, and it's based on the initial risk assessment that was done.

MR. ANTOINE HACAULT: So I'll take --

MR. BORIS FICHOT: Not -- not the numbers that are on the screen. The numbers that are on the screen are from the updated 2014 study.

MR. ANTOINE HACAULT: I -- I'll take you to the -- so -- yeah, just to -- there is an updated table in your supplementary report.

MR. BORIS FICHOT: Okay.

MR. ANTOINE HACAULT: So as of January, when this report is being written, what assumptions, or what are the kind of back -- what's the background? Do we have the 2013 capital update in by this time? Because there was a further update in March of 2014.

MR. MICHAEL ROBERTSON: No, the table on the screen in front of us was produced in the January report, at which time the -- the capital cost estimate had not been redone for 2013. As I say, there's data from Manitoba Hydro and it was based on their previous -- essentially, their risk assessment.

MR. ANTOINE HACAULT: So I always have

a little bit of difficulty understanding probabilities. If I go to P90, does that mean one (1) times -- one (1) time out of ten (10) we're actually going to be higher than 950 million, and the other nine (9) times we hope to be doing better than a $950 million contingency overrun?

MR. MICHAEL ROBERTSON: Well, it -- well, it's not the 950 million number. What we're saying is that if you apply a 950 million contingency to your best estimate, that cost is short and you'd be exceeded 10 percent of the time.

MR. ANTOINE HACAULT: Okay. So again, that just speaks to the level of tolerance we've seen in other parts of this proceedings, some of the P10 and P90s being used on certainty. Here, one (1) conservative view that Knight Piesold has put forward is that we -- we might want to look at P80. And if we want it to be more conservative, the way would -- we'd have to go is go to a P90.

Am I understanding you correctly?

MR. MICHAEL ROBERTSON: In principle, correct.

MR. ANTOINE HACAULT: Yes. So there was roughly a $300 million difference between P50 and P80 in the initial filing. And if we go to Exhibit 3-

2, at page 23 of 26, at the bottom of the page we have another contingency comparison. This time we haven't included the P90 and the P95. And the P50 has actually gone down from -- from 527 million to 327 million.

Now, is that just because of the runs of the Monte Carlo simulation that we get that reduction, or is that something that your company independently assessed?

MR. MICHAEL ROBERTSON: No, it's -- it's not a result of rerunning the thing, except that at this time you have removed a large measure of uncertainty, because you now have the GCC results. So the capital cost has not gone down, the -- the contract cost went up. But because it's now more firm, the contingency that you need to add to it to get to the P50 is less.

MR. ANTOINE HACAULT: Now, and this is something that the Chairman has asked questions about...

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Yes, sorry. Sorry. Boris was just clarifying, yes, they -- they are reruns from the model. But the essential difference is that the model parameters have been changed.

MR. ANTOINE HACAULT: Now, if we go from P50 to P80 on this revised calculation, we subtract from six ninety-one (691) the three twenty-seven (327) and come to -- in the range of 360 to $70 million difference between those two (2) probabilities, correct?

MR. MICHAEL ROBERTSON: M-hm, yes.

MR. ANTOINE HACAULT: And before, the range was -- we would subtract if we -- I don't know if you still have handy, Diane (sic), page 25 of the prior exhibit, from the P80, 848 million, we would subtract the 527 million. So we actually have a little bit smaller of a range.

One of the questions the Chair, and quite frankly I nothing, when we introduced some certainty with respect to the contract, why are we seeing such a wide range at the P80 continue to exist, and in fact, get a bit wider?

MR. MICHAEL ROBERTSON: Well, essentially, if you look at it graphically, it's a flatter curve with a lower peak, but are more extended. So your -- your limits are wider, so the differences between your centre point and any chosen point are greater. So you -- as you say, it's three (3) -- three sixty (360) difference now, and it was three twenty (320) difference.

That comes out in the math, and -- and in the readjusted factors that you put into re-running the model. But it is still -- the P80 at six ninety-one (691) is still less than it was at eight forty-eight (848). It's just a different shape of distribution that comes mathematically out of the exercise.

MR. ANTOINE HACAULT: And, sir, would you be able to provide us with the probability value on Table 9.1 of Exhibit 3.2 for the probability points of P90 and P95?

MR. MICHAEL ROBERTSON: Manitoba Hydro might be able to, but I don't have the data.

MR. BORIS FICHOT: We actually do have the data, but I don't know if we can share it, so. I -- I don't have it with me.

MR. MICHAEL ROBERTSON: I -- I don't have it with me either.

MR. ANTOINE HACAULT: Okay. Well, my request, as long as it's not commercially sensitive information, and I don't see why it would be if we already have one (1) table, is to update Table 9.1 in

Exhibit 3.2 -- or 3-2 to also include the P90 value and the P95 values.

Do I have that undertaking, subject to availability of information?

MR. CHRISTIAN MONNIN: Yes, we undertake to do that, subject to the availability of information.

--- UNDERTAKING NO. 117: Knight Piesold to update Table 9.1 in Exhibit 3-2 to include the P90 value and the P95 values

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: If I go back to the executive summary of Exhibit 3.1, it's Roman numeral II of IV, and one of the issues that's discussed in that executive summary is the issue of indirect costs, which, as I understand it, contribute about one-third of the total costs of the project.

Am I right, that it's about one-third (1/3) of the cost of the project?

MR. MICHAEL ROBERTSON: You are correctly stating that Manitoba Hydro have told us that.

MR. ANTOINE HACAULT: And one of the issues that was raised was that -- I'm looking at the bottom of the first paragraph under Item 2:

"KP would have liked to see more Hydro documentation of the indirect cost."

Why would it have wanted to see that?

MR. MICHAEL ROBERTSON: So that we could offer an opinion as to whether or not they had been well-documented and covered the requisite territory.

MR. ANTOINE HACAULT: Is it just the question of well-documenting? How are you bil -- able to assess whether or not the estimate of indirect costs have been reasonably assessed if you don't have the detail to make that examination, sir?

MR. BORIS FICHOT: We -- we had some level of comfort with a -- a first level -- level of breakdown of the cost estimate they'd given us, as well as some of the -- some of the contracts that were in place that kind of fit under that category. But the detailed, detailed breakdown and a documentation of those indirect costs would have been desirable to -- to firm up those numbers.

But at the same time, in terms of the

limited scope that we can do -- go, there's only so many levels of detail that we can go into.

MR. ANTOINE HACAULT: So are you able to give me any sense as to the extent to which your ability to provide your opinion was impaired as a result of not having the documentation to the level that you would have liked to have it?

MR. MICHAEL ROBERTSON: I -- I think what we can honestly say is what we have said, i.e., that we -- we saw a lot of data on the direct costs and can confirm that that has been handled well and in good detail. We cannot say quite the same about the indirect costs for whatever reason.

MR. ANTOINE HACAULT: So trying to search some kind of a -- a suggestion or a fairness issue that I might be able to suggest to you. You've got about a third of the costs which you believe you don't have in -- enough information about.

Are you satisfied that, for example, that's adequately dealt with in the contingency allowance?

MR. MICHAEL ROBERTSON: Ultimately, if -- if you were going to hang me on my answer, I would say no. We -- we would have liked to have seen more detail, as -- as we say; we didn't. We -- we therefore cannot offer the same degree of confidence as we can on the direct costs.

MR. ANTOINE HACAULT: Okay. On the issue of confidence, and I'll get into some of the details, Conawapa now has projected in-service dates which might be deferred to 2031.

Were you aware of that, sir? Depending on the level of DSM being introduced.

MR. BORIS FICHOT: We -- we didn't look further into Conawapa after issuing the first report. Our additional scope of work really just covered Keeyask.

MR. ANTOINE HACAULT: Okay. Diana, could you bring up Exhibit 104-1? It'll show us the in-service dates under the various DSM plans.

And, gentlemen, as you can perhaps see in the middle of the page, there's Level 2 DSM, which is the level of DSM that we've been discussing in this hearing as being achievable, somewhere between Level 1 and Level 2. As you can see, the new resources and dates, at the very bottom of the screen, we have a date 2031 for Conawapa.

Do you see that, sir?

MR. MICHAEL ROBERTSON: Yes.

MR. ANTOINE HACAULT: Now, is this a

limitation with respect to your report, that your analysis and your comments relate to the estimate with an in-service date for Conawapa of 2026?

Is that a limitation to your report?

MR. MICHAEL ROBERTSON: I would say no.

MR. ANTOINE HACAULT: Okay.

MR. MICHAEL ROBERTSON: If -- if only, because as Boris says, the focus certainly of the second report has been specifically Keeyask. On -- Conawapa is -- is a long way away. I mean, some -- many things will change before then.

MR. ANTOINE HACAULT: And perhaps I didn't word my question correctly when I said, "a limitation to your report."

If there's a deferral of Conawapa from 2026 to 2031, have you considered in your report whether or not your comments on the soundness and accuracy of the estimates, as it relates to Conawapa, can still be relied on?

MR. MICHAEL ROBERTSON: I -- I don't think I can answer that question.

MR. ANTOINE HACAULT: So you're uncertain as to whether or not we -- that would be MIPUG and this Board -- can rely on your conclusions with respect to Conawapa estimates and the reasonable of those -- reasonableness of those estimates if the construction date is pushed to 2031?

You can't comment on that?

MR. MICHAEL ROBERTSON: Sorry. Boris is itching to say something as well. But we are not expressing an opinion on the total in-service cost of Conawapa and whether or not Manitoba Hydro have got that even in the right ballpark.

MR. ANTOINE HACAULT: That's useful. I hadn't understood that there was that limitation with respect --

MR. BORIS FICHOT: I would put in the context --

MR. ANTOINE HACAULT: -- to Conawapa.

MR. BORIS FICHOT: -- of the economic analysis specifically. So we -- we looked at the capital costs as they were presented and have our opinion on the capital costs. But we don't look into the change of in-service dates as affecting it.

So we don't look at the -- beyond the immediate calculation of the amortization as it's portrayed, whether there's a delay, that wasn't part of our scope of work in terms of what we look at.

MR. ANTOINE HACAULT: I want to understand that a bit better, because in your report --

and I had a line of questioning on this; I maybe can jump to it -- you had some comments on the escalation of prices if the -- for the two (2) projects, and whether or not you thought Manitoba Hydro's view of escalation costs was reasonable.

Can I simply, for Conawapa, apply your view of escalation, which I think was three (3) point something percent, to the Conawapa estimates and -- and change those from 2026 to 2031?

MR. MICHAEL ROBERTSON: If -- if you wish. Discounted back to present day, it's a long way ahead. It's not an exercise that, as Boris says, is -- is within our scope.

MR. ANTOINE HACAULT: Now, if we can go to slide 18, you had mentioned, and perhaps I just didn't see it in your report, you've got what I would consider, firstly, the capital cost of a CCGT at 1.3 million.

Then you've done some for the other types of units, correct?

MR. MICHAEL ROBERTSON: That's correct.

MR. ANTOINE HACAULT: And that was basically looking as to whether or not the reference value assigned by Manitoba Hydro to this -- these units were appropriate?

MR. MICHAEL ROBERTSON: Correct.
MR. ANTOINE HACAULT: Now, I didn't see any analysis as to whether or not the lows and highs with respect to those units were appropriate.
MR. MICHAEL ROBERTSON: And that's because we didn't do it.
MR. ANTOINE HACAULT: Okay.
MR. MICHAEL ROBERTSON: So we -- we were not asked to do it. We were asked to comment on Manitoba Hydro's capital costs and operating and maintenance cost estimates for these alternative energy generation.
MR. ANTOINE HACAULT: And in addition not to commenting on whether Manitoba Hydro chose an appropriate high to stress test the plan, you also didn't address, sir, whether or not the reference capital costs might go down between now and, say, for example if we go back to Exhibit 104-1, the first in-service of one (1) of these units would -- under Plan 2 would be 2042.
Do you see that under Plan 1-2, under the CCGT, we have the year 2042?
MR. MICHAEL ROBERTSON: Yes.
MR. ANTOINE HACAULT: You didn't make any assessment, sir, as to whether or not what Hydro

was using as a ref value for that first unit to be in service, whether that ref value was something that was appropriate.

You just did a current day value, correct?

MR. MICHAEL ROBERTSON: Correct.

MR. ANTOINE HACAULT: And is the same true with respect to the SCGTs, the first of which would be in 2031?

You didn't assess, sir, whether or not the reference value was something that could be reasonably expected in 2031, as used by Manitoba Hydro?

MR. MICHAEL ROBERTSON: No.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: And just to make it clear, you didn't assess the reasonableness of any numbers that were used for SCGTs any time thereafter? That's after 2031.

MR. MICHAEL ROBERTSON: No.

MR. ANTOINE HACAULT: Now, with respect to...

(BRIEF PAUSE)

MR. ANTOINE HACAULT: The next subject was -- we've heard in addition to the contingency reserve, which we've had some discussion about, whether or not the management reserve was appropriate and whether its been fully disclosed. So in Exhibit 3.1 at -- it's Roman number I of IV; it's, I believe, the last item. There's discussion about the management reserve. And in -- it's about the middle of the page that's being shown on the screen, there's some words in parentheses, "Not fully disclosed."

What did you feel you needed more with respect to the description of management reserve to be able to assess whether or not that was an appropriate amount --

MR. CHRISTIAN MONNIN: Sorry, Mr. Hacault, you're referring to management reserve, but if I'm reading the sentence correctly it's -- it refers to labour reserve.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Just wait.

(BRIEF PAUSE)

MR. BORIS FICHOT: We -- we can

probably address that question, just understanding that the management reserve is the addition of labour reserve and escalation reserve, so it's probably labour reserve. We weren't given, at -- at the time of writing the first report, the -- the details of how about -- how they came about the labour reserve, and now we -- we have a better indication of how that was calculated. And that -- that's where we go into CSI material, in terms of how they came about the labour reserve.

MR. ANTOINE HACAULT: Okay.

MR. BORIS FICHOT: So they've -- they've made some assumptions about productivity in their comparison, and that -- those lead them to believe that the labour reserve is 'X' dollars --

MR. ANTOINE HACAULT: Yes.

MR. BORIS FICHOT: -- the two (2) estimates.

MR. ANTOINE HACAULT: And one of the comments was that the assumption was that the -- there would not be a repeat of the inefficiencies encountered at Wuskwatim in the new estimates.

Is that correct?

MR. BORIS FICHOT: That is an allowance for that experience.

MR. ANTOINE HACAULT: But it's not as high as what was experienced as -- at the Wuskwatim project, correct?

MR. BORIS FICHOT: We'll go into CSI material if we talk about it.

MR. ANTOINE HACAULT: Okay. There is the -- the comment in -- in this report that the labour reserve for the new estimates was lower than the experience. And this is at page 4 of 4 in the -- in this index.

MR. BORIS FICHOT: That is correct.

MR. ANTOINE HACAULT: The very last sentence on -- on the slide here of the second paragraph under Item 9:

"The cost estimate rates, however, do not incorporate the actual Wuskwatim productivity rates, and Hydro has made the general assumption that the labour conditions will not be as bad during the construction of Keeyask and Conawapa, because they plan to offer better labour conditions."

MR. BORIS FICHOT: That's correct.

MR. ANTOINE HACAULT: So was Knight Piesold able to assess whether or not, based on experience of other projects, this assumption was a sound one?

MR. BORIS FICHOT: No.

MR. ANTOINE HACAULT: Was Knight Piesold able to assess in any way whether or not this assumption, that labour conditions would not be as bad, was a sound one?

MR. MICHAEL ROBERTSON: Beyond the observation that they are going to offer better labour conditions, and logically, that should improve the situation, I cannot comment.

MR. ANTOINE HACAULT: Okay.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: If we go to page 6 of 73 in this document, or there's a -- there's a section called 'Gaps', and Knight Piesold explains that it provided its best efforts in answering the PUB inquiries, but it notes three (3) gaps in its ability to answer the questions that were asked by this Board.

Now, firstly, and -- and I'll deal with each point, does the first point affect the conclusion? And if so, which one?

MR. BORIS FICHOT: The -- the first

point dealing with the methodology, numerical breakdown of the systemic risk calculation, we have had more recently, as a result of the -- the whole reevaluation of the GCC tenderers being able to -- to view a document produced by a -- by a third party, they're detailing some of the methodology behind the numbers. So we've got more confidence that there's some rigour to -- to calculating those numbers.

MR. ANTOINE HACAULT: So is that still a gap? And --

MR. BORIS FICHOT: I -- I would say that's no longer a gap in terms of our appreciation of whether or not they've done a good job in -- in coming up with a -- with a number.

MR. ANTOINE HACAULT: Okay. So I can strike that one off as a gap. The second one at -- listed there is contingency determination on the indirects.

Does that affect your conclusion? If so, what? And does it continue to be a concern?

MR. MICHAEL ROBERTSON: It -- it's -- there is a remaining risk, we believe, that -- that the quantification of that risk we -- we cannot in any way verify, because we don't have the details.

MR. ANTOINE HACAULT: So it does

continue to be a concern as compared to the fli -- first bullet, which is now dealt with, correct?

MR. MICHAEL ROBERTSON: I would say so.

MR. ANTOINE HACAULT: And what about the last one? And does it continue to be a gap? It is a justification for not using the Hydro escalation factor estimated.

MR. MICHAEL ROBERTSON: Yes, that is still a gap, and that is CSI.

MR. ANTOINE HACAULT: Okay. Now...

(BRIEF PAUSE)

MR. ANTOINE HACAULT: I had a line of questioning with respect to the class estimates on Conawapa, and that's been clarified, because as I understand it now, we've revised it from a Class 2 to a Class 3, correct?

MR. MICHAEL ROBERTSON: Yes.

MR. ANTOINE HACAULT: And, sir, how does this Board deal with the challenge of determining what a ref cost is, a low cost, and a high cost for a plant like Conawapa, assuming DSM 2, would have an in-service date starting -- that's the first turbine -- out of 2031?

MR. MICHAEL ROBERTSON: With great difficulty.

MR. ANTOINE HACAULT: Now, that leads me to the discussion of escalation reserve at page --

THE CHAIRPERSON: Just a second, Me. Hacault, s'il vous plait.

(BRIEF PAUSE)

MR. CHRISTIAN MONNIN: Merci. Now, just to advise Mr. Hacault and -- and the balance of the room that we've been advised that under the gap section of M. Hacault's canvassing questions on the -- we touched upon the justification for not using the hydro escalation factor estimated. That -- and the answer that was provided, that that would sway into CSI. And -- and we determined that that's not the case.

And therefore, M. Hacault can return on that subject and ask questions.

MR. MICHAEL ROBERTSON: In which case the

----answer is that we still see it as a gap. We haven't seen the justification and we think it's a risk.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Thank you very much for that. And just to get a little bit more detail on that, at page 23 -- or 27, 2-7, of the report. At the bottom of the page there's some discussion with respect to the escalation rate and the comparison to Muskrat Falls. Now, is there any reason why Muskrat Falls was chosen?

Is it just because you had the data for Muskrat Falls to compare?

MR. BORIS FICHOT: That's correct. We thought it was al -- along the same magnitudes and we had corresponding periods, so we -- we just showed that this is what they use, this is what we thought they calculated, and this is what the two point five (2.5) looks like.

MR. ANTOINE HACAULT: And with respect to Muskrat Falls, am I correct in interpreting this paragraph that your understanding is that they used a rate of about 3.4 percent as an escalation rate in -- when compared to Manitoba Hydro at 2.5 percent?

MR. BORIS FICHOT: Yes, it's -- but it's our understanding that they calculate a hydro power escalation factor of three point one (3.1). At least from the report, that's our understanding.

MR. ANTOINE HACAULT: Could -- could you explain that? Sorry. What's the distinction between the 3.4 percent and the three point one (3.1)? Not that it's a huge amount, but I've learned that the small percentage on billions of dollars can make a little bit of a difference.

(BRIEF PAUSE)

MR. BORIS FICHOT: I believe there's a -- a portion of the official submission that discusses those numbers, and that's what we're referring to. I'm advised that it -- it would be an undertaking to go and dig that out and show it.

MR. ANTOINE HACAULT: You're not too sure what the difference is between the 3.4 percent number and the 3.1 percent number --

MR. BORIS FICHOT: Oh, that's -- that's the -- basically, they would go and solicit and look at their act -- exact quantities of material that they anticipate, look at what all these different market studies would project the price of different commodities to be, and then bring all these aggregate numbers to an index, which is, in Muskrat Falls, three point four (3.4), and which I understand in the

Manitoba Hydro case to be three point one (3.1).

So you -- they -- they do a -- a detailed study where they look at the commodities that they expect to have to use, get labour -- get market studies for the different materials, copper, steel, and so forth, and then bring it back to a composite index. And that's what Muskrat Falls has done.

And they -- they have different quantities. So they -- they would get a different number as a result of that -- of that evaluation.

MR. ANTOINE HACAULT: So is it the opinion of Knight Piesold that an appropriate escalation rate should be 3.1 percent? I believe that number is referenced in your --

MR. BORIS FICHOT: Yes.

MR. ANTOINE HACAULT: -- supplemental report.

MR. BORIS FICHOT: Yes. We believe that might be more appropriate, especially when you're talking about management reserve and -- and a pool of money that you're setting aside for that purpose in case the escalation occurs.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Now, the other thing that occurred in the updates -- and this is in our book of documents at page 5. There was a re-weighting of the high capital costs, low capital costs, and reference costs.

Is that your understanding also, sir?

MR. BORIS FICHOT: That's my understanding, although our scope of work does not cover the economic analysis and these -- these alterative analyses. So the -- the relationship between our review of the capital cost estimate and these numbers is not straightforward, as you're -- you're deducting a number of things that were considered in the economic analysis that we didn't necessarily look at.

MR. ANTOINE HACAULT: And I'm not trying to get you to answer things --

MR. BORIS FICHOT: Yeah.

MR. ANTOINE HACAULT: -- about the economic analysis, sir. But there was some discussion in your report with respect to the probabilities of certain values, certain construction values, and it's in that context that I was going to ask a couple questions.

If we flip back to the previous page,

page 4, and it's at the very bottom of that page. There's a table, and there's a range of values with the high and low probabilities. And that's why I referenced that previous number, so we could come back to this table and understand what 'low' meant.

We've assigned a 20 percent value to the low, a 60 percent value to the ref, and a 20 percent value of probability to the high. And there's the swings that we were looking at when I started the cross-examination for the P80s, P90s, et cetera.

With respect to the swing, is it the view that we should use an expected value or is the range, for example for Conawapa26 because that's what you looked at, appropriate from the ref to the high because we looked at the change from P50 to -- to P80?

MR. BORIS FICHOT: That's where we can't really draw a relationship between what we've evaluated and the statistical numbers that they've attributed to these different buckets. What we have looked at is the statistical variation around the contingency, as well as the -- the thinking behind the number used to come up with the management reserve.

And we don't have a good understanding because it wasn't part of our work to take that information and relate it back to this economic uncertainty analysis. And there's a jump there. There's something that needs to be analyzed but we haven't looked at that because that's not part of our scope of work.

MR. ANTOINE HACAULT: Okay.

MR. BORIS FICHOT: But what we have looked at is statistical variation around the contingency numbers, and the justification around the management reserve, and whether or not it's high or low.

MR. ANTOINE HACAULT: Diana, if we could go to Exhibit 161. I just want to try and better understand what you weren't looking at and weren't doing then. If we look -- actually, it would be page 2 of 3, please.

You may recall, sir, when we were looking at contingency amounts; and this was the first table. I'm asking you to kind of stretch your memory. When we were doing -- first let's look on this table. Under the point estimate, there's another heading, 'Contingency'. And the ref contingency is point five three (.53), and the high contingency is point five three (.53).

Now, if we can kind of keep that number in our minds for a little bit and quickly revert back to page 25 of Exhibit 3-1.

So we were looking, and in Exhibit 161 under the contingency, we had both for the ref and the high a contingency reserve of point five-three (.53), and that corresponds to the P50 of 523 million.

Are you following me so far, sir?

MR. MICHAEL ROBERTSON: Yeah.

MR. BORIS FICHOT: This table.

MR. ANTOINE HACAULT: Yeah. Now, if I understood your evidence correctly, if we were going to attribute a more conservative number, we'd go to either the P80 or P90 and put that, because we'd have more certainty that our high costs -- it wouldn't come higher than what that number is.

Is that correct?

MR. BORIS FICHOT: That's correct.

MR. ANTOINE HACAULT: So although I know you can't comment on why Manitoba Hydro chose to keep -- keep it at $.53 billion, you would agree with me that the point five-three (.53), if it's kept constant, does not give us a higher certainty that you'll come in within the agreed numbers.

MR. MICHAEL ROBERTSON: I -- I think, probably, we -- we should just repeat what Boris said. I mean, we -- we were not part of the economic analysis at all, and so we're really not in a position to make sensible commentary on it.

The other point I would make is that the process that we've followed in our reporting related specifically to the probability that the -- that the estimate that we're given of 6.5 billion for Keeyask is sensible and -- and a probability distribution around where those values might be.

This other process that -- that you're looking at was one that was used to compare all the different alternatives, and -- and essentially support the -- the PDP, and -- and we had no part in that, so it --

MR. ANTOINE HACAULT: Yeah.

MR. MICHAEL ROBERTSON: -- it would be inappropriate for us to comment on that.

MR. ANTOINE HACAULT: I'm not asking you to comment on why Hydro chose it, but I'm just -- I just wanted to confirm that, if we keep -- kept the number at the same, it wouldn't reflect this different 'P' value that you've talked about.

MR. MICHAEL ROBERTSON: That's a logical conclusion.

MR. ANTOINE HACAULT: Okay. And if we go back to Exhibit 161, because I don't just want to dwell on one when I see a difference, and the update, if we continued along that line, we see that they've chosen a -- a different number this time under the reference number, but this time, they didn't choose to keep the three (3) -- point three-one (.31) consistent across the different -- different scenarios.

MR. MICHAEL ROBERTSON: I see that.

MR. ANTOINE HACAULT: Okay.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Diana, if you go to page 2, please, of our book of documents? Now, this is not a Manitoba Hydro document. It's a document that was created by the consultants hired by MIPUG. If we can make a little bit smaller so we can see the -- all the writing?

I had just gone to the -- the different ranges and the different probabilities, and you've indicated you can't comment on that.

Had you done any S-curves for the probabilities that you speak of in your report, sir?

MR. MICHAEL ROBERTSON: No.

MR. ANTOINE HACAULT: Okay.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Okay. I don't think I can ask you any other questions about that. If I could just have thirty (30) seconds to check my notes? And then I believe I'm finished. But I'd just like to have an opportunity to double check my notes.

THE CHAIRPERSON: Agreed.

(BRIEF PAUSE)

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Just one (1) question, page 12 of Exhibit 3 -- 3-1. Diana, could you bring that up, please. And under the heading, "Intended use of cost estimate," and 2.4.1.3 there's a paragraph, and I'll quote it.

"It is important to note that the PUB and Manitoba Hydro are making different uses of the same cost estimate [in parentheses] (with a specific level of prove -- project definition) [closed parentheses] and as a result may have a different perspective on risks and accounting

for uncertainty which are built into
the relevant contingency and
reserves."

Can you just expand on why you think that there's different uses being made of the same cost estimate?

MR. BORIS FICHOT: It -- it was in the context if you're making decisions with -- where you have a large number of pools with different projects, it'll have a 50 percent chance of going over or under. It's a different decision-making context than if you're deciding on a single project.

MR. MICHAEL ROBERTSON: And it's also the appetite for risk that we've been discussing. You know, the PUB may look at it very differently from Manitoba Hydro.

MR. ANTOINE HACAULT: Thank you. Those are all my questions.

THE CHAIRPERSON: I think it would be an appropriate time to take a break. Let's take ten (10). Thank you.

--- Upon recessing at 2:45 p.m.

--- Upon resuming at 3:00 p.m.

THE CHAIRPERSON: I believe that everybody's in position to resume the proceedings. So I will turn the microphone over to you, Ms. Van Iderstine, sorry.

CROSS-EXAMINATION BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: Thank you very much. I would like to start by saying this may be a bit disjointed because we've been adding and subtracting and I have all these coloured points on here, and I'm not really sure I'm supposed to be watching the -- the orange or the green.

But I have to say a couple thank-yous. First of all, Ms. Bowen will appreciate me thanking you for -- because I've been bugging him since I started working on this for definitions, and so I will be coming back to definitions, but I was delighted to see them in your -- in your presentation.

And the second thing is I love the photographs. I was try -- I was -- I kept saying, I want to see pictures of the project. And here it is right on the front of their presentation. So thank you very much for that. Well...

MR. MICHAEL ROBERTSON: I have to say that is your photograph.

MS. HELGA VAN IDERSTINE: Regardless, I haven't seen it often enough. So what I'm going to do and what I'd appreciate you doing is keeping handy the two (2) reports that you've written and that are in -- in evidence and on the record. And, as well, I've got a book of author -- or documents which I'll be referring to. But other than that, I think that is about it.

So just in general terms, I'd like to ask you a few questions, some -- a bit about some experience issues and expertise that goes into producing this type of report. And as I was reviewing your materials, I noticed, of course, that KP has been involved in providing construction advice and quality control advice for construction of hydroelectric projects in the past.

Is that right?

MR. MICHAEL ROBERTSON: That's correct.

MS. HELGA VAN IDERSTINE: And you have had some expertise in wind power generation, as well?

MR. MICHAEL ROBERTSON: That's correct.

MS. HELGA VAN IDERSTINE: But with respect to the wind power gen -- generation, have you done any wind power generation in Manitoba?

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: And as I understood from the report you prepared, the way you compiled the information was -- on the wind issue was to do a literature review primarily?

MR. BORIS FICHOT: I -- I would rel -- I would also say that we relied heavily on Garrad Hassan's opinion in the published a report for Manitoba Hydro.

MS. HELGA VAN IDERSTINE: Thank you very much. And so when the PUB commissioned you to do a review that -- of Manitoba Hydro's plans, you felt that it was within your expertise to do so?

MR. MICHAEL ROBERTSON: In general, yes.

MS. HELGA VAN IDERSTINE: And that's because you and your team have expertise in cost estimating?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And as I understand it, there was about six (6) of you involved in this project.

Is that right?

MR. MICHAEL ROBERTSON: Up to.

MS. HELGA VAN IDERSTINE: And would you, Mr. Robertson, have -- be the person who has the most expertise?

MR. MICHAEL ROBERTSON: Yes, I would believe so. And -- and I'm certainly responsible for the collective viewpoint that's expressed.

MS. HELGA VAN IDERSTINE: And as I understand it, the area of cost estimating and quality control risk management is a very specialized area?

MR. MICHAEL ROBERTSON: It can be in the detail.

MS. HELGA VAN IDERSTINE: Which requires both experience in cost estimating, education, and training?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: All of which you obviously have?

MR. MICHAEL ROBERTSON: Obviously.

MS. HELGA VAN IDERSTINE: So -- and in your dealings with the Manitoba Hydro staff, as I understand it, you dealt with a number of the staff in obtaining information from them and understanding what was going on in their development of this project?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And would it be fair to say that many of them also had expertise in these areas?

MR. MICHAEL ROBERTSON: Absolutely.

MS. HELGA VAN IDERSTINE: And in addition to the internal expertise that Manitoba Hydro had, they also went to external persons and companies to obtain further expertise to ensure that the -- their processes and estimating was as good as it could be?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And one of those would be a company called Validation Estimating?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And a fellow named John Hollmann?

MR. MICHAEL ROBERTSON: I don't know him.

MS. HELGA VAN IDERSTINE: But that's Validation Estimating.

MR. MICHAEL ROBERTSON: Okay.

MS. HELGA VAN IDERSTINE: Do you know that -- whether he -- do you know of, or have you been read any of the reports he's written?

MR. MICHAEL ROBERTSON: We have.

MS. HELGA VAN IDERSTINE: Would you -- do you know whether or not he is -- would be considered one of the experts in this area?

MR. MICHAEL ROBERTSON: I -- I would

say he -- he is, if only by virtue of the fact that Manitoba Hydro elected to employ him.

MS. HELGA VAN IDERSTINE: Okay. One of the things that occurred to me as I listened to your evidence is that all of this expertise that you've gained is something beyond -- and with all due respect to the engineers in this room, it's something beyond that you would get just simply as just having an engineering degree?

MR. MICHAEL ROBERTSON: Oh, absolutely.

MS. HELGA VAN IDERSTINE: And so the information you reviewed and all of the data that you collected, it's something which -- that you take, you put together, and you have to utilize your judgment as well in putting -- coming up to a conclusion?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And that judgment is based on expertise and experience?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And again, you'd agree that there's people within Manitoba Hydro who have that expertise and judgment as well?

MR. MICHAEL ROBERTSON: I have no doubt.

MS. HELGA VAN IDERSTINE: And I don't

want to belabour this point, but it's not just as simple as pulling out some spread -- and I -- I -- with all due respect to the accountants in the room -- who may be in the room, it's not just reading a spreadsheet?

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: Well, that's something I can't do either, so I'm all... So in the scope of your -- I want to address a few things on the scope of your work.

You've outlined in your documentation, and I appreciate it very much, all the documents that you reviewed to the extent you could; but I also gather that beyond that, there were conversations you had with people from Manitoba Hydro?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: To obtain information?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: There was emails that you would have had with people from Manitoba Hydro?

MR. MICHAEL ROBERTSON: M-hm.

MS. HELGA VAN IDERSTINE: There were meet -- teleconferences you had with people from

Manitoba Hydro?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And all of that gets incorporated into your report.

Is that right?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Now, one (1) of the things -- and I'm sorry, Mr. Hombach, I probably should have addressed this earlier -- is I understood that there was a presentation you reci -- had with the PUB in September?

It was -- it was an IR that you answered and you identified that there was a September 17th meet -- presentation and a slide deck?

MR. BORIS FICHOT: Yes, that's when we were first given the scope of work.

MS. HELGA VAN IDERSTINE: Okay. Was there any -- Mr. Hombach, is that available to be provided somewhere?

MR. SVEN HOMBACH: Sorry, this is which slide deck?

MS. HELGA VAN IDERSTINE: The presentation from September 17th, and the September 18th slide deck.

MR. SVEN HOMBACH: That's Manitoba

Hydro's presentation?

MS. HELGA VAN IDERSTINE: I don't know.

MR. BORIS FICHOT: The -- the --

MS. HELGA VAN IDERSTINE: The --

MR. BORIS FICHOT: -- yeah, the only listed reference was the -- when we first came to -- to work for the PUB, there was a series of presentations, and I believe there was a IR that asked for them, and we don't know if that's disclosable. We leave it to -- we left it to the PUB to disclose it if it's --

MR. SVEN HOMBACH: I take --

MR. BORIS FICHOT: -- supposed to be disclosed.

MR. SVEN HOMBACH: -- I take that under advisement, Ms. Iderstine, and we can have an offline discussion.

MS. HELGA VAN IDERSTINE: Thank you.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: Now, in broad general terms, can we describe the first report that you prepared as being one (1) that addressed processes for estimating construction costs and the overall project execution plan?

MR. BORIS FICHOT: To -- to the state

of our knowledge at that time --

MS. HELGA VAN IDERSTINE: Yeah.

MR. BORIS FICHOT: -- so we had a certain amount of time to review information. At that -- at that end date, we -- we had to reach those conclusions.

MS. HELGA VAN IDERSTINE: And --

MR. MICHAEL ROBERTSON: And -- and, sorry, if I may interrupt. Some of that was revisited with the more detailed questions that were asked in the second scope.

MS. HELGA VAN IDERSTINE: Yes. And -- and I was just trying to draw a distinction that the first one was -- was planning and the project execution plans, and the second report, you -- was after you had the -- some firmer numbers and were able to then, in the second report, deal with more of the execution plans as opposed to the planning process, per se.

MR. MICHAEL ROBERTSON: With -- with some overlap.

MS. HELGA VAN IDERSTINE: Okay.

MR. MICHAEL ROBERTSON: And -- and also with the singular focus in the second lot of Keeyask.

MS. HELGA VAN IDERSTINE: Right. In one (1) of the IRs that you responded to from the

Public Utilities Board, it was 1031A, that's at Tab 1 of the book of documents, you commented that, "Hydro was generally very" -- it's about halfway down the answer.

"Hydro was generally very cooperative with KP's review, but full disclosure of all information was never forthcoming, as Hydro is rightfully protective of their commercially sensitive information, and the information often required internal screening and processing."

So a couple questions on that.

First of all, after that time, I understand you were then provided with information about the general civil contract?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: In fact, as I understand it from Manitoba Hydro, that on February 27th, that within two (2) days of the Board approving the Keeyask GCC, they were having conversations with you about it?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And on March 5th, a day after the executive committee reviews of the corresponding impacts, they were providing you with some information on the NFAT references, and they met with you on a teleconference call about the updated capital costs for both Keeyask and Conawapa?

MR. MICHAEL ROBERTSON: March 5th does sound like the date we had that call, yes.

MS. HELGA VAN IDERSTINE: And they provided confidential information to you relating to the development of the estimate, development of the project contingency, and the development of the labour reserves?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: So it would be fair to say that now, the concern that was addressed in that response has generally been addressed?

MR. MICHAEL ROBERTSON: Generally, with some exceptions.

MS. HELGA VAN IDERSTINE: The exceptions, I -- I think you talked about earlier with some of the detail, that you -- is that what you're referring to?

MR. MICHAEL ROBERTSON: Well, particularly the indirects.

MS. HELGA VAN IDERSTINE: Oh. But nevertheless, you were still able to, by January 13th or 17th, I think maybe this date of the report was, you were able to come -- complete the report with -- within the scope of the work from the first project, despite not yet having the GCC at that point.

MR. MICHAEL ROBERTSON: Well, we did, because that was the deadline, but we had to make a comment that we couldn't really fully answer some of the questions until we had that data.

MS. HELGA VAN IDERSTINE: And that's identified in the places in your report as gaps, and that sort of thing?

MR. MICHAEL ROBERTSON: Or comments that, you know, when -- when we get the GCC data, we will be in a better position to comment on those.

MS. HELGA VAN IDERSTINE: Would it be fair to say that you draw on your -- drew on your abilities from your experience and training to be able to pull out salient details from the huge amount of information that was available and selectively identify the information that you required?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: So that you didn't feel you had to read every single detail in order to come up with your opinion?

MR. MICHAEL ROBERTSON: Well, first it

was not possible to read everything that's posted on the -- on the website, but yes, I -- I believe that we were able to get what we needed to come to our opinions.

MR. BORIS FICHOT: I'll -- I'll just add that sometimes even if you don't review the information, it's nice to have a little checkbox to say, Yes, they have indeed prepared a document that describes this. You don't necessarily need to go through the details, but to know that it exists and has been prepared does give some comfort in -- in the numbers.

MS. HELGA VAN IDERSTINE: And what you're saying there is -- is, in terms of the process, you want to know that Manitoba Hydro's thought about it and considered it and has the backup. Much the way when I do my income tax, the income tax return, they don't always ask for all the information. They just want to know I've got it.

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And I -- I think you may have answered that in -- if you look at Tab 2, you know, there was a -- an IR asked of you, PUB/KP I-021a. And you were asked about some of the difficulties obtaining information, and you commented that:

"The difficulties stem from obtaining the right level of information without being either overwhelmed or receiving too little."

And then you went on to say that:

"Hydro had retained rights not to share all the information available and only wishes to release enough information to be convincing without revealing details inside commercially sensitive information."

Do you see that?

MR. MICHAEL ROBERTSON: I do.

MS. HELGA VAN IDERSTINE: And that reflects what your thinking was, I take it, about the -- obtaining the information and the level of detail you needed?

MR. MICHAEL ROBERTSON: At -- at that time, yes.

MS. HELGA VAN IDERSTINE: We'll talk about this a little bit later, but I -- I take it from that comment in that IR that you understood from Manitoba Hydro and appreciated their need to keep some information confidential.

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And that would be because, if that information got out in any public way, it could drive up the costs associated with the project?

MR. MICHAEL ROBERTSON: Conceivably.

MS. HELGA VAN IDERSTINE: It might harm the relationship with some of their contractors?

MR. MICHAEL ROBERTSON: Possibly.

MS. HELGA VAN IDERSTINE: And you didn't need -- as we've talked about, you didn't need every single detail in order to feel confident enough to put your stamp on the first -- first and then the second report?

MR. MICHAEL ROBERTSON: I -- I think the -- the overall tone of the conclusions of the first report were that what we're seeing is good. But really, at the end of the day, we need to see a lot more very significant stuff before we can provide a good opinion back to the -- to the Board.

MS. HELGA VAN IDERSTINE: And that's what you got for the second report?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: Okay. So I just want to talk about the estimating process for

Keeyask and Conawapa a little bit

And would it be fair to say that there, fairly similar processes were applied in Manitoba Hydro with respect to both of those?

MR. MICHAEL ROBERTSON: For the two (2) projects?

MS. HELGA VAN IDERSTINE: Yes.

MR. MICHAEL ROBERTSON: It would appear so.

MS. HELGA VAN IDERSTINE: And to the extent that the Keeyask process is similar to the Conawapa one, we can have some confidence in the estimates with Conawapa, given the lack of development of that process?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And you would anticipate, I would take it -- well, first of all, you saw and comment on the fact that Manitoba Hydro has learned from the experience they had with Wuskwatim?

MR. MICHAEL ROBERTSON: I believe so.

MS. HELGA VAN IDERSTINE: And you would expect, based on what you've seen of the Manitoba Hydro staff, that they would take any other learning points they get from Keeyask and apply that to Conawapa when they go to build that?

MR. MICHAEL ROBERTSON: You would logically assume that.

MS. HELGA VAN IDERSTINE: Nothing you saw or discussed within Manitoba Hydro would suggest that they wouldn't be doing that kind of constant learning and appro -- improvements in their practices?

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: Now, as we've gone through, you were advised about the -- you were part -- saw the process leading up to the awarding of the GCC. And when I say that, one of things I understand you were aware of and you had some discussions about was the fact that Manitoba Hydro qualifi -- pre-qualified four (4) bidders for their project.

Is that right?

MR. MICHAEL ROBERTSON: To be honest, I don't recall that directly, but it's a sensible thing to do and it's a very typical thing to do.

MS. HELGA VAN IDERSTINE: And these were all builders that were experienced in building large sim -- similar, large-scale, hydroelectric-type projects?

MR. MICHAEL ROBERTSON: yes.

MS. HELGA VAN IDERSTINE: And they've

been described -- and -- and you described Manitoba Hydro as being diligent in their internal comparisons between the four (4) GCC tenders, their engineers, estimates, and the independent third-party estimate.

Is that --

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And you'll recall that after that due diligence, they selected a company called -- the acro -- the acronym BBE?

MR. MICHAEL ROBERTSON: I am aware of that.

MS. HELGA VAN IDERSTINE: And did you know that one (1) of the main partners in BBE, being Bechtel, was involved in the building of Limestone?

MR. MICHAEL ROBERTSON: I do.

MS. HELGA VAN IDERSTINE: And that would suggest that they are, therefore, familiar with both the geography and complexity of the project they're undertaking?

MR. MICHAEL ROBERTSON: Correct, it does suggest that.

MS. HELGA VAN IDERSTINE: Now, we've -- you talked this morning a couple times about the early contractor involvement process which was being used.

Do you recall that?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And as I understand, that the early contractor involvement in the -- is used in projects in the expectation that it may mitigate some of the project costs?

MR. MICHAEL ROBERTSON: It'll mitigate the -- the project risks, which should -- should come up with a better defined cost, amongst other things.

MS. HELGA VAN IDERSTINE: Will optimize and bring as much certainty to the process as possible?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And the hope is that they will bring -- they con -- they will bring their knowledge to the process to help improve the processes and the ultimate execution of the project?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And it provides opportunities to identify and share risk?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And that includes the geotechnical conditions, a scheduled design, input costs, and contract conditions?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And I take it that would be an example of how Manitoba Hydro is working to eliminate as much risk as they can in this -- in this project?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And I think -- I think you mentioned, but if you didn't, then I'll raise it right now, that about -- with the GCC in place, about 80 percent of all the project costs have now been defined?

MR. MICHAEL ROBERTSON: That's the statement made by Hydro.

MS. HELGA VAN IDERSTINE: Well, Mr. Bowen's correcting me. The project contract costs, so I don't...

MR. MICHAEL ROBERTSON: But it's not a state -- not a statement that we originated.

MS. HELGA VAN IDERSTINE: Okay. And that would give you, again, a fairly strong level of certainty with respect to the costs that you're talking about in the estimates and the ultimate cost?

MR. MICHAEL ROBERTSON: Certainly as far as the direct costs are concerned.

MS. HELGA VAN IDERSTINE: Now, returning to those definitions that I like so much. So I wanted to make sure that when we're talking about the estimates, that we're talking about the capital cost estimates.

And I think it's been interchangeably used with the term 'point estimate'?

MR. MICHAEL ROBERTSON: Well, there -- there are a number of terms along the line of that chart. They -- they are different parts of the capital costs. I mean, they -- they talk about in-service. They talk about point. They talk about base. So, yeah, you've got to be specific.

MS. HELGA VAN IDERSTINE: Yes. So if we can look over to Tab 4 of the -- of the book of documents that I provided to you. Mr. Bowen provided these definitions for the panel in Exhibit 95 at the -- maybe in Exhibit 95; I'm forgetting the number. The presentation that was done on the first day, and this is from page 94.

So if you look at the definition of 'estimate', would you agree with that -- that definition?

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Essentially.

MS. HELGA VAN IDERSTINE: And so that would be the calculation of a range of costs to complete the project based on a set of assumptions. The critical assumptions include the project scope, level of defin -- definition, schedule, and in-service date?

You actually have to say a word.

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Thank you. Now, you would take this budget -- or this estimate, excuse me; that's where I'm getting in trouble.

You take this estimate, and you would use it to establish what's been called the control budget of the project cost?

MR. MICHAEL ROBERTSON: Forgive me, I -- I need to read this.

MS. HELGA VAN IDERSTINE: Yeah.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: I -- I think that is a statement of Manitoba Hydro's process.

MS. HELGA VAN IDERSTINE: I don't want to -- I'm not suggesting -- it -- what I would -- what I would like to hear from you is if you've got any concerns about that being the definition, because one of the concerns, as we've talked about a moment ago, is making sure that when we're talking about the estimates and we're talking about a control budget, that we're talking about two (2) separate things and why they might be different.

And in your report when you start adding things like escalation and things like that, that's where we're going to get to the control budget, right? We start with the estimate, and then we add some things to get to the control budget.

Is that right?

MR. MICHAEL ROBERTSON: Well, you start with the point estimate.

MS. HELGA VAN IDERSTINE: Yes.

MR. MICHAEL ROBERTSON: And then you add a bunch of things and you get a base -- well, you then add uncertainty and you get a base cost. Then you multiply that by interest and inflation, then you add money spent to date, and you get what is called an in-service cost. Now, I would say to some extent those are all estimates.

MS. HELGA VAN IDERSTINE: Okay.

MR. MICHAEL ROBERTSON: Generically.

MS. HELGA VAN IDERSTINE: Mr. Bowen had used the term 'control budget' to talk about the budget as -- once it's been approved, and it being the benchmark for measuring project cost performance. Is that --

MR. MICHAEL ROBERTSON: If -- if he so chooses.

MS. HELGA VAN IDERSTINE: Well, this is actually an important distinction. So I want to make sure that we under -- we're both talking about the same thing, that -- let me maybe to do it this way...

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: So if we -- if you turn over to Tab 8.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: And you'll see that we've -- there was a point estimate at the beginning of the three point three-six (3.36). And if you come down to the bottom, a total in service, number of six point five (6.5). The six point five (6.5) is what I'm talking about as being the control budget.

Can we agree on that?

MR. MICHAEL ROBERTSON: If -- if that's the way you want to set up your management system, yes.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: And in order to get to that $6.5 billion, Manitoba Hydro included a contingency of a P50 value, as well as labour and escalation management reserves.

Is that what your understanding was?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And by doing so, by both adding the contingency -- the P50 value and the labour and escalation management reserves, would you agree that that pushes Manitoba Hydro over a P50 value?

MR. MICHAEL ROBERTSON: Big picture, yes. Because as I mentioned in my presentation, the -- the contingency quote -- quote typically on a project includes the issues which Manitoba Hydro has chosen to deal with separately under the term 'management reserve'. So if you added those sums of money into the contingency, into one (1) contingency, it would represent, effectively, something greater than P50.

MS. HELGA VAN IDERSTINE: And if you look over to page 24 of the book of documents, you'll see what's identified, or called, "Keeyask Low, Reference, and High." And this is what we've been calling the NFAT analysis.

Did anyone talk to you about that at all at any time during your -- your processes?

MR. MICHAEL ROBERTSON: Not really, except the talking that was done was by me asking for details of it, which -- which I don't believe we ever got.

MS. HELGA VAN IDERSTINE: You didn't get, or you didn't get information that enabled you to understand that process?

MR. MICHAEL ROBERTSON: We -- can we take this offline?

MS. HELGA VAN IDERSTINE: Yeah.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: Oh, I'm sorry. Yeah, please go ahead, Mr. Robertson.

MR. MICHAEL ROBERTSON: I was -- I was just going to say that it -- you know, going back to some of the discussions we've had earlier today, this whole process of low/reference/high in the economic analysis is more properly part of the whole development alternatives decision, and it is not directly relevant to what we were asked to do. The reason I was asking for it was really to get some measure of how high Manitoba Hydro thinks the price might go above the 6.5 billion expected in-service costs that they are now forecasting.

MS. HELGA VAN IDERSTINE: Okay. Thank you.

MR. MICHAEL ROBERTSON: And I didn't get that answer.

MS. HELGA VAN IDERSTINE: Okay. Thank you. The -- looking at -- just -- I'm going to stop here so I don't forget. I should have mark -- requested and marked that the book of documents be marked as the next exhibit, Exhibit Manitoba Hydro 173.

MR. KURT SIMONSEN: Correct, thank you.

--- EXHIBIT NO. MH-173: Book of documents

THE CHAIRPERSON: Could I -- I'm sorry, could I intervene here? I just wanted to clarify something in my mind because I -- you indicated that -- correct me if I'm wrong, please. You indicated that the inclusion of management reserve along with contingency would address your concerns around establishing contingency at P50.

Now, did I hear you wrong? I mean, I --

I understood you, and at least I under -- I interpreted your report as indicating that contingency at a P80 level would -- would indicate a higher number exclusive of any consideration of the management reserve.

MR. MICHAEL ROBERTSON: It would.

THE CHAIRPERSON: Okay. So we're in agreement on that point. In other words, a more conservative assessment of contingency would -- would be addressed separately from any concerns you might have around the management reserve.

MR. MICHAEL ROBERTSON: Well, they're -- they're both aimed at quantifying possible uncertainty. Uncertainty; not possible uncertainty. Whether you chose to break that up into two (2) packets and label them differently is up to you.

Effectively though, if your contingency, quote/quote, is based on a P50 assessment and you separately have a separate allowance for other uncertainties, if you were to add them together and put them all into a contingency box, it would effectively be higher than P50.

I'm not prepared to say that the amount of the management reserve that has been quantified by Manitoba Hydro added to Manitoba Hydro's P50 contingency would be the same as a P80 contingency.

I'm just saying it would be higher than P50.

THE CHAIRPERSON: So they are, to some extent, correlated.

MR. MICHAEL ROBERTSON: Yes.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: And as you said this morning, part of the decision making around what 'P' value you use is the decision maker's appetite for risk.

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: So one of the -- again, one of the IRs that was -- you answered, MH/KPI-010 at -- reproduced it at Tab 6, you were asked about other projects that used different 'P' values, and I'd like to talk a little bit about these.

MR. MICHAEL ROBERTSON: Okay.

MS. HELGA VAN IDERSTINE: So if you look down to Quebec-Hydro, one -- a little further down -- you'll see -- and it goes over onto the second page -- that Quebec-Hydro uses a P50.

Is that right?

MR. BORIS FICHOT: So we're told, yes.

MS. HELGA VAN IDERSTINE: And BC Hydro uses a P50 estimate but carries a reserve equal to the difference between P50 and P90?

MR. BORIS FICHOT: That's what we were told, yes.

MR. MICHAEL ROBERTSON: Well, and -- and we have experienced that --

MS. HELGA VAN IDERSTINE: And as I understood from your report, you weren't able to identify any standards that outlined a correct level of contingency for these reserves.

MR. BORIS FICHOT: That's correct.

MR. MICHAEL ROBERTSON: No, it's -- it's subjective.

MS. HELGA VAN IDERSTINE: And what interested me about some of the information provided in this report is if you look at what was asked here and -- so in this IR is what the recommendation was for the 'P' value, and then the positives and negatives of the approach.

And so if you look at the United States Army Corps of Army of -- United States Army Corps of Engineers, which is the first item, you'll see that they use a P80 for cost contingency calculation.

And can you just elaborate a little bit for me why -- the positive -- the positives of this approach and the negatives of this approach?

MR. MICHAEL ROBERTSON: Boris...?

MR. BORIS FICHOT: I'd have to jog my memory there in terms of what the article actually said, but -- oh, as -- as stated there, the -- the positive side of using a P80 is that you're more likely to be within your budget.

And the negative side of using a P80 is that you're -- you're more risk averse and therefore you're -- you're more pessimistic about what the likely outcome might be.

MS. HELGA VAN IDERSTINE: And -- and the language you use is -- you say they're more likely to be spent, meaning -- I take it meaning the money's more likely to get spent.

MR. BORIS FICHOT: That's -- that's correct. That's the impression: If the money's in the pool, we'll find something to spend it on.

MS. HELGA VAN IDERSTINE: Yeah. That's what I thought you were getting at.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: So that -- that's what the US Army Corp of Engineers stated. I'm not sure I totally agreed that it's more likely to be spent.

MS. HELGA VAN IDERSTINE: It doesn't appear to me that any of these organizations are using both a 'P' value and a management reserve, are they?

MR. MICHAEL ROBERTSON: Well, I -- I guess Hydro, BC Hydro. Between their P50 and their P90, you might call that a management reserve. A "project reserve" they call it.

MS. HELGA VAN IDERSTINE: Okay. So they've got a 'P' val -- 'P' value -- a -- a P50 value, and then they add to it in some capacity to come up, right?

MR. BORIS FICHOT: We -- we wouldn't be able to actually answer that question, I think. We'd have to look into it.

MR. MICHAEL ROBERTSON: Well, I -- I mean, I -- I do have direct experience of one (1) project we did for -- for BC Hydro where the -- the budget that we were all working to essentially was the P90 budget, included this allowance.

MS. HELGA VAN IDERSTINE: And I -- the language you just used was that the budget you were working to was to -- to the P90 level. So that would be the goal that you set -- setting a target that you think is reasonable to meet the budget under.

MR. MICHAEL ROBERTSON: Probably not reasonable, but more like you better not go over it.

MS. HELGA VAN IDERSTINE: So if I were to say that the -- a controlled budget was trying to set a -- a benchmark for performance that's rea -- that is reasonable without being either too high or too low, that would be another way -- another reason why somebody might set a lower 'P' value.

MR. MICHAEL ROBERTSON: If -- if that's your stated intent, yes.

MS. HELGA VAN IDERSTINE: Because the concern in those cases would be, if you set it too high, there might be a tendency to build to that higher cost.

MR. MICHAEL ROBERTSON: I would not agree with that.

MS. HELGA VAN IDERSTINE: But certainly if you set it too low, you're going to exceed the budget.

MR. MICHAEL ROBERTSON: You're more likely to. Let's take something offline here.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: Sorry. Are

you ready to start again?

MR. MICHAEL ROBERTSON: Well, I mean, I -- I -- Boris was essentially saying, you know, your ability to manage your budget is a different issue from whether or not that budget's set at the right level.

MS. HELGA VAN IDERSTINE: So I'm going to change topics a little bit at the moment. I wanted to talk about some of the items that you identified in your second report, and specifically the items that we've identified at -- and put in as document 3.3 or 3-3. Yes, that's the one. Thank you very much.

Now, as I understand that, just from the comment, you -- you highlighted some key risks which you describe as being confirmed by validation estimating. So that would be information then that you obtained from validation estimating, or is it information that you identified separately?

MR. BORIS FICHOT: At least we concurred with their opinion on those.

MS. HELGA VAN IDERSTINE: So one (1) of the things we talked about earlier was that validation estimating was somebody with whom Manitoba Hydro's been working.

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: So a -- fair

to say that Manitoba Hydro is aware of these concerns?

MR. MICHAEL ROBERTSON: They -- they gave us those, probably, yes.

MS. HELGA VAN IDERSTINE: I was -- I was going to say before -- before they saw it in your report, I mean.

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Thank you.

MR. MICHAEL ROBERTSON: Sorry, Boris would like to say something.

MR. BORIS FICHOT: I -- I'd add that you guys provided us with a complete risk register for Keeyask and a lot of these overlap with each other, and there's -- there is a process by which you identify risks, and...

MS. HELGA VAN IDERSTINE: And I -- as I think you commented earlier, you thought that they were doing a good job in creating that register, and -- and monitoring that. Is that right?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Thank you. Now, so back to validation estimating. So Manitoba Hydro would be aware of these issues, and would it be fair to say that they're working to address these issues?

MR. MICHAEL ROBERTSON: At the end of the day, we understand that they are addressing the issues through the provision of the contingency and management reserve.

MS. HELGA VAN IDERSTINE: So in terms of the resource challenges, if I understood you correctly, that concern related to the fact that you thought -- there was a concern, at least in September 2013, that Manitoba Hydro might not be able to staff the onsite construction team with all Manitoba Hydro employees?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And this -- so this is an issue of the number of people that they might be able to -- to hire, and -- or have in place, as opposed to the quality of their knowledge?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And I know you had a lot of meetings with Manitoba Hydro, and they provided you with a lot of information, but do you recall them advising you in one (1) of your discussions that they were aware of the risk, that it was included in the risk register, and they've addressed it in their current capital cost update by including a budget for external consultants?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And that would effectively mitigate that risk?

MR. MICHAEL ROBERTSON: Correct, and I think we said that this morning.

MS. HELGA VAN IDERSTINE: And in terms of the sys --

MR. MICHAEL ROBERTSON: Sorry.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: Yes, I -- I mean, it's -- it's -- it was highlighted by you in September that this was a risk that needed mitigation, and you have mitigated it. It's cost you more, but the risk itself has been reduced.

MS. HELGA VAN IDERSTINE: And it's been -- and -- and it's now included their budget?

MR. MICHAEL ROBERTSON: Correct. We understand so.

MS. HELGA VAN IDERSTINE: One (1) of the other areas that you identified is the systemic risks associated with their maturing system, and you've talked a bit about it. It's a system to monitor controls.

Is that right?

MR. MICHAEL ROBERTSON: It's -- it's essentially to monitor the -- the whole performance of the project going forward.

MS. HELGA VAN IDERSTINE: So I -- I've got it described here as, "To monitor and control actual costs and forecasts." That would be...?

MR. MICHAEL ROBERTSON: And schedule and everything else.

MS. HELGA VAN IDERSTINE: It's a way of monetizing the maturity of the project, and at the -- at the time, the contingency was calculated by asking some key questions of the staff on an ongoing basis?

MR. MICHAEL ROBERTSON: Are -- are you talking now about the internal Manitoba Hydro process, or what --

MS. HELGA VAN IDERSTINE: Yes.

MR. MICHAEL ROBERTSON: -- validation estimating did?

MS. HELGA VAN IDERSTINE: Validation estimating did that to establish that.

MR. MICHAEL ROBERTSON: As we understand, that they'd talked to the staff in order to provide some measure of uncertainty related to the systemic risks of Manitoba Hydro's process.

MS. HELGA VAN IDERSTINE: And did you do anything independent of validation estimating?

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: So again, something that Manitoba Hydro is aware of. Now, this process -- this -- that you've talked about, and described as a new system, was that your impression, that it was a new system, or is it one that they've had in place, and they're making enhancements and improvements to?

MR. MICHAEL ROBERTSON: No, we were very explicitly told that it was a new system, and that the -- it is different from the process that was used from Wuskwatim, and details were given of various parts of the change.

And -- and the statement's quite often made that it was very difficult to compare old estimates for Keeyask with new ones, because essentially, the boxes have all been resorted, and they're being managed differently.

And so -- and -- and some of the questions we asked, we -- the reply was that there were some things that were still being developed, and that they couldn't get -- share them with us. Okay?

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: Sorry, I'm trying to think how I can address this without giving evidence, so -- and I -- I think I better just leave it, because I think that maybe there is a -- a miscommunication somewhere along the way. In any event, a -- along with the other systems, it's more -- something that Mari -- Manitoba Hydro is working with. They're continuing to monitor, and they're trying to improve on it.

MR. MICHAEL ROBERTSON: Yes, that is apparent.

MS. HELGA VAN IDERSTINE: Now, one (1) of the other issues that you identify in here is the concern about a potential deferral due to the stage 1 cofferdam delay as being a potential risk?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And if I understood you earlier, the driver for that deferral would be due of -- some kind of reason for a deferral in construction from starting on July -- in July?

MR. MICHAEL ROBERTSON: There is a risk that something will come along that will prevent Manitoba Hydro from starting construction in July.

MS. HELGA VAN IDERSTINE: For example, inability to get regulatory approval?

MR. MICHAEL ROBERTSON: Correct.

MS. HELGA VAN IDERSTINE: And if that was the case, did -- were you aware that Manitoba Hydro has identified that that would cost somewhere around $250 million to the project?

MR. MICHAEL ROBERTSON: I am aware of that. I don't see it included in any of the contingencies or management reserves.

MS. HELGA VAN IDERSTINE: Okay. And would you agree that that -- the inclusion of that in a management reserve at this stage would be a question of judgment as opposed -- dependent on whether or not the project is, in -- in fact -- goes forward? So including it in a -- in a management reserve may not be the appro -- or a -- a contingency may not be the appropriate place for it, but you should be aware of it?

MR. MICHAEL ROBERTSON: I wouldn't put it in a different box from the other risks.

MS. HELGA VAN IDERSTINE: Would you agree that the change in scope, if it was a --

MR. MICHAEL ROBERTSON: No. It -- it's a risk. It's a schedule risk.

MS. HELGA VAN IDERSTINE: Now, the reason I was identifying -- talking about it a little bit was -- and I -- am I -- talking earlier about the NFAT is because if you look over to that Tab 8 again, one (1) of the things that has -- that may not be apparent to you, looking over at page 24, when establishing the low, reference, and high, that that risk is something that's included in that NFAT analysis? And I'm -- I'm not sure that you were aware of that, just given what our discussion was earlier.

MR. MICHAEL ROBERTSON: I think my reaction would be -- I have said that's irrelevant.

MS. HELGA VAN IDERSTINE: Okay.

MR. MICHAEL ROBERTSON: Because in terms of what we were asked to do, and -- and this will come out tomorrow in CSI.

MS. HELGA VAN IDERSTINE: Okay.

MR. MICHAEL ROBERTSON: We -- we'd been asked by the PUB to provide the expected in-service cost of this project. We -- we feel that we should also indicate -- give some indication or some -- wave a few flags about where it may end up.

MS. HELGA VAN IDERSTINE: Yeah, I -- I think, actually, we're talking about the same thing, that the -- the analysis done, and the -- the scope of the project for Manitoba Hydro in establishing what we've been calling the control budget was to -- to plan for an in-service date of two (2) -- 2019, and so that's where their direction is. If you assume that, then you wouldn't include, I take it, the -- that risk of delay of -- of starting, because of regulatory processes, because that would assume an in-service date of 2020.

MR. MICHAEL ROBERTSON: Which will lead to extra costs.

MS. HELGA VAN IDERSTINE: Yes. And I think we're both saying the same thing. It's just a question of where you put it.

MR. MICHAEL ROBERTSON: Well, to some extent in what we've seen, apart from this table, it's a question of if you've put it.

MS. HELGA VAN IDERSTINE: Sorry, the table we're looking to is the NFAT table --

MR. MICHAEL ROBERTSON: Page 24.

MS. HELGA VAN IDERSTINE: Yeah. And -- and --

MR. MICHAEL ROBERTSON: I mean, for -- for where we're coming from, we see the 6.5 billion. We don't see anything else. And the 6.5 billion does not include what we perceive to be a significant risk.

MS. HELGA VAN IDERSTINE: So looking at -- another area, again, that's part of the NFAT analysis -- I may be getting it confused between the NFAT analysis and the way you've approached the -- the contingencies, is your discussion of escalation. And as you commented, Manitoba Hydro used a 2.5 percent inflation factor in their estimate.

Do you recall that?

MR. MICHAEL ROBERTSON: We understand that they used one point nine (1.9), being CPI in their point estimate.

MS. HELGA VAN IDERSTINE: Yes.

MR. MICHAEL ROBERTSON: And that in their escalation reserve they have bumped that up to two point five (2.5).

MS. HELGA VAN IDERSTINE: Sorry, I -- now, I'm -- thank you for correcting me, because as I said at the outset that the definitions is where the -- the details sometimes is problematic.

MR. MICHAEL ROBERTSON: M-hm.

MS. HELGA VAN IDERSTINE: So they used a two point five (2.5) inflation factor in their escalation reserve and their estimate.

And you suggested they should have used a 3.1 percent?

MR. MICHAEL ROBERTSON: We're suggesting, based on evidence of escalation of hydro pro -- projects, and we gave the example of Muskrat Falls, that two point five (2.5) is probably not adequate and that it would be more like three point one (3.1) or three point four (3.4).

And in fact, the number of three point one (3.1) resulted as a back calculation of the two (2) data points which we were given by Manitoba Hydro, which was the one point nine (1.9) CPI and the two point five (2.5). And two point five (2.5) was stated as the average of -- average escalation for hydro power projects and the CPI.

So you can work backwards and say, Well, oh, that means that they think the hydro power projects are three point one (3.1).

MS. HELGA VAN IDERSTINE: Did you know that they used a -- a variety of different interest calculations in the NFAT analysis? Escalation, sorry. Excuse me.

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: Do you know what BC Hydro uses as an escalation factor?

MR. MICHAEL ROBERTSON: No.

MS. HELGA VAN IDERSTINE: Now, you have

commented on some of the things that Manitoba Hydro -- or you have commented -- or you're aware that Manitoba Hydro has used a number of things to mitigate some of the risks of the project.

And would you agree that some of those include per -- the use of performance bonds, liquidated damages, letters of credit with respect to the contract with the GCC?

MR. MICHAEL ROBERTSON: Yes, we've been given details of -- of some of those details. It is though a very standard procedure, and I wouldn't say that those are measures which deal specifically with the specific risks for Keeyask.

MS. HELGA VAN IDERSTINE: And you've concluded that the approach to the con -- construction risk management is industry standard and cons -- consistent with best practices?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Now, one (1) of the things you've referred to is Manitoba Hydro's experience with Wuskwatim?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Now, in earlier testimony we'd heard that there was a 10 to 13 percent increase from the point of awarding the GCC contract in Wuskwatim to project completion.

Was that infor -- information ever provided to you?

MR. MICHAEL ROBERTSON: I don't recall that particular data. But all of the information that we are quoting on Wuskwatim and lessons learned from it have come directly from Manitoba Hydro.

MS. HELGA VAN IDERSTINE: Would you call the time frame in which Wuskwatim was built an escalation super cycle?

MR. MICHAEL ROBERTSON: I don't think I'd want to go there.

MS. HELGA VAN IDERSTINE: Okay. Again, going back to Tab 8. And looking at that first page, you'll see the cont -- Keeyask control budget is $6.5 billion?

MR. MICHAEL ROBERTSON: I see that.

MS. HELGA VAN IDERSTINE: Towards the bottom of the page.

And if you look at the numbers under the point estimate, you'll see contingency management reserve, labour reserve, and escalation reserve?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And those total approximately $600 million?

MR. MICHAEL ROBERTSON: Seven hundred (700), yeah.

MS. HELGA VAN IDERSTINE: So looking -- if you took 6.5 billion and took the $700 million off, that you'd come down to about 5.7 billion?

MR. MICHAEL ROBERTSON: Five point eight (5.8), yes. Your math is correct.

MS. HELGA VAN IDERSTINE: Which would suggest that that cost would -- would go up about 10 percent. That's about a 10 percent -- that 600 million is about 10 percent of the entire cost of the project?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: Which would similar, again, to the increase in price between Wuskwatim after the -- the GCC was awarded and the project was completed?

MR. MICHAEL ROBERTSON: If you -- if you say so. I don't have that data.

MS. HELGA VAN IDERSTINE: I just want to turn to one (1) other topic. In your report with respect to wind, you commented on the wind costs and suggested that those construction costs are likely to decrease.

Do you recall that?

MR. MICHAEL ROBERTSON: Yes.

MS. HELGA VAN IDERSTINE: And one of the citations you referred to support that was the EIA reports from the -- which are, as I understand it, and they're at Tab 8 -- or, sorry, Tab 7, the US Energy Information Administration?

MR. MICHAEL ROBERTSON: Boris will talk to this.

MR. BORIS FICHOT: Yeah. Did we use it as a reference? Yes.

MS. HELGA VAN IDERSTINE: Yes. And if you look at Tab 7, we've given you the cover page from the April 2013 report, and on the opposite side of the page the overnight cost comparison with 2010 estimates from that report.

Do you see that?

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: I think we've highlighted it so you can find it.

MR. BORIS FICHOT: Okay, I see it.

MS. HELGA VAN IDERSTINE: And that -- would that be the onshore wind cost that you were using and suggesting there had been a 10 percent -- or 13 percent decrease in cost between 2013 -- or 2010 --

yeah, 2010 to '13?

MR. BORIS FICHOT: To justify the decrease?

MS. HELGA VAN IDERSTINE: Yes.

MR. BORIS FICHOT: No, it's a different source.

MS. HELGA VAN IDERSTINE: Maybe check the next -- try the -- try the next one. It might be the one you were using, updated capital cost estimates for electricity generation plants, again, November 2010.

MR. BORIS FICHOT: Just give me maybe one (1) second here to look through our report to see where --

MS. HELGA VAN IDERSTINE: Okay.

MR. BORIS FICHOT: -- it was coming from.

(BRIEF PAUSE)

MR. BORIS FICHOT: Sorry, we've just quoted -- we've looked at a number of sources, and I'm just trying to get the -- the original one. The -- the basis for our reduction was a DOE document.

MS. HELGA VAN IDERSTINE: And that's

the Department of Energy again from the United -- US government?

MR. BORIS FICHOT: That's correct.

MS. HELGA VAN IDERSTINE: You do refer, however, in your report to the Energy Information Administration?

MR. BORIS FICHOT: That's likely.

MS. HELGA VAN IDERSTINE: So you were looking at these reports in some form of capacity?

MR. BORIS FICHOT: That's correct.

MS. HELGA VAN IDERSTINE: So looking at this one, using the onshore wind cost there, it does demonstrate -- and I don't want to be proving your point too hard -- but that there was -- appears to have been a 13 percent decrease between 2010 to 2013.

Is that what it shows?

MR. BORIS FICHOT: Yes.

MS. HELGA VAN IDERSTINE: And if you look over to the estimates for electricity, again for November 2010, and that's again from the US Energy Information Administration, they also provide a comparison of costs this time between -- for wind and a bunch of other resources that demonstrate a change -- the changes in costs.

And do you see that there was a change

in costs between 2010 to 2011 with a 21 percent increase there?

MR. BORIS FICHOT: Okay.

MS. HELGA VAN IDERSTINE: So at least between 2010 to 2011 there appears to have been an increase in cost, not a decrease in cost?

MR. BORIS FICHOT: From what these guys compiled, yes.

MS. HELGA VAN IDERSTINE: So another -- some -- somebody else is obtaining liter -- obtaining information from the industry in the US, which is where I understand you got your information from.

Is that right?

MR. BORIS FICHOT: Yes, we -- we looked at a number of sources. If I -- I'll just go straight to the point in terms -- I think I feel like I know where this is going, and to me the analysis for why we came up with the capital cost estimate for wind was relatively simple.

We based most of the assessment at the end of the day on the Garrad Hassan report, which was done professionally Manitoba Hydro -- Manitoba specific, and came up with a capital cost. The documentation that we had that's in the slide deck shows that for specifically the equipment -- and we're not talking about context because what's difficult with the overall study is that you've got different regional effects that enter into consideration.

So you go back to the Garrad Hassan one, which is Manitoba Hydro -- Manitoba specific. And then you look at what they think the cost is going to be and you ratio what the specific wind turbine generator is going to cost. And the trend overall has been that the equipment piece, not the rest of it, but the equipment piece which constitutes the majority of the cost, has decreased. And that's the basis for our -- our explanation of the decrease.

MS. HELGA VAN IDERSTINE: Thank you for clarifying that for me, because I did want to raise that issue.

What you were talking about in your slide presentation and the -- the slide you gave with the graph on it, which was slide number --

MR. BORIS FICHOT: Seventeen (17).

MS. HELGA VAN IDERSTINE: Thank you very much.

That is a graph demonstrating the costs of wind equipment, turbines and towers?

MR. BORIS FICHOT: That's correct.

MS. HELGA VAN IDERSTINE: It doesn't

include the costs of the foundations, the road access, the transmission hook up, any of that?

MR. BORIS FICHOT: It doesn't include any of that.

MS. HELGA VAN IDERSTINE: So it's not a direct comparison then to the numbers that Manitoba Hydro was using of twenty-two hundred (2,200).

MR. BORIS FICHOT: It -- it comp --

MS. HELGA VAN IDERSTINE: Or twenty-four hundred (2,400) --

MR. BORIS FICHOT: -- we're -- we're just talking about the equipment portion. The -- the overall twenty-two hundred (2,200) includes all those elements that you mentioned.

MS. HELGA VAN IDERSTINE: Right. So -- so, yes, you're showing a decrease there, but you haven't accounted for labour or any of those other items in this, correct?

MR. MICHAEL ROBERTSON: Well -- well, perhaps if -- if I can intervene here. I mean, if you look at that chart we're saying in January '09 maybe the equipment cost was fifteen hundred dollars ($1,500) a kilowatt, and since then there has been a steady decline in costs. And so in January '13, it's eleven hundred dollars ($1,100) a kilowatt for the turbine.

MS. HELGA VAN IDERSTINE: Yes.

MR. MICHAEL ROBERTSON: And that's maybe 75 percent of the cost.

MS. HELGA VAN IDERSTINE: And do you know that the -- often the turbines come in somewhere around -- in Texas and have to be shipped north, which would include an additional cost then?

MR. MICHAEL ROBERTSON: But the Garrad Hassan report was talking about Manitoba.

MR. BORIS FICHOT: Yeah.

MS. HELGA VAN IDERSTINE: So looking --

MR. BORIS FICHOT: We -- we just -- we -- it was very simple. We didn't include anything else. We just went the equipment piece cost less, and we ratioed it to what the -- what the work -- what the breakdown structure showed us in the Manitoba context.

MS. HELGA VAN IDERSTINE: So I just want to close this off by taking you to that last page of the -- of the report that we put in at Tab 7 at page 19, just because it does seem to demonstrate that although there was an increase -- that the increase -- total overnight costs on the -- that's the fifth column -- would demonstrate that in 2008 you have a cost of two thousand and eighty-nine (2,089).

It then had a significant increase into

2009, to two -- two thousand five hundred and thirty-eight (2,538). And then you see some -- a decrease in 2000 -- to two thousand five hundred and thirty-three (2,533) in 2010. A de -- a decrease in 2011 to twenty-two fourteen (2,214). And, yes, a decrease in 2012 to two thousand two hundred and thirteen (2,213).

But they're all still costs that are higher than the 2010 year. So there are some -- and there -- anomalies, obviously, in these numbers.

MR. BORIS FICHOT: I'd have to look into what the context of what those numbers correspond to.

MS. HELGA VAN IDERSTINE: Thank you very much. Those are my questions.

(BRIEF PAUSE)

THE CHAIRPERSON: I think we're ready for your questions now, Mr. Hombach.

MR. SVEN HOMBACH: Okay. Thank you, Mr. Chairman. Demonstrating what I've learned today, my point estimate is about twenty (20) minutes, but I may need ten (10) minutes as a contingency.

CROSS-EXAMINATION BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Good afternoon. My name is Sven Hombach. I act as counsel to the Public Utilities Board. And I appreciate that a lot of the comments we've heard today were somewhat general, because a lot of the specifics with respect to the contract are CSI. We'll have an opportunity to explore those tomorrow.

So my questions are going to be at a fairly high level to -- to get a better understanding of what the systemic risks are, and on a higher level how to mitigate it so that the CSI session can be put into context.

Before we get started, I did circulate on the weekend a Volume VI of Board counsel's book of documents. I would like to have that entered as PUB Exhibit 58-6, and I'll be referring to the document. At that point I'd ask Ms. Villegas to just put it up on screen.

--- EXHIBIT NO. PUB-58-6: Volume VI of Board counsel's book of documents

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Hearing all this talk about a P50 contingency, can you provide me with a general understanding of how many P50 projects in the past twenty (20) years you've actually seen come in on or under budget?

MR. MICHAEL ROBERTSON: Short answer, no.

MR. SVEN HOMBACH: But you've seen some?

MR. MICHAEL ROBERTSON: I would have to -- I mean, that's a very specific question. I would have to check that indeed the budget was set at P50 and compare it to what it ended up at.

MR. SVEN HOMBACH: Okay.

MR. MICHAEL ROBERTSON: I mean, in many ways the budget is not set at P50.

MR. SVEN HOMBACH: Well, appreciating the comment that we heard from you on Ms. Van Iderstine's question, it takes years to gain the experience in -- in cost estimating. I, unfortunately, didn't have the opportunity to get years of experience. I've got some general high-level literature in this book of documents. And Tab 1 of the book of documents is a paper by a gentleman named Bent Flyvbjerg from the Said Business School at Oxford entitled, "Delusion and Deception in Large Infrastructure Projects, Two (2) Models for Explaining and Preventing Executive

Disaster."

And I assume you haven't had an opportunity to -- to read it, but I want to take you to a specific section to determine if -- if you agree with the way he describes risk. So maybe we can go to page 26 of the document. And let's scroll down to the bottom half of the page.

There's a discussion in the -- in the middle of the page that states that:

"In fact, during the tender bidders can act opportunistically by assessing the probability that compensation is possible after the construction state has been initiated. If compensation is possible, bidders will bid the lowest possible value in order to win the tender. The winning bidder will be typically the bidder who most underestimates the true cost of the project. We call this the 'winner's blessing'. After the project has been initiated, the initial low price will be compensated through overpricing the expected scope

increases, which the experienced
bidders know are almost certain.
When compensation is not possible,
there is less chance that the bidding
price is artificially low."

So do you generally agree with this analysis?

MR. MICHAEL ROBERTSON: It's -- it's an oft voiced fear. And it's -- it's obviously based sensibly. There -- there are jurisdictions which, for this very reason, do not award the contract to the lowest bidder. I mean, I understand that in Germany, for instance, they will award the contract to -- public service contracts to the bidder closest to the average, rather than the lowest. So the bidder next lowest -- lower than the -- than the average of all the bids.

If you have a contractor that goes into a tender looking for loopholes and planing to exploit them later, yes, there are contractors who do that and there is a risk that that will happen. And the defence is that you have a well-defined project. You have a very good contract document. You have suitable measures to address change.

MR. SVEN HOMBACH: So in your view then, is the primary way of addressing this issue, a, for lack of a better word, bulletproof contract?

MR. MICHAEL ROBERTSON: As -- as good a contract as you can. And in -- in this case the -- the whole process of the early contractor involvement should contribute to reducing the risk of this happening.

MR. SVEN HOMBACH: And generally speaking, that would mean what? Placing quantity risk or pricing -- placing escalation risk to a large extent with the contractor?

MR. MICHAEL ROBERTSON: Well, not escalation risk. That's something outside of the control of all the parties, and there is a management reserve for that. But -- sorry, what was your other example?

MR. SVEN HOMBACH: Quantity risk.

MR. MICHAEL ROBERTSON: Quantity risk. Quantity risk is -- is there. And -- and to the extent that Manitoba Hydro is working with a contractor in a target price, but unit price contract, yes, there is some risk to -- to Manitoba Hydro. And -- and the defence there is that they have advanced the design to a level where the quantification of those quantities should be good. And they have done a significant amount of investigation of the foundations to -- to mitigate that risk.

MR. SVEN HOMBACH: Okay. If we could go to Knight Piesold Exhibit 2. That's Knight Piesold Second Round Information Requests to Manitoba Hydro, page 6.

(BRIEF PAUSE)

MR. SVEN HOMBACH: That is a chart that you're no doubt familiar with?

MR. MICHAEL ROBERTSON: In principle.

MR. SVEN HOMBACH: And what that shows is generally you have your point estimate, you apply your escalation to go to P50.

And generally, the probability of under- or overruns are following some type of a bell curve?

MR. MICHAEL ROBERTSON: Yes. Just a -- a slight correction there. The -- you add the contingency to the point estimate to get to P50.

MR. SVEN HOMBACH: Right.

MR. MICHAEL ROBERTSON: I -- I don't think it's quite what you said.

MR. SVEN HOMBACH: I -- I thought it's what I said, but I appreciate the correction. Thank you.

If we could go to Tab 2 of Volume VI of Board counsel's book of documents, page 47, that is another paper published by somebody at Said Business School at Oxford, a gentleman names Atif Ansar, entitled, "Should We Build More Large Dams? The Actual Costs of Hydro Power Megaproject Development." And you may have heard about it. This paper was in the news a little while ago.

And I just want to take you to page 51 of the book of documents. That suggests that, for large dams, you're not dealing with a classical bell curve. You've got a -- a long tail where your P90 probability of overruns can be fairly high.

Is that something that you've seen in your experience as well?

MR. MICHAEL ROBERTSON: Personally, no, although there is very well-documented evidence of this happening with a large -- number of large megaprojects throughout the world.

MR. SVEN HOMBACH: But the conclusion of this paper is that, on average, for large dams, the final tally is 96 percent over budget. But it doesn't state whether that's a Class 1, 2, 3, 4, or 5 estimate.

MR. MICHAEL ROBERTSON: Well -- well, I -- I don't think it matters what the designated class of the estimate was, but it is certainly not my experience that, on average, the projects that certainly we've been involved with go 96 percent over budget.

MR. SVEN HOMBACH: So let me then take you to the third document in the book of documents. It's Tab 3, page 63. There's been reference to Mr. Hollmann before, and just so that I can be clear, was Mr. Hollmann a -- a person retained by you, or is it your understanding that he was a Manitoba Hydro consultant?

MR. BORIS FICHOT: We -- we just reviewed one (1) report that was supplied to us that was authored by -- by him.

MR. SVEN HOMBACH: You just reviewed a paper, but you didn't consult with him and --

MR. BORIS FICHOT: No.

MR. SVEN HOMBACH: Have you reviewed the paper that we're looking at, which is entitled "Variability in Accuracy Ranges: A Case Study in the Canadian Hydro Power Industry"?

MR. BORIS FICHOT: I haven't. It looks like it's dated 20 -- 2014.

MR. SVEN HOMBACH: It is quite a recent paper from the AACE International Technical Conference.

And AACE is Association for the Advancement of Cost Engineering.

Do I have that right?

MR. BORIS FICHOT: Correct.

MR. SVEN HOMBACH: Okay. Let's go to page 65 of the book of documents, two (2) pages in, and scroll to the bottom. That is a chart from AACE RP 69R12.

And 'RP' stands for recommended practice under AACE, correct?

MR. BORIS FICHOT: Yes, that's correct.

MR. SVEN HOMBACH: And this shows the percentage of project definition for the different classes, starting in Class 1 on the right and then moving to Class 5 on the left?

MR. BORIS FICHOT: That -- that is the -- the documented standard, yeah, by -- by AACE -- by AACE.

MR. SVEN HOMBACH: And if I heard you correctly this morning, you testified that you now think that with systemic risk, the Keeyask Infrastructure Project, the Keeyask Generating Station Project, and the Conawapa Project are all Class 3?

MR. BORIS FICHOT: That -- that's correct.

MR. SVEN HOMBACH: So that would be somewhere on the left side, where you'd have a project definition between 20 to 80 percent?

MR. BORIS FICHOT: According to this graph, yes.

MR. SVEN HOMBACH: Where, generally speaking, taking into the account -- taking into account the systemic risk, would you see the Keeyask Generating Station Project?

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: What we said this morning was that in the first report, you will notice that we deemed Manitoba Hydro's classification of Class 3 for certainly the Keeyask -- two (2) Keeyask projects to be unnecessarily pessimistic, and that given the level of project definition, if you use that as the variable, with the amount of information that -- that was to hand and the number of contracts that had actually been led, they would be better classified in the system as Class 2 and Class 1.

In the discussion this morning, we advised that, because of the reapprecion -- reappreciation of system risk by -- by the independent risk assessment people, we -- we believed that it would be appropriate to -- to put the projects back into Class 3. And -- and essentially, the -- the reasoning is just that there are significant systemic risks remaining that -- as -- as we believe.

MR. SVEN HOMBACH: Let's go to page 68 of the book of document, and scroll down onto the page. Now, the -- the -- again, this is a paper that looks at the Canadian hydro power industry, and it ultimately concludes, and you can see that in the table on the screen in front of you, that for a Class 3 estimate, the suggested contingency on a P50 probability is 24 percent, on a P90 probability, it's 63 percent, and on a P10, or 10 percent probability, it would actually be a -- a negative 1 percent.

You -- you follow the reasoning on this chart?

MR. MICHAEL ROBERTSON: I -- I follow the data.

MR. SVEN HOMBACH: Do you have any reason to disagree with those general percentages?

MR. MICHAEL ROBERTSON: No. I don't. I equally don't confirm or otherwise comment on them. It's -- it's their interpretation of the data that they've chosen to use.

MR. SVEN HOMBACH: Well, the reason I'm asking you, sir, is that My Friend, Ms. Van Iderstine, took you through some of the probabilities, as did Mr. Hacault. And I just wanted to have an opportunity to put those into context. Could I ask you, Ms. Villegas, to put Manitoba Hydro Exhibit 161 on the screen, please? And I believe we have to go three (3) pages in.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Sorry, two (2) pages and the previous page. Do you recall Ms. Van Iderstine taking you through this chart?

MR. MICHAEL ROBERTSON: I do, yes.

MR. SVEN HOMBACH: And on the right, we see the current update for Keeyask. This is on the second page of Manitoba Hydro Exhibit 161, and there's a $310 million contingency for the P50. You see that?

MR. MICHAEL ROBERTSON: I do.

MR. SVEN HOMBACH: And the point estimate is 3.36 million -- sorry, billion?

MR. MICHAEL ROBERTSON: Yes.

MR. SVEN HOMBACH: If my basic lawyer math is correct, that's only about 9.2 percent, so significantly less than the suggestion in the Hollmann paper of 24 percent. Are you comfortable with a 9.2 percent contingency?

MR. MICHAEL ROBERTSON: I -- I think the question, really, is not how the nine point two (9.2), which is a derived number, fits into the AACE classification system. I think it's more -- well, there's a philosophy around whether you're using P50 or some other number.

And then given that, this is really being superceded by the -- the detailed risk analysis that has been done by the consultants, out of which has come the number there for contingency to get to P50.

So I -- I think what I'm saying is that the -- the reference that produced this is now background noise to Keeyask.

MR. SVEN HOMBACH: Well, the -- the understanding that I'm trying to get is how you reconcile the fairly clear project definition for Keeyask on the one (1) hand with a systemic risk that you discussed this morning. And if you're then saying it's a P3 estimate, but the contingency can actually be relatively low, can you explain that without actually delving into the details of the risk and engaging the panel in CSI?

MR. MICHAEL ROBERTSON: Sorry, you -- you mean a Class 3 estimate --

MR. SVEN HOMBACH: Yes.

MR. MICHAEL ROBERTSON: -- not -- not a P3 estimate?

MR. SVEN HOMBACH: Sorry, yes.

MR. MICHAEL ROBERTSON: Well, I -- I -- as I say, to -- to be honest, I -- I don't think it's relevant. You know, we've -- when -- when you're in the early stages of -- of cost estimating, and -- and project appreciation, those are good guidelines. They're useful. They help you put things in boxes and -- and assign a sensible contingency or a provision for uncertainty to the process at any particular time in that process.

I think once you've got as far as -- as Manitoba Hydro has with Keeyask, you -- you've got to look at -- at what you've -- you've specifically got there. You've got to look at your processes. You -- you've got to have a really good appreciation of the -- of the risks, both systemic and project-specific, and you respond accordingly in terms of making provision for what might happen.

MR. SVEN HOMBACH: Now, before we move away from this page, Ms. Van Iderstine engaged you in a discussion about the management reserve, and whether that's usually part of the contingency.

Again, by my math, if we simply add the labour reserve to the contingency on a P50 basis, we get to 14.8 percent. If we also include the escalation reserve, we get to 17.6 percent, so still less than the 24 percent suggested in the Hollmann paper, but closer.

The escalation reserve that you see here, is that a reserve in case Manitoba Hydro's 2.5 percent escalation is not sufficient, or is this supposed to be the escalation period?

MR. MICHAEL ROBERTSON: That -- my understanding is that that is an allowance for the difference between CPI at one point nine (1.9) and 2.5 percent.

MR. SVEN HOMBACH: Okay. So would you contin -- would you consider both of these items, labour reserve and the escalation reserve, to be part of the contingency, and just be a contingency by a different name?

MR. MICHAEL ROBERTSON: Not necessarily. It just goes to how you want to define that allowance.

MR. SVEN HOMBACH: Let's go over one (1) page and have a look at the Conawapa numbers. Now, you also said Conawapa is a -- a Class 3 estimate?

MR. BORIS FICHOT: Sorry, just a second.

(BRIEF PAUSE)

MR. MICHAEL ROBERTSON: I mean, just to support what I was saying earlier in -- in that I -- I don't think that this is an appropriate document with respect that we should be looking at any longer, because we've moved beyond it. We -- we do not know how these numbers were put together.

MR. SVEN HOMBACH: I appreciate that qualification, but I -- I still want to ask you on Conawapa as well, because on Keeyask, you indicated that Keeyask is well-defined and you -- you indicated Manitoba Hydro seems to have an appreciation of what the specific risks are?

MR. MICHAEL ROBERTSON: M-hm.

MR. SVEN HOMBACH: Does that hold true for Conawapa as well, or is Conawapa not as defined, in your view?

MR. MICHAEL ROBERTSON: I don't know, because we have not been given the same level of detail as we have for Keeyask, particularly in the second report and the second round of questions, which were aimed specifically at Keeyask, and which we therefore asked Manitoba Hydro to provide us details for.

We didn't ask them to provide similar details for Conawapa. I would expect the -- the level of definition to be somewhat lower for Conawapa. I would expect the process, the systemic risks to be pretty much the same. That's probably all I could say.

MR. SVEN HOMBACH: Well, again, let's go to the Conawapa P50 contingency on this page, which, based on the most recent cost update, is 460 million.

You see that?

MR. MICHAEL ROBERTSON: The contingency, yes.

MR. SVEN HOMBACH: Compared to a point estimate of 4.93 billion?

MR. MICHAEL ROBERTSON: Yes.

MR. SVEN HOMBACH: And again, by my math, that is 9.3 percent, so significantly less than the suggestion in the Hollmann paper of 24 percent?

MR. MICHAEL ROBERTSON: Yeah.

MR. SVEN HOMBACH: Would that cause you any cause for concern at all, or do you believe that that is a realistic estimate?

MR. MICHAEL ROBERTSON: Not at all,

because I'm not going to hang my hat on what's shown on this table.

THE CHAIRPERSON: We -- I need to clarify something in my mind, because I -- I think where -- where we're getting into -- we're -- we're getting confused is we heard from Power Engineers last week that typically, the labour reserve and escalation reserve were part of the contingency. Here we've seen them split out, and I guess where the confusion's arising in our minds is, when we talk about modifying the probability from P50 to P90, are we talking about the collective modification of contingency management, labour, and escalation to the P90 level, or are we talking separately, specifically, the contingency as defined here?

MR. MICHAEL ROBERTSON: Well, as -- as I -- as I tried to indicate, we would typically combine all of this into one (1) provision for uncertainty, which would be contingency, quote/quote, and all of these would be factors within that contingency allowance.

And I did also make the point that if you were to add what is provided for here in terms of reserves to what is stated to be the contingency, then you would be getting a contingency, in my normal practice, which is obviously significantly greater than P50, but I -- I'm not really in the position to put a number to that.

MR. SVEN HOMBACH: So just to briefly follow up on the Chairman's point, if we do actually add in the labour reserve and the escalation reserve, we get to a P50 contingency of about 1.13 billion for Conawapa, which would be about 22.9 percent? That's --

MR. MICHAEL ROBERTSON: You -- you would get a contingency, but not a P50 contingency.

MR. SVEN HOMBACH: Well, that's based on the reference contingency. Is it your understanding that in this chart, the reference contingency is a P50?

MR. MICHAEL ROBERTSON: For those items that were included in the analysis that -- that produced that, but it didn't include all the items. It didn't include the items that are in the reserve.

MR. SVEN HOMBACH: The items that are in the management reserve itself?

MR. MICHAEL ROBERTSON: Correct. So -- so if you add point three-six (.36) and point three-one (.31) to point four-six (.46), really, you do not have any longer an overall P50 contingency.

MR. SVEN HOMBACH: Because you're stating that the contingency of point four-six (.46), that's the P50?

MR. MICHAEL ROBERTSON: For those items that are included in that analysis.

MR. SVEN HOMBACH: Okay. When one develops a P50 contingency for a project, is it your understanding that the overall number that is given, including what Manitoba Hydro here calls the management reserve, would be lumped into the P50?

MR. MICHAEL ROBERTSON: That would be my normal practice, but that is not the way Manitoba Hydro has chosen to do it. I mean, to -- to some extent, it's -- this is semantics. It's -- it's really what allowance has been made for uncertainty, and is the amount appropriate.

MR. SVEN HOMBACH: Well, it's relevant, though, because if -- if, when you add the labour reserve and the escalation reserve, you don't have a P50 anymore, then you're basically -- you're left with a higher probability, correct?

MR. MICHAEL ROBERTSON: Right.

MR. SVEN HOMBACH: And if we do the math, adding those three (3), that's about 1.13 billion. It indicates in the right-most column that the high estimate is about one point five six (1.56), so pre -- we're presumably looking at something like a

P70, P75?

MR. MICHAEL ROBERTSON: I wouldn't put a number to it, but it's higher than P50.

MR. SVEN HOMBACH: Somewhere in that ballpark.

MR. MICHAEL ROBERTSON: It's higher than P50.

MR. SVEN HOMBACH: Yeah.

MR. BORIS FICHOT: I'm just going to add a -- a small point to this is that, when we're talking about the contingency, that is -- that is statistically derived. So we can talk about P50s and P80s.

But when we're talking about the labour reserve and escalation reserve, those are subjective-based quantities. They have no statistical basis to them. They -- they're -- they're a judgment call that we make on what are some of the things that can happen, and as a result we come up with a number.

So one is subjective, which is the management reserve, and one has a statistical basis. And those -- there's no link to it.

The way we have seen traditionally, and it seems like power engineers have seen traditionally, is you qualify all these elements statistically, and then you roll them up and come up with one (1) number based on the statistics.

But in this case, contingency has statistical basis, but management reserve doesn't. And there's a little bit of a -- I feel like there's a little bit of a mix there.

MR. SVEN HOMBACH: Did you actually examine the statistical analysis for either of the two (2) projects?

MR. BORIS FICHOT: No. That's far beyond what -- what we could do. We -- we observe -- we -- we read the validation estimating report that had results that showed statistical distributions. And we've seen Manitoba Hydro's justification behind the -- the labour reserve and why they came up with the labour reserve that they came up with.

MR. SVEN HOMBACH: And are you satisfied that the statistical distributions are accurate? Or perhaps I should say reasonably, appreciating that accuracy can only --

MR. BORIS FICHOT: To -- to the -- to the extent that they went to a specialized firm who does this, they produced a document, they ran models, they had input from Manitoba Hydro staff that went into this to come up with this distribution.

So there's a process. It's documented. We can't check the nitty-gritty of that, and they've given an output that has a distribution to it.

MR. SVEN HOMBACH: Okay. Thank you, Mr. Chairman. I don't have any further questions to this panel in the public session.

THE CHAIRPERSON: I wonder if there's any other business to attend to before we adjourn for the day.

Ms. Ramage...?

We're not getting anything from the Intervenors.

MR. SVEN HOMBACH: Mr. Chairman, in the -- in the meantime, if I briefly may, I would like to remind members of the public that the morning session tomorrow is reserved for CSI. So it's not going to be available to the public.

The public session with respect to Typlan, the independent expert speaking to socioeconomic issues, is scheduled to come in after the lunch break.

THE CHAIRPERSON: I think that completes today's business. Me. Monnin, have you -- no. That completes today's business, so we'll adjourn for the day, and we'll see each other again at nine

o'clock, those of you who are eligible to consider CSI.
Thank you. Have a good evening, everyone.

(PANEL RETIRES)

--- Upon adjourning at 4:31 p.m.

- B: Amplitude Consultants Report
- C: Scheduling Best Practices

SECTION 1 - Executive Summary

This Report is confidential and for the sole review of The Manitoba Public Utilities Board and Manitoba Hydro.

MGF Project Services Inc. was retained by The Manitoba Public Utilities Board as an Independent Expert Consultant to review Manitoba Hydro's capital expenditure program and to provide expert opinion on Manitoba Hydro's updated costs for the Keeyask Hydroelectric Dam, the Bipole III Transmission Line and Converter Stations, the Manitoba - Minnesota Transmission Line and The Great Northern Transmission Line.

The following is a summary of this Report:

Keeyask Hydro Electric Dam

The Joint Keeyask Development Agreement between the Keeyask Cree Nations is in our opinion inline with industry best practice.

The General Civil Contract (GCC) and its performance is the largest single contributor to planned cost and schedule not being met.

The contracting strategy was schedule driven and resulted in using a cost reimbursable pricing mechanism for the GCC. The Contractor gets paid for its actual costs rather than the performance of the construction work. The Contractor is currently behind schedule and over budget.

The largest single contributor to the budget increase from $6.5 billion to $8.7 billion is the [redacted] sum 1a, 8a
added to the original GCC on account of the Contractor's poor productivity and increased indirect costs as the GCC would take longer to perform.

Other major cost contributors comprise delay claims, management costs, project support services, interest & escalation and contingency.

The GCC Contractor is not meeting the revised productivity factors for concreting and earthworks in the Amending Agreement No. 7 dated 28th February 2017, adding further cost and schedule pressure to the likely forecasted final cost and completion date.

The current contingency is insufficient and will soon be fully committed to cover other increasing costs.

The performance issues related to the GCC and their consequent impacts on other contracts will result in the Final Project Cost being in the $9.5 billion to $10.5 billion range.

Manitoba Hydro staff are competent and professional but they are not a construction manager with the experience and skills to direct the GCC. As such, its project management and control effectiveness is low.

There is an opportunity for Manitoba Hydro to implement contract management improvements, take ownership for the GCC and drive the GCC contractor to higher levels of predictable performance, to accelerate project schedule and to lower the likely forecast cost at completion

HVDC Converter Stations

This project is well managed by Manitoba Hydro and the potential for cost over-runs is low.

Manitoba Hydro's contracting strategies are commercially astute, allocating risk appropriately between the parties and using predominantly lump sum or unit rate pricing mechanisms which place the risks of productivity, cost and schedule on its contractors.

The HVDC Converter Stations were competitively tendered to three of the most experienced technology vendors and two bids were very close in price, indicating a successful competitive tender. The same observation applies to the Synchronous Condensers scope.

The Bipole III Basis of Estimate (which includes the Converter Stations) document is well written and documented. It would be improved if benchmarking and industry metrics were included.

We would recommend that Manitoba Hydro's Estimating Team prepare the overall estimate with input from each department, thereby ensuring consistency and accuracy in the Estimates.

Bipole III Transmission Line

This project is generally well organized and managed efficiently.

Manitoba Hydro's contracting strategies are commercially astute, allocating risk appropriately between the parties and using predominantly lump sum or unit rate pricing mechanisms which place the risks of productivity, cost and schedule on its contractors.

The project is currently on schedule although some activities are slipping from their critical paths which may jeopardize the August 2018 completion.

A key risk to completion by August 2018 is the poor performance by Rokstad Power Corporation. Manitoba Hydro is managing this risk by de-scoping the under-performing contractor. Whether this maintains the August 2018 is uncertain at this time.

Manitoba – Minnesota Transmission Line

This project is currently on schedule. As it further develops, its schedule should be updated more frequently than the current two month frequency.

Manitoba Hydro's estimating methodology is consistent with industry standard. Industry benchmarking suggests the cost estimate is below market value.

MGF recommends that the cost estimate is updated pursuant to an Estimate Preparation Plan and in accordance with a Basis of Estimate. Where possible the values of awarded contracts should be incorporated rather than previous estimated costs.

Great Northern Transmission Line

This project is well organized and managed efficiently.

The project is progressing, with Rights of Way being cleared in advance of subsequent construction activity.

The Construction Management Agreement meets exceptional commercial business practice and protects Manitoba Hydro's interest.

Minnesota Power's cost estimating methodology is consistent with industry standard for the class of Estimate produced. The cost estimate is considered high when benchmarked to other similar projects so further reviews are recommended.

General

The Manitoba Hydro teams on all projects are very capable and dedicated.

The Keeyask Generating Station project presents the greatest threat to Manitoba Hydro on account of the GCC contract with a contractor that is under performing and being compensated on cost reimbursable pricing mechanism.

The recovery of this project will require Manitoba Hydro taking a construction management, hands-on approach to design and implement a recovery plan and hold the GCC contractor to perform.

SECTION 2 - Introduction

MGF Project Services Inc. (MGF) have been requested by the Manitoba Public Utilities Board to carry out a review of Manitoba Hydro's (MH) Capital Expenditure, associated with a public evidentiary process.

Manitoba Hydro is undertaking a substantial capital program expansion through the construction of a large new generating station and transmission lines. As many of these projects have seen a substantial increase in capital cost since project inception, The Manitoba Utilities Board has requested this review.

This Report is confidential and for the review of The Manitoba Public Utilities Board and Manitoba Hydro only.

The Projects include:

- The Keeyask Hydroelectric Dam: is a large, complex and remotely located project 725 kilometers northeast of Winnipeg on the Lower Nelson River. The Keeyask Generating Station will include the following structures:
  - 695 megawatt seven-unit Powerhouse/Service Bay complex on the north side of Gull Rapids
  - Seven bay Spillway on the south side of Gull Rapids
  - 23 Km of dykes built on the north and south sides of the reservoir
  - North, central and south dams across Gull Rapids
- The Bipole III HVDC Converter Stations: are specialized stations which form the terminal equipment for the 500kV HVDC Transmission Line, converting alternating current (AC) to direct current (DC), for transmission and back to AC for distribution. The Bipole III project consists of two (2) converter stations, namely the Keewatinohk Converter Station located in northern Manitoba, northeast of Gillam and the Riel Converter Station located in southern Manitoba, east of Winnipeg.
- The Bipole III Transmission Line: is a 1,385 kilometer 500kV DC transmission line originating at the Keewatinohk Converter Station travelling west of Lake Manitoba and terminating at the Riel Converter Station
- The Manitoba to Minnesota Transmission Line: is a 213 kilometer 500kV AC transmission line from the Dorsey Converter Station northwest of Winnipeg, terminating at the United States border near Piney MB
- The Great Northern Transmission Line: is a 361 kilometers single-circuit 500kV AC transmission line from the Minnesota-Manitoba border to the Iron Range Substation near Grand Rapids, Minnesota

The process adopted while compiling the report was to work closely with Manitoba Hydro and where time permitted, exchanging our Observations and Findings with them for their viewpoint. Manitoba Hydro was very co-operative and engaging throughout the process.

This Report details our Observations, Findings, Conclusions and Recommendations.

SECTION 3 - The Keeyask Hydroelectric Dam

SCOPE ITEM 1:

Review, assess, and determine the reasons for project cost overruns from the $6.5 billion final pre-construction budget with respect to:

i. Design or project scope changes;
ii. Deviations from estimated quantities;
iii. Labour productivity;
iv. Labour costs;
v. Labour hiring constraints with respect to: Competition with other large civil projects in Canada; Remote location; and Northern and First Nations jobs.

Inputs into the $6.5 billion budget should be reviewed and assessed as required.

Finding No. 1: Keeyask - Community Initiatives (Payment Obligations)

Observations & Findings

The table below compares community initiatives for 2014 and 2017.

Network / Project Number	Work Package	CEF2014 Phase 2 Estimate (2014$)	2017 CPJA Budget (2016$)	Variance ($)	Variance (%)
255740	Keeyask Adverse Effects	[redacted]			
255741	Keeyask Operational Employment				
244009	K-Operational Employment PMT Obligation				
243996	K-Ad Effects Payment Obligation (LCKD)				

1a, 8a 7a

Manitoba Hydro has committed the above funds to various community initiatives. Variations in estimates are due to the 2017 estimate including interest capitalized on cash payments – the CEF2014 estimate was the present value of future payments.

Conclusions & Recommendations

Community initiatives are an industry norm for major capital projects being developed and Manitoba Hydro's approach is very effective.

Source of Information & Reference Materials

- Keeyask Generating Station, Basis of Estimate Document, 2014 Capital Project Justification Addendum, dated August 2014
- Keeyask Generating Station, Basis of Estimate Document, 2017 Capital Project Justification Addendum, dated January 2017
- Keeyask Generating Station, 2017 Capital Project Justification Addendum, Comparison of 2014 Estimate to 2017 Estimate, dated August 2017

Finding No. 2: Keeyask - Licensing and Planning

Observations & Findings

Manitoba Hydro has indicated that the "Licensing Phase is substantially complete and remaining funds were removed." This results in a $5 million saving to the project.

Conclusions & Recommendations

Manitoba Hydro is reporting that the Licensing Phase is "substantially complete" and as such, we would expect little to no cost variation costs associated with this activity.

Source of Information & Reference Materials

- Map to Comparison of Keeyask 2014 to 2017.xlsx
- Keeyask Generating Station, 2017 Capital Project Justification Addendum, Comparison of 2014 Estimate to 2017 Estimate, dated August 2017

Finding No. 3: Keeyask - Labour Costs & Labour Hiring Constraints

Observations & Findings

Upon a review of the market place and demand for labour over the period that the Keeyask Project commenced development to date, indicates that there has been ample supply of labour for the development of the Keeyask Project. However, the choice of a 21 days on, 7 days off rotation cycle is not as attractive as the more common 14 days on, 7 days off rotation (as in Northern Alberta).

To compete for labour, Schedule 12-3 entitled "Proposed Letter of Agreement, Burntwood/Nelson Agreement" of the Joint Keeyask Development Agreement was developed to stipulate that special measures needed to be implemented during the construction of the project to facilitate the employment, training and retention of First Nations members and other Northern Aboriginals, which measures might conflict with existing Burntwood/Nelson Agreement provisions relating to referral, recruitment or placement procedures.

LOA 35 executed on 1st January 2016 instituted a 13% completion bonus to attract and retain labour for the project. It is difficult to ascertain whether this was a critical component to project cost over-runs as most major capital projects in Canada have some form of retention mechanism, so this could have been reasonably predictable and costed for.

The Joint Keeyask Development Agreement provides for the consultation with, participation of and business opportunities for members of the Keeyask Cree Nation (KCN). There is the potential for equity participation in the project and for Direct Negotiated Contracts with KCN joint ventures.

Manitoba Hydro advised MGF that they have had great success with local Aboriginal labour, however they have exhausted all availability.

Conclusions & Recommendations

The commitments in the Joint Keeyask Development Agreement to KCN and other Northern Aboriginal groups is, in our opinion, an industry best practice. LOA 35 provides an industry typical attraction and retention mechanism. The 21 days on, 7 days off rotation cycle is not as attractive as the more typical 14 days on, 7 days off used on many other capital projects.

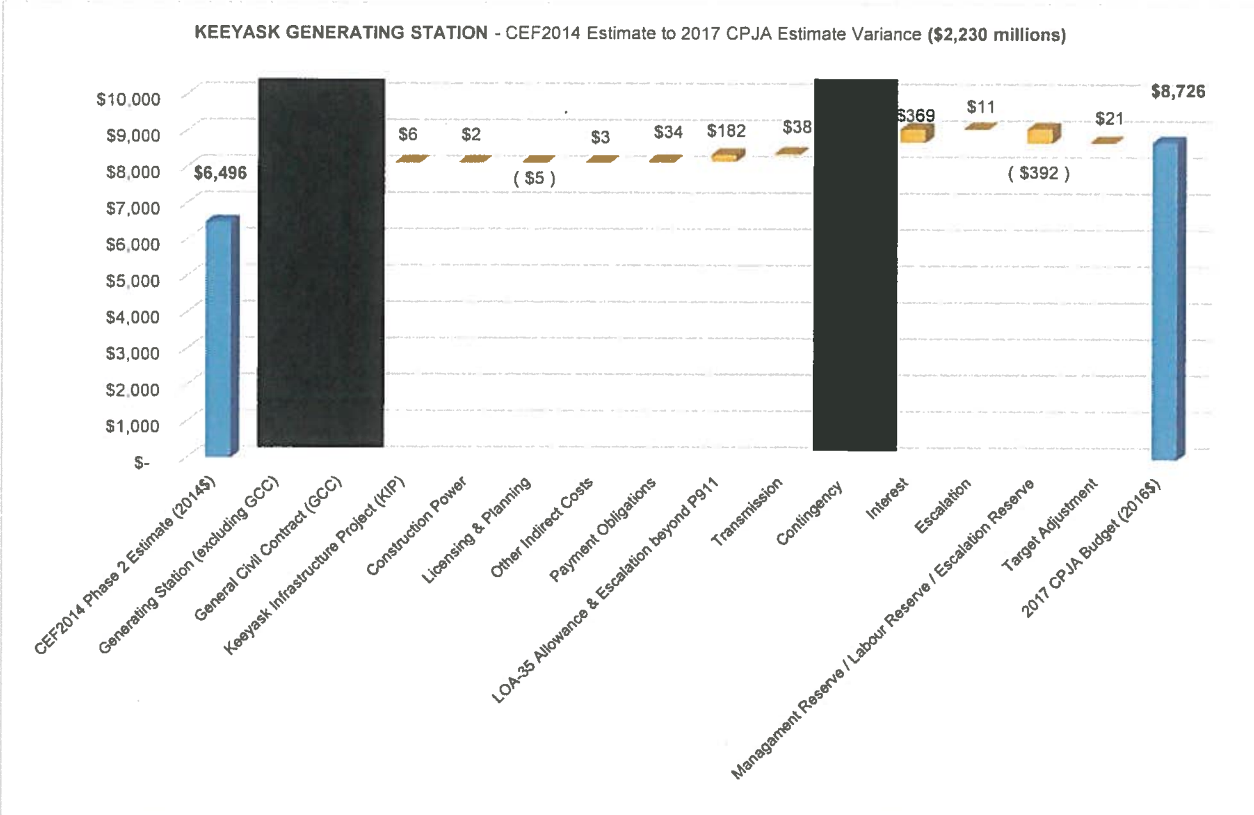
- JKDA Schedule 13-1 Identified Work Packages and Allocation

Finding No. 4: Keeyask - Project Cost Variance Review

Observations & Findings

Based on our review, the following provides a build-up of how the project costs have evolved from the CEF2014 ($6.496 billion) to the 2017 CPJA ($8.726 billion):



1a , 7a
4b

- 2013$: Expressed in fiscal year 2013/2014
- 2014$: Expressed in fiscal year 2014/2015
- 2016$: Expressed in fiscal year 2016/2017

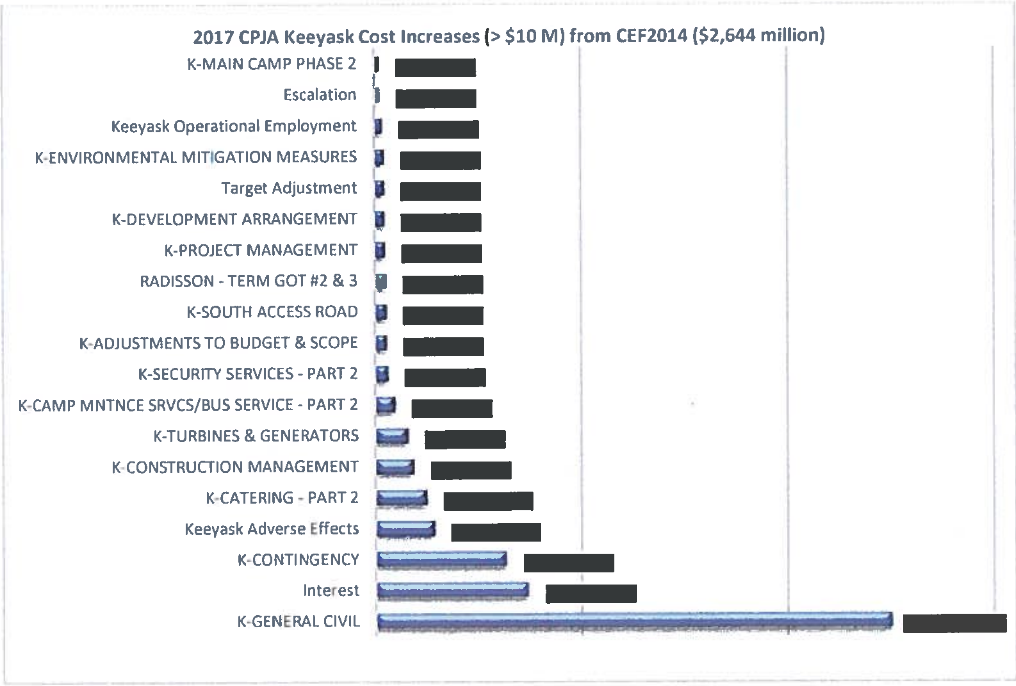
The following provides a summary of key project variances from the $6.5 billion final pre-construction budget to the $8.7 billion current budget.

Final Pre-Construction Budget	6,496,076,546
Additions	2,783,971,637
Omissions	-554,009,510
Total	**8,726,038,673**

Total Budget Additions: $2.784 billion

MGF PROJECT SERVICES

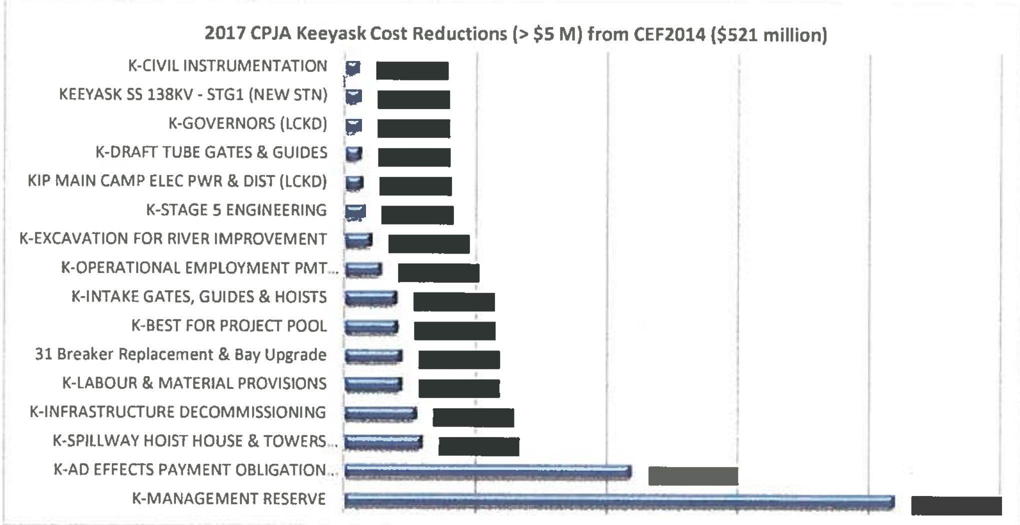
The following table sets out $2.644 billion of project cost increases out of the $2,784 million. The remaining $140 million is distributed across several other cost elements.



1a 7a

Total Budget Omissions: $554 million

The table below table sets out $521 million in project omissions. The remaining $33 million is distributed across several other cost elements.



1a 7a

Conclusions & Recommendations

The largest contributor to the overall project cost is the [redacted] increase in the value of the General Civil Contract (GCC) on account of Amending Agreement No. 7. Over [redacted] of the \$2.23 billion net addition 1a
is due to the GCC, caused by concrete and earthwork productivity that is less than planned and additional indirect costs.

- Keeyask Generating Station, Basis of Estimate Document, 2014 Capital Project Justification Addendum, dated August 2014
- Keeyask Generating Station, Basis of Estimate Document, 2017 Capital Project Justification Addendum, dated January 2017

12011

Finding No. 5: Keeyask - Project Cost Overruns – Interest

Observations & Findings

Network / Project Number	Work Package	CEF2014 Phase 2 Estimate (2014$)	2017 CPJA Budget (2016$)	Variance ($)	Variance (%)
	Interest	1,379,944,641	1,749,184,959	369,240,318	26.8%

Manitoba Hydro has noted that increases to the project's base costs have increased interest costs.

Currently, interest represents 20% of the budgeted "Total In-Service Cost" ($8.7 billion).

Conclusions & Recommendations

MGF concludes that the costs associated with the interest rate are a function of funding the overall capital project.

MGF's recommendation is that contingency carried should consider the risk exposures associated with interest in the same manner it does with escalation.

MGF views Manitoba Hydro's current contingency as insufficient and further interest adjustments will likely be required.

Finding No. 6: Keeyask - Project Cost Overruns – General Civil Contract (GCC)

Observations & Findings

Network / Project Number	Work Package	CEF2014 Phase 2 Estimate (2014$)	2017 CPJA Budget (2016$)	Variance ($)	Variance (%)
243994	K-General Civil	[redacted]	[redacted]	[redacted]	[redacted]

1a 7a

CEF2014 – Phase 2 Budget (2014$)

Total Estimated Value:[redacted]

2017 CPJA Budget (2016$)

- CEF2016 Plan - [redacted] 1a 7a
- Delay Estimate - [redacted]
- Trends - [redacted]
- Approved Contract Changes - [redacted]
- Forecasted Contract Changes - [redacted]

Total Estimated Value:[redacted]

In comparing the Bill of Quantities (BOQ) provided within Amending Agreement No. 7, dated 28th February 2017 and the Original Contract, dated 10th March 2014, MGF has identified variances in both quantities and unit prices which have resulted in the increase to the overall cost.

Increased cost relating to the General Civil Contract is directly due to the adjustments in unit rates, on account of poor productivity experienced on the project. Poor productivity results in additional man-hours being required to perform the work compared to the man-hour assumptions carried in the Original Contract.

Based on documents viewed, [redacted] of the increased costs relate directly to the revision of unit prices. [redacted] are due to the increase of the "to-go" costs which are noted as being more than the total 1a previous budget for Indirects, Temporary Utilities, Construction Facilities, Contingency and Crane Operator cost elements.

[redacted] of the increase was due to quantities, [redacted] resulting from Proposed Extra Work and another [redacted] in schedule incentive profit.

The total of these contributing factors account for 80% of the [redacted] increase related to this cost element. 1a

Conclusions & Recommendations

MGF concludes that the increased costs from the Original Contract to the Amending Agreement No.7, are a direct result of the revised productivity rates and increased man-hours required to complete the project.

Finding No. 7: Keeyask - Project Cost Overruns – Generating Station

Observations & Findings

The following observation relates to the cost elements within the MGF reviewed line item "Generating Station (excluding GCC)".

A point to highlight are those costs which are attributed to "Delay Estimates". This is a result of an additional 11 months added to the project schedule.

Direct Cost Work Packages - Turbines & Generators (Including Governors):

Network / Project Number	Work Package	CEF2014 Phase 2 Estimate (2014$) CAD$	2017 CPJA Budget (2016$) CAD$	Variance ($) CAD$	Variance (%)

Total Estimated Value: [redacted]

1a 7a

2017 CPJA Budget (2016$)

- CEF2016 Plan - [redacted]
- Trends - [redacted]

Total Estimated Value: [redacted]

The following are variances provided by Manitoba Hydro:

- Each year, escalation is added to the base cost estimates based on policy P911 escalation rates. At the same time, remaining escalation is calculated by financial planning, which results in a reduction in the allowance for remaining P911 escalation. In 2014 and 2015, the amount of escalation removed by financial planning exceeded the amount of escalation added to the base costs by $25 million. Because of concerns that the remaining P911 escalation allowance was not sufficient, these funds from the original escalation allowance were retained in the estimate.

1a 7a

The above table only shows variances.

CEF2014 – Phase 2 Budget (2014$)

Total Estimated Value: $376.2 million

2017 CPJA Budget (2016$)

- CEF2016 Plan - $357.4 million
- Delay Estimate - $17.7 million
- Trends - $6.9 million
- Approved Contract Changes - $4.3 million
- Forecasted Contract Changes - $10.3 million

Total Estimated Value: $396.6 million

This category "Other," within the Cost Estimate, in the sum of $396.6 million appears to be a "catch-all" for various scope and service elements. The largest cost increases are due to Transportation, Reservoir Cleaning, Stage 1 Cofferdam and Camp Communications requirements.

Conclusions & Recommendations

The cost increases are due to the performance of the General Civil Contract (GCC) contractor. The GCC contractor is behind schedule which causes delays and cost increases on other services and scopes of work related to the project, therefore raising the total project cost.

- Keeyask Generating Station, 2017 Capital Project Justification Addendum, Comparison of 2014 Estimate to 2017 Estimate, dated August 2017

SCOPE ITEM 2:

Determine whether the current state of design work, engineering work and geotechnical analysis supports the $8.7 billion cost estimate. If not, identify what changes in the contingencies, reserves or forecast at completion cost are required.

Finding No. 1: Keeyask - Klohn Crippen Berger Report

Observations & Findings

The last bullet point on page 15 of the Klohn Crippen Berger Report states "The only potential issue may be the timing of the drawing production, which may have created some delays in construction".

In the video conference with BBE Hydro Constructors Limited Partnership (BBE) on 23rd October 2017, BBE advised MGF that construction had not been delayed on account of the issue of Issued for Construction (IFC) drawings.

Conclusions & Recommendations

The production of Issued for Construction drawings has not impacted BBE's progress.

Source of Information & Reference Materials

- Video conference with BBE on Monday 23rd October 2017

SCOPE ITEM 3:

Review and assess Manitoba Hydro's cost estimating methodologies, identifying best practices and short-comings, beginning with the development of the $6.5 billion final pre-construction budget and with specific attention to the changes that have resulted in the $8.7 billion forecast at completion budget. Identify whether sufficient contingency amounts are included in the $8.7 billion forecast at completion budget.

Finding No. 1: Keeyask - Manitoba Hydro Cost Estimating Methodologies

Observations & Findings

The review of the Basis of Estimate and associated attachments identified areas of significant disconnects and insufficient details with which to understand the development of the $6.5 billion final pre-construction budget and the $8.7 billion forecast at completion budget.

Manitoba Hydro's Basis of Estimate for the "2014 Capital Project Justification Addendum" provides, at a high level, the evolution of the estimate. KGS Acres Ltd. produced the cost estimate in 2007 which was later updated in December 2009. Price adjustments over the years were made using escalation calculations to select cost elements of the cost estimate. This is an area upon which Manitoba Hydro can improve.

It was difficult to align the levels of detail and structure of the estimates with the various cost reports, despite the fact that the project has an established Work Breakdown Structure (WBS). The estimate basis has not been aligned with either the WBS or the summary tables provided within the Basis of Estimate itself. The detailed cost summary in the Basis of Estimate seems to align with Manitoba Hydro's SAP cost reports which appear to drive much of Manitoba Hydro's estimating formats, development process and ultimately its estimating philosophies.

The following are examples of items we expected to find in the Basis of Estimate but which were missing:

- Estimate classification
- Benchmarking references
- Estimate deliverables checklist
- Listing of documents available or relied upon at the time of the estimate
- Engineering progress
- Change logs (by date, number, value and parties impacted). Only a summary of Contract Change values was provided. Attachments noted as being included within the BBE Basis of Estimate were not available upon request and it was indicated that these may not have been provided to Manitoba Hydro
- Basis for quantities (model, manual take-offs, factors, allowances, etc.)
- Schedule basis (identifying major milestone dates)

Conclusions & Recommendations

In general Manitoba Hydro is very strong in capturing and reporting costs and has a very capable group. It is MGF's opinion that additional governance and cost control, not accounting, measures need to be implemented. Tighter pre-tender and project sanction estimates can be developed by addressing the observations and findings above.

More consistent alignment is recommended between the level of project execution reporting and financial reporting (i.e. different metrics are used to benefit both groups in different ways). Development and use of a logical Work Breakdown Structure and Cost Breakdown Structure is recommended and to use these to structure budgets and reports in a consistent manner throughout the project.

- Keeyask Generating Station, Chronological History of Approved Project Budget (CEF08 – CEF16)
- Keeyask Generating Station, Final Design Phase, Basis of Cost Estimate Report December 2009 Cost Estimate, dated June 1, 2010
- Keeyask Generating Station, Basis of Estimate Document, 2014 Capital Project Justification Addendum, dated August 2014

Finding No. 2: Keeyask - Manitoba Hydro Cost Estimating Methodologies

Observations & Findings

2017 CPJA Budget (2016$)

The 2017 CPJA Budget has been developed through the combination of estimates as well as values represented as Approved Contract Changes and Forecasted Contract Changes which, depending on the compensation method and terms outlined within the Contract to which the Contract Change applies to, could also be considered only an estimate (i.e. Cost Reimbursable vs. Fixed Price). The following categories of estimate update "type" have been presented by Manitoba Hydro, as a basis for the 2017 CPJA Budget (2016$).

- CEF2016 Plan: These are estimates that were generated by the respective Work Package Lead (WPL) assigned to a given work package (there have been some 59 WPLs identified as preparing 149 work packages).

  Templates were provided by Manitoba Hydro's Cost & Schedule Section which were then issued to the WPL for population. Upon completion of these templates, the estimates were loaded into SAP, Manitoba Hydro's cost management system. Based on a distribution curve assigned to the costs, in terms of when and how the expected spend would occur, cash flows were produced and various time driven cost adjustments could be accounted for.

The templates included the following "Sunk Costs" and "Planned Costs" for the following fiscal years until completion of the project. These have been presented per the following categories:

- Labour
- Expenses
- Contracts
- Consulting (Consulting was new to the 2017 Estimate)

- Delay Estimate: WPL's generated estimates associated to their respective work package(s) based on a one-year schedule delay to the first unit In-Service Date, which was driven by the contractor's schedule. Costs were allocated into Labour, Expenses, Contracts and Consulting categories.
- Trends: WPL's generated estimates for other known trending costs not associated with delay. These have been identified as including Project Change Authorizations (PCA) waiting for approval and other potential PCAs not yet formalized.
- Approved Contract Changes: Approved contract changes were based on information compiled from the Contract Revision Register (CRR).
- Forecasted Contract Changes: These are referenced in the basis as pending Contract Changes and were based on information compiled from the Contract Revision Register (CRR).

Pending Contract Changes are identified by WPLs for changes that are known, but not yet finalized. Manitoba Hydro's Cost & Schedule Section confirmed that no delay costs or trends identified by the WPLs were duplicated in the list of pending Contract Changes.

CEF2016 Plan: Costs noted within the CEF2016 Plan Estimate Summary Sheets are planned for as late as 31st March 2023.

CEF 2016 Estimate Sheets were provided in the Basis of Estimate appendices as supporting details to the cost estimate, however, the values included within these estimate sheets did not align with the values carried in the actual estimate. In the 2014 Capital Project Justification Addendum, Basis of Estimate variances occur because of SAP's use of a more accurate treatment of overhead. It was also noted through conversations that these variances are the result of updated labour rates themselves which are to be applied throughout the next fiscal year. Rates current at the time the CEF 2016 Estimate Sheets were generated, and then adjusted prior to being carried in the final estimate. This was not specified within the 2017 Capital Project Justification Addendum, Basis of Estimate and the reconciled estimate sheets that were provided in 2014 were also neither provided nor developed for the 2017 Estimate. This made one-for-one reconciliations difficult to perform.

Manitoba Hydro's overhead is calculated at 5% and includes:

- Personal Computers
- Tools and Consumables
- Accounts Payable Group
- Supply Chain Management Group
- Software Licensing & Maintenance (i.e. Autocad, Mapinfo, etc.)

Delay Estimate: Delay estimate values and descriptions have been presented within the Basis of Estimate document.

Trends: Manitoba Hydro has indicated that these costs are largely due to estimates that had been completed by the Transmission Group. The Keeyask Project Team did not have copies of these.

Approved Contract Changes: Manitoba Hydro provided the Project Contract Revision Register and an appendix within the Basis of Estimate. There was not a list of Approved Contract Changes in the estimate.

Forecasted Contract Changes: Manitoba Hydro provided a copy of the Project Contract Revision Register and an appendix within the Basis of Estimate. There was not a list of Pending Contract Changes included in the estimate.

Conclusions & Recommendations

CEF2016 Plan: MGF recommends that future estimates have appropriate reconciliations to reflect the control budget, including narratives to support the Basis of Estimate developed by WPLs.

MGF was provided with the detailed CEF 2016 Estimate Sheets used as the input basis to SAP, however, no reconciled details were provided in relation to the output of SAP and the eventual build-up of costs associated to the CEF 2016 Plan costs.

Estimated values carried in the budget are based on SAP cost modelled and time phased outputs which is an excellent approach for generating a control budget that considers future matters such as escalation and interest, albeit the estimate and SAP reporting structures need to align.

Delay Estimates & Trends: Manitoba Hydro's Keeyask Project, Costs and Schedule Group should hold the accountability for all change management, including the review and approval process associated with potential, proposed and approved project changes. A Change Log should be developed and used for tracking and managing changes for current projects.

MGF has not seen a Consolidated Project Change Log. What has been expressed as the project Change Log is simply a document management tool, which does not provide a summary of values by change, the history of the change nor how changes have evolved from either trends or Project Change Authorizations (PCAs). The Change Log is an important project management tool which should capture all potential, pending and approved changes on the project and provide an increased level of traceability. This is extremely valuable when attempting to reconcile actual costs with the approved changes.

- Email dated 15th November 2017 (Blair Purvis), Subject: "Re: PEWS"

MGF PROJECT SERVICES

Finding No. 3: Keeyask - Inconsistent Estimate and Cost Structure

Observations & Findings

MGF reviewed the line item entitled "Keeyask Generating Station (excluding GCC)" as reported in the CEF 2014 and 2017 CPJA Budget, to understand how the costs were assembled.

Manitoba Hydro has used a variety of different formats and structures with which to assign costs to Scopes of Work. Note the following:

- The structure of the Cost Summary Tables included in the CPJA Basis of Estimate was not explained
- The Work Package WBS Summary was logical but the estimate summaries did not follow this structure
- The Detailed Estimate Summary was by Network, by Project and aligned with SAP, not the WBS or summaries within the Basis of Estimate

Conclusions & Recommendations

MGF recommends utilizing a single Work Breakdown Structure for consistent cost and schedule reporting.

- Keeyask Generating Station, 2017 Capital Project Justification Addendum, Comparison of 2014 Estimate to 2017 Estimate, dated August 2017
- Capital Project Justification Addendum No.3, dated 30th October 2012
- Capital Project Justification Addendum No.4, dated 4th November 2014

Finding No. 4: Keeyask - $6.5 billion Estimate Adjustments, Updates and Inputs

Observations & Findings

Estimate updates used in developing the "Final Pre-Construction" Budget have been generated by Manitoba Hydro's Work Package Leads and based on various Manitoba Hydro internal and external sources at various points in time.

Estimate reference information came through market underpinned contract values, data from recently completed projects, namely Wuskwatim and costs that were based on information included and prepared for previously issued estimates, from as early as 2006.

For these previously developed estimates, escalation adjustment methods have been applied in consideration of year over year market conditions experienced since the source pricing was established, ultimately with the intention of achieving a price reflective of the current market.

These costs were noted to include Internal Labour, Expenses as well as items identified as contract estimates.

The Basis of Estimate document provided in 2014, representing the $6.496 billion project value is said to be:

> *"...generally based on the phase 2 estimate, unless noted otherwise."*

"Other Direct Cost" elements, noted below have been specifically identified in the 2014 Basis of Estimate as being based on escalated 2009/10 Estimates:

- Intake and Spillway Gates
- Other Water-to-Wire Contracts
- Balance of Plant Contracts
- Reservoir Clearing Contracts (was adjusted in the Phase 1 Estimate)

In review of the estimate detail summary sheets it was stated some costs were based on an escalated cost from 2009$, or earlier.

Conclusions & Recommendations

In general, many of the earlier Manitoba Hydro estimates used for the Pre-Construction Budget are very well detailed and clearly outline the sources and methodology applied to the development.

Adjusting previously prepared estimates to later points in time is a common estimating practice. It is MGF's opinion that a complete re-estimate should have been performed as part of the pre-tender estimate.

Many variables including scope, market conditions, foreign exchange rates, commodity indices, labour rates (agreement specific), labour composition, productivities, regulations, cash flow assumptions for escalation and even technologies are likely to have changed greatly over a 5 to 8 year period.

Any estimate inaccuracies are potentially further compounded over time and even more if the escalation itself is improperly calculated or the selected indices are inappropriate for the application.

There were numerous adjusted estimates noted through our review and the adjustment methods appear to have been very broadly applied. This method of adjustment would be more suitable to a preliminary type estimate. A control budget should have more relevant and accurate market underpinning prior to execution.

MGF
PROJECT SERVICES

SCOPE ITEM 4:

Review and assess Manitoba Hydro's scheduling methodologies, identifying best practices and short-comings.

Finding No. 1: Keeyask - Basis of Schedule

Observations & Findings

Currently there is no Basis of Schedule for the Integrated Master Schedules developed and managed by Manitoba Hydro.

BBE had provided a Basis of Schedule with the original baseline schedule. Since the re-baseline, a revised Basis of Schedule was submitted by BBE to Manitoba Hydro for approval. However, this was rejected by Manitoba Hydro due to a lack of sufficient detail.

As of 23rd October 2017 BBE has not re-submitted a more detailed Basis of Schedule.

Conclusions & Recommendations

A Basis of Schedule is an industry best practice and typically includes information about the Scope of Work (e.g. inclusions and exclusions), assumptions, execution strategy (e.g. standard or aggressive approach to the Work), options to accelerate the schedule and average and peak resource demand during the project.

The Basis of Schedule should be a "live" document which is frequently updated as any of the key aspects change and is generally updated and maintained by the scheduler.

Manitoba Hydro does have a "Develop Baseline Schedule" Procedure (CSS-011) that is noted as "Draft", dated 26th June 2013, which does address some of the above-mentioned requirements.

MGF would recommend that Manitoba Hydro implements its "Develop Baseline Schedule" Procedure CSS-011 to develop and maintain a Basis of Schedule so that the Basis of Schedule exists, is commonly understood and guides the consistent development and maintenance of the project's schedules.

Source of Information & Reference Materials

- AACE – 38R – 06, Documenting the Schedule Basis
- Manitoba Hydro "Develop Baseline Schedule" Procedure (Procedure Number: CSS-011) dated 26th June 2013

Finding No. 2: Keeyask - Hatch Schedule

Observations & Findings

The Keeyask Hatch schedule has a start date of 20th February 2013 and a completion date of 31st December 2020. The project is currently in progress with a status date of 5th November 2017. It has 3,871 normal activities of which 3,210 are complete, 132 are in progress and 529 are still planned. It contains 1,782 milestones, 1 summary and 634 LOE (Level of Effort) activities. The project baseline start date was 18th February 2013 with the baseline finish date of 29th May 2020. The project is currently behind schedule by 154 days.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Keeyask - Hatch baseline and forecast schedules each scored 82, giving them an 85% probability of success.
- Schedule Quality: Scored 82% versus a score of 75% or better which is considered a 'good' schedule.
- High float: Schedule paths with high amounts of float typically arise due to artificially constrained activities. The metric identifies activities with total float greater than 2 months and should not exceed 5%. This schedule scored 57%. Paths with float more than 2 months should be considered for acceleration and schedule optimization.
- Critical Path Length Index (CPLI): Measures the relative efficiency required to complete a milestone on time or how close a critical path is to the project target completion date. A project with an aggressive or conservative completion date may not carry the same overall duration as that of the critical path through the network. CPLI of greater than 1 indicates that a schedule is conservative with a very high chance of early completion. A CPLI of less than 1 is very aggressive with a very high chance that completion will overrun beyond the target project completion date. The Keeyask - Hatch schedule scored 0.89.
- Baseline Execution Index (BEI): Measures the efficiency with which actual work has been accomplished when measured against the baseline. The BEI score for this schedule is 0.78. The more activities that are completed on time or ahead of the baseline schedule will reflect a BEI of 1 or more. Conversely, a BEI of less than 1 indicates that the actual work is behind schedule.

Conclusions & Recommendations

With a Fuse score of 82%, this is a well-developed schedule. However, it is worth noting that many of their activities are currently behind schedule.

Source of Information & Reference Materials

- 2017.11.05 H341433-FSOW Updated Schedule to 5th November 2017.xer
- H341433 Baseline Rev13 25th September 2017

Finding No. 3: Keeyask - Schedule Baseline

Observations & Findings

Manitoba Hydro defines Baseline Revision as "…partially [changing] the baseline schedule without affecting the contract dates or budget. In other words, it is just re-sequencing of the work due to any opportunity. Contract Change Management procedure does not apply."

As per industry best and common practice, baseline schedules should not be modified outside of the Change Management process. The baseline schedule should only change if there is a change in cost (cost loaded Schedules) or Scope of Work. If the Scope remains the same, revised schedule dates should be made in the forecast schedule only, so Earned Value Management (EVM) metrics can be used.

Conclusions & Recommendations

Manitoba Hydro's Baseline Revision definition limits their ability to see a true picture of planned versus actual effort, as each new baseline resets the planned effort. This makes the schedule impact on subsequent contracts, such as Voith, impossible to ascertain with any accuracy.

Source of Information & Reference Materials

- Schedule Change Management CSS-010

Finding No. 4: Keeyask - BBE Schedule: Negative Float

Observations & Findings

The review of BBE's schedules revealed that 15 activities are slipping their constrained dates causing 1,030 activities to have negative float. The negative float ranges from 2 hours to 204 days. Negative float generally occurs when date constrained activities are slipping or have slipped from their scheduled finish date. Negative float indicates that the activity cannot finish by its scheduled finish date.

Further, there are 97 activities with negative float that are on the critical path.

Conclusions & Recommendations

Each additional day the critical path activities are delayed has the potential to delay the schedule by the amount of such delay or longer. Until these deficiencies in BBE's schedule are reviewed and corrected, Manitoba Hydro cannot have confidence in BBE's schedule, its completion date or the impact on interfaces with other contractors.

Manitoba Hydro should remind BBE of its obligations with respect to Contract Schedule (Article 3, General Specification) and ensure that BBE complies with this going forward. For example, Article 3.1 (i) states that the Contract Schedule shall "not have any negative float", yet BBE is currently maintaining a schedule with 1,030 activities with negative float, 97 of which are on the critical path. This is unacceptable schedule sanagement and, more importantly, not in accordance with the Contract.

Source of Information & Reference Materials

- BBE Approved Revised Baseline (Rev.01) - AA7.xer
- BBE updated schedule_DD Oct 06 2017(3) – Current Schedule.xer
- BBE Constrained Activities with Negative Float OB04-02.pdf
- BBE Activities with Negative Float – OB04-02.pdf
- BBE Critical Activities with Negative Float – OB04-2.pdf

Finding No. 5: Keeyask - BBE Schedule Quality

Observations & Findings

The BBE schedule has a start date of 10th March 2014 and has 23rd January 2022 as the completion date. The project is currently in progress with a status date of 6th October 2017. It has 7,781 normal activities of which 2,021 are complete, 186 are in progress and 5,574 are still planned. It contains 745 milestones, no summaries and 17 LOE (Level of Effort) activities.

The project baseline start date was 10th March 2014 with the baseline finish date being 8th October 2021. The project is currently behind schedule by 102 days.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of the detailed analysis. The BBE schedule scored 62, giving it an 59% probability of success.
- Schedule Quality: Scored 62% versus a score of 75% or better which is a considered a "good" schedule.
- Hard Constraints: Is the number of activities with hard or two-way constraints. Two-way activity constraints completely override Critical Path Methodology (CPM) calculations and break the schedule into two parts. This schedule contains 121 hard constraints.
- Negative Float: Is the number of activities with total finish float less than 0 working days. Negative float is a result of an artificially accelerated or constrained schedule and indicates the schedule is not possible based on the current completion dates. This schedule has 17% of the activities with negative float.

Conclusions & Recommendations

With a Fuse score of 62%, this is a medium quality schedule. We would recommend removing the hard constraints. If constraints are absolutely necessary, they should be soft or one-way constraints which do not violate CPM calculations. All constraints on the schedule should be reviewed as activities which are slipping the constraint dates are causing the negative float on the schedule.

Source of Information & Reference Materials

- September 2017 – KGS-BBE Phase II Contract Schedule Rev 1 DD Oct 06 2017 (013).xer

Finding No. 6: Keeyask - BBE Forecast Completion Date

Observations & Findings

BBE is currently forecasting a completion date of 23rd January 2022 versus the planned completion date of 8th October 2021. Based on the September monthly progress figures, BBE has a concreting productivity factor of [redacted]

Assuming the [redacted] productivity factor remains constant, we have applied a [redacted] increase to the duration of each concreting activity, excluding completed work, work being performed by others and activities involving curing of concrete, to estimate the potential impact to the completion date. 1a

This results in a completion date of 25th November 2022, which is later than Manitoba Hydro's control date of 4th August 2022 for unit 7 to be in service.

It is important to note that no mitigation strategies or schedule recovery options have been added to this forecast. Therefore, the order of magnitude estimated delay is the difference between 8th October 2021 and 25th November 2022.

ORDER OF MAGNITUDE DELAY IS 410 DAYS (progress to 6th October 2017)

MGF

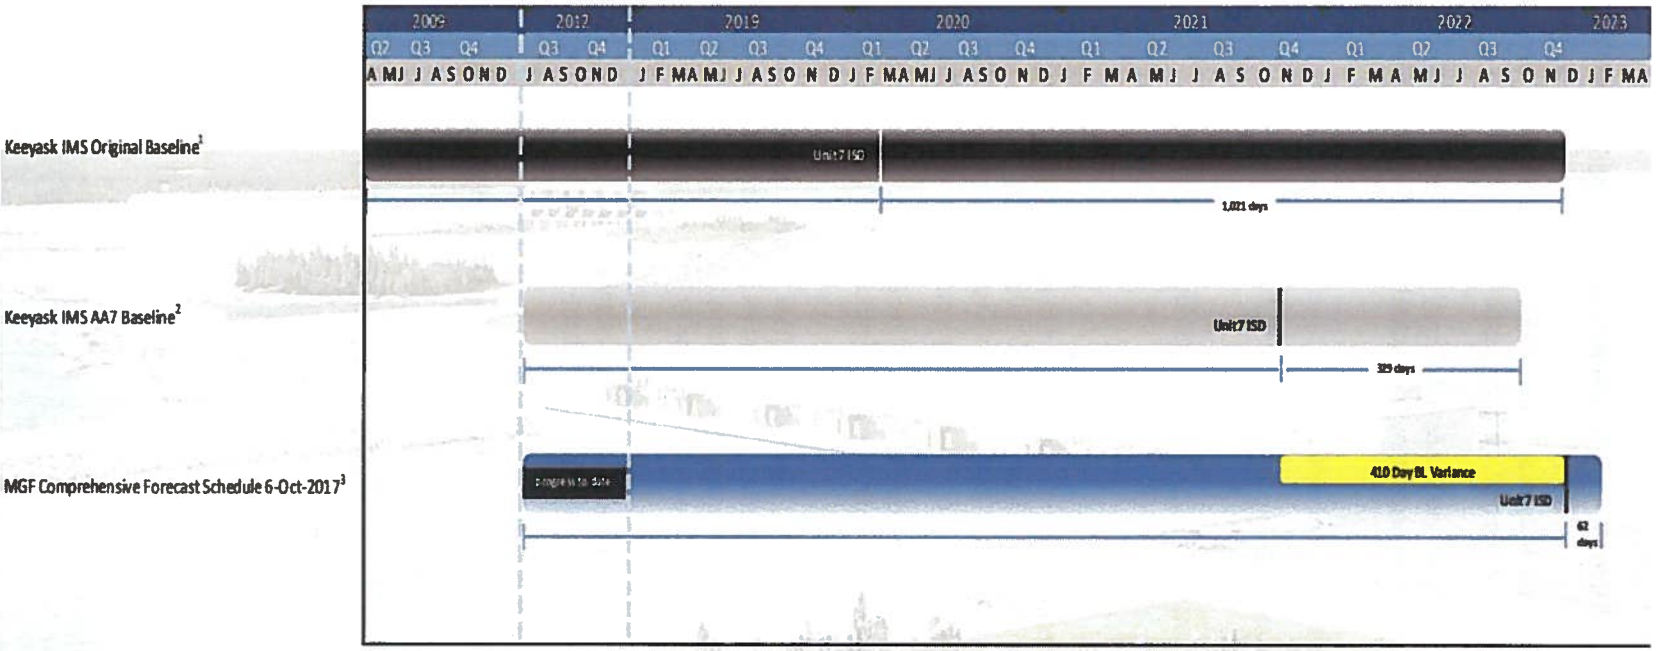
Keeyask Project Planned vs Forecast Dates Including Unit 7 In-Service Dates to Completion



1. **Keeyask IMS Original Baseline: The 1,021 days after Unit 7 In Service date reflects the completion of Generating Station Site Decommissioning and Rehabilitation which does not appear on the current schedule.**
2. **Keeyask IMS AA7 Baseline: The 329 days after Unit 7 In Service date reflects the completion of construction of Egress Channels downstream of spillway which was constrained to start on or after 1st July 2022, followed by an Ancestral Feast 2022 (Fall).**
3. **MGF Comprehensive Forecast Schedule: The 62 days after Unit 7 In Service date reflects the completion of construction of Egress Channels downstream of spillway but no constraint has been added. If this activity can only happen in the summer months, the completion date would be 1st September 2023.**

Conclusions & Recommendations

There are several factors which limit BBE's options to recover its schedule, such as environmental restrictions, weather, physical space and workforce accommodation. Two ways in which a schedule can be recovered are working longer hours or adding more resources. As productivity is an issue for BBE, neither of these strategies may produce the desired result as both will add cost and may further diminish the actual productivity.

A third way to recover the schedule is to change how the work is being executed. To recover the schedule BBE is proposing a winter concrete campaign which may help recover its schedule but this will add extra cost.

Source of Information & Reference Materials

- KGS-BBE Phase II Contract Schedule Rev 1 DD Cot 06 2017 (#013)

Finding No. 7: Keeyask - Integrated Master Schedule (IMS)

Observations & Findings

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

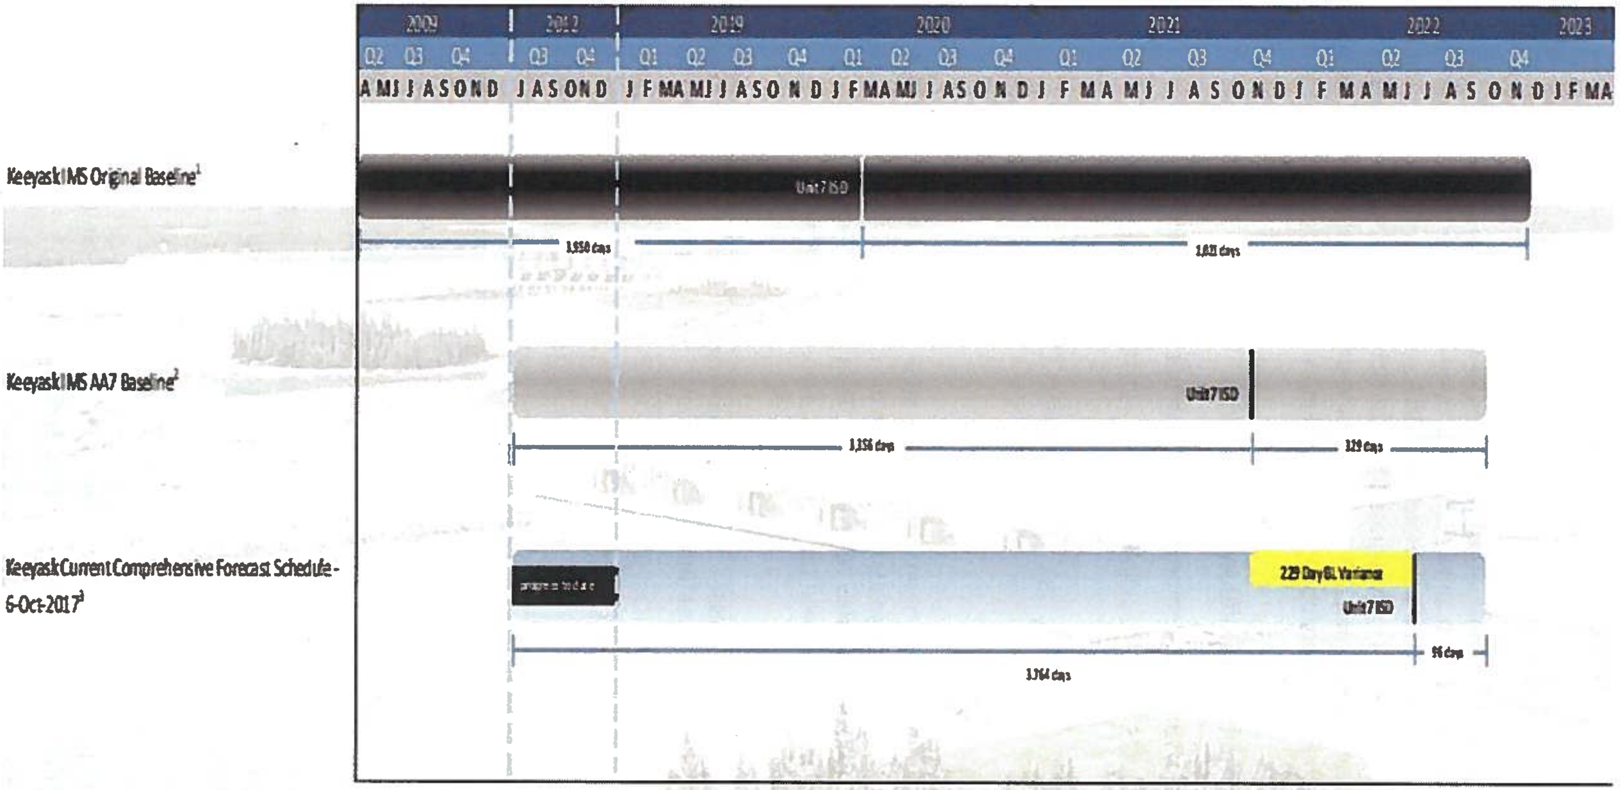
- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Keeyask Integrated Master Schedule forecast schedule scored 72%. The forecast schedule is rated as having a 72% probability of success.
- High float: Schedule paths with high amounts of float typically arise due to artificially constrained activities or much longer competing critical paths. This metric identifies activities with total float greater than 2 months and should not exceed 5%. The Integrated Master Schedule scored 77%. Schedule paths with float more than 2 months should be considered for acceleration and schedule optimization.

The review of the Integrated Master Schedule indicated that it did not show the latest General Civil Contract dates. We discussed this matter with Manitoba Hydro who concurred with our observation, correcting the dates and returning the revised schedule now correctly showing progress from all the contractors' schedules.

ORDER OF MAGNITUDE DELAY FOR UNIT 7 ISD 229 Days (progress to 6th October 2017)

MGF

Keeyask Project Planned vs Forecast Dates Including Unit 7 In-Service Dates to Completion



1. **Keeyask IMS Original Baseline: The 1,021 days after Unit 7 In Service date reflects the completion of Generating Station Site Decommissioning and Rehabilitation which does not appear on the current schedule.**
2. **Keeyask IMS AA7 Baseline: The 329 days after Unit 7 In Service date reflects the completion of construction of Egress Channels downstream of spillway which was constrained to start on or after 1st July 2022, followed by an Ancestral Feast 2022 (Fall).**
3. **Keeyask Current Comprehensive Forecast Schedule – 6th October 2017: The 96 days after Unit 7 In Service date reflects the completion of construction on the Egress Channels downstream of the spillways.**

Conclusions & Recommendations

With a Fuse score of 72%, MGF considers this schedule to be of medium quality. As with any Integrated Master Schedule, its quality in large part is directly related to the quality of the contractor schedules which are incorporated in to it. The Voith, Hatch and BBE schedules are imported directly in to this schedule and directly impact the score. The Integrated Master Schedule is showing slippage of 81 days on in service dates of turbine units 1 to 4 and 229 days on turbine units 5 to 7 as a result of slippage on the BBE schedule and the Voith schedule. Manitoba Hydro is working with both contractors to resolve the slippages.

Source of Information & Reference Materials

- Keeyask GS – IMS Comprehensive Schedule DD 171006.xer
- Keeyask GS – IMS Baseline Schedule – 20161008 - AA7.xer

Finding No. 8: Keeyask – Completion Dates

Observations & Findings

Dates: Multiple dates have been provided to MGF representing the same activities and completions. Outlined below are forecast and planned dates in the Integrated Master Schedule, the forecast and planned dates in the BBE schedule (also referred to as Target Date in some reporting), and the Manitoba Hydro Control Dates which are ten months later than the baseline dates.

	IMS Baseline	BBE Baseline (Target)	IMS Forecast	BBE Forecast	Control Date
Unit 1 In Service	17-Oct-20	17-Oct-20	29-Jan-21	29-Jan-21	14-Aug-21
Unit 2 In Service	16-Dec-20	16-Dec-20	30-Mar-21	30-Mar-21	13-Oct-21
Unit 3 In Service	14-Feb-21	14-Feb-21	29-May-21	29-May-21	12-Dec-21
Unit 4 In Service	15-Apr-21	15-Apr-21	28-Jul-21	28-Jul-21	10-Feb-22
Unit 5 In Service	14-Jun-21	14-Jun-21	2-Feb-22	26-Sep-21	11-Apr-22
Unit 6 In Service	13-Aug-21	13-Aug-21	3-Apr-22	25-Nov-21	10-Jun-22
Unit 7 In Service	7-Oct-21	7-Oct-21	28-May-22	23-Jan-22	4-Aug-22

Using the control dates, the in service dates are currently forecast to finish earlier than planned; however, using the baseline (contract dates), BBE is behind schedule and their delay has caused delays to the Voith in service dates for Generating Units 5 through 7.

Conclusions & Recommendations

To avoid confusion with the various dates, the significance of the different dates should be documented in the Basis of Schedule for the Integrated Master Schedule.

Source of Information & Reference Materials

- Email – Blair Purvis, Manitoba Hydro, dated 23rd November 2017
- KGS BBE Phase II Contract Schedule Rev 1 DD Oct 06 2017 (#13)

SCOPE ITEM 5:

Review and assess Manitoba Hydro's tender, contract management and cost control methodologies, and determine whether these methodologies support the $8.7 billion forecast at completion cost. If not, identify what changes in the contingencies, reserves or forecast at completion cost are required.

Finding No. 1: Keeyask - Tender Management

Observations & Findings

The key components of Tender Management are:

- Contracting Strategy
- Contractor Pre-qualification
- Individual Contract Plans
- Tender, Evaluate, Negotiate and Award

The review and assessment of Manitoba Hydro's Tender Management involved reviewing its documentation related to the key components above and testing the extent these were used on the following contracts:

- General Civil Contract – BBE
- Generators and Turbines – Voith
- Catering – Sodexo

Contracting Strategy

Standard # 103 Project Delivery Evaluation and Strategy dated 12th March 2015 was used in developing the contracting strategies for the above referenced contracts. The standard is sufficient, requiring the project team to consider or perform the following:

- Define key success factors
- Identify project drivers, e.g. schedule or cost
- Identify work packages, delivery options and contract types
- Screen possible work packages against key success factor and project drivers
- Create schedule for various project delivery strategy options
- Perform project risk analysis

- Determine preferred strategy and prepare board recommendation

No significant deficiencies were noted and no notable deviations were identified.

Prequalification

The purpose of prequalification is to ensure that owners have access to contractors with the capabilities, capacity and expertise to perform the required work and services. It is an important step to ensuring a successful project outcome.

Manitoba Hydro's prequalification procedure is available on its website and was used in prequalifying tenderers for both the General Civil Contract and the Generators and Turbines scopes. The Camp Services contract was pursuant to a Request for Information from a joint venture comprised of Sodexo and the Fox Lake and York Factory First Nations as a Direct Negotiated Contract in accordance with Schedule13-1 Identified Work Packages and Allocation.

The sample matrix to evaluate contractors for prequalification is comprehensive and addresses the following areas:

- Safety: safety program reviewed; WCB in good standing; overally safety record and number of accidents
- Experience: demonstrated construction experience on similar projects
- Availability: contractor available to perform the work within the desired timeframe
- Personnel: key contractor staff, including project manager, supervisors and office staff much have relevant experience of contract scope
- Track Record: contractor must have evidence of successful project completions on previous projects
- Qualification Statement: financial references given; principal projects listed
- Conflicts of Interest: conflict of interest forms completed
- Manitoba Content: contractor to maximize use of Manitoba labour (not used in prequalification but may be used in Tender Evaluation)
- Bonding: contractor eligible to bond for 50% of work or more than $500,000

The standard provides a Sample Evaluation Summary together with a Sample Scoring Guide to be used by evaluators to rank proposals.

A review of the prequalification practice produced no significant deficiencies or deviations from the corporate requirement.

Individual Contract Plans

The purpose of an Individual Contract Plan is to outline the key components required for a successful contract formation process and eventual post award contract management. For each work package or tender, this typically requires decisions on the following matters to allow the contract formation process to be successfully progressed:

- Scope of Work
- Estimated contract value
- Form of contract
- Compensation mechanism
- Approach to market (competitive tender or direct negotiation)
- Pre-qualified bidders
- Schedule milestones e.g. prepare tender, issue, evaluate, award, commence work, completion date.
- Evaluation plan

Manitoba Hydro addressed these matters in the following documents:

- Standard #206 Design Development and Procurement Document Preparation
- Standard #302 Develop Work Package Procurement Plan
- Standard #105 Developing the Work Breakdown Structure (WBS)
- Standard #103 Project Delivery System Evaluation and Strategy
- Standard #104 Work Package Charter Development
- Standard #402 Project Quality Plan
- ENV-003 Contractor Environmental Protection Plan

Standard #104 Work Package Charter Development was structured to reflect the chosen contracting type:

- Cost reimbursable contract – General Civil Work
- Fixed price contract – Generators and Turbines
- Direct negotiated contract – Catering Services

No significant deficiencies were noted and no notable deviations were identified.

Tender, Evaluate, Negotiate and Award

Standard #303 Tender, Evaluate, Negotiate and Award dated 12th July 2013 provides guidance and standardization on how contracts on the Keeyask Project are to be tendered, evaluated, negotiated and awarded. It sets out the necessary steps to conduct a bid process, evaluate bids received from tenderers, select a successful tenderer/proponent, negotiate a contract and award a purchase order.

The standard encompasses the following related documentation:

- Corporate Policy P1-6 Purchase Approvals
- Standard #206 Design Development and Procurement Document Preparation

- Standard #305 Changes to Procurement Documents
- Standard #801 Project Change Authorization
- KCP-001 Executive Approval Preparation
- PAS-001 Contract Change Management
- PAS-006 Consulting Purchase Order
- PLS-001 Project TEBO Strategy Development
- Partnership Agreements
- eform 0136 Purchase Recommendation & Authorization
- DOC-F-008 Project Change Authorization Form
- DOC-F-010 Notice of Contract Award
- F-301 Procurement Checklist

Standard #303 sets out its Tender, Evaluate, Negotiate and Award process as follows:

- Prepare Purchase Requisition (PR) and Obtain Approvals
- Prepare Procurement Documents and Issue
- Obtain Bids
- Evaluate Bids
- Obtain Approvals
- Negotiate (if applicable)
- Prepare Contract Binders
- Award

The Tender, Evaluate Negotiate and Award process was followed for the three referenced contracts and appears comprehensive. No significant deficiencies were noted and no notable deviations were identified.

Conclusions & Recommendations

The standards, procedures and processes supporting Contracting Strategy, Contractor Prequalification, Individual Contract Plans and Tender, Evaluate, Negotiate and Award are sufficient and well documents.

Source of Information & Reference Materials

- Manitoba Hydro Tender Management Documentation referenced in the Observations & Findings section

MGF PROJECT SERVICES

Finding No. 2: Keeyask - Contract Management

Observations & Findings

Standard #505 Contract and Work Package Management dated 29th June 2015 addresses work package management during the execution phases of a contract and outlines the requirement of the Work Package Lead (WPL) to manage the work package and associated contracts. The standard encompasses the following related documentation:

- Standard #204 Quality Management
- Standard #801 Project Change Authorization
- DOC-002 Naming, Filing and Format Conventions
- PSD-001 Lessons Learned
- PCC-002 Construction Contract Monitoring and Controls
- PAS-001 Contract Change Management
- DOC-F-009 Project Change Authorization Info-path form

Standard #505 describes the responsibilities of the Work Package Lead, the Engineer and the Purchaser who work together to manage the work packages and contracts. It also describes their roles in relation to the following major aspects of contract management:

- Scope Management
- Schedule Management
- Cost Management
- Payment and Accruals
- Purchase Order Maintenance
- Quality Management
- Document Management
- Communication Plan
- Resource Management
- Reporting Requirements
- Lessons Learned

It is industry best practice to perform contract audits to ensure the parties to the contract are complying with them. In our review, we only found one instance of a contract audit being performed, which we consider to be too low and infrequent for the number of contracts on Keeyask.

Conclusions & Recommendations

The Contract Management process appears comprehensive in terms of the standards to guide Manitoba Hydro in managing contracts. Manitoba Hydro should consider having periodic contract management audits to ensure Manitoba Hydro and their contractors are complying with their respective contracts.

MGF PROJECT SERVICES

Source of Information & Reference Materials

- Manitoba Hydro Contract Management Documentation referenced in the Observations & Findings section

Finding No. 3: Keeyask - Extra Work Orders (EWOs) – Indirects

Observations & Findings

MGF has reviewed the indirect percentage applied to Extra Work Orders.

MGF has reviewed extra work orders for the BBE contract and has observed that [redacted] is used for indirects. This figure is considerably less than the actual percentage for indirects. 1a

A low indirect percentage will underestimate the projected cost to complete.

Conclusions & Recommendations

Manitoba Hydro should use indirects that reflect actuals.

Source of Information & Reference Materials

- Manitoba Hydro-000172, Manitoba Hydro-000211 rev 02, Manitoba Hydro-000247, Manitoba Hydro-000225

Finding No. 4: Keeyask - Cost Performance Index (Earned Value)

Observations and Findings

The Cost Performance Index (CPI) specifies how much you are earning for each dollar spent on the project. The Cost Performance Index is an indication of how well the project is remaining on budget.

If the CPI is less than one, you are earning less than the amount spent. In other words, you are over budget.

If the CPI is greater than one, you are earning more than the amount spent. In other words, you are under budget.

If the CPI is equal to one, this means earning and spending are equal.

Overall CPI (which is determined by dividing earned value by actual cost) for the Keeyask Project is 0.96, as per September 2017 Project Management Report. "It is near 1 because budgets were re-set in the Capital Project Justification Addendum".

The CPI index for the cost incurred prior to 8th October 2016 was set to 1 rather than actual to date.

Conclusions & Recommendations

This results in inflating the CPI for the overall Keeyask project and does not reflect the actual, thereby giving a false view of performance. Manitoba Hydro should consider tracking the CPI from either the Amending Agreement No. 7 or project commencement, to give a more realistic figure.

Source of Information & Reference Materials

- Manitoba Hydro Monthly Project Management Report September 2017

Finding No. 5: Keeyask - Interest Earned on Advance Funding

Observations & Findings

BBE, as per its contract, is paid 2 months in advance since the start of the project, BBE were not requested to pass the interest on the advance monies to Manitoba Hydro.

This type of funding mechanism is not typical.

We have been advised by Manitoba Hydro that they have identified the issue and are in the process of recouping the interest monies.

Total cost is a follows:

Order of Magnitude Estimate $1,400,000

Notes:

- The costs are from project commencement to October 2017.

Conclusions & Recommendations

This issue is in the process of being rectified.

Source of Information & Reference Materials

- Meeting with Manitoba Hydro 28th September 2017
- BBE Contract

Finding No. 6: Keeyask - General Administration and Overhead (GA&O) on Procurement

Observations & Findings

BBE procurement personnel are reimbursed for time spent on purchasing equipment, tools and materials for the Keeyask project on behalf of Manitoba Hydro. In addition, BBE also includes [redacted] for GA&O for the cost of purchased equipment. 1a

This finding addresses the Construction Equipment and Construction Material/Tools categories.

Manitoba Hydro may wish to carry out this activity with their own personnel so as to save paying for GA&O

Order of Magnitude Estimate $65,500,000

Notes:

- The costs are based on project commencement to completion
- The above estimate excludes BBE's procurement personnel

Conclusions & Recommendations

If Manitoba Hydro processes future purchases internally, this will result in a reduction in GA&O.

The risk is, if materials are purchased late, it may give rise to BBE claiming delays.

However, MGF does not see the same level of risk with equipment purchases. A turnaround timeframe would need to be agreed upon.

Source of Information & Reference Materials

- To date costs for Non-Labour category provided by Manitoba Hydro up to July 2017

MGF PROJECT SERVICES

Finding No. 7: Keeyask - Craft to Foreman Ratio

Observations & Findings

On reviewing BBE's October 2017 Construction Monthly Report, the ratio of Craft to Foreman is 3.97:1. This appears to be high.

Page 19 of the report states "Ratios of Workers" (apprentices, journeymen and lead hands) to foremen are used to evaluate:

- whether there is sufficient supervision to support the work; and,
- the impact on wage rate if supervision counts are too high.

Typical ratios for similar construction projects have higher craft to supervision ratios. MGF has allowed for a craft to foreman ratio of 6:1. This ratio is applied to the total project direct hours to determine the variance in supervision hours. An average blended labour rate for foreman is used to determine the extra cost.

Ratio of 6:1 versus actual Ratio of 3.97:1

Applying these ratios to the total 7,078,000 direct labour hours will result in a 603,205 hours' variance at a rate of $ 76.32, which will result in:

Order of Magnitude Estimate $91,600,000

Note the above figures include [redacted] for GA&O and Indirect costs. 1a

Conclusions & Recommendations

Manitoba Hydro to review Craft Foreman mixes with the goal of improving the ratios.

MGF PROJECT SERVICES

Finding No. 8: Keeyask - Trade & Cash Discounts

Observations & Findings

On reviewing BBE's Progress Payments relating to Construction Equipment and Construction Materials/Tools categories for October 2016 and June 2017, it was noted that Trade Discounts were negligible.

No cash (prompt payment) discounts were identified.

Trade Discount

If we take an average 10% as an example that BBE could achieve with the suppliers, this would represent Trade Discounts **to date** in the sum of:

Order of Magnitude Estimate $ 54,000,000

If we take an average 10% as an example that BBE could achieve with the suppliers, this would represent Trade Discounts **to completion** in the sum of:

Order of Magnitude Estimate $ 61,800,000

Total Overall Trade Discount:

Order of Magnitude Estimate $ 115,800,000

Cash Discount

If we take an average 2% as an example that BBE could achieve with the suppliers, this would represent Cash Discounts **to date** in the sum of:

Order of Magnitude Estimate $ 10,800,000

If we take an average 2% as an example that BBE could achieve with the suppliers, this would represent Cash Discounts **to completion** in the sum of:

Order of Magnitude Estimate $ 12,400,000

Total Overall Cash Discount:

Order of Magnitude Estimate $ 23,200,000

Conclusions & Recommendations

Manitoba Hydro to ensure all Contractors are negotiating Trade Discounts.

Also as BBE is receiving Progress Payments 2 months in advance all Cash Discounts should be passed to Manitoba Hydro.

Source of Information & Reference Materials

- Progress Payment Applications - October 2016 and June 2017
- BBE Projected Cash Flow

Finding No. 9: Keeyask - Increased use of Overtime and Double Time

Observations & Findings

The CPJ 2017 Addendum, Appendix 1 "Basis, Assumptions and Exclusions", Section 2 sets out that the construction work week will be 7 days per week, 10 hours per shift, with labour on a 21 day on and 7 day off rotation and assumed that standard time (ST), overtime (OT) and double time (DT) would be 63%, 23% and 14% respectively.

From analysis of the progress payments of October 2016, May 2017 and June 2017, the actual split is 54% standard time (ST), 22% overtime (OT) and 24% double time (DT).

From the above referenced progress payments, we have calculated a weighted average blended rate per hour of $61.70 and a [redacted] ratio to direct cost to allow for indirect costs. 1a

Assuming 5,552,196 hours from 7th October 2016 to the end of the contract, then excluding indirects, with the actual mix of ST, OT and DT, this results in:

Additional Cost Order of Magnitude $ 20,900,000

As DT is never 100% efficient, if and we assume a 30% loss in productivity for illustration purposes, then the increase in labour costs based on 5,552,196 hours, including indirects, rises to:

Additional Cost Order of Magnitude $ 40,900,000

MGF PROJECT SERVICES

Conclusions & Recommendations

The concern is that with a different mix of ST, OT and DT, the cost of labour will continue to rise, potentially resulting in a higher cost for the BBE Contract.

Manitoba Hydro should carry out an exercise on the cost of additional camp versus additional labour costs.

Sources of Information & Reference Materials

- BBE Monthly Progress Statement for October 2016, May 2017 and June 2017.
- CPJ 2017 Addendum, Appendix 1 "Basis, Assumptions and Exclusions", Section 2
- Burntwood Nelson Agreement analysis by Manitoba Hydro for craft rates for ST, OT and DT

Finding No. 10: Keeyask - BBE Indirect Costs

Observations & Findings

On reviewing BBE's September 2017 Construction Monthly Report for Indirect Costs to date, there is a cost difference of 6.4%. The cost overrun is determined by the variance between actual spend to date of 30.4% compared to actual physical progress of 24%.

Currently, the indirect budget is [redacted] 1a

If the cost overrun trend continues, the potential cost impact is:

Order of Magnitude Estimate [redacted] 1a

Notes:

- The above figure includes [redacted] for GA&O.
- We have used the physical percentage complete from direct progress. 1a

Conclusions & Recommendations

Manitoba Hydro to review and implement cost reductions on BBE's Indirect costs.

Source of Information & Reference Materials

- BBE September 2017 Monthly Cost Report No 6 Rev 1

MGF PROJECT SERVICES

Finding No. 11: Keeyask - Transmission

Observations & Findings

This scope of work and costs are managed by Manitoba Hydro's Transmission Group.

Manitoba Hydro has noted variations in estimates due to:

- Increase of $21 million for 138 kV Generation Outlet Transmission (GOT) Lines
- Increase of $3 million for Terminations at Radisson
- Increase of $14 million for 138 kV Unit Lines

Conclusions & Recommendations

MGF recommends that Manitoba Hydro assigns a single owner of Cost Estimating and Scheduling. This will ensure no scopes of work are missed or overlapping, promote consistency in the development and appoint a custodian for all estimate back-up, methodologies and history.

This ensures that clear accountability is assigned and would align Manitoba Hydro's approach with industry best practice.

Source of Information & Reference Materials

- Map to Comparison of Keeyask 2014 to 2017.xlsx
- Keeyask Generating Station, 2017 Capital Project Justification Addendum, Comparison of 2014 Estimate to 2017 Estimate, dated August 2017

Finding No. 12: Keeyask - Board Recommendation

Observations & Findings

The Board Recommendation records the decision to approve a contract to the BBE joint venture for the General Civil Works "at a price not to exceed [redacted] billion excluding taxes and escalation." Please note the following: 1a

- Reference is made to Bechtel being "an experienced contractor", having been involved in the "construction of the civil works for the Limestone Generating Station". The Limestone Generating Station was completed in 1992 and involved 650,000 cubic metres of concrete and 7,100,000 cubic metres of earthwork; compared to the Keeyask Generating Station that was to commence work 22 years later in 2014 involving 350,000 cubic metres of concrete and 12,400,000 cubic metres of earthworks.

  What Bechtel did 22 years ago is only remotely relevant if its Limestone Generating Station construction management and supervision team was to be used on Keeyask.

  Note: We were advised by Manitoba Hydro that Bechtel were self-performing Contractor's on Limestone and this predicated their decision to appoint BBE, however was the question asked, what was Bechtel's history self-performing contracts in North America since Limestone.

- It is stated that BBE are "…the lowest cost and offer best value to the project". This is not strictly correct as BBE and the other proponents did not offer the "cost", but their assessment of an "Initial Target Price" that would equate to the total of all Actual Costs to be paid by Manitoba Hydro.
- The Board Recommendation further identifies the risk of concrete productivity, stating "[redacted] There is no further commentary on why this primary difference is not a high risk in the recommendation to award to BBE which is of concern. In addition, no mention of this risk is made or accounted for in the Contingency for Manitoba Hydro Held Risks' section of the Total Purchase Order Upset Limit calculation. 1a

Conclusions & Recommendations

The above raises concerns on whether the risks inherent in the contracting strategy, e.g. a cost reimbursable compensation mechanism and potentially too aggressive concreting productivity factors were fully understood by Manitoba Hydro and how it would set up the contract to manage and mitigate such risks with their chosen contractor.

Source of Information & Reference Materials

- Board Recommendation dated 26th February 2014

Finding No. 13: Keeyask - Estimated Final Cost Range

Observations & Findings

Based on our findings in this Capital Review, in our opinion the Final Cost for the Keeyask project will not meet the budget of $8.7 billon, but rather be in the range of:

Order of Magnitude Estimate Range $ 9.5 billion to 10.5 billon

This Order of Magnitude Range addresses the current status and issues related to:

- Productivity
- Schedule
- Costs
- Indirects
- Craft to Foremen ratios
- Other related matters

It is difficult for MGF to advise where the Final Cost will land in this range, given the Productivity and Schedule performance of BBE and the fact the GCC Contract is Cost Reimbursable. However, we would advise:

1. If Manitoba Hydro addresses the current issues, taking control of the Project and its Contractors, the Final Cost will be at the lower end of the range
2. Keeping the status quo and leaving control with the Contractors will result in a Final Cost at the upper end of the range

Conclusions & Recommendations

These are many cost saving and contract management exercises that Manitoba Hydro can implement, which will drive down the Final Cost.

Our recommendation is to do this without delay.

Source of Information & Reference Materials

- This report and its findings

SCOPE ITEM 6:

Review and assess Manitoba Hydro's and the Keeyask Cree Nations' project governance structure and processes comparing to best practices and shortcomings. Provide an opinion how the governance has affected – both positively and negatively – project management, contractor management, and scheduling.

Finding No. 1: Keeyask - Joint Keeyask Development Agreement

Observations & Findings

Overview

The purpose of the Joint Keeyask Development Agreement ("JKDA") is to establish the Keeyask Hydropower Limited Partnership ("KHLP") comprised of:

- Cree Nations Partners
- York Factory First Nation
- Fox Lake Cree Nation
- The Manitoba Hydro-Electric Board

to complete the planning and design of the Keeyask Generating Station and all related works (the "Keeyask Project") and to carry on the business and affairs of the KHLP, including "...the design and the ownership, construction, operation, maintenance and control of the Keeyask Project".

Section 2.6 "Employment, Training and Business Opportunities" sets out opportunities for members of the Keeyask Cree Nations ("KCN") with respect to:

- Pre-project training
- Construction employment
- Operational job
- Business opportunities during construction

The following articles set out how the KHLP will be established and financed; how the Keeyask Project will be developed and constructed; sets out the services Hydro will perform together with the arrangements for Power Purchase and Transmission:

- Article 4: The Limited Partnership and the General Partner
- Article 5: Financing the Limited Partnership
- Article 6: Project Development
- Article 7: Description of the Keeyask Project
- Article 8: Construction of the Project
- Article 9: Hydro Services
- Article 10: Power Purchase and Transmission Arrangements.

Construction Agreement

Schedule 1-2 "Construction Agreement" is part of the Joint Keeyask Development Agreement. The Construction Agreement identifies the "Owner" as the Limited Partnership and Hydro as the "Project Manager" to carry out the Scope of Work of the Keeyask Project, comprised of:

1. All required planning, engineering and designing
2. The Purchase of Insurance
3. Award of the contracts for construction
4. Commissioning of each of the turbines / generators and associated works to be supplied and installed
5. Procurement, award and administration of related contracts including Identified Work Packages
6. De-commissioning of camps and the clean-up of the construction site

Article 2 "Schedule for Construction" stipulates that:

1. The Project Manager ("Hydro") shall commence the Scope of Work on the date specified by the Owner (the Limited Partnership)
2. The Project Manager shall develop detailed schedules with construction contracts, manufacturers and suppliers to construct, supply, install or commission specific parts of the Scope of Work
3. Parties agree to use their respective best efforts to complete the Scope of Work in approximately eight (8) years from the start of construction

Article 3 "Project Manager Responsibilities" sets out the responsibilities of the Project Manager as follows:

1. Solely responsible for the planning, designing, engineering and procurement to complete the Scope of Work
2. Responsible for obtaining and maintaining throughout the term of the Construction Agreement, all required licences, permits, orders, authorizations and approvals

3. Allocation and negotiation of Identified Work Packages
4. Supply of construction power
5. Supervise, control and direct all aspects of the Scope of Work
6. Provide timely updates of costs to the Owner and Owner shall use these updates to forecast and arrange the necessary funds to meet its cash flow requirements
7. Inform Owner of any material changes to the plan, design, engineering or actual costs to complete
8. Prepare and provide written monthly reports
9. Conduct all testing to complete the satisfactory installation and commissioning of each turbine/generator and related equipment
10. Ensure that all product, equipment and material warranties for components of the Keeyask Generating Station shall be assigned by contractors to the Owner upon the Final Completion Date

Article 4 "Invoices" requires the Project Manager to prepare and submit invoices to Owner for costs incurred in carrying out the Scope of Work. The Owner shall pay these invoices within ten (10) Business Days.

Construction Advisory Committee

Schedule 4-6 sets out the terms of reference of the Construction Advisory Committee (the "CAC"). The CAC is an advisory committee to KHLP and has no decision-making authority. It is intended to be a communication forum to discuss timely, accurate and pertinent information related to the Keeyask Project construction activities.

The CAC is comprised of five (5) Keeyask Cree Nations' Members, two (2) for TCN and one (1) each for War Lake, York Factory and Fox Lake and two (2) Hydro employees.

The purposes of the CAC and CAC meetings are summarized as follows:

- Provision of non-privileged information related to the Keeyask Project
- Discussion of major activities and events planned for or occurring during construction e.g. updates on engineering activities; contracts planned and awarded to date; project schedule status and reports on current and upcoming cultural events

Following the Construction Start Date, the CAC will meet monthly until the Final Closing Date, which is the first Business Day, one hundred and eighty (180) days following the date on which the last of the turbines comprising the Keeyask Generating Station is fully commissioned and comes in to service.

Monitoring Advisory Committee

Schedule 4-7 sets out the terms of reference of the Monitoring Advisory Committee (the "MAC"). Like the CAC, the MAC is an advisory committee to KHLP and has no decision-making authority. The MAC is comprised of five (5) Keeyask Cree Nations' Members, two (2) for TCN and one (1) each for War Lake, York Factory and Fox Lake and five (5) Hydro employees.

The purpose of the MAC and MAC meetings is summarized as follows:

- Discuss the environmental, social and economic monitoring activities planned to occur during construction, commissioning, operations and decommissioning of the Keeyask Project
- Review and comment on regulatory and public reporting materials

Proposed Letter of Agreement, Burntwood/Nelson Agreement

Schedule 12-3 entitled "Proposed Letter of Agreement, Burntwood/Nelson Agreement" of the Joint Keeyask Development Agreement is between Hydro Projects Management Association and Allied Hydro Council of Manitoba. Schedule 12-3 requires that special measures need to be implemented during construction to facilitate the employment, training and retention of First Nations members and other Northern Aboriginals, which measures might conflict with existing Burntwood/Nelson Agreement (BNA) provisions relating to referral, recruitment or placement procedures.

The Limited Partnership has recognized the importance of successful recruitment, referral, placement, training and retention of Aboriginal employees on the Project and that Aboriginal cultural issues are addressed at all stages of the recruitment, referral, placement, training and retention process.

Schedule 12-3 amends the Burntwood/Nelson Agreement (BNA) as follows:

1. The Hydro Projects Management Association's membership will include the Limited Partnership
2. KCN shall appoint two representatives from their communities to the Project Site as advisors to the resident Site Manager
3. An Aboriginal union representative shall be hired to facilitate union interaction with Aboriginal employees, assist Aboriginal employees in matters related to discipline, liaise with the HR departments of major contractors and the Project's third-party retention service providers
4. The parties agree that no person covered by the BNA shall be subject to discrimination or harassment on the basis of any characteristics referred to in subsection 9(2) of the Human Rights Code of the Province of Manitoba and sets out the procedure to be followed regarding claims of discrimination or harassment
5. Sets out the goal to maximize the number of Aboriginal apprentices and trainees and encourages member unions to approach and recruit Aboriginal apprentices, trainees and journey persons.
6. Union site representatives will be required to take appropriate cross-cultural sensitivity and awareness training

Identified Work Packages and Allocation

Schedule 13-1 "Identified Work Packages and Allocation" of the Joint Keeyask Development Agreement details the following types of contracts:

1. Service Contracts
2. Infrastructure Contracts – Camps
3. Infrastructure Contracts – Roads
4. Principal Structures Contracts
5. Principal Structures Contracts (Schedule and Cost Critical)

All contract scopes include the supply of all supervision, administration, labour, mobilization/demobilization, materials, plant, tools, equipment, transportation, insurance and warranty of workmanship and materials. Each contract has been allocated to either the Cree Nations Partners, York Factory First Nation or the Fox Lake Cree Nation. As of 31st October 2017, the aggregate spend to date on these contracts is in excess of [redacted], as advised by Manitoba Hydro.

Conclusions & Recommendations

The JKDA and its associated Schedules provide an appropriate structure for the Keeyask Project:

- The JKDA establishes the Keeyask Hydropower Limited Partnership (KHLP) to carry on the business and affairs e.g. ownership, financing, construction, operation, maintenance and control of the Keeyask Project
- Section 2.6 "Employment, Training and Business Opportunities" sets out opportunities for members of the Keeyask Cree Nation
- Schedule 1-2 Construction Agreement defines the Scope of Work of the Keeyask Project, the Schedule for Construction and the responsibilities of the Project Manager
- Schedule 12-3 Proposed Letter of Agreement, Burntwood/Nelson Agreement addresses special measures to be implemented during construction to facilitate the employment, training and retention of First Nations members and other Northern Aboriginals
- Schedule 13-1 Identified Work Packages and Allocation - sets out the Contract Scopes to be directly negotiated with and performed by the Keeyask Cree Nations.

The Joint Keeyask Development Agreement embraces and implements the ownership and participation in the Keeyask Project with Manitoba Hydro. The JKDA itself does not directly impact Project Management, Construction Management and Scheduling. However, the appointment of Manitoba Hydro as the Project Manager does place the responsibility for Project Management, Construction Management and Scheduling on Manitoba Hydro.

- JKDA Schedule 13-1 Identified Work Packages and Allocation

MGF PROJECT SERVICES

SCOPE ITEM 7:

Assess Manitoba Hydro's updated Keeyask cost estimate for reasonableness, including whether appropriate contingencies and reserves have been provisioned.

Finding No. 1: Keeyask - Cost Contingency

Observations & Findings

In the Keeyask Generating Station Basis of Estimate Document 2017 Capital Project Justification Addendum, 14.0 Risk, Contingency on pages 4 and 5 it states "The contingency that was incorporated into the CPJ Addendum estimate was based on a P50 confidence level. Also, an additional 10 months of schedule contingency was added to the estimates, resulting in a total schedule delay of 21 months to the first unit In-Service Date".

In Appendix O - Contingency of Keeyask Generating Station Project Capital Cost and Schedule Risk Analysis and Contingency Estimates FINAL for Manitoba-Hydro dated 7th March 2017, contingency at the P90 confidence level is [redacted] as per Manitoba Hydro's presentation to MGF on 25th July 2017. 4b

Conclusions & Recommendations

BBE has not made its planned progress for either 2016 or 2017 and continues to plan work based on productivities it does not appear capable of achieving, hence MGF would recommend that Manitoba Hydro carry the P90 figure of [redacted] 4b

Source of Information & Reference Materials

- Keeyask Contract Summary as at 30th September 2017
- Keeyask Generating Station Basis of Estimate Document 2017 Capital Project Justification Addendum
- Appendix O – Contingency of Keeyask Generating Station Project Capital Cost and Schedule Risk Analysis and Contingency Estimates FINAL for Manitoba Hydro 7th March 2017 by Validation Estimating LLC.

MGF PROJECT SERVICES

SCOPE ITEM 8:

Identify aspects of the updated cost estimate and schedule that are at heightened levels of risk and recommend risk mitigation strategies that Manitoba Hydro should use.

Finding No. 1: Keeyask - Concrete Quantity Reporting

Observations & Findings

The concrete quantity in BBE's September 2017 Monthly Cost Report 06 Rev.0 is reported in three different places, each time with a different value.

On page 31:

- Total concrete to be placed is 278,962 cubic metres
- Installed concrete is nearly 100,000 cubic metres complete
- Concrete quantity to be installed is 278,962 - 100,000 = 178,962 cubic metres

On page 211:

- Total concrete to be placed is 341,480 cubic metres
- Installed concrete is 158,121 cubic metres complete
- Concrete quantity to be installed is 341,480 - 158,121 = 183,359 cubic metres

On page 264:

- Total concrete to be placed is 269,027 cubic metres
- Installed concrete is 81,213 cubic metres complete
- Concrete quantity to be installed is 269,027 - 81,213 = 187,814 cubic metres

Conclusions & Recommendations

Cost reports should be accurate as they are an important project controls tool. The estimates of total concrete to be placed have a range of 72,453 cubic metres (341,480 – 269,027) and the installed concrete estimates have a range of 76,908 cubic metres (158,121 – 81,213). Manitoba Hydro should not accept such inconsistent, inaccurate and unreliable reporting and should request BBE to review and revise with correct figures and improve their reporting going forward.

Source of Information & Reference Materials

- BBE September 2017 Monthly Cost Report 06 Rev. 0

MGF PROJECT SERVICES

Finding No. 2: Keeyask - Earthworks Total Fill

Observations & Findings

The document "Control, Advanced, Aug 2017 Forecast Earthworks Total Fill Placement Plan vs Actual to Date (Permanent Structures – Dams & Dykes)" was reviewed to determine if the completion dates depicted were achievable.

As per the October 2017 QURR and the BOQ-Rev 2 Monthly Report, the quantity of fill remaining is 5,874,585 cubic metres and the average fill placement for July and August 2017 was 237,216 cubic metres.

To meet the August 2021 completion date monthly production must be 244,774 cubic metres. This is an increase of 7,558 cubic metres or 3.2% per month over the 2017 July and August average of 237,216 cubic metres. This can likely be achieved by working longer shifts (less productivity) during the summer months to take advantage of the longer daylight hours or deploying more manpower if the camp can accommodate additional personnel.

To meet the February 2021 completion date monthly production would also have to be 244,774 cubic metres. This is an increase of 7,558 cubic metres or 3.2% per month over the 2017 July and August average of 237,216 cubic metres. This would include four (4) months of winter placement from October 2020 to February 2021 with fewer daylight hours and the potential for severe winter conditions. In view of the winter work, this schedule will likely be difficult to meet.

To meet the October 2020 completion date monthly production must be 293,729 cubic metres. This is an increase of 56,515 cubic metres or 23.8% per month over the 2017 July and August average of 237,216 cubic metres. Operating a double shift might make this monthly production possible, but camp space could be a constraint. This schedule does not appear to be achievable.

Other considerations that might preclude the required monthly production being achieved are:

1. Production is dramatically reduced for the initial lifts covering bedrock and invert.
2. Production is dramatically reduced nearing the crest elevation as the zones become very narrow as the rate of spread and compaction governs production.
3. Potential for heavy rains and/or impact from snowmelt and high water levels in local creeks, ponds, etc.

Conclusions & Recommendations

Manitoba Hydro should work with BBE to examine the basis of these proposed completion dates to test them for realism and achievability. The August 2021 completion date appears achievable with extra effort. The completion dates of October 2020 and February 2021 appear unlikely to be achieved.

Source of Information & Reference Materials

- Control, Advanced, Aug 2017 Forecast Earthworks Total Fill Placement Plan vs Actual to Date (Permanent Structures – Dams & Dykes)
- October 2017 QURR and BOQ-Rev 2 Monthly Report

MGF PROJECT SERVICES

SCOPE ITEM 9:

Identify changes to project governance or project management that would beneficially improve the execution of the remaining work and minimize risks.

Finding No. 1: Keeyask - Structural Steel Progress

Observations & Findings

The review of the Weekly Construction Report - week ending 6th October 2017 revealed the following weekly period and year to date performance:

The following table analyzes planned and actual structural steel quantities and hours spent installing structural steel for the period:

Period	Unit of Measure	Plan	Actual
Installed Quantity	Kilograms	132,472	78,124
Job Hours	Hours	[redacted]	[redacted]
		[redacted]	[redacted]

1a

The installed quantity in the period is 54,348 kgs or [redacted] less than planned, although actual productivity was [redacted] per man hour better than planned.

The following table analyzes planned and actual structural steel quantities and hours spent in installing structural steel year to date:

Year to Date	Unit of Measure	Plan	Actual
Installed Quantity	Kilograms	506,636	292,163
Job Hours	Hours	[redacted]	[redacted]
		[redacted]	[redacted]

1a

Year to date, BBE installed 214,473 kgs or [redacted] less structural steel than planned and its average productivity is [redacted] per man hour less than planned.

12073

Conclusions & Recommendations

BBE failed to meet its schedule in 2016 and continues to do the same in 2017, even after the Amending Agreement No. 7 and renegotiation of target price and schedule. The analysis raises serious concerns with BBE's optimistic productivity rates, its ability to plan construction activities and to coordinate and supervise its construction workforce. The constant slippage brings in to question the finish date, the impact such delay will have on other contractors and what the final cost will be to Manitoba Hydro.

At the moment, Manitoba Hydro cannot have confidence in BBE's completion date and the final cost.

MGF recommends that Manitoba Hydro works with BBE on a recovery plan to improve BBE's construction management, construction planning, co-ordination and supervision of construction work. The schedule should be adjusted based on productivity factors that BBE can realistically achieve based on historic data and revise its forecast at completion cost based on this new schedule.

Source of Information & Reference Materials

- BBE Weekly Construction Report – week ending 6th October 2017

Finding No. 2: Keeyask - Earthworks Embankment Fill Measurement

Observations & Findings

During the site visit to the Keeyask site on 9th and 10th November 2017, MGF performed a survey of earthworks to compare to the value reported by BBE. The quantity of embankment fill claimed by BBE is approximately 10% higher than the quantity assessed by MGF.

Conclusions & Recommendations

Whilst the physical quantity of work performed does not impact payment to BBE, relying on incorrect quantities may result in an inaccurate assessment of progress made in the period or in the year to date analysis.

Manitoba Hydro should perform spot checks on the quantities claimed by BBE to ensure quantity progress being relied upon for scheduling is accurate.

Source of Information & Reference Materials

- Site visit and physical remeasurement

MGF PROJECT SERVICES

Finding No. 3: Keeyask - Earthworks Productivity

Observations & Findings

As per the BBE Quantity Unit Rate Report (QURR) of 25th September 2017, the budgeted man-hours per cubic metre for earthwork is [redacted] The actual average productivity achieved to date is [redacted] man-hours per cubic metre as per the QURR Report dated 25th September 2017. The lower productivity will result in increased direct costs, indirect costs and a longer schedule. 1a

We applied the [redacted] difference in earthwork productivity between actual and forecast to the to-go earthwork quantity using an average blended labour rate of $61.70 to determine the direct cost impact. In addition, we added the [redacted] mark-up for GA&O and applied the [redacted] ratio of indirect cost / direct. This results in an increase in earthworks cost of: 1a

Order of Magnitude Estimate $88,400,000

Conclusions & Recommendations

If BBE continue to miss their productivity targets then completion is likely to be delayed, resulting in higher earthwork cost and increased indirect costs for the BBE contract. This cost should be set against the project contingency.

Source of Information & Reference Materials

- BBE Monthly Cost Report run date 25th September 2017 (QURR)
- BBE Amended Contract bid item level to go estimate volume 4

Finding No. 4: Keeyask - Review of Earthmoving Equipment

Observations & Findings

MGF has reviewed the most recent hour meter readings for major pieces of earthmoving equipment and we comment on potential cost impacts to completion of project. The schedule indicates that earthworks will be completed within 35 months from December 2017.

MGF have observed idle Manitoba Hydro purchased CAT 740 articulated trucks, while similar rental equipment is in use. The possible explanation for this could be that the purchased trucks have meter readings in excess of 10,000 hours and are not economical.

Running repairs and maintenance costs tend to rise steeply starting around the 6,500-hour mark for heavy earthmoving equipment. At 8,500 hours, most owners decide if they are going to invest more funds in maintenance or replace with new. At 10,000 hours, earthmoving equipment, generally speaking, is economically at the end of its useful life.

Hour meter readings for the earthmoving equipment at Keeyask on 11/19/17 were as follows:

- CAT 740 articulated trucks have an average hour meter reading of 10,198
- CAT dozers have an average hour meter reading of 7,033
- CAT rigid frame trucks have an average meter reading of 8,944
- CAT excavators have an hour meter reading of 9,255

The project has recently rented Komatsu HM400 articulated trucks to replace the aging fleet of CAT 740 articulated trucks. Is this a permanent or temporary measure?

A decision will have to be made in the very near future whether to rent or purchase replacement units for the dozers, excavators, and rigid frame trucks. If the decision is to replace in kind, the cost to do so will be $38,000,000. If the decision is to rent in kind, the cost to do so for 35 months will be $39,900,000 ($1,140,000 per month).

MGF has done a comparison of rental vs. purchase for the earthmoving equipment over a 35-month period. For the 35-month period, purchase would cost $1,900,000 less than rental. However, 33 months is the "break even" point. For any period less than 33 months, it would be cheaper to rent than purchase.

For the rental period stipulated by Manitoba Hydro for Multitiek-700KCA, and the Herman Nelson 1.2M BTU heaters, it would be cheaper by $423,500 to purchase these units.

Conclusions & Recommendations

Rent in lieu of purchasing of earthmoving equipment if planned to work for less than 33 months.

Schedule impact: None

MGF
PROJECT SERVICES

Finding No. 5: Keeyask - Scaffold and Crane Costs

Observations & Findings

The October 2017 BBE Monthly Cost Report shows spend to date from Amending Agreement No. 7 for the Scaffold and Crane category in the sum of [redacted] compared to the total budget of [redacted] for the period October 2016 to completion. 1a

The physical progress to date based on attachment 12.10 QURR in the October 2017 BBE Monthly Cost Report is at [redacted]

Additional Scaffold cost will result in:

Order of Magnitude Estimate CAD $103,500,000

Notes:

- The above figure includes Indirects and [redacted] for GA &O 1a
- We have used the physical percentage complete
- In the October 2017 Report, the following was the expenditure for the month:

Labour	[redacted]
Material	[redacted]
Total	**4,344,935**

1a

Conclusions & Recommendations

Manitoba Hydro to review and implement cost reductions.

MGF recommends Manitoba Hydro retains a Scaffold Inspector on site to ensure cost effective scaffolding strategies.

Source of Information & Reference Materials

- BBE Monthly Cost Report 07 Rev 0 for October 2017

MGF PROJECT SERVICES

Finding No. 6: Keeyask - Concrete Placement

Observations & Findings

The review of the Weekly Construction Report – week ending 6th October 2017 revealed the following:

- 2017 Planned Quantities - 78,877 cubic metres
- 2017 Year to Date Plan - 61,172 cubic metres
- 2017 Year to Date Placed - 48,834 cubic metres

Year to date concrete placement is down 12,338 cubic metres from the plan or 20%.

The following table analyzes planned and actual placed quantities and hours spent in concrete placement in the period:

Period	Unit of Measure	Plan	Actual
Placed Quantity	Cubic Metres	3,149	1,085
Job Hours	Hours	[redacted]	[redacted]
No. of placements	Each	15	11

1a

The planned number of placements was not achieved in the period; BBE performed 73% of its plan.

BBE expended [redacted] extra hours in placing 2,064 cubic metres **less** concrete.

Conclusions & Recommendations

BBE failed to meet its schedule in 2016 and continues to do the same in 2017, even after the Amending Agreement No. 7 and renegotiation of target price and schedule.

The analysis raises serious concerns with BBE's optimistic productivity rates and its ability to plan and execute concreting activities. The constant slippage brings in to question when BBE will most likely finish and at what final cost to Manitoba Hydro.

BBE needs to improve its construction management practices and, more accurately, plan and execute concreting activities. We would recommend that BBE revises its schedule with productivity rates that it has actually achieved on this project to produce a more accurate and realistic schedule and associated cost. This will allow Manitoba Hydro to better understand BBE's forecast at completion cost and a more probable completion date. This information will help plan and sequence other contractors interfacing with BBE to avoid potential delay and disruption claims.

Source of Information & Reference Materials

- BBE Weekly Construction Report – week ending 6th October 2017

MGF PROJECT SERVICES

Finding No. 7: Keeyask - Concrete Productivity

Observations & Findings

The cost and schedule of the Amending Agreement No. 7 is based on an average concrete productivity rate of [redacted] man-hours per cubic metre. The actual average productivity achieved to date is [redacted] man-hours per cubic metre. The difference in concrete productivity between forecast and actual is [redacted] man-hours per cubic metre. 1a

If the actual average productivity of [redacted] man-hours per cubic metre remains the same, then applying the shortfall in productivity to the total concrete quantity as measured from 7th October 2016 until the end of the contract using an average blended labour rate of $61.70 results in additional costs: 1a

Order of Magnitude Estimate

Direct cost (including GA&O)	[redacted]	1a
Indirect costs	[redacted]	
Total	**136,500,000**	

It should be noted that the original Contract was based on the Limestone project, built 25 years ago, which achieved [redacted] man-hours per cubic metre. 1a

In addition, the actual average productivity is likely to worsen as the Contract has more complicated structures to pour and three further winter seasons to work through.

Conclusions & Recommendations

If concrete productivity is not brought back in line with the assumption in the contract schedule and forecast to completion, then the cost of concrete will increase by approximately $136.4 million.

Manitoba Hydro should closely monitor and manage productivity as with winter work been planned for this season and the fact that more intricate pours are being performed the productivity factor may further deteriorate.

- Manitoba Hydro concrete productivity analysis tables November 23, 2017 File
- BBE Monthly Progress Statement for October 2016, May 2017 and June 2017

Finding No. 8: Keeyask - Extended Overtime

Observations & Findings

MGF reviewed BBE's Progress Payments for May and June 2017 and noted that some personnel were working greater than 16 hours per day.

There were 73 instances of personnel working greater than 16 hours per day. In some instances, there are personnel working up to 21 hours per day and, in some cases, working 16 hours per day for three consecutive days.

These extended hours will not be as productive as straight time hours and will result in diminishing output for every hour worked. This raises concerns about personnel safety.

Note: In May and June 2017, the total hours worked were 726,354, of which 326,000 were overtime.

Conclusions & Recommendations

Manitoba Hydro should consider working in line with the standard 10 hours per day where possible, to improve productivity. The camp expansion cost would need to be considered in this decision.

Source of Information & Reference Materials

- May and June 2017 BBE Progress Payment backup

Finding No. 9: Keeyask - Reporting

Observations & Findings

MGF's review has identified issues related to reporting that may impact successful project management. Examples identified comprise:

- Late reporting, e.g. BBE's monthly report is due by the 7th of the following month and as advised by Manitoba Hydro, is typically not submitted to Manitoba Hydro until the 14th of the month
- Incorrect reporting
  - potential discrepancy in quantities of earthworks claimed by BBE
  - schedule reporting based on 1,030 activities with negative float, of which 97 are on the critical path whilst the Contract stipulates that the Schedule shall have no activities with negative float
- Inconsistent reporting e.g. BBE has reported in its September 2017 Monthly Report three differing figures for both the total concrete quantity to be placed and the installed concrete to date

The risk is that Manitoba Hydro is treating reports as "rely upon" and making decisions potentially based on incorrect data.

Conclusions & Recommendations

Persistent late submission of the monthly report and provision of reports with inaccurate and conflicting data is unacceptable. This situation would be serious enough on a lump sum fixed price contract but is amplified considering the BBE contract is cost reimbursable, with Manitoba Hydro holding the risks of schedule, productivity and cost.

We recommend Manitoba Hydro enforces its contract with BBE and demands BBE's compliance with it so that Manitoba Hydro receives timely report with the required accuracy of content so that Manitoba Hydro can make data driven decisions on matters of progress and cost.

Source of Information & Reference Materials

Finding No. 10: Keeyask - Construction Management

Observations & Findings

In Construction **"Time is Money"**

In Traditional Fixed Contracts **"Time is the Contractor's Money"**

In Cost Reimbursable Contracts **"Time is the Owner's Money"**

The three main Contract types to consider are:

- Fixed Price Lump Sum (FPLS): The Contractor is paid FPLS amount regardless of incurred expenses or duration
- Unit Price: The Contract is based on estimated quantities. The Contractor is paid unit rates against actual quantities. Generally, the unit rates will include the Contractors overheads & profit
- Cost Reimbursable (in this case): The Contractor is paid for all its allowed costs, plus profit and General Administration & Overheads (GA&O)

The GCC Contract strategy of adopting a cost reimbursable commercial arrangement for this project was flawed from the outset, with a predictable outcome, i.e. it promotes and rewards inefficient work and doesn't encourage efficient work.

However, the design and construction methods for such a project are predictable, therefore, there is no reason why the Contract strategy adopted could not have been Lump Sum or at the very least Unit Rate (with Provisional Sums/Quantities for unforeseen below surface work).

Ensuring a good level of design upfront would have lent itself to these Contract types, thereby transferring the Construction risk from the Client to the Contractor.

With the current Contract strategy, the Client is taking all the risk on Productivity, Schedule and Cost.

As all construction decisions affect Manitoba Hydro financially, therefore they need to move actively into the role of a Construction Manager. Guiding & instructing the Contractor on more efficient:

- Crew make-ups
- Work methods
- Shift lengths
- Supervision
- Etc.

The application of incorrect machinery and work methods causes delay and additional cost. The following picture depicts an example where both Schedule and Cost are pushed out in favour of the Contractor and at the expense of the Client.

While the above is an example, the poor productivity achieved on site reflects poor Supervision and Management by the Contractor. If Manitoba Hydro want to reduce cost and schedule overruns they should have a more hands on approach.

Conclusions & Recommendations

Manitoba Hydro needs to take ownership of the site, as they are the party exposed. They need to hire experienced site supervisors (with trade backgrounds) to implement a more efficient workplan.

MGF PROJECT SERVICES

SECTION 4 - HVDC Converter Stations

SCOPE ITEM 10:

Review and assess Manitoba Hydro's cost estimating methodologies with respect to the final pre-construction budget of $2.68 billion and forecast at completion budget of $2.78 billion, identifying best practices and short-comings.

Finding No. 1: HVDC Converter Stations - Manitoba Hydro Internal Labour Cost Capital Expense vs. Operational Expense (Beyond Finish Date)

Observations & Findings

On reviewing back-up files provided by Manitoba Hydro to support the CEF-16 Estimate, budgeted "Labour Costs", we have noted costs that extend beyond the July 2018 "In-Service Date" and into 2021. These costs are included in the $2.78 billion Capital budget.

The following are the budgeted values for Labour Costs by year:

Year	Budget (CEF-16)	(Assumed) CapEX	(Assumed) OpEX
2017	$35,694,634	$35,694,634	
2018	$40,226,246	$23,465,310	$16,760,736
2019	$28,338,108		$28,338,108
2020	$6,503,469		$6,503,469
2021	$106,668		$106,668
	$110,869,125.02	**$59,159,944**	**$51,708,981**

Note: The above costs are based on the budget relating to the July 2018 In-Service Date.

Conclusions & Recommendations

Based on the schedule presented by Manitoba Hydro, the In-Service Date is noted as occurring during year 2018. It would be expected that a significant portion of the costs associated with any period following the In-Service Date should be allocated as Operational Expenditures, i.e. $51,708,981.

Source of Information & Reference Materials

- BPIII_MCP_Labour_FY2017(20160531).xlsm
- Manitoba Hydro 2017/18 & 2018/19 General Rate Application, Appendix 5.4, Page 12

Finding No. 2: HVDC Converter Stations - Manitoba Hydro Cost Estimating Methodologies

Observations & Findings

Based on the level of information available and the intended use of the cost estimate, we reviewed the estimate classifications that have been indicated by Manitoba Hydro for the following budgets:

- CEF14 ($2.68 billion)
- CEF16 ($2.78 billion)

MGF's review of Manitoba Hydro's cost estimating methodology for Bipole III Converter Stations with respect to the final pre-construction budget of $2.68 billion and forecast at completion budget of $2.78 billion is outlined within this section.

The pre-construction budget of $2.68 billion cost estimating methodology is explained in detail in the BPIII 2014 Basis of Estimate Document and is "Deterministic" as defined by AACE RP – 18R-97. Manitoba Hydro's cost estimating methodology is consistent with industry standard for the particular Class of Estimate and for the estimate's intended purpose.

A summary of the estimating basis for quantity and unit rates, is as follows:

- Internal Labour Estimate – based on estimated hours by year by labour rates and overhead. Generally internal labour hours were estimated on the basis of similar past work. BOE item 11.1.5
- Outsourced Labour Estimate – based on estimated contract costs for each specific contract for the network. Generally based upon similar past work packages or budget quotations BOE item 11.1.2
- Material and Expenses – Material Take Off quantities were provided by Engineering. Material costs were then estimated based on recent quotations, pricing and invoices. BOE item 11.1.3
- Contract Estimates – Based on similar proposals that had recently been received. 'Budget bids' BOE item 11.1.4

The estimating methodology for the forecast at completion budget of $2.78 billion is also "deterministic". Quantities, rates and unit costs remained unchanged except for the inclusions of the "previously out of scope provincial road upgrades and an increase in contingency levels to a P75 confidence level to better address project risks to the completion of the work."

Best Practices that have been identified:

- The BPIII 2014 Basis of Estimate document is well-written and closely aligns with the suggested structure and content outlined within AACE Recommended Practice Number 34R-05
- The use of estimating templates promotes consistency and familiarity with the estimate

Short-comings:

- The Basis of Estimate did not include Benchmarking and/or Industry Metrics based on data from similar projects
- A Basis of Estimate document was not developed for CEF16, identifying the changes in project scope definition, scope of work, Contingency development and updated pricing
- Design/Material Take Off and Construction Waste Allowances are neither identified nor included for Material Key Quantities
- Use of Estimating Software will eliminate possible math errors and familiarity with estimate reports. Manitoba Hydro's cost estimating methodology for the final pre-construction estimate for the Bipole III Converter Station Project was based on a first principle estimating methodology "using quantities and historical project unit rates dependent on design criteria"

It was indicated that each department, section or business unit with assigned scope to the project were responsible for producing their cost estimates and cash flows for internal labour, external labour, materials, equipment and contracts required for their respective project component.

Conclusions & Recommendations

MGF recommends that the Manitoba Hydro Estimating Team prepare the overall estimate with input from each department. The Manitoba Hydro Estimating Team would detail and reconcile scope, quantities and unit rates provided by each department. This would ensure consistency and accuracy in the estimates produced.

The method with which the financial aspects of the project are reconciled and revised for past and future expenditure each year within SAP, appear sound from a budget management perspective.

The fact that many of the project cost adjustments and calculations occur within SAP does reduce the level of transparency. Reconciliations should be conducted to update the physical quantity and item based cost estimates, to which rates of placement, production rates, and quantities can be detailed. This too, would aid in aligning with the project Work Breakdown Structure (WBS) and Cost Breakdown Structure (CBS).

MGF PROJECT SERVICES

Finding No. 3: HVDC Converter Stations - Risk Management

Observations & Findings

The Bipole III Converter Stations Project Controls Report of June 2017 identified in the Risk Management section the following: "Future Risk: Majority or major component installation occurring this summer. Interfaces with SLI may cause delays to system installation. Concern with aggressiveness of Synchronous Condensers commissioning schedule".

The Bipole III Converter Stations Project Controls Report of September 2017 states "There is a risk to the project ISD due to the following - Complexity of interfaces between Contractors and installation damage causing delays to system installation and pre-commissioning, installation delays impacting system commissioning (AC Switchyard), delivery delay of components impacting aggressive commissioning schedules submitted by contractors".

The 'Dashboard' page of the September 2017 report goes on to state "Recent Contractor submissions show delays in activities that could jeopardize the ISD and the Contractor's critical paths keep changing, increase the difficulty to forecast any potential impact to ISD."

The September 2017 report further states "HVDC contractor critical path changes in every weekly submission and does not reflect the plan that is being discussed during the progress meeting and RFI responses which is the risk."

Conclusions & Recommendations

The risk which was identified in June 2017 was not mitigated by September 2017 and poses a risk to the In-Service Date (ISD) being met. It is unacceptable for a project at this stage to have the critical path changing from week to week.

It raises concerns with the contractor's ability to plan and execute its work and equally, why Manitoba Hydro having been aware of the risk, has failed to mitigate it. Risk management is a dynamic and ever present activity on a project and needs to be proactively performed if projects are to be successful.

Finding No. 4: Bipole III - Integrated Master Schedule for Converter Stations

Observations & Findings

The Bipole III Integrated Master schedule contains 25,650 activities versus the baseline schedule which contains 19,386 activities.

As with any Integrated Master Schedule, its quality in large part is directly related to the quality of the schedules which are incorporated in to it. The Keewatinohk Converter Station (KCS) schedule, the Riel Converter Station (RCS) schedule, General Converter Stations, and the Transmission Connector Line schedules are imported weekly into the IMS with progress updates. This method for updating the IMS is precise; however, it isn't without risk. If certain elements of the individual schedules are changed, the progress may not be imported correctly into the IMS resulting in inaccurate dates.

Whilst an Acumen Fuse was not done on these individual schedules, the following describes the overall findings for these schedules.

Keewatinohk 230 kV AC Switchyard schedule:

The Keewatinohk schedule has a start date of 11th Jun, 2014 and has 17th January, 2018 as the completion date. The project is currently in progress with a status date of 27th October, 2017. It has 2,206 normal activities of which 2,080 (94%) are complete, 18 (1%) are in progress and 108 (5%) are still planned. It contains 118 milestones, 0 summaries, and 228 Level of Efforts (LOE).

The project baseline start date was 3rd July, 2014 with the baseline finish date being 7th October, 2017. The project is currently 93 days behind schedule.

The main issues on this schedule are the percentage of activities (70%) using a relationship type other than Finish to Start (FS) and the percentage of missed activities (46%).

Riel Synchronous Condensers schedule:

The Riel Synchronous Condenser schedule has a start date of 1st April, 2015 and has 25th December, 2018 as the completion date. The project is currently in progress with a status date of 16th October 2017. It has 7,602 normal activities of which 4,107 (54%) are complete, 330 (4%) are in progress and 3,165 (42%) are still planned. It contains 1,238 milestones, 0 summaries, and 452 Level of Efforts (LOE). As a re-baseline was just approved in October, 2017, the baseline and forecast dates are the same.

The main issues in this schedule are activities using the Start to Start, Finish to Finish, and Start to Finish (SS/FF/SF) relation (13%), missed activities (35%), and activities with a high duration (10%).

Transmission Department Schedules

The Transmission Project Department schedules include the following:

- Long Spruce 230kV Station
- Riel Electrode Line
- Ridgeway 230kV/66kV Breaker Replacement
- Rosser 230kV Breaker Replacement
- Rosser 230kv Breaker Replacement
- R49R T/L Sectionalization at Riel

- Dorsey Station
- Richer Station
- Ridgeway Station
- Riel Expansion
- Keewatinoow Collector Lines Henday
- Keewatinoow Electrode Line
- McPhillips 115kV Breaker Replacemnt
- Keewatinohk – Limestone U/G Fibre Optic Installation
- Henday 230kV Station Modification
- Keewantinoow CS Collector Line Long Spruce to Henday L61K

Across all of the Transmission Department schedules residing in the Bipole III Master schedule, the main issues are the activities missing logic (57%), activities using the Start to Start, Finish to Finish, and Start to Finish (SS/FF/SF) relation (48%), missed activities (61%), and activities with a high duration (39%).

As these schedules are built using critical path methodology (CPM), it is essential to have all activities linked together. Activities with high durations can be symptomatic of incorrectly identified support activities or activities that have not been broken down into enough detail. Supporting activities need to be identified as LOE activities in the schedule so they do not drive the critical path. Other high duration activities need to be decomposed into smaller discrete units so logic can be properly assigned to the network. A schedule containing primarily Start to Start and Finish to Finish (SS/FF) relations is a strong indicator the activities are too high level. The level of confidence in the forecast start and finish dates on this schedule would improve significantly if the logic issues are resolved.

Conclusions & Recommendations

The mechanical aspects of these schedules should be fixed to improve the quality and reliability of the completion dates for the project.

- BPIII OCT 2016-(CEF 16).xer

SCOPE ITEM 11:

Review and assess the tendering and contracting methodologies for the converter stations, identifying best practices and short-comings.

Finding No. 1: HVDC Converter Stations - Tendering & Contracting

Observations & Findings

MGF's review of the Manitoba Hydro's tendering of major HVDC converter station contracts > $25 million produced the following considerations.

- Approach to Market: appropriate use of competitive tender e.g. HVDC converter equipment & Keewatinohk 230kV AC switchyard and single sourced directly negotiated contracts e.g. Keewatinohk Site Development
- Contract types: appropriate use of contract types and allocation of risks was made e.g. HVDC Equipment on a design, supply, construct, install and commission contract. The Keewatinohk Camp Operations Services scope on a services based contract
- Pricing mechanism: appropriate choices were made for pricing mechanisms relative to contract scope, the degree of scope definition and risk. For example, HVDC Converter Equipment with payment against key lump sum milestones achieved by the Contractor that are defined in the Contract; and the Keewatinohk Camp Operations Services on a cost reimbursable pricing mechanism, comprised of reimbursing actual costs incurred plus a management fee

Conclusions & Recommendations

In tendering the HVDC converter station contracts, Manitoba Hydro has made has appropriate use of approaches to market, contract types and pricing mechanisms to successfully manage the scopes and risks associated with their contracts.

Finding No. 2: HVDC Converter Stations - Compensation Mechanisms

Observations & Findings

The Converter Station Contract Revision Register (CRR) as of 30th September 2017 shows open contracts with a remaining spend of $302,704,674. This is broken down by compensation mechanism as follows:

- Lump sum $253,083,916
- Unit price $12,234,989
- Cost reimbursable $37,385,769

Lump sum and unit rate priced contracts amount to 88% of the remaining spend which provides higher predictability in the forecast final cost.

MGF PROJECT SERVICES

Conclusions & Recommendations

Manitoba Hydro's choice of compensation mechanisms is appropriate for the contracts required for the converter station projects and is a sensible allocation of risk between Manitoba Hydro and its contractors.

Source of Information & Reference Materials

- Converter Stations Contract Summary

Finding No. 3: HVDC Converter Stations - Variation Management

Observations & Findings

We reviewed random variations to test if the management of variations was performed in accordance with the contract in terms of appropriate documentation, scope description and pricing. We found that most of the approvals were in accordance with the process outlined in the respective contract and Manitoba Hydro's corporate Contract Change Management Procedure.

It was noted that a few lump sum priced variations had a 15% mark-up added to the lump sum. This is in error; lump sum prices should be inclusive of all costs associated with the variation as per Section 5.7.2 of Schedule XV – Variation Procedures of the Contract. Section 5.7.3 of Schedule XV - Variation Procedure states that the 15% mark-up is only to be applied where a variation is priced on the basis of actual costs incurred. For example, the variation for the [redacted] should have the 15% fee removed from the calculation of its cost. 1a

Conclusions & Recommendations

Variations previously processed should be reviewed to ensure that the 15% mark-up has not been incorrectly applied and paid to the contractors.

Source of Information & Reference Materials

- Sample Variation Orders
- Manitoba Hydro Schedule XV Variation Procedure

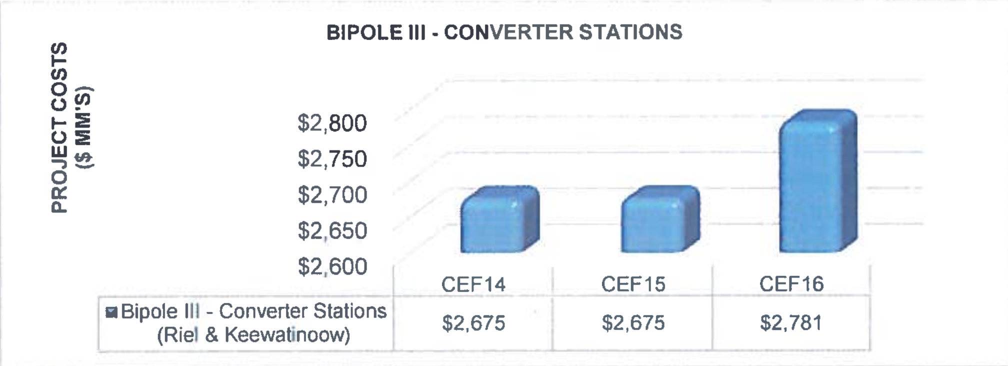
SCOPE ITEM 12:

Review and assess the reasons for the capital cost increases from the 2014 control budget of $2.68 billion to the current forecast at completion amount of $2.78 billion.

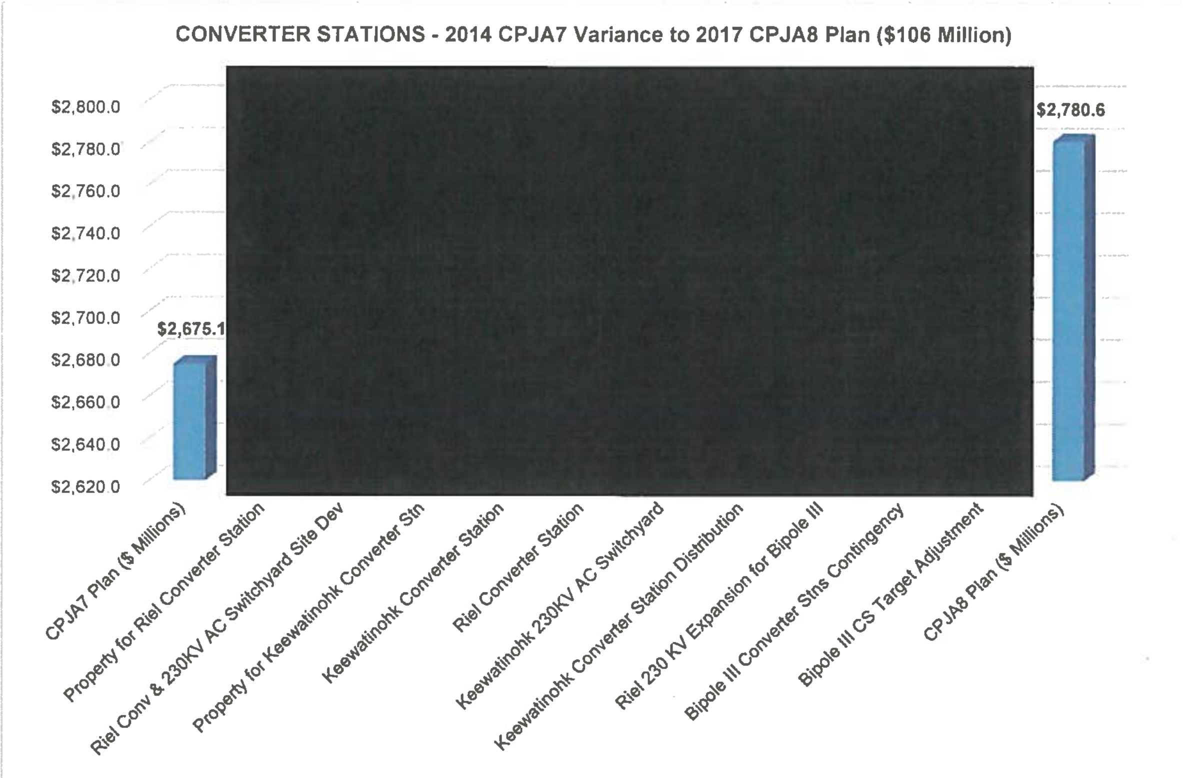
Finding No. 1: HVDC Converter Stations - Project Cost Overruns

Observations & Findings

MGF reviewed the "Bipole III Project, Basis of Estimate Document, September 2014 Cost Estimate Update", in addition to the justification for adjustments to the current budget of $2.78 billion. The budget comparison between CEF14, CEF15 and CEF16 are summarized below:



The budget increased by $106 million between CEF14 and CEF16. The revised budget maintains an In-Service Date of July 2018. The table below illustrates the cost elements, identifying variances to the original budget.



1a

Manitoba Hydro increased the 2014 Control Budget in CPJ Addendum #08(b) by approximately $106 million. This increase was subsequently approved by the MHEB on 26th October 2016. Changes to the scope included within the justification were as follows:

- Provincial Road 280 Upgrade
- Provincial Road 290 Upgrade
- Conawapa Access Road Upgrades

In addition, the estimate was adjusted to an increased confidence level of P75, i.e. 75% chance of achieving the estimate value. This confidence level adjustment increased the Contingency.

Costs which were once shared between the Bipole III and Conawapa Projects have now been fully allocated to the Bipole III Project in light of the Conawapa Generating Station project being "shelved".

Manitoba Hydro provided MGF with an additional document entitled "Basis for the Current Converter Stations Budget" which was reviewed in early September. Whilst this document does not satisfy the requirements of a formal Basis of Estimate document, it did provide an explanation for some of the increases to the current budget.

Key changes from the pre-construction budget have been attributed to the following:

- Unallocated Contingency adjustment to increase budget confidence: [redacted]
- Cost Recovery from loss of Conawapa Project cost sharing: [redacted]
- HVDC Contract commodity escalation reserve to increase budget confidence: [redacted] 1a
- BNA Agreement LOA payments reserve amount: [redacted]
- Possible Post-Construction PR280/290 upgrade agreement with MHI: [redacted]

Conclusions & Recommendations

The budget was primarily increased to account for scope items mentioned above and to add further Contingency to address remaining project uncertainties.

Source of Information & Reference Materials

- 2016 Estimate Basis Notes
- CPJ Update Notes (Final)
- Bipole III Estimate Details by Network CEF 14 vs CEF16 MGF

SCOPE ITEM 13:

Assess Manitoba Hydro's updated converter station cost estimate for reasonableness, including whether appropriate contingencies and reserves have been provisioned in relation to outstanding uncertainties.

Finding No. 1: HVDC Converter Stations - Estimate Reasonableness

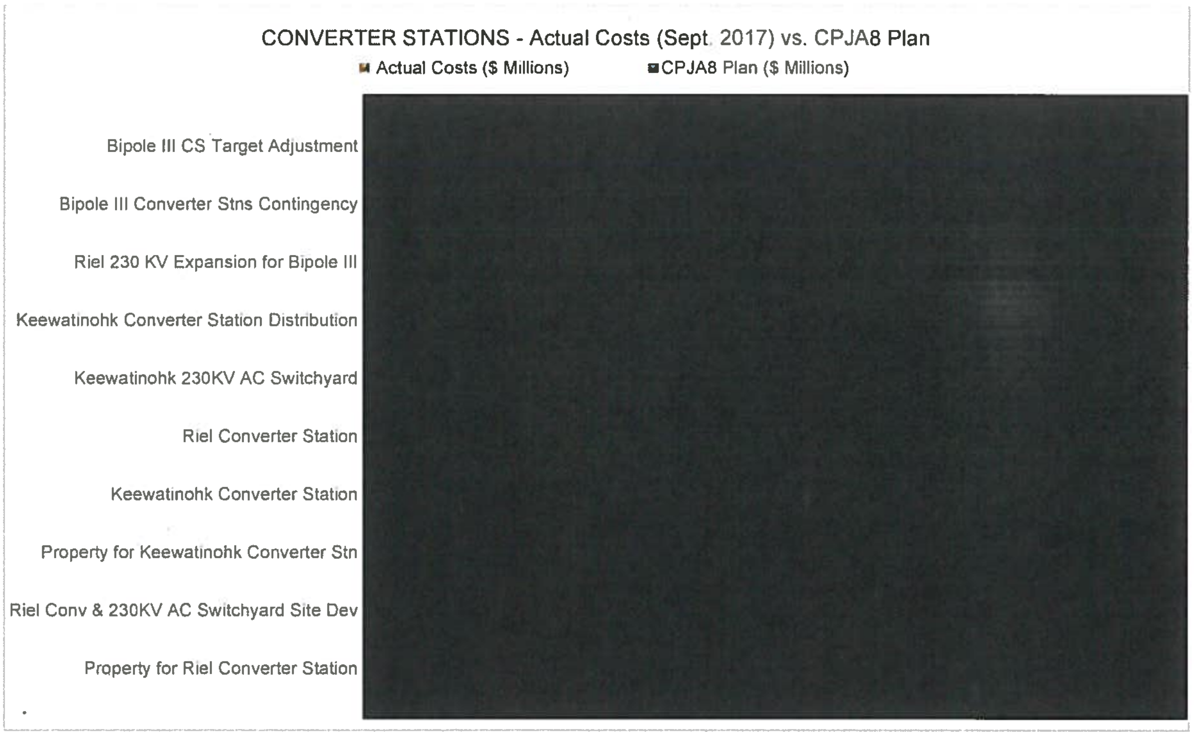
Observations & Findings

MGF's review of various reports produced the following observations and assessments:

- The review of "Actual Life to Date Amount" indicates $2,136,260,097 in actual spend to 30th September 2017. This represents 77% of the current project budget and aligns with that reported in the September 2017 Monthly Project Controls Report
- The September 2017 Monthly Project Controls Report indicates a Contingency of [redacted] broken down as follows:
    - Dispersed - [redacted] 1a
    - Allocated to Scope - [redacted]
    - Allocated to Contracts - [redacted]
    - Unallocated - [redacted]
- In reviewing the Risk Management section of the September 2017 Monthly Project Controls Report, the primary risk is schedule. There are no current risks impacting the project In-Service Date, but instances of late equipment delivery and component installation damage have been noted
- Future risks to the project In-Service Date have are on account of the following:

  - Complexity of interfaces between Contractors
  - Installation damage causing delays to system installation and pre-commissioning
  - Installation delays impacting the system commissioning (AC switchyard)
  - Delivery delay of components impacting aggressive commissioning schedules submitted by Contractors
- Whilst mitigation actions have been addressed, schedule and cost risks still exist and plans to potentially accelerate activities will result in additional costs
- The last entry on the Bipole III Risk Register, MFR 169 Converter Station tab was April 2017 which would imply that the Risk Register may not be up to date

The following table compares the Actual Costs (September 2017) to the CPJA 8 Plan



[redacted]

1a, 7a

Cost Summary

- CPJA8 (CEF-16): $2,780.56 MM
- Actual Costs (September 2017): $2,136.26 MM
- Costs To-Go (September 2017), Excl. Contingency: [redacted]
- Costs To-Go (September 2017), Incl. Contingency: $644.3 MM 1a

MGF PROJECT SERVICES

Conclusions & Recommendations

Based on the selected contracting strategies and the fact that a large portion of the project is based on a lump sum commercial model, the estimate is considered reasonable. Remaining project risks have been identified in relation to achieving the planned In-Service Date and it is MGF's view that the remaining unallocated contingency is reasonable.

Source of Information & Reference Materials

- BPIII CS CPJ Comparison vC14 vs vC16 Actual spend to Sept 30, 2017.xls
- 2017 09 Project Controls Report
- Bipole III Risk Register, MFR 169 Converter Station tab
- Transmission Bipole III Converter Stations, Project Controls Monthly Report September 2017

Finding No. 2: HVDC Converter Stations - Variation Management

Observations & Findings

The converter stations have approximately $320 million of spend to completion in August 2018. Of this value, the respective percentage spend by pricing mechanism is as follows:

- 83% on a lump sum basis
- 4% on a unit rate basis; and
- 13% on a cost reimbursable basis

Variations to date have not had a significant impact.

Conclusions & Recommendations

The potential for a cost over-run is low for the converter station scopes.

Source of Information & Reference Materials

- Converter Stations CRR Report
- September 2017 Project Controls Risk Management
- September 2017 Project Controls Risk Management

Finding No. 3: HVDC Converter Stations - Contingency Review

Observations & Findings

Contingency was carried in the final pre-construction budget at a value of [redacted] with no provisions for a management reserve, as this had been addressed within the Transmission Line Project. Contingency was set using a P50 value on an estimate value of $2.107 billion, which was inclusive of the Riel 230kV 7a

Expansion ($229 million) and Keewatinoow Converter ($1.878 billion). It was noted that at the time the contingency was assessed there were sunk costs against the project at a value of $307 million.

The Converter Station has a scheduled In-Service Date of July 2018. The total contingency carried for the project was [redacted] 7a

MGF has reviewed a third-party consultant's report that had been developed as part of the Bipole III Project risk and contingency review in August of 2014. In this report, suggested contingencies and reserves had been identified and presented as follows:

- Contingency (Cost) - Riel 230kV Expansion
  - P10, [redacted]
  - P50, [redacted]
  - P90, [redacted]
- Contingency (Cost) - Keewatinoow Converter (KCS) 7a
  - P10, [redacted]
  - P50, [redacted]
  - P90, [redacted]
- Bipole III - Contingency (Schedule)
  - P50, [redacted]
- Converter - Reserve Risks
  - Lost Season - [redacted]
  - Labour Shortage - [redacted]

The justification and recommendation for the reserves within the report were outlined as follows and it was suggested that Manitoba Hydro fund an amount to cover the costs of one of the risks:

- Lost Season, [redacted] a moderate to high probability was identified for one of the following to occur, which would result in an additional construction season. These are noted as delay impacts: 1a
  - Weather – KCS
  - Labour shortage
- Labour Shortages, [redacted] moderate probability that suppliers would experience poor productivity. The reserve did address the fact that the commercial strategy was based on EPC lump sums. Not a delay impact 1a

It was recommended that for the project business case analysis, Manitoba Hydro use the P95 value, plus escalation.

CPJA 8b authorized an additional [redacted] to address previously out of scope items and remaining risks. This authorization increases the Contingency carried within the project to a "P75 confidence level." The difference between the P50 and P90 values carried within the third-party report for the Converter Station scope was [redacted] This value did not account for any reserve, as indicated above. 7a

The noted variance between the contingency (P50) value presented by the third party consultant and the value carried by Manitoba Hydro within the project was approximately [redacted] 7a

Conclusions & Recommendations

The current value of contingency at a P75 confidence level does not appear to be based on a current or updated Contingency review. As such, this would not take into consideration the events and updated risks that the project has been or may be exposed to.

Manitoba Hydro's corporate standard states that contingency is set at a P50 or 50% confidence level.

- CPJA 8b

SECTION 5 - Bipole III Transmission Line

SCOPE ITEM 14:

Determine whether the current state of design and engineering work supports the $1.96 billion cost estimate. If not, identify what changes in the contingencies, reserves, or forecast at completion cost are required.

Finding No. 1: Bipole III Transmission Line - Stanley Consultants Inc.

Observations & Findings

On account of the one-week timeframe that Stanley Consultants Inc. ("Stanley") had to perform their work, MGF directed Stanley to those areas where it was felt that Stanley's efforts in the one week available would add best input and content for the review.

Stanley, through its review of the estimates, did review certain aspects of the design and engineering drawings and specifications but have not commented specifically on these.

Conclusions & Recommendations

As such, Stanley did not address this scope.

SCOPE ITEM 15:

Review and assess Manitoba Hydro's cost estimating methodologies, identifying best practices and short-comings.

Finding No. 1: Bipole III Transmission Line - Section N4

Observations & Findings

We performed a unit price comparison between CEF 16 Estimate and the Rokstad Power Company's Contract for section N4 of the transmission line. CEF 16 carried a cost of [redacted] The actual cost based on Rokstad's contract unit prices is [redacted] thereby reducing CEF 2016 by [redacted] 1a, 7a, 8a

Conclusions & Recommendations

As contracts are placed, prior estimates should be updated with the contract rates to ensure the accuracy of estimates and forecast costs to completion. [redacted] Such low rates might indicate that Rokstad may have had an insufficient understanding of the scope and the cost to perform it. 1a, 8a

Source of Information & Reference Materials

- BPIII Estimate Rev 2 _ TLCC
- BPIII Transmission Line CPJA8 (2016) – 05

Finding No. 2: Bipole III Transmission Line - Manitoba Hydro Cost Estimating Methodologies

Observations & Findings

Manitoba Hydro's cost estimating methodology for the final pre-construction estimate for the Bipole III Transmission Line project was based on a first principles estimating methodology "*using quantities and historical project unit rates dependent on design criteria*".

This is also known as Deterministic Estimating methodology as defined by AACE RP – 18R-97, which is predominantly based on the use of unit cost line items. Manitoba Hydro's cost estimating methodology is consistent with the industry standard for the Class of Estimate and for the estimate's intended purpose.

It was indicated that each department, section or business unit with assigned scope to the project was responsible for producing their cost estimates and cash flows for internal labour, external labour, materials, equipment and contracts required for their respective project component.

It was difficult aligning the detail and structure of the various cost reports. The estimate basis did not align with either the Work Breakdown Structure or the summary tables provided in the Basis of Estimate. The detailed summary provided within the estimate packages did not align with the SAP cost reports.

Quantities, man-hours and unit rates associated with the physical scope were not clearly defined within the estimate summary sheets included within the estimate packages. From the estimate package provided, the information was not consolidated in any one location. This was limited to the estimate summary sheets that had been populated with accounting codes, descriptions and costs, which when checked and calculated, did not match the values carried in the estimate.

Conclusions & Recommendations

Manitoba Hydro is very strong in capturing and reporting costs. The team is comprised of a very knowledgeable and capable group; however, it is MGF's opinion that additional governance and control (not accounting) measures be implemented.

The 2014 pre-construction Basis of Estimate was extremely well done. Supporting back-up and more detailed explanation outlining the structure and relationship between the physical scope of work and resources with the cost / financial reporting system is suggested for the future.

MGF PROJECT SERVICES

Summaries should align with the Work Breakdown Structure and provide base costs, free of any escalation, taxes, contingency, interest, etc., as these should be shown separately.

Summaries should also be presented, outlining owner's costs, direct costs, indirect costs, etc. in accordance with the project Work Breakdown Structure and Cost Breakdown Structure. SAP reports and data dumps does not satisfy the requirements of an estimate summary or basis for the build-up of the estimate.

- BPIII T Line CPJA8 (2016) 2016-05 - BPIII Estimate Rev 2 _TLCC

Finding No. 3: Bipole III Transmission Line - CEF 2016 Estimate

Observations & Findings

The concern raised is with respect to Manitoba Hydro's cost estimating and forecasting capability as the "Estimate of Go Forward Costs" dated 16th June 2016 fails to include costs for Distribution Line Crossings and the Transmission Line Construction Yard. The notation advises that these costs are to be provided by others, but no cost is carried in the Total Estimated Cost of Construction.

Conclusions & Recommendations

The omission of these costs means that Manitoba Hydro is understating the "Estimate of Go Forward Costs." The degree to which this is replicated elsewhere is not defined or known, but it raises concerns on Manitoba Hydro's forecast costs to completion. MGF recommends that Manitoba Hydro implement a quality review of its "Estimated to Go Forward Costs" during its next review cycle to ensure adequate costs are provided for.

Source of Information & Reference Materials

- Estimate of Go Forward Costs dated 16th June 2016

MGF PROJECT SERVICES

SCOPE ITEM 16:

Review and assess Manitoba Hydro's tendering and contracting methodologies, including choices of contract types for the major contracts, identifying best practices and short-comings.

Finding No. 1: Bipole III Transmission Line - Contracting

Observations & Findings

Manitoba Hydro has used lump sum, unit rate, cost reimbursable and material supply contracts effectively. Examples of lump sum price contracts are as follows:

- Transmission Line Clearing
- GIS Upgrade

Examples of unit rate priced contracts are as follows:

- Precast Concrete Self-supporting Tower
- Transmission Line Construction Package

Examples of cost reimbursable or "Service Release Order" contracts are as follows:

- Inspection Services
- Lidar & Digital Imagery

Conclusions & Recommendations

Manitoba Hydro has made appropriate use of lump sum, unit rate and cost reimbursable contract types for the Bipole III Transmission Line project.

Source of Information & Reference Materials

- BPIII Transmission Contract Summary dated 30th September 2017

MGF PROJECT SERVICES

SCOPE ITEM 17:

Review and assess Manitoba Hydro's contract management and cost control methodologies, and determine whether these methodologies support the $1.96 billion forecast at completion cost. If not, identify what changes in the contingencies, reserves, or forecast at completion cost are required.

Finding No. 1: Bipole III Transmission Line - Risk Register

Observations & Findings

Upon review of the Bipole III risk register the following deficiencies were identified:

- The date of creation of the risk is not identified
- The dates that risks are to be potentially resolved are not identified
- The person responsible for the risk is not identified

Conclusions & Recommendations

Manitoba Hydro to add the missing attributes to its risk register. This complies with industry best practice and will enhance their effectiveness in managing risks.

Source of Information & Reference Materials

- Risk Register "MFR-169 Transmission Line

Finding No. 2: Bipole III Transmission Line - Contract Management

Observations & Findings

The Bipole III Project Charter states that Contract 031074 with Valard Construction LP for Specialty Anchors & Foundations Installation (N1) had been closed out in the amount of [redacted] The Bipole III Transmission Contract Summary as at 30th September 2017 identifies this contract to be open with an actual expenditure of [redacted] and with a contingency remaining of [redacted] 1a, 7a

Conclusions & Recommendations

The Transmission Contract Summary should be corrected to status this Contract as closed and ascertain whether the remaining contingency of [redacted] can be reallocated. 1a, 7a

Source of Information & Reference Materials

- Bipole III Project Charter dated 17th February 2017
- Bipole III Transmission Contract Summary as at 30th September 2017

Finding No. 3: Bipole III Transmission Line - Variation Management

Observations & Findings

Bipole III contract 031061 with Forbes is for transmission line sections N2, N3, S1 and S2. We reviewed BPIII 031061 Variation Summary to understand how variations were being managed. The Variation Summary generally follows good practice in that it:

- Allocates a variation number
- Identifies the transmission line section reference to which the variation pertains
- Provides a description of the variation
- Records the value of the variation
- Identifies if the variation is an increase or reduction in cost
- Provides the basis of determining the cost of the variation

The variation number sequence runs from 1 to 54. However, variations 24, 30, 31, 36, 37, 43, 45 and 49 do not appear on the summary, and therefore, it's not possible to determine whether these are variations pending a decision by Manitoba Hydro or agreement with the contractor, or whether they have been rejected.

The Variation Summary only records those variations that are "approved." A better practice would be to retain all variations on the Variation Summary and provide a status to each of these e.g. Approved, Under Negotiation/Pending or Rejected.

If the variations that are not identified on the Variation Summary are under consideration by Manitoba Hydro then there is potential for an increase in cost to Contract 031061. The biggest risk with contract variations is when potential or pending variations are not visibly being tracked or recorded.

Conclusions & Recommendations

Maintaining the Variation Summary with all variations, e.g. approved, pending and rejected would be a more effective way for Manitoba Hydro to manage variations. With respect to the 8 variations that are not reported on the Variation Summary, Manitoba Hydro should review and confirm that these variations are rejected and will have no further cost impact or if they are pending, put these variations in to the Variation Summary for proper variation management.

Source of Information & Reference Materials

- BPIII 031061 Variation Summary

Finding No. 4: Bipole III Transmission Line - Variation Management

Observations & Findings

Bipole III contract 031063 with Rokstad Power Company is for transmission line sections N1, N4, C1 and C2.

We reviewed the BPIII 031063 Variation Summary to understand how variations are being managed. The Variation Summary generally follows good practice in that it:

- Allocates a variation number
- Identifies the transmission line section reference to which the variation pertains
- Provides a description of the variation
- Records the value of the variation
- Identifies if the variation is an increase or reduction in cost
- Provides the basis of determining the cost of the variation

The variation number sequence runs from 1 to 29. However, variations 3, 4, 6, 7, 12, 14, 15, 19, 21, 22, 24 and 25 do not appear on the summary, and therefore, it's not possible to understand whether these are variations pending a decision by Manitoba Hydro or agreement with the contractor or whether they have been rejected.

The Variation Summary only records those variations that are "approved." A better practice would be to retain all variations on the Variation Summary and provide a status to each of these, e.g. Approved, Under Negotiation/Pending or Rejected.

If the variations that are not identified on the Variation Summary are under consideration by Manitoba Hydro, then there is potential for an increase in cost to Contract 031063.

The biggest risk with contract variations is when potential or pending variations are not visibly being tracked or recorded.

Conclusions & Recommendations

Maintaining the Variation Summary with all variations, e.g. approved, pending and rejected would be a more effective way for Manitoba Hydro to manage variations. With respect to the 12 variations that are not reported on the Variation Summary, Manitoba Hydro should review and confirm that these variations are rejected and will have no further cost impact, or if they are pending, put these variations in to the Variation Summary for proper variation management.

- BPIII 031063 Variation Summary

MGF PROJECT SERVICES

Finding No. 5: Bipole III Transmission Line - Rokstad Power Company Schedule

Observations & Findings

Based on the proposed recovery plan dated 17th October 2017, Rokstad Power Corporation's contract has a completion [redacted] Rokstad has only one season to perform the remaining work in sections N1, N4, C1 and C2. Close monitoring of construction of [redacted] is important, especially for stringing in the winter construction period. 4, 8a

Work in sections N1, N4, C1 and C2 has not progressed to plan since the contract start. The risk is if construction in these sections is not progressed as per the schedule, work will need to be performed in another construction season, with a schedule impact of one year.

Conclusions & Recommendations

In-Service Date (ISD) is critical and there remains only one season of work before ISD. The construction work requires close planning and the schedule needs close monitoring to ensure the completion date of 21st April 2018.

Source of Information & Reference Materials

- Bipole III – Transmission Line Construction Report, July 27, 2017
- BPIII Transmission Line CPJA8 (2016) – 05
- Bipole III Project Construction Report, June 2017

Finding No. 6: Bipole III Transmission Line - Rokstad Power Company Schedule

Observations & Findings

The Rokstad Power Company Schedule has a start date of 21st Sep 2015 and a completion date of [redacted] The project is currently in progress with a status date of 20th August 2017. It has 4,794 normal activities of which 2,721 are complete, 16 are in progress and 2,057 are still planned. It contains 178 milestones, no summaries and 86 LOE (Level of Effort) activities. [redacted] The project is currently behind schedule by 8 days. 4b, 8a

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Rokstad Power Company Schedule scored 69, giving it a 69% probability of success
- Schedule Quality: Scored 69% versus a score of 75% or better which is considered a 'good' schedule

- [redacted] Schedule paths with [redacted] typically arise due to artificially constrained activities. The metric identifies activities with [redacted] and should not exceed 5%. This schedule scored 49%. [redacted] 4b, 8a
- Baseline Execution Index (BEI): Measures the efficiency with which actual work has been accomplished when measured against the baseline. The BEI score for this schedule is 0.87. The more activities that are completed on time or ahead of the baseline schedule will reflect a BEI of 1 or more. Conversely, a BEI of less than 1 indicates that the actual work accomplished is unlikely to achieve the completion date

Conclusions & Recommendations

In our opinion, this is a medium quality schedule. Although the schedule is only 8 days behind the baseline finish date, approximately 50% of the activities are slipping from the November 2016 approved baseline dates. The concern is that as many of the slipping activities are on the critical path, any further delays to these activities will further delay the completion date of the project. A recovery plan has been developed and submitted by Rokstad Power Company to Manitoba Hydro, but has not been approved at this time.

Source of Information & Reference Materials

- 031063 RPC Update to 20th August 2017 – POBS Removed.xer
- 031063 RPC Approved Baseline November 2016 – POBS Removed.xe5

Finding No. 7: Bipole III Transmission Line - Master Schedule

Observations & Findings

The Bipole III Transmission Line Master Schedule has a start date of 25th January 2014 and a completion date of 31st July 2018. The project is currently in progress with a status date of 1st October 2017. It has 131 normal activities of which 93 are complete, 22 are in progress and 16 are still planned. It contains 54 milestones, no summaries and 40 LOE (Level of Effort) activities. The project baseline start date was 14th February 2014 with the baseline finish date of 31st July 2018. The project is currently on schedule.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Bipole III Transmission Line Master Schedule scored 36, giving it a 22% probability of success
- Schedule Quality: Scored 36% versus a score of 75% or better which is considered a 'good' schedule

- Missing Logic: This metric measures the total number of activities that are missing a predecessor, a successor or both. Missing Logic is a core project quality check and the score should not exceed 5%. The score for this schedule is 41%
- [redacted] Schedule paths with [redacted] typically arise due to artificially constrained activities. The metric identifies activities with total float greater than 2 months and should not exceed 5%. This schedule scored 74%. [redacted] 4b, 8a
- High Duration: Measures the number of activities with [redacted] and typically this should not exceed 5%. The score for this schedule is 47% and this generally indicates that the schedule is too high level for adequate planning and controls
- Baseline Execution Index (BEI): Measures the efficiency with which actual work has been accomplished when measured against the baseline. The BEI score for this schedule is 0.87. The more activities that are completed on time or ahead of the baseline schedule will reflect a BEI of 1 or more. Conversely, a BEI of less than 1 reflects work that is finishing behind schedule

Conclusions & Recommendations

The overall quality of the schedule is considered low. In speaking with Manitoba Hydro's scheduler, we were advised that the Bipole III Master Transmission Line Schedule is a high-level schedule only. For detailed information, the Bipole III Master Programme schedule should be used.

As the Bipole III Transmission Line In-Service Date is 31st July 2018, this project has been identified as progressing on schedule. However, it is worth noting that approximately 61% of the normal activities are slipping from their baseline dates.

The overall Bipole III project is on schedule but the transmission line contractors are not. Recovery plans from both contractors have been submitted to Manitoba Hydro for review.

Source of Information & Reference Materials

- BPIII TL Master Schedule September 2017 POBS Removed.xer
- BPIII TL Master Schedule Baseline 2016 POBS Removed.xer

SCOPE ITEM 18:

Review, assess, and determine the reasons for project cost overruns since the final pre-construction control budget of $1.66 billion.

Finding No. 1: Bipole III Transmission Line - Project Cost Overruns from $1.66 billion Final Pre-Construction Budget

Observations & Findings

We reviewed the "Bipole III Project, Basis of Estimate Document, September 2014 Cost Estimate Update". The overall project cost has increased by $302 million from the $1.66 billion final pre-construction control budget to $1.96 billion.

Table 1: Comparison of Budgets

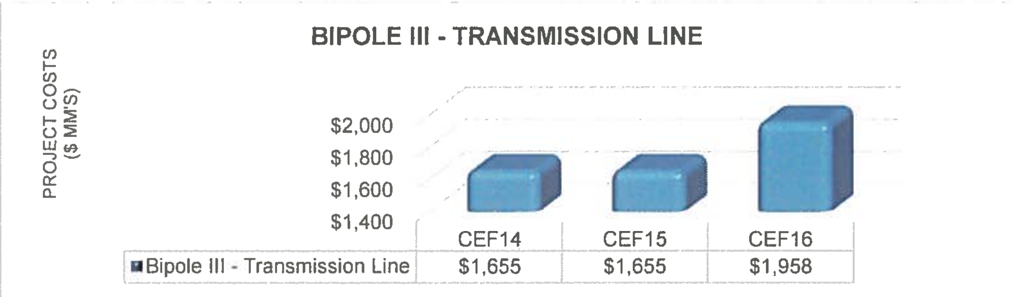

Table 2, below identifies the variances resulting in the project cost increase of $302 million.

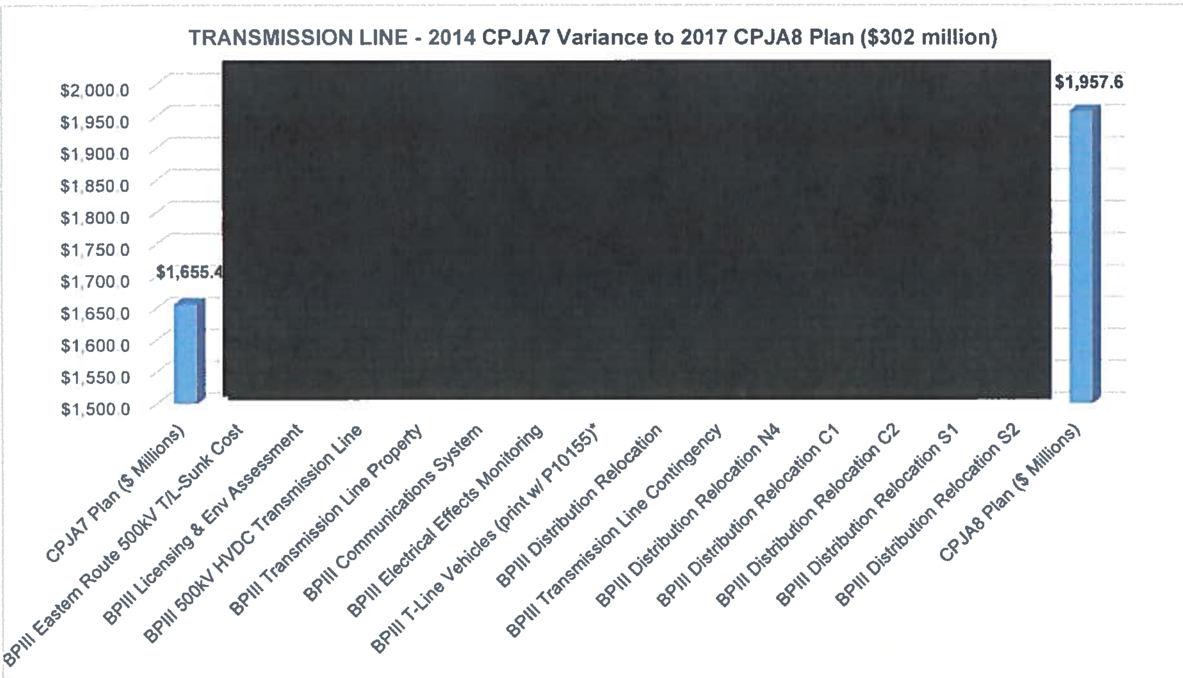


1a

Values above are reflective of Manitoba Hydro planned costs, that were provided by Manitoba Hydro in September 2017.

Key contributing factors driving the overall project cost increases are related to the following cost elements:

- BPIII 500 kV HVDC Transmission Line (P:10155) - [redacted]
- BPIII Transmission Line Property (P:14518) - [redacted] 1a, 4b, 8a,
- BPIII Transmission Line Vehicles (P:20255) - [redacted]
- BPIII Transmission Line Contingency (P:23817) - [redacted]

These cost elements account for [redacted] project cost increase. There is a $5 million cost reduction related to the communications system that reduces the project cost increase to $302 million. 1a, 4b, 8a,

Manitoba Hydro provided MGF with an additional document entitled "Scope Summary - from Bipole III TL CPJ 8A," that was referred to during a meeting in early September. This document does not satisfy the requirements of a formal Basis of Estimate, but does provide high level explanations for variations to the budgets presented in CEF16 from CEF14.

MGF PROJECT SERVICES

The justification for the $302 million cost increase is presented in this document as follows:

[redacted] increase: 1a, 4b, 8a

- Higher than planned "actual" market rates associated to anchors and foundations, tower assembly, erection and stringing contracts
- Delay claims (weather and material)
- Construction schedule compression (including schedule acceleration by helicopter tower erection in sections N2, N3, S1 and S2
- Biosecurity matting in S1 & S2
- Increased equipment and vehicles to support construction

[redacted] increase: 1a, 4b, 8a

- Additional materials required for southern route changes
- Costs associated with delays in materials
- Premiums to accelerate materials
- Engineering and material management contract cost increases

[redacted] increase: 1a, 4b, 8a

- Increased property costs for finalized southern route
- Inclusion of Land Valuation Appraisal Council (LVAC) certification
- Legal fees

[redacted] increase: 1a, 4b, 8a

- Increase in material management costs
- Increase in project and construction management costs

[redacted] increase:

- [redacted] 1a, 4b, 8a
- [redacted]

[redacted] increase: 1a, 4b, 8a

- Increase to project contingency (from P50 to P80)

$48 million decrease:

- Interest and escalation reduction due to compressed schedule and later than planned spends

Conclusions & Recommendations

Many of the additional costs appear to be a result of a project that was perhaps not at a stage of readiness at the time of project approval in terms of permit approvals, design development, land acquisitions and execution planning (i.e. procurement cycle and delivery time, market underpinned costing based on a tested and firm strategy, etc.).

Addressing many of the above elements prior to entering the project execution phase would have likely de-risked many of the project costs incurred.

Source of Information & Reference Materials

- Bipole III Project, Capital Cost and Schedule Risk Analysis and Contingency Estimate, dated 29th August 2014
- Scope Summary – from Bipole III TL CPJ 8A, presented 5th September 2017
- BPIII T Line actual costs to Sept. 2017 – ACTUALS
- BPIII T Line Contingency Drawdown Tracking_2017 08 09
- CPJA8 CPJA7 Comparison

SCOPE ITEM 19:

Assess Manitoba Hydro's updated forecast at completion capital cost, including whether appropriate contingencies and reserves have been provisioned, and schedule estimates for reasonableness.

Finding No. 1: Bipole III Transmission Line - Sections N1 and N4

Observations & Findings

Manitoba Hydro carries [redacted] its Estimate to Go Forward dated 16th June 2016 for the counterpoise scope. The cost of this work valued in accordance with Rokstad Power Company's Contract No. 031063 is [redacted] 1a, 4b, 8a

Conclusions & Recommendations

The estimated cost should be updated in accordance with Rokstad's contract. This will reduce the forecast at completion cost by [redacted] 1a, 4b, 8a

Source of Information & Reference Materials

- BPIII Estimate Rev 2 _ TLCC
- BPIII Transmission Line CPJA8 (2016) – 05
- Manitoba Hydro Contract No. 031063

Finding No. 2: Bipole III Transmission Line - Contingency

Observations & Findings

The following observations are taken from the September 2017 Bipole III Project Construction Report and the October 2017 Milestone Schedule:

- Project is 68% complete
- Targeted completion is 31st July 2018
- Contingency balance as of 1st November 2017 is [redacted] of the forecast work to go 7a

Conclusions & Recommendations

Based on the performance to date, it would appear that the contingency amount for the 500kV Transmission Line will be sufficient. The contracts for the 500kV Transmission Line are either lump sum or unit rate, so the risk is low that the contingency would be exceeded. This may be impacted by Rokstad's performance issues.

Source of Information & Reference Materials

- September 2017 Bipole III Project Construction Report
- PCS Log
- PCA Log
- October 2017 Milestone Schedule

Finding No. 3: Bipole III Transmission Line - Contingency Review

Observations & Findings

Contingency and management reserve carried in the final pre-construction budget was [redacted] in Contingency and [redacted] in Management Reserve). Contingency was set using a P50 value 7a
on an estimate value of $1.191 billion and a scheduled In-Service Date of July 2018. The total Contingency plus Management Reserve carried for the project was [redacted]

MGF has reviewed a Manitoba Hydro third-party consultant's report that was developed as part of the Bipole III Project Risk and contingency review in August of 2014. This report identified and proposed the following contingencies and reserves:

- Contingency (Cost)
    - P10, [redacted]
    - P50, [redacted]
    - P90, [redacted] 7a
- Bipole III - Contingency (Schedule)
    - P50, [redacted]
- Transmission - Reserve Risks

- Lost Season, [redacted]
- Bidding Market, [redacted] 7a
- Biosecurity, [redacted]

The justification and recommendation for the reserves within the report were outlined as follows and it was suggested that Manitoba Hydro fund an amount to cover the costs of the risks:

- Lost Season, [redacted] - a moderate to high probability was identified for one of the following to occur, which would result in an additional construction season. These are noted as delay impacts: 7a 8a
  - Late permits
  - Weather
  - Labour Shortage
- Bidding Market, [redacted] - moderate probability that the "historical" cost of local suppliers used in the estimate will not reflect the pricing of international contractors faced with a mega-project in a tough environment. Not a delay impact 7a 8a
- Biosecurity, [redacted] - a moderate probability that permit requirements will require the use of matting to be used for construction of Southern segments. Not a delay impact
- Two additional risks associated to the Converter Stations had been included within the listing of reserves:
  - Lost Season, [redacted] 7a 8a
  - Labour Shortage, [redacted]

It was recommended that for the project business case analysis, Manitoba Hydro use the P95 value, plus escalation.

CPJA 8a authorized an additional [redacted] to address remaining risks and schedule protection. This authorization increases the contingency carried within the project to [redacted] or as stated by Manitoba Hydro, a P80 or 80% confidence level. The difference between the P50 and P90 values carried within the third-party report for the Transmission Line scope was [redacted] This value does not account for any reserve, as indicated above. 7a 8a

In the "Scope Summary – from Bipole III TL CPJ 8A" document provided to MGF, Manitoba Hydro has indicated that "*...it is assumed that at completion of the project risks will have materialized and budget dollars previously allocated for Contingency will be depleted.*".

The remaining risks and the allocation of the available contingency [redacted] were provided by Manitoba Hydro as follows:

- [redacted] - biosecurity measures, schedule acceleration [redacted], and route alterations 1a, 7a, 8a
- [redacted]

- [redacted]
- [redacted]- potential material changes and quantity variations, [redacted]
- [redacted]- cover contract contingency for material supply and anchor foundation installation 1a, 7a, 8a
- [redacted]
- [redacted] potential schedule acceleration resultant interest and escalation changes to maintain the In-Service Date

Conclusions & Recommendations

The current value that Manitoba Hydro has indicated is at the P80 confidence level, and does not appear to be based on a current or updated review. This does not take into consideration events and updated risks that the project has been or may be exposed to.

Manitoba Hydro's corporate standard currently states that a set contingency of P50 or 50% confidence level is used.

This may be impacted by Rokstad's performance issues.

Source of Information & Reference Materials

- Bipole III Project, Capital Cost and Schedule Risk Analysis and Contingency Estimate, dated 29th August 2014
- Scope Summary – from Bipole III TL CPJ 8A, presented 5th September 2017
- BPIII T Line actual costs to Sept. 2017 – ACTUALS
- BPIII TLine Contingency Drawdown Tracking_2017 08 09
- CPJA8 CPJA7 Comparison

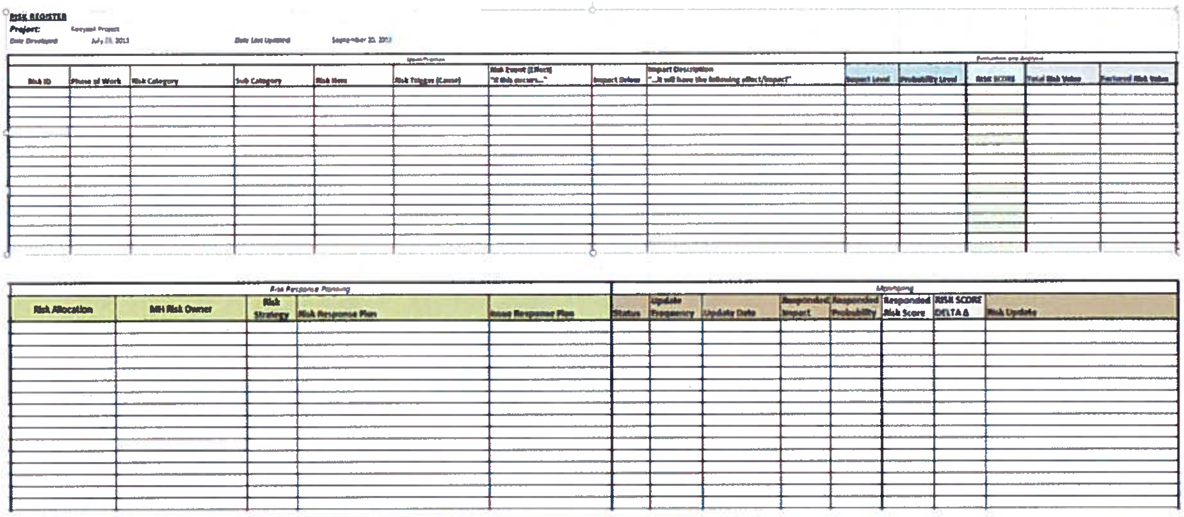
SCOPE ITEM 20:

Identify aspects of the updated cost estimate and schedule that are at heightened levels of risk and recommend risk mitigation strategies that Manitoba Hydro should use.

Finding No. 1: Bipole III Transmission Line - Risk Review

Observations & Findings

Manitoba Hydro does not have a specific Risk Management Plan for the Bipole III Transmission Line Project which has been identified as a requirement for all projects in the Keeyask and Converter Station Projects Procedure (RSK-001). Illustrated below is the Risk Register template included in the Procedure.



RISK REGISTER
Project: Keeyask Project
Date Developed: July 23, 2013 Date Last Updated: September 20, 2013

Risk ID	Phase of Work	Risk Category	Sub Category	Risk Item	Risk Trigger (Cause)	Risk Event (Effect) "If this occurs..."	Impact Driver	Impact Description "...it will have the following effect/impact"	Impact Level	Probability Level	RISK SCORE	Total Risk Value	Factored Risk Value

Risk Allocation	MH Risk Owner	Risk Strategy	Risk Response Plan	Issue Response Plan	Status	Update Frequency	Update Date	Responded Impact	Responded Probability	Responded Risk Score	RISK SCORE DELTA Δ	Risk Update

Overall, the Risk Register used for the Bipole III Transmission Line project appears to be thorough, containing typical information necessary to track and monitor potential projects risks; however, key information that is missing includes the date the Register was last updated and the date the specific Risk line item was last updated.

Some of the "potential" risks identified in the register related to specific issues that had already occurred on the project (e.g., BPIII TLR 38 - Section [redacted] Tower steel damaged by Contractor during Tower Erection Operation) and they were classified with a low probability which puts into question whether risks are being assessed correctly. 1a, 1c, 4b

Conclusions & Recommendations

MGF recommends the date the Register was last updated and the date the Risk ID was last updated be added to the Risk Register. The probability assessed to the specific risks should also be reviewed for accuracy.

Source of Information & Reference Materials

- RSK-001 Keeyask and Converter Station Projects Procedure
- Practice Standard for Risk Management (Project Management Institute)
- Bipole III Risk Register

Finding No. 2: Bipole III Transmission Line - Schedule Risk

Observations & Findings

The Transmission Line Integrated Master Schedule is a high level schedule which uses constraints rather than logic to set the start date for many of the activities. The schedule is currently progressing on schedule; however, the majority of the activities are slipping from their baseline dates. The biggest risk to the schedule is the stringing productivity by Rokstad. Manitoba Hydro requested a recovery plan from Rokstad which was not approved. Effective 9th November 2017, Manitoba Hydro removed scope of work from Rokstad Power Company for Tower 1 to 231 (inclusive) in the N1 section only.

Conclusions & Recommendations

Replacing Rokstad Power Company with another contractor for work located in Section N1 does not guarantee the project will finish as planned. The risk to the project in service date is still high and will remain so until a new contractor is assigned the work.

- MH BPIII TL Maser Schedule Sept 2017 POBS Removed.xer
- MH BPIII TL Master Schedule Baseline 2016 POBS Removed.xer

Finding No. 3: Bipole III Transmission Line - Contractor Risk

Observations & Findings

Both Rokstad Power Corporation (Rokstad) and Forbes Brothers Ltd. (Forbes) have had performance issues which continue in to the 2017/2018 winter season.

An analysis of the respective unit prices provided by Rokstad and Forbes would suggest that Rokstad may have front loaded its tender. [redacted] 1a, 4b, 7a, 8a

Manitoba Hydro in its letter dated 3rd October 2017, Manitoba Hydro addressed lack of progress issues with Rokstad, [redacted]

[redacted]

[redacted] 1a, 4b, 7a, 8a

[redacted]

Conclusions & Recommendations

Manitoba Hydro needs to properly record its cost associated with placing the removed scope with another contractor and to record the extra over costs it has incurred in having the new contractor perform Rokstad's removed scope.

- Manitoba Hydro letter dated 8th November 2017

SECTION 6 - Manitoba – Minnesota Transmission Project

SCOPE ITEM 21:

Determine whether the current state of design and engineering work supports the $453 million cost estimate. If not, identify what changes in the contingencies, reserves, or forecast at completion cost are required.

Finding No. 1: MMTP Transmission Line - Stanley Consultants Inc.

Observations & Findings

On account of the one-week timeframe that Stanley Consultants Inc. ("Stanley") had to perform their work, MGF directed Stanley to those areas where it was felt that Stanley's efforts in the one week available would add best input and content for the review.

Stanley, through its review of the estimates, did review certain aspects of the design and engineering drawings and specifications but have not commented specifically on these.

Conclusions & Recommendations

As such, Stanley did not address this scope.

Source of Information & Reference Materials

SCOPE ITEM 22:

Review and assess Manitoba Hydro's cost estimating methodologies that support the $453 million cost estimate, identifying best practices and short-comings.

Finding No. 1: MMTP - Cost Estimating Methodologies

Observations & Findings

A formal Basis of Estimate document which normally describes the cost estimating methodologies for the project was not prepared by Manitoba Hydro.

MGF describes Manitoba Hydro's cost estimating methodology as follows:

- Estimate methodology is "deterministic" as defined by AACE RP – 18R-97, which involves the predominant use of unit cost line items. Manitoba Hydro's cost estimating methodology is consistent with industry standard
- Detailed Estimates sheets are developed by Manitoba Hydro's subject matter experts in each respective field involved in the project (civil design, controls, apparatus procurement,

construction, commissioning, etc.) Some Excel estimate sheets include estimate preparation background and assumptions

- The estimate reflects Manitoba Hydro's most detailed scoping exercise, which includes a final preferred route for the transmission line, planning for indigenous opportunities in the project and final system studies out of Manitoba Hydro's planning and design groups
- Details for the breakdown of costs are included for the Transmission Line Construction and Design spreadsheets that includes estimated quantities and unit rates
- Estimate details for other Network/WBS were likewise developed in Excel spreadsheets and were input into SAP
- Interest and Escalation calculations are done automatically within Manitoba Hydro's accounting software (SAP)

Best Practices Identified

- The level of project definition as described in the scope of work is considered reasonable to develop the quantities
- Historical project unit rates and recent pricing is reasonable for the class of estimate
- Using Project Estimate templates provides consistency and familiarity with the estimate

Short-comings

- A Basis of Estimate was not created for the $453 million cost estimate
- Estimate detail sheets provided do not capture the level of detail provided in the Network / WBS scope of work
- Scopes of work for each Work Breakdown Structure are outdated and need revising
- Design/Material Take Off and Construction Waste Allowances are not identified or included for Equipment and Material Key Quantities. Allowances will be developed by the estimating team and department leads

Conclusions & Recommendations

MGF recommends that an appropriate Basis of Estimate (BoE) be developed for the project. Preparing a BoE is an industry Best Practice for all levels of estimates as it supports in ensuring many aspects of the project are understood, and/or necessary assumptions made at the time of estimate development have been documented.

As outlined by AACE International Recommended Practice No. 34R-05, "a well written basis of estimate will:

- Document the overall project scope
- Communicate the estimator's knowledge of the project by demonstrating and understanding of the scope and schedule as it relates to cost
- Alert the project team of potential cost risks and opportunities
- Provide a record of key communications made during estimate preparation

- Provide a record of all documents used to prepare the estimate
- Act as a source of support during dispute resolution
- Establish the initial baseline for scope, quantities and cost for use in the cost trending throughout the project
- Provide historical relationships between estimates throughout the project lifecycle
- Facilitate the review and validation of the cost estimate"

A Basis of Estimate should:

- Be factually complete, but concise
- Be able to support facts and findings
- Identify estimating team members and their roles
- Describe tools, techniques, estimating methodology and data used to develop the cost estimate
- Identify other projects that were referenced or benchmarked during the estimate preparation
- Be prepared in parallel with the cost estimate
- Establish the context of the estimate, and support estimate review and validation
- Qualify any rates or factors that are referenced either in the estimate or BoE"

Suggested guidelines for the structure, topics and contents are also included within the Recommended Practice that will assist Manitoba Hydro in ensuring consistent and transparent cost estimates.

- AACE International Recommended Practice No. 34R-05, Basis of Estimate, TCM Framework: 7.3 – Cost Estimating and Budgeting, dated 2nd May 2014

SCOPE ITEM 23:

Review and assess Manitoba Hydro's proposed tendering and contracting methodologies, including choices of contract types for the major contracts.

Finding No. 1: MMTP - Tendering & Contracting

Observations & Findings

Manitoba Hydro has not placed significant contracts for this project as yet. However, it should follow and learn from the experience of performing the Bipole III Transmission Line contracts. These were a mix of lump sum, unit rate, cost reimbursable and material supply contracts. Any variations arising on these contracts should be taken account of in the development of tenders for the MMTP project so that issues are not repeated.

Conclusions & Recommendations

Manitoba Hydro can apply the lessons learned on the Bipole III Transmission Line project in developing its contracting strategy for this project and the required suite of contracts with which to execute the project.

SCOPE ITEM 24:

Review and assess Manitoba Hydro's proposed construction management, contractor management, construction risk management, and scheduling methodologies.

Finding No. 1: MMTP - Schedule

Observations & Findings

The 26410 Dorsey 500kV Station Terminate Tie Line Project schedule was created from an existing template which promotes and ensures consistency between similar projects. It had a start date of 23rd July 2013 and is currently in progress with a completion date of 13th November 2020. The project is currently on schedule. As of 2nd October 2017, the schedule has 151 normal activities of which 9 are complete, 14 are in progress and 128 are still planned. The schedule is being updated every two months but should be updated more frequently once construction activities commence.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defense Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Schedule Quality: Scored 61% versus a score of 75% or better which is considered a 'good' schedule
- Logic Density: Assesses the average number of logic links per activity. An average of less than two indicates the schedule should be reviewed and updated with additional logic links. The

schedule scored 3.71. An upper limit of four is also recommended as logic density above this threshold indicates an overly complex logic within the schedule. The logic density peaks at 4.11 in 2019. These activities should be reviewed and updated

- Missed Activities: This measures the number of activities that have slipped from their baseline performance and is a measure of how good execution performance is. The schedule has 33 missing activities and all of these have high float thereby have no impact on the currently forecasted project finish date

Conclusions & Recommendations

The project is on schedule as per status date of 2nd October 2017. Once construction activities commence, the schedule should be reviewed and updated more frequently than the current every two months. Activities related to the logic density peaking at 4.11 in 2019 should be reviewed and updated to reduce potential complexity.

Finding No. 2: MMTP - Riel 500 or 230KV Stn. – Inst. Transformer Schedule

Observations & Findings

The Riel 500 or 230kV Stn – Inst. Transformer schedule has a start date of 23rd July 2013 and a completion date of 16th November 2020. The project is currently in progress with a status date of 2nd October 2017. It has 87 normal activities of which 10 are complete, 2 are in progress and 75 are still planned. It contains 16 milestones, no summaries and 17 LOE (Level of Effort) activities. The project baseline start date was the 5th January 2016 with the baseline finish date being 16th November 2020. The project is currently on schedule.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: is a single quality indicator resulting from a summary of detailed analysis. The Riel 500 or 230kV Stn – Inst. Transformer forecast schedule scored 64, giving it a 62% probability of success
- Schedule Quality: Scored 64% versus a score of 75% or better which is considered a 'good' schedule
- Missing Logic: This metric measures the total number of activities that are missing a predecessor, a successor or both. Missing Logic is a core project quality check and the score should not exceed 5%. The score for this schedule is 15%
- High float: Schedule paths with high amounts of float typically arise due to artificially constrained activities. The metric identifies activities with total float greater than 2 months and should not exceed 5%. This schedule scored 86%. Paths with float more than 2 months should be considered for acceleration and schedule optimization

- High Duration: Measures the number of activities with total float greater than 2 months and typically this should not exceed 5%. The score for this schedule is 41% and this generally indicates that the schedule is too high level for adequate planning and controls

Conclusions & Recommendations

The overall quality of the schedule is medium quality. The biggest areas for improvement include fixing logic areas, removing hard constraints on completed activities and modifying remaining hard constraints to soft constraints. The high duration is a concern, however Manitoba Hydro indicated that construction contracts have not been awarded. We recommend that these long duration activities be decomposed into more detail once contracts have been awarded and contractor schedules have been approved.

Finding No. 3: MMTP - Glenboro Transmission Line Re-Alignment Schedule

Observations & Findings

The Glenboro Transmission Line Re-Alignment has a start date of 1st July 2015 with a completion date of 13th November 2020. As of 2nd October 2017, the schedule has 26 normal activities of which 2 are complete, 1 is in progress and 23 are still planned. It contains 5 milestones, no summaries and 19 LOE (Level of effort) activities.

There is no baseline schedule for this scope of work. The schedule was recently created (no date on the information reviewed) to address some additional scope which was estimated but not scheduled in the 2016 budget. As there is no baseline schedule, Earned Value Management cannot be performed.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Schedule Quality: Scored 64% versus a score of 75% or better which is considered a 'good' schedule
- Missing Logic: This metric measures the total number of activities that are missing a predecessor, a successor or both. Missing Logic is a core project quality check and the score should not exceed 5%. The score for this schedule is 39%
- High Duration: measures the number of activities with total float greater than 2 months and typically this should not exceed 5%. The score for this schedule is 28% and this generally indicates that the schedule is too high level for adequate planning and controls

Conclusions & Recommendations

The schedule should be reviewed and address issues related to Missing Logic. Inaccurate logic in a schedule may put the project finish date at risk, as the correct critical path may not be identified or understood.

The identified High Duration activities should be decomposed into more detail to properly understand and monitor the plan.

Source of Information & Reference Materials

- MMTP – MGF Request – October 2017

Finding No. 4: MMTP - Glenboro Phase Shifter Schedule

Observations & Findings

The Glenboro Line G82R Phase Shifter schedule has a start date of 1st March 2013 and a completion date 5th May 2021. The project is currently in progress with a status date of 2nd October 2017. It has 117 normal activities of which 5 are complete, 7 are in progress and 105 are still planned. It contains 31 milestones, no summaries and 23 LOE (Level of Effort) activities.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office (GAO) Scheduling Best Practices and the US National Defence Industrial Association (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Glenboro Line G82R Phase Shifter forecast schedule scored 60, giving it a 55% probability of success
- Schedule Quality: Scored 60% versus a score of 75% or better which is considered a 'good' schedule
- Missing Logic: This metric measures the total number of activities that are missing a predecessor, a successor or both. Missing Logic is a core project quality check and the score should not exceed 5%. The score for this schedule is 40%
- Negative float: Ideally there should not be any negative float in a schedule. Negative float is a result of an artificially accelerated or constrained schedule and indicates that a schedule is not possible based on current completion dates. The analysis determined that 11% of activities contained negative float
- High Duration: Measures the number of activities with total float greater than 2 months and typically this should not exceed 5%. The score for this schedule is 40% and this generally indicates that the schedule is too high level for adequate planning and controls

Conclusions & Recommendations

The overall quality of the schedule is medium quality. The biggest areas for improvement include fixing logic areas, removing hard constraints on completed activities, modifying remaining hard constraints to soft constraints.

Source of Information & Reference Materials

- MMTP – MGF Request – October 2017

MGF PROJECT SERVICES

Finding No. 5: MMTP - Dorsey Stn: Manitoba – US 500kV Tie Line schedule

Observations & Findings

Dorsey Stn: Manitoba - US 500kV Tie Line schedule has a start date of 1st April 2010 and a completion date of 13th November 2020. The project is currently in progress with a status date of 31st July 2017. It has 84 normal activities of which 23 are complete, 23 are in progress and 38 are still planned. It contains 28 milestones, no summaries and 14 LOE (Level of Effort) activities. The project baseline start date was 12th July 2013 with the baseline finish date of 13th November 2020. The project is currently on schedule.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office (GAO) Scheduling Best Practices and the US National Defence Industrial Association (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The Dorsey Stn: Manitoba – US 500kV baseline schedule scored 42, giving it a 30% probability of success
- Schedule Quality: Scored 45% versus a score of 75% or better which is considered a 'good' schedule
- Missing Logic: This metric measures the total number of activities that are missing a predecessor, a successor or both. Missing Logic is a core project quality check and the score should not exceed 5%. The score for this schedule is 29%
- Logic Density: Assesses the average number of logic links per activity. An average of less than two indicates the schedule should be reviewed and updated with additional logic links. The schedule scored 3.00. An upper limit of four is also recommended as logic density above this threshold indicates an overly complex logic within the schedule. The logic density rises to 4.2 and 4.71 in years 2019 and 2020. These activities should be reviewed and updated
- High float: Schedule paths with high amounts of float typically arise due to artificially constrained activities. The metric identifies activities with total float greater than 2 months and should not exceed 5%. This schedule scored 66%. Paths with float more than 2 months should be considered for acceleration and schedule optimization
- High Duration: Measures the number of activities with total float greater than 2 months and typically this should not exceed 5%. The score for this schedule is 38% and this generally indicates that the schedule is too high level for adequate planning and controls
- Baseline Execution Index (BEI): Measures the efficiency with which actual work has been accomplished when measured against the baseline. The BEI score for this schedule is 0.27. The more activities that are completed on time or ahead of the baseline schedule will reflect a BEI of 1 or more. Conversely, a BEI of less than 1 reflects less than forecasted schedule execution

Conclusions & Recommendations

The overall quality of the schedule is medium quality. Manitoba Hydro uses a common template for these schedules which is good for consistency across schedules. However, the template should be modified as required for project specific information. The most important improvement required to this schedule is to review the logic which is the leading contributor to the poor Acumen Fuse score. Missing logic needs to be added to this schedule; leads should be removed; Start to Start and Finish to Finish Relations should be replaced with Finish to Start relations where possible. The High Duration and insufficient detail is a concern. Manitoba Hydro has indicated that construction contracts have not been awarded yet and we would recommend that these long duration activities are decomposed into more detail once contracts have been awarded and contractor schedules are approved.

Source of Information & Reference Materials

- MMTP – MGF Request – October 2017

SCOPE ITEM 25:

Assess Manitoba Hydro's updated capital cost estimate of $453 million for reasonableness, including whether appropriate contingencies and reserves have been provisioned.

Finding No. 1: MMTP - Estimate Reasonableness

Observations & Findings

Manitoba Hydro's Development Plan presently includes the construction of a new 500kV Transmission Line between Winnipeg and Duluth, Minnesota. The transmission line will originate at Dorsey Converter station and head south to the Manitoba-Minnesota border.

The project also includes associated upgrades at Dorsey, Riel and Glenboro stations. This scope of work addresses the design and construction of the new 500kV transmission line and the associated licensing, environmental assessment and property acquisition requirements. The In-Service Date for the project is 31st May 2020.

The following table is the summary provided by Manitoba Hydro outlining the MMTP Network Level Budget.

Manitoba Minnesota Transmission Project

Network Level Budget

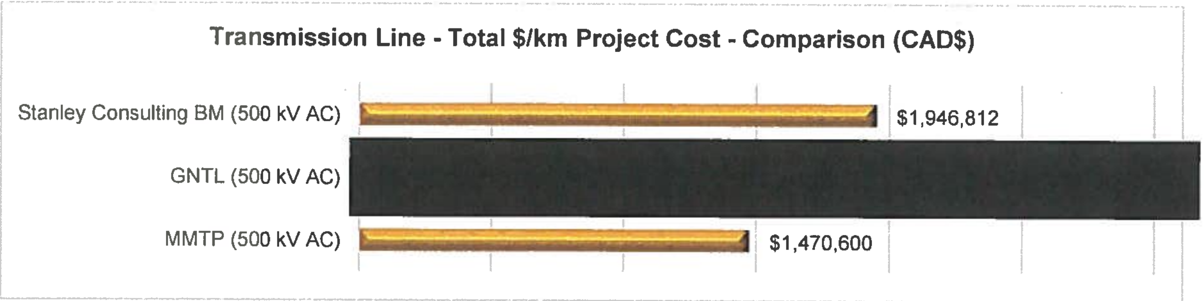
		TOTAL	**453,209,197.65**

1a, 4b, 7a,

MGF's review has focused on the transmission line and related scope of work, which represents [redacted] of the total project budget ([redacted] excl. Contingency).

- Dorsey 500kV T/L - [redacted]
- 500kV Facilities - [redacted]
- Glenboro Tie T/L - [redacted]
- Subtotal - [redacted]
- Contingency Prorated ([redacted] - [redacted]
- Total - [redacted]

These costs were broken down line item by line item to align with benchmark categories. The total value was converted to USD$ (at 0.787 USD per 1 CAD$) for a total of [redacted] The current project metrics suggest the costs for MMTP are lower than what other similar industry projects.



1d

We have set out below those activities whose costs are lower than other similar industry projects:

- Site Access Materials - Site access is based on ground conditions. This project corridor based on route maps provided, passes through areas requiring a higher level of site access than benchmark projects. Given probable conditions and standard site access methods this category is worth further review.
- Material Receipt Yards - Material receipt yard costs vary depending on the amount of civil work that is required to be performed to establish material laydown yards. Additions such as civil upgrades can increase costs. Further review is required to determine the extent to which yards are being upgraded and thus requiring restoration upon completion of use.
- Access Road/Clearing - Access/road clearing is the work required to be performed to provide off-ROW access. There appears to be no budget for this activity and given the expected ground conditions, this is of high concern and needs review, unless the budget for this resides elsewhere in the cost estimate.
- Clearing - Clearing cost is a function of the amount of vegetation to be removed to allow for construction access and installation. Given the existing conditions based on route selection, this appears to be low.
- Anchors - Anchor costs are a function of the foundation design. MMTP and GNTL have similar foundations; additional review to explain why costs for MMTP are much lower than GNTL is required.
- BFD/Aerial Markers – these costs are a function of environmental requirements; the included costs are much lower than benchmark and GNTL. This warrants additional review to confirm if BFD/Aerial Markers estimate is sufficient.
- Optical Fiber Ground Wire – these costs are a function of the OPGW selected. The costs appear low based on length of line.
- Overhead Ground Wire (OHGW) – these costs are a function of the OHGW selected. The costs appear low based length of line.
- Reclamation - Reclamation drivers are the amount of ground disturbed during construction and the extent to which grounds need to be restored to original conditions. Given the region in which the line is being routed it should be expected that restoration costs would be lower than typical.
- Construction Management (CM) & Inspection - CM and inspection costs are a function of the duration of construction as well as the number of inspectors required to verify construction compliance. Based on project complexity and length of construction these costs appear low.
- Construction Management (CM) - CM costs appear to be low based on scope and length of construction. The cost included appears low compared with benchmark values.
- CM Indirects - CM Indirects are a function of additional inspection, design work, or other construction related work. These costs should be reviewed in conjunction with CM cost.
- Legal (Internal) - Legal costs are a function of the amount of effort required to acquire land and permitting functions. Lower values indicate an easier approval process.
- Design Engineering - Design engineering costs are a function of the time and effort to develop operating design. Lower values would indicate either usage of standardized design or a more streamlined design process.

- Permitting - Permitting costs are a function of the effort required to research, develop applications, and obtain approvals of permitting applications for the line. Lower costs indicate a more streamlined permitting plan.

Areas of higher than expected costs have been identified as follows:

- Tower Steel - Tower steel is a function of the type and design of the towers required for the project. Given the type and configuration this costs appear high.
- Conductor - Line appears to be utilizing ACSR, key drivers are conductor type and whether conductor is bundled adding additional cost. Given voltage and load factors, the cost appears to be a little high but not excessive.
- Environmental – Environmental costs are driven by the level of environmental inspection and approvals required to permit the project. Given a greater amount of approval/review and a satisfactory permitting of the project, this may not be a concern but requires additional review based on difference to similar project (GNTL). MMTP appears to be at a higher cost.
- Survey & Geotech - Survey & Geotech work is based on work scope and amount of activities necessary to permit and perform construction. Higher number of survey activities required can drive up this cost. This activity needs further review.
- Community Affairs - Community affairs are driven much like public involvement and are a function of company outreach to inform public of the project and receive public input related to the permitting process. Harder to permit areas will drive community affairs costs higher.
- [redacted] 8a
- Public Involvement - Public involvement costs are driven by the required effort to obtain permitting. Project costs can vary based on the level of effort as public involvement can be viewed as an 'up front' permitting cost. Higher permitting costs can indicate project resistance early on but can result in lower follow-on permitting costs.

Conclusions & Recommendations

For comparison purposes, using similar project metrics converted from USD/mile, MMTP's current budget appears to be in the lower range of benchmarking metrics used.

MGF recommends that the items identified above are reviewed in further detail to ensure adequate budget has been provisioned.

MGF also recommends implementing an industry standard project stage gate process is recommended.

Source of Information & Reference Materials

- Overall SOW - MMTP - 500kV Transmission Line
- MMTP Network Level Budget
- Stanley Consulting Email, Re: Memo #1 – MGF High Level Cost Estimate Validation (GNTL and MMTP), dated 5th December 2017

SECTION 7 - Great Northern Transmission Line

SCOPE ITEM 26:

Compare the current GNTL estimated capital costs with estimates for similar projects and assess whether the estimated cost is reasonable.

Finding No. 1: GNTL - Capital Cost Comparison – Similar Projects

Observations & Findings

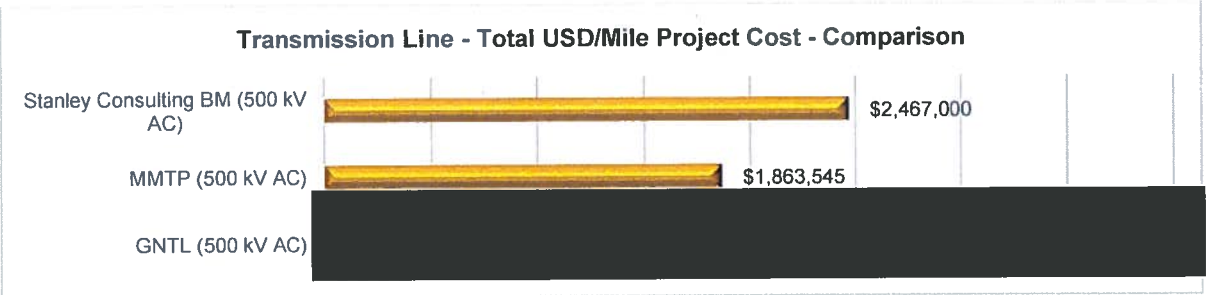
The transmission line scope of work represents 89% of the overall project budget, which is where MGF has focused this project review.

The following table represents a comparison of the GNTL Project to the Manitoba Minnesota Transmission Project (MMTP) and benchmarking data provided by Stanley Consultants Inc. ("Stanley"). These projects are based on AC transmission and a per mile cost.

Data provided by Stanley was based on the following assumptions. Currency assumed by Stanley's is US dollars, who based their estimate on referenced material from Midcontinent Independent System Operator (MISO), Western Electricity Coordinating Council (WECC) and various projects located in the great northern plains (Minnesota, North Dakota, Montana, Nebraska and Alberta Canada). The estimates are regionally based on actual project costs, with pricing escalated to reflect 2018 costs.

The costs were broken down line item by line item to align with benchmark categories. The CAD$ values were converted to USD$ (at 0.787 USD per 1 CAD$).

The current project metrics indicate that the costs for GNTL are higher than other similar industry projects.



1d

12132

We have set out below those activities whose costs are lower than other similar industry projects:

- Conductor - Line appears to be utilizing ACSR, key drivers are conductor type and whether conductor is bundled adding additional cost. Given voltage and load factors, the cost appears to be a little high but not excessive
- Site Access Materials - Site access is based on ground conditions. This project corridor based on route maps provided, passes through areas requiring a higher level of site access than benchmark projects. This value appears very high given probable conditions and standard site access methods and should be further reviewed
- Material Receipt Yards - Material receipt yard costs vary depending on the amount of civil work required to establish material laydown yards. Additions such as civil upgrades can increase costs. Further review is required to determine to what extent the yards are being upgraded and thus likely restoration upon completion of use
- Construction Management (CM) & Inspection - CM and inspection costs are a function of duration of construction as well as the number of inspectors required to verify construction compliance. Longer working hours, additional work days, and longer planned construction periods drive this cost
- Project Development - Project development costs are an internal function driven by the complexity of the project. Given an international project with project specific structures and high voltage, this cost is expected to be higher than benchmark values. Routing and permitting values also drive this cost
- PM & Engineering - Project management and engineering costs are an internal function that is driven by the complexity of the project. Given an international project with project specific structures and high voltage, this cost is higher than benchmark values
- Construction Management - CM costs appear to be high based on scope and length of construction relative to benchmark projects. This category needs further review
- CM Indirects - CM Indirects are a function of additional inspection, design work, or other construction related work. These costs should be reviewed in conjunction with CM cost
- Permitting Fees - Permitting fees are a function of required regulatory fees
- Public Involvement - Public involvement costs are driven by the required effort to obtain permitting. Project costs can vary based on the level of effort as public involvement can be viewed as an 'up front' permitting cost. Higher permitting costs can indicate project resistance early on but can result in lower follow-on permitting costs
- Land Analysis - Land analysis is a function of determining the land value and ownership on potential routes. Land analysis can be driven higher with multiple routes being considered and a larger number of routes being investigated
- Total Development CPM - Project development portion is higher than benchmark data and requires additional review to understand the reasons for the additional costs

MGF PROJECT SERVICES

Areas of lower than expected costs have been identified as follows:

- Grounding - Grounding costs are based on soil conditions and resistivity. The soils in the region of this project appear to be favourable to grounding conditions. For a 500kV line, the cost differential should not be this great even with these favourable conditions, so it is probable that additional grounding costs are nested within other budgetary areas
- Material Subtotal - Material costs in this format are being driven by the site access costs. Overall, removing the site access costs, this line item is lower than benchmark for material costs
- Reclamation - Reclamation cost drivers are related to the amount of ground disturbed during construction and the extent to which ground needs to be restored to original conditions. Given the region in which the line is being routed we would recommend that these restoration costs are further evaluated
- Environmental - Environmental is driven by the level of environmental inspection and approvals required to permit the project. Given a lesser amount of approval/review and satisfactory permitting of the project, these lower costs are the result
- Legal - Legal costs are a function of the amount of effort required to acquire land and permitting functions. Lower values may represent an anticipated easier approval process
- Design Engineering - Design engineering costs are a function of the time and effort to develop operating design. Lower values would indicate either usage of standardized design or a more streamlined design process
- Permitting - Permitting costs are a function of the effort required to research, develop applications, and obtain approval of permitting applications for the line. Lower costs indicate a more streamlined permitting plan

Conclusions & Recommendations

MGF finds the [redacted] transmission line estimate for the GNTL Project to be high when compared to 1d
other similar projects.

MGF recommends that further review is required and the items identified above are reviewed in further detail to ensure adequate budget has been provisioned.

Implementing an industry standard project stage gate process is recommended.

It is understood that there are provisions in place for the management of contingency draw-downs and as it stands the budget has been approved. MGF does, however, recommend that Manitoba Hydro maintain the greatest level of involvement in the areas of planning, selecting and implementation of contracting strategies, contract awarding process, management of change reviews and approvals as well as design reviews to ensure maximum value to Manitoba Hydro is achieved at a reasonable cost.

MGF recommends a detailed review of the revised estimate is performed as soon as possible. This review should be accompanied with a Basis of Estimate which addresses the items identified above.

- Stanley Consulting Email, Re: Memo #1 – MGF High Level Cost Estimate Validation (GNTL and MMTP), dated 5th December 2017

SCOPE ITEM 27:

Review and assess the Construction Management Agreement between Minnesota Power and Manitoba Hydro's subsidiary for reasonableness, identifying whether the agreements follow best practices or have short-comings and whether Manitoba Hydro's interests are protected.

Finding No. 1: GNTL - Structure of Construction Management Agreement

Observations & Findings

The Great Northern Transmission Line (GNTL) Construction Management Agreement (CMA) between Minnesota Power (MP) and 6690271 Manitoba Ltd. (6690271) governs the finalization of pre-construction activities and construction related activities of the GNTL Project and remains in effect until construction is complete and the Project is placed in service.

The CMA provides key definitions to understand the roles of the Parties to the CMA and how it is designed to operate. Minnesota Power is a:

(i) CUU Transmission Owner (CUU TO) – transmission function.
(ii) Transmission Line Payer (TLP) – merchant function.
(iii) Construction Manager (CM) – appointed by the Participants and retained by the CUU TO's

A Participant means any CUU TO or TLP but does not include the Construction Manager. 6690271 performs the following roles:

- CUU Transmission Owner
- Transmission Line Payer (TLP)

CUU Transmission Owners are defined as Owners of the Facilities, the Discretely Owned Substation Assets and the Underlying System Improvements (USI). MP is 100% owner of Discretely Owned Substation Assets and USI; and ownership of the Facilities was divided between MP (51%) and 6690271 (49%). Immediately after the CMA was executed, 6690271 assigned its 49% ownership to MP resulting in MP being the sole owner of the Project.

The Project is comprised of the following components:

(i) Facilities (all aspects of the 500kV transmission line.)

(ii) Discretely Owned Substation Assets (the Warroad River Series Compensation Station & the 500/230kV Iron Range Substation.)

(iii) Underlying System Improvements (specified MP system improvements that are identified in Appendix G of the CMA.)

Transmission Line Payers (TLP) are the Parties funding the development and construction of the Project. Under the CMA there are two (2) TLP's, MP and 6690271 respectively responsible for 46% and 54% of the costs of the Projects (the "CM Costs").

The Management Committee (MC) is established pursuant to Article 9: Participants' Rights, Duties and Obligations for the oversight and management of matters arising under the CMA. Each Participant shall be represented on the MC. All decisions by the MC must be unanimous, therefore 6690271 has a veto right.

The table of contents of the CMA is comprehensive, follows best practice and is as follows:

- Article 2: Management of the Construction Manager
- Article 3: Contracting Responsibilities
- Article 4: Certain Pre-Construction Duties
- Article 5: Project Budget and Management of CM Costs
- Article 6: Funding
- Article 7: Description of Construction Manager Duties
- Article 8: Financial Accounting; Reporting; Independent Oversight
- Article 9: Participants' Rights, Duties and Obligations
- Article 10: Representations and Warranties
- Article 11: Completion and Acceptance of Work
- Article 12: Construction Work Warranties
- Article 13: Indemnification
- Article 14: Confidentiality Provisions
- Article 15: Breach, Cure and Default
- Article 16: Term and Termination of Agreement
- Article 17: Limitations of Liability
- Article 18: Dispute Resolution
- Article 19: Notices
- Article 20 Miscellaneous Provisions

Conclusions & Recommendations

The structure of the Construction Management Agreement meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 2: GNTL - Management of the Construction Manager (Article 2)

Observations & Findings

Article 2: Management of the Construction Manager provides for the engagement of the Construction Manager to perform the CM Services, Real Property Management Services and the Agency Authority given to and accepted by the Construction Manager.

Section 2.1 addresses the appointment of Minnesota Power to act as Construction Manager for each Participant and the fact that a Participant is serving in the capacity of Construction Manager as well as Participant, does not in any way change, modify or release such Person from its rights, interest and obligations in its capacity as a Participant under the Construction Management Agreement.

Section 2.2 requires the Construction Manager to furnish its Services at no charge in excess of its actual cost to coordinate, manage, administer, oversee and enforce the performance of the Construction Work through the Final Completion of the Project.

The Construction Manager owes the Participants a duty of care to apply the skill and judgement of its organization to the Construction Management Services in accordance with the Construction Management Agreement, all Applicable Laws, Good Utility Practice and the directives and policies of the Management Committee.

In addition to the Construction Management Services, the Construction Manager shall provide Real Property Management Services to acquire Real Property in accordance with the Right of Way Strategies and Guidelines Plan.

Each CUU TO designates and appoints the Construction Manager as its designated and disclosed agent to carry out on behalf of each Participant, the Construction Management Services and the Real Property Management Services.

Conclusions & Recommendations

Article 2 Management of the Construction Manager of the Construction Management Agreement meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

MGF PROJECT SERVICES

Finding No. 3: GNTL - Contracting Responsibilities (Article 3)

Observations & Findings

Article 3: Contracting Responsibilities addresses the contracting and bidding requirements that the Construction Manager is to comply with together with identifying which approvals are required from the Management Committee (MC) in relation thereto. For example:

(i) Section 3.2.1.2 (i): MC approves CM's pre-bid qualification process.
(ii) Section 3.2.1.2 (ii): MC approves the list of interested bidders who will be invited to pre-qualify and will approve the eventual "Approved Bidders' List.
(iii) Section 3.2.1.6: MC shall approve the Bid Process Guidelines setting out the guidelines and procedures to be utilized during the bid process.
(iv) Section 3.2.2.1: CM shall provide a copy of all contracts, amendments and change orders to the MC.
(v) Section 3.2.3: CM may only enter into a Project Construction Contract with a Participant with the approval of the MC.
(vi) Section 3.2.4: CM can only amend or revise the Approved Bidders List with MC consent.
(vii) Section 3.2.5: CM shall present all Major Contracts, Major Change Orders and Material Actions to MC for approval *prior* to entering in to or undertaking such Major Contracts, Major Change Orders and Material Action,

Conclusions & Recommendations

Article 3 Contracting Responsibilities of the Construction Management Agreement meets acceptable commercial business practice. It provides Manitoba Hydro's subsidiary 6690271 with the right of approval to key decisions on the tendering, award and management of contracting.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 4: GNTL - Certain Pre-Construction Duties (Article 4)

Observations & Findings

Article 4: Certain Pre-Construction Duties addresses the Construction Work Schedule, Scope of Work, Project Plan, Approved Design and Pre-Construction Estimated Project Budget that shall be developed by the Construction Manager and submitted to the Management Committee for approval. These pre-construction duties shall be performed in accordance with Good Utility Practice and Applicable Law, compromising the following:

(i) Section 4.1: Preparing the Project Plan.
(ii) Section 4.2: Identifies the Approved Design for the Project that must be developed in accordance with Section 4.10 Design Criteria.
(iii) Section 4.3: Development Period Government Approvals.
(iv) Section 4.4: Preparation of Pre-Construction Estimated Project Budget.
(v) Section 4.5: Preparing the Equipment and Materials Procurement Plan.
(vi) Section 4.6: Implementing the Right of Way and Guidelines Plan.
(vii) Section 4.7: Develop and implement the Risk Management Plan.
(viii) Section 4.8: Prepare the Basis of Estimate.
(ix) Section 4.9: Implement the Change Control Guidelines.
(x) Section 4.10: Design Criteria.
(xi) Section 4.12: Use the Standard Forms (contracts and purchase orders) approved by the Management Committee.

Conclusions & Recommendations

Article 4 Certain Pre-Construction Duties meet acceptable commercial business practice. The above activities shall be approved by the Management Committee and any changes require the approval of the Management Committee before the Construction Manager may proceed with any change, thereby protecting the interests of 6690271.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 5: GNTL - Project Budget and Management of CM Costs (Article 5)

Observations & Findings

Article 5: Project Budget and Management addresses the project budget and cost accounting. Key components of this Article are:

(i) Section 5.1: describes the Construction Manager's responsibility for updating the Pre-Construction Estimated Budget and submitting to MC for approval.

(ii) Section 5.4.1.3: Construction Manager will evaluate and in good faith determine the projected effect of any Participant-Directed Program Change Request affecting the Construction Work or the Project Budget. The Management Committee will approve such determination before the Project Budget or Construction Work Schedule is adjusted.

(iii) Section 5.4.2: modifications to the Approved Design, the Project Plan or the Project Budget may be proposed by the Construction Manager as a Program Change Request to the Management Committee for approval.

(iv) Section 5.5: addresses specifically what are eligible and recoverable CM Costs and those cost that are not chargeable to the Project.

Conclusions & Recommendations

Article 5 Project Budget and Management meets acceptable commercial business practice. The activities are appropriate for the successful and transparent management of the Construction Management Agreement and these activities require approval by the Management Committee.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 6: GNTL - Funding (Article 6)

Observations & Findings

Article 6 generally describes the processes by which the Construction Manager shall be compensated for the CM Costs expended by it in performing the Services.

Section 6.1 states that the Construction Manager shall be compensated for CM Costs expended by it in the performance of the Services or in connection with the Construction Work. Section 6.2 sets out the Application for Payment process with invoices submitted to each Transmission Line Payer on a monthly basis complete with Supporting Documentation and in accordance with each Transmission Line Payer's Participant Payment Percentage. The Construction Manager has the obligation to reconcile all payments made and if the Construction Manager has received funds in excess of the actual CM Costs to which it is entitled, then the Construction Manager shall pay to each Participant the applicable Participant Payment Percentage of such excess.

Section 6.5 sets out the process by which the Final Payment will be calculated and any under or over payment to the Construction Manager will be processed. This shall be undertaken within ninety (90) days after the Final Completion.

MGF PROJECT SERVICES

Section 6.12 provides that the obligations of the Transmission Line Payers are several in proportion to their respective Participant Payment Percentages. This means each TLP is severally obligated to the extent of its Participant Payment Percentage for the payment of the CM Costs.

Conclusions & Recommendations

Article 6 Funding meets acceptable commercial business practice. The activities are appropriate for the successful and transparent management of the Funding requirements of the Construction Management Agreement and reinforces that the Parties are severally liable to the extent of their Participant Payment Percentages.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 7: GNTL - Description of Construction Management Duties (Article 7)

Observations & Findings

Article 7.1 provides a series of conditions precedent that have to be satisfied before the Construction Manager may commence construction thereby protecting the Transmission Line Payers. These conditions precedent are as follows:

(i) Management Committee has approved the Approved Design
(ii) Management Committee has approved the Updated Right of Way Strategies and Guidelines Plan
(iii) Management Committee has approved the Project Insurance
(iv) Management Committee has approved the Procurement Plan
(v) Management Committee has approved the Risk Management Plan
(vi) 6690271 has provided notice of its satisfaction or waiver of all 6690271 Construction Phase Conditions Precedent
(vii) MPM (Minnesota Power in its capacity as a Transmission Line Payer) has provided notice of its satisfaction or waiver of all MPM Construction Phase Conditions Precedent.
(viii) Management Committee has retained its Independent Oversight Engineer.
(ix) Management Committee has approved the Bid Process Guidelines
(x) Management Committee has approved the Project Plan
(xi) Management Committee has approved the Design Criteria

Section 7.3 Material Documents requires the Construction Manager to use commercially reasonable efforts to provide to each of the Participants all material documents related to the Project such as engineering and design matters, procurement and contracting strategies, final Permits, overall coordination and administration of the Project, project controls and processes, meeting minutes, etc.

Section 7.4 Project Meetings provides a list of planned meetings for GNTL. These include Discipline Team Meetings, Full Team Meetings and Management Team Meetings, which each Participant has the right to participate in and the Construction Manager must provide each Participant with notice of such meetings including copies of all agendas, meeting documentation and prior meeting minutes.

Section 7.5 Consultation and Approval obliges the Construction Manager to consult with and discuss with 6690271 any material decision it proposes to make in respect of the matters identified in Appendix N –

MGF
PROJECT SERVICES

Proposed Appendix N Decision. The Construction Manager shall provide 6690271 with a written outline and supporting basis for each Proposed Appendix N decision. 6690271 has the right to provide to the Construction Manager written revisions to the Proposed Appendix N Decision for the Construction Manager's consideration. The Construction Manager shall not proceed with implementing any Proposed Appendix N Decision until it has received the approval of the Management Committee.

Proposed Appendix N Decision comprise matters such as revisions to:

(i) Integrated Baseline, Budget, Schedule and Cash Flow
(ii) Risk Management
(iii) Procurement Plan
(iv) Tower Evaluation Studies
(v) Conductor Design
(vi) Construction Specification
(vii) Major Equipment Specifications
(viii) Commissioning

Section 7.6 Approval obliges the Construction Manager not to proceed with making any material decision in respect of the matters identified in Appendix O – Proposed Appendix O Decision. Proposed Appendix O Decision matters comprise:

(i) Insulator Type Selection
(ii) Tower Testing
(iii) Sub-Synchronous Resonance Screening
(iv) Structure Design
(v) Control and Relay Schematics
(vi) Emergency Response Plan

The Construction Manager shall provide the Management Committee with a written outline and supporting basis for each Proposed Appendix O Decision. If the Management Committee does not approve the Proposed Appendix O Decision, 6690271 has the right to provide the Construction Manager with written revisions to the Proposed Appendix O Decision for the Construction Manager's consideration ("Appendix O Revisions"). The Construction Manager has the right to again seek approval from the Management Committee of the Proposed Appendix O Decision with or without incorporating the Appendix O Revisions. If not approved by the Management Committee, then the dispute resolution process set out in Section 18.1.2.1 shall resolve the dispute.

Section 7.8 Contract Administration addresses the contract administration duties of the Construction Manager. It is worth noting that the Construction Manager shall not enter into any Major Change Order or take any Material Action until the Management Committee has voted to approve same; sections 7.8.4 (i) and 7.8.4 (ii) refers.

Section 7.15.1.1 Construction Manager Rights and Obligations allows the Construction Manager to adjust, defend and settle insured claims against a Participant, so long as such is within the policy limits provided by any of the applicable insurance policies maintained in accordance with the Project Insurance. The Construction Manager needs the approval of the Management Committee to settle claims above the policy limits.

Section 7.15.2.5 permits the Construction Manager to settle any individual uninsured claim up to [redacted] and to release any Third Party from liability or potential liability up to a limit of [redacted] 1d

12142

MGF PROJECT SERVICES

Conclusions & Recommendations

Article 7 Description of Construction Management Duties provides a comprehensive scope of the Construction Manager's duties together with appropriate protective approval mechanisms to protect 6690271's interests.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 8: (Article 8) GNTL - Financial Accounts; Reporting; Independent Oversight

Observations & Findings

Article 8 generally describes the Construction Manager's duties with respect to the preparation and contents of progress and financial accounts and reports. The reports include Progress Reports, Financial Reports, Year-end Financial Reports and Final Completion Reports

Section 8.5 Independent Oversight Engineer provides for the Management Committee to retain an engineering consulting firm to provide objective and independent oversight of the Construction Work and the Construction Manager's performance of the Services. All information and reports provided by the Independent Oversight Engineer may be used by any Participant in furtherance of exercising its rights under the Construction Management Agreement and in resolving any dispute pursuant to Article 18 Dispute Resolution.

The Independent Oversight Engineer, inter alia, will:

(i) Review Funding Requests, Change Orders, Contract Amendments and associated documentation
(ii) Inspect and determine whether Construction Work has been properly performed
(iii) Monitor the obligations of the Construction Manager
(iv) Conduct monthly review of the design, procurement and construction
(v) Verify Project Completion

Conclusions & Recommendations

Article 8 Financial Reports; Reporting; Independent Oversight meets acceptable commercial business practice. The Article provides for comprehensive reporting and the appointment of the Independent Oversight Engineer provides additional protection to the interests of 6690271.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 9: GNTL - Participant's Rights, Duties and Obligations (Article 9)

Observations & Findings

Article 9.1 Participants Act Through Management Committee provides that oversight and management of matters that arise under the Construction Management Agreement will be determined by the Management Committee. The Management Committee has the authority to direct the means, manner and methodology used by:

(i) The Construction Manager to carry out the Services; or

(ii) Any Contractor to carry out Construction Work in accordance with the express provisions of the Construction Management Agreement (Section 9.1.1 refers)

Section 9.1.3 sets out the Management Committee composition with Section 9.1.4 addressing meetings, notice of meetings and associated governance. Section 9.1.4.2 addresses the quorum for a Management Committee meeting. Section 9.1.4.3 provides for each Participant having a representative on the Management Committee and each representative having one vote. Section 9.1.4.4 requires the unanimous affirmative vote of all representatives of the Management Committee, which in effect give 6690271 a veto. Section 9.10 permits the Management Committee to suspend, delay or interrupt Construction Work and Section 9.12 allows each Participant to audit or inspect the Records of the Construction Manager.

Conclusions & Recommendations

Article 9 Participant's Rights, Duties and Obligations provides appropriate mechanisms for oversight and management of the Construction Management Agreement. The requirement for all decisions to be by unanimous affirmative vote provides 6690271 with a right to veto those matters with which it disagrees or would not support.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 10: GNTL - Representations and Warranties (Article 10)

Observations & Findings

Article 10 generally sets out the particular representations and warranties of the Participants and the Construction Manager.

Section 10.1 sets out the Construction Manager's representations and warranties, which representations and warranties survive the execution and delivery of the Construction Management Agreement. Section 10.2 provides the same for the Participants, on a several, not joint basis.

Conclusions & Recommendations

Article 10 Representations and Warranties meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 11: GNTL - Completion and Acceptance of Work (Article 11)

Observations & Findings

Article 11 addresses the terms governing the commissioning, completion and acceptance of the Project. Section 11.1.1 states that the Construction Manager makes no performance guarantees nor guarantees the successful commissioning of the Project, with Section 11.1.2 addressing the procedure and requirements regarding the Initial Notice of Commissioning. Section 11.1.3 obliges the Management Committee to advise the Construction Manager of any inadequacy, inaccuracy or otherwise unacceptable information or result set forth in a Notice of Commissioning and specifies the Construction Manager's responsibility to correct such deficiency.

Section 11.2 sets out the process for the Construction Manager to advise the Management Committee that Substantial Completion has been achieved and Section 11.4 addresses the process for achieving Final Completion. In both cases the Management Committee has the authority to vote to approve or reject such Notices.

Conclusions & Recommendations

Article 11 Completion and Acceptance of Work meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 12: GNTL - Construction Work Warranties (Article 12)

Observations & Findings

Article 12 Construction Work Warranties addresses the warranty requirements for Contractors engaged on the Project, addressing matters such as the scope, duration and enforcement of warranties.

Section 12.1 provides for the Construction Manager to make commercially reasonable efforts to obtain warranties from Contractors with respect to the performance of the Construction Work. The Construction Manager shall also make commercially reasonable efforts to procure from each Contractor pursuant to its respective Project Construction Contract, an undertaking from the Contractor to procure from all its Subcontractors, warranties with respect to any Materials, Equipment or services provided by each such Subcontractor. Such Subcontractor warranties shall be enforceable by, or be assignable to, the Participants (Section 12.1.3 refers).

Conclusions & Recommendations

Article 12 Construction Work Warranties provides appropriate mechanisms to obtain for the benefit of the Participants warranties from Construction Contractor and their Subcontractors.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 13: GNTL - Indemnification (Article 13)

Observations & Findings

Article 13 addresses Third Party Indemnification and Environmental Indemnity by Discrete Substation Owners and USI Owners. Section 13.1.1 provides that each Participant shall severally to the extent of its ownership indemnify the Construction Manager from Third Party claims, except to the extent such claims arise from an act or omission of the Construction Manager for which the Participants are indemnified under Section 13.1.2 or for which there is contributory negligence under Section 13.1.3. Sections 13.3 and 13.4 address Insurer Obligations and Indemnification Costs respectively.

Conclusions & Recommendations

Article 13 Indemnification Representations and Warranties meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 14: GNTL - Confidentiality Provisions (Article 14)

Observations & Findings

Article 14 sets out the confidentiality obligations of the Parties defining matter such as Confidential Information, required disclosure, public disclosure, inadequate remedy at law issues and additional regulatory requirements.

Conclusions & Recommendations

Article 14 Confidentiality Provisions meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

MGF PROJECT SERVICES

Finding No. 15: GNTL - Breach, Cure and Default (Article 15)

Observations & Findings

Article 15 sets out the provisions relating to Breach, Cure and Default addressing matters such as Events of Breach, Notice of Breach, Cure, Default and Default Rights. The Participants further agree in this Article that the dispute resolution provisions set forth in Article 18 are and shall be the sole and exclusive remedy of the Participants for the resolution of all disputes, claims or controversies arising under this Agreement.

Conclusions & Recommendations

Article 15 Breach, Cure and Default meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 16: GNTL - Term and Termination of Agreement (Article 16)

Observations & Findings

Article 16 generally addresses the:

(i) Effective Time
(ii) Term
(iii) Termination by Participants
(iv) Termination by the Construction Manager; and
(v) the Effect of Termination.

Section 16.2.1.2 provides the right by Participants to terminate the Construction Management Agreement for convenience and for the Management Committee to terminate for cause as per Section 16.2.1.3, if the Construction Manager has:

1. Committed an act of material fraud
2. Failed to follow any material policy or directive of the Management Committee
3. Abandoned or suspended performance of the services for at least thirty (30) consecutive days
4. Assigned its rights or obligations without the prior written consent of the Management Committee
5. Failed or refused to perform any obligations under the Construction Management Agreement
6. Failed or refused to comply with any Applicable Law
7. Breached a Major Contract as a result of intentional misconduct or wilful misconduct
8. Experienced an Insolvency Event
9. Committed a breach of fiduciary duty when acting as an agent under the Construction Management Agreement.

The Construction Manager has the opportunity to cure in accordance with Section 16.2.1.3.1 failing which the Process for Termination in Section 16.2.1.3.4 is followed.

The Construction Manager may terminate the Construction Management Agreement for Good Reason in accordance with Section 16.2.1.4 where Good Reason means:

- Failure of 6690271 to make the required payments
- Failure or refusal of 6690271 to perform any other obligation under the Construction Management Agreement

and 6690271 fails or refuses to cure such default within the proscribed period. Section 16.2.3 Effect of Termination addresses matters such as Duties upon Termination, Property Rights, winding up the Services and Construction Work together with any payment obligations to Contractors and Third Parties.

Conclusions & Recommendations

Article 16 Term and Termination of Agreement meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 17: GNTL - Limitations of Liability (Article 17)

Observations & Findings

Section 17.1 provides that no party under the Construction Management Agreement shall be liable to the other party for any "special, incidental, consequential, indirect, exemplary, treble or punitive Damages or any other penalty, with the exception of Third Party claims set out in Section 13.1.

In accordance with Section 17.2 the Construction Manager shall not be liable for Damages to the Participants, except for Damages arising from:

- Construction Manager's fraud; or
- Construction Manager's gross negligence, intentional misconduct or wilful misconduct

with the exception of the Construction Manager's liability for Third Party claims that are indemnified pursuant to Section 13.1.2

Conclusions & Recommendations

Article 17 Limitations of Liability Term meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

MGF PROJECT SERVICES

Finding No. 18: GNTL - Dispute Resolution (Article 18)

Observations & Findings

Subject to the provisions of Articles 16 and 17 of the Construction Management Agreement, Article 18 sets out the dispute resolution provisions that govern all disputes, claims and controversies arising out of the Construction Management Agreement. Section 18.1.1 addresses disputes between the Participants and Section 18.1.2 between the Construction Manager and the Participants.

Appendix Q: Dispute Resolution Procedures sets out the procedures for resolution for all disputes arising under the Construction Management Agreement. The procedure is comprehensive, addressing:

1. Notification to all Parties of a Dispute
2. Resolution of the Dispute by each Participant assigning an executive for the purpose of resolving such dispute or controversy within ten (10) Business Days following the commencement of discussions to resolve such Dispute.
3. If the Dispute remains unresolved then the disputing Participant may initiate non-binding mediation. Section 2.2 Non-Binding Mediation addresses the selection of the mediator, location in Minneapolis-St. Paul, MN, the governing rules and how the mediation shall be terminated.
4. Disputes not resolved by either the executives of the Participants or pursuant to Non-Binding Mediation shall be finally settled under the Regular Track Procedures of the Construction Industry Arbitration Rules of the American Arbitration Association by three (3) arbitrators appointed in accordance with the Arbitration Rules.
5. The proceedings comprised of all documents and testimony including depositions and expert reports shall be confidential.
6. Both Participants have the right to seek immediate injunctive and other equitable relief through the courts in the event of any material breach of the Construction Management Agreement by the other Party that would cause the non-breaching party irreparable injury for which there would be no adequate remedy at law.

Conclusions & Recommendations

Article 18 Dispute Resolution meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 19: GNTL - Notices (Article 19)

Observations & Findings

Article 19 Notices contains the Notice provisions for the Construction Management Agreement.

Conclusions & Recommendations

Article 19 Notices meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

Finding No. 20: GNTL - Miscellaneous Provisions (Article 20)

Observations & Findings

Article 20 Miscellaneous Provisions contains the usual miscellaneous provisions found in a contract for example, 'binding obligations', 'amendment and waiver', 'severability', 'survival', 'execution in counterparts', 'force majeure', 'governing law' and 'venue'.

Conclusions & Recommendations

Article 20 Miscellaneous Provisions meets acceptable commercial business practice.

Source of Information & Reference Materials

- Great Northern Transmission Line Construction Management Agreement dated April 12, 2016

SCOPE ITEM 28:

Assess the current forecast at completion capital cost for reasonableness, including whether appropriate contingencies and reserves have been provisioned.

Finding No. 1: GNTL - Estimate Review -- Forecast at Completion (FAC)

Observations & Findings

In May 2016, Minnesota Power submitted an updated estimate for the GNTL Project. Since the 2013 USD$677 million cost estimate, project costs have [redacted]

The variance noted between the estimate total and the total approved budget is [redacted]

The table below summarizes the project costs. The transmission line scope of work represents 89% of the overall approved budget of [redacted] The supporting back-up provided to MGF for review is the 2016 Cost Estimate totalling [redacted] prepared by Minnesota Power. 1d

MGF's findings within this review are based upon the 2016 Cost Estimate provided. The noted variance between the cost estimate and the approved budget is a [redacted]

A cost estimate review was addressed in "Scope Item 26", reviewing many of the cost elements included in the transmission line scope of work. It was noted in this review that costs are considered to be at the high range as compared to other similar projects.

Scope of Work	MP (2013 USD) Cost Estimate	MP (2016 USD) Cost Estimate	Variance (USD) Cost Estimate	Approved Budget (USD) (June 2017 Mo. Rpt)	Variance (USD) Est. vs. Budget	Project %
GNTL 500kV Transmission Line	**$579,685,986.81**	[redacted]				**89%**
Iron Range 500kV Substation	$42,994,380.00					7%
Warroad River Series Compensation Station	$49,258,220.00					3%
Existing 230kV Transmission System Modifications – 230 kV Line Portion	$3,891,710.90					1%
Substation Upgrades – Blackberry	$275,000.00					0%
Substation Upgrades – Arrowhead	$137,500.00					0%
Substation Upgrades – Forbes	$137,500.00					0%
Substation Upgrades – Hilltop	$137,500.00					0%
Required Network Upgrades	$430,000.00					0%
Project Total Cost	**$676,947,798**					**00%**

1d

Note: Values above, include Contingency (No Contingency Incl. for Network Upgrades) and Capitalized Property Taxes ($44.2 million)

12151

MGF's reference for the "Approved Budget" was taken from Minnesota Power's "Monthly Progress Report (June 2017)".

The following elements have been carried as Contingency in the sum of [redacted] of the base cost.

- Landowner Payment Contingency - [redacted]
- Engineering and Program Management, Construction Phase Contingency - [redacted]
- Construction Phase Contingency - [redacted]
- 500kV Line - [redacted]
- Iron Range 500kV Substation, Construction Phase Contingency - [redacted]
- Iron Range 500kV Substation - [redacted]
- Warroad River Series Compensation Station, Construction Phase Contingency - [redacted] 1d
- Warroad River Series Compensation Station - [redacted]
- Existing 230kV Transmission System Modifications, Construction Phase Contingency - [redacted]
- Existing 230kV Transmission System Modifications - [redacted]
- 230 kV Substation Upgrades - [redacted]

Minnesota Power's cost estimating methodology is consistent with the industry standard for the class of estimate and for the estimate's intended purpose. The level of project definition is considered reasonable to develop quantities and unit prices.

MGF considers that the cost estimate prepared is comparable to a Class 4 estimate, as per AACE standards and based on the level of scope definition and estimate methodology used in developing the estimate.

A "COST ASSUMPTIONS" summary was provided; however, a detailed Basis of Estimate was not.

Expected items to be included would consist of the following:

- Purpose
- Project Scope Definition
- Methodology
- Estimate Classification
- Design Basis
- Planning Basis
- Cost Basis
- Allowances
- Reconciliation
- Benchmarking
- Estimate Quality Assurance

- Estimating Team
- Attachments
- Estimate Deliverable Checklists
- Reference Documents
- Exclusions
- Exceptions
- Risks and Opportunities
- Containments
- Contingencies
- Management Reserve

Based on USD/mile metrics for the project, GNTL ([redacted] is significantly higher than those project metrics seen for past projects (USD$2.47 million) and compared to MMTP (USD$1.86 million). 1d

Conclusions & Recommendations

The Contingency is reasonable for this project, but would point out that the overall project cost is considered high when compared with other similar projects.

MGF recommends that an updated estimate, which has been supported through additional technical and commercial deliverables, as well as market underpinning (i.e. quotations or even awarded contracts) be developed and reviewed as soon as possible. This will ensure a higher level of confidence.

MGF also recommends that regardless of which stage the cost estimates are produced, that a Basis of Estimate is produced.

It was noted that Manitoba Hydro's Transmission Projects Department (TPD) has collaborated with internal Manitoba Hydro subject matter experts to conduct a review of the "Pre-Construction Estimate Project Budget and Basis of Estimate" provided by Minnesota Power. This is good practice, and it was also noted that the transmission line approved budget has been reduced, but the overall project total remains unchanged.

This would further reinforce MGF's view that continued oversight should be maintained.

Source of Information & Reference Materials

- Great Northern Transmission Line Project Scope Document – Revision 1
- AACE International Recommended Practice No. 34R-05, BASIS OF ESTIMATE, TCM Framework: 7.3 – Costs Estimating and Budgeting.

SCOPE ITEM 29:

Assess Minnesota Power's approach to establishing the contingency for GNTL and whether appropriate risk areas and magnitudes of uncertainty are recognized.

Finding No. 1: GNTL - Iron Range 500/320kV Sub – MTEP 3831 Schedule

Observations & Findings

The GNTL 107621 – Iron Range 500/230kV Sub-MTEP 3831 schedule has a start date of 1st December 2015 and a completion date of 2nd February 2021. The project is currently in progress with a status date of 31st October 2017. It has 353 normal activities of which 77 are complete, 31 are in progress and 245 are still planned. It contains 188 milestones, 4 summaries and 0 LOE (Level of effort) activities.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The GNTL 107621 Iron Range 500/230kV Sub-MTEP 3831 schedule scored 81, giving it an 84% probability of success
- Schedule Quality: Scored 81% versus a score of 75% or better which is considered a 'good' schedule
- High duration: Is the total number of activities that have a duration longer than 2 months. High duration activities are generally an indication that a plan is too high level for adequate planning and controls. The number of high duration activities should not exceed 5% and this schedule scored 32%. Four of the activities identified with high durations are the summary activities of Engineering, Procurement, Construction and Project Closeout. These activities are planning packages which should be broken down into more detail as the project proceeds and more details become available

Conclusions & Recommendations

With a Fuse score of 81, we consider this to be a "good" schedule. The schedule will be improved when the summary activities of Engineering, Procurement, Construction and Project Closeout can be broken down in to more detail as the project proceeds and these details become available.

- GNTL Program Master Schedule DD 10.31.17.xer

MGF PROJECT SERVICES

Finding No. 2: GNTL - 500kV MTEP 3831 Schedule

Observations & Findings

The GNTL 105471 500kV Transmission Line MTEP 3831 schedule has a start date of 1st October 2011 and a completion date of 2nd February 2021. The project is currently in progress with a status date of 16th September 2017. It has 868 normal activities of which 277 are complete, 114 are in progress and 477 are still planned. It contains 249 milestones, 6 summaries and 21 LOE (Level of effort) activities.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The GNTL 105471 500kV Transmission Line MTEP 3831 schedule scored 60, giving it a 55% probability of success
- Schedule Quality: Scored 60% versus a score of 75% or better which is considered a 'good' schedule
- High Float: is the number of activities with total float greater than 2 months and this should not exceed 5%. This schedule scored 51% which indicates that schedule paths have artificially constrained activities. Schedule paths with float of more than two months should be considered for acceleration and schedule optimization
- High duration: is the total number of activities that have a duration longer than 2 months. High duration activities are generally an indication that a plan is too high level for adequate planning and controls. The number of high duration activities should not exceed 5% and this schedule scored 44%. Four of the activities identified with High Duration are summary activities, namely Engineering, Procurement, Construction and Project Closeout

Conclusions & Recommendations

With a Fuse score of 60%, we consider this to be a "medium quality" schedule. We recommend that all logic issues should be corrected to improve the quality and reliability of the schedule and that activities with high duration should be reviewed and broken down into more detail as the information becomes available.

Source of Information & Reference Materials

- 105471 – GNTL 500kV Transmission Line MTEP 3831 - GNTL Program Master Schedule DD 10.31.17.xer

Finding No. 3: GNTL - 107626 Blackberry Sub Mods MTEP 3831

Observations & Findings

The 107626 Blackberry Sub Mods MTEP 3831 schedule has a start date of 3rd September 2019 and has 25th January 2021 as the completion date. The project is currently planned with a status date of 16th September 2017. It has 14 planned activities and contains 3 milestones, 4 summaries and no LOEs (Level of Effort).

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of the detailed analysis. The 107626 Blackberry Sub Mods MTEP 3831 schedule scored 67, giving it a 65% probability of success.
- Schedule Quality: Scored 67% versus a score of 75% or better which is a considered a "good" schedule.
- Missing Logic: Is the total number of activities that are missing a predecessor, a successor, or both. This number should not exceed 5% and 12% of the activities on this schedule are missing logic. Missing logic impacts the quality of results derived from a time and risk analysis.
- High Duration: Is the total number of activities that have a duration longer than 2 months. High duration activities are generally an indication that a plan is too high level for adequate planning and controls. The number of high duration activities should not exceed 5% and this schedule scored 18%. This project is still in the planning phase. Activities should be broken down into more as the planning phase proceeds.

Conclusions & Recommendations

With a Fuse score of 67, we consider this to be a "medium quality" schedule. We recommend that all logic issues should be corrected to improve the quality and reliability of the schedule and that activities with high duration should be reviewed and broken down into more detail as the information becomes available.

Source of Information & Reference Materials

- GNTL Program Master Schedule DD 10.31.17

Finding No. 4: GNTL - 107625 230kV Line Mods MTEP 3831

Observations & Findings

The GNTL 107625 230kV Line Mods MTEP 3831 schedule has a start date of 2nd January 2019 and has 15th January 2020 as the completion date. The project is currently planned with a status date of 1st January 2019. It has 15 normal activities of which 0 are complete, 0 are in progress and 15 are still planned. It contains 3 milestones, 4 summaries and no LOEs (Level of Effort).

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of the detailed analysis. The GNTL 107625 230kV Line Mods MTEP 3831 schedule scored 55, giving it a 48% probability of success.
- Schedule Quality: Scored 55% versus a score of 75% or better which is a considered a "good" schedule.
- Missing Logic: Is the total number of activities that are missing a predecessor, a successor, or both. This number should not exceed 5%. On this schedule, 17% of the activities are missing logic which impacts the quality and reliability of the schedule.
- High Duration: Is the total number of activities that have a duration longer than 2 months. High duration activities are generally an indication that a plan is too high level for adequate planning and controls. The number of high duration activities should not exceed 5% and this schedule scored 39%. This project is still in the planning phase. Activities should be broken down into more as the planning phase proceeds.

Conclusions & Recommendations

With a Fuse score of 55, we consider this to be a "medium quality" schedule. We recommend that all logic issues should be corrected to improve the quality and reliability of the schedule and that activities with high duration should be reviewed and broken down into more detail as the information becomes available.

- GNTL Program Master Schedule DD 10.31.17

MGF PROJECT SERVICES

Finding No. 5: GNTL - 107623 500kV Series Comp – MTEP 3831 Schedule

Observations & Findings

The GNTL 107623 – 500kV Series Comp-MTEP 3831 schedule has a start date of 1st December 2015 and a completion date of 2nd February 2021. The project is currently in progress with a status date of 31st October 2017. It has 71 normal activities of which 5 are complete, 14 are in progress and 52 are still planned. It contains 22 milestones, 3 summaries and zero LOE (Level of effort) activities. The project baseline start date was 18th February 2013 with the baseline finish date of 29th May 2020. The project is currently behind schedule by 154 days.

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, the US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of detailed analysis. The schedule scored 69, giving it a 68% probability of success.
- Schedule Quality: Scored 69% versus a score of 75% or better which is considered a 'good' schedule.
- Insufficient Detail: measures the number of activities that have a duration longer than 10% of the total duration of the project. This number should not exceed 5% and this schedule scored 28%. Activities with a high duration relative to the duration of the project are generally an indication that a plan is too high level for adequate planning and controls. In this schedule, these activities are used to define effort that does not directly generate a deliverable. These activities are cost loaded and will expand and contract with the critical path. These activities are currently set as Task Dependent activities but should be set as LOE activities. With these activities set as Task Dependent activities, there is the potential for these activities to incorrectly drive the critical path.
- High float: Schedule paths with high amounts of float typically arise due to artificially constrained activities. The metric identifies activities with total float greater than 2 months and should not exceed 5%. This schedule scored 37%. Paths with float more than 2 months should be considered for acceleration and schedule optimization.
- High duration: identifies the total number of activities that have a duration longer than 2 months. This number should not exceed 5% and this schedule scored 32%. High duration activities are generally an indication that a plan is too high for adequate planning and control. Three of the activities identified with high duration are summary activities i.e. Engineering, Procurement and Construction. These are planning packages which should be broken down into more detail as the project proceeds and more details are available.

Conclusions & Recommendations

With a Fuse score of 69%, this is a medium quality schedule. We would recommend changing the activities currently set as Task Dependent to Level of Effort activities to improve the overall quality of the schedule.

Source of Information & Reference Materials

- GNTL Master Schedule DD 10.31.17

Finding No. 6: GNTL - 107627 - Arrowhead Sub Mods, 107628 Forbes Sub Mods, 107629 – Hilltop Sub Mods

Observations & Findings

The 107627 - Arrowhead Sub Mods, 107628 Forbes Sub Mods and 107629 - Hilltop Sub Mods schedules each have a start date of 3rd September 2019 and have 17th December 2019 as the completion date. These projects are currently planned with a status date of 16th September 2017. Each schedule has 11 planned activities and contain 3 milestones, 4 summaries and no LOEs (Level of Effort).

Acumen Fuse is a software application which uses metrics to identify problematic areas and activities in a project schedule. It has hundreds of industry metric libraries including DCMA 14-Point Assessment, US Government Accountability Office's (GAO) Scheduling Best Practices and the US National Defence Industrial Association's (NDIA) Generally Accepted Scheduling Practices (GASP). The Acumen Fuse analysis produced the following:

- Fuse Schedule Index: Is a single quality indicator resulting from a summary of the detailed analysis. The 107627 - Arrowhead Sub Mods, 107628 Forbes Sub Mods, 107629 - Hilltop Sub Mods schedules each scored 61, giving them a 57% probability of success.
- Schedule Quality: Each schedule scored 61% versus a score of 75% or better which is a considered a "good" schedule.
- Missing Logic: Is the total number of activities that are missing a predecessor, a successor, or both. This number should not exceed 5%. On these schedules, 14% of the activities are missing logic which impacts the quality and reliability of these schedules.
- High Duration: Is the total number of activities that have a duration longer than 2 months. High duration activities are generally an indication that a plan is too high level for adequate planning and controls. The number of high duration activities should not exceed 5% and these schedules scored 14%. These projects are still in the planning phase. Activities should be broken down into more as the planning phase proceeds.

Conclusions & Recommendations

With a Fuse score of 61, we consider these schedules to be "medium quality" schedules. We recommend that all logic issues should be corrected to improve the quality and reliability of each schedule and that activities with high duration should be reviewed and broken down into more detail as the information becomes available.

Source of Information & Reference Materials

- GNTL Program Master Schedule DD 10.31.17

Finding No. 7: GNTL - Baseline Schedules

Observations & Findings

For the GNTL project, there is only one Primavera P6 file for each schedule. Three of these schedules have progress (17623 – 500kV Series Comp-MTEP 3831, 107621 – Iron Range 500/230kV Sub-MTEP 3831, and 500kV Transmission Line MTEP 3831). The project team indicated the baseline schedule will reflect actual commencement dates for activities. This practice violates the Manitoba Hydro's Schedule Change Management process (CSS-010) which specifies the baseline schedule "freezes the original plan at the completion of initial planning ... Should not be changed to match performance". This process (CSS-010) aligns with the Project Management Institute's (PMI) definition of a baseline as "the approved version of work product that can be changed using formal change control procedures and is used as the basis for comparison to actual results". .

Conclusions & Recommendations

Baseline schedules reflect the planned schedule progress. In Earned Value Management (EVM), the baseline schedule is compared to the Forecast schedule to determine the value of the work "earned". Without a baseline, the Earned Value cannot be determined.

MGF PROJECT SERVICES

Finding No. 8: GNTL - Establishing Contingency and Risk Areas

Observations & Findings

The current GNTL Risk Management Plan (RMP) describes the scope, roles and owners risk, management approach risk, risk identification, risk assessment and prioritization, risk monitoring, risk response strategies, risk register, active risks and contingency management.

While reviewing the Risk Register it was noted that the cost estimate was dated 26th May 2016, while the Risk Register was dated 21st June 2017.

In addition, the register has a total of 17 Risk events identified as "High" cost impact amounting to $118 million with Risk item 5 amounting to $100 million.

Risk item 5

Risk Trigger or Cause – "Change in Program parameters, quantities more or less than estimated, unanticipated escalation, additional information"

Risk event or effect – "Budget component cost may be higher than estimated"

Impact – High

Cost Impact of Risk - $100 million

Response Plan - "Review assumptions made in preparing budget; regular monitoring of estimate and program information, fuel adjustment clause in construction contract. Review estimate and quantities after completion of Seg 2 access, clearing and geotech."

Mitigation Action Completed – "Estimate and assumptions were updated in May 2016. Update estimate toward the end of 2017 as bid pricing is received."

Conclusions & Recommendations

The Risk Register was established after the [redacted] pre-construction budget was estimated. Currently, there is no correlation between the Risk Register and Contingency amount. 1d

MGF strongly agrees with the plan to update the estimate at the end of 2017. A risk analysis work session is also suggested with the project team to develop inputs that support cost and schedule contingency development.

MGF considers the that risk mitigation costs to eliminate the "high" risk items should be included within the estimate (e.g. paying premium to have final design completed for the towers to eliminate delays in procurement and ultimately the project).

- GNTL PGM_Risk Register for 7-12-17 Qtrly Review
- CMA Pre-Const - GNTL Risk Management Plan (Approved)
- Great Northern Transmission Line Project Scope Document – Revision 1

SECTION 8 - Conclusion

This section summarizes the conclusions we have drawn for the various projects reviewed as part of MGF's review of Manitoba Hydro's Capital Expenditures Program. In summary:

- the Keeyask Hydroelectric Dam poses the biggest threat to the Capital Expenditures Program
- the HVDC Converter Stations and Bipole III Transmission Line is nearing the finish line and Manitoba Hydro is aware of the remaining risks and working to mitigate these
- MMTP and GNTL are well organized and being set up for success.

We would provide the following specific conclusions on the specific projects as follows:

Keeyask Hydroelectric Dam

The cost reimbursable compensation mechanism in the General Civil Contract (GCC) is not typical for this kind of project. Rather than linking the compensation of the contractor to the quantity of work performed in accordance with contracted quality and time for completion obligations, the GCC contractor gets paid its actual costs irrespective of the quantity of work performed, the quality or the time it is takes to perform the work.

This cost reimbursable pricing mechanism has placed the following risks on Manitoba Hydro:

- Labour costs
- Labour availability
- Material costs
- Material performance
- Escalation
- Productivity
- Final contract costs
- Contractor's re-work
- Indirect costs
- Schedule
- Time and cost impacts due to GCC contractor

and as such, introduces significant unpredictability to the outcome of the GCC contract, in particular with an under-performing GCC contractor. The reality is that whilst Manitoba Hydro is accountable for the risks above, it is the GCC contractor who is leading and managing the activities that will trigger these risks.

The GCC contractor over promised in its tender, failed to perform the Original Contract and following the Amending Agreement No. 7 dated 28th February 2017, is continuing to miss the revised productivities for concreting and earthwork, which is of high concern given the following:

- There are four more years of this contract to go
- Concreting activities are becoming more complex with productivity likely to deteriorate
- Large earthwork scope still to be performed

The GCC contractor is behaving like a contractor engaged on a cost reimbursable contract where they have no risk. Selected data points are:

- Repeated failure to achieve agreed upon productivities
- 1,030 negative float activities in its schedule, of which 97 are on the critical path, when the Contract demands that the GCC contractor's schedule should not contain any negative float activities.
- Working without an approved basis of schedule
- Monthly progress reports repeatedly submitted 7 days late
- Inconsistent and inaccurate reporting

Unless and until Manitoba Hydro adopts a hands-on role of construction manager for the GCC, the time for completion of this contract, and the Keeyask Generating Station project generally, will take longer. As the GCC takes longer to perform, the GCC contractor's direct costs, indirect costs and escalation costs will continue to rise. The delay in completion of this contract will cause delay and disruption claims from other contractors, which Manitoba Hydro will have to pay.

If Manitoba Hydro is to regain control of this Contract, then it needs to directly exert its influence on the GCC contractor. To do this the following areas will need to be addressed:

- Construction management
- Site supervision
- Recovery plan
- GCC Contractor's role
- Cost control
- Schedule management
- Cost estimating and forecasting

Construction Management:

Manitoba Hydro needs to be proactive in the construction management of the GCC. This scope requires better planning and execution. It is likely that Manitoba Hydro will need to recruit key personnel for this activity.

Site supervision:

Manpower, productivity and co-ordination are critical success factors particularly on a cost reimbursable priced contract. If not done correctly, productivity goals are not met and higher costs are incurred for less output. It is likely that Manitoba Hydro will need to recruit key personnel with trade backgrounds for this activity.

Recovery plan:

The current plan is not working and appears to be continuously changed when progress is not met. This needs to be re-visited with better construction management and site supervision insight and planned with a labour force and productivities that are reasonably achievable.

MGF PROJECT SERVICES

GCC Contractor's role:

The GCC contractor has not performed and its role together with some key personnel will need to re-considered.

Schedule management:

The recovery plan with realistic targets and achievable productivity assumptions will need to be input in to a Contract Schedule that meets the requirements of the GCC contract.

Cost estimating, forecasting and cost control:

The Contract Schedule will need to be cost loaded so that activities are characterized by time and costs.

Unless Manitoba Hydro is prepared to make a step change in the management of the GCC contract, then it will continue to limp along, taking longer to perform and costing Manitoba Hydro more money. This could result in a final cost range of $9.5 billion to 10.5 billion.

If Manitoba Hydro is prepared to embrace a new contract management strategy to drive the GCC contractor to perform, then it will bring more predictability in terms of time and cost to this contract.

HVDC Converter Stations

This project is well managed and is expected to complete on time and within budget. Recommendation is to keep close monitoring of progress until completion.

Bipole III Transmission Line

This project is well managed and progressing on schedule. However, the critical paths of both Rokstad Power Corporation and Forbes Brothers Ltd. are slipping which may jeopardize completion in August 2018.

Manitoba – Minnesota Transmission Line

This project is on schedule. Its cost however appears low compared to other similar projects. We recommend that the cost estimate is reviewed and updated in due course.

Great Northern Transmission Line

The project is progressing, with Rights of Way being cleared, amongst other activities. The Construction Management Agreement is well considered commercially and serves to protect the interests of Manitoba Hydro. When benchmarked with other similar projects, its cost estimate is considered high and this should be reviewed in due course.

List of Tables

TABLE OF CONTENTS
(continued)

1 INTRODUCTION

The Klohn Crippen Berger scope of work is to assist MGF in reviewing the following areas and activities related to the Keeyask Hydro Project.

- **Project Cost Estimate** – where are the overruns, are they in a specific area or across the project?
- **Project Design** – were the design technical specifications and drawings reasonable, and in particular was the contractor provided with a reasonable amount of information?
- **Cost Estimate changes** – what were they, were they reasonable and how did they impact the project costs?
- **Contracting Methodology** – is the contract format reasonable and appropriate for the project?
- **Schedule Review** – is the current General Civil Contract Amending Agreement #7 schedule reasonable or is there likelihood of additional slippage?
- **Project Execution and Construction Management** – was the project set up to be a success and is the project being managed effectively?

KCB has approached the assignment in a straightforward manner:

- Reviewing the cost overruns to date to identify the areas of concern;
- Reviewing the engineering associated with each area of concern;
- Looking at the changes to the cost estimates caused by extra work orders, quantity changes and the reasonableness of the unit prices;
- Reviewing of the contract format, specifically the measurement and payment sections;
- Reviewing the changes in the schedule for project; and
- Commenting on the project execution and construction management to date.

Finally, KCB has expressed opinions on the likelihood of the project meeting the current contracted costs and schedule.

2 COST REVIEW

2.1 Reference Documents

- Contract Summary – All Contracts – September 2017.xlsx

2.2 Contract Cost Review

Review of the table shows the project has awarded 247 contracts with a forecasted value totaling $4,644,369,106.43.

Adding up the original contract values comes to $2,722,776,658.18.

The increase in the project cost is therefore $1,921,592,448.25, which is one of the main reasons for this review.

To focus our work, we initially sorted all the contract information by contract value. Then we calculated the percentage increase for each contract. The contracts that increased are shown in the Table 1. The base data does show that some contracts did or are predicted to complete under budget for a total of $16,431,830.59 in savings, however the total savings are less than 1% of the total cost increase and are therefore insignificant in the total project cost.

CANMEC INDUSTRIEL INC	Stoplogs, Bulkhead/Draft Tube Gates & Followers	[redacted]	[redacted]	[redacted]	

We noted that many of the contracts are relatively small and do not materially affect the overall project cost, for example fence materials have gone up over 1000% but that is still less than $14,000. What is more important is the percentage increase of each contract as percentage of the total project cost, to understand which contract changes are important to the overall project. Therefore, the total project increase was calculated for each contract and then the results were resorted according to the percentage of total project increase, see Table 2. Contracts with variances less than 0.1% or negative are not shown in Table 2.

1a

Clearly the General Civil Contract with BBE is the critical contract for the project. If for example BBE was on budget and schedule the total project would only be over budget by $628M or 23%. But much of that 23% is directly related to civil delays, camp costs, turbine supply costs, etc. all would be significantly reduced. Therefore, the majority of our review will examine the General Civil Contract.

3.2 General Civil Technical Specification Review

Often increases in projects costs are related to changes in the design which occur after the contract is signed. These changes typically appear as revisions to the Issued for Construction Drawings or the Technical Specifications.

There have been 12 versions of the Technical Specifications produced between March 2014 and July 2017. The amended agreement in volume 2 includes technical specifications dated 10 March 2014.

Table 3 lists the specification sections and shows the revision versions of the sections at three dates, the amended contract version (10 March 2014), Version 3 in May 2015 and Version 12 from July 2017.

Legend: 1 Revision from previous (green) 2 or more Revisions from previous (yellow)

Table 3 shows that many specifications have been changed over the course of the project, but not that many have been changed multiple times. KCB compared specifications Version 12 with Version 3 looking for major changes. Significant changes were observed in the following sections:

03 11 00 **Concrete Formwork** – revised to include many more payment items, i.e. much more detailed with respect to vertical surfaces and locations.

03 15 19 **Embedded Anchors** – revised to include more types of anchors for specific locations.

03 30 00 **Cast-in Place Concrete** – various changes to make production easier, but also added requirement for a layer of thermal crack protection reinforcing, which would add cost in some areas.

05 50 00 **Miscellaneous Metal** – added davits, bulkhead gate storage slot guides, crane end stops, miscellaneous metal supplier by purchaser, all will increase the costs associated with this section.

09 90 00 **Painting and Coating** – embedded guides were added. This is an expensive item to paint, requiring staging or scaffold and coordination with the gate installations.

14 20 00 **Elevators** – This specification underwent significant rework, including deletion of floors and stops as well as changes to the control system and dimensions, but cost may not have changed dramatically.

22 13 00 **Sanitary System** – many new pipe classes, fitting and valves were added to the specification. Impression is that this section may not have been well developed at bidding, thus costs for this section likely increased significantly.

22 15 00 **Service Air and Brake Air Systems** – revisions include addition of depression air and additional measurement and payment items. The addition of depression air will likely double the costs associated with this specifications section.

23 09 00 **Instrumentation and Control for HVAC** – major revisions, presumably to suit the specific equipment selected and control technology upgrades. Some price increase would be expected.

23 30 00 **HVAC System** – also significant revisions to the specifications, including addition of payment items for embedded piping. Changes also included dampers, AHU's, controls and assorted heaters.

26 11 02 **600V Load Centre Switchgear** – revised to include arcflash requirement.

26 22 13 **Low Voltage Distribution System** – multiple changes in this specification, driven perhaps by changes to the lighting and HVAC systems.

26 32 13 **Standby Diesel Generators** – the spillway genset was added and changes made to the technical details.

26 50 00 **Facility Lighting and Controls** – significant revisions to eliminate fluorescent lights and include LED technology as well as intelligent controls including occupancy sensors. Good technical improvement, but will have a cost impact.

28 31 00 **Fire Detection and Alarm System** – multiple revisions, likely to match up to the ventilation system controls as well as the plant control system.

31 23 24 **Granular Fill** – most of the sieve size percentages for the various fill have been adjusted. We assume this is to better suit the materials in the quarries and borrow areas.

31 37 00 **Riprap** – class 7and 8 riprap percent fines by weight was revised, likely also to suit the quarry materials.

35 20 13 **Bulkhead Gates, Stoplogs and Trashracks** – temporary stoplogs for the spillway have been added as well as the trashracks. These will impact the concrete pier construction as well. We assume the stoplogs were added to make more work areas available, in an attempt to recover some lost schedule.

46 07 13 **Domestic Water Treatment Plant** – the process and type of plant has been revised, but the nominal capacity remains the same.

46 07 53 **Waste Water Treatment Plant** - the process and type of plant has been revised, but the nominal capacity remains the same.

All the changes will have made some impact on the costs and together they show that the mechanical and electrical design was not as well advanced as the civil design back in 2014. Interestingly, very little changes have been made to the excavation, fills and concrete specifications, thus any significant cost changes in those areas should only be due to quantity changes.

3.3 Geotechnical Information Review

Several campaigns of geological/geotechnical investigations were carried out between 1962 and 2010 to investigation the structure foundations and potential borrow materials. These included drill holes, test pits, laboratory testing of materials, reconnaissance and detailed inspections and mapping, and geophysical surveys.

The investigations appear to have been reasonably comprehensive, both for construction materials and, in general, for the structures. There are relatively few investigations in or over water, which is understandable given safety concerns at rapids and fast-flowing river sections; the in-river areas beneath structures are areas of risk with respect to unknowns that are common to many similar projects.

Although geophysical investigations are identified as having been performed, contract drawings of investigations do not show their locations and the results are not included in Volume 5 of Contract 016203. It is not known whether this information was included in a "data room" or as additional information provided by Manitoba Hydro.

The regional bedrock geology drawing (1-00195-DE-11000-001 Rev E) in the contract, which covers the vicinity of the major structures, does not include the locations of drill holes and test pits. Addition of this information would facilitate understanding whether features such as deformation zones and contacts of geologic units had been adequately investigated. One must estimate where these features would occur on the locations of explorations plan (1-00195-DE-0019-0001 Rev D), then review logs of nearby drill holes to determine conditions at those features.

There is a brittle deformation zone (intense jointing and fracturing) which crosses the axis of principal structures beneath the central dam and central dam cofferdam. It was investigated with one drill hole (G-010). Water pressure testing was performed near the bedrock surface; it was not performed in the brittle zone, but the log indicates this zone was healed (i.e. had been broken but subsequent mineralization resulted in a solid rock mass).

A ductile deformation zone (shear or fault) is shown on the geology plan beneath the central dam and its cofferdam, mainly within water. This feature was not investigated, even though it is shown to continue onto the island near Gull Rapids.

KCB would expect identified features such as the deformation zones to be investigated and a description of the features to be provided, in order that bidders could assess potential impacts on cofferdam performance (e.g. need for dewatering) and foundation preparation (depth of excavation, type of treatment) beneath the major structures. We have not received historic investigation reports; it is possible that these features have been addressed. The text of Volume 5 states that “during each of the investigations, the bedrock outcrops and overburden exposures were examined and described.”

Volume 5, Section 6 is “Investigations by Areas of Interest”. It describes the cofferdams, groin, and excavated material placement areas (waste material deposition areas). Section 6 does not describe the main structures – dams, powerhouse and spillway. However, the contractor would perform excavation, grouting and foundation preparation beneath the structures and a description of investigations would be of interest to the contractor.

The material balance – available sources of various fills and aggregates and their possible use for construction – was reviewed (Drawing No. 1-00195-06200-0010 Rev OC). The engineer’s material balance represents one plan that could be followed, thus the term “possible use” to show that identified material volumes are adequate. The Contractor would be expected to develop its own plan. It is desirable to identify material sources well in excess of the actual requirement, in order to allow for wastage, materials for Contractor’s own use, and unanticipated requirements; available volumes of twice those required is a common target. This is generally achieved. The following are noted:

- The required rock excavations are shown as being 100% utilized. This is because demand is much greater than the required excavation volume. Abundant additional rock is available in nearby quarries.

- Impervious borrow source N5 on the north abutment is shown as being 77.6% utilized. This is the closest source to the major earthworks – North and Central Dams – on the north side of the main channel, and using N5 to its maximum extent is logical. In the event that N5 were to be exhausted, source N21 is available at a similar distance from the major structures, and N6 is at a greater distance. The material balance indicates that quantities in the three sources greatly exceed the requirements.

The earthfill dam and dyke designs depicted on the drawings vary somewhat to accommodate, for dams, the cofferdams and nearby concrete structures; and for dykes, the topography and foundation conditions. On the dam sections, some material zones are relatively thin, in particular on the upstream slopes; the materials will be slow to place and (where required) to compact and special placement techniques such as very careful placement to limit their width or the use of "side boards" at the design zone limits with to confine the materials may be required to properly construct them. Other than these narrow zones, the dams appear to be constructible without special placement techniques. The designs are as expected in the northern climate.

Placement of Zone 5 riprap bedding as shown at the upper parts of the dams will be challenging. The zone width narrows to 500 mm. However, the specified maximum size of the material is 500 mm; and 30% of the material by weight must be larger than 300 mm. It is common to specify minimum zone thicknesses of twice the maximum particle size to facilitate placement that permits a uniform distribution of all particle sizes. This narrow placement area is limited to a 2 m vertical height in the dams.

3.4 General Civil Contract Drawing Review

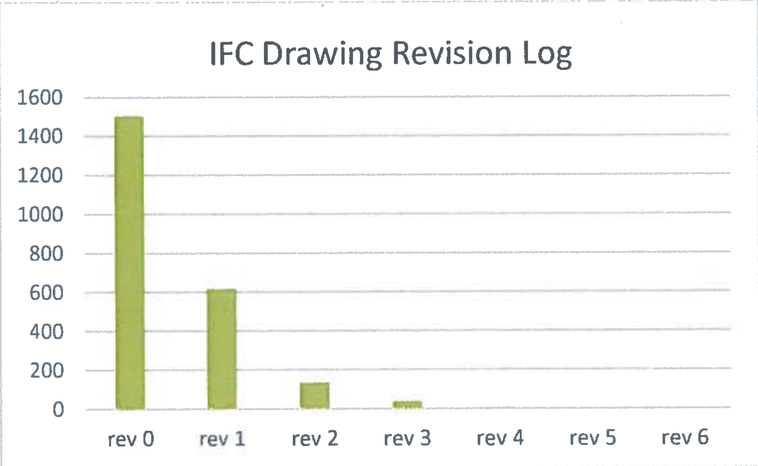
KCB has reviewed the list of approximately 2300 IFC drawings prepared by Hatch and listed in the drawing register (HATCH IFC DWGS Aconex Report - January 1,2014 to October 5,2017). We also reviewed the drawings associated with the General Civil Contract. We did not review each drawing in detail, however we did look to see if the major structures have sufficient detail to enable quantity takeoff and subsequent pricing. In general, the IFC drawing are clear and certainly define the majority of the permanent works.

By comparison we looked at the number of civil drawings for two similar sized projects we have been involved with and they were 2500 drawings and 1100 drawings respectively. For the 1100 drawing project KCB was as the civil designer inside a design build project team and the project included an RCC dam with integral spillway, long large tunnel, significant channels and a large 1100 MW powerhouse. The project with 2500 drawings was a 900 MW project with diversion tunnel, large earthfill dam with complex foundation issues and large spillway and powerhouse structures. The procurement was done with multiple contracts. The large contracts included excavations, concrete structures and generating equipment. In general, the design was substantially completed prior to award, thus there was limited opportunity for design innovations, only construction methodology.

As a further check, we looked at the revision history for the IFC drawings, if the drawings had undergone multiple revisions that would likely indicate changes to the scope or inadequate drawings to start. The revision log is summarized in Table 4 and the associated graph.

Table 4 IFC Drawing Revisions

Rev 0	Rev 1	Rev 2	Rev 3	Rev 4	Rev 5	Rev 6
1503	616	133	35	7	2	1

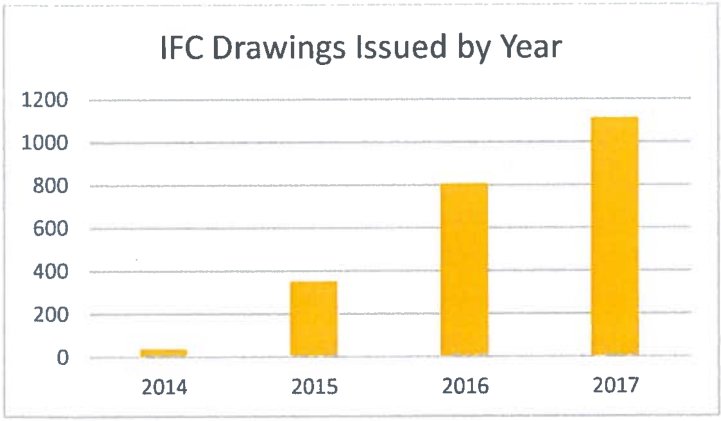


The vast majority of the drawings have not been revised after issued IFC, in fact drawings not rev 0 or Rev 1 are insignificant. This is good from the perspective of limiting the engineering effort and proof that the engineering was almost always on target and not being questioned by the contractor.

Finally, KCB looked at when the drawings were issued, to try and understand if the contractor was getting the drawings in a timely manner. Table 5 and the associated graph shows the IFC drawings by year of issue.

Table 5 IFC Drawing Years Issued

2014	2015	2016	2017
37	351	806	1113



The data shows that in 2014 the contractor priced the job with a limited number of drawings. The majority of the drawings were prepared in 2016 and 2017 which may have created two issues which would impact the costs:

- The contractor missed or did not allow for all the complexity of the project – i.e. underbid; and
- The engineer could have added more detail and work after the contract was signed.

In summary, our conclusions regarding the design engineering, drawings and information presented are:

- The information is generally good to very good based on the low number of IFC drawings revisions;
- The design is reasonable and well detailed;
- The number of drawings produced is reasonable for a project of this size;
- The revisions to the specifications have been generally related to the balance of plant work and generally should be low cost impacts to the entire project; and
- The only potential issue may be the timing of the drawing production, which may have created some delays in construction.

4 COST ESTIMATE CHANGES

4.1 Reference Documents

- Original Contract (OC) dated Mar 10, 2014
- Amending Agreement #7 (AA7) dated Feb 28, 2017
- Keeyask Contract Revision Register for Allocated Contingency - August 2017
- Hatch Stage IV Engineering Summary Report - GN-10.1 Rev 0.pdf

4.2 EWO's

Extra work orders (EWO's) normally occur in construction projects, which is one of the reasons for contingency in the project budget. The value of the EWO's are typically larger for projects where the design is not fully completed at the time of tender which was the situation for Keeyask.

We reviewed the EWO's for the GCC as extracted from the Keeyask Contract Revision Register for Allocated Contingency - August 2017. We sorted the information by year as part of the review.

June/July 14 MH Directed Work	
January 2016 Directed Work	
Total	

1a

Review of Tables 6 and 7 shows the total additional for all the "Approved GP" EWO's, which is where the technically driven changes are recorded, adds up to [redacted] which includes [redacted] in 1a
MH directed work. The EWO values per year are:

Year	EWO Value
2014	[redacted]
2015	
2016	
2017	
Total	

1a

Clearly the total project increase in price is not driven by the technical EWO's. In fact, the technical changes in 2017 have saved [redacted] according to the data provided.

Furthermore, the negative values for profit reductions add up to a savings of [redacted] so there 1a
is actually a net savings of approximately [redacted] between the profit reductions and the approved technical EWO's.

The GCC price change to date is fundamentally all in the renegotiation of the contract AA#7 for
[redacted] 1a

Normally the cost estimate for the majority of General Civil Contract components should be built up from the unit prices times the quantities. Given the dramatic change in the contract cost in AA#7 both the unit prices and the quantities deserve scrutiny.

As mentioned previously, the schedule changes to the GCC have impacted the other contracts, for example review of the [redacted] Voith contract for the supply of the units shows [redacted] in
total revisions to the contingency of which [redacted] is associated with delays to the GCC. Similar 1a
impacts have occurred on the camp supply and operation.

4.3 Quantities

The MH review of the cost increases to date lists changes in quantities as one of the factors in the price change. Most of the work to date has been related to earthworks and concrete. The mechanical and electrical costs associated with the balance of plant for the powerhouse and spillway are proportionally small relative to the entire project and have generally not been started. Therefore, KCB concentrated our review on the earthworks and concrete quantities and their changes. Table 8 shows the values from the Original Contract (OC) dated Mar 10, 2014 compared with the Amending Agreement #7 (AA7) dated Feb 28 and also compared with some values from the original Hatch report titled the Stage IV Engineering Summary Report - GN-10.1 Rev 0.pdf.

Table 8 Civil Quantities changes

Work Class	Work Type	UoM	Stage IV Hatch Report	Original Budget (OC)	Current Budget (AA7)	%	Variance

	Powerhouse (incl. Transitions)			19,200.00	36,604.00	90.65%	17,404.00
	Intake			-			

Examination of the table shows variances ranging from -41% for granular fill to +86% for rockfill, which suggests there may have been some volumes changed from one category to the other. The variance between the sum of the two is approximately 200,000 m3 or about 4%.

The concrete volumes starting with the Hatch project report are remarkably close for all the estimates.

In conclusion, the change in quantities in total do not justify the large increase in the contract value. If the basis for payment for the project was the original Unit Prices together with the actual quantities were the project would likely be within the contingency, i.e. on budget.

4.4 Unit Prices

The unit prices in the Bill of Quantities, Prices and Target Price Estimate- are very detailed, comparison with the unit prices of the original contract and later agreement amendments is difficult. For our review, and to enable comparisons, similar items in the Bill of Quantities have been grouped together and an equivalent unit price has been calculated by dividing the total cost of the grouped items by the total quantity.

KCB made a comparison of the consolidated unit prices thus calculated between the original contract, as provided in Amending Agreement 3 (March 2014) and the latest amendment with unit prices, as provided in Amending Agreement 7 (February 2017).

The following consolidated items are selected to provide an overview of the unit prices for the civil works:

- Cast-in-Place Concrete. The consolidated unit prices include the formwork costs. The ratio of formwork area to concrete volume differ for the various structures as follows:
  - Intake: formwork area to concrete volume = 0.7 m^2/m^3.
  - Powerhouse and service bay: formwork area to concrete volume = 0.52 m^2/m^3.
  - Tailrace: formwork area to concrete volume = 1.08 m^2/m^3.
  - Spillway: formwork area to concrete volume = 0.32 m^2/m^3.
- Reinforcing Steel.
- Structural Steel. The consolidated unit price included all main structural steelwork.
- Unclassified Excavation for concrete structures, for dams and dykes and for dykes in winter.
- Rock excavation.
- Impervious fill.
- Granular fill, all classes.
- Rockfill.

Table 9 presents the changes in the consolidated unit prices between the initial contract provided in Amending Agreement 3 and Amending Agreement 7.

Table 9 Consolidated Unit Prices Extract from Amending Agreement 3 and 7

			[redacted]		[redacted]	[redacted]
Rockfill	m^3	1,567,750	[redacted]	2,319,923	[redacted]	[redacted]

1a

The percentage increase in the consolidated unit prices from Amending Agreement 3 to Amending Agreement 7 in the samples provided in Table 9 vary between 67% to 366%. Reviewing the entire Bill of Quantities, Prices and Target Price Estimate in the two respective Amending Agreement, virtually all the unit prices show similar increases as demonstrated above. KCB believe that the substantial increases in the unit prices in Amending Agreement 7 is largely responsible for the substantial increase in the Target Price Estimate in Amending Agreement 7.

To be able to comment on the reasonableness of the unit prices in the Amending Agreements 3 and 7, KCB compared the unit prices with some historical information obtained for similar work for the construction of a large hydroelectric power project in northern Canada. Table 10 present the comparison between the consolidated unit prices for Amending Agreements 3 and 7 and the historical information.

Table 10 Comparison between Consolidated Unit Prices

Description	Unit	Consolidated Unit Price		
		Amending Agreement 3	Amending Agreement 7	Historical Information
Cast-in-Place Concrete		[redacted]	[redacted]	
Intake	m^3	[redacted]	[redacted]	$1,000
Powerhouse and service bay	m^3	[redacted]	[redacted]	$1,000
Tailrace	m^3	[redacted]	[redacted]	$1,200
Spillway	m^3	[redacted]	[redacted]	$600

Impervious fill	m^3	[redacted]	[redacted]	$25.00
Granular fill	m^3	[redacted]	[redacted]	$10.00
		[redacted]	[redacted]	
Rockfill	m^3	[redacted]	[redacted]	$80.00

1a

The following comments are made regarding the comparison between the consolidated unit prices:

- Cast-in-Place Concrete. The consolidated unit prices in the initial contract appear to be low but those in the Amending Agreement 7 appear high compared to the KCB historical information.
- Reinforcing Steel. The consolidated unit prices in the initial contract appear to be low but those in the Amending Agreement 7 appear reasonable compared to the KCB historical information.
- Structural Steel. Both the consolidated unit prices in the initial contract and the Amending Agreement 7 appear to be low compared that in the KCB historical information. This difference could be the result of the difference locations for sourcing the structural steel.
- Unclassified Excavations. The consolidated rates for unclassified excavation appears to be reasonable but those in the Amending Agreement 7 appear high compared to the KCB historical information.
- Rock Excavation for both the initial contract and the Amending Agreement 7 appear to be higher than the KCB historical information. The higher rock excavation unit price could relate to the hardness of the rock being excavated.
- Impervious fill. The consolidated unit prices in the initial contract appear to be low but those in the Amending Agreement 7 appear very high compared to the KCB historical information.
- Granular fill. Both the consolidated unit prices in the initial contract and the Amending Agreement 7 appear to be low compared that in the KCB historical information.
- Rockfill. The consolidated unit price for both the initial contract and Amending Agreement 7 are significantly lower than the KCB historical information. The haul distance for the rockfill for the KCB historical information is very substantial as the quarry for this rockfill is located far away from the site, whereas the rockfill for the Keeyask GS is sourced locally.

In summary, the unit prices in the initial contract appear to be generally lower when compared with the corresponding KCB unit price data, whereas the unit prices in Amending Agreement 7 appear to be generally significantly high.

KCB was interested in the impact of the unit prices on the associated costs and therefore performed the following calculations using the consolidated unit prices from Table 9 and the associated quantities.

Initial Contract - The consolidated unit prices times the original estimated quantities = cost

Historical Information - The KCB historical unit prices times the original estimated quantities = cost

AA#7 – the AA#7 unit prices times the new estimated <u>total</u> quantities = cost. (Could be viewed as what the price should have been)

The results of our analysis are shown in Table 11.

Table 11 Unit Price and Cost Comparison

Description	Unit	Amending Agreement (AA) 3 Basis			Amending Agreement(AA) 7 Basis			KCB Historical Information Unit Prices		
		Total Quantity	Consolidated Unit Price	Total Cost ('000$)	Total Quantity	Consolidated Unit Price	Total Cost ('000$)	AA3 Total Quantity	Historical Unit Price	Total Cost (thousand $)

Rockfill	m^3	1,567,750	[redacted]	[redacted]	2,319,923	[redacted]	[redacted]	1,567,750	$80.00	$125,420
			[redacted]	[redacted]		[redacted]	[redacted]			
TOTAL			[redacted]	[redacted]		[redacted]	[redacted]			**$683,236**

1a

The table shows that, for the subset of quantities we examined, using the original unit rates the price
would have been [redacted], and with the blended original and AA#7 rates the same work will be [redacted] 1a
or about [redacted] times the original target price. Using the AA#7 [redacted] multiplier the BBE original contract
price might have been [redacted]

Using KCB's assumed unit rates BBE's original Target Price was low by at least [redacted] or a factor of
[redacted]. If the [redacted] were to have been included the BBE original contract price ([redacted]) would have 1a
been [redacted]

There are other costs associated with the project that this simple analysis does not consider, for example mobilization, dewatering and coffer dam costs, which, if done in detail, will adjust these figures. But the conclusion is that the original BBE project target price was very optimistic and that a more realistic price might have been between $1.8B and $2.2B.

5 CONTRACTING METHODOLOGY

5.1 References

- Original Contract - 243994-0020-016203-CON-GCC Volume 1 20140310
- AA#7 - 243994-0020-016203-CON-GCC Volume 1 20170228.pdf

5.2 Discussion

The original 2014 contract was a cost reimbursable model with early contractor involvement. Early contractor involvement is currently one of the more favoured aspects of contracting. The advantages of working with a contractor to optimize the design, is intended to fairly apportion the risks and settle on fair profits and incentives for the contractor.

Based on our analysis of the design, the quantity estimates, the extra work orders and the unit prices, we could not initially understand how the project could be as far over budget as it is, because the variances in quantities are not that high and the initial unit prices were in fact low.

Then we read the 2014 contract terms, and in particular the Terms of Payment sections. Section 5 Price and Payment of the Work says:

> *"The general basis of payment for the Work will be on a cost reimbursable basis with provisions for an Initial Target Price and Final Target Price in accordance with and subject to the terms of the Contract."*

> *"For purposes of payment, the Work shall be measured as set out in the Contract documents."*

The Initial Target Price is defined, the Target Price Assumptions and calculation are defined and presented in sections 5 and 6. Most importantly the Adjustments to the target price are also defined and include:

- Escalation including;
- Extra Work Orders, *based on variations in quantities;*
- Additional scope items added to the contract;
- Extensions of time and delay payments; and
- Cash allowance overruns.

These adjustments are reasonable clauses and logical reasons for additional funds.

To that point the project risk seems to be clearly defined, and in fact Section 6.2.2 defines how the target price is to be adjusted for changes in quantities. Specifically, the unit prices are not to be changed unless the quantity variance is more than +/- 15%.

> *"....there shall be no changes to the Unit Prices originally submitted by the Contractor, unless the actual quantities vary from the estimated quantities by +/- 15% of the estimated quantities...."*

These are all reasonable and relatively typical contract clauses for a contract where the payment is based on unit prices and quantities for work actually performed.

Reading Section 9 Basis for Payment also seems generally reasonable for a cost reimbursable contract, with profit and GA&O defined as a percentage using formulas based on the Actual Costs and the Final Target Price.

However, the payment wording definition for Actual Costs does not seem to include any exclusions or amendment possibility and does **not seem to be related to quantities x unit prices**.

> *"Subject to these Terms and Conditions of Payment, the Purchaser shall pay the Contractor the Contractor's Actual Costs incurred in the performance of the Work."*

Thus, the definition of Actual Costs is critically important to the payment process. The Definition of Actual Costs from section 11 is:

> *""Actual Costs", for the purposes of the Contract, shall mean only the following:*
>
> *(a) **all actual, indirect and direct costs** incurred by the Contractor in performing the Work including, but not limited to (and specifically excluding GST and RST required to be collected from Purchaser by Contractor but including any RST required to be paid by Contractor to its suppliers or required to be self-assessed and paid by Contractor), all costs incurred for **all labour** (including the cost of workers' compensation assessments, vacation pay, employment insurance, pension plan payments, payroll taxes, and any other employee benefits paid by the Contractor), **equipment rentals, all supplies and materials, services, delivery and transportation, or any other direct, indirect and actual cost incurred by the Contractor in the performance of the Work** as is more fully set out in this Section 11;*
>
> *(b) all actual, indirect and direct costs incurred by the Contractor (in accordance with paragraph (a) above) resulting from an addition to, deletion from or modification of the Work as documented in an Extra Work Order or Change Order; and*
>
> *(c) all actual, indirect and direct costs incurred by the Contractor (in accordance with paragraph (a) above) resulting from a termination for convenience by the Purchaser of the Contract in accordance with Section 29.3 TERMINATION FOR CONVENIENCE of the General Specification..."*

As noted there is no connection between actual costs and the quantities and unit prices in the Bill of Quantities. This is a critical omission, because as has been demonstrated, the contractor may have little incentive to actually perform the work.

Another interesting clause relates to Progress and Cost Forecasts, whereby the contractor is paid two months in advance for planned work. We have never seen a contract with that clause, typically the way a contractor ensures his cashflow remains positive is through the mobilization payment and actually performing the work and earning revenue based on quantities times unit prices.

Interestingly even after the project schedule and budget went awry and was renegotiated, the 2017 contract AA#7 still has the same method of payment as the 2014 original contract using Actual Costs and still has little or no direct connection to measured work done or the approved unit prices except with respect to small changes dependent on the Target Price.

In summary, we have never seen a large contract where payment was not related to actual performance of the construction work as measured in some manner. Where we have seen cost reimbursable contracts is for small work directly controlled by the owner, for example drilling contracts where the owner tell the drillers where to drill, when to stop and then pays for actual equipment and crew time. MH is not a contractor and likely does not have the staff and experience to direct all aspects of a major project like Keeyask day to day, in sufficient detail, thus KCB believe the contract is very one sided benefiting the contractor.

6 SCHEDULE REVIEW

6.1 References

- BBE - High Level Schedule (current)
- BBE High Level Approved A7 Baseline
- BBE High Level Original Contract Schedule

6.2 Schedule

MGF has examined the schedule in detail however KCB also examined the overall schedule from a high level perspective, looking at the overall durations for the major structures.

The original schedule, the AA#7 Baseline and a current schedule provided by MGF were all compared. The durations for the major activities are shown in the following table and schedule figure.

Table 12 Schedule Dates

Task Name	Original Schedule		Amendment #7 Schedule		Slippage	Current Schedule		Slippage
	Start	Finish	Start	Finish	Original vs #7 (Months)	Start	Finish	#7 vs Current (Months)

Project: KGS High Level Schedu
Date: 16 November 2017

Original | Amendment #7 | Current

Page 1

Some observations are:

- The earthworks, dams dykes and stage II river management structures are two years late, and that obviously impact other components.
- Compared with the original, the intake was started late on the AA7 schedule and based on work to date we do not understand how the long duration shown in AA7 can be compressed as shown on the current schedule.
- Similarly, the spillway work in the current schedule is a much shorter duration than either the original or the AA7 schedule, which may not be reasonable.
- The powerhouse duration in the current schedule is also dramatically shorter than the previous schedules.
- The Electrical Power system, Instrumentation and Control System and auxiliary Processes & Service Systems are all heavily dependent on the powerhouse schedule and in particular, require a weatherproof structure with all the walls and primary concrete installed to enable cable tray and pipe racks to be installed followed by the cables, pipes, cubicles and equipment and then all the terminations, connections, testing and commissioning. We do not understand how that work can start as close to the powerhouse start as shown on the current schedule and finish as close to the end of the powerhouse structure as shown.

In summary, the current schedule looks to be aggressive and unlikely to be met.

Note that the schedule evaluation considers the completion of all the units, and that some of the units may be complete and operational for the dates shown and that may be enough to handle the river flows at that time. Thus, there may be no hydrological reason to have all the units completed by October 2021 as shown, however there are likely strong commercial reasons to complete the project.

7 PROJECT EXECUTION AND CONSTRUCTION MANAGEMENT

7.2 Discussion

The execution of the work is behind schedule and over budget. As noted, the majority of the cost and schedule slippage can be traced back to the General Civil Contract and the lack of performance by the contractor.

KCB has not examined in any detail the manpower or the nominal productivity at site, however we understand from the changes in unit prices between the original and AA#7 Target Prices, and comments in reports related to the worker benefits, in particular booking time away from site, that productivity has not been as presented by BBE in their original bid.

Reading the Board Recommendations related to the contract price change, the KPMG project Health Check and the Recovery Plan strategy, we also understand there have been significant staff turnovers in the contractor's management and supervision, all of which will/have contributed towards delays on the project.

However, in our opinion the most significant issue for the project is the almost 100% decoupling of work performance from payment by paying Actual Costs instead of Quantities times Unit Prices for actual work done.

While we were not part of the process that selected the contracting model, we surmise that MH either had success with this model elsewhere, or there were significant reasons to push the project into construction quickly relying on the early contractor involvement, the expectations of a quality design from Hatch and an experienced contractor with a realistic target price to make the project a 4b
success. MH only assigned a contingency of [redacted] to the contract for MH held risks, which when added to the BBE target price is still lower than the costs of the project. While hindsight is 20:20 and we were not party to the bid evaluations, the contingency now looks to have been significantly too low.

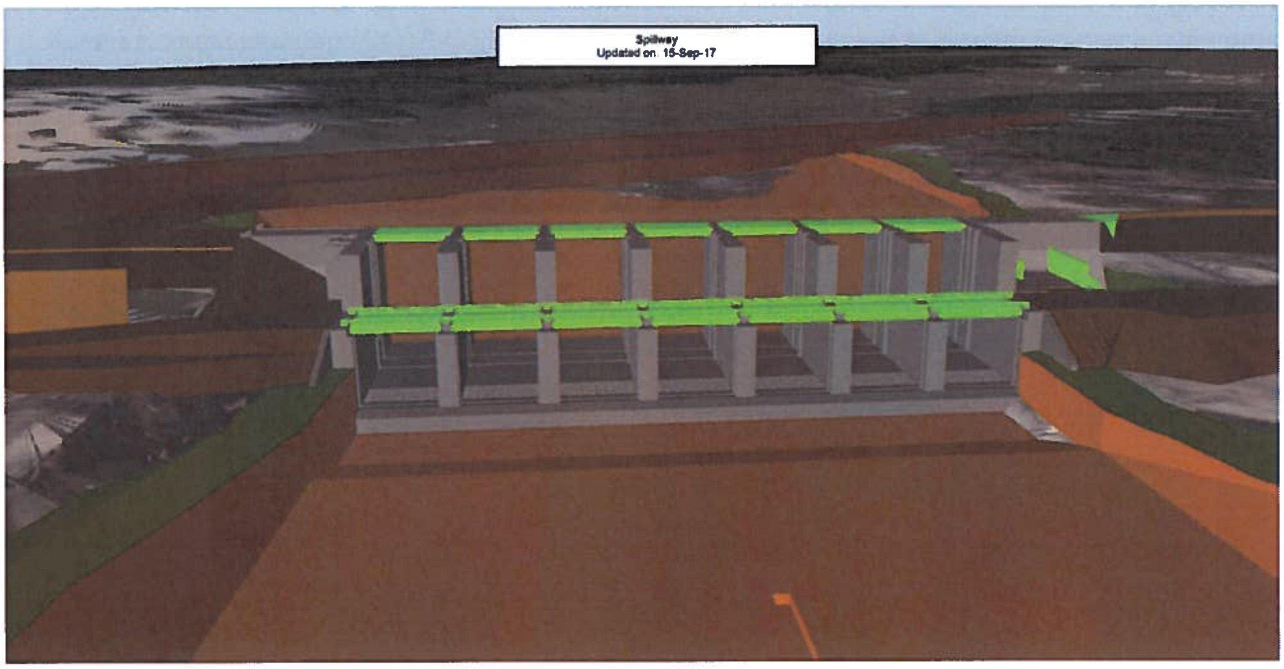
Interestingly during the discussions leading to AA#7 we understand there were serious considerations given to removing the contractor for all or part of the work.

Again, KCB was not part of the discussions and in all likelihood, would have also recommended continuing with the contractor as the likely least cost alternative. But we do not understand why the Actual Cost payment model remained almost unchanged without any modifications to connect payments to actual progress. We can only surmise there were legal issues preventing that much revision to the contract.

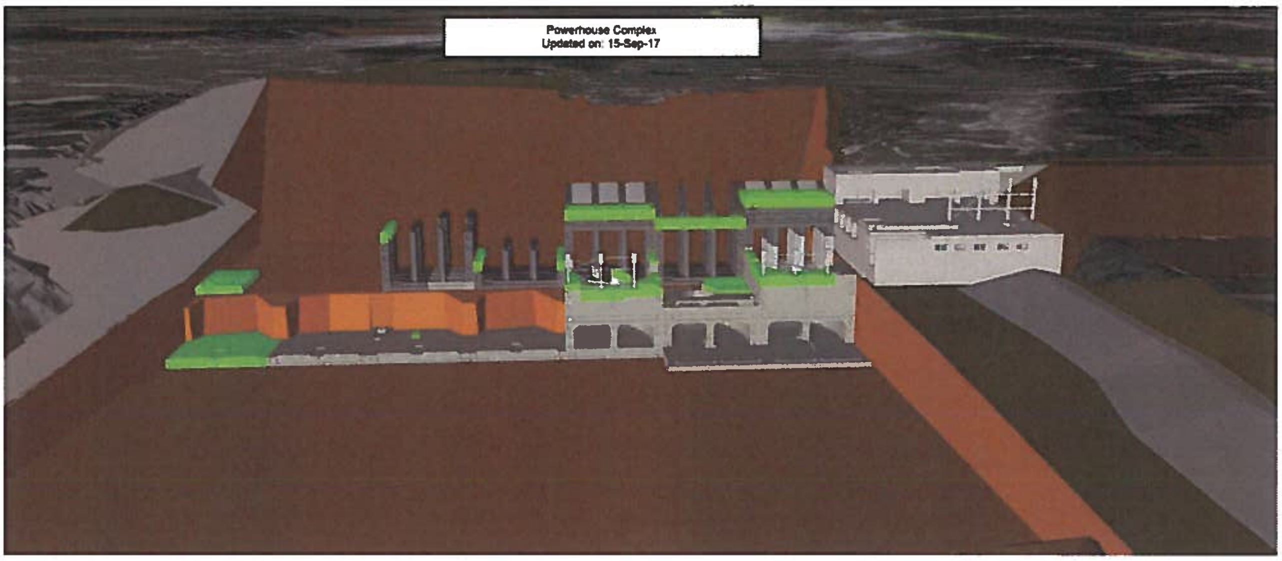
Review of the other major contracts for gates and the units found they are all more conventional, with payment tied to delivery and installation of various components.

KCB has observed that MH appears to have a robust and organized system for documenting changes, recording and filing information during construction which suggests the information needed for construction management is being collected and prepared. KCB has not been to site, and is unaware of the relationships between the MH and Hatch site staff and the BBE site staff, but we have read that getting staff for site for all parties has been somewhat of a problem. Changing staff at site makes building relationships harder and most certainly will affect speed of decision making at site and the level of trust which is always needed between owner and contractors staff.

After review of the referenced information, KCB is of the opinion that BBE will not be able to complete the project according to the AA#7 schedule and that the Actual Cost will therefore be higher than the current AA#7 value. The two figures below show the September 2017 work status on the spillway and powerhouse.



The spillway is relatively far advanced, however none of the ogee's are installed and none of the gates have been started. With reasonable progress next summer we would expect that the spillway will not be on the critical path.



The powerhouse is on the critical path and based on the current status KCB does not expect the powerhouse to be ready for any significant unit installation on schedule. Consequently, in addition to the additional costs for the civil work, there are likely to be additional claims for delay payment from Voith and almost all the other mechanical and electrical contractors and suppliers.

KCB has not examined the schedule in detail or the productivity rates, but MGF has, and after discussion with KCB, together our opinion is that we are forecasting a further delay.

1 Introduction

Amplitude Consultants (Amplitude) were requested to undertake a review of the converter station component of the Bipole III HVDC project currently being built by Manitoba Hydro. Amplitude's scope of work was to, for the Keewatinohk and Riel high voltage direct current converter stations, and as directed by MGF, assist MGF with the assessment for reasonableness of the current forecast at completion capital costs, including whether appropriate contingencies and reserves have been provisioned.

Amplitude performed the required scope of work with the information made available through the Manitoba Hydro online document system and subsequent email responses to queries posed to Manitoba Hydro.

Amplitude experienced some difficulties related to the timing of PRA approvals for members of the team and in getting access to the Manitoba Hydro online document system, including:

1. Late advice of the PRA approval of the technical team members – the PRA process took longer than expected, with some team members not getting advised of the success of their PRA approval until a number of weeks after submission.
2. Difficulties getting access to and logging into the Manitoba Hydro online document system – despite being eventually provided user names and passwords, team members were unable to access the system due to a variety of IT and permission related issues. On the date of the submission of the first draft of the report to MGF, only one out of Amplitude's five team members was able to access the system using their credentials.

The issues above led to a late start on the review of the documentation, and some team members being unable to commence work and contribute as expected. The lead reviewer, who was the only person able to access the system, had to spend more time accessing documents and dealing with access and IT issues.

The outcomes of the review presented in this report are provided with the caveat that the issues described above reduced the effective amount of time that Amplitude had to review the vast amount of data and information provided.

Amplitude has addressed this scope item through two findings:

1. Our view on the reasonableness of the current (2016) forecast completion costs for the converter stations;
2. Our view on whether reasonable contingencies and reserves have been provisioned.

2 Reasonableness of the 2016 forecast completion costs for the converter stations

2.1 Observations & Findings

The most recent revision to the cost estimate and budget for the Keewatinohk and Riel converter stations was completed in 2016. This cost estimate applied the same structure as that used in the 2014 cost estimate, which is explained in detail in the Manitoba Hydro document "Bipole III Project, Basis of Estimate Document, September 2014 Cost Estimate Update" dated March 2015.

The 2014 cost estimate applied a Work Breakdown Structure level (WBS) and each WBS was broken down further into a number of networks. The cost estimate for the converter stations were grouped into nine WBS. The same WBS structure was applied to the 2016 estimate. Table 1 provides a summary of 2014 and 2016 cost estimates for the converter station WBSs.

Table 1 - Converter Station Cost Estimates - 2014 and 2016

WBS No.	Description	2014 Estimate (CAD)	2016 Estimate (CAD)
14363	Property – Riel Converter Station	[redacted]	[redacted]
14364	Riel Converter Station & 230kV AC Switchyard Site Development	[redacted]	[redacted]
15533	Property – Keewatinohk Converter Station	[redacted]	[redacted]
15540	Keewatinohk Converter Station	[redacted]	[redacted]
15541	Riel Converter Station	[redacted]	[redacted]
15544	Keewatinohk 230kV AC Switchyard	[redacted]	[redacted]
21082	Keewatinohk Converter Station Distribution	[redacted]	[redacted]
23788	Riel 230kV Expansion for Bipole III	[redacted]	[redacted]
23837	Converter Stations Contingency	[redacted]	[redacted]
	Totals	2,675,082,692.80	2,779,633,110.33

1a, 7a

The documents indicate that the values in Table 1 include Manitoba's Provincial Sales Tax. This was assumed to be 8% on "applicable items" in the 2014 estimate, and Amplitude has assumed that this same assumption was carried over to the 2016 estimate update.

Table 1 shows an increase in the estimate/budget between 2014 and 2016 for the converter stations of $104,550,417.53. Some WBS values were increased materially (15540, 15541 and 23837) while others were reduced. The most notable increase in budget is an increase in contingency by [redacted] 1a, 4b

Documents reviewed have identified a need to increase contingency during the April 2016 cost estimate revision, due to risks identified by the Boston Consulting Group. We understand that additional funds were requested as the confidence level of P50 was not considered "*appropriate to address the remaining risks on the work*"[1] and that the project management team requested additional funds to bring the confidence level to P75 "*in order to complete the project on budget and to address costs that had been drawn from contingency as a result of cost sharing with the now-shelved Conawapa Project*"[1]. A summary of the contingency adjustments is provided in the Manitoba Hydro document. These amounts add up to [redacted] The difference between the budget increase and this amount has been explained by Manitoba Hydro as due to a reduction in the target adjustment account that is held, from [redacted] These are accounting elements and Amplitude is not qualified to comment on such transactions. 1a, 7a

[1] Manitoba Document "CEF-16 Budget Update and CPJA Budget Increase Summary", August 29, 2017.

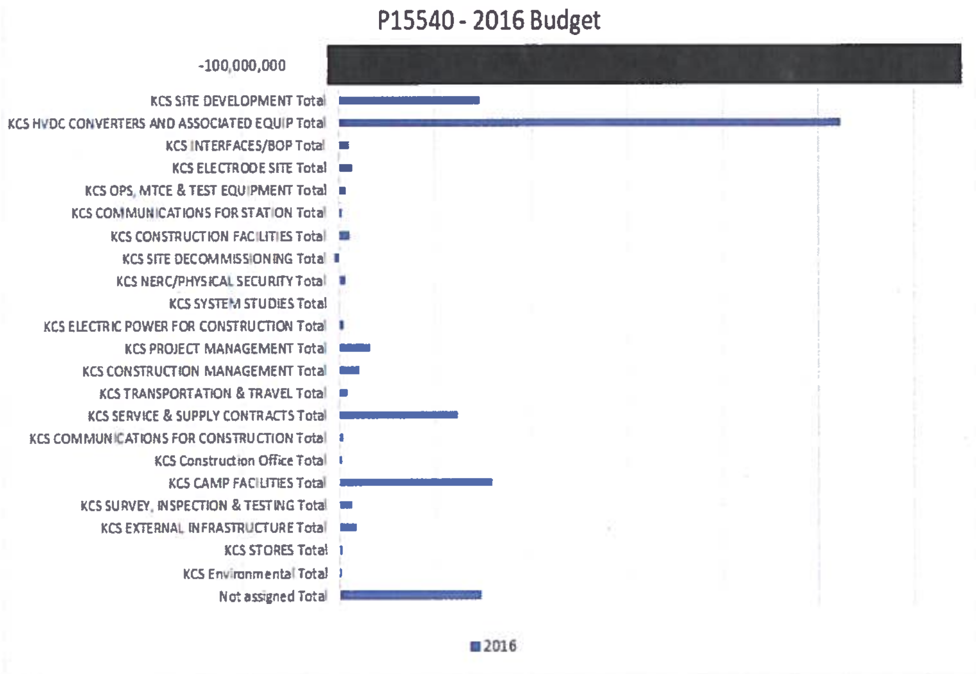
The only scope change identified in the documents provided is the additional funding for the access road for Conawapa, the cost of which was originally to be shared with the Conawapa Project, which was since shelved[2]. This resulted in an increase to the converter station contingency of [redacted] 7a

The WBS values in Table 1 show that the major cost items for the converter stations are (in descending order):

1. WBS 15540 - Keewatinohk Converter Station
2. WBS 15541 - Riel Converter Station
3. WBS 23837 - Converter Stations Contingency.
4. WBS 15544 - Keewatinohk 230kV AC Switchyard
5. WBS 14364 - Riel Converter Station & 230kV AC Switchyard Site Development

The first two WBS (15540 and 15541) make up close to 78% of the total budget for the overall converter station costs. These two WBS have a high number of cost networks, compared to the others, having each 22 networks. A breakdown of the 2016 budget allocations for each of the 22 networks for P15540 an P15541 is provided in Table 2 and Table 3 respectively.

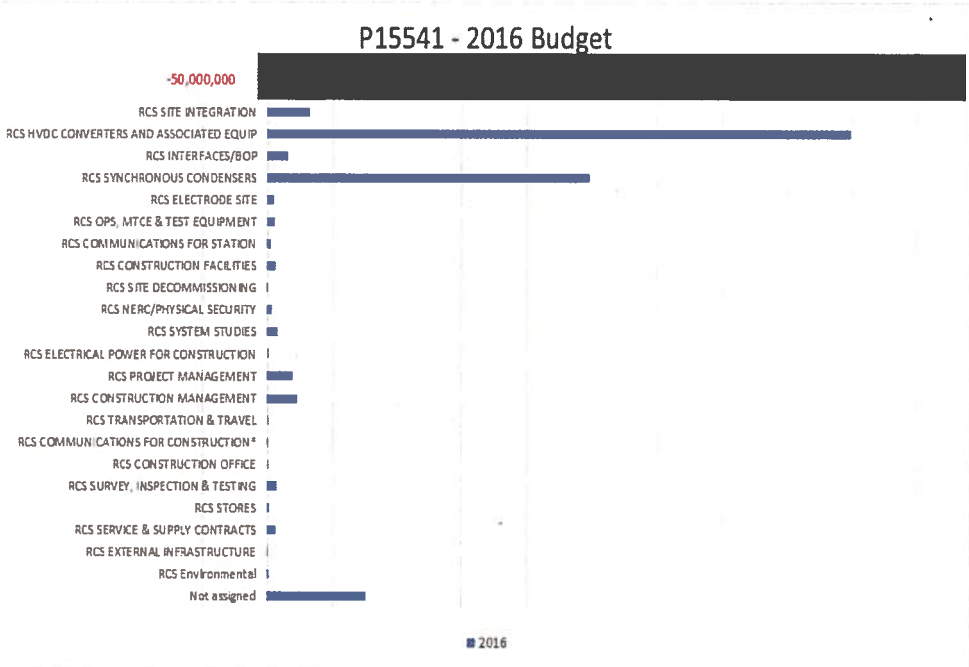
Table 2 - Breakdown of Cost Networks for P15540 - Keewatinohk Converter Station



1a, 7a

[2] Manitoba Hydro Document, "Basis for the Current Converter Stations Budget", page 1.

Table 3 - Breakdown of Cost Networks for P15541 - Riel Converter Station



1a, 7a

For Keewatinohk (P15540), it can be seen that the cost network for the HVDC converters and associated equipment (Network 244644) is the dominant cost, as would be expected. This is followed by the camp facilities (Network 244633), site development (Network 244643) and not assigned amounts.

For Riel (P15541), the dominant cost is again the HVDC converters and associated equipment (Network 244616) followed by the cost of the Synchronous Condensers (Network 244618) and unassigned amounts.

The sum of the HVDC converters and associated equipment networks (for both sites) and the synchronous condensers at Riel (i.e. the major EPC contracts) makes up over [redacted] or about [redacted] 1a, 7a
of the total estimate for the HVDC converters. In our experience, this proportion of "EPC costs" to "non-EPC costs" appears low, although we acknowledge that there are some unique major cost elements to this project, such as the extensive work on the AC switchyards and the provision of the camp at Keewatinohk that do not fall within the scope of the EPC contracts for the converter stations and synchronous condensers.

For the large part, the overall cost of the converter stations is made up of three major contracts:

- HVDC Converter Stations and Associated Equipment – Siemens/Mortensen.
- Synchronous Condensers – Voith.
- Keewatinohk AC Switchyards – SNC Lavalin.

The information provided indicates there is also an EPC contract for the Riel Converter Station 230kV Switchyard Expansion and Switchyard, although no information on such a contract was provided.

2.1.1 Siemens/Mortensen Contract

The Siemens/Mortensen EPC Contract covers the engineering, procurement, construction and commissioning of both HVDC converter stations including all equipment associated with the converter valves, converter transformers, civil and structural, AC and DC yards, auxiliary power, control and protection and mechanical plant.

The contract was awarded following a competitive tender process. Tender documentation provided shows that there were three bidders:

1. Siemens / Mortenson Construction (Siemens)
2. ABB/Kiewit (ABB)
3. Alstom / PCL Constructors Canada Inc. (Alstom)

All three companies are well known in the HVDC industry and have a long history of providing LCC HVDC transmission solutions globally. Copies of the individual tender submissions were provided to Amplitude, along with a spreadsheet summarising the outcomes of the tender analysis conducted by Manitoba Hydro[3].

The original bid price from Siemens/Mortensen for the main engineering, construction, installation testing, commissioning and project management component of the works (excluding spares, provisional sums, training and other optional components) was approximately [redacted] 1a, 7a, 8a

In our view, the technology partners of all three bidders (i.e. Siemens, ABB and Alstom Grid) are all in the "top three" in terms of experience with the development and delivery of LCC HVDC projects worldwide.

In our view, the comparison of three competitive bids from the three most experienced vendors of this technology provides some comfort that the EPC contract costs of the HVDC converter stations for Bipole III are within market for the scope of the project and location.

The tender evaluation sheet provided by Manitoba Hydro[3] identifies all three bidders as having passed the mandatory requirements. [redacted] 8a Amplitude did not explore these evaluations in detail, however the techno-economic evaluation of the bidders appears to have been thorough with consideration was given to technical capability, compliance with technical requirements, performance (including losses and expected replacement costs), technology proposed, schedule and overall value.

Siemens/Mortensen were the selected tenderer. The final contract price, assumed to be after post-tender clarification and negotiation (excluding spares, provisional sums, training and other optional components) was approximately [redacted][4]. 8a

The breakdown of the initial contract price for the Siemens/Mortensen contract is shown in Table 4.

Table 4 - Major Cost Components of Siemens/Mortensen Contract - Initial Contract Price

No.	Description	Cost
1	System Engineering and System Studies	[redacted]
2	Keewatinohk Converter Station – Design, Supply, construction, installation, testing, commissioning and mandatory spares for converter equipment and civil works.	
3	Riel Converter Station – Design, Supply, construction, installation, testing, commissioning and mandatory spares for converter equipment and civil works.	
4	Project Management Services and Performance Bond	
5	Optional Spares and Training	
	Total:	$819,773,930.35

1a, 7a, 8a

[3] 244616-244644-0020-033102-SHT-Final Proposal Evaluation-20140627.xlsx
[4] Converter Equipment Contract, Schedule III "Payment Milestones & Contract Price".

Note that item 4 in Table 4 (project management services and performance bond) makes up [redacted] of the whole contract price, with the "Performance Bond" component (we expect to be a requirement of the contract) called out as just under [redacted] of that amount (i.e. just under [redacted] of item 4). 1a, 8a

The initial contract price presented here is exclusive of PST. Manitoba Hydro has advised that the calculated PST amount for the base contract is [redacted][5], bringing the initial contract price to [redacted] including PST.

2.1.1.1 Contract Variations

The copies of the approved project variations that were provided have been reviewed by Amplitude. A total of 115 variations were reviewed. The status of the variations received is summarised below:

- The total value of approved variations reviewed was [redacted] This is close to the number determined from the combination of the variation amounts from the latest Siemens and Mortensen progress statements of [redacted] (to end of September 2017). Manitoba Hydro has since emailed an updated value of [redacted] for the combined Siemens/Mortensen variations. All these values are exclusive of PST. 1a, 8a
- There are some variations that still have no value, although most of these are expected to be not material. It is expected that the difference between the two values above are due to these "actual cost" variations.
- The variations are broken down by site as approximately 66% at Keewatinohk and 34% at Riel. In some cases, assumptions as to which site was affected or whether the costs would be roughly 50/50 between the sites have been made by Amplitude.
- Approximately 80% of the total value of approved variations are due to 14 variations (out of 115), all with a value greater than $1M.

Manitoba Hydro has advised a calculated PST amount on the variations of $1,086,687.74. Therefore, the sum of the Siemens/Mortensen original contract price and the value of approved variations (taking the latest advised by Manitoba Hydro), up to end of September 2017, comes to $904,604,618.48 including PST.

In the spreadsheet "2018 06 BPIII CS September 2017 Monthly Contracts Report 20171011.xlsx", the following information is provided:

- Current Contract Value - [redacted]
- Actuals including accruals - [redacted] 1a, 7a, 8a
- Dollars Remaining - [redacted]

There is a discrepancy between the original contract price plus variations determined by Amplitude ([redacted]) and the stated current contract value ([redacted]) of [redacted] which has been explained by Manitoba Hydro as the difference is due to escalations for steel, copper, on-site labour and concrete costs which are allowed under Schedule III of the contract[6]. 1a, 7a, 8a

For the purpose of determining adequacy of remaining budget and contingency, a post-PST contract value of [redacted] will be used.

2.1.1.2 Overall Cost Compared to Other Projects

The pricing of HVDC converter stations can be very complex, and dependent on many factors. In our view, the most accurate cost estimates and pricing is delivered by the vendors themselves, who can

[5] Email from Alastair Fogg of Manitoba Hydro dated 17 November 2017.
[6] Email from Alastair Fogg of Manitoba Hydro dated 17 November 2017.

take account of these factors and have access to detailed design and up to date pricing for components and materials. Our experience shows that accurate estimates should involve the submission of budgetary estimates from the HVDC vendors. Any attempts to build a check price from the bottom up with limited information is likely to result in large discrepancies that will be difficult or impossible to explain.

Some factors that influence pricing when comparing converter station EPC costs between projects include:

1. Cost of raw materials and metals – HVDC converter stations costs are dependent on the cost of certain raw materials and metals at the time – including concrete, steel, iron and copper. The cost of these materials will vary from year to year, either due to fluctuations in global markets or due to changes in local supply and demand.
2. Global demand for HVDC and vendor manufacturing capacity – there are only a relatively small number of HVDC vendors globally and their engineering resources and manufacturing capacities are finite. The global demand for HVDC projects can vary from year to year, although we are observing an overall increase in demand annually. If the vendors cannot increase resources and capacity in proportion to the increase in demand, this may push up costs and push back delivery schedules. In a situation where all vendors have many projects underway and have their manufacturing "slots" already filled, the submitted costs for the work, even in a competitive tender, could be higher across the board than previous projects.
3. Location – The location of the project can drive the project cost in a number of ways. The "top three" major HVDC vendors are all based in Europe (UK, Sweden and Germany). Projects that are a large distance from the HVDC vendors' facilities, especially those that require a long inland journey or require equipment to be flown to site, will incur higher transportation charges and longer lead times. Remote locations tend to require labour to be brought in from outside (leading to higher travel and accommodation costs) and the provision of higher wages or salaries to compensate for the remote location.

Most reported costs for HVDC projects are published exclusive of local taxes. Therefore, the estimated pre-PST current contract value of [redacted] will be used for comparison, less the performance bond component ([redacted][7]). The cost per kW for both terminals, based on 2,000MW continuous rating comes to approximately $422.6/kW. In the case of Bipole III, the entire converter station is specified to a 15% 1a, 8a
"continuous overload", which from an equipment and materials point of view is more or less a 2,300MW converter. Based on 2,300MW the cost per kW becomes approximately [redacted].

Amplitude presents here a selection of reported HVDC EPC costs for a variety of LCC projects, and has scaled these to 2016 levels for comparative purposes. These values represent actual announced costs and often represent the initial contract price (i.e. public announcement by the vendors on project award, without variations). Representative projects have been identified based on these being relatively recent (since 2006), utilising LCC HVDC technology, bipolar configuration and where a statement as to the converter station (only) contract has been issued from a reliable source. All of these projects except one (China) are based on one valve group per pole. These are the EPC contract costs only and does not include other non-EPC costs, such as owner's costs, environmental, permitting and land acquisitions. The selection is presented in Table 5.

[7] Converter Equipment Contract, Schedule III "Payment Milestones & Contract Price"

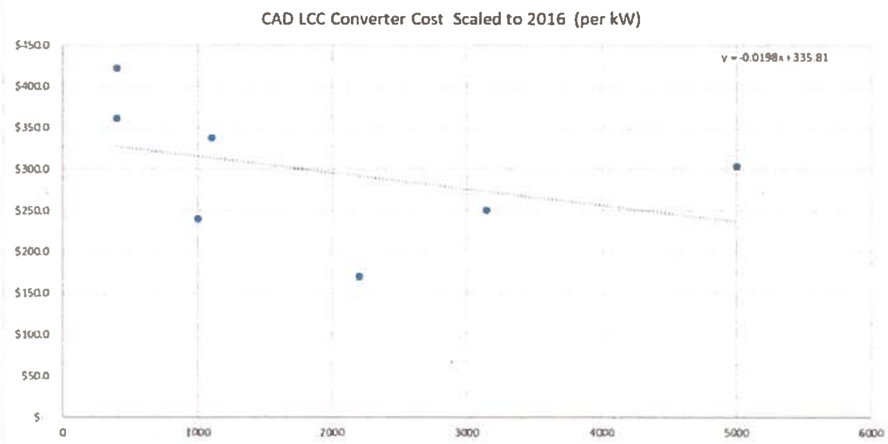
The converter station costs from Table 5, in CAD/kW, are shown graphically in Figure 1.

Figure 1 - Cost/kW for Two-Terminal Converter Stations



[8] For both converters, converted to CAD and scaled as follow: Scaling has been performed as follows: The value is converted to Canadian currency using annual average exchange rate for the year of publication and then scaled to 2016 amounts using published inflation rates for Canada.

Using the trend line, the sample produces a cost per kW for a 2,000MW of CAD296/kW and for a 2,300MW HVDC system, CAD290/kW. Multiplying these by their respective ratings results in an EPC contract cost between $592M and $667M.

It should be stressed again that these values are based on initial contract price (announcements made on award) and are not reflective of final converter station EPC contract costs at or toward the end of each project.

There also exists some Cigre documents that provide good benchmarks for pricing, although one of these uses quite old data. Two such references are:

- Technical Brochure 186 – "Economic Assessment of HVDC Links" published in June 2001. The document provides some costing information for LCC HVDC converters (Table 4.1). This document presents costing information that are stated as being "typical turnkey costs of the vendor's HVDC supply and installation" or in other words, the total expected vendor contract (EPC) cost. The values provided cover both terminals of a two-terminal scheme and they assume the DC bipole is made up of only one valve group per pole and no requirement for additional reactive power compensation due to connection to a weak AC system (i.e. synchronous condensers). The costs specifically do not include owner's costs, taxes, IDC or borrowing costs and are quoted to be at an accuracy of "no better than ±20%".
- Technical Brochure 492 – "Voltage Source Converter (VSC) HVDC for Power Transmission – Economic Aspects and Comparison with other AC and DC Technologies" published in April 2012. Although this document is a reference for VSC projects, some indicative pricing for a bipole LCC project (1,000MW) is provided. The values are stated as having an accuracy of ±30%.

By applying the same scaling assumptions as applied to the values in Table 5, the indicative cost per kW values become:

- TB186 – 2,000MW Bipole - $294.7 / kW; and
- TB492 – 1,000MW Bipole - $298.2 / kW.

In recent years, Canada has seen two new HVDC systems installed in Alberta. Both of these projects were built by Siemens, and both utilise the same LCC HVDC technology, albeit using one valve group per pole. While the ultimate design of these projects is for a bipole configuration, only one pole was built for each, with the individual pole being rated at 1,000MW. In both cases, we could not locate a vendor announcement for the overall contract price. However, there is information available publicly issued by the Alberta Utilities Commission (AUC) that provides the following information.

- Western Alberta Transmission Line (WATL) – Estimated cost of the converter station contract after deducting costs associated with significant works undertaken by the contractor for nearby AC substations, was $360M[9]/[10]. After scaling, and based on 1,000MW converters, we estimate this at $376.4/kW.
- Eastern Alberta Transmission Line (EATL) – Estimated forecast cost for the converter stations was $481.8M, but after removing AC interconnection facilities, reactive power compensation

[9] Alberta Utilites Commission, "Decision 2013-407: AltaLink Management Ltd. 2013-2014 Genreal Tariff Application," AUC, Nov. 2013.
[10] Transsmission Facilities Cost Monitoring Committee, "Review of the cost status of major transmission projects in Alberta," TFCMC, Dec. 2013.

and ATCO in-house labour, the estimate for the contractor works becomes $374.4M[11]. Further adjustments to the contract price (downwards) resulted in an estimated at the time (2012) of $349.8M[12]. After scaling, and based on 1,000MW converters, we estimate this at $369.1/kW.

These values are more in line with the cost per kW for Bipole III, and are likely more relevant given they are located in Canada and would have experienced similar circumstances as the Bipole III project, particularly in relation to proximity to the vendor facilities, construction and operation in harsh environmental conditions and the remoteness of at least one converter station site.

2.1.1.3 Price Differentiators

There are certain differentiators associated with the scope of the Bipole III project that are likely to impact the comparison of the cost of this HVDC scheme with others, particularly those outside of Canada. Some key differentiators that would lead to a higher cost compared to other HVDC LCC projects include:

- Each pole of the Bipole III project comprises two series valve groups. The majority of HVDC projects built up to now have only one valve group per pole. Poles can be split into series valve groups particularly where there are certain practical limitations with the project size – such as the manufacture and transportation to site of the converter transformers. Splitting the pole into valve groups results in double the number of valve halls and converter transformers, although these will have lower power ratings each, and one of these valve halls/transformers will have a much lower line to ground voltage (shorter clearances, smaller building, smaller transformer). The overall effect however would be that a two-valve group pole would be more expensive than a single valve group pole of the same rating and voltage. On page 24 of Cigre Technical Brochure 186, the following statement is made:

  "*It is estimated that there would be about a 20% total cost premium to the turnkey supply for a same-size bipole having two parallel valve groups per pole instead of one. If the two valve groups are in series, however, this extra cost applies only to the second (higher-voltage) valve groups.*"[13]

  The statement is not helpful in determining an actual cost difference for multiple series valve groups, but does identify that there will be a cost premium associated with it when compared to the cost of projects with only one valve group per pole.
- Extreme temperature and environmental conditions to be experienced both during construction (at both sites) and during operations.
- The remoteness of the Keewatinohk Converter Station site, and the additional costs associated with performing work in these locations (personnel, travel, transportation etc.).
- Unique controls, including:
  - De-icing controls – the capability to operate with each pole in opposite directions to de-ice the transmission lines.
  - SPS interface, frequency controls, damping controls and reduction ("run-back") capability.
  - NERC cyber security requirements.

---

[11] Alberta Utilities Commission, "Decision 2013-358: ATCO Electric Ltd. 2013-2014 Transmission General Tariff Application," AUC, Sept. 2013.
[12] ATCO Electric Ltd., "Updated cost for Eastern Alberta Transmission Line project," AUC, Dec. 2013.
[13] Cigre Technical Brochure 186 "Economic Assessment of HVDC Links", June 2001, Page 24.

- External TFR systems in addition to those provided with the Vendor's C&P systems (typical).
- Control system replica for the RTDS lab at Riel and the control system simulators at each converter.
- Interface to the Manitoba Hydro supplied DC line fault locator.

These price differentiators are expected to result in a higher EPC contract price than other projects that do not have these characteristics. It is not possible to quantify by how much with the information available and the time provided.

2.1.1.4 Summary of Outcomes

The comparison of three competitive bids from the three most experienced vendors of this technology provides some comfort in the validity of the EPC contract costs of the HVDC converter stations for Bipole III. The Siemens-Mortensen price was selected as having a lower "Total Evaluation Price" than the other two bidders.

In terms of comparing the Bipole III Siemens-Mortensen current contract value of [redacted] (without PST) with comparative projects and cost references: 1a, 8a

1. The values drawn from Figure 1 will result in a vendor (EPC contract) price for 2,000MW-2,300MW bipole converter stations between $592M and $667M. These values will be based on initial contract prices, are based on projects that have one valve group per pole and will have some error associated with scaling assumptions and due to each comparative HVDC project having slight differences in scope that impact price.
2. The values drawn from the Cigre technical brochures will result in a vendor (EPC contract) price for 2,000MW-2,300MW bipole converter stations between $589.4M and $685.8M. These values are stated as having an accuracy no better than ±20%, widening the range to between $471.5M and $822.9M. These values are based on projects that have one valve group per pole.
3. The values drawn from information from recently completed HVDC LCC projects in Canada, the WATL and EATL projects in Alberta, will result in a vendor (EPC contract) price for 2,000MW-2,300MW bipole converter stations between $738M and $865.7M. These projects have only one valve group per pole.

Due to the expected cost premium for two valve groups per pole and for the challenges associated with the remoteness of the Keewatinohk Converter Station, it is expected that the Bipole III costs will be higher than representative single valve group per phase projects not located in remote areas, as would be the case for those identified in items 1 and 2 above.

2.1.2 Voith Contract

The synchronous condenser contract makes up over [redacted] of the estimate for WBS P15541 Network 244618. The contract covers the design, manufacture, supply, install, construct and commission four synchronous condensers, each rated at 250MVAr, at the Riel Converter Station. 1a, 8a

The contract was awarded following a competitive tender process. Tender documentation provided shows that there were three bidders – Siemens, Alstom and Voith.

The original bid price from Voith was [redacted] 1a, 8a

From the tender evaluation sheet provided, we observe that all three bidders passed the mandatory requirements[14]. [redacted]

1a, 8a

Voith was the selected tenderer. The final contract price (assumed to be after post-tender clarification and negotiation) was [redacted] not including PST.

The breakdown of the initial contract price for the Voith contract is shown in Table 6.

Table 6 - Major Cost Components of Voith Contract - Initial Contract Price

No.	Description	Cost
1	Engineering and Design	[redacted]
2	Manufacture and Supply of Equipment and Materials	
2a	Synchronous Condensers and Associated Equipment	
2b	Civil Works	
3	Installation and Construction	
3a	Synchronous Condensers and Associated Equipment	
3b	Civil Works	
4	Testing and Commissioning	
5	Spare Parts	
6	Project Management	
7	Training	
	Total:	**$213,896,689**

1a, 7a, 8a

In the cost breakdown, site installation and construction costs make up [redacted] of the total contract price, while project management makes up [redacted] of the total contract price. The actual supply of the synchronous condensers and associated equipment is only just above [redacted] of the total contract price. This shows the strong influence of local conditions and project/construction management on the pricing for this contract. 1a, 8a

2.1.2.1 Contract Variations

The copies of the approved project variations that were provided have been reviewed by Amplitude. A total of [redacted] variations were reviewed. The status of the variations received is summarised below:

- The total value of approved variations reviewed was [redacted] This is significantly lower than the number determined from the combination of the variation amounts from the latest Voith/Stuart Olsen progress statements of [redacted] (to end of September 2017) 1a, 8a
- There are some variations that still have no value. We anticipate that the difference between the amount of approved variation reported by Voith and Stuart Olsen and the numbers we have looked at is due to these types of variations, or we have not been provided with all variations for this contract.
- Of those provided to Amplitude, only one variation had a value greater than $1M and the value of this variation ([redacted]) makes up almost 50% of the total variations provided to Amplitude (over 26% of the total approved variations reported by Voith and Stuart Olsen). 1a, 8a [redacted]

[14] 244618-0020-033852-MAT-Riel Synchronous Condenser Final Evaluation Matrix-20150206.xlsx

The sum of the Voith original contract price and the value of approved variations (using the end of September value reported by Voith and Stuart Olsen) comes to [redacted] (not including PST). 1a, 8a
No calculated PST amount has been provided by Manitoba Hydro.

In the spreadsheet "2018 06 BPIII CS September 2017 Monthly Contracts Report 20171011.xlsx", the following information is provided:

- Current Contract Value - [redacted]
- Actuals including accruals - [redacted] 1a, 8a
- Dollars Remaining - [redacted]

There is a discrepancy between the original contract price plus variations determined by Amplitude ([redacted]) and the stated current contract value ([redacted]). The latter values are post-PST amounts, and likely the difference is due to both PST and escalation for metal, material and labour prices as allowed under Schedule III of the contract [15]. 1a, 8a

2.1.2.2 Overall Cost Compared to Other Projects

Similar limitations and influencing factors to those identified for the cost of the converter stations would apply here. Table 7 provides a sample of publicly available information related to the cost of synchronous condensers globally.

Table 7 – Publicly Available Pricing Information on Synchronous Condenser Projects

Reference	Year Published	Source Type	Synchrnous Condenser Type and Rating	EPC Costs (Original Currency, Published Date)	EPC Costs (CAD/kVAr, Scaled to 2016) [16]	Source
Cigre TB186	2000	Estimate	250MVAr	€ 20,000,000	$159.92	Cigre TB186 "Economic Assessment of HVDC Links"
Codrongianos Substation on Sardinia island	2014	Actual	2 x 250MVAr	€ 40,100,000	$120.66	http://integrated.terna-reports.it/2014/sites/default/files/pdf-header/Terna_Annual_Report_2014.pdf
Favara and Partinico Substations near Sicily	2015	Actual	2 x 160MVAr	€ 30,800,000	$138.51	http://integrated.terna-reports.it/2015/sites/default/files/pdf-header/Terna_Integrated_Report_2015.pdf
Bjæverskov Substaion, Denmark	2012	Actual	1 x 250MVAr	€175,000,000	$127.47	https://energinet.dk/Om-nyheder/Nyheder/2017/04/25/Energinet-dk-sikrer-spandingen-pa-Sjalland
Fraugde and Herslev Substation, Denmark	2013	Actual	2 x 200MVAr	€340,000,000	$163.07	https://energinet.dk/Om-nyheder/Nyheder/2017/04/25/Energinet-dk-bygger-nye-anlag-pa-Fyn-og-Vestsjalland

[15] Email from Alastair Fogg of Manitoba Hydro dated 15 November 2017.
[16] Reported amount converted to CAD and scaled as follow: Scaling has been performed as follows: The value is converted to Canadian currency using annual average exchange rate for the year of publication and then scaled to 2016 amounts using published inflation rates for Canada.

Reference	Year Published	Source Type	Synchrnous Condenser Type and Rating	EPC Costs (Original Currency, Published Date)	EPC Costs (CAD/kVAr, Scaled to 2016)[16]	Source
Otahuhu, Auckland New Zealand	2005	Estimate	1 x 100MVAr	NZD22,686,000	$232.26	https://www.ea.govt.nz/dmsdocument/4715
Grid Upgrade Plan 2007, New Zealand	2008	Estimate	1 x 120MVAr	NZD34,000,000	$240.60	https://www.transpower.co.nz/sites/default/files/plain-page/attachments/hvdc-gup-vol-l-may-2008.pdf
Proposed Haywards, New Zealand	2005	Estimate	1 x 65MVAr	NZD12,900,000	$203.18	https://www.ea.govt.nz/dmsdocument/180

The values in Table 7 show costs per kVAr ranging from $120.66/kVAr to $240.60/kVAr. The estimated current contract value (pre-tax and escalation) of $220.2M for 1,000MVar equates to $220.2 per kVAr.

Based on these amounts, the Voith contract is within the range of other projects, although it is on the high side of this range. The costing factors and price differentiators unique to the Bipole III project as discussed for the converter station pricing are likely to apply when comparing the cost of Bipole III to the cost of projects elsewhere in the world – including the extreme temperature and environmental conditions to be experienced both during construction and during operations.

2.1.3 SNC-Lavalin Contract

The AC switchyard contract makes up over [redacted] of the estimate for WBS P15544. The work included in this contract consists of system studies, supervision, design, manufacture, factory testing, supply, delivery to site, installation, site testing, commissioning of the nine-bay Keewatinohk 230 kV air insulated AC switchyard located adjacent to the Keewatinohk converter building, with all associated buildings and equipment. 1a, 8a

The contract was awarded under a competitive tender process. Tender documentation provided shows that there were three bidders – Burns & McDonnell, Siemens Canada and SNC-Lavalin.

The original adjusted proposal price from SNC-Lavalin was [redacted] 1a, 8a

[redacted]

SNC-Lavalin was the selected tenderer. The final contract price (assumed to be after post-tender clarification and negotiation) was [redacted] including spare parts and training, not including PST. 1a, 8a

The breakdown of the initial contract price for the SNC-Lavalin is shown in Table 8.

Table 8 - Major Cost Components of SNC-Lavalin Contract - Initial Contract Price

No.	Description	Cost (CAD)
1	Design, Supply, Installation, Testing & Pre-Commissioning of Switchyard and Equipment	[redacted]
2	Design, Supply, Construction, Testing and Commissioning of Civil Works, Structures, Foundations and Buildings	
3	Site and Interface Support	1a, 7a, 8a
4	Switchyard Commissioning Support	
5	Project Management Services	
6	Aboriginal Awareness Training and Ceremonies	
7	Performance and Payment Securities	

No.	Description	Cost (CAD)
8	Spare Parts and Special Tools	[redacted]
9	On-the-Job Training Plan	
10	Training of the Purchaser's Personnel for the Operation and Maintenance of the Switchyard	
	Total:	$123,838,715.43

1a, 7a, 8a

In the cost breakdown, the equipment, site installation and construction make up [redacted] of the whole project, while project management makes up only [redacted] of the total contract price. 1a, 8a

2.1.3.1 Contract Variations

The copies of the approved project variations that were provided have been reviewed by Amplitude. A total of [redacted] variations were reviewed. The status of the variations received is summarised below: 1a, 8a

- The total value of approved variations reviewed was [redacted] This is slightly lower than the number determined from the reported variation amounts from the latest SNC-Lavalin progress statement of [redacted] (to end of August 2017).
- Of those provided to Amplitude, three variations had a value greater than $1M and the value of the largest variation ([redacted]) makes up almost [redacted] of the total variations provided to Amplitude. This variation was a request for SNC-Lavalin to implement the revised circuit breaker requirements for the design of the 230kV AC Switchyard. 1a, 8a

The sum of the original contract price and the value of approved variations (using higher number from the sum of the variations provided) comes to [redacted] (not including PST). No calculated PST amount has been provided by Manitoba Hydro. 1a, 8a

In the spreadsheet "2018 06 BPIII CS September 2017 Monthly Contracts Report 20171011.xlsx", the following information is provided:

- Current Contract Value - [redacted]
- Actuals including accruals - [redacted] 1a, 8a
- Dollars Remaining - [redacted]

There is a discrepancy between the original contract price plus variations determined by Amplitude ([redacted]) and the stated current contract value ([redacted]). The latter values are post-PST amounts, and likely the difference is due to both PST and the escalation for metal, material and labour prices as allowed under Schedule III of the contract [17]. 1a, 8a

2.2 Conclusions & Recommendations

- The comparison of three competitive bids from the three most experienced vendors of this technology, with at least two of these being very close in price – provides some comfort in the validity of the EPC contract costs of the HVDC converter stations for Bipole III.
- Comparing the Bipole III HVDC EPC contract cost with other comparative projects and cost references in the public domain, we conclude that the EPC costs are reasonable after taking into consideration the use of two valve groups per pole, the remoteness of the Keewatinohk Converter Station and the extreme temperature and environmental conditions to be experienced both during construction and during operations.

[17] Email from Alastair Fogg of Manitoba Hydro dated 15 November 2017.

- Similarly, we are on the view that the EPC costs for the synchronous condensers are reasonable, after comparison to publicly available cost references and consideration of the extreme temperature and environmental conditions to be experienced both during construction and during operations.

3 Reasonableness of contingencies and reserves Observations & Findings

3.1 Observations & Findings

Information on actual costs incurred per WBS and per network, up to September 2017, has been provided and reviewed by Amplitude[18].

The actual costs incurred to September 2017 versus the 2016 budget is presented in Table 9 and graphically in Figure 2.

Table 9 - Bipole III - Actual Costs incurred to September 2017 versus the 2016 Budget

WBS	Description	2016 Budget	Sept 2017 Actual	Remaining Budget
P:15533	Property for Keewatinohk Converter Station	[redacted]		
P:15540	Keewatinohk Converter Station			
P:15544	Keewatinohk 230KV AC Switchyard			
P:21082	Keewatinohk Converter Station Distribution			

1a, 7a, 8a

[18] BPIII CS CPJ Comparison vC14 vs vC16 Actual spend to Sept 30, 2017.xlsx

WBS	Description	2016 Budget	Sept 2017 Actual	Remaining Budget

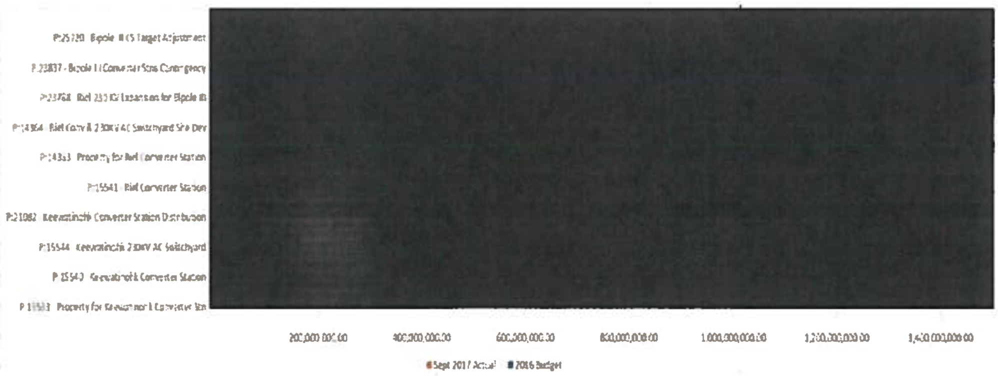
	Totals	2,780,556,950.46	2,136,788,968.93	644,691,821.66

1a, 7a, 8a

Figure 2 - Bipole III Converter Station Costs - 2016 Budget vs Sept 2017 Actual - WBS Level



1a, 7a, 8a

Table 9 and Figure 2 both show that as at September 2017, all WBSs are running under budget with a substantial contingency remaining on the project.

As at the end of September 2017, the project has been progressed to the point that significant progress has been made on the construction and installation of the converter stations and AC switchyards at both sites and of the synchronous condensers at Riel.

An overall picture of the remaining activities of the converter station component of the project is shown in Table 10 which is based on our interpretation from the latest schedules provided in .XER format for the three major contracts (HVDC converters, synchronous condensers and AC switchyards).

Table 10 - Bipole III – Converter Station Works – Major Remaining Activities

Contract	Activity
HVDC	Loss Measurements and Losses Study
HVDC	Manufacture of Spare Transformers
HVDC	Manufacture of HVDC Line Coupling Capacitors
HVDC	Operator Training Simulator – Preparation for Shipment
Converter Stations	
HVDC	Completion of Civil Works, Structural Erection and Installation – Converter Building, AC Yard and DC Yard
HVDC	Civil works for spare transformer bays
HVDC	Completion of equipment installation and pre-commissioning - Filter Bays
HVDC	Completion of equipment installation and pre-commissioning - Valve and Valve Cooling

Contract	Activity
HVDC	Completion of equipment installation and pre-commissioning – Valve hall equipment
HVDC	Completion of pre-commissioning – Converter transformers
HVDC	Completion of pre-commissioning – AC and DC yards
HVDC	AC Yard - High voltage connections to filter banks and converter transformers
HVDC	DC Yard – High voltage connections to DC equipment and HVDC line
HVDC	Completion of installation and termination of control and fibre optic cable installations in converter building
HVDC	Completion of drywall and internal finishing in converter building
HVDC	Completion of HVAC, fire and auxiliary systems in converter building
HVDC	Completion of overhead wire installation – AC and DC yards
HVDC	Completion of yard fencing and grounding
HVDC	Sub-Systems Tests and Station Tests
Synchronous Condensers	
Synch Cond	Complete Manufacturing rotor and stator – SC5
Synch Cond	Complete Manufacturing of Unit Transformer – SC4 and SC5
Synch Cond	Complete installation works – electrical, cabling, auxiliary systems and mechanical systems – SC2, SC3, SC4 and SC5
Synch Cond	Mechanical Completion of SC2, SC3, SC4 and SC5
Keewatinohk 230kV Switchyard	
230kV Switchyard	Complete cable installation, interface to converter stations – controls and communications
230kV Switchyard	Complete 600V building feeder cable installations
230kV Switchyard	Complete switchgear building and control building
230kV Switchyard	Complete fire protection works
230kV Switchyard	Pre-commissioning of buswork, lighting and grounding
230kV Switchyard	Pre-commissioning of AC and DC station services
230kV Switchyard	Complete grounding works
230kV Switchyard	Pre-commissioning of CBF bays and switchgear buildings
230kV Switchyard	Sub-Systems Testing
Testing and Commissioning	
HVDC	System Tests – KCS and RCS
HVDC	Acceptance Tests – KCS and RCS
HVDC	Trial Operation
Synch Cond	Testing and commissioning of SC2, SC3, SC4 and SC5
230kV Switchyard	System Testing

The expected status of each WBS, based on the information provided, is summarised in the following sections.

3.1.1 P15533 - Property for Keewatinohk Converter Station

Manitoba have advised that typically property for transmission lines are acquired by easement and converter station sites by ownership[19]. The estimate for the property components for the converter stations (P15533 and P14363) includes internal and external labour to conduct property appraisals, property acquisitions and surveys.

Manitoba Hydro will own the land for the Keewatinohk Converter station at the end of the project. As this site is on Crown land, a flat rate annual fee is paid up front for permission for construction rights and access to the land[20].

This WBS has only one Network (243352). The breakdown of actual versus 2016 budgeted expenditure is shown in Table 11.

Table 11 - WBS15533 - Budget vs Actual

Description	2016 Budget	Sept 2017 Actual	Budget Remaining
LAND PURCHASES-NRTHRN CNVRTR STATION* Total	[redacted]		
Conawapa Access Road* Total			
Keewatinohk Infrastructure Total			
Not assigned Total			
Totals	**486,556.41**	**463,957.75**	**22,598.66**

1a, 7a, 8a

The majority of costs associated with this project has been related to the land purchase. Given the project site works are close to completion, it is reasonable to expect that any further expenditure on this WBS, if any, would be non-material.

3.1.2 P15540 - Keewatinohk Converter Station and P15541 - Riel Converter Station

These WBS cover the largest component of the overall converter station costs. Each WBS contains 22 cost networks, covering various cost elements for the converter station. A summary of these networks, along with the 2016 budget and Sept 2017 actual costs (assumed to include PST) is provided in Table 12 and Table 13 for P15540 (Keewatinohk) and P15541 (Riel) respectively.

Table 12 - WBS15540 - Budget vs Actual

The reported status of the payment milestones for the Siemens/Mortensen Contract is shown in Table 14. Note that while the table shows reporting from Siemens to end August, Amplitude was advised that this is because no payment milestones were claimed by Siemens during September 2017[21].

[21] Email from Kimberley Savage of Manitoba Hydro dated 18 November 2017.

Table 14 - Progress Payments Made for Siemens/Mortensen Contract – Up to End September 2017

Variations: LOA 35 Completion Bonus	[redacted]							

1a, 7a, 8a

Contract No. 033102	Siemens (end August-2017)			Mortenson (end September-2017)			Total Paid to Date (September 2017)	Total Remaining to Date (September 2017)
	Payment to Date	Remaining	%Spent	Payment to Date	Remaining	%Spent		
Totals	$329,034,656.24	$69,253,644.12		$418,788,573.31	$51,471,625.86		$747,823,229.55	$120,725,269.98

Table 14 shows that as of end of September 2017, there is a commitment to pay the Siemens/Mortensen contract $120.7M (not including PST). Using an assumed overall PST of 4%[22], this comes to approximately $125.5M including PST. All approved variations are included in Table 14. Amplitude are not aware of any pending variations that are pending and have not already been approved.

Table 9 shows approximately [redacted] of budget remaining between WBS P15540 and P15541 (including PST). In terms of the networks in each of these WBSs that contain the Siemens/Mortensen contract (244644 and 244616 respectively), the remaining budgets for these networks add up to about [redacted]. This means that assuming no variations, and no other activity under 244644 and 244616 not 1a, 7a, 8a
already costed under the Siemens/Mortensen contract, at least [redacted] will need to come out of the other budgets and/or contingency (P23837). Table 9 shows there to be [redacted] remaining in the contingency.

The other significant contract element is the Voith contract for the Synchronous Condensers at Riel Converter Station. Table 13 shows that for the cost network associated with the synchronous condensers (244618), the actual expenditure to end September 2017 is approximately [redacted] compared to a budget of [redacted] (inclusive of PST), leaving a remaining budget for the network of 1a, 7a, 8a
approximately [redacted] This cost network includes the Voith contract, which makes up about [redacted] of the budget, with the remaining budget covering Manitoba Hydro staff and contractor works.
The reported status of the payment milestones for the Voith Contract is shown in Table 15.

Table 15 - Progress Payments Made for Voith Contract – Up to End September 2017

Contract No. 033852	Voith Hydro (September-2017)			STUART OLSON (September-2017)			Total Paid to Date (September 2017)	Total Remaining to Date (September 2017)
	Payment to Date	Remaining	%Spent	Payment to Date	Remaining	%Spent		
Item 1: Design of Synchronous Condensers & Associated Equipment	[redacted]							
Item 2: Design of Civil Works								
Item 3: Manufacture & Supply								
Item 4: Installation & Construction								
Item 5: Testing & Commissioning								
Item 6: Mandatory & Recommended Spares								
Item 7: Project Management Services								
Item 8: Optional Spares, Special Tools & Maintenance Equipment								
Item 9: Training of Purchaser's Personnel for O&M of Synchronous Condensers								

1a, 7a, 8a

[22] Amplitude has not calculated the elements of these contracts that are subject to PST. However, the percentage of PST to contract values provided by Manitoba Hydro in an email dated 17 November 2017 shows this proportion to vary between 2% and 4%, depending on the proportion of labour and materials. We have used 4% as a conservative estimate, for comparative purposes.

Contract No. 033852	Voith Hydro (September-2017)			STUART OLSON (September-2017)			Total Paid to Date (September 2017)	Total Remaining to Date (September 2017)
	Payment to Date	Remaining	%Spent	Payment to Date	Remaining	%Spent		
(Purchaser's option - not exercised yet)	[redacted]							
Variations	[redacted]							
Totals	$113,891,199.99	$21,443,921.75		$57,106,532.23	$27,776,037.43		$170,997,732.22	$49,219,959.18

1a, 7a, 8a

Table 15 shows that as of end of September 2017, there is a commitment to pay the Voith contract a further $49.2M (not including PST) or, using the same PST assumptions previously, approximately $51.17M including PST. All approved variations are included in Table 15. Amplitude are not aware of any pending variations that are pending and have not already been approved.

Table 13 shows approximately [redacted] of budget remaining for WBS P15541/ cost network 244618 (including PST). This means that assuming no variations, and no other activity under cost network 244618 not already costed under the Voith contract, at least [redacted] will need to come out of the other budgets and/or contingency (P23837). 1a, 7a, 8a

The analysis above covers cost network 244644 in WBS 15540 (Keewatinohk Converter Station) and cost networks 244616 and 244618 in WBS 15541 (Riel Converter Station). Combined, it is expected that at least [redacted] will need to come out of contingency just to cover off outstanding committed values to the contracts – assuming no further Manitoba Hydro costs are to be charged to these networks (which is unlikely) and no further variations are received (also unlikely). There is not enough information or time for Amplitude to attempt to analyse these costs to project completion. 1a, 7a, 8a

However collectively, these three WBS account for only [redacted] of the 2016 budget and [redacted] of actual expenditure to date. These costs are mostly Manitoba Hydro staff and contractor costs and associated smaller contracts. There is not enough information or time for Amplitude to attempt to analyse these costs to project completion. However, Table 16 and Table 17 provide some commentary on these activities for Keewatinohk and Riel respectively, including whether there is expected to be substantial activity going forward (from end of September 2017) based on the estimated remaining activities provided in Table 10. 1a, 7a, 8a

Table 16 - P15540 - Keewatinohk Converter Station - Status of Other Networks

Network No.	Description	Scope Inclusions[23]	Budget Remaining	Anticipated Future Activity
244643	KCS SITE DEVELOPMENT	• Civil site development, ancillary and auxiliary buildings, insulation stone, concrete supply and aggregate, asphalt pavement, re-vegetation, landscaping and signage. • Includes draining and improvement to existing site prior to construction, plus clearing and winter excavation, and placement of materials. • Mostly internal labour, supply and installation contracts and expenses.	[redacted]	• The bulk of this work should be complete, covering site preparation, civil and earthworks. • There will still potentially be some insulation stone, asphalt, re-vegetation and landscaping to be done. • No information available on the status of these works. • Assume the remaining budget will be spent.
244644	KCS HVDC CONVERTERS AND ASSOCIATED EQUIP	• Elements not directly associated with the Siemens/Mortensen contract includes line fault locators and special protection schemes, grounding studies, construction work oversight and support services. • Also includes HVDC expertise for early phases of the project.		• Assume line fault locators and SPS schemes installed. • Grounding studies should be complete. • Early phase of project sunk cost. • Some outstanding activity for oversight completion of Siemens/Mortensen Contract.

1a, 7a, 8a

[23] Taken from Manitoba Hydro document "Bipole III Project, basis of Estimate Document, September 2014 Cost Estimate Update", Revision 0, March 2015.

Network No.	Description	Scope Inclusions[23]	Budget Remaining	Anticipated Future Activity
			[redacted]	• With an anticipated site completion date of 20 July 2018, there remains another 9 months of construction oversight for this contract. • No information available on ongoing costs for construction oversight. • Assume a portion of the remaining budget will be spent on these activities.
244645	KCS INTERFACES/BOP	• Includes supplementary electrical and mechanical works, transition structures, 230kV and 12kV connections, DC line connections, ground grid, electrode connections and lightning protection.		• Some of these activities are likely complete – electrical and mechanical interfaces, ground grid, lightning protection and some of the high voltage connections. • There may be remaining activities for the 230KV, DC line and electrode connections although no information available on the status of these works. • Assume the remaining budget will be spent.
244646	KCS ELECTRODE SITE	• Covers the design, installation and construction of the electrode and the access road to electrode site. • Includes internal costs for detailed design, construction management and oversight, support services.		• This component is already overbudget. • There should be no further work on site improvement and preliminary engineering. • Manitoba Hydro advised that "The Keewatinohk Electrode work is complete and no additional costs are anticipated."[24] • The overrun was due to significant construction issues and challenges encountered, including excessively wet conditions, extra de-watering and excavation and added costs for blasting larger rocks and boulders[24]. • Based on advice from Manitoba Hydro, assume no further expenditure on this item.
244647	KCS OPS, MTCE & TEST EQUIPMENT	• Includes furniture for all site buildings, test equipment and motor vehicles, plus internal labour to procure these.		• No information provided on the progress of these items. • These items tend to be procured towards the end of the project, so it is reasonable to expect that much of this had not been procured as of the end of September 2017. • Assume the remaining budget will be spent.
244648	KCS COMMUNICATIONS FOR STATION	• Includes OPGW to Long Spruce and Henday, internal comms installed with the distribution networks plus communications equipment for between KCS and RCS and from the site to SCC and BUCC.		• No information provided on the progress of these items. • Some of these items tend to be procured in the leadup to commissioning. • Assume the remaining budget will be spent.
244649	KCS CONSTRUCTION FACILITIES	• Includes procure of fire equipment, fire truck, modular and pre-engineered buildings, motor vehicles, forklifts, load, grader et. • Some site electrical panels and fuel tanks.		• Cost information shows the fire truck has been procured and significant expenditure of fire protection, vehicles and buildings already. • As these are all procured for the purpose of construction, and site construction is in its final stages (moving into commissioning), assume all expenditures are complete and no further activity.
244650	KCS SITE DECOMMISSIONING	• Includes salvage for main camp and construction facilities.		• The site has not yet been decommissioned (as of September 2017). • Keep in full anticipated salvage.
244651	KCS NERC/PHYSICAL SECURITY	• Includes physical security and NERC compliant cyber security, including all consulting and construction.		• Very little has been spent on this item as of September 2017. • Possibly this is an activity that will incur costs later in the project. • Assume the remaining budget will be spent.
244652	KCS SYSTEM STUDIES	• Includes system studies for both KCS and RCS, with the costs divided equally between both sites.		• These studies are usually performed before the project commences. • Assume no more activity on this item.
244653	KCS ELECTRIC POWER FOR CONSTRUCTION	• Includes site electrical distribution and the cost of taxes for consumption of electrical power.		• While the construction and installation components would have been completed prior to commencement of construction, there will be continued consumption of electrical power for the next 9 months+. • No information available on how much power consumption and the value of these taxes going forward. • Assume the remaining budget will be spent.
244654	KCS PROJECT MANAGEMENT	• Includes costs for Manitoba Hydro personnel to provide: - cost and scheduling services - project accounting services		• These activities would be expected to continue until the end of project works (July 2018). • No information available on forecast costs for these activities.

1a, 7a, 8a

[24] Email from Alastair Fogg of Manitoba Hydro on 14 November 2017.

Network No.	Description	Scope Inclusions[23]	Budget	Anticipated Future Activity
		- project and engineering management - health and safety management - project insurance - quality assurance (third party) - builder's risk insurance at KCS - wrap up liability, builder's risk, deductible expenses and policy extensions	[redacted]	• 75% has been spent. • Given the converter station contracts were signed in October 2014 (3 years ago) and there is approximately 9 months remaining after September 2017 (i.e. 20% of project duration remaining), it is reasonable to assume the remaining 25% will be spent.
244655	KCS CONSTRUCTION MANAGEMENT	• Includes both Manitoba Hydro and contracted personnel to undertake site management, construction management, contract administration, cost and scheduling services, site engineering and work package management.		• This item includes budgeted amounts close to $3.8M for commissioning activities. • Just over 60% of the site construction and safety management has been spent. • Converter station site construction commenced approximately 24 months ago with 9 months remaining, it is reasonable to expect that the remaining 40% will be spent (plus commissioning budget). • Assume the remaining budget will be spent.
244657	KCS TRANSPORTATION & TRAVEL	• Incudes travel and transportation costs for Manitoba Hydro personnel and contracted personnel. • Includes all costs directly to MH personnel (including contracted personnel) travelling to and from KCS		• Just over 55% has been spent to date. • Assume the remaining budget will be spent.
244658	KCS SERVICE & SUPPLY CONTRACTS	• Services required during KCS construction, including catering, janitorial, security, maintenance, emergency medical services, employee retention and support, Manitoba Advanced Education and Training Referral Services, satellite services, TV, internet and telephone, landfill and parking, sewage removal and portable toilets, propane gas, fuel and septic services and interim camp accommodations.		• With the exception of interim camp accommodations, these costs will be expected to continue to be incurred until the end of site activities. • Just over 65% of the original budget has been spent. • Converter station site construction commenced approximately 24 months ago with 9 months remaining, it is reasonable to expect that the remaining 35% will be spent. • Assume the remaining budget will be spent.
244660	KCS COMMUNICATIONS FOR CONSTRUCTION	• Includes communications in site trailers during construction - telephone, FAX and LAN and fibre optic messenger cables and internal labour, supply contracts.		• Those items associated with general infrastructure should be complete. • The remaining items are well under-budget – only 43% spent to date. • Assume the remaining budget will be spent. 1a, 7a, 8a
244662	KCS CONSTRUCTION OFFICE	• Include miscellaneous purchase orders to procure materials and equipment as needed. • Purchase cost of office equipment, office furniture, printers and supplies.		• It is expected that the majority of the more expensive items required for the construction office would have already been procured with only office supplies (non-material) outstanding. • Assume no further activity on this item.
244663	KCS CAMP FACILITIES	• Site improvement, engineering, construction of a high quality 600 person residence including kitchen, lounge and common room facilities. • Furnishings, finishings and equipment 3 x pre-engineered buildings for recreation centre, emergency response and maintenance building. • Supply and setup of all furnishings and equipment, including gym, appliances and furniture. • All camp and camp lagoon construction, - potable water treatment plant, fire suppression storage tank and domestic water systems.		• All of these activities should have been completed early in the project. • Assume no further activity on this item.
244664	KCS SURVEY, INSPECTION & TESTING	• Includes supplies and services required for quality assurance. • Set up of new concrete testing lab, aggregate testing, new mobile soils testing lab, survey equipment and seismic and vibration monitoring equipment. • Site inspection services, concrete inspection and water testing, engineering survey services.		• It is expected that the various labs and civil testing facilities have already been procured with very little ongoing need for concrete inspection, water testing and engineering survey services. • Assume no further activity on this item.
244674	KCS EXTERNAL INFRASTRUCTURE	• Includes upgrades to the existing stores and staging area, repairs to existing buildings, regrading 160,000m2 of fenced area and general site improvements. • 1.4km of ballast and rail and remediation of existing rail.		• Many of these activities are expected to have occurred early in the project. • Includes provincial road upgrades. • No information available as to the status of these activities. • Assume no further activity on this item.

Network No.	Description	Scope Inclusions[23]	Budget Remaining	Anticipated Future Activity
244676	KCS STORES	• Includes the cost of miscellaneous local purchases, the relocation of foldaway and existing "coverall" buildings and maintenance costs for yard and fabric storage buildings. • Yard fencing, wheeler storage trailer, shelving, tarps, slings, barriers and warehousing in Winnipeg.	[redacted]	• The vast majority of equipment now installed. • Expect that the cost of warehousing buildings and yards was incurred early in the project. • Assume no further activity on this item.
250135	KCS Environmental	• Includes the management and administration of Environmental Protection Program during construction. • The preparation of documents, correspondence, work permit preparation on crown land, familiarity with water rights act and related activities • Costs for consultants for monitoring work (vegetation, heritage, aquatic and mammals), including 2 years post-construction		• Budget included need for monitoring for 2 years post construction. • Assume the remaining budget will be spent.

1a, 7a, 8a

Table 17 - P15541 - Riel Converter Station - Status of Other Networks

Network No.	Description	Scope Inclusions[25]	Budget Remaining	Anticipated Future Activity
244615	RCS SITE INTEGRATION	• Civil site development, ancillary and auxiliary buildings, insulation stone, asphalt pavement, re-vegetation, landscaping and signage. • Includes underground infrastructure (drain extensions, fire water line, fire hydrants etc)	[redacted]	• The bulk of this work should be complete, covering site preparation, civil and underground works. • There will still potentially be some insulation stone, asphalt, re-vegetation and landscaping to be done. • No information available on the status of these works. • Assume the remaining budget will be spent.
244616	RCS HVDC CONVERTERS AND ASSOCIATED EQUIP	• Elements not directly associated with the Siemens/Mortensen contract includes line fault locators and special protection schemes, grounding studies, construction work oversight and support services • Also includes HVDC expertise for early phases of the project.		• Assume line fault locators and SPS schemes installed. • Grounding studies should be complete. • Early phase of project sunk cost. • Some outstanding activity for oversight completion of Siemens/Mortensen Contract. • With an anticipated site completion date of 20 July 2018, there remains another 9 months of construction oversight for this contract. • No information available on ongoing costs for construction oversight. • Assume a portion of the remaining budget will be spent on these activities.
244617	RCS INTERFACES/BOP	• Includes supplementary electrical and mechanical works, transition structures, 230kV and 12kV connections, DC line connections, ground grid, electrode connections and lightning protection.		• Some of these activities are likely complete – electrical and mechanical interfaces, ground grid, lightning protection and some of the high voltage connections. • There may be remaining activities for the 230KV, DC line and electrode connections although no information available on the status of these works. • Assume the remaining budget will be spent.
244618	RCS SYNCHRONOUS CONDENSERS	• Elements not directly associated with the Voith contract includes construction work oversight and support services. • Also includes expertise for earlier contract phases.		• Early phase of project sunk cost. • Some outstanding activity for oversight completion of Voith Contract. • With an anticipated site completion date of August 2018 (SC5), there remains another12 months of construction oversight for this contract. • No information available on ongoing costs for construction oversight. • Assume a portion of the remaining budget will be spent on these activities.
244619	RCS ELECTRODE SITE	• Covers the design, installation and construction of the electrode and the access road to electrode site. • Includes internal costs for detailed design, construction		• Based on advice from Manitoba Hydro, assume no further expenditure on this item.

1a, 7a, 8a

[25] Taken from Manitoba Hydro document "Bipole III Project, basis of Estimate Document, September 2014 Cost Estimate Update", Revision 0, March 2015.

Network No.	Description	Scope Inclusions[25]	Budget	Anticipated Future Activity
		management and oversight, support services.	[redacted]	
244620	RCS OPS, MTCE & TEST EQUIPMENT	• Includes furniture for all site buildings, test equipment and motor vehicles, plus internal labour to procure these.	[redacted]	• No information provided on the progress of these items. • These items tend to be procured towards the end of the project, so it is reasonable to expect that much of this had not been procured as of the end of September 2017. • Assume the remaining budget will be spent.
244621	RCS COMMUNICATIONS FOR STATION	• Includes communications equipment for between KCS and RCS and from the site to SCC and BUCC. • Also communications to Dorsey	[redacted]	• No information provided on the progress of these items. • Some of these items tend to be procured in the leadup to commissioning. • Assume the remaining budget will be spent.
244622	RCS CONSTRUCTION FACILITIES	• Includes procure of modular and pre-engineered buildings, motor vehicles, forklifts, loaders, etc. • Some site electrical panels, toilets, washcars and fuel tanks.	[redacted]	• Cost information shows the expenditure to date on vehicles and buildings are significantly below budget. • As these are all procured for the purpose of construction, and site construction is in its final stages (moving into commissioning), assume all expenditures are complete and no further activity.
244623	RCS SITE DECOMMISSIONING	• Includes salvage for main camp and construction facilities.	[redacted]	• The site has not yet been decommissioned (as of September 2017). • Keep in full anticipated salvage.
244624	RCS NERC/PHYSICAL SECURITY	• Includes physical security and NERC compliant cyber security, including all consulting and construction.	[redacted]	• Very little has been spent on this item as of September 2017. • Possibly this is an activity that will incur costs later in the project. • Assume the remaining budget will be spent.
244625	RCS SYSTEM STUDIES	• Includes system studies for both KCS and RCS, with the costs divided equally between both sites.	[redacted]	• These studies are usually performed before the project commences. • Assume no more activity on this item.
244626	RCS ELECTRICAL POWER FOR CONSTRUCTION	• Includes site electrical distribution and the cost of taxes for consumption of electrical power.	[redacted]	• While the construction and installation components would have been completed prior to commencement of construction, there will be continued consumption of electrical power for the next 9 months+. • No information available on how much power consumption and the value of these taxes going forward. • Assume the remaining budget will be spent. 1a, 7a, 8a
244627	RCS PROJECT MANAGEMENT	• Includes costs for Manitoba Hydro personnel to provide: - cost and scheduling services - project accounting services - project and engineering management - health and safety management - project insurance - quality assurance (third party)	[redacted]	• These activities would be expected to continue until the end of project works (July 2018). • No information available on forecast costs for these activities. • 60% has been spent. • Given the converter station contracts were signed in October 2014 (3 years ago) and there is approximately 9 months remaining after September 2017 (i.e. 20% of project duration remaining), it is reasonable to assume at least 25% will be spent. • Reduce remaining budget by 15% of original budget (approx. $2.8M).
244628	RCS CONSTRUCTION MANAGEMENT	• Includes both Manitoba Hydro and contracted personnel to undertake site management, construction management, contract administration, cost and scheduling services, site engineering and work package management.	[redacted]	• This item includes budgeted amounts close to $4.0M for commissioning activities. • Only 37.5% of the site construction, safety management and HVDC construction support has been spent. • Converter station site construction commenced approximately 24 months ago with 9 months remaining, it is reasonable to expect that another 25% will be spent (plus commissioning budget). • Reduce remaining budget by 37.5% of original budget for these three activities (approx. $7M).
244630	RCS TRANSPORTATION & TRAVEL	• Incudes travel and transportation costs for Manitoba Hydro personnel and contracted personnel. • Includes all costs directly to MH personnel (including contracted personnel) travelling to and from RCS.	[redacted]	• Just over 30% has been spent to date. • Assume the remaining budget will be spent.
244632	RCS COMMUNICATIONS FOR CONSTRUCTION*	• Includes communications in site trailers during construction - telephone, FAX and LAN and fibre optic messenger cables and internal labour, supply contracts.	[redacted]	• Those items associated with general infrastructure should be complete. • Assume the remaining budget will be spent.
244633	RCS CONSTRUCTION OFFICE	• Include miscellaneous purchase orders to procure materials and equipment as needed. • Purchase cost of office equipment, office furniture, printers and supplies.	[redacted]	• It is expected that the majority of the more expensive items required for the construction office would have already been procured with only office supplies (non-material) outstanding. • Assume only the remaining consumables budget ($0.264M).

Network No.	Description	Scope Inclusions[25]	Budget Remaining	Anticipated Future Activity
244634	RCS SURVEY, INSPECTION & TESTING	• Includes supplies and services required for quality assurance. • Set up of new concrete testing lab, seismic and vibration monitoring equipment. • Site inspection services, concrete inspection, engineering survey services.	[redacted]	• It is expected that the various labs and monitoring equipment have already been procured with very little ongoing need for concrete inspection and engineering survey services. • Assume no further activity on this item.
244635	RCS STORES	• Includes shelving for storages and warehousing in Winnipeg, along with maintenance costs for the stores building and internal labour for a storekeeper and utility worker. •	[redacted]	• The vast majority of equipment now installed. • Expect that the cost of warehousing buildings and yards was incurred early in the project. • Assume no further activity on this item.
244636	RCS SERVICE & SUPPLY CONTRACTS	• Services required during RCS construction, including site engineering, cost and schedule services, janitorial, security, maintenance, emergency medical, telephone services, landfill charges, sewage removal, maintenance of portable toilets and supply of fuel.	[redacted]	• Many of these costs will be expected to continue to be incurred until the end of site activities. • Only 28% of the original budget has been spent. • Converter station site construction commenced approximately 24 months ago with 9 months remaining. • It is reasonable to expect that no more than 30% of the original estimate will be spent to end of the work. • Assume only $1.92M to remain in the budget. 1a, 7a, 8a
244675	RCS EXTERNAL INFRASTRUCTURE	• Includes rail upgrades at the RCS site (2km) and turnout. • Also includes internal labour for procurement and legal services.	[redacted]	• These activities should have occurred early in the project. • Assume no further activity on this item.
250136	RCS Environmental	• Includes the management and administration of Environmental Protection Program during construction. • The preparation of documents, correspondence, work permit preparation on crown land, familiarity with water rights act and related activities. • Costs for consultants for monitoring work (vegetation, heritage, aquatic and mammals), including 2 years post-construction.	[redacted]	• Budget included need for monitoring for 2 years post construction. • Assume the remaining budget will be spent.

For Keewatinohk, the assumptions summarised in Table 16 mean that of the remaining budget of [redacted] for this WBS, at least another [redacted] will be expected to be incurred, plus what assumptions can be made for ongoing activities for cost network 244644. If we assume 10% of remaining budget for continued oversight of the HVDC converter installation works (i.e. [redacted]) – that means approximately [redacted] remaining plus the outstanding commitment on the Siemens Mortensen contract. 1a, 8a

For Riel, the assumptions summarised in Table 17 mean that of the remaining budget of [redacted] for this WBS, at least another $58.1M will be expected to be incurred, plus what assumptions can be made for ongoing activities for cost networks 244616 and 244618. If we assume 10% of remaining budget for oversight of the HVDC converter installation works and the synchronous condenser installations works (i.e. [redacted]) – that means approximately [redacted] remaining plus the outstanding commitment on the Siemens Mortensen and Voith contracts. 1a, 8a

Combining these two amounts ([redacted] including PST) with the amounts owing on the Siemens/Mortensen contract (estimated at approximately [redacted] including PST) and the Voith contract (estimated at approximately [redacted] including PST), this comes to approximately [redacted] (including PST), well below the combined remaining budget of [redacted], without having to dip into contingency (P23837). 1a, 8a

3.1.3 P15544 - Keewatinohk 230KV AC Switchyard

According to the costing information provided, this WBS has a number of networks covering preliminary engineering, foundations, buildings linear infrastructure, circuit breakers, station services, control and protection, communications and AC switchgear for the new 230kV switchyard located adjacent to the

Keewatinohk Converter Station. This includes an EPC contract for the substation works. The breakdown of actual versus 2016 budgeted expenditure is shown in Table 18.

Table 18 - WBS15544 - Budget vs Actual

Network No	Description	2016 Budget	Sept 2017 Actual	Budget Remaining
244671	KCS 230kV AC Switchyard	[redacted]		
244673	Spare network – 230kV Switchyard			
	Not assigned			
		164,235,230.53	160,823,007.09	3,412,223.44

1a, 7a, 8a

Table 18 shows that majority of the budget has been spent as of September 2017.

In cost network 244671, the largest single cost will be the SNC Lavalin contract, which has a reported current contract value of [redacted] (including PST), making up close to [redacted] of the budgeted amount. The estimated amount outstanding on this is estimated to be $30M (not including PST) or, using the same PST assumptions previously, approximately [redacted] including PST. Assuming no further Manitoba Hydro activity (which is unlikely), the deficit will be about [redacted] Including another [redacted] for Manitoba Hydro costs, this will require at least [redacted] from contingency. 1a, 8a

3.1.4 P21082 - Keewatinohk Converter Station Distribution

The 2014 Basis of Estimate does not provide any detail as to what is and is not included within this WBS.

From the detailed cost estimate data, the scope covered by this WBS covers a number of smaller activities associated with providing power distribution to the site, and includes:

- Relocation of Keewatinohk LC9 Line
- Power to the Keewatinohk Start Up Camp
- Power to the Security Gate House
- EMPA Distribution
- Converter Station Distribution
- Converter Station Batch Plant

The reported amount incurred to September 2017 is [redacted] With a 2016 budget of [redacted] there is [redacted] remaining in the budget. 1a

While no details are provided, these activities appear related to the initial provision of power and a number of site construction and up-front works. It is reasonable to expect that any further expenditure on this WBS, if any, would be non-material.

3.1.5 P14363 - Property for Riel Converter Station

Manitoba Hydro owns the land for the Riel Converter station[26]. The land was privately owned and purchased prior to construction. The Manitoba Report published in 2014 advised that the costs included in the estimate are the sunk costs of purchasing the land[26].

This WBS has only one Network (243351). The breakdown of actual versus 2016 budgeted expenditure is shown in Table 19.

---

[26] Manitoba Hydro, "Bipole III Project, Basis of Estimate Document, September 2014 Cost Estimate Update", Revision 0, March 2015, Page 85.

Table 19 - WBS14363 - Budget vs Actual

Description	2016 Budget	Sept 2017 Actual	Budget Remaining
REQUIRED LAND PURCHASE* Total	[redacted]		
OPTIONAL LAND PURCHASES Total			
LAND - SALE OF SURPLUS ITEMS Total			
Not assigned Total			
-	18,030,907.33	17,842,418.11	188,489.22

1a, 7a

The majority of costs associated with this project has been related to the land purchase. Given the project site works are close to completion and advice that the Riel Converter Station land was purchased before 2014, it is reasonable to expect that any further expenditure on this WBS, if any, would be non-material.

3.1.6 P14364 - Riel Conv & 230KV AC Switchyard Site Dev

Amplitude has received no information on the major contract associated with this work.

According to the costing information provided, this WBS has a number of networks covering site development (including contract and protection management, provision of circuit breakers, grounding and technical studies, civil and electrical works and commissioning), an EPC contract for the work at Riel Converter Station, some old (assumed to be sunk) costs for the Bipole III 230kV expansion and some communication works. The breakdown of actual versus 2016 budgeted expenditure is shown in Table 20.

Table 20 - WBS14364 - Budget vs Actual

Network No	Description	2016 Budget	Sept 2017 Actual	Budget Remaining
243371	Riel Converter Site Development Total	[redacted]		
243400	Design/Construct for Riel Convert Total			
243443	Riel Station Eng. Procurement Contract Total			
244172	(OLD)Riel C.S. 230KV Expansion for BPIII Total			
246108	Riel Converter Site Dvlpmt-Const Pwr Total			
246242	Riel Communications Total			
4302550	Riel Station 230 kV Expansion Ph2 Total			
#	Not Assigned Total			
		132,721,211.72	131,855,257.75	865,953.97

1a, 7a, 8a

Table 20 shows that majority of the budget to be spent as of September 2017. As we have not received any updated schedules or contract reports for this work, Amplitude is unable to provide an opinion as to whether this budget is expected to be used or if this work will require anything from contingency.

3.1.7 P:23788 - Riel 230 KV Expansion for Bipole III

Amplitude has received no information on the major contract associated with this work.

The breakdown of actual versus 2016 budgeted expenditure is shown in Table 21.

Table 21 – WBS23788 - Budget vs Actual

Network No	Description	2016 Budget	Sept 2017 Actual	Budget Remaining
253035	Riel C.S. 230kV Expansion for BPIII	[redacted]		
253036	Riel HVDC Reduction for Riel Expansion			
#	Not Assigned Total			
		86,810,310.68	72,245,731.04	14,564,579.64

1a, 7a

Table 20 shows that majority of the budget to be spent as of September 2017. As we have not received any updated schedules or contract reports for this work, Amplitude is unable to provide an opinion as to whether this budget is expected to be used or if this work will require anything from contingency.

However, it is expected from observations of other parts of the project that the majority of this work should be complete, and therefore it is assumed that the remaining budget will be adequate to finalise any outstanding activity.

3.2 Conclusions & Recommendations

- In our view, the remaining budget for the Keewatinohk 230kV AC Switchyard (P15544) will not be enough to cover the outstanding contract amounts payable to SNC Lavalin and will require a draw from contingency of the order of at least [redacted] 1a, 7a, 8a
- For the remaining WBS numbers associated with the HVDC converter stations (i.e. P14363, P14364, P15533, P15540, P15541, P21082, and P23788), the information made available indicates that there should be satisfactory amounts remaining in the budgets for each WBS to complete the project without having to draw from contingency.
- The current contingency budget for the converter stations (P23837) is [redacted] Taking out the [redacted] from P15544 should leave approximately [redacted] remaining to cover the impact of any unexpected events or activities which cannot be ascertained from the information made available for this review. 1a, 7a, 8a
- No information has been provided on outstanding contracts associated with P14354 and P23788, covering the Riel 230kV AC switchyard site development and the Riel 230kV expansion. It has been assumed that given the current status of the site works, these activities are expected to be complete or close to completion and no further material costs are expected.

APPENDIX C

Scheduling Best Practices

MGF
PROJECT SERVICES

Scheduling Best Practices

Manitoba Hydro has developed procedures for the Keeyask and Converter Station projects which generally follow recommended best practices by the Project Management Institute and/or AACE International; however, there does not appear to be any mechanism for enforcement of these procedures.

Due to the size, complexity and dollar value of these projects, a Project Management Office (PMO) would provide governance to Manitoba Hydro's major projects. The role of the PMO could include defining and updating existing standards and processes, developing and delivering project management training, mentoring, and conducting periodic audits on projects to identify non-conformance to documented schedule, cost, and risk procedures. The establishment of a PMO should reduce bureaucracy and duplication of effort across the projects while ensuring consistency and transparency.

Areas Requiring Improvement

- Basis of Schedule: There is no Basis of Schedule for the Keeyask Integrated Master schedule (IMS), the MMTP, nor the GNTL schedules. There is a Basis of Schedule for the Bipole III Converter Station. The General Civil Contractor for Keeyask, BBE, appears to be the only major contractor who submitted a Basis of Schedule. The Amending Agreement #7 (AA7) Basis of Schedule submitted by BBE was rejected by Manitoba Hydro. The Basis of Schedule should be a live document with updates as the schedule changes.
- Schedule Development: Bid packages should clearly identify schedule expectations and schedules not meeting these expectations should be rejected. Manitoba Hydro scheduling procedures should outline acceptable logic types within a schedule (e.g., Finish to Start (FS) versus Start to Start (SS), Finish to Finish (FF), or Start to Finsh (SF), maximum duration for any activity, maximum amount of lag, number and type of constraints allowed, removal of negative float, and how to handle planning packages (latest timing on decomposing the activities). How change orders are reflected in the schedule should also be considered. For example, if an activity has already started, how is additional scope handled in the schedule?
- Schedule Quality:
  - Missing logic: only the start activity should not have a predecessor and only the finish activity should not have a successor.
  - High duration: if they are planning packages, they should be identified as such in the schedule. These planning packages should be broken down into more detail before the work commences.
  - Use of relations other than Finish to Start (FS). Activities using other types of relations should be reviewed and changed where possible.
  - Hard constraints should be removed. If a constraint is required, change the constraint to a soft constraint which does not violate critical path method logic this should also resolve much of the negative float.
  - Lags: Consider replacing lag with activities to add visibility to the schedule.
- Schedules should be fully resource loaded.

- The Work Breakdown Structure developed for the project should be the same Work Breakdown Structure used in the schedule.
- Ensure activity names use a verb/noun construct (e.g., Pour Concrete) and that each activity name clearly identifies the work being performed and is unique so when the schedule is grouped or filtered differently, the activity name will still make sense. Avoid the use of acronyms and abbreviations.
- Pick one system to track costs, quality and progress. For example, Ecosys is system which integrates a variety of tools such as P6, SAP, and estimating systems to facilitate the creation of a "single version of the truth".

Tab 127

Section:	Tab 4, App. 4.1	Page No.:	CEF 14, p.3
Topic:	Capital Expenditures		
Subtopic:	Bipole III Project Cost		
Issue:	Current Cost Projections and Cost Risk		

PREAMBLE TO IR (IF ANY):

During the NFAT hearing, Bipole III project cost was $3.24B, but in 2014 Manitoba Hydro revised the estimate to $4.65B.

QUESTION:

Please detail the reasons for the cost increases to Bipole III. In particular, please detail the reasons for the cost increases to the converter stations and the decision to add synchronous condensers.

RATIONALE FOR QUESTION:

This Information Request seeks to explore the risk of Bipole III cost increases, which would impact Manitoba Hydro's revenue requirement and domestic rates.

RESPONSE:

The table below provides a comparison of the capital cost of Bipole III from CEF12 to CEF14. Material variances are explained below.

MANITOBA HYDRO
BIPOLE III PROJECT COMPARISON

(in millions of $)

Project	CEF 12	CEF 14	Inc/(Dec)
Transmission Lines	$ 1,259.9	$ 1,655.4	$ 395.5
Converter Stations	1,828.5	2,675.1	846.6
Collector Lines	191.4	260.2	68.8
Community Development Initiative	-	62.0	62.0
Total	**$ 3,279.8**	**$ 4,652.7**	**$ 1,372.9**

The increase to the project cost of Bipole III versus the previous approved amount has been driven by several factors as discussed below:

1. **The finalization of the HVDC Converters contract and resulting need for Synchronous Condensers:**

   The largest contributing factor to the increase in the Bipole III Control Budget was the final fixed pricing received for the HVDC Converters Equipment and the direct current converter technology selected. Vendors were given the freedom to offer Line Commuted Conversion (LCC) technology or Voltage Source Converter (VSC) technology based upon their own technical and risk assessment of the work. All bids received by Manitoba Hydro recommended the reliable and proven LCC technology. The LCC technology requires the use of synchronous condensers. As a result, converters and related equipment costs came in higher than the estimate which had assumed the use of VSC technology.

2. **The finalization of the Transmission Line route and subsequent route adjustments based on the CEC recommendations:**

   The items related to the Transmission Line route were preliminary and not yet finalized in the previous budget. The 2014 Bipole III Control Budget incorporates all costs associated with the finalization of the Transmission Line route and incorporates all project Licence requirements as recommended by the Clean Environment Commission.

   The finalized Transmission Line route has been adjusted to minimize environmental and agricultural impacts of the transmission line. This includes adjustments to help protect caribou and their habitats, protect and reduce effects on mineral resources and mining interests, minimize effects on agriculture, and minimize effects on landowners. The impact of these adjustments increases the length, turns and bends in the line and constrains tower placements requiring additional stronger and heavier structures. This includes 31 route adjustments and approximately 200 additional towers.

3. Increase in the capacity of the converter equipment to 2300 MW:

Bipole III converter equipment rating was increased to 2300 MW (from 2000 MW) to ensure sufficient capacity for future generation development and flexibility to take advantage of emerging export opportunities. The increased cost for capacity is marginal in comparison to the costs that would be incurred to add this additional transmission capacity at a later date.

4. Incorporation of Awarded Contract Amounts:

In addition to the inclusion of the awarded, fixed price contract amount for the HVDC Converter Equipment, the awarded contract prices for the Keewatinohk Camp, Keewatinohk Site Development and the Keewatinohk 230kV AC Switchyard have been incorporated into the revised Control Budget.

5. Revised In-Service Date:

The previous Bipole III budget assumed an October 2017 in-service date (ISD) for the project. Delays in obtaining the Licence and subsequent delays in obtaining environmental and work permits resulted in Manitoba Hydro having construction delayed by a year and a half. As a result of the delays, the ISD was updated to July 2018 which impacts interest and escalation costs.

6. Increased Project Contingency and Reserves:

A complete risk and contingency review was conducted as part of establishing the revised Control Budget. The same risk identification and contingency development process applied on the Keeyask project (as presented during the NFAT process) was applied to the Bipole III Project. A revised P50 contingency and Management Reserve fund were developed.

7. Funds Associated with the Community Development Initiative (CDI):

Funds associated with the Community Development Initiative (CDI) have been included within the revised $4.65B Bipole III Control Budget.

Tab 128

Bipole III - Converter Stations

Description:
Design and build an HVdc converter station with a rating of 2300MW at the proposed Keewatinohk site, including property acquisition costs and the Keewatinohk 230kV AC switch yard. Design and build an HVdc converter station with 2300MW of converters at Riel, including four LCC HVdc synchronous condensers, property acquisition costs and expansion of the Riel 230kV AC switch yard.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole I and II) corridor outage or a Dorsey station common mode outage. The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. The increased rating ensures future generation can be transmitted via Bipole I, Bipole II and Bipole III in the event of a single valve group outage.

In-Service Date:
July 2018

Revision:
The increase in the estimate is due to the inclusion of additional provincial road upgrades and an increase in contingency levels to a higher (P75) confidence level to better address project risks. The 2014 estimate was based on a P50 confidence level.

	Total	2017	2018	2019	2020	2021	2022-27
Previously Approved	$ 2 675.1	$ 943.4	$ 372.9	$ 180.3	$ 12.2	$ 1.8	$ -
Increase (Decrease)	105.6	(121.9)	306.1	106.0	(4.2)	(1.3)	-
Revised Forecast	$ 2 780.7	$ 821.5	$ 679.0	$ 286.3	$ 8.0	$ 0.6	$ -

TABLE OF CONTENTS

LIST OF EXHIBITS

--- Upon commencing at 9:02 a.m.

THE CHAIRPERSON: Good morning, everyone. Good morning to the people on line. Mr. Peters, I understand that you're going to tell us what we're doing today.

MR. BOB PETERS: Yes, I too have that understanding now. Mr. Chair, we're pleased to welcome to the hearing the independent expert consultant witness panel, which is comprised of representatives of MGF, KCB and Amplitude recognizing that -- and Stanley.

I should indicate, as Mr. Simonsen has done, that on the conference call and the video link we have, I believe, Mr. Les Brand from Australia. We also have Mr. Potter and Mr. Phillips from Stanley. They're in the United States. And I should have mentioned that Mr. Les Brand is with Amplitude and is in Australia.

I'll leave it to My Friends opposite to introduce the witness panel that is present today. As -- after they are sworn and we can proceed. We expect the entire morning will be on the direct evidence. And then there will be questioning throughout the day today and tomorrow. Thank you, sir.

THE CHAIRPERSON: Thank you. Thank you. Mr. Simonsen, can you swear in the witnesses, please.

MR. KURT SIMONSEN: Mr. Chair, I'll swear the witnesses who are in the hearing room first then I'll swear the witnesses over the telephone, if that's acceptable?

THE CHAIRPERSON: Yes.

INDEPENDENT WITNESS PANEL - MFG, KCB and Amplitude

RYAN DEVEREUX, Sworn
CAMPBELL ADAMS, Sworn
KIERANN FLANAGAN, Sworn
VAL MUSFELT, Sworn
DAN CAMPBELL, Sworn
LESLIE BRAND, Affirmed (by video)
JIM POTTER, Affirmed (by video)
DWAYNE PHILLIPS, Affirmed (by video)

THE CHAIRPERSON: Thank you very much. I'll just note for the record that this is the first time we've lived streamed such a large panel so we're hoping that it goes well and I thank Mr. Simonsen and Ms. Schubert because they've been testing this out for quite a while.

With that, Mr. Haight, if you'd like to start.

EXAMINATION-IN-CHIEF BY MR. WILLIAM HAIGHT:

MR. WILLIAM HAIGHT: Thank you. Good to remember that. As I said, I will begin with my immediate right and take the members of the MGF panel through their background and qualifications. Then I will move to Mr. Campbell from KCB at the back, and then I will move to the witnesses that are attending by way of video stream.

So to my immediate right is Ryan Devereux. Mr. Devereux, you are one (1) of the authors of MGF report, which is Exhibit 2(r); correct?

MR. RYAN DEVEREUX: That's correct.

MR. WILLIAM HAIGHT: And you are a professional quantity surveyor?

MR. RYAN DEVEREUX: That's correct.

MR. WILLIAM HAIGHT: And you have over fifteen (15) years experience with heavy industrial natural resource energy and utility infrastructure construction?

MR. RYAN DEVEREUX: That is correct.

MR. WILLIAM HAIGHT: And you have a

degree in construction --

THE CHAIRPERSON: Maybe I will just warn the witnesses. These microphones are -- need to be at a certain distance from you. The light needs to be on that indicates that it's on. If you're too far away the reporter won't pick it up and we'll have to -- have to interrupt to -- to tell you to move it closer. I have been told on numerous occasions to move it closer, so don't take it personally.

MR. KURT SIMONSEN: Mr. Chair, they'll also need to be very articulate and ensure that they're -- they are close to the microphones so our friends on the telephone can also hear them clearly.

MR. WILLIAM HAIGHT: Thank you, Mr. Chair and Mr. Simonsen.

Mr. Devereux, you hold a diploma in -- in construction engineering technology, which you received from the Northern Alberta Institute of Technology?

MR. RYAN DEVEREUX: That is correct.

MR. WILLIAM HAIGHT: And your experience in the construction section -- sectors has resulted in your providing advice to both contractors, as well as owners of projects?

MR. RYAN DEVEREUX: Correct.

MR. WILLIAM HAIGHT: And the range of skills that you have provided to contractors and owners over the last fifteen (15) years, sir, includes strategic asset management, estimating, variation analysis, contractual advice, contract management administration, contract negotiations and lifecycle costing, to name but a few?

MR. RYAN DEVEREUX: Yes.

MR. WILLIAM HAIGHT: I will then move to Mr. Devereux's immediate right and introduce Campbell Adams.

Mr. Adams, you are here on behalf of MGF Project Services, and you are one (1) of the authors of the report that is Exhibit MGF-2(r)?

MR. CAMPBELL ADAMS: That's correct.

MR. WILLIAM HAIGHT: And as I understand it, sir, you will be the principal spokesperson today for the MGF representatives?

MR. CAMPBELL ADAMS: Correct.

MR. WILLIAM HAIGHT: You are a chartered quantity surveyor and have been so for over thirty (30) years?

MR. CAMPBELL ADAMS: I've been a chartered quantity surveyor for probably thirty (30) of those thirty-three (33).

MR. WILLIAM HAIGHT: Okay. You hold a diploma in quantity surveying from University of Ulster in Northern Ireland?

MR. CAMPBELL ADAMS: Correct.

MR. WILLIAM HAIGHT: You also hold a Masters in Business Administration from the University of Bradford Management Centre in England?

MR. CAMPBELL ADAMS: Correct.

MR. WILLIAM HAIGHT: You are a member of the Chartered Institute of Arbitrators of England?

MR. CAMPBELL ADAMS: Yes.

MR. WILLIAM HAIGHT: And I understand that in the course of your evidence today, you will provide the panel and -- and all the other members here with some information as to what exactly a quantity surveyor is and does?

MR. CAMPBELL ADAMS: That will be revealed.

MR. WILLIAM HAIGHT: Yes, okay. And in your years as a quantity surveyor, you've been involved with the construction of major capital projects?

MR. CAMPBELL ADAMS: Yes.

MR. WILLIAM HAIGHT: And by the use of the word "major," I'm talking about projects in excess of a billion dollars?

MR. CAMPBELL ADAMS: From 1 billion to 27 billion.

MR. WILLIAM HAIGHT: Okay. And your involvement in these projects -- some of your involvement has been on behalf of owners and some has been on behalf of contractors?

MR. CAMPBELL ADAMS: That's correct.

MR. WILLIAM HAIGHT: So you've seen these projects from both sides of the owner/ contractor fence?

MR. CAMPBELL ADAMS: Yes, that's correct.

MR. WILLIAM HAIGHT: And your projects have ranged geographically from North America, Europe, the Middle East, Russia, West African and Southeast Asia?

MR. CAMPBELL ADAMS: Correct.

MR. WILLIAM HAIGHT: And as a quantity surveyor providing advice and services to contractors and owners, the -- the skills that you have brought include development of project contracting strategies and specific contract tactics, contract formation, estimating and tendering, replacement assessments and reporting, post award contract management, design, development and implication of contract management policies, procedures and processes, preparing and leading negotiations and dispute resolution to name but some?

MR. CAMPBELL ADAMS: Yes.

MR. WILLIAM HAIGHT: Thank you. Moving then next to Mr. Adams' immediate right and I'll introduce Mr. Kieran Flanagan.

Mr. Flanagan, you are one (1) of the founders of MGF Project Services.

MR. KIERAN FLANAGAN: Correct, yep.

MR. WILLIAM HAIGHT: And you hold the position of managing director?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: And you are one (1) of the authors of the MGF report?

MR. KIERAN FLANAGAN: Correct.

MR. WILLIAM HAIGHT: And you are also a quantity surveyor and have been so for over twenty-five (25) years.

MR. KIERAN FLANAGAN: Yes, and chartered for twenty (20).

MR. WILLIAM HAIGHT: And MGF is a quantity surveying and construction cost consultancy firm?

MR. KIERAN FLANAGAN: Correct.

MR. WILLIAM HAIGHT: So origins begin in Europe and Australia?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: It's now located in and operates out of Calgary, Alberta?

MR. KIERAN FLANAGAN: Correct.

MR. WILLIAM HAIGHT: And as I indicated, you are a quantity surveyor. You obtained your Bachelor of Science in quantity surveying from Harriet Wyatt University in Edinburgh, Scotland?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: You hold a professional diploma in quantity surveying from Limerick, Ireland?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: You have experience in commercial, residential, oil, gas resources, infrastructure and heavy industry sectors?

MR. KIERAN FLANAGAN: Correct.

MR. WILLIAM HAIGHT: And you, as well, sir, have -- as a quantity surveyor have provided advice and services to both owners and contractors?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: And those --

those skills include development management, estimating, replacement assessments, contractual advice, contract management and administration, asset management, to name just some of them?

MR. KIERAN FLANAGAN: Yes.

MR. WILLIAM HAIGHT: Moving to Mr. Flanagan's far right, I will introduce Valerie Musfelt.

Ms. Musfelt, you are also one (1) of the authors of the MGF report?

MS. VALERIE MUSFELT: That's correct.

MR. WILLIAM HAIGHT: And you are employed as the lead scheduler for MGF Project Services?

MS. VALERIE MUSFELT: Yes.

MR. WILLIAM HAIGHT: And you have a project leadership certificate and project management certificate from the Northern Alberta Institute of Technology?

MS. VALERIE MUSFELT: Yes.

MR. WILLIAM HAIGHT: You're also an instructor at that Institute as I understand?

MS. VALERIE MUSFELT: That is correct.

MR. WILLIAM HAIGHT: And a technical writer and a facilitator for that Institute?

MS. VALERIE MUSFELT: Yes.

MR. WILLIAM HAIGHT: You have over fifteen (15) years of experiences scheduling, facilitation and software specialists in the oil and gas, mining, infrastructure, environmental and general construction sectors?

MS. VALERIE MUSFELT: That's correct.

MR. WILLIAM HAIGHT: You assist both owners and contractors on projects with facilitating planning, construction scheduling, incorporating change management into schedules, and critical path analysis?

MS. VALERIE MUSFELT: That is correct.

MR. WILLIAM HAIGHT: And you are -- the skills that you bring to both owners and contractors include critical path analysis and reporting on schedule progress?

MS. VALERIE MUSFELT: Correct.

MR. WILLIAM HAIGHT: Moving then next to -- t behind me, Mr. Dan Campbell.

Mr. Campbell -- and by the way, all of these CVs for these individuals are on the record as MGF Exhibits 3-1 to 3-8. The record, I note from the Public Utilities' website does misstate some -- who works for who so to speak. Mr. Campbell who I'm just about to introduce is from Klohn Crippen Berger who you've heard a fair bit about in these proceedings.

For ease of reference, Mr. Campbell, I'll refer to them as KCB. You are one (1) of the principles of KCB, Mr. Campbell?

MR. DAN CAMPBELL: Yes.

MR. WILLIAM HAIGHT: And KCB provides engineering, geoscience and environmental services to an array of different clients throughout the world?

MR. DAN CAMPBELL: Yes.

MR. WILLIAM HAIGHT: Since 1951 KCB has participated in some of the largest and most challenging engineering projects in the world; is that a fair statement?

MR. DAN CAMPBELL: We like to think so.

MR. WILLIAM HAIGHT: Okay. You hold a Bachelor of Science in Mechanical Engineering from the University of British Columbia?

MR. DAN CAMPBELL: Correct.

MR. WILLIAM HAIGHT: You obtained that in 1979?

MR. DAN CAMPBELL: Yes.

MR. WILLIAM HAIGHT: And for the past thirty-six (36) years, you've been involved in a broad

range of major construction projects, including a
number of hydroelectric projects?
MR. DAN CAMPBELL: Yes.
MR. WILLIAM HAIGHT: These projects
have varied geographically from Canada to the United
States, Argentina, Columbia, Brazil, Peru, Vietnam,
Thailand, Sri Lanka and India?
MR. DAN CAMPBELL: Yes.
MR. WILLIAM HAIGHT: And your
experience that you brought to these projects include
project planning, design, construction supervision,
site inspection, asset evaluation, contract
negotiation and project management, to name just some
of them?
MR. DAN CAMPBELL: Yes.
MR. WILLIAM HAIGHT: KCB was asked by
MGF to provide assistance with its review of the Keey
-- the Keeyask project in the areas of project cost
estimate, project design, cost estimate changes and
contracting methodology, correct?
MR. DAN CAMPBELL: Yes.
MR. WILLIAM HAIGHT: And you prepared
a report that is dated December of 2017, which is
attached as appendix A to the MGF report?
MR. DAN CAMPBELL: I was one (1) of

the authors, yes.

MR. WILLIAM HAIGHT: Yes, and you've also prepared a PowerPoint summary. I'm not sure whether that PowerPoint presentation has been provided with an exhibit number yet today.

MR. KURT SIMONSEN: Yes, it has and it's MGF-6.

MR. WILLIAM HAIGHT: Thank you, Mr. Simonsen.

--- EXHIBIT NO. MGF-6: PowerPoint presentation by KCB

CONTINUED BY MR. WILLIAM HAIGHT:

MR. WILLIAM HAIGHT: Moving then to our participants that are attending by way of video. I'll begin with Mr. Les Brand please.

MR. KURT SIMONSEN: Just timeout for a minute as we get Les.

MR. WILLIAM HAIGHT: Yes. Mr. Brand, can you hear me?

MR. LESLIE BRAND: I can, thank you.

MR. WILLIAM HAIGHT: And thank you for attending today, sir. Nice to finally meet you somewhat face-to-face.

Mr. Brand, you are an author of a report that reviewed the capital expenditure review for Bipole III and the converter stations; is that correct, sir?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: And that report has been attached as appendix B to the MGF report.

You're aware of that?

MR. LESLIE BRAND: Yes, I am.

MR. WILLIAM HAIGHT: And you were the director and principal consultant for Amplitude Consultants which is based out of Australia?

MR. LESLIE BRAND: Correct.

MR. WILLIAM HAIGHT: You hold a degree in Electrical Engineering from the University of Western Australia, as well as a Bachelor of Commerce from that same university?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: For approximately twenty-five (25) years, sir, you have been providing engineering -- engineering services for electrical utilities and -- and companies that provide services to electrical utilities?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: You have

significant experience in this -- in these sectors in Australia, United States, Canada and China, to name just some of the countries?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: You have significant experience in -- in assessing HVD systems, as well as converter stations?

MR. LESLIE BRAND: Correct.

MR. WILLIAM HAIGHT: Your review of these systems include both design review, development of systems and technical specifications and replacement of converter stations?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: Would it be safe to say, sir, that your areas of expertise involve all of the nuts and bolts for transmission lines, as well as converter stations?

MR. LESLIE BRAND: Predominantly converter stations but I've had some involvement with transmission lines, that's correct.

MR. WILLIAM HAIGHT: Right. And the -- in the course of providing services to this industry, sir, I understand that you have provided advice to both contractors, as well as owners?

MR. LESLIE BRAND: That's correct.

MR. WILLIAM HAIGHT: Thank you, sir. If we can then move to Mr. Potter who is on the screen.

Mr. Potter, nice to meet you somewhat face-to-face. You are the transmission group manager and senior engineer with Stanley Consultants?

MR. JIM POTTER: Correct.

MR. WILLIAM HAIGHT: I understand that Stanley Consultants is one of the world's largest consulting engineering firms with a focus on energy, water transportation and environmental work?

MR. JIM POTTER: I like to think so, yes.

MR. WILLIAM HAIGHT: Okay. You hold degrees in both civil and structural engineering from Iowa State University and the University of Iowa, respectively?

MR. JIM POTTER: That's correct.

MR. WILLIAM HAIGHT: And Stanley was asked to provide advisory services to MGF regarding the transmission lines that will originate from the Keeyask generating station?

MR. JIM POTTER: That's correct.

MR. WILLIAM HAIGHT: And you have significant experience with design and construction of transmission lines, ranging from 69 kVA to 345 kV?

MR. JIM POTTER: Correct.

MR. WILLIAM HAIGHT: And you have provided design -- both design, as well as project management services for transmission line projects?

MR. JIM POTTER: Yes, I have.

MR. WILLIAM HAIGHT: And you've been doing so for over thirty (30) years?

MR. JIM POTTER: No, that should be twenty-one (21) years.

MR. WILLIAM HAIGHT: Excuse me, I have been known to misread a CV on occasion. Thank you very much, Jim. If we can then move to Mr. Phillips.

MR. DWAYNE PHILLIPS: Yes, good morning.

MR. WILLIAM HAIGHT: Good morning, sir. Nice again to meet you as well, almost face-to-face.

Sir, you are constructability lead with Stanley Consultants?

MR. DWAYNE PHILLIPS: I am.

MR. WILLIAM HAIGHT: And you have over thirty (30) years in construction and operational management in both generation, as well as the transmission of electricity projects?

MR. DWAYNE PHILLIPS: I do.

MR. WILLIAM HAIGHT: And you have a technical engineering training with -- in nuclear energy through the U.S. Navy?

MR. DWAYNE PHILLIPS: Yes, I do.

MR. WILLIAM HAIGHT: And you also hold a technical engineering degree through the U.S. Navy in electrical engineering?

MR. DWAYNE PHILLIPS: That's correct.

MR. WILLIAM HAIGHT: And in your role with Stanley, you've been responsible for project scope, technical design, coordination, construction and scheduling of both transmission, as well as generation projects?

MR. DWAYNE PHILLIPS: That's correct.

MR. WILLIAM HAIGHT: And prior to joining Stanley, you held managerial positions with several large utilities?

MR. DWAYNE PHILLIPS: That's correct.

MR. WILLIAM HAIGHT: And you have developed and published a number of training manuals and a number of dif -- on a number of different tropic -- topics relevant to generation transmission, including project management -- and including project management and analysis?

MR. DWAYNE PHILLIPS: That's correct.

MR. WILLIAM HAIGHT: And like Mr. Potter you provided anal -- analysis to MGF regarding the transmission lines which originate or are to originate from the Keeyask generating station?

MR. DWAYNE PHILLIPS: Yes, I did.

MR. WILLIAM HAIGHT: Thank you, sir.

MR. DWAYNE PHILLIPS: Thank you.

MR. WILLIAM HAIGHT: With that background, I will now turn it, with your permission, Mr. Chair over to Mr. Adams who will begin the presentation on behalf of MGF.

THE CHAIRPERSON: Thank you, Mr. Haight, please proceed.

MR. KURT SIMONSEN: Mr. Haight, before we do that, I'd just like to put on the record that the Amplitude presentation will be MGF-5 and the MGF presentation is MGF-4.

And I would ask all parties during the course of their presentation that they introduce the slide number so our friends on the telephone can follow along exactly where we are in the presentation.

MR. WILLIAM HAIGHT: Thank you, Mr. Simonsen.

--- EXHIBIT NO. MGF-4: MGF presentation.

--- EXHIBIT NO. MGF-5: Amplitude presentation

CONTINUED BY MR. HAIGHT:
PRESENTATION BY MFG

MR. CAMPBELL ADAMS: Good morning, everyone. Could we please move to the slide entitled Contents, please. And this is slide number 3.

This is the overview of what we will be presenting this morning to everyone. I'll tell you a little bit about the company; decipher what a quantity surveyor is because they're not common in Canada. And then we'll go through the -- the main sections of our -- our report; most likely, focusing more on the -- the Keeyask hydroelectric dam and to a lesser extent the other -- the other components of the -- of the report.

MGF Project Services is a quantity surveying construction cost consultancy firm. Oh, next slide, sorry, is number 4. Its origins are in Europe and Australia where quantity surveying is more common. There -- they work in multiple industrial sectors, offering services starting from when the owner has the idea of a project; helping the owner put their first cost proposal together for that; looking at contracting strategies; how to build it; which contractors tendering; giving award recommendations to the owners; and then helping to manage that -- or those contracts through to successful completion.

The team who -- who worked in this assignment has a broad geographic experience set on major capital projects working across many jurisdictions, as you can see there, from North America, Australia, Europe and certain parts of -- of Africa.

If we move to slide 5. If you go back over the last three (3) centuries the year '59 has had some amazing events. In 1959 Arthur Guinness invented a wonderful nutritional drink called Guinness. In 1959, yours truly made his debut. However, in 1859, we have the first recorded role of someone called a quantity surveyor.

And a quantity surveyor, our -- our training is -- it's all about the construction process from the start of it to the end of it. We're -- we not only cover contrite law, the law of tort, we do building economics. We cover construction technologies or disciplines like structural engineering, electrical engineering, civil engineering and we are the -- the centre point of bringing all that information together to put it into a contract -- a tendering and contracting process so these major capital projects get built.

The services we offer start from strategy, or cost estimating, a strategy, preparing tender documents, evaluating the bids that come back, and risk those, and give an evaluation to award. And then we move into what's called the post-award contact management fee is where we're -- we get the contract in place. We manage the contract. We look at -- we -- we try to ensure that the obligations of both parties are actually performed. We value the work as it goes along so the contractor company paid the proper amount, and the owner doesn't overpay.

Like most contracts, they don't always run smoothly. We -- we try our best to -- to mitigate, avoid, minimize. Sometimes that works. Sometimes it doesn't. You get involved in dispute resolution that be a negotiation. It can be a mediation. It can be escalated to arbitration, or even worse, we end up in court. So the QS, for short, is a very broadly experienced individual relative to the major capital projects arena.

Slide 6, please. Now, there's a

wonderful picture of the dam. Slide 7, if I can see okay. This slide gives a summary of the -- of Manitoba Hydro's revised budget. It started about six point five (6.5). There was some additional scope added. There was some scope removed. That was a, what, $2.23 billion net increase. And I think the -- the point this slide makes is that a significant portion of that increase is due to the outcome of the amending agreement number 7 negotiated between Hydro and its contractor BBE.

The reason for the -- the greater contract value or target price is additional man hours to perform the contract and extending the cost based on higher productivity rates.

Number 8, please. The next two (2) -- the next two (2) slides will provide the cost categories of how the increases were built up, and also the cost reductions. There are no numbers there, because that is commercially sensitive, and it's not within our permission to share this in this -- this forum.

Slide 9, please. Again, this is the -- the cost reduction slide -- slide. Down on the left-hand side, you can see the -- the categories of cost that built up to reduce the -- the overall new project budget of eight point seven (8.7).

Number 10, please. Cost reimbursable. Cost reimbursable is not a bad pricing mechanism, despite some of the conversations we have had. If it is used appropriately and well-managed, it can be the right choice for an owner in which to place a contract.

Cost reimbursable with an underperforming contractor who continually lets down its owner is a world of pain. The mechanism, in essence, means that whatever costs the contractor incurs in performing the work, it gets paid that cost by the owner. That means that the items there like labour costs, material costs, escalation, productivity, those risks all fall onto the owner who agrees to a cost reimbursable pricing mechanism.

In other pricing mechanisms, some of those risks are placed on the contractor. Productivity is a classic one. Whether you're building a hydroelectric project, or you're building an oil battery, contractors learn -- they know how to manage productivity. It's what they do. Owners typically don't know how to do that, because it's not their skill set. It's not their game.

At this point, I'd like to pass the --

the microphone to my colleague Mme. Val, who's going to take us through the next number of slides.

MS. VAL MUSFELT: Thank you, Campbell. Next slide, please. Okay. On the -- this slide here, BBE forecast completion dates, what we're really trying to show is the -- the different dates that are on the different schedules.

So first off, we have the 8th of October, 2021, and this is the planned completion date. So this is the date as per amending agreement number 7. And this is for the Unit 7 generator. If you look at the most recent forecast schedule, and that would have been dated the 6th of October, 2017, they're forecasting a completion date on that same unit for the 23rd of January, 2022.

Now, Manitoba Hydro has a -- a control date for when they -- the unit should be ready, and that control date is the baseline date of October of 2021, plus approximately ten (10) months of contingency. So that date is the 4th of August, 2022. Now, when we went in and took a look at the productivity of BBE, we applied that productivity onto all the concreting activities and determined that based on that level of productivity, the completion date for the Unit 7 would be the 25th of November,

2022. So that represents an order of magnitude delay of four hundred and ten (410) days from the baseline date of 8th of October, 2021 to our forecast date of the 25th of November, 2022.

Next slide, please. The next slide is -- really, what we're trying to show is this -- the schedule history of the different dates. So in this slide, if we start from the top bar and work our way down, the first bar shows the date of 19th of August, 2020, and that would have been on the original baseline schedule. So that was when Unit 7 was to be -- that was the in-service date for Unit 7.

The next date directly below that, the blue bar showing 7th of October, as discussed in the previous slide, that is the baseline date as of the amending agreement number 7.

Now, what we're showing in the third bar, the purple bar, this is a new bar that -- or a new date that wasn't in the previous slide. And this represents the Manitoba Hydro integrated master schedule. So in the -- in schedules, typically you would have a baseline schedule, and you would have a forecast schedule. The baseline schedule represents the planned dates, so as per the contract, whereas the forecast is based on progress. So this particular schedule would show the progress as at the 6th of October, 2017. So on this schedule, Manitoba Hydro is showing that the completion date for that same Unit 7 is the 28th of May, 2022.

Now, as you can see, this date is still prior to the control date of the 4th August that Manitoba Hydro -- Hydro has. And again, that was the baseline date, plus approximately ten (10) months of contingency. And then just to show that with our forecast, based on the level of productivity, the date would slip out to the 25th of November.

So what we're showing are two (2) main dates, here, the two hundred and twenty-nine (229) day delay represents the delay from BBE's date to Manitoba Hydro's date. So the BBE slippage date would have been approximately a hundred and three (103) days. But when you integrate it with other contractors on the schedule, what you're going to see is they may not be on the interface quite the same way. So that's pushing out Units 5 through 7 to the two hundred and twenty-nine (229) days. So that's -- this slide is really just trying to summarize all the different dates that we have going on on the project.

Can we see the next slide, please? So this slide really just recaps the dates that I just talked about on that graph. Can we move to the next slide, please. Now, the next thing that we're talking about here is a basis of schedule. And a basis of schedule is a document that describes what's going on on a schedule. Just like you would have a basis of estimate from a cost perspective, you usually have a basis of schedule for all of your -- like, your integrated master schedule. You would have it usually on some of your main contractor schedules.

What this document does is it really explains what's going on in the schedule. So it's going to show you this scope of work. It's going to tell you if there are specific constraints. It's going to talk about different calendars that may be in play. So it's such a very important document that describes what's going on in the schedule. It would also indicate whether things are being fast-tracked, whether there's winter work that's occurring. So all of this is typically in that document.

So we've noticed that BBE did have a basis of schedule prior to amending agreement number 7, but after amending agreement number 7, they did -- BBE did submit one, but unfortunately, it wasn't detailed enough, so it was rejected by Manitoba Hydro. And to -- at the point of the writing this document, there was no revised basis of schedule for BBE.

Next slide. Now, the next thing that we talk about is negative float. And negative float, by definition, really means that an activity is extremely critical. Now, when you're looking at it from a scheduling perspective, negative float basically means that you have activities that are slipping that can't happen on the scheduled date. Now, going through and analyzing the BBE schedule, I came across a thousand and thirty (1,030) activities that were with negative float.

So then the next thing is, Okay, why -- what's causing the negative float? So I went in and took a look, and there were approximately fifteen (15) activities that had constraints that were causing all of this negative float. And when you looked at these activities that were impacted by this negative float, ninety some of them -- ninety-seven (97) of them were on the critical path. And what that's really saying is that anything on the critical path, any delay means that you will delay the end date of the project. So we're basically just saying that it's important that this negative float gets removed from the schedule so that you can get a true picture of where things are really at on the schedule.

Now at this point, we're moving on to the next slide. I will hand the microphone back to my colleague, Campbell.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Sorry. Okay. I'm on the air again. Just to build on what Val said, there, the -- that third bullet point about the ninety-seven (97) activities on the critical path, our view of the -- this project is that the concreting activities are the critical path for this project. Of that ninety-seven (97), eighty-five (85) are concreting activities. So that brings into question whether there is a coherent schedule to build the -- the project, and that is something we were recommending gets -- gets addressed as quickly as possible.

Next slide, please, number 16. There -- there has been some commercially-sensitive information in this that we've had to -- to remove. I think the -- the bottom line, and the message here is that this is a problem area, earthworks productivity. It hasn't gone well in 2016. When their plan was re-cast for 2017, it still hasn't gone particularly well, with the contractor taking more -- more time than planned to do the -- to do the work. This deteriorating productivity is going to cost more in terms of the direct costs of doing the work, the indirect costs associated with that, and will drive a longer -- a longer schedule.

There is a figure there of 88.4 million. That is not a precise cost. It's an order of magnitude. It's to give a sliver of perhaps this is -- perhaps it might end up -- could be higher, could be lower, could be lower if more control is brought to bear on this contractor to get them to perform better. The -- the message is that the -- the contractor's inefficiencies is causing Hydro to pay more.

Slide 17, please. Concrete placement has been another area of under performance by Hydro's contractor. Their promises to what they would deliver in 2016 were not met, were not kept. They revised their -- their schedule with new productivities as part of the amending agreement number 7, and those have not been met in 2017. And it really -- it -- it demonstrates to us the BBE is very optimistic with its productivity rates, and that they're not realistic within their capability to -- to deliver against.

We -- we have to say that we -- we can't change the past, but we can influence the future. The recommendation there is to -- is to work with BBE, find out what it is they can, what -- what are they capable of doing, of realistic productivities that they can achieve, agree that, re-cast the schedule, redo the forecast and completion cost, and give -- give Hydro a realistic plan to get these guys to work and see where we're -- where we're going.

The last bullet point there refers to the -- the sequencing of subsequent contractors. The contractor who follow in the -- the path of BBE have been told there's a time they're required to come and perform their works, and they plan for that, and they price for that. The more that those dates get delayed or pushed back raises the opportunity for them to rightly seek compensation in terms of extra money and more time to perform their contract. BBE is cost reimbursable, so most likely, I would suggest that the cost of those delay and disruption claims will fall on to Hydro to pay for.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: This is slide 18.

Yes, some of the -- our information has been redacted for commerciality reasons. It is the -- it's -- it's the same comment. It's the contractor is inefficient. They're taking longer to do the work. And -- and the concreting activities that we believe they are moving to perform are more complex. They're more complicated than what they have had to do hitherto. That begs the question: Why would we think that their productivities will improve? We put an order of magnitude additional cost in there. Again, it's -- it's a best forecast at this point in time, could be a bit higher, could be lower, but directionally, this is where the cost for this activity is likely to head.

Next slide, please. This is number 19. We were asked to look at the -- the approaches of tender management and contract management. Both were very well written, comprehensive. Tendering was sufficient, lots of document to support the teams and what they -- what they had to do to guide them in their -- in their job. Same for contract management.

The -- the concern we have is the -- whilst the written documentation is there, that there's still this concern of BBE's noncompliance with their contractor. There's some obligations they have that they seem to repeatedly get away with, so they don't do it.

Our recommendation is that Hydro initiates periodic contract compliance reviews. We have seen these in other industries. They are -- they're -- they're very effective. Both parties to the contract get to be measured against what it is they should be doing. Are they doing it? If they're not doing it, why are they not? It can be done by an internal team. It can be done by an external team. But the -- the outcome of this is it -- it pro -- promotes assurance. It promotes compliance with the contract, and makes sure that both parties are doing what they -- they signed up to do.

The next slide is number 20. The message of this slide is the physical construction progress. We -- we're advised by the -- the construction monthly report, there, as stating 24 percent, whilst the actual spend in indirects is -- is over 30 percent. So that's telling us that we're spending more money on indirects than for the -- the con -- the actual construction progress we're -- we're getting. This is a -- another inefficiency finding, I would suggest. And again, if that 6.4 percent cost variance continues, then the indirects budget will have to be funded with further monies to get the -- to get to the end of the contract.

Slide 21. As part of our assignment, we -- we come up with the final cost range, a final potential forecast, a range within which we felt that all other things being equal, that the cost of Keeyask would fall somewhere within that billion dollar range. It's currently reported at eight point seven (8.7). We think there's a lot of pressure to going above that. The issues that drive that are the -- it's really the ongoing under performance of BBE, their productivities for concreting, earthworks, is pushing the schedule to the right. The costs are going up further, indirects are being consumed, and there is the potential delay and disruption to other contractors.

The last bullet point is trying to convey that this -- this range is not fixed and firm. There -- there may be actions that Hydro can take to bring more control to its contractor and try to mitigate the costs going -- going higher.

The next slide deals with construction management.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: The -- the evidence we have found suggests to us the -- that BBE is struggling to plan, manage, and execute its work. 2016 for concreting earthworks didn't go well. 2017 didn't go well. So unless something changes, you can reasonably expect this to continue.

The impact of the cost reimbursable compensation mechanism means that all construction decisions, all inefficiencies of its contractor, ends up being paid by -- by the owner, in this case, Hydro. As I said, plan productivity is not being achieved. It's -- it's startling that the -- the contract that Hydro has stipulates that the schedule shall not have one (1) negative float activity, yet we find one thousand and thirty (1,030) that don't meet the planned schedule. They spend more in directs budgets than for less construction progress.

In our view, this -- this is endemic of inadequate supervision, inefficient supervision, and we -- we believe that this is one (1) of the levers that Hydro can pull to try and arrest and then help BBE improve its -- its performance.

Slide 23, please. So just in summary...

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: In summary, BBE is not performing as they promised Hydro. They've let them down in 2016. As we say in golf, they got a Mulligan and they got to renegotiate the amending agreement number 7. And they recast their productivity through schedule and the final cost. And they have not performed in 2017.

XXX billion was added to the GCC on account of their poor productivity and the additional indirect spend. They are being paid their actual costs rather than for quantities of work performed against fixed-price unit risk, which would drive them to be responsible for both time, cost, productivity. With this upward pressure, our view is that the current contingency is likely to be insufficient if this performance continues.

The final bullet point restates the -- the wide range of potential outcomes for this. So I think to -- to conclude, if we don't hear them, the alarm bells are ringing. We can't change the past, but there's four (4) years to run. And I believe there's an opportunity to try and get this contractor to perform better for its owner, Manitoba Hydro. That ends the Keeyask presentation. Just move straight on to the converter stations, Mr. Chairman?

THE CHAIRPERSON: Sorry, Mr. Adams. I've got one (1) question, if I could. When you're -- when you're citing the -- the nine-point-five (9.5) and ten-point-five (10.5), is nine-point-five (9.5), the P50 and ten-point-five (10.5) the P90? Or are we looking at a different standard of estimate?

MR. CAMPBELL ADAMS: You're looking at a different approach to estimate.

THE CHAIRPERSON: Okay.

MR. CAMPBELL ADAMS: In my experience, the -- we -- we prefer to build up estimates as construction and project professionals. We do that understanding activity, understanding cost, understanding risk, understanding time. The -- the use of Monte Carlo P50s, P75, P90s, I think is a good test of a well thought through plan. I -- I don't believe in rolling the dice when it comes to determining what the final cost would be? We -- we build this up from -- from a bottoms up perspective.

THE CHAIRPERSON: Okay. Thank you. Certainly. Ms. Kapitany...?

THE VICE-CHAIRPERSON: Mr. Adams, just looking at your slide 19. I see your comment at the bottom that the recommendation is for Hydro to initiate period cont -- periodic contract compliance reviews.

Given the structure of this contract as you know what, what levers does Hydro have to improve the performance of the contractor

MR. CAMPBELL ADAMS: They're paying them money. They've got a contractor who has let them down in 2016/2017. Our -- our view would be you've got to sit with your contractor and understand that if you planned a process to pour concrete a certain way, and that's your plan and it's not working, you've got to get down to the root cause of why is that not working. And it's -- in the -- in the past I've seen this just is constant vigilance when an owner has gone down the cost reimbursable path and it's not working. It's -- my father used to say, Hold their feet to the fire. It's that kind of scrutiny.

On a cost reimbursable price contract you cannot stand away from what's going on. It's your money they are spending. As opposed -- as opposed to a lump sum where -- well, let me see. You build me this and I pay you this. It's lump sum. The contractor has the responsibility for performing the work within the right time, to the right quality for that price. You stand off and you watch that. You don't tinker and tamper with the lump sum.

Cost reimbursable is better managed when you've got a -- oh, what's that saying? It's a -- a salt-and-pepper team. You've got the owner's team embedded, co-located with the contractor. What are they doing day-to-day? What's working well? What's not working well? How do we learn? ow do we correct? It's quite high level, but I -- I'm sure within that contract there are -- there are levers to be pulled that the negative float -- if you're not allowed to have negative float and it's stipulated in your contract, why the heck let it happen?

MR. WILLIAM HAIGHT: So for the purposes of the record, just to the written record, when Mr. Adams held up two (2) objects, one (1) was this, one (1) was that, one (1) was a pen. The other was -- was an eyeglass case. So two (2) different -- very different objects, for the purpose of the record.

BOARD MEMBER GRANT: Let me just follow-up on that in terms of the nature of the contract. So suppose it was a fixed-price contract, and you got into a situation of inadequate productivity. I'm -- I'm thinking of these holdup costs that the contractor often has a certain leverage.

And so I guess going back to Board Member Kapitany's question, would the world really be that much different? Does the -- are you held hostage to a certain extent by your contractor if the threat of walking away from the project? I guess I'm wondering -- there's -- I'm -- I'm sure there's lots of cost overruns in fixed-price contracts that you must've seen. And so...

MR. CAMPBELL ADAMS: If -- if I may, the -- the cost overrun on a fixed-price compensation strategy belongs to the contractor, not the owner.

BOARD MEMBER GRANT: No, I understand that. But if they -- they walk up to you halfway through building your house and say, You know, by the way, I've already -- I'm -- I'm going to lose money doing this. I'm going to walk away from it.

How easy -- you know, what sort of position does that put the homeowner in?

MR. CAMPBELL ADAMS: Well, I think you should enforce your contract. If the -- the contractor, if he walks away then you're going to sue him for damages. There is something about -- the -- the contracts typically say that the time and the price are sufficient for performing the work. We had that in the original contract from BBE.

The -- the -- that price, I'm not going to say it in case I get off side of someone, there's an undertaking in that contract that that price is sufficient to perform the work. The work hasn't changed. You get to the -- the Mulligan I spoke to and you get the amending agreement, and then it becomes that next target price. There's still an undertaking in the contract that their price is sufficient for doing the work. They are representing that. They have to stand over that.

BOARD MEMBER GRANT: But surely you've seen fixed-price contracts which have -- I'm going to use the homeowner as the example -- has simply agreed to absorb the higher cost.

MR. CAMPBELL ADAMS: Yes.

BOARD MEMBER GRANT: Have you observed that's --

MR. CAMPBELL ADAMS: Well, that -- that's the -- that's the contractor's risk. That's how they make -- they make more money. If it goes badly wrong, and it's not that that happens, that's -- there may be reasons for that, but it doesn't affect the position of the -- the owner. Otherwise, everybody will be -- all -- all owners will be held to ransom.

BOARD MEMBER GRANT: That was my point.

MR. CAMPBELL ADAMS: I've only seen -- I've only seen one (1) walk away.

BOARD MEMBER GRANT: Okay. Thank you.

THE CHAIRPERSON: Sorry, Mr. Adams, for your nine-point-five (9.5) to ten-point-five (10.5), what assumptions did you make about the south dam, considering they haven't done geotech on it yet?

MR. CAMPBELL ADAMS: Just a second.

THE CHAIRPERSON: Yeah.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: We -- we took figures that were given to us as part of the assignment, and we put some contingency in against that. There's no way we know what that could be me. There's no way Hydro today would know what that would be, unless somebody's got a crystal ball, which I haven't found in my thirty-three (33) years.

THE CHAIRPERSON: Yes. Thank you.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Converter stations. So we're on slide 25. The team did a review of the -- as part of the assignment to look at how cost estimating was performed. They -- they found it was -- it was well done. The basis of estimate, which is a narrative that explains how the costs were derived, was well written, aligns with best practices.

The -- their approach was consistent with industry standards, and there was -- they made -- Hydro made great use of estimating templates to promote -- to promote consistency. As ever, when somebody looks at something, one (1) of the folks thought that a bit more detail would've been good, but overall it was a -- it was a good -- good review from our perspective.

Tendering and contracting. Okay. Let me -- let me give you some background as to what this means because it might just be our termin -- our -- our terms, given that we're the quantity surveyors. The -- the approach to market speaks to how you -- how you get your price. You can competitively tender to a number of firms that have got the right technical skills, commercial skills, financial backing to do the work. You can single source where you take one (1) of those companies that you could competitively tender to, and you can decide to negotiate directly with them.

You can also sole source. And sole source is when you've got to deal with one (1) company who only can provide that product or service. An example of that would be if you wanted the LNG skid technology, you could only deal with ConocoPhillips to get that. You cannot competitively tender that. So that is the -- that is the range of the opportunity when it comes to approach -- approach to market.

Contract types are the -- are the -- what I call the terms and conditions around whether you are buying construction, or a service, or you're asking somebody to design, procure, and build your project. The -- the risk allocations are different. The rules are different. The skills to perform them are different. And that's what I mean by contract types in this slide.

The pricing mechanism is one (1) of the key functions of the contract that allocates risk. At one (1) end of the continuum, if it's cost reimbursable, the risk -- the risks are largely held by the owner. At the other end of the continuum, if it's lump-sum, the risks are probably better allocated with the contractor, in particular, being responsible for time, cost, and schedule.

Our review of the -- the tender and contracting of the converter stations, we thought it was very well done. The con -- HVDC converter equipment was -- it was competitively tendered to, I think, three (3) world-renowned companies. It was a design, supply, construct, install, and commission contract, and the contractor was paid on achieving key lumps -- lump-sum milestones.

The camp operations was a -- was a single source contract. It was placed on a services -- service-based contract, and it was -- used a cost reimbursable pricing mechanism because the -- of the fluctuation and variability in what would be consumed. And they were compensated for managing that with a management fee. All -- all good choices in -- in our --in our view.

Slide 27, please. As I said in the previous slide, the -- the choice -- choices made by Hydro for the contract pricing mechanism were -- were excellent. They -- they are -- they -- they promote predictability in outcomes, which is something that we always want as owners in terms of final cost and schedule. At the time of the report there was around 320 million to be spent between then and August or the

31st of July, if I'm more precise, this year.

The 83 percent on lump-sum and 4 percent in unit rate, that's 87 percent on a fixed pricing mechanism and 13 percent was cost reimbursable. We thought cost control was -- was well exercised. There were some variations, but they had not had a significant cost impact in our -- in our opinion.

28, please. Oh, summary. We -- we came away with thinking this was a well-managed project. Estimating was well done, well-written pieces of estimate, which is not something we always find. We concur that the likelihood of a cost overrun was low, and effective use was made of the -- those fixed-price compensation mechanisms, the lump-sum, the unit price that placed those -- the risk of productivity cost and schedule on to the contractor market.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Moving to slide 30. We're now on Bipole III transmission line. The team was impressed with the -- how the final preconstruction estimate was compiled. We like using quantity since we're quantity surveyors, and they used applicable unit rates to come up with the values of those -- of the estimate. It's an approach that was consistent with our industry standard.

In working with Hydro's team, we find them a knowledgeable and very capable group of people. As ever, you ask somebody to look at something, they will find something to tell you can do better. And the -- the guys felt that a bit more transparency or backup would be good for the estimate. And if you're using a value in one (1) summary that it's the same value you use in another so they align. But all in all it found to be that it was fine.

31, please. As with the -- the converter stations, Hydro's contracting strategy, their approach to market, their use of lump-sum on unit rate and cost reimbursable pricing mechanisms was -- was highly appropriate. Examples there are transmission line clearing as a lump-sum, the stringing contract as a unit rate. And where, for example, they required inspection services, which you call out from time to time, that was done on a cost reimbursable basis which just makes a lot of sense.

32. During our review we came across the performance of Rokstad Power Corporation. They

seem to have struggled achieving their promised work plan. In November, many of their dates appeared to be slipping from the approved baseline dates. This is obviously a risk that Hydro became aware of. They stepped in. They -- they took immediate action. They -- they requested a recovery plan from RPC. I'm not sure that we saw that, but I know on the 9th of November, to try and de-escalate this risk are de-risk it, sorry, they removed scope -- a part of the scope of work from Rokstad, so they could focus on the other -- the other three (3) dominion areas, and they gave that scope to another contractor to perform.

Whilst we -- we believe that is -- that was the right course of action, you've still got a contractor who may still incur some progress issues between now and the end of the winter season. If that does come to pass, then there may be a further schedule impact of one (1) year if they don't finish their reduced scope of work.

Thank you. We're on slide 33 for the record. So the preconstruction control budget was 1.66 billion. It increased by around 300 million. Nothing untoward in that. The -- the key contributing factors that you can see there were just additional scope that was required and it was added to the -- to the to the project.

Slide 34, please. So in summary, the team found the -- the transmission line project well-managed, well-organized, great use of the compensation mechanisms to manage risk better, place that appropriately on the contractor market rather than keeping that in-house within Hydro.

We believe it's on schedule to complete on the 31st of July this year, although it's worth noting that some contractors did have some slippage on the critical path. And the -- probably the biggest risk to a successful conclusion to this is Rokstad Power Corporation. And just to repeat, Hydro is aware. They stepped in and they're taking action to -- to de-risk that to the extent that they can.

Moving on to the Manitoba-Minnesota Transmission Project. The cost estimate is 453 million. I hope that that's not commercially sensitive because it's on my screen. We found a lot of good practices when we reviewed this. The -- the level of project definition was excellent in terms of being able to take quantities off to get your cost estimate. Again, good -- good use of historic project unit rates and the use of existing project templates to promote consistency and accuracy in building --

building your estimate.

As ever, a little shortcoming. We -- we like to have a basis of estimate to read when we look at an estimate, so we understand -- we get a narrative to explain where did the costs come from, how were they compiled. And we don't believe from what we reviewed that one (1) was prepared for this. A small point.

So let me -- let me take you slowly through this because I'm not a scheduler, but I try to understand things and as best I can. If get into difficulty you'll be hearing from -- from Val again. In looking at schedules, the -- the use of a common template was -- was very well used. It did promote consistency across the schedules.

If you look at the third bullet point where it refers to "high logic density," and let me look at my notes. Logic density, the metric of logic density assesses the average number of logic links per activity. If the score is greater than four (4), then that would indicate an overly complex schedule that we would recommend gets reviewed to take out the complexity and make it -- place it better for success.

Missing logic, in the next bullet point, means that either the activity before that activity, the predecessor or the successor or both are missing. So it's sort of standing out its own. Where we identify that, then it means that we have not got a critical path with which to follow to complete the project on the due date.

High duration activities indicate that -- where you have activities that are greater than two (2) months, it points that there is insufficient detail to manage that activity. And they -- these need to be further reviewed, deconstructed, decomposed into more granular activity so you understand what has to happen to establish your critical path and get you to finish by the -- the due date. So within this there is some stuff that was really well done, but there's some homework, I believe, that can be done in the coming months just to -- to raise the schedule to a better place.

38, please. Inn looking at the -- the estimated cost for -- for the MMTP, our colleagues Stanley Consulting focused on a significant percentage of the estimated project cost. The -- the outcome of that analysis would suggest that the estimate that's being carried is lower at its highest level than other similar industry projects. When Stanley drilled down into the cost components, as ever you find some are higher than you thought and you find some that are lower than you thought.

I think the -- the message here is that we would recommend a review of that, just test the points that we have made to see whether they agree, or they need to amend them, or otherwise. And just re -- refine the -- that -- that estimated cost because in our view it was -- it was on the low slide.

Slide 39, please. So in summary, project's on schedule. The estimating methodology was -- was consistent with industry standard and what we would expect. In performing subsequent cost estimates we -- we believe that the process would be improved upon, if it's done pursuant to an estimate preparation plan of hat are we going to do to build this cost estimate. And as they build the cost estimate, just compile that basis of estimate to provide a narrative to explain to the reader how the costs were -- were derived, were compiled/

So moving to the Great Northern Transmission Line. The review concluded that the -- the estimate appeared on the high side. We can't talk too much about some of the pricing because it's commercially sensitive. We believe that further review is required to establish the reasonableness of the cost estimate. And again, as -- as before, having a basis of estimate to explain the -- the estimate would be -- would be very, very useful.

42, please. We reviewed the -- we reviewed the construction management agreement that sets out the obligations and rights of Hydro's 669 company with Minnesota Power. This was a -- this was a very well drafted, very well thought through, very well written agreement. It would operate well at the operational level. We felt that it protects Hydro's risks, business interests very well. It identifies the risks, provides mechanisms to deal with those.

And I -- and I think it's worth -- it's worth reporting that not only was the document, well -- well-written, but I've seen documents that are well written, but badly understood by those who have to manage them. But in -- in speaking with the folks at Hydro, they -- their key personnel had a common and shared understanding of the content of that agreement, which -- which is a great thing to report back on.

Slide 44. The schedules generally were assessed as -- as medium quality. Some areas that would improve would be breaking down activities into greater detail. We did find high duration activities that in future, for more adequate planning control purposes, need to be broken down.

THE CHAIRPERSON: Excuse me for a second. I think we may have skipped a page.

MR. CAMPBELL ADAMS: Oh, did we? Well, beg your pardon.

THE CHAIRPERSON: Yeah, I think we're at the forecast at completion page.

MR. CAMPBELL ADAMS: Oh, sorry.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Oh, okay. Apologies. So this has been redacted for some commercial sensitivities. However, the cost estimate in 2013 is the 677 million. No comment on the next one (1). We find, as ever, the cost estimate methodology was -- was consistent and well done. Solid project definition with -- which, again, to get quantities to evaluate unit risk to give you a better feel for what the cost is likely to be.

There was, in this case, a summary of cost assumption that -- that was provided that gave you an understanding of how the cost estimate was built up. However, the more formal basis of estimate was not. The conclusion from the team was that the --

the overall cost was high and the recommendation was for this to be -- to be revisited.

I think now we can go to 40 -- 44. The schedules were assessed as medium quality. As touched on earlier, we -- we find a number of activities that were -- which suffered from either high duration or missing logic, and -- and these -- these matters need to be addressed to give more -- what's the word -- more integrity to the schedule that's being presented and is to be followed.

So in conclusion, we found the project be well -- well-organized, well-managed. The construction management agreement, we were impressed with how it was drafted from an operational and a risk perspective. The estimate methodology was -- was consistent with what we would've expected. And the -- the last comment there is, it was considered high when benchmarked with other projects. And this is something that we would expect Hydro over time as it progresses this project to have a look at that again. I think that's me done.

THE CHAIRPERSON: Thank you. Mr. Haight, are you planning to proceed with Amplitude next?

MR. WILLIAM HAIGHT: No. Planning

just to proceed with Mr. Campbell from KCB next.

THE CHAIRPERSON: Okay. With Mr. Campbell. You know, I think it might be a good point to take the morning break. So we'll -- we'll break for fifteen (15) minutes now. Okay. Thank you.

--- Upon recessing at 10:22 a.m.

--- Upon resuming at 10:40 a.m.

THE CHAIRPERSON: Mr. Haight...?

MR. WILLIAM HAIGHT: Mr. Chair, we're ready to proceed with -- with Dan Campbell's presentation.

THE CHAIRPERSON: Thank you.

CONTINUED BY MR. WILLIAM HAIGHT:

PRESENTATION BY KCB

MR. DAN CAMPBELL: Thank you and good morning to all. I apologize for the lateness of our presentation being provided. There was some confusion with MGF and I happened to be in Mexico and it was warmer there than here, I must confess.

Okay. Can you hear me now? Okay. First, a brief history of KCB and we're a consulting engineering company. Some of our major clients include BC Hydro. We're working on Site C. I'm sure you've heard of that project. Ontario Power Generation, SaskPower. We work for contractors as well.

Our typical competitors are Hatch and SNC is two (2) examples. The flowchart on the -- on the cover here is just to give an idea of what I'm going to be covering in my presentation this morning. The -- our report was a team effort. I was not the only author. Garry Stevenson, one of our geotechnical engineers with over forty (40) years of experience was -- he did the -- the geotechnical portion and he did the northern -- he has northern climate experience as well.

Neil Heidstra, a structural engineer with thirty-five (35) plus years of experience was the lead on the -- on the structural piece and he was also recently the lead on the powerhouse design for Site C.

Unfortunately, the others could not be available today. For example, Garry is at -- at a review board meeting on Site C. So I guess I drew the short straw, please bear with me.

Next slide. The presentation is going to cover the project costs where -- specifically where -- where the overruns in terms of the contracts, the project design, the -- the -- where the specifications -- was the design generally reasonable and was -- fundamentally, did the contractor seem to be provided with enough information to be able to proceed with -- with his work.

A review of the extra work orders as -- as the information was provided by Manitoba Hydro. Did they have a significant impact in the project cost to date. We looked at the unit prices. We compared them with other costs -- other projects I should say. We also looked finally at the contracting methodology from the perspective of the contract format. Did it make sense to us, right? And we did not go to site, so we don't have any comments on what -- what happened there. And MGF has already commented in detail about the -- the schedule and so I'm not mentioning that today.

Thank you. Slide 3. We reviewed the cost overruns in the different contracts and the information that was provided by Manitoba Hydro to identify -- to identify the contracts that were important and of concern. Then we looked in more detail about the information on those contracts to see if we could identify anything that, again, was of concern to us.

Again, as I said, we looked at the extra work orders. We looked at the -- then we looked to the contract format. Specifically, the measurement and payment sections.

Next slide, please. In the -- in the contracting summary table that was provided by Manitoba Hydro, there were two hundred and forty-seven (247) contracts which as you see were 4.6 billion, and the increase was 1.9 billion to date or -- or that was shown in the information that we -- we saw.

We looked at that and we said, what are the -- where and what are the important contract increases. So we sorted all the information by contract value. Then we calculated the percentage increase for each contract to see if that was of interest and that was provided in -- in the report.

Then we sorted the percentage increase of each contract as a percentage of the total project cost to try and understand which contract changes were important to the overall project, right.

There's a bunch of information that's not shown here, obviously, for commercially sensitive reasons, but the list here lists the order of contracts, and for most important to least important. Everything that's not on that list is effectively insignificant.

And I think the only comment I can probably make about this is that the general civil contract is about ten (10) times more important than -- than the second contract in terms of cost increase. I don't think I can say any more than that.

Next slide, please. So, obviously, the general civil contract with BBE is the critical contract for the project, with a significant -- responsible for a significant portion of the project overrun, right. We tired and did a calculation or we did a calculation, and we said if they were on budget and schedule, how much would the project be over budget? And that's that number there, 628 million, right, or 23 percent.

But not all of that 23 percent is directly -- is -- is directly related to work that was -- that other contractors would've been able to claim. A lot of it is directly -- is directly related to delays in the civil contract. For example, Voith used the delay to date to significantly increase the value of their contract. Obviously, things like the camp were also major contract increases, both in percentage and dollar value because of the increase in the schedule and the higher manpower then maybe was originally planned. So the impact of the delay is not only on the civil contractor.

Next slide, please.

THE VICE-CHAIRPERSON: Could I just ask you one question before you leave that slide?

MR. DAN CAMPBELL: Sure.

THE VICE-CHAIRPERSON: You say if BBE was on budget and schedule the project would only be over budget by 23 percent.

Is 23 percent something that you would think is normally, acceptable? How would you place that?

MR. DAN CAMPBELL: That 23 percent includes the cost overruns -- or sorry, the additional costs claimed by the other contractors, like Voith and the camp and people like that. So the -- we didn't calculate -- because we have no really good way to do it, what the cost overrun would have been if those other delay costs had not been incorporated.

So that number should be less and less is better. Normally.

(BRIEF PAUSE)

MR. DAN CAMPBELL: Just find -- okay.

Then we sort of said, okay, where the design change is a major driver of the cost increases because we're looking at -- we're engineers, we're looking at this from an engineering perspective, trying to see if -- if the design is reasonable.

From our experience design changes typically appear as revisions to drawings and specifications, right. So we review the drawing and specification logs which were provided by Manitoba Hydro, right. We noticed that there -- to date or to July 2017, there were twelve (12) versions of the technical specifications between March and July -- March 2014 and July 2017. So we looked at those three (3) dates. We looked at them in 2014; we looked at them on version 3 in May 2015; and we looked at version 12 from July 2017, and then we reproduced a table, which is I think the next slide, please.

Slide eight. And this is just an extract of that table and what we did is we looked at those dates and we looked -- we coloured the revisions to see revision 1, for example -- or -- is -- is green, right. So that's a -- one (1) revision. And if it's more than -- two (2) or more revisions, it got coloured yellow. So we had a bit of a colour coding to try and see where the important revisions were because then our next move was to go back and look at those -- at those sections in more detail.

Okay, next slide, please. And that table -- and it's a multipage table and you just had an extract in this presentation. So there were many, many sections that were changed; at least twenty (20) sections were changed in the -- between those two (2) versions, right. All of the changes have some impact on the costs, always, right. Sometimes it goes up; sometimes it goes down. Most of the time it goes up, right.

What we saw is that a lot of mechanical and electrical changes were being made and some of them were technic -- technically astute. For example, the lighting was incor -- it was made to be much more environmentally sensitive with the use of LEDs and so that was upgraded and that was a reasonable change.

Now, those costs inside the civil contract, the mechanical/electrical changes that were -- that we noticed were generally small dollar values in the total value of the contract because the mechanical/electrical inside the civil contract is generally a small dollar value compared with the excavation and civil work and concrete work.

Very little changes were actually made

in the excavation, the fills and the concrete specifications. They were very consistent through all of the documents that we looked at in terms of the specifications. So, therefore, we couldn't -- we couldn't actually's blame the specifications, quote unquote, for the cost increase that we saw in the civil contract. So then we said, okay, maybe it's the quantities.

Next slide, please. Sorry geotechnical. This may address somebody else's question from earlier in the day. So then we said, okay, maybe it's the basis of the geotechnical information. Was the information insignificant or inadequate; was it -- were there a lot of changes as a result of -- of investigations that weren't there.

And I'm not a geotechnical engineer but this is what I get from my -- from my geotechnical engineer Garry is that the investigations appear to have been reasonably comprehensive, both for construction materials and for the structures. In other words, do they have the materials that are needed to build the project. The borrow areas and all that good stuff. And do they actually -- have they actually investigated where the structures are going to be so that they try -- are -- are minimizing the risk when the excavation is done of -- of surprise. I'll use that phrase.

Of course, as MGF noted in their presentation, you can always find things that can be done better. And we found a few things which causes a little bit of interest, one of which the regional bedrock geology drawings in the contract, which in the vicinity of the major structures do not actually show clearly and easily the locations of the drill holes and test pits, which is a -- means that the contractor has go and search for it and try and put those two (2) pieces of information together.

The information is there, as far as we can see, right. So it was more of a pres -- of a presentation issue and make it easy for the contractor, but there's obviously an opportunity for the information to be missed or misinterpreted if it's not presented that way.

There was a brittle deformation zone which crosses the axis of the principal structures beneath the central dam and the coffer dam, and that only had one (1) drill hole in it. Now the comment was that that was healed. In other words, it was -- I'll use -- I'll just leave it at that being -- not being a geotechnical engineer, but the issue being really it was not an issue. Although there was only one (1) hole, to investigate it.

And then there was a ductile deformation zone, a shearer fault, shown on the geology plan beneath the central dam which is mainly in the water, and that was not investigated and we understand why because it's in the water, and it's hard to get to, and it's dangerous. But we noticed that it did -- that deformation zone did continue on to the island near Gull Rapids, but there didn't seem to be particularly a lot of investigation of that. So there's -- those are three (3) issues which were -- were noted.

Next slide, please. As I mentioned, was there enough material for construction? Did you actually have all the rock that you needed. The material balance was reviewed. The engineer had a material balance plan which he showed which is one way of doing it, right, and he had identified that there was enough material to build the project, which is obviously good. He -- that plan showed that the rock excavations were being 100 percent utilized.

You might think there's a risk there, but we don't think so because there's certainly abundant additional rock available in nearby qua --

quarries so we don't see that as an issue.

Ditto with the impervious borrow material which goes in this -- in the core of the dams, right. We'd -- there were three (3) locations identified and the material volumes, they greatly exceeded what was needed. So we're saying to ourselves, okay, that looks good.

Next slide, please. Oh, sorry, back one, please. Okay. Forward again, please. Then the question of: Can you actually build the structures? We've seen some designs and -- in earth-filled structures which are actually not possible to construct. So that -- we thought that was worthy of investigation. Can you actually build what was -- what was shown on the drawings, right?

Yes, there's some areas which are going to be slow to construct, right and -- and compact, right, and there are some narrow zones, but we didn't see -- other than those little narrow zones, we didn't see any particular need for special placement techniques, or any fancy -- fancywork there. So we weren't -- we didn't see a problem there.

The designs, from our experience, and our design skills are appropriate for a northern climate. So we were happy with that. We did note that the placement of the zone 5 riprap bedding as shown in the upper parts of the dams will be challenging. The zone widths are narrow. This -- and -- but it's only two (2) vertical metres in height. So it's not a lot of volume in the grand scheme of the amount of materials that have to be placed on this project.

So from a geotechnical design perspective, in summary, as I say, there -- there are a few areas where more investigations might have helped but overall the geotechnical information is sufficient, and there's plenty of material available to build the project.

So from our perspective, we said, okay, the information the contractor had and what appears to be there from a geotechnical perspective and from a specifications perspective we're happy.

So next slide, please. What about the drawings? Were the drawing sufficient and in enough detail to be able to build the project, right. There's a drawing list which has twenty-three hundred (2300) drawings in it, IFC, associated for the general civil contract. We did not read every drawing. We didn't have time, right. We looked at them in some detail and we particularly looked at them -- Garry looked at them from the geotechnical perspective just because there's a lot of -- a lot of effort and money in the -- in the earthworks piece to see whether or not they looked reasonable from his perspective. And the answer is yes, right. And generally IFC drawings are clear and certainly define the majority of the permanent works. We didn't have a problem with the drawings, right.

The information that was presented on the drawings showed a design that was substantially complete, right, prior -- prior to award, to the actual contract, right. So we didn't see a lot of opportunity for the contractor to actually go back and say, well, that you've revised the drawings many times or you didn't tell me about something in particular that, I needed a dam here or something like that. You didn't tell me about it. So, we were looking -- we were looking at that to see if there was an issue there and the only real thing that we saw that the -- that the contractor had to do was figure out his construction methodology. What he had to do was defined.

So then we said, okay, what about the drawings. Were they revised lots of times? Did he -- can the contractor come back and claim that the drawings -- the drawings were -- were inadequate and designed and revised and there was multiple times and every time it cost us money. So we looked at the revision history.

Next slide, please. This is just a graph showing the IFC wri -- drawing revision log that shows the drawings that were issued -- issued for construction, revision 0, revision 1, revision 2, et cetera.

You can clearly see that the majority of the drawings were not revised after issued IFC. This is very good because this -- this tells the cont -- tells us that the contractor generally had the information that he needed to be able to design from. So, that's a positive thing. So far everything looks good.

Next slide, please. So then we said, maybe they were late. Maybe the drawings came late. So we looked at the issue of when -- when they were issued by year. Okay. And there you can see it. There's a graph as well. Okay. We know the contractor priced the job in 2014 with a limited number of drawings. You can see there, the IFC drawing list, right. The majority of the drawings were prepared later in 2016 and '17, possibly, but we don't have particular proof that the contractor missed or did not allow for the complexity of the job. Maybe that explains some of the -- some of the issues, right, and therefore underbid the pro -- the project, right.

And certainly there's the possibility that the engineer could have added more detail in the drawings that he's produced in 2015, '16 and '17 and, certainly, he did because he produced the mechanical drawings in more detail and there's a bunch of information there. But they were issued IFC and the technical specs weren't revised and so those are -- I'll use the word "if" questions, "maybe" questions. They're not cast in stone facts, definitely questions -- or -- or reasons for some -- for some of the issues, some of the cost overrun.

Slide 16, please. So from a design perspective, the revision to the specifications have been generally related to the balance of plant work, i.e., the mechanical/electrical work and should be low -- low cost impacts on the entire project. Some more geotechnical investigations might have helped but overall we don't think that -- that the information was insufficient. We think there's enough information there and there's lots of materials to build it. The drawing information is good. The design is reasonable and well detailed. The number of drawings produced is reasonable for a project of this size. It's not like he had to build it with two (2) drawings on the back of a cigarette box. He had lots of drawings and lots of information, right. The only niggling potential issue may be the timing of the drawing production, which may have created some delays, not sure.

In summary, design changes do not account for, in our opinion, for the major cost increase.

Next slide, please. So then we looked at the extra work order information that was provided. Do the extra work orders show where the costs came from? So we reviewed the extra work orders from the general civil contractor as extracted from the Keeyask contract revision register for allocated contingency August 2017.

And I must say that I want to complement Manitoba Hydro for all of the information that they provide and -- and the quality of the information, for the excellent job of tracking the extra work order and the extra -- and generally supplying the -- providing the data. They've -- they are doing an excellent job from our obser -- from our observation.

What we saw there is that the extra work orders which are driven by technical information add up to a number which includes another number, a small number, about 10 percent of that directed by Manitoba Hydro and direct work that they asked for. We'll leave it at that.

Next slide, please. We looked to the information by year to see if there was a -- an issue there in terms of: Was the extra work orders, were they a function of -- of year? What we found was that the majority of the informa -- of the extra work that was -- that was listed was done in 2015 and '16, which makes sense because of the great rece -- reset of the project in 2017, right.

The number which is we can't tell you was -- was noticeable, but we also noticed that the profit reductions were a bigger number than the extra work orders. So there's actually a -- a net savings when you subtract the extra work orders. When you take the extra work orders and subtract the profit reductions, there's actually been a net savings to the project to date, based on the information that was provided.

Next slide, please. So on that basis

we can't sort of say the extra work that's been claimed to date or paid to date is driving the project cost either, right. And in fact, in 2017, there's been some additional money saved by technical changes.

Quantity estimates. This goes back to the question of target price and unit rates, times -- times quantities equals the target price. Manitoba Hydro mentioned in one (1) of the documents that the cost increases to date are -- was a reflection of the change in quantities. They believe that's part of the -- one (1) of the issues that have -- that has impacted the price change.

Most of the work to date was related to earthworks and concrete. As we said, the civil -- or sorry, the mechanical/electrical turbine installation and gates, all the good things for a person like myself as a mechanical engineer, that hasn't been done yet. So -- but we did look at the -- we concentrated our review on the earthworks and the concrete quantities and their changes.

Next slide. We looked at the -- at the concrete works and the formwork and there's a long table, which is in our report. This is just an extract of it. We looked at the variances there to see whether or not the variance percentages and that's column C there, vary dramatically between the original budget, the current budget so -- and we also reviewed some of the information that was provided in a Hatch report, a Stage IV Hatch Report which was in 2012 or '13, I believe. I'm not sure of the date on that one.

So we want -- because we were looking to see if there was a trend from the very early part of the -- of the project to the end to see whether or not the quantity changes were significant enough to actually drive a cost change, a major cost change.

Next slide, please. We saw variances ranging from minus 41 percent for granular fill to plus 86 percent for rockfill. Remember, we've identified there's lots of materials, right. So our suspicion is in the way it was priced or the way it was -- it was -- was being considered there is that there's been some category changes in some of those rockfills in particular, and then that shows when you look at some of the definitions I believe of what the rockfill is in terms of the sizes and the sieve mixes for some of the -- for some of the fills from what one -- from early in the project to later in the project.

So -- and I think that -- that's not entirely unreasonable because you will classify your rock based on what you can make from the quarries that you have, and then you'll use it appropriately. But, when you add it all up, you've only got a variance of about 4 percent in terms of the total volumes of all these different bits and pieces.

Now, I know there was some geotechnical issues with some additional excavation. And I've heard that there's some issues with additional heights of cofferdams and so some of that may account for some of that but still 4 percent is not a huge number. And if you were to do it on a unit price basis, that would presumably change your price by something similar, maybe.

The concrete volumes going right back to the initial Hatch report are remarkably close throughout the estimates. So, the changing quantities in total doesn't seem, from our perspective, to justify the change in the contract value.

Next slide, please. So where are we at this point? The design is reasonable. The drawings and specifications have very few revisions, i.e., they're reasonable. The geotechnical investigations are reasonable and generally good. The extra work orders technically have -- don't seem to have been excessive, right. The quantity estimates are in total reasonable close. We're thinking as we're going through this project at this point, everything looks pretty good. We haven't figured out -- found the smoking gun yet.

Next slide, please. And we looked at unit prices. Were the unit prices changed in '87 (sic) and if so, what was the impact? This was a difficult thing to do because what we found was that the -- there was (a) a lot of information. There was a very, very, very detailed breakup -- breakdown and development of unit prices in the -- in the -- in the different contracts and they weren't always -- or the different versions and they weren't always directly comparable. We had a limited time.

And so we kind of struggled with this. And so what we did is we took similar items in the -- in the bill of quantities and we grouped them together into consolidated unit prices, right, so that we could have a fewer -- a fewer -- a smaller grouping and we could also bundle things together, which were not easy to -- to directly comparable from one document to another. And then we divided the total cost of the grouped items by the total quantities.

Next slide, please. The following consolidated items were reviewed. The cast-in-place concrete. Now, we recognize -- and I think it's really important to understand -- that concrete construction is different for the spillway, for example, compared with the powerhouse, or the te -- and/or the intake in terms of the complexity, the amount of rebar, the formwork, all of these things have an impact on the -- on the unit price nominally of your cast -- cast-in-place concrete. So that one we broke out into those four -- four (4) groupings and you can see we -- we chose a formwork ratio -- formwork area to concrete volume ratio, which is defined there. We looked at the volumes of reinforcing steel, structural steel, right, the unclassified excavations, the rock excavations, the impervious fills, the granular -- granular fills together as a -- and the rockfills.

Next slide, please. We compared the -- all of that information after we consolidated it altogether in a -- in our own spreadsheet between the March 2014 contract AA3 and the AA7 version of 2017.

Next slide, please. And you can see there's the -- the quantity -- the quantities are shown on this table, right, and you can see that there's similar. They're not identical, but there's certainly similar, right. So this goes back to the comment that I made earlier that the quantities generally were -- were similar.

I think the thing that I can say that the blacked out piece in terms of unit price --

THE CHAIRPERSON: Technology is wonderful when it works.

(BRIEF PAUSE)

MR. KURT SIMONSEN: Whoever just joined, can you please mute your phone. Thank you.

THE CHAIRPERSON: Mr. Campbell...?

MR. DAN CAMPBELL: Could I stop saying I've lost my train of thought?

The unit prices all increased between three (3) and seven (7) significantly, as a comment.

Next slide, please. Between, as I say in the slide there, between 67 to 366 percent. When you looked at the entire bill of quantities, not just those that -- subset that I was talking about there, we saw that there were similar increases through the entire bill of quantities comparing 3 and 7.

(BRIEF PAUSE)

MR. DAN CAMPBELL: So if you were to assume that the quantities times the unit price equals the target price, which is true, right, the target price estimate in 7 is much larger than in 3, and it's a function of the unit price increase, not the quantity increase. Next slide, please.

(BRIEF PAUSE)

MR. DAN CAMPBELL: Then we said, Okay, somebody's going to ask, I'm assuming, so we did, are the Keeyask unit prices comparable to other similar projects? I have to be careful when I say here because of confidentiality reasons on other similar projects, but what we did is we compared the unit prices that were present -- that were available to us on Keeyask with some historical information for similar work for a large hydroelectric project in Northern Canada. One (1) of the reasons we consolidated the projects is because that information is commercially sensitive to other clients. We couldn't present it anyhow.

And we -- the next slide shows -- well, is was supposed to show the his -- the comparison between 3 and 7, and our estimates. Unfortunately, the good bits aren't shown. So we might as well move on to the next slide, please.

What it's -- so we saw there is that the initial contract appears to be generally low compared with what we are -- that we have for historical information, and that the amending agreement 7 prices would be -- appeared to be significantly higher compared with what we have.

Thank you. So being engineers, we then said, Well, what impact does that have on the subset of information that we're actually looking at in terms of that unit price comparison? So we did that calculation. It's nicely shown in the black, right? The -- unfortunately, I can't tell you the numbers, but looking at the numbers and I would say that the original contract was dramatically low, and that the existing for the AA7 version is, while higher than what -- what our math showed it might be, is much closer to what our math showed it should be.

So fundamentally, we don't think the contractor could have done the job for the price he bid it, all right, if the target price was high -- was -- was ultimately how he was being paid. So we said, This is a bit of an issue. So we said, Well, how is he be -- getting -- getting paid?

Next slide, please. So we read the contract. This was after we've done all of the good engineering bits to see if we can figure out what's going on. And the blue bit is a direct quotation, more or less, out of the contract, and it talks about the work being on a cost reimbursable basis, fine, with an initial target price and final target price, which is subject to terms of the contract and measured -- and there's going to be measurement in the contract documents, and there would be no change to the unit price unless actual quantities vary by some numbers, and this all looks sort of initially pretty good, all right? So that -- because this is certainly reasonable for a contract with unit prices and measured qualities leading to a final target price with some ultimate adjustments.

Next slide, please. Basis for payment, section 9:

> "Subject to these terms and conditions of payment, the purchaser shall pay the contractor and contractor's actual costs, emphasis by us], incurred in the performance of the work."

Now, section 9 has a bunch of

modifications to the -- to the contract related to profit, and GA&O, and there's a bunch of formulas based on actual costs, and the final target price. And generally, the -- the wording seems reasonable, except it never actually says what the actual costs are. It says -- it never actually says the actual costs are equal to the quantities times the unit price.

So we had to read some more. So we went looking for the definition of actual costs. In section 11, "actual costs shall mean only the following." And I've shortened that section, but basically, and I think you people already know this all probably way to well, it's all the actual indirect and direct costs, all the labour, equipment, et cetera, et cetera, et cetera, incurred by the contractor. Again, the definition of actual cost -- there is no connection between actual costs and the quantities and unit prices.

We have never seen a contract of this size, in our experience, that does this. In fact, I went around and I had a discussion with some of our senior management about contracts of this value and this particular contracting strategy. And I asked other people who have experienced, like, thirty-five

(35), forty (40) years experience, have they seen a major project with this as the contract format, payment format? And the answer was no.

Yes, there are certainly, as MGF mentioned in the -- in the transmission contracts, there are sections of contracts that have cost reimbursable sections, all right? For example, typically on drilling contracts, where you have a driller, and you're drilling -- doing in-field investigations, those are that way because fundamentally, someone is telling the contractor exactly when to do, Drill down till you -- till now. Okay, we're down far enough. Stop. Move over, let's do another hole over here, all right? Someone is directing the contractor specifically in controlling when he stops and starts, telling him what to do.

But we don't -- we've never seen -- and I'm not saying this hasn't been done. I'm just saying, we've never seen it, right, on a contract of this size, of the -- in this industry, or in the mining industry that we're familiar with, and we work in that industry as well, contracts that are set up like this.

Next slide, please. So our conclusions. Design is reasonable. Drawings and specs are reasonable. Geotechnical inf -- investigations are reasonable. Technical -- extra work orders have been okay. Quantity estimates are okay. The unit price -- original unit prices were -- were optimistically low. As I said, the contractor would not, in our opinion, have been able to do the work for the original target price, and that the actual costs are not based on the quantities and unit prices. And I mean, MGF commented on that as well, and I think that's really the -- the crux of the matter, from our perspective, and our review of what is happened, is that the contractor basically did not have the incentive -- I'll use that word -- to be able to perform to meet his unit price times quantity calculation. Thank you.

(BRIEF PAUSE)

THE CHAIRPERSON: Mr. Haight, did you want to proceed with your next witness?

MR. WILLIAM HAIGHT: Yeah, I -- I think that we should be able to deal with the Amplitude presentation before the lunch hour?

THE CHAIRPERSON: Well, we will go late if required into the lunch hour --

MR. WILLIAM HAIGHT: Sure.

THE CHAIRPERSON: -- but I think it'd be better to go through -- go through it now.

MR. WILLIAM HAIGHT: Yes, sir.

(BRIEF PAUSE)

MR. WILLIAM HAIGHT: Mr. Brand, can you hear us now, sir?

MR. LES BRAND: Yes, I can hear you. So can -- good morning, everyone. Can everyone hear me okay?

MR. KURT SIMONSEN: Yes, we're okay, Mr. Brand.

MR. LES BRAND: Okay. So we'll go through my present -- our -- Amplitude's presentation. So if we can go to slide -- to slide 2.

MR. KURT SIMONSEN: We have slide 2.

PRESENTATION BY AMPLITUDE CONSULTANTS:

MR. LES BRAND: Okay. Great, thank you. Right. So this presentation, it's -- it's relatively shorter than the others, and it's really just a summary of our report. Just by way of introduction, Amplitude Consultants are an Australian-based consultancy. We specialize in the various technical issues associated with the transmission and distribution of electricity, and in particular, we specialize in the high-voltage direct current technology, as well as a few other things. We're based down here in Australia, but our consultants have experience with HVDC projects globally.

So going through the presentation, we were asked to -- to look at the HVDC converter stations in particular. Amplitude's scope of work, as -- as I'm showing here, was to assist MGF with the assessment of reasonable of the current forecast at completion capital cost of the converter stations, and to provide an opinion on whether appropriate contingencies and reserves have been provisioned. As I pointed out, it's only in relation to -- to the two (2) converter stations associated with the Bipole III project.

Can we go to slide 3. Now, what we found when we -- when we looked through the documents, most -- the most recent revision to the cost estimates was completed in 2016. We were specifically asked to look at the difference between the previous cost estimate, 2014, and -- and compare it against the -- the 2016 cost estimate.

As MGF have already mentioned, there was a -- a -- quite a -- a detailed basis for estimate document, so the 2014 estimate. It was a good document, and I think the point was made earlier, it did lack a -- a bit of detail, but it was -- it was sufficient for our purpose.

What we found was during the estimate, Manitoba Hydro applied a work breakdown structure method. When I broke down the converter station costs into a number of work breakdown structures, and you can see them there in the table, quite an appropriate way to -- to divide up the -- the various technical elements of -- of the converter station.

But we found that the -- the difference between the 2014 and the 2000 and -- 2016 estimates...

(BRIEF PAUSE)

MR. KURT SIMONSEN: We've clearly lost him. We're going to send him a note to try and get him to sign in again.

THE CHAIRPERSON: We'll -- we'll -- yeah. We'll wait to see the response. Mr. Simonsen, is there way that he would know that the call's been dropped? Do you know?

MR. KURT SIMONSEN: If he's not hearing us, he should know.

THE CHAIRPERSON: Yeah, but we're not --

MR. KURT SIMONSEN: No, I know.

THE CHAIRPERSON: -- okay.

MR. KURT SIMONSEN: So that's why we're sending him an email.

(BRIEF PAUSE)

MR. LES BRAND: Good morning. Apologies. Can everyone hear me okay?

MR. KURT SIMONSEN: Yeah, welcome back. I -- that must be the Australian telephone, I assume.

MR. LES BRAND: Yes, well, we -- we have -- we have dropped out two (2) or three (3) times this morning already, so we should be okay.

So where did we get up to, slide 4?

MR. KURT SIMONSEN: We're -- slide -- slide 3, we were looking at the table.

MR. WILLIAM HAIGHT: Your last words, Mr. brand, was "comparing the 2014 and 2016 estimates," and that's where you cut out.

MR. LES BRAND: Okay. Thank you. Apologies. And what we found was that the -- it was a difference of -- of the order of just over 104 million between the two (2) estimates.

Now, if we go to slide 4, comparing the 2014 to 2016 estimates, we noted some material changes to the work breakdown structures for the convert -- the two (2) converter stations, Keewatinohk and Riel. But the most notable increase was to the contingency value, and the -- the numbers were -- have been removed from -- commercially-sensitive information.

But what we -- what we did note, when we drilled down into it, is that the increase in contingency was -- was due to an increase -- a requested increase in confidence from P50 to P75, as was recommended by the Boston Consulting Group.

In terms of scope change, the only significant scope change that we could notice between 2014 and 2016 was additional funding required for an access road to Conawapa, which is related to a project that was shelved, but originally, there was a plan to share the costs associated with that access road.

Exploring the -- the work breakdown structures for the KCS, and Keewat -- Keewatinohk converter station, and Riel converter station, we found that those two (2) work breakdown structures make up close to 78 percent of the total budget for the converter stations, which -- which is to be expected. The EPC contract for the -- for the HVDC converter stations, and the EPC contract for the synchronous condensers make up a significant portion of those two (2) work breakdown structure elements.

The next slide, slide 5. So this was already touched on by MGF in their presentation, but there was a competitive tender process applied to the converter station contracts. The technology -- the three (3) bidders each had a -- a international technology partner, Siemens, ABB, and Alstom. In our view, the technology -- the technology partners, all three (3) bidders, which -- which are Siemens, ABB, and Alstom, which is now GE, are well -- well-known in the HVDC industry, and have a long history of providing this technology globally.

We reviewed the techno-economic evaluation of the bidders. These appear -- these appear to have been thorough, with consideration given to technical capability compliance, performance technology, schedule, and overall value, and the contract was awarded to Siemens Mortenson.

Go to slide 6, please. When it comes

to checking the reasonableness of converter station pricing, we -- we make the point, and we've made the point in our report that the pricing of HVDC converters depends on a number -- many factors, and many of those factors are known only to the vendors at the time of pricing. It's a -- it's a common trait of HVDC projects that each project is quite unique, and offers a -- an opportunity for the vendors to -- to apply unique charac -- characteristics -- characteristics, but it gets to the point that every converter station is -- that's built every year is more or less the spoke design.

It does make it a little bit difficult to compare the cost of one (1) converter station to the other. There's also a -- a general reluctance of the vendors, because it is such a -- a tight and competitive area, and is -- is a -- a -- often, a leading-edge technology that costing information can be quite difficult to find, or reliable cost information can be quite difficult to find in the public domain.

There are also other elements that impact the cost of one (1) project to another, the cost of raw materials or metals at the time, lots of copper, lots of aluminum, and steel, associated with the project. The global demand for HVDC and the capacity -- manufacturing capacity of the vendors can impact pricing as well. For example, if -- if all the major vendors have pretty full order books, that could increase the price, and often, the schedule of the project. If it's the -- the opposite, we could end up with lower prices in the market. And project location is -- is an issue as well with the three (3) vendors here all European-based, Sweden, Germany and -- and the UK, and therefore the further away from the -- from the -- the manufacturing facilities, then the -- the higher the price can be. So overall, the comparison of proj -- of the cost of an HVDC converter station to other projects requires an understanding of the scope of each project, and an understanding of any key differences between them.

Go to the next slide, slide 7. Looking at the scope of the Bipole III project, there are -- there are a couple of specific characteristics associated with Bipole III that may influence the costs, in most cases -- in all cases, result in a higher cost than other HVDC projects would not normally have these characteristics.

So the first one is that, from a technical perspective, the project required two (2) series valve groups per pole, and without getting too technical, it's -- it's a way of -- of providing additional reliability and availability to the project, and it can also be driven by the general size of the equipment, in particular, the transformers. I could not find anywhere as to why that was charged for this particular project.

But suffice it to say, when compared to the price of other projects, the majority of other projects that have been built up until now had only had one (1) valve group per pole. And public -- public information and -- and documentation quite clearly points out that a two (2) series valve group pole project should have a -- a higher price than one (1) valve group per pole.

Also, in the Bipole III project, there are extreme temperature and environmental conditions to be experienced both during construction and during operation. There's the remoteness factor of the Keewatinohk converter station, which would have added some -- some costs to -- to a project when compared to others, and there are some unique controls applied to this project which wouldn't normally occur to projects in warmer climates or outside of North America, and I've listed a few of them here: De-icing, some SPS requirements, run-back capability, and NERC cyber-security requirements.

The other interesting thing about Bipole III converter station specification is it requires a continuous overlay of 2,300 megawatts. So although it's a 2,000 megawatt project, this continuous overload would, in our view, require that the converter stations themselves have its major project elements, mostly primary equipment, rated for the higher value because of the requirement for a continuous overload. Now, from a cost perspective, when we did a comparison, we actually used 2,300 megawatts when trying to determine a -- a cost per megawatt.

So I'm going to slide 8. Thank you. So we performed a comparison of the overall cost per megawatt. We can't show that number for commercially-sensitive reasons, but we compared that against published costs of similar projects. These -- we've -- we had to apply at a -- it's -- it's a very high-level comparison, so we had to apply time and for -- foreign exchange assumptions to those other projects.

We noted that of the projects we were able to -- to source costing information, all but one (1) was based on one (1) valve group per pole. What we found was that looking at the different types of information, we found ranges -- a -- a range of a costing based on that -- that quite high-level dollars per megawatt value that was often in the order of -- or marginally below the value of the EPC contract for the converter station. However, we concluded, and we are of the view that the EPC costs for the Bipole III converter station, which concludes variations to date, are reasonable, after taking into consideration the use of two (2) valve groups per pole, the remoteness of the Keewatinohk converter station, and the extreme temperature and environmental conditions associated with this project.

Now it's slide 9. Thank you. So another significant part of the cost of the converter stations was the synchronous condenser costs. We have performed a -- a similar activity -- similar comparison as we did for the HVDC converters. So the scope of the EPC contract is for four (4) 250 MVAr synchronous condensers at the Riel converter station. Once again, it was taken through a competitive tender process. The contract was awarded to Voith. And we performed an analysis of similar published costs. We found a range where on our dollars per MVAr level and we found that the Voith contract is within that range, although it -- it is on the high side of the range, and we're of the view that this is reasonable to expect for -- for similar reasons as we mentioned for the HVDC converter station, but in particular, the extreme temperature and environmental conditions associated with the Bipole III project.

And we'll go to slide 10. So the second part of our scope was to comment on the reasonableness of contingencies and reserves, and unfortunately, with this part of the -- our scope for this presentation, we -- we had to remove, obviously, some -- a fair amount of information for commercially-sensitive reasons. But the process we followed, we -- we compared the reported actual costs at -- as of September 2017 to the 2016 budget. The comparison showed a remaining budget as of September '17 for the -- for the whole converter station, all converter station work breakdown structures of about 614 million.

Go to the next slide, slide 11. So we -- we reviewed the monthly reports and the schedule updates in order to get an understanding of the status of the project. We also looked at the -- the progress payments to date, the current vendor of each contract, the -- the major contracts, particularly the Siemens and the -- and the Voith contracts, and compared the progress payments to date against our -- against our outstanding payment past amounts due.

From there, we -- we concluded, or we're of the view that the remaining budgets for the converter stations in general should be satisfactory, and -- and should not, without an event, that's -- that's unforeseen at this point, should not lead to a draw from contingency. We found that for the Keewatinohk 230 kVA switch yard there was only a small -- the budget that's -- exceeded the amount of progress payments that are due, so they will -- will -- it will require a draw from contingency.

However, when you combine the expectations that the converter station contracts will come in on budget and the -- the relatively small draw from contingency, our -- our conclusion in this respect was that the remaining contingency should be considered reasonable to cover the impact of any unexpected activities, which cannot be ascertained from the information made available for this review.

So that's slide 12. That's -- that's our presentation. Thank you.

THE CHAIRPERSON: Thank you, sir. Dr. Williams, I've got you down for fifteen (15) minutes.

Did you want to start now, or afterwards?

DR. BYRON WILLIAMS: I think -- I think I can manage it, sir.

THE CHAIRPERSON: Okay. Thank you.

MR. WILLIAM HAIGHT: I should just say, Mr. Chair, that we have been in contact with Misters Phillips and Potter, just to determine whether they, after hearing the presentations, had anything that they wished to add. And they have indicated that they do not. And so we can proceed with the cross-examination.

THE CHAIRPERSON: Thank you.

MS. HELGA VAN IDERSTINE: Mr. Chair, if I could just have a couple of minutes to consult with counsel for MGF and Board counsel, I'd appreciate it.

THE CHAIRPERSON: Certainly.

(BRIEF PAUSE)

THE CHAIRPERSON: Mr. Haight, I understand you have something to say.

MR. WILLIAM HAIGHT: Yes, I do. Thank you, Mr. Chair. Ms. van Iderstine has brought to my attention, as well as counsel to PUB, a portion of the

MGF presentation which was not included in the public presentation, and which Manitoba Hydro has no objection to it being included in the public presentation. It was inadvertently left out. MGF believed it to be CSI and so, therefore, it was not included. We have had a discussion and there's no objection to it being included in the public presentation.

The only caveat that -- that because MGF assumed that it would be part of the CSI presentation, it really didn't come here today prepared to answer any involved questions regarding this page. And -- and, of course, it just wants to reserve its rights to -- to answer fully and completely any questions about this page at -- at a point in time when they are more fully prepared to do so. So be that this afternoon, be that tomorrow morning, whatever that might be.

THE CHAIRPERSON: Fine. Ms. Van Iderstine...? It's fine. It's not CSI?

MS. HELGA VAN IDERSTINE: No, I mean --

THE CHAIRPERSON: Hydro's okay with the --

MS. HELGA VAN IDERSTINE: -- we just wondered when they took it off the record whether they thought they couldn't speak to it because there were some -- in order to answer questions they had to disclose CSI. But the document itself is not CSI, no.

THE CHAIRPERSON: Okay. So if -- if we could proceed and, I guess, put the document on the record and then have MGF go through it.

(BRIEF PAUSE)

THE CHAIRPERSON: That -- Mr. Haight, is this going to be a separate exhibit number or just part of the --

MR. WILLIAM HAIGHT: No, it would be part of the public presentation, sir. Yeah.

MR. KURT SIMONSEN: We'll call it 4-1, Mr. Haight.

MR. WILLIAM HAIGHT: Thank you, Mr. Simonsen.

--- EXHIBIT NO. MGF-4-1: MGF Presentation

PRESENTATION CONTINUED BY MGF:

MR. CAMPBELL ADAMS: The -- earlier on today we gave the -- the range again of 9.5 to 10.5 billion. In front of you we have our calculation as to what the project value might be, around the 9.9 billion. What I'll do for a minute or two (2) is just talk you through the construct of that, taking us to the 9.9 billion total. The -- the basis of this was taking the expenditure to date that was reported by Hydro as at the 31st of December 2016, and adding to that Hydro's estimated cost to completion from the 1st of January 2017 through to the end.

The next bullet points, craft to foreman ratio, trade in cash discounts, increased use of overtime, net BBE indirect costs, the earthwork productivity, scaffold and crane costs, and concrete productivity are -- have been calculated and taken directly from our final report. Those were our assessments of the costs associated with those cost categories.

With the data that we find, we've added in additional costs associated with the delay and disruption to Voith, and to ongoing service contracts that will be required to support the project. For example, camp operations. I believe, in accordance with -- I'll watch my language -- in accordance with Hydro's interest and escalation, we have used their percentage to that. And given some of the -- the risks that lie ahead over the next four (4) years, we have added to this a contingency of -- of 10 percent. When you add it all up -- up together that order of magnitude estimate of project cost comes to 9.9 billion.

MR. WILLIAM HAIGHT: So that is it, essentially, for that particular Exhibit 4.1. And the panel is now able to answer questions under cross-examination, if you should so -- so choose, Mr. Chair.

THE CHAIRPERSON: Thank you. I've been advised by counsel for the Consumers Coalition, GSS, GSM, and MIPUG that they do have questions, but they should not take too long. So I would suggest that we'll proceed now with those questions, and maybe if we can finish, you know, on or before 12:30 we'll just take a break later on. And then we would just have Manitoba Hydro and -- and Board counsel in the afternoon. So, Mr. Williams...? Dr. Williams, sorry.

CROSS-EXAMINATION BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Good morning, members of the panel, and good morning, MGF, et al team. Perhaps we can go -- and my first few questions are to Mr. Campbell in the back. Mr. Campbell, can you -- can you see me, sir? Okay. Perhaps we can go to the pre-filed evidence from December of 2017 of

Klohn Crippen Berger, appendix A to MGF's evidence, page 33, towards the bottom, please, Kristen.

MR. DAN CAMPBELL: Klohn Crippen Berger, by the way, is how you say it. KCB for short.

DR. BYRON WILLIAMS: And, excuse me, I misspoke. It should be page 34. And, sir, I apologize for the mispronunciation and I'll govern myself with KCB going forward. And -- and certainly, just so you know, sir, I know you'll see me sitting beside a number of Hydro employees or external counsel. I just want you to -- not that I don't think highly of my friends to my left, but I want you to distinguish me from -- I'm not part of Hydro, okay, sir? You understand that?

Going down towards the bottom of this page, just scroll down a bit more, Kristen. Okay. So at KCB and -- and Mr. Campbell, first of all, thank you for the way that you unraveled that story like a detective story. That was very entertaining and -- and informative. Obviously, towards the end of your presentation you raised the concern with the -- with the contract, the -- the March 2014 contract, and -- and what you saw as an absence of connection between actual costs and quantities and unit price -- prices.

You recall that, sir?

MR. DAN CAMPBELL: Yes, sir.

DR. BYRON WILLIAMS: Would -- to my knowledge, sir, you -- you didn't talk about is in the last paragraph of page 34, which is a clause within the contract by which the contractor, presumably the general civil contractor, is paid two (2) months in advance -- advance for planned work.

You didn't refer to that in your presentation this morning, sir?

MR. DAN CAMPBELL: That's correct.

DR. BYRON WILLIAMS: Sir, you characterize -- to -- to back up for a moment, you noted when you began your presentation this morning that you have had some involvement with Site C in British Columbia?

MR. DAN CAMPBELL: I personally have not, but Klohn Crippen Burger is one (1) of the co-designers of it.

DR. BYRON WILLIAMS: Okay. And, sir, in terms of the -- the clause in which the contractor is paid two (2) months in advance for planned work, you suggest that that is a con -- a clause that you've not seen previously before in a contract, sir?

MR. DAN CAMPBELL: Correct.

DR. BYRON WILLIAMS: And, sir, from

the issue of incentives or -- what is the implication of this unusual clause? Why does it matter, sir?

MR. DAN CAMPBELL: We made an assumption that the contractor was being paid in advance for work he had yet to do so that his cash flow would remain positive, which is what I said in the paragraph. It's an interesting way to do it. We haven't seen it done that way before.

Typically, where we've seen it to make the contractor have a positive cash flow he's given a mobilization payment. And that mobilization payment is enough to get him going and hopefully make sure that when his regular billings come in, based on the work that he does, that his cash flow remains positive and he's happy. We don't know the ne -- what the negotiation logic was or the rationale was. We just made the assumption and I'm just saying we haven't seen it that way before.

DR. BYRON WILLIAMS: Okay. And the observation that you've not seen it before, that would extend to the Site C contract to your knowledge, sir?

MR. DAN CAMPBELL: I don't believe I can comment on that.

DR. BYRON WILLIAMS: Fair enough. Let -- let us go to the top of the next page. And, sir, you may have a similar answer. In -- in the last paragraph on page 35 you're describing again the fact that KCB has not seen a large contract previously where payment was not related to actual performance of the cont -- construction work.

Do you see that reference, sir?

MR. DAN CAMPBELL: Yes.

DR. BYRON WILLIAMS: And, sir, if you're able to comment, would that comment extend to Site C as well?

MR. DAN CAMPBELL: Yes, I believe those contracts, in terms of the bid documents, were publicly -- generally publicly available and I believe that the Site C contracts are based on -- generally based on unit prices, times, quantities, or lump sums.

DR. BYRON WILLIAMS: And, sir, do you have any sense of when the contracts related to Site C were let?

MR. DAN CAMPBELL: Over the last three (3) years, perhaps.

DR. BYRON WILLIAMS: And regulatory approval via the National Energy Board decision would have been three (3) or four (4) years ago, sir, subject to check?

MR. DAN CAMPBELL: I'm not able to

comment. Don't know.

DR. BYRON WILLIAMS: Thank you for that. Mr. Adams, perhaps we can go to the pre-filed written evidence of MGF, and specifically page 80 under Finding Number 10, Keeyask construction management. And, sir, likewise we'll -- you didn't unravel a detective story, but our clients do thank you for your lyrical presentation this morning. I've never heard the word endemic pronounced with such vigour.

Sir, we don't need to go there, but you'll recall in -- in your PowerPoint presentation today, and specifically at slide 10 in your verbal description of it, I believe you used words to the -- to the sense that cost reimbursable pricing mechanisms are not necessarily a bad mechanism.

Do -- do you recall using words to that effect, sir?

MR. CAMPBELL ADAMS: Yes.

DR. BYRON WILLIAMS: What our clients took to be the thrust of your commentary on that page though, sir, is that they can become an inefficient mechanism in circumstances where Hydro bears all of the productivity and schedule risk and fails to hold the general civil contractor's feet to the fire.

Would that be fair, sir? You're nodding your head?

MR. CAMPBELL ADAMS: Yes.

DR. BYRON WILLIAMS: Yes. In that context, sir, directing your attention to the third last paragraph, your concern is with the cost reimbursable contract as entered into with regard to Keeyask, that it promoted and rewarded inefficient work, sir?

MR. CAMPBELL ADAMS: What are you looking at? Sorry.

DR. BYRON WILLIAMS: The third last paragraph, sir.

MR. CAMPBELL ADAMS: Yes, I see it.

DR. BYRON WILLIAMS: And that it did not encourage efficient work, sir? That was your conclusion?

MR. CAMPBELL ADAMS: Yes.

DR. BYRON WILLIAMS: And generally, sir, would you agree that in terms of business practices that pass-through costs, regardless of productivity or adherence to schedule, those could generally be described as not efficient and not prudent?

MR. CAMPBELL ADAMS: Cost reimbursable

contracts work well when the scope is not defined and it's difficult to -- to define the scope and to put a boundary around it. An example would be you're going to build a house, and you believe there are services, pipes under your plot, but you don't where they are. You can't get that really on a lump price because you can't show the contractor what it is he or she has to do. So cost reimbursable is appropriate for that. When you know what it is you want to have built, you've got project definition. Cost reimbursable is an unusual pricing mechanism to choose.

DR. BYRON WILLIAMS: And ultimately inefficient, sir?

MR. CAMPBELL ADAMS: It can be, yes.

DR. BYRON WILLIAMS: I think, Mr. Chair and members of the panel, I thank MGF for those comments, and I'll move on -- or I'm -- I'm completed our cross, sir.

THE CHAIRPERSON: Thank you, Dr. Williams. Sorry. M. Monnin...?

CROSS-EXAMINATION BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Thank you, Mr. Chair, members of the panel. Good morning. I'm counsel for General Service Small, General Service

Medium customer class and also Keystone Agricultural Producers. I have a few questions. I'll start with Mr. Adams, and then a few short questions for Mr. Campbell.

Mr. Adams, with respect to MGF is it safe to say that MGF's view is that Keeyask poses the greatest threat to the capital expenditures program?

MR. CAMPBELL ADAMS: Yes.

MR. CHRISTIAN MONNIN: And I want to explore the notion of Mulligan which you've raised a few times in -- in your evidence this morning. Now, you'd agree with me that Mulligan in golf is a shot -- it's a -- it's a chance to perform a shot, usually after the first chance went wrong either through bad luck or for -- or through a blunder.

You agree with that?

MR. CAMPBELL ADAMS: A do-over, yes.

MR. CHRISTIAN MONNIN: And in -- in golf the result is that the hole is played and scored as if that errant shot had never been made.

Is that fair to say?

MR. CAMPBELL ADAMS: Yes.

MR. CHRISTIAN MONNIN: Now, you referred to the Amending Agreement Number 7 as a Mulligan. Is it fair to say that Amending Agreement

Number 7 doesn't undo the bad luck or the blunders that occurred previous to February 20 of 2017?

MR. CAMPBELL ADAMS: Yes. What I was trying to convey was the contractor was given a second chance to get it right.

MR. CHRISTIAN MONNIN: Right. And with -- let's refer to that as a correction shot, perhaps.

With that correction shot, is it safe to say that it's MGF's view that even with the Amending Agree -- Amending Agreement Number 7, BBE or Manitoba Hydro is continuing to miss the revised productivities for concreting and earthworks?

MR. CAMPBELL ADAMS: Yes. Those have been missed, both in 2016 and 2017.

MR. CHRISTIAN MONNIN: And, Kristen, if you can please go to page 63 and 64 of the MGF report. If you scroll down. Under the order of magnitude estimate, we have the range of 9.5 billion to 10.5 billion. And on the next page over, please, MGF's view was that it's difficult to advise where the final cost will land in this range and it gives two (2) points of -- of advice. First, that if Manitoba Hydro addresses the current issues, taking control of the project and its contractors, the final cost will be at the lower end of the range. And that -- that would be the 9.5 billion that we see on the previous page.

Is that...

MR. CAMPBELL ADAMS: Yes.

MR. CHRISTIAN MONNIN: And then, number 2, keeping the status quo and leaving control with the contractor result in the final cost at the upper of the range. And that would be the 10.5 million (sic)?

MR. CAMPBELL ADAMS: Yes.

MR. CHRISTIAN MONNIN: So looking at number 1, and -- and staying with the -- the golf vernacular, would you agree with me that BBE would need to be a scratch golfer in order to ensure that they -- they're at the 9.5 -- the lower range? Meaning they'd have to be -- they'd -- they'd have to correct every single outstanding issue that you have identified in your report in order to be at the lower end of the range.

Is that fair to say?

MR. CAMPBELL ADAMS: Our -- our view is they've got to get control of their productivities. They've got to be able to provide productivities and achieve them. That has not happened between the --

their tender and 2016. They get a chance to restate them in the Amending Agreement, and those are still not being met.

MR. CHRISTIAN MONNIN: And they would have to take control of all of the productivities?

MR. CAMPBELL ADAMS: Yes.

MR. CHRISTIAN MONNIN: Thank you very much, Mr. -- Mr. Adams. Mr. Campbell, a few questions for you with regards to the Klohn Crippen Berger report. At page 35, My Friend Dr. Williams took you through two (2) outliers regarding -- or concerns that were raised with respect to the contract, the first being the actual costs and the other one (1).

If you go one (1) page up, page 34, apologize, Kristen. And the other one (1) being referred to in the second -- or the last paragraph, another interesting clause. I think the answer is on the second page -- on the next page over. I just want to make sure that when Manitoba Hydro had this second shot or second bite at the apple with the Amending Agreement Number 7, they didn't correct the language or those clauses.

Is that fair -- fair to say?

MR. DAN CAMPBELL: I believe that to be correct.

MR. CHRISTIAN MONNIN: Thank you. No further questions. Thank you, Mr. Chair.

THE CHAIRPERSON: Thank you, Mr. Monnin. M. Hacault...?

CROSS-EXAMINATION BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Yes, my name is that Mr. Hacault. I represent industrial users in this province. And my question is a follow-up to -- or my series of questions is a follow-up to those asked by Counsel Monnin, and also relates to MGF-4-1, which is the last exhibit with the numbers on it.

In this process we have been looking at estimates and probabilities. And you had one (1) question from the Chair on that issue. I'd like to explore it. I really don't care who answers this.

Are there any stages or critical points in the schedule or the works at which we should be looking to have a better idea of where we're going to land in final costs of Keeyask?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: I think you've asked a really good and important question. Given what we've reviewed again here today, the -- the first activity, in -- in our professional opinion, is to work with BBE to understand what productivities they can realistically achieve. And whatever advice they give, test those productivities, that they -- they makes sense, that they look achievable that they're -- they're thoughtful, they're thought through, they're considered, they're backed up, hopefully with some kind of historic data to underpin those assumptions.

Once you get to a point that you believe you've tested and challenged and you've got now the real productivity they can do for the -- the structures and concrete ahead, then we would suggest that the schedule is -- is recast with those realistic achievable productivities.

In concert with that, you should look at the associated estimate of costs that go with that, the directs, the indirect. There is the -- the issue of other contracts that will interface with the progress of the BBE contract, like Voith, for example, and figure out where is that going to play. And if it's a different date, are we facing further delay and disruption impacts.

Until we get to what I would call that steady state, I -- I couldn't sit here and predict a point in time when you will know better. I think that Hydro needs to see that BBE is going to deliver as they have promised. They haven't. They -- they were let down in 2016. They've been let down in 2017. But until we correct the productivity issue for concreting and earthworks, it's difficult for us to sit here and -- and give you a date in the future, a milestone in the future by which you'll have a better handle.

I -- I think one (1) -- one (1) more point to add is, given -- given the history with this contractor, that once we've got a better schedule and cost that that is just rigorously enforced, making sure that it happens. If it doesn't happen on one (1) day, step in and figure out why did the plan not work. Where did it go wrong? What can we learn? How does it impacts subsequent activities? That's my answer.

MR. ANTOINE HACAULT: Mr. Campbell, do you have anything further to add on that issue?

MR. DAN CAMPBELL: The classic issues related to construction of a hydro project in terms of impacts on cost often have to do with the excavation piece. And if all of the excavation has not yet been completed, so the contractor knows or can -- someone can predict and measure how much additional volume or how much -- if there are changes, or what the actual volume of material that has to be placed.

If that work has not been done when that point is reached, that's a -- certainly a point where the future is hopefully easier to predict. So that's one (1) point that I think should be considered. I agree with what Campbell said, but I -- and MGF said, but I think that's -- I think in answering your question a little more specifically, that's one (1) point.

The other one (1) would be when you look at where the handover points are to Voith and to the spillway contractor, who I don't believe is on the critical path, but could eventually become there. The -- and how they perform, those are -- those are points where I think you -- you want to look very carefully because those contractors may well be looking for other opportunities to ask for additional funding at some point in the future. And it all counts, whether it's the civil contractor's money, or whether it's Voith asking for more money, or whoever. It's all money.

And the coordination, in particular, inside the powerhouse going forward when the ser -- when -- when Voith finally comes on to site, and how they have to interface with the civil construction, which are particularly the concrete placement which won't be complete, how they share the powerhouse crane is a excellent example, is an area where care needs to be taken. And certainly I would anticipate that Manitoba Hydro, based on their experience in the past, is going to be intimately involved in the -- in the coordination of the powerhouse crane sharing.

I think that those are a couple of areas where I think maybe you would want to get back and get a review or get a confirmation that things are still on track.

Does that help?

MR. ANTOINE HACAULT: Yes, it does. Now, so I may be oversimplifying this, but if after Hydro sits down with its general contractor and believes it's come to get a reasonable handle on what's going to happen with respect to productivity and redoes a schedule according to that, there might be natural points at which all parties, including this Board, might want to revisit estimates to see whether we're on track for an eight-point-seven (8.7) number, a nine-point-five (9.5) number, or a ten-point-five (10.5) number.

Is that fair?

MR. CAMPBELL ADAMS: Yes, that's fair.

MR. ANTOINE HACAULT: And then we talk about handover points, you know the works inside and out, gentlemen sitting in front of me, is that the completion of the concrete works that allows coordination of the powerhouse work? Could you provide a little bit more explanation on those handover points, what you meant by that?

MR. DAN CAMPBELL: When you build a hydroelectric unit there's a bunch of concrete that's poured in the excavation, I should say, and then there's the foundation that's poured and there's some concrete built to a certain point. And then at that point in time, the equipment supplier comes in and he has to install the turbine. And often significant portions of that are embedded in concrete. So he has to put it in and position it, and then the civil contractor has to come in and put concrete around it.

And they work their way up basically from the basement up to the operating floor, a bit in lockstep with the mechanical contractor doing work, the civil contractor coming back to do a little bit, the mechanical contractor doing some more, eventually the electrical contractor putting in the generator pieces. And eventually the unit is complete to a point where you can walk around on the floors and it's all -- it's all built.

That coordination is something that while that is happening on a particular unit, the contractor is also attempting to pour concrete around, for example, the basement or the -- the walls even of the other units further down in the powerhouse. So he's wanting to be able to work overtop of or past, beyond where, for example, the mechanical contractor is working.

There's issues with the powerhouse crane. Often there's more than one (1) powerhouse crane. I suspect there is in this particular project. There's temporary cranes sometimes used, concrete pumps, all kinds of equipment. At some point in time down the road you then get into actual electrical commissioning of the first unit while you may well still be building the last unit.

Care has to be taken that -- that you can do that without interference. And the coordination of that, and there's a -- there's -- that is, in our experience, in a contract where -- in a contracting situation where you have multiple contractors responsible to the owner, it's the owner's responsibility to take some significant hands-on management of all of those contracts during that construction phase when they're all working in the same place.

Where there's a specific point in time, I think it would be prudent to suggest that at the point in time when it looks like they've got a fixed point in time where the -- Voith can start the installation of the first unit, you would want to be able to understand whether or not you're -- you have a high likelihood of continuing on successfully.

Thereafter, then it becomes a coordination issue and -- and the owner will know just as much, if not more, than either of the contractor because he's actually balancing the wishes of both of them, because they will both at certain times be asking for the same space and place. And nei -- you -- they can't be in the same place in space at the same time. So sometimes you -- you tell Voith, No, you can't do it today. But they -- do they have float in their schedule? They should have, because they've done this before.

Ditto if the -- the civil contractor wants to pour concrete and do a major pour. You may tell him, Sorry, you can't do it during day shift. You have to do it during night shift because Voith is on day shift on the cranes and you can't have the crane. So that's when the intensity ramps up in terms of the coordination. Everything outside the powerhouse, with the exception of the spillway, I believe is something that the civil contractor has fundamentally control of.

Does that help?

MR. ANTOINE HACAULT: Yes, it does. So in a general way if parties here were going to review the progress of where we are at between an 8.5 billion number and a 10.5 billion number, would it make sense to come back annually, if that was somebody's wish? Say, for example, later in the fall of 2018 and later in the fall of 2019 to keep track of this project and -- and what's happening.

(BRIEF PAUSE)

MR. DAN CAMPBELL: My opinion on that one (1), and MGF may have a different opinion, is that it's not an annual review. It's a point review. And so you need to look at the schedule of what's being planned. Then you have to look at what they actually achieve, and you have to pick some points in the future. And so that's when we want to do it.

When -- when they get to this point,

for example, and Voith is being -- going to come on site, prior to that you want to make sure that they can come on-site on schedule. Then after they've done some significant portion of unit 1, to the point where the civil contractor is fundamentally not involved, you want to look at the timing of that and see whether or not you can extrapolate what might happen when you get the unit 7 in terms of schedule. So it's not a let's do it every -- every March. Its let's do it at certain specific points in time, in my opinion.

MR. ANTOINE HACAULT: And right now is there a best estimate of a range of months, say four (4) to six (6) months, as to when that point in time might be?

(BRIEF PAUSE)

MR. DAN CAMPBELL: I don't think Klohn Crippen knows the schedule well enough to be able to answer that specific question. That would be something that we would have to go away and study. And certainly I think I would ask -- suggest that you might want to ask Manitoba Hydro that question as well.

MR. ANTOINE HACAULT: Thank you,

members of the panel. And, Mr. Chair, those are all of my questions.

THE CHAIRPERSON: Thank you, M. Hacault. We will break for lunch until 1:30. Thank you.

--- Upon recessing at 12:26 p.m.

--- Upon resuming at 1:32 p.m.

THE CHAIRPERSON: Good afternoon. Ms. Ramage, I understand you wanted to put something on the record? Are you doing it in a Newfoundland accent?

MS. PATTI RAMAGE: I wish. My husband can do a great one, I can't. Yes, Mr. Chair, earlier in the proceedings with respect to rebuttal and the one transcript reference I don't have on me is -- is where you said this, but you had -- when you ruled that Manitoba Hydro could deal with certain issues on rebuttal you indic -- an issue that if there was any additional we should come back to you.

And we have one (1) additional issue that we wish to bring to your attention that we would intend to address in rebuttal and that is a -- an item that came in MPA's presentation at page 33 of their presentation where MPA introduced new information for the first time on the record, which was a Moody's report titled US Public Power Utilities With Generation Ownership. That's what its title is and they indicated it's available at Moodys.com.

That document, nod its contents, were on -- referenced in MPA's prefiled evidence and the first we saw of it was in the January 15th slidedeck. And as a -- it's -- it's not a public document. In fact, it's a pay to review document. Mr. Colaiacovo spoke to the Moody's report at transcript page 4919 and the comments he made, in short, Manitoba Hydro disagreed. Mr. Ghikas attempted to deal with them in cross but was unsuccessful.

And we have a disagreement in opinion or -- or what Moody's -- I -- I don't want to jump ahead of myself. There was a term. Mr. Colaiacovo gave his definition. Manitoba Hydro staff believe it is incorrect, and they wish to put on the record their view of what it means and what that means to Manitoba Hydro. So, we are requesting that -- that we be allowed to refer to that in rebuttal.

I am advised by Mr. McCallum, who was working out a couple of slides in order to address these things, that he expects the entire rebuttal to take roughly fifteen (15) minutes.

THE CHAIRPERSON: Thank you.

MS. PATTI RAMAGE: So the -- and the -- the notion is that we -- we would just have Mr. McCallum address it by slide to -- similar to a direct in short, and then keep it short. So we -- we wanted to give you notice of that. I have already spoken to counsel for MIPUG and the Coalition, as well as Mr. Peters. They have not had an opportunity, I don't think, to look at the transcript references and provide their comments.

And before I turn the -- turn the mic over, the one other thing I should bring to the Board's attention is Board counsel following MIPUG's evidence requested Manitoba Hydro do some additional IFF runs. Manitoba Hydro is undertaking those runs. One (1) of the issues we'll have to address is in Board counsels' request, they indicated that this may actually be CSI. We have to look at that for that, but I can advise that Manitoba Hydro is looking at those runs and working on them. And I have to say much to my chagrin because I'm telling these people they need to help me with final argument but, in any event, wanted to bring that to your attention also.

THE CHAIRPERSON: And Ms. Ramage, I

understand that at least from Board counsel that we're looking at Thursday morning for the rebuttal rather than Friday morning?

MS. PATTI RAMAGE: Yes, that's what we're work -- working to.

THE CHAIRPERSON: Thank you very much. And by --

MS. PATTI RAMAGE: And we're expecting the presentation will be distributed then Wednesday evening is the goal for us.

THE CHAIRPERSON: Thank you. Just for the record when I made the comment to Ms. Ramage, it's because we both saw the play Come from Away, which if any of you have a chance of seeing is spectacular so.

MS. PATTI RAMAGE: It may be the one thing everyone in the room could agree on.

THE CHAIRPERSON: That's true, thank you very much. Ms. Van Iderstine...?

CROSS-EXAMINATION BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: Thank you. So I'm going to address a couple comments, first of all, to Mr. Phillips and Mr. Potter and Mr. Brand and that is, I have no questions for you so you're off the hook at least for a couple of hours from my perspective.

And then if I can address the questions to both Mr. --

MR. WILLIAM HAIGHT: Perhaps, Ms. Van Iderstine, sorry to interrupt, if we could just have Mr. Brand, Phillips and Potter acknowledge that they received that. Are they on the line?

MR. JIM POTTER: So, we're having a very hard time hearing you.

MR. WILLIAM HAIGHT: Try it again.

MS. HELGA VAN IDERSTINE: Do you want me to start --

MR. LESLIE BRAND: Yes, I'm on the line and likewise having trouble hearing.

MS. HELGA VAN IDERSTINE: Well, from -- this is Ms. Helga Van Iderstine. I'm couns -- external counsel for Manitoba Hydro, and I was just going to address you by saying that I don't have any questions for you.

MR. WILLIAM HAIGHT: And -- and what I will say to all of those individuals is that even though Ms. Van Iderstine doesn't have direct questions for you, there may be areas that you can assist the MGF and KCB personnel with and so, I would invite you to -- to stay on the line.

MR. DWAYNE PHILLIPS: Understand, we'll stay on the line.

(BRIEF PAUSE)

MR. WILLIAM HAIGHT: You -- you heard from Mr. Brand, Mr. Potter and Mr. Phillips.

MR. KURT SIMONSEN: And could I ask Mr. Brand, Mr. Potter and Mr. Phillips to make sure their telephones are -- are on mute.

MR. LESLIE BRAND: Yes, will do.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: Okay. And Mr. Campbell, I know that you will be answering for KCB and am I right, Mr. Adams, that your pri -- I should primarily direct my questions to you and if somebody else wants to chime in they can do so at that point?

MR. CAMPBELL ADAMS: Absolutely.

MS. HELGA VAN IDERSTINE: Okay. So this is to both Mr. Adams and Mr. Campbell, did you have an opportunity prior to preparing your reports to review the Needs For and Alternatives To report from the Manitoba Public Utilities Board relating to the

Keeyask project?

MR. DAN CAMPBELL: No, KCB did not review it.

MR. CAMPBELL ADAMS: We had received it but I'm not -- I can't speak to the extent to which it was fully reviewed.

MS. HELGA VAN IDERSTINE: Okay.

MR. CAMPBELL ADAMS: I know I certainly personally did not.

MS. HELGA VAN IDERSTINE: Were you -- and so again, Mr. Campbell or Mr. -- Mr. Adams, were you aware that the contract model was discussed at that proceeding, the NFAT proceeding, and reviewed by the independent assessor Knighte Piesold?

First of all, Mr. Campbell.

MR. DAN CAMPBELL: In reviewing the documentation that was provided, it became clear to us that the contracting model had been discussed with Knighte Piesold and others.

MS. HELGA VAN IDERSTINE: And just to clarify that would be after you received the probably the IR responses or the rebuttal from Manitoba Hydro?

MR. DAN CAMPBELL: Not, it was actually prior to that.

MS. HELGA VAN IDERSTINE: Mr.

Adams...?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: So you had -- you were aware of that that Knighte Piesold had reviewed it, the contracting model?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And again, that was after you had -- was that before or after you'd prepared your report?

MR. CAMPBELL ADAMS: It would've been before, I believe.

MS. HELGA VAN IDERSTINE: So Mr. Campbell, I have a few questions about the KCB report and your comments about the contracting model.

And first of all, on page 39 which is 217 of the KCB report and that's MG -- sorry, that is MGF-217. It's page 39 so I guess I went a little too far.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: Sorry, I'm confusing you, I'm sorry, Kristen, that was 39 of the KCB report, but you know what, we'll just leave that for a second, because the question really was, and I think Mr. Campbell probably knows the area.

In that report you had stated that in your opinion:

"The most significant issue for the project was the almost 100 percent decoupling of work performance from payment by paying actual costs instead of quantities times unit prices for actual work done."

Do you recall that?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And what you would be describing there is a cost reimbursable contract?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And I just want to make sure we're all on the same page so if you'll bear with me.

A target price contract would be established by multiplying the quantities in the contract to the unit prices bid by the contractor to reach a target price?

MR. DAN CAMPBELL: That would be the definition of target price, yes.

MS. HELGA VAN IDERSTINE: And if you

were paying quantities multiplied by the unit price for actual work completed, that would more closely relate to a unit price contract?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And did you review the KPMG report attached to Manitoba Hydro's rebuttal evidence, and that's at Manitoba Hydro Exhibit 117 and page 64, bottom of the page. It's the second page of the appendix. Go down to the bottom of the page.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: And did you review where it states... My apologies. Where they say:

"The gain share/pain share formula was structured as follows: The gain share formula for cost savings was 80 percent for Manitoba Hydro and 20 percent for BBE. If BBE delivered a project under the adjusted target price, as defined in the contract, the profit increased from a percentage to another percentage of the additional savings. The pain share formula, however, was more punitive to the contractor if the cost went over the adjusted target price BBE was responsible for 80 percent of the cost overruns and their percentage of profit would erode to zero profit based on the amount of cost overrun. Additionally, once the actual costs exceeded the target price by 1.3 times, BBE would no longer receive their percentage GA&O and the objective of this cap on GA&O was to ensure that the contractor would not benefit from escalating project costs and remove the incentive for the contractor to increase project cost to improve their overall position."

I'm sorry if I didn't have the site there correctly for you. Do you want me to find that site properly for you so you can review that?

Okay, so, -- it's at the top of the page, up on page 2. There we go. And where the bullets are.

MR. DAN CAMPBELL: What is the question?

MS. HELGA VAN IDERSTINE: So did you have a chance to review that?

MR. DAN CAMPBELL: Briefly.

MS. HELGA VAN IDERSTINE: And if you -- now that you've reviewed it, can we agree that the original price -- original contract that Manitoba Hydro signed with BBE was not a pure cost reimbursable contract but more accurately described a cost reimbursable contract with a target price?

(BRIEF PAUSE)

MR. DAN CAMPBELL: I don't think I would describe it that way.

MS. HELGA VAN IDERSTINE: Okay. And so you are aware, though, that the GA&O was capped?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And that would take -- that would provide some incentive then to the contractor to ensure that their -- they came in within the target?

MR. DAN CAMPBELL: It should.

MS. HELGA VAN IDERSTINE: And so in that sense, it's not a pure cost reimbursable contract?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: Meaning that the contractor is sharing some of the risk?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: Now before I go any further, GA&O means general administration and overhead; is that right?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And that would typically support the -- meaning it supports the project from the contractor's home offices, including but not limited to expenses such as human resource, management, corporate procurement, IT, that sort of thing?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And Mr. Campbell, I see from your CV and for the comments you've made this morning that you've been involved in several hydroelectric projects?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And in a variety of capacities?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: As a consultant to the owner?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: Project manager?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: You've done design?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And it would be fair to say that every one of those projects is different?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: They have different risks?

MR. DAN CAMPBELL: There's different roles for the engineer.

MS. HELGA VAN IDERSTINE: Yeah, different roles for the engineers but the project as a total would have different risks depending on the circumstances of the project, where it was located, that sort of thing?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: There'd be

different design challenges, again, depending on where it's located?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And so, although there are similarities obviously between a hydroelectric project in one place and another hydroelectric project, there's also a lot of differences?

MR. DAN CAMPBELL: All hydro -- all significant hydroelectric projects are fundamentally custom objects.

MS. HELGA VAN IDERSTINE: And we look at Keeyask, the complexity of that would be associated, that would be things like location.

You agree with that?

MR. DAN CAMPBELL: It's certainly a significant factor, yes.

MS. HELGA VAN IDERSTINE: Some of the geotechnical issues associated with it?

MR. DAN CAMPBELL: I think there's, as I said, in -- in our report and in my comments this morning, I think there was enough investigation that from the perspective of the complexity of the project it's not as complex and it's reasonably well-known.

MS. HELGA VAN IDERSTINE: You say not

as complex as some; more complex than others?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: It's subject to extreme weather conditions given its location?

MR. DAN CAMPBELL: Certainly.

MS. HELGA VAN IDERSTINE: And Mr. Campbell, in your report one (1) of the things you speculated on was the --

"The potential reason for the cost reimbursable contract being selected may have been to push the construction project quickly."

Do you recall having said that?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And I understand that from the Manitoba Hydro staff that you didn't have any discussions with them about that?

MR. DAN CAMPBELL: That's why it was speculation.

MS. HELGA VAN IDERSTINE: Exactly. So I just want to talk to you a little bit about some of -- and put to you some of the evidence about why that contract was selected and see what your thoughts are.

So, first of all, when selecting a contract delivery strategy, would you agree that one

(1) of the considerations is the market conditions that might influence the availability of major con -- contractors willing to bed on a project?

MR. DAN CAMPBELL: No argument.

MS. HELGA VAN IDERSTINE: And so the example that came to us was in Vancouver recently or Toronto where the housing prices have been so hot, a buyer was really subject to the whims of the seller. If the seller wanted to sell it to them they could buy it, but the prices were going up and the seller had the choice of who they wanted to -- to sell to.

Would that be a good analogy to a hot construction market where the experienced contractors have a choice of who they might decide to bid on and what projects they would bid on.

MR. DAN CAMPBELL: All contractors have a choice on whether they want to bid or not.

MS. HELGA VAN IDERSTINE: Okay. Well, let me take you back a bit. Do you recall the period of time just before mid-2014 when oil prices were escalating quite quickly?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And there were a number of projects across North America that were on the way -- under way, particularly, in the oil industry that were attracting a lot of labour, general contractors to them?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And in that kind of market, would you agree that senior project managers and general contractors would've had their pick of what projects they might want to bid on?

MR. DAN CAMPBELL: Yes, they -- they always have the choice of what project to bid -- to bid on and certainly, there were more projects perhaps at the time.

MS. HELGA VAN IDERSTINE: And therefore, owners would have less negotiating room with respect to choosing contractors and the terms that contractors might be prepared to take on?

MR. DAN CAMPBELL: I think that the decision about whether you proceed or not is a function of the negotiation that you make with the contractor and/or the price that is presented. And if the price was presented as being too high under a contracting model that shared the risks or put the risk on one side or the other, then the owner has -- obviously, has the right and the opportunity to reflect and perhaps redo it.

MS. HELGA VAN IDERSTINE: So one (1)

of the other things you speculated -- one (1) of the other matters that you had speculated on in terms of why Manitoba Hydro might've selected that type of contracting model was what -- if they'd had experience with it in a similar project.

Do you recall that?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And so, were you aware that Manitoba Hydro's experience with Wuskwatim, they had attempted to tender a general civil contract as a unit race contract and it only received one (1) bid and it was at two (2) times the engineer's estimate?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: You were aware of that?

MR. DAN CAMPBELL: Yes, that was in the documentation that was made available.

MS. HELGA VAN IDERSTINE: And was that before or after you had prepared your report?

MR. DAN CAMPBELL: It was during the preparation of our report.

MS. HELGA VAN IDERSTINE: So it -- was that what you were talking about then when you say that they may have had success with that model in past?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And so you were aware then that the Wuskwatim contract was a cost reimbursable target price model?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And Manitoba Hydro has given evidence that they started doing their procurement for Keeyask two (2) years prior to signing a contract with BBE.

Were you aware of that?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And that they had gone out to the market and had done an initial sounding of the market to determine if there was interest?

MR. DAN CAMPBELL: Yes, that's typical.

MS. HELGA VAN IDERSTINE: And based on that feedback, they had prequalified four (4) contractors who they thought were capable of performing the work?

And again, that would be a reasonable thing to do?

MR. DAN CAMPBELL: Yes and it's also

typical.

MS. HELGA VAN IDERSTINE: And in their market sounding they would also had some in -- opportunity to determine what type of contracts were likely to be acceptable to bidders in that market?

MR. DAN CAMPBELL: It's a question that's often asked and sometimes viewed with a bit of suspicion on occasion by the owner relative to what the contractor says.

But yes, it's -- the question would have likely been asked.

MS. HELGA VAN IDERSTINE: So in those circumstances, it would not appear that there was any rush to construction, given that they had taken two (2) years to do the -- their diligence in terms of getting the contractors bids together?

MR. DAN CAMPBELL: I don't know the -- the schedule that they were looking at in terms of ultimately delivering power to wherever they had to do it in terms of other commitments. So, whether or not they were in a rush or not, given the long duration that it takes to design, build and construct and commission a hydroelectric project, I can't comment on that.

MS. HELGA VAN IDERSTINE: You are

somewhat familiar, though, I understand with the Site C project?

MR. DAN CAMPBELL: Somewhat.

MS. HELGA VAN IDERSTINE: And I'm not going to ask anything that you consider confidential and I'm -- I'm -- hopefully I've -- my questions will be such that you'll still feel comfortable answering them without being put in a difficult spot, so. If you think so, please, let me know and I'll see if I can answer -- ask them in a different way. And for any of you, quite frankly. I'm not asking anything that's CSI. If you think I'm going there, then please stop me.

So, Mr. Campbell, I just wanted to ask you a couple questions about the Site C project and we have a book of documents that you should have. I think your counsel may have or put it forward to you.

And one (1) of the things that I just wanted to comment on too is that the documents we've put in here were ones that were -- we got off the internet. So -- or from -- either from Manitoba's -- or BC Hydro's website or from the BC Utilities Commission's website. So, they are public documents.

And when I'm saying that, I'm referring to the first two (2) items. So first of all, the Site

C hydroelectric project is a project of the BC -- BC Hydro; is that right?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And it's located in northern BC near Fort St. John?

MR. DAN CAMPBELL: Correct.

MS. HELGA VAN IDERSTINE: Which is, again, is a remote town, but fairly sizable?

MR. DAN CAMPBELL: Depends on your definition of "sizable" but...

MS. HELGA VAN IDERSTINE: Bigger than Keeyask?

MR. DAN CAMPBELL: Yes, certainly.

MS. HELGA VAN IDERSTINE: And when it's completed, it will provide about 1100 megawatts of energy?

MR. DAN CAMPBELL: Correct.

MS. HELGA VAN IDERSTINE: And if you'll look at the first item in the book of documents that -- which is at page 3 and it starts -- actually it's starting on page 2 is where I'd like to start.

This is the Site C main civil works contract, as I understand it, and -- and I also understand that this is just a tiny little portion of what it would be but this is what's on the website.

So, if you look at the date of it you'll see that it's dated -- the contract was dated December 8th, 2015; is that correct?

MR. DAN CAMPBELL: Yes.

THE CHAIRPERSON: Sorry, I believe it's December 18th.

MS. HELGA VAN IDERSTINE: Well, thank you for that correction, sir.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: The December 18th, 2015, so about eighteen (18) months or so or actually twenty (20) months -- or one month after that Manitoba Hydro project was signed with BBE?

MR. DAN CAMPBELL: If your math is correct, yes.

MS. HELGA VAN IDERSTINE: And that's a dangerous thing, I will warn you. The -- the -- so again, looking back to the market in that period of time, you'll recall that sometime in mid 2014, the market, the oil prices dropped and a lot of the big oil projects that had been planned dropped out of the marketplace.

Do you recall that?

MR. DAN CAMPBELL: Unfortunately, yes.

It affected the engineers as well.

MS. HELGA VAN IDERSTINE: I guess. That's why I thought you might actually remember it.

So -- so a different market than that this contract was ca -- signed in?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And if you look at page 5 of that contract, page 7 of the book of documents, you'll see under Contract Price and then entire compensation and if you look at that, would you agree that that's a unit price contract?

(BRIEF PAUSE)

MR. DAN CAMPBELL: Yes, fundamentally.

MS. HELGA VAN IDERSTINE: There's always nuances.

MR. DAN CAMPBELL: Exactly.

MS. HELGA VAN IDERSTINE: And so if we look over then -- so then, as you would also be aware, and I'm -- I'm -- you can confirm, you didn't give evidence before the BC Utilities Commission when the Site C project was being reviewed last summer, did you?

MR. DAN CAMPBELL: No.

MS. HELGA VAN IDERSTINE: Okay. But you were aware that it was going on.

MR. DAN CAMPBELL: Obviously, yes.

MS. HELGA VAN IDERSTINE: So if you look over to page 15 of the documentation in our book of authorities and what this is is an excerpt from the BCUC's decision and on this section there -- on page 15, they are just -- their reviewing the comments made by Deloitte in a report they provided to PU -- the BCUC.

And if you look down at the bottom of the page, you'll note that it says:

> "Deloitte noted that PRHP plans to submit a claim to BC Hydro for the delay caused by the first tension crack on left bank. Also Deloitte reported that discussions were underway between BC Hydro and the -- and PRHP regarding how the delays caused by the second left bank to crack in May 2017 could be mitigated, and that PRHP had suggested that more claims are to come."

And PRHP, of course, is the contractor?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And as a consequence of delays they appear to be issuing claims?

MR. DAN CAMPBELL: In the contract of the nature of that BC Hydro signed with them, the way for the contractor to get additional funding is often through claims. And there's certainly claims have been filed on the project and there's certainly dispute as to whether those claims are a function of the contractor's work, or others.

MS. HELGA VAN IDERSTINE: And, no, I wasn't trying to cast aspersions one way or the other --

MR. DAN CAMPBELL: No, I'm just commenting.

MS. HELGA VAN IDERSTINE: -- and that's -- but I -- I agree. That's one of the troubling problems that results when as soon as the contractor's profit is at risk; is that correct?

MR. DAN CAMPBELL: I don't think the contractor's profit necessarily has to be at risk. He's just looking for -- he may just be looking for additional profit.

MS. HELGA VAN IDERSTINE: And if we

look over to -- and again, in the summer when BCUC was reviewing the Site C budget, it was initially presented as being at 8.3 billion, and was being described at that time as a P50 and if you look over at page -- the top of page 16, you can see where that's being described by Deloitte.

Do you see that?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And they go on to state that BC Hydro was using up a large part -- portion of their contingency, in fact, on page 12 -- going back one page, sorry for jumping around a bit, but going back one page. They describe it as having used up 45 percent of their contingency when they were only two (2) years into the project.

MR. DAN CAMPBELL: Do you mean total project contingency or just contingency for this contract because this particular contract is only for the earthworks piece, it's not for the concrete work or for the equipment supply?

MS. HELGA VAN IDERSTINE: Okay, so I'm -- what I'm referring to is actually the third bullet -- third paragraph from the bottom on page 15 of the book of documents.

"Deloitte further noted that

"contingency at 356 million committed to date represents 45 percent of the budgeted cost contingency of 794 million, a percent significantly higher than the 22 percent of the total budget spent to date."

So again, the co -- the contingency appeared to be used -- being used up faster than the project was progressing?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And then if I can take you to page 18, which is in the BCUC's findings section and it's just above the line where they say "other implications of continuing Site C."

"BC Hydro comes to the conclusion [and then they say] however, given the nature of this type of project and what has incurred to date total cost of the project may be in excess of 10 billion and there are significant risks that could lead to further budget overruns."

Now the reason -- and you'll be aware, of course, that the initial budget that they were represent -- that BC Hydro was presenting was 8.3

billion, is that what -- correct?

MR. DAN CAMPBELL: Again, if your math is correct. Sure.

MS. HELGA VAN IDERSTINE: So and as I understand it, Site C is behind in its estimated completion dates?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: And am I right when I say that they're about two (2) years into a nine (9) year project?

MR. DAN CAMPBELL: That's I believe approximately correct.

MS. HELGA VAN IDERSTINE: Okay and now I'd like to look -- ask you a few questions about Muskrat Falls.

Were you involved at all in Muskrat Falls?

MR. DAN CAMPBELL: No.

MS. HELGA VAN IDERSTINE: So you and I and may be subject then to what we read in the news and so I put forward on -- on tabs -- or pages 19 an article which appeared in the -- in Global News on June 23rd, 2017. And I'm going to ask you -- take you to something on that in a minute, but first of all, you are familiar with Muskrat Falls just generally because of your knowledge of the hydroelectric projects in Canada.

MR. DAN CAMPBELL: Yes, I'm aware of that particular project, and that it's overbudget if that's where you're going.

MS. HELGA VAN IDERSTINE: Well, I am going there but I was going to say -- start off by saying, again, like Keeyask, it's a remote project?

MR. DAN CAMPBELL: Yes.

MS. HELGA VAN IDERSTINE: But unlike Keeyask there's a large town -- a larger town nearby being Goose Bay?

MR. DAN CAMPBELL: Having been to Goose Bay I wouldn't describe it as large, but okay.

MS. HELGA VAN IDERSTINE: I think I said "larger." And do -- do you happen to know what the contract model on that was?

MR. DAN CAMPBELL: No.

MS. HELGA VAN IDERSTINE: And I don't think Global reported on that either. So, we'll have to leave it at that.

And you've ment -- commented that they're overbudget and this budget suggests that the budget from 5 billion to 12 billion.

Does that sort of meet with what you

understand the magnitude of the overruns to be?

MR. DAN CAMPBELL: My understanding is the magnitude of the overruns on Muskrat are significantly more than on Keeyask or what is anticipated for Site C.

MS. HELGA VAN IDERSTINE: And so -- and one (1) of the current issues and a major dispute right now for Muskrat Falls -- and again, the reason I put this article in was because if you look over at page... Sorry, if you look over to page 26 which is actually the CBC report, there is the headline that the -- about the dispute with their contractor and they say:

> "Both sides are at odds with a stall demanding hundreds of millions in additional payments from Nalcor."

And again, challenges with the con -- managing the contractor in this site -- at site -- at Muskrat Falls? That's what appears to be the problem or a problem? I shouldn't say --

MR. DAN CAMPBELL: I don't know what the problems are because I haven't looked at it.

MS. HELGA VAN IDERSTINE: We'll leave that then. But I think it -- would it be fair to say that contracting strategy alone doesn't define the success or even a guarantee that a project will be on time?

MR. DAN CAMPBELL: Yes, I would say that's true. It helps to have a contractor who is responsive to the contracting strategy he's working with.

MS. HELGA VAN IDERSTINE: And fair to say that in huge hydroelectric generating projects that regardless of the type of project -- contractor project, that once the contractor seeing its profit eroded, we see those types of claims starting to -- to come forward?

MR. DAN CAMPBELL: As I said earlier, all contractors are looking for opportunity to make additional funding and it's been my experience whether or not it's a large contract or a small contract, whether it's domestic or international, the -- the contractor is looking for reasons to claim often, not always, but often.

MS. HELGA VAN IDERSTINE: So I'd like to -- to turn to the -- another topic now. And, Mr. Adams, I think I may have some questions for you.

First, can we agree that until May of 2016, when the contractor fell behind on the permanent earthworks and concrete, that Keeyask was generally on budget and schedule?

MR. CAMPBELL ADAMS: I believe it was for the first couple of years, yes.

MS. HELGA VAN IDERSTINE: And that when it became apparent that there were problems sometime in the summer of 2016, meaning that when those events occurred that the contractor fell behind and in putting in the concrete, that Manitoba Hydro then acted upon it.

And I'm going to ask you some questions about -- about that and specifics about what they did but, is it fair to say that they -- they did act upon it?

MR. CAMPBELL ADAMS: Yes, my understanding is that the -- the volume of concrete, I think it was, that was placed in quarter two of 2016 was so small that you didn't need really to look at the schedule to understand there was an issue.

And I believe a recovery plan was requested by Hydro, which was appropriate in accordance with the contract as I understand.

MS. HELGA VAN IDERSTINE: Right. And so some of the things they took over this -- summer, falls -- they took it in a stepwise fashion to get things moving and some of the things they did, as I understand it, was -- and -- they met with the GCC -- or GCC to -- to discuss it which would be appropriate.

MR. CAMPBELL ADAMS: Yeah.

MS. HELGA VAN IDERSTINE: They determined what -- they started working to determine what the root causes of the problem were that the contractor was experiencing and that would be appropriate?

MR. CAMPBELL ADAMS: That would be appropriate.

MS. HELGA VAN IDERSTINE: And I think you would -- you said earlier that you'd need to identify those roots -- causes before you could successfully plan how to remediate?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And Manitoba Hydro and the GC then developed a plan for continuing concrete through the winter months?

MR. CAMPBELL ADAMS: I believe so.

MS. HELGA VAN IDERSTINE: And they initiated activities to reforecast the cost and the schedule for the project?

MR. CAMPBELL ADAMS: As part of the negotiation do you mean?

MS. HELGA VAN IDERSTINE: Both part of

the negot -- prior to the negotiations of the amending contract, they started doing those discussions?

MR. CAMPBELL ADAMS: I don't know about that.

MS. HELGA VAN IDERSTINE: But that would be something appropriate to do?

MR. CAMPBELL ADAMS: If you've got an underperforming contractor, yes, you've got to be engaged.

MS. HELGA VAN IDERSTINE: Yeah and that's what you were saying. You've got to be engaged with them?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And they started looking at the contractor's claims as well as -- another thing just to do as you are moving forward?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And they supplemented and -- and I think you under -- saw and from the evidence that they supplemented the expertise of the Manitoba Hydro team by retaining KPMG?

MR. CAMPBELL ADAMS: I believe so. I don't know -- I don't know the expertise that was provided.

MS. HELGA VAN IDERSTINE: They sought legal advice from a large law firm BLG, did you know that?

MR. CAMPBELL ADAMS: Yes, I read that.

MS. HELGA VAN IDERSTINE: Again, that would be a reasonable thing to do?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And they sought advice from an estimating -- from validation estimating?

MR. CAMPBELL ADAMS: I believe they did, yes.

MS. HELGA VAN IDERSTINE: Perhaps to assist with their budgeting process and how this might impact their costs going forward?

MR. CAMPBELL ADAMS: At a high level, yes. The actual work they did, I don't know.

MS. HELGA VAN IDERSTINE: Okay. They retain --

MR. CAMPBELL ADAMS: So, just -- my point is, I don't know the degree to which work was undertaken to get done to the root causes that caused the issues in 2016.

MS. HELGA VAN IDERSTINE: Fair enough. They retained a claims company called Revay.

Are you familiar with them?

MR. CAMPBELL ADAMS: I have heard of Revay, yes.

MS. HELGA VAN IDERSTINE: And, of course, we know that there was a review conducted by the Boston Consulting Group around the same time?

MR. CAMPBELL ADAMS: Yes, I've heard of that.

MS. HELGA VAN IDERSTINE: Then I had a cold eyes review done to give them some advice, generally?

MR. CAMPBELL ADAMS: By -- by whom?

MS. HELGA VAN IDERSTINE: Does it matter?

MR. CAMPBELL ADAMS: It might be depends who it is.

MS. HELGA VAN IDERSTINE: Okay.

MR. CAMPBELL ADAMS: Like in relation to the issues, if you've got productivity issues and you pick the wrong person to give you advice it's not going to be very helpful.

MS. HELGA VAN IDERSTINE: Sorry, I'm -- you said depend on -- on the personnel --

MR. CAMPBELL ADAMS: Depends on the nature of the issue you're trying to understand who you would turn to to get that advice. Like KPMG, I didn't think did construction work.

MS. HELGA VAN IDERSTINE: Okay, what about --

MR. CAMPBELL ADAMS: That might be my ignorance.

MS. HELGA VAN IDERSTINE: -- some of -- utilizing people such as retired Manitoba Hydro employees who had construction experience that conn -- people with general contracting experience in the area; that sort of --

MR. CAMPBELL ADAMS: I think if they drew upon people who had work for contractors and planned activities like concreting, how to place formwork, how to place rebar, how to pour, that would be useful given the productivity issues experienced.

MS. HELGA VAN IDERSTINE: And they involved Hatch Engineering to provide them with some further advice and assistance?

MR. CAMPBELL ADAMS: They're -- they're an engineer --

MS. HELGA VAN IDERSTINE: And again --

MR. CAMPBELL ADAMS: I don't -- I don't know how that helps.

MS. HELGA VAN IDERSTINE: Well, it

might -- I'm going to get to that but one (1) of the areas that they might engage an engineer to do and Mr. Campbell might be able to provide us with some assistance on that, would be to help them with some design choices that would help move the project forward in a more efficient manner?

MR. CAMPBELL ADAMS: Yes, that would be a worthwhile activity.

MS. HELGA VAN IDERSTINE: Mr. -- Mr. Campbell, that would be correct? Since we've got our expert here.

MR. DAN CAMPBELL: It's always good to have an engineer on board.

MR. CAMPBELL ADAMS: I say the same for quantity surveyors.

MS. HELGA VAN IDERSTINE: And as we know, when things didn't resolve over the summer they moved to the next step and the next step was to -- looking at the contract and determining whether -- how they would proceed forward with the contract.

And in this circumstance, what they did was amended it. You're of aware?

MR. CAMPBELL ADAMS: Yes, I'm aware they considered dispensing with the contractor and looking at other options but they ended up deciding to stay with BBE.

MS. HELGA VAN IDERSTINE: And again, having that -- doing that kind of analysis and making those kind of decisions would be the appropriate review and decision-making tree that somebody would -- that you'd expect an organization to do in those kind of circumstances?

MR. CAMPBELL ADAMS: Yes. The -- the thing I haven't seen, and you referred to earlier, is the working on the root causes of what caused the poor productivity.

MS. HELGA VAN IDERSTINE: Okay.

MR. CAMPBELL ADAMS: But that, to our team, seems to be the root of the evil.

MS. HELGA VAN IDERSTINE: Okay. And in terms of amending the contract, I think you'll agree that that can only be done by mutual agreement?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: In fact, I think in response to one (1) of the Coalition questions you actually said:

> "To attempt to change this would significant change the risk allocation of the contract currently in place, and might be difficult to

achieve."

MR. CAMPBELL ADAMS: Yeah.

MS. HELGA VAN IDERSTINE: And again, if you tried to make unilateral changes to a contract as some had suggested, what would happen is you risk breaching the contract or -- and any other -- and the fallout that might come from that?

MR. CAMPBELL ADAMS: You can't amend the contract without the -- the agreement of the other party. So, I don't believe it could be imposed on the other party.

MS. HELGA VAN IDERSTINE: And so --

MR. CAMPBELL ADAMS: The other -- other comment or observation I would make the -- you mentioned about the -- the hot market. I'm not sure the market was that hot at the time this amending agreement was reconsidered, or considered.

MS. HELGA VAN IDERSTINE: Okay.

MR. CAMPBELL ADAMS: Oil was a lot less. Alberta was pretty quiet.

MS. HELGA VAN IDERSTINE: So again, using that as an example, then one (1) of the things that goes into the -- even doing something like the amending agreements or the gives and takes of things like the market conditions and what strength two negotiating parties have with respect to the -- to moving forward?

MR. CAMPBELL ADAMS: Yes, and how each party views the risks of where the -- what's happened to get them where they are today and what's it likely to be going forward. And the biggest risk to Hydro was cost.

MS. HELGA VAN IDERSTINE: Well and -- and -- or not having a complete project?

MR. CAMPBELL ADAMS: Why would you say that?

MS. HELGA VAN IDERSTINE: Well, if the contractor decides to walk away then there's a -- they've got a problem.

MR. CAMPBELL ADAMS: Well, you can get another contractor.

MS. HELGA VAN IDERSTINE: So let's talk about your recommendations for -- from your report. And if we ignore -- sorry, can we go to IR Manitoba Hydro/MGF-1 -- or round 1, question 2(j).

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: So -- and just before I ask you some questions on this one, Mr.

Adams, I just want to follow-up on the last response you had.

In order to get another contractor in place, obviously, the time would -- it would take time to re-tender that?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And during that time there'd be delay costs associated with all the indirect and directs that have of -- or all the other contracts that -- and contractors that are now not working because that's not pro -- work is not proceeding?

MR. CAMPBELL ADAMS: There is normally a provision to suspend work, but there would be cost, for sure, yes.

MS. HELGA VAN IDERSTINE: And you've got a -- the camp at Keeyask is about twenty-four hundred (2400) people and those people would not be working?

MR. CAMPBELL ADAMS: That's the -- that's a capacity if the contractor has left and those people go with him.

MS. HELGA VAN IDERSTINE: Yeah. So, those would be some of the problems you'd have if the contractor just walked away?

MR. CAMPBELL ADAMS: Those would be part of the switching costs, I agree, yes. It's not an easy decision to make but it's...

MS. HELGA VAN IDERSTINE: No, it's not and there'd be other costs of equipment sitting dormant; the -- the work that had been done, possibly deteriorating while that stoppage of work occurs?

MR. CAMPBELL ADAMS: Yes. Typically, we would have to protect the work that had been built and if there's other equipment sitting on site that has to be preserved and maintained.

MS. HELGA VAN IDERSTINE: And then after you do get a new contract, it would take time to bring onboard the new staff, get them up to speed, get the -- get the site recommissioned and then move forward?

MR. CAMPBELL ADAMS: Yes, there is -- there's a learning curve for another contractor, yes.

MS. HELGA VAN IDERSTINE: And all that would have additional costs?

MR. CAMPBELL ADAMS: There would be costs to that, yes.

MS. HELGA VAN IDERSTINE: So as -- so if we can look at this IR that I've got right here, the recommendation -- the question was: Can MGF please identify the risks to the Keeyask project that aros -- arr -- would arise by Manitoba Hydro taking on this type of role?

And the type of role that was being asked about was -- was the -- was construction manager. And your answer was:

"The recommendation is not for Manitoba Hydro to become the construction manager and replace BBE but for Manitoba Hydro to exert more control and hold BBE accountable for its performance."

Do you see that?

MR. CAMPBELL ADAMS: I do see that.

MS. HELGA VAN IDERSTINE: So I take it then with that answer, we can ignore the recommendation that you make on page 81 of your report where you had stated, all:

"As all construction decisions affect Manitoba Hydro financially, therefore, they need to move actively into the role of construction manager guiding and instructing the contractor on more efficient crew makeups, work

methods, shift lengths and
supervision."

MR. CAMPBELL ADAMS: Can I see that on the screen, please.

MS. HELGA VAN IDERSTINE: Yep, you can. It's the top of the page.

MR. CAMPBELL ADAMS: No, I don't think that they're mutually exclusive. The cost reimbursable is the -- if an owner needs to be more engaged on a contract, that is a pricing mechanism on which it has to be engaged because there's no ceiling or lid on it. For every day that is not spent well, that adds to the cost of -- to the -- to the owner.

Our -- our view is the -- that BBE has let Hydro down in two (2) consecutive years. Our experience of managing cost reimbursable projects in the past, is you've got to get -- you've got to work side-by-side. You've got to watch what they do because if they get it right, great; if they don't get it right, it's your money that's being wasted.

There's a different approach to managing a cost reimbursable priced contract versus that of the lump-sum. And when things are going wrong repeatedly, I don't see how an owner can stand off. You've -- you've got to get involved and getting down to those root causes as we spoke to you earlier.

MS. HELGA VAN IDERSTINE: But the term "construction manager" has a specific definition, and you're not suggesting that Manitoba Hydro, as I understood from this IR, step in and replace BBE as the construction manager?

MR. CAMPBELL ADAMS: That is correct, we're not saying replace them -- Hydro becomes the construction manager. It's perform the role of a construction manager. It's manage -- it's help manage your own money.

MS. HELGA VAN IDERSTINE: Yeah, but I -- I want to be clear, the activities you identify here: crew makeup, work methods, shift length, supervision, those are all the means and methods of a general contractor; aren't they.

MR. CAMPBELL ADAMS: Yes, they are and something's not working so I don't -- I can't agree to just letting it go on beca -- if it's not working. They've got to understand how crews are made up; how the work is being planned; understand the resources then watch it happen and if you let me finish.

As -- as you're watching it unfold. If it works understand that and repeat that, but if it didn't work as planned, why did it not work as planned

How do we learn from this so that subsequent concrete pours, for example, are done better.

MS. HELGA VAN IDERSTINE: But you'll agree there's a distinction by -- about learning from something and putting in some changes to the project being distinct and different from taking over managing crew makeup, work methods, shift lengths or supervision, which are all the means and methods of the construction manager, i.e., GC --

MR. CAMPBELL ADAMS: Exactly.

MS. HELGA VAN IDERSTINE: So that's quite something different. And it would be appropriate -- because if Manitoba Hydro were to step in and take active role over doing those things, it would lead to an allegation that they had -- were then acting as the construction manager or the GC?

MR. CAMPBELL ADAMS: Okay.

MS. HELGA VAN IDERSTINE: And if they were to do that they would expose themselves to financial risk.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Again, let me try to clarify this. It is not -- we're not recommending that Hydro replace BBE and Hydro becomes the construction manager.

We are recommending that Hydro understands how work is being planned, how the crews are being made, how the -- the work is being sequenced. To understand that it's going to work and if doesn't, why does it not.

That typically, in our experience, means that Hydro would have people in the field as work is being planned and work is being executed. I think I heard an example that quality control wasn't working that well originally and that the two (2) quality divisions of the contractor and Hydro were actually merged to make it work more efficiently.

MS. HELGA VAN IDERSTINE: So, Mr. Adams yester -- or earlier this morning, you used the two (2) phrases that I noted down to des -- I think to describe what you're talking about now. And one (1) of those you said:

"Is that the owner needs to hold the contractor's feet to the fire and you want --

Do you remember saying that?

MR. DAN CAMPBELL: Yes, I do.

MS. HELGA VAN IDERSTINE: And you also

used the phrase:

"They need to work hand-in-hand with their contractor..."

Or words to that effect. Do you recall saying that?

MR. CAMPBELL ADAMS: Okay.

MS. HELGA VAN IDERSTINE: And so if I understood what you're saying this morning and perhaps this afternoon, is that there's a fine balance that the owner has to work with at that point where they are both trying to move the contractor ahead through perhaps the stick method, but at the same time using the carrot to help to work with them to move things cooperatively and collaboratively ahead?

MR. CAMPBELL ADAMS: My experience of cost reimbursable contracts, the -- the owner's team and the contractor's team are typically working side-by-side. They've -- they've got staff in the same place.

The comment about holding a contractor's feet to the fire is there is a contract in place that needs to be managed. The contractor needs to perform his -- his obligations. For example, if -- if Hydro has stated in its contract that no activity should have negative float, why do you lie

1,030; that to me -- that to me is an opportunity to enforce the contract.

If your monthly report should come in at a certain day why accept it ten (10) days later? These -- these are --

MS. HELGA VAN IDERSTINE: So I -- and -- so I'll come back to that. I just want to correct you on that --

MR. WILLIAM HAIGHT: I -- I think he was -- wasn't finished answering his question there.

MR. CAMPBELL ADAMS: The rigour with which -- thank you. The rigour with which you manage a contract I think -- I don't think -- it's -- it's different from a lump-sum to a cost reimbursable priced one. They're -- they're different risks, but you still have to manage the contract.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: So -- so let's talk a little bit about what Manitoba Hydro does and -- and I think you used the word this morning or earlier about, you want to embed some of the Hydro staff with BBE or the contractor?

MR. CAMPBELL ADAMS: Sorry, could you repeat that please.

MS. HELGA VAN IDERSTINE: You used the -- you used the phrase "embedding" -- or maybe that was Mr. Campbell -- the contractor with the -- now, he's shaking his head.

MR. CAMPBELL ADAMS: Co-location is -- as a normal description of that.

MS. HELGA VAN IDERSTINE: Correct. And so were you aware that Manitoba Hydro has a hundred and twenty (120) to a hundred and fifty (150) staff working on site at Keeyask on the project helping to address issues as they arise on a day-to-day basis?

MR. CAMPBELL ADAMS: I'll take you at their word. I'm only looking at the output of the performance.

MS. HELGA VAN IDERSTINE: But that's the sort of thing that you would expect Manitoba Hydro to just now put in place just to monitor that cost reimbursable contract?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And that when the problems occurred in 2016, one (1) of the things that Manitoba Hydro did was they matched up approximately thirty (30) of their area lead staff who were tasked then with keeping a very close interface with their co -- counterparts at BBE.

And that, again, would be the type of thing that you would want them to do to make sure that they were working closely with BBE to move things forward?

MR. CAMPBELL ADAMS: I guess it depends on the next level down of what those work activities are and how decisions are made. I say that because the -- the performance didn't improve in 2017. So colocation is one (1) thing, whether it's effective is another.

MS. HELGA VAN IDERSTINE: Well, let's -- I can't leave that. That's not where I was going right now, but you've used that phrase that it didn't improve in 2017 and the fact is that in 2016 things were behind. 2017, things did improve. They may not have improved as much as they would've liked, but they certainly improve.

MR. CAMPBELL ADAMS: My comment is based on the contractor promise to do X and the contractor did less than X.

MS. HELGA VAN IDERSTINE: But they improved?

MR. CAMPBELL ADAMS: Productivity didn't, it got worse.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: And at that point in the contract, again, -- or in the project, the complexity of those items that were being installed in 2017 were more complex?

MR. CAMPBELL ADAMS: I believe they were but the contractor's plan should have taken note of that.

MS. HELGA VAN IDERSTINE: And that with that complexity of the first unit, you'd expect productivity to improve as they moved along repeating those tasks?

MR. CAMPBELL ADAMS: That's what you'd expect.

MS. HELGA VAN IDERSTINE: Yeah. And so as they put the -- some of the concrete -- the more complicated concrete in this summer, as they move forward on those tasks over the next year or so you would expect the productivities to start to improve?

MR. CAMPBELL ADAMS: Possibly if it's the same people doing the work.

MS. HELGA VAN IDERSTINE: Were you aware -- we talked about some of the things that Manitoba Hydro's done and does to stay closely aligned with its contractor, and were you aware that one (1) of the things that they've done is they've got -- a cost control team led by a Mr. Strongman who monitors budget and expenses and performance on a day-to-day basis? Are you aware of that?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And that would, again, be something that would be a reasonable thing to be doing?

MR. CAMPBELL ADAMS: Yes, it's a cost reimbursable contract. You keep a score of the costs and then you pay them.

MS. HELGA VAN IDERSTINE: One of the things you -- I think -- and again, maybe I do have this one right, Mr. Campbell had raised this morning was a concern that delays may have -- might occur as scheduling moves forward.

And one (1) of the things you mentioned was the -- the competition for the crane by various -- by the two (2) contractors? Or was that you, Mr. Adams?

MR. DAN CAMPBELL: That was me and yes.

MS. HELGA VAN IDERSTINE: And so were you aware and perhaps you wouldn't be, that Manitoba

Hydro has hired a crane coordinator to make -- to deal with just that type of problem?

MR. DAN CAMPBELL: I was not aware of that but it does make sense.

MS. HELGA VAN IDERSTINE: And again that would -- again help address these potential problems of scheduling that might occur.

MR. DAN CAMPBELL: Hopefully.

MS. HELGA VAN IDERSTINE: And, Ms. Musfelt, I think earlier today you mentioned something about concern about BBE not having their schedule in.

MS. VALERIE MUSFELT: I don't remember making that statement about them not having a schedule in.

MS. HELGA VAN IDERSTINE: Sorry, the schedule was negative float that they were to address?

MS. VALERIE MUSFELT: Yes, basically the schedule that I was looking at which was dated the 6th of October, 2017, the BBE contract or BBE schedule was showing one thousand and thirty (1,030) activities that were showing negative float.

And those were a direct result of fifteen (15) constraints that were within the schedule. So that -- those fifteen (15) constraints were causing the one thousand and thirty (1030) negative float items.

MS. HELGA VAN IDERSTINE: And if that -- if I were to tell you that by November of 2017 that schedule had been addressed and there was no longer a negative float would that --

MS. VALERIE MUSFELT: I never seen that schedule so I can't comment as to that.

MS. HELGA VAN IDERSTINE: Okay but that's sort of thing you'd expect them to be moving forward with and doing and that would help resolve some of the concerns you have?

MS. VALERIE MUSFELT: That is correct.

MS. HELGA VAN IDERSTINE: And, Ms. Musfelt, in your -- on -- if I could get you to go to slide 12 of your presentation. And in -- and this is a presentation you have a graph that provides a different timelines for the completion of Keeyask?

MS. VALERIE MUSFELT: Yes, this is the Unit 7 turbine generator.

MS. HELGA VAN IDERSTINE: And in those slides you have October 21st as the plan completion date?

MS. VALERIE MUSFELT: Yes.

MS. HELGA VAN IDERSTINE: And January 20 -- 2022 as the BBE forecast completion date?

MS. VALERIE MUSFELT: I think that's on the previous slide, the date. So there's two (2) different things that this -- this particular slide here is referring to just really the BBE schedule. This one here is referring to the integrated master schedule.

So what you're basically seeing here is that as a result of BBE's slippage, it's ca -- when they integrate the -- the Voith schedule into the integrated master, their -- Voith is forecasting an additional delay on Units 5 through 7 which is pushing it out to the 28th of May as opposed to BBE's date of January.

MS. HELGA VAN IDERSTINE: So if we go back to the previous slide. Using that January 22nd -- or January 2022 date that -- what you're suggesting is that BBE is forecasting a delay --

MS. VALERIE MUSFELT: Of a hundred and three (103) days, yes. So as of 6th of October, their progress or their forecast schedule, which is the schedule that shows progress on the project, they're forecasting that they are now going to put Unit 7 in-service on the 23rd of January, 2022.

MS. HELGA VAN IDERSTINE: And again, appreciating that you don't have -- haven't seen their updated schedule that may -- may change the information that you would have?

MS. VALERIE MUSFELT: Absolutely. Every -- every single progress update made to a schedule is going to change the impact.

MS. HELGA VAN IDERSTINE: And if that was the case then there'd be no negative floats and we wouldn't have to worry about the -- the delay date that you've identified?

MS. VALERIE MUSFELT: It's very -- I can't comment without seeing what the schedule looks like.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: And in preparing those kind of -- that schedule, it would be important and I think -- and if -- to include and -- and I'd think you'd agree, that the work being planned use actual production rates for concrete and earthworks to be achieved by BBE in 2016 and 2017?

MS. VALERIE MUSFELT: Yes. So it was a -- a document provided by Manitoba Hydro, which showed the actual productivity of BBE from the period October 2016 to September 2017.

MS. HELGA VAN IDERSTINE: And then using the -- the updated materials and information that Manitoba Hydro has and BBE had, they would then submit monthly targets for concrete and earthworks consistent with the information they have going forward?

MS. VALERIE MUSFELT: That is correct.

MS. HELGA VAN IDERSTINE: And that could, again, rollback that -- that date closer to the planned-in service dates?

MS. VALERIE MUSFELT: Well, there again, a forecast date is exactly that, a forecast so it's going to be based on them correctly forecasting their productivity.

So if they're forecasting a higher level of productivity than what they're actually achieving then I -- I can't verify what the dates would be.

MS. HELGA VAN IDERSTINE: And if they included more time and -- for winter concrete work and winter work on the south dike, for example, that would tend to improve the forecasts?

MS. VALERIE MUSFELT: The -- the winter concrete is -- is -- is an option to help bring the schedule back in line. But winter concrete number

1 is typically less productive, and number 2, it's extremely expensive.

MS. HELGA VAN IDERSTINE: Okay. And if -- and if they were getting better productivity rates using the -- as they move forward that too would impact the schedule?

MS. VALERIE MUSFELT: I'm sorry, could you repeat the question?

MS. HELGA VAN IDERSTINE: So if they're getting better production rates that too would impact the schedule?

MS. VALERIE MUSFELT: Definitely.

MS. HELGA VAN IDERSTINE: Again, some of the other things that might help improve the schedule and would be things like design changes that Manitoba Hydro took on to improve cost and performance; things such as investing in new forms which are easier to use and then thus will shorten the time required to install portions of the draft tube on the remaining five (5) units.

MS. VALERIE MUSFELT: I think I would defer that question to a subject matter expert.

MS. HELGA VAN IDERSTINE: Okay, Mr. Campbell perhaps.

MR. DAN CAMPBELL: Making the draft

tubes easier to build is definitely going to improve the schedule.

MS. HELGA VAN IDERSTINE: And how about you -- they're going to use column extenders in the powerhouse and intake to allow structural steel to be installed at lower elevations; would that improve -- that's an anticipated improvement on the schedule?

MR. DAN CAMPBELL: I can't comment on that specifically. A general comment would be that the schedule has to fundamentally make sense and the integration of it together with the -- with the other contractors and, particularly, Voith and in specifically looking at the powerhouse, because without referring back to the schedule, I'm suspecting that the powerhouse is the critical path object and that the dikes and the spillway are I presume -- there's hope that they'll be done on time, right.

MS. HELGA VAN IDERSTINE: So if I -- if I added to that comment and said that the reason that -- by using the column extenders they're going to have an opportunity to enclose the powerhouse and service bay earlier and thereby improve the schedule by a year on that item, that would obviously be something that would improve and lead to better outcomes?

MR. DAN CAMPBELL: The sooner you get the powerhouse enclosed the better off you're going to be.

MS. HELGA VAN IDERSTINE: And you mentioned this dike work that was being -- needed to be done. As I understand, they've had some supporting design changes to -- on that to get the south dike work done in 2018 so that it doesn't delay any project -- any further -- the project any further.

Would that also assist in the final scheduling and the costs?

MR. DAN CAMPBELL: It may or may not impact the cost. I suspect the cost might go up but that's my cynical view. The -- it -- it may improve the schedule for that item which, if it's on the critical path, would be of -- advantageous.

MS. HELGA VAN IDERSTINE: In any event, these types of initiatives, this sort of thought process that Manitoba Hydro has gone through and the steps they're taking, are all the sort of things that you would expect to improve the chances for their having -- coming in on budget and on schedule?

MR. DAN CAMPBELL: Is that a question for me or for Campbell?

MS. HELGA VAN IDERSTINE: You'll do.

MR. DAN CAMPBELL: It's better than some people say. Yes, all of the things that you've mentioned are reasonable -- are proper things that should be done.

MS. HELGA VAN IDERSTINE: So, Mr. Adams, I am going to move on to another topic and what I wanted to talk to you about is the 9.5 to 10.5 billion --

THE CHAIRPERSON: Ms. Van Iderstine, I'm just wondering if it's appropriate to take a short break at this time?

MS. HELGA VAN IDERSTINE: Perfect.

THE CHAIRPERSON: Great.

MS. HELGA VAN IDERSTINE: Thank you.

THE CHAIRPERSON: As soon as she said "new topic" I -- fifteen (15) minutes.

--- Upon recessing at 2:42 p.m.

--- Upon resuming at 3:03 p.m.

THE CHAIRPERSON: Before we start, Ms. Kapitany had a question.

THE VICE-CHAIRPERSON: So my question is on this issue of negative float and I did read about it in your report at page 43. And I must confess, before that I didn't know what negative float was, and I'm still not totally sure I know what it is.

But what I heard the discussion between Ms. Van Iderstine and you was that in your report in October you talked about a number of incidents of negative float and some constraints that had caused that. And that that was a real bottleneck or real problem for the schedule.

MS. VALERIE MUSFELT: Yes.

THE VICE-CHAIRPERSON: Could you expand on that a bit?

MS. VALERIE MUSFELT: Okay, the definition of negative float is activities that are extremely critical, but when you're looking at a P6 schedule, what causes negative float are constraints on the schedule. So if you're putting constraints into the schedule and those dates then aren't met, now, you start getting into a negative float situation.

So what it's really highlighting are activities that -- that either have not met their -- a scheduled or constrained dates or that will not in future meet those scheduled or constrained dates.

So that's really what it's telling you.

So, it just means that these are all activities that have missed the dates, the hard dates that have been put into the schedule. So they're activities that have slipped.

THE VICE-CHAIRPERSON: Okay. And so you said when you reviewed the schedule in October, October of 2017, there were these incidents of negative float?

MS. VALERIE MUSFELT: That is correct.

THE VICE-CHAIRPERSON: And, Ms. Van Iderstine, you said that in November of 2017 they were gone but I didn't see that in either the Manitoba Hydro rebuttal evidence. I didn't see it in the direct evidence. So I'm just wondering where that has come on the public record and what we should be making of that.

MS. VALERIE MUSFELT: I've -- having not seen the schedule, the last schedule that I seen was stated 6th of October, so it is possible that in their next update that they may have removed some of the constraints that might have caused some of that negative float, but I -- I can't really speak to it because I haven't seen the schedule.

THE VICE-CHAIRPERSON: That would be a good thing if that had happened.

MS. VALERIE MUSFELT: Yes, that would be a good thing.

MS. HELGA VAN IDERSTINE: Yeah and I'm informed, just to give some clarity to that, that an undertaking was given with respect to the schedule and when that schedule is like fully completed in terms of ... in a form that can be provided, it will be provided as part of the undertaking.

THE VICE-CHAIRPERSON: Okay. So then that evidence will be on the --

MS. HELGA VAN IDERSTINE: Sorry, I've switched microphones. It's a further away then I -- then the previous one, so. How's that?

So what I -- so what I just said was that there was an undertaking given to produce the schedule and it is just being completed now and is put into a form that can be produced as the undertaking and when that's done, it will be evidence in the proceeding.

THE VICE-CHAIRPERSON: Okay, thank you.

THE CHAIRPERSON: Thank you. Ms. Van Iderstine, do you want to -- would you like to continue? Yes, thank you.

MS. HELGA VAN IDERSTINE: So let me

know if I'm too close or too far to the microphone.

MS. VALERIE MUSFELT: One (1) of the -- the things that I seen on the -- the integrated master schedule is it's very hard the way it sits right now because of the constraints, you can't see a true critical path on the schedule.

So, for example, the integrated master schedule is showing of -- I think it was -- the date was the 23rd of May for unit 7 to come in service, but the actual -- there's an activity that isn't happening till September 1st, 2022. So what that means is there's constraints in the schedule that you do not allow you to see the correct critical path to start with, and that's been -- you know, that's part of the problem and then the negative float, all you're really saying is that there are activities that have missed the date that they -- when they were supposed to happen.

THE VICE-CHAIRPERSON: Okay, I didn't really get that so apologies, but you are talking then about a schedule item for 2022, that could impact something that's going to happen before that or after that. And so, how does that relate to the whole concept of negative float?

MS. VALERIE MUSFELT: Okay. I -- I've

been told it's called schedule mumbo-jumbo. Okay, what causes negative float on a schedule are when people put hard dates in. So rather than letting the logic dictate when an activity is going to start and finish, you're basically putting a date in and saying, this is when it's going to happen.

So on the integrated master schedule there are such dates in there. So, for example, the unit 7 would go into service in May, but the last activity on the schedule is not until September 2022, which means there are several months in there that -- afloat. So you can't really tell what the finished -- or what the critical path is because as long as there's float on the schedule, there is no critical path.

And that's part of the problem when you're talking about constraints is they lead to negative float because if any of those dates are missed. So if I say that I'm going to have an activity that supposed to finish by, let's say, March, 2018, March 31st, 2018, if it does not finish on time now it will have negative float.

So that's really what you're saying and when you're working with a critical path method, which is the scheduling method used by Manitoba Hydro, every single activity really should be dictated by the logic. So what has to happen before this activity and what can't happen until this activity is finished. When you put a whole bunch of fixed dates in their, you're not seeing the true logic of the schedule, and that's really what the negative float is pointing to is that there's a lot of dates that have been put into the schedule that are not necessarily being driven by logic. They're just dates that have been put in there. Does that help?

THE VICE-CHAIRPERSON: That's very helpful. Thank you. And then I'm hoping when we see the answer to this IR that that will provide the -- the other part of the picture. Thank you very much.

Sorry, an undertaking not an IR, apologies.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: So, Mr. Adam -- Mr. Adams, so I am going to just turn now I think I had said to you before the break to your estimate of 9.5 to $10.5 billion into -- as the Keeyask final budget estimate.

And I understand from your evidence this morning that that is something that is neither fixed nor firm and not precise.

MR. CAMPBELL ADAMS: It's an order of magnitude estimate.

MS. HELGA VAN IDERSTINE: Meaning what I just referred to; not fixed, not firm, not precise?

MR. CAMPBELL ADAMS: If we were building an estimate based on anticipated quantities against fixed price unit rates then there would be certainly more -- more precision in a cost reimbursable price contract with the contractor who has not performed as they have promised for two (2) consecutive years, then there is a -- there's a wide ban.

MS. HELGA VAN IDERSTINE: And those numbers could go up and they could go down?

MR. CAMPBELL ADAMS: I -- I believe so depending what actions are taken.

MS. HELGA VAN IDERSTINE: And looking at your report -- and again, because you've used this order of magnitude, is that why there's nothing in your report that identifies any of the data or analysis behind that 9.5 to 10.5 billion?

MR. CAMPBELL ADAMS: What are you looking for by way of data?

MS. HELGA VAN IDERSTINE: Some

supporting information that would support the numbers 9.5 or 10.5?

MR. CAMPBELL ADAMS: The -- the numbers are taken from the final report and then summarize there to come up with the 9.9 billion and then the range is either side of that.

MS. HELGA VAN IDERSTINE: And when you say the 9.9 billion, that's the -- that's the Exhibit 4.1 from MGF that we put up this morning?

MR. CAMPBELL ADAMS: Correct.

MS. HELGA VAN IDERSTINE: And I'm going to go through some of those components, but the -- the data behind some of the information in those components is that all in your report?

MR. CAMPBELL ADAMS: The methodology is.

MS. HELGA VAN IDERSTINE: Well, we'll go through that in a moment then. So you'd agree that in order for Manitoba Hydro or the PUB to go forward and understand these calculations and act on them, it is important that they understand how those estimates were achieved at?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And then again, understanding the methodology behind those numbers that you're presenting?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: Now, you understand that Manitoba Hydro has presented an 8.75 -- or $8.7 billion number, which they described as P50 and there's now on the record that a P90 number of $9.6 billion has been presented.

When you presented your 9.5 to 10.5, are you using a P50 or a P90 number?

MR. CAMPBELL ADAMS: No. As I mentioned earlier, we did not build up the estimate on that basis.

MS. HELGA VAN IDERSTINE: And as I understand it that what you would typically do -- or -- in building up an estimate is you'd start at the ground up and work your numbers up to a point?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And that, as you understand it, I would expect from the thousands of documents you received from Manitoba Hydro is how they developed their estimate?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: The way we built

up our -- our cost, our estimated project value was based on information we received from Hydro.

I think that the difference is we probably take a different view on the impact of the poor productivity in contra to date.

MS. HELGA VAN IDERSTINE: But just in terms of the way that one builds an estimate, you'd agree that if Manitoba Hydro built it from the ground up to getting a number and then they test that number against probabilities, that would be a way of identifying whether that number that they have is accurate and reasonable?

MR. CAMPBELL ADAMS: The method doesn't always result in an accurate and reasonable estimate. The method you speak to, I can agree to but it's how it's worked may come up -- may result in different figures.

MS. HELGA VAN IDERSTINE: And after Manitoba Hydro reaches their estimate, were you aware that they both used their in-house expertise and then they go to Validation Estimating to assist with the contingency analysis?

MR. CAMPBELL ADAMS: We believe so.

MS. HELGA VAN IDERSTINE: And are you familiar with the Validation Estimating and Mr. John

Holman?

MR. CAMPBELL ADAMS: MGF is, yes.

MS. HELGA VAN IDERSTINE: And I noticed that it was Mr. Devereux who was nodding so is that because your -- of your background with having your AACE designation or certification, membership?

MR. RYAN DEVEREUX: Yes, and he is very common in providing publications.

MS. HELGA VAN IDERSTINE: That's what I was going to say, he's a very -- he's published extensively.

MR. RYAN DEVEREUX: Correct.

MS. HELGA VAN IDERSTINE: An expert in his field?

MR. RYAN DEVEREUX: Correct.

MS. HELGA VAN IDERSTINE: And as we've heard evidence on this hearing, that P50 and P90 is a way of expressing the likelihood of the budget as presented being met.

Is that an accurate description of what the P50 or P90 is?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And it's created by doing a Monte Carlo analysis meaning the budget and the probability -- addressing the budget and the probabilities of reaching that budget?

MR. CAMPBELL ADAMS: Yes. We're not clear on the work that this fellow did. I don't know if he build up the estimate or whether he was given data and then just ran the Monte Carlo simulation.

MS. HELGA VAN IDERSTINE: But certainly -- running the Monte Carlo simulation as part of establishing the P50 or P90 bud -- budget numbers?

MR. CAMPBELL ADAMS: As a -- as a method, yes. As guaranteeing what the outcome will be, no.

MS. HELGA VAN IDERSTINE: And as I understand it, it's quite a complicated mathematical analysis in which the probability of a number of different scenarios are run against one another to come up with an outcome?

MR. CAMPBELL ADAMS: That's the definition.

MS. HELGA VAN IDERSTINE: And the primary purpose is often to provide risk-based confidence forecasts for the achievement of key milestones, including the budget end milestone?

MR. CAMPBELL ADAMS: In my experience it's to give a degree of confidence around what the party team has developed as their estimate for a contract or for a project.

MS. HELGA VAN IDERSTINE: And that's -- as you said this morning, you did not do the Monte Carlo analysis on your numbers?

MR. CAMPBELL ADAMS: Correct, we did not.

MS. HELGA VAN IDERSTINE: So, looking at the slide that's on the -- up on the monitors and that's MGF-4.1. Is it fair to say that what you've done is you've taken Manitoba Hydro's number for, as you say, spent to December 2016, that's a path number you got from Manitoba Hydro and then you've added what their estimate is excluding contingency as the second big number?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: What was your question, sorry?

MS. HELGA VAN IDERSTINE: So you've taken information that Manitoba Hydro has given you and the first being what their costs to date or to December 31st was, together with their estimate and that's the first two (2) numbers in that chart that you've presented.

MR. CAMPBELL ADAMS: Correct, yes.

MS. HELGA VAN IDERSTINE: And after that the items from the -- are the -- between craft to foreman down to interest and escalation, you've done your own calculations on of some sort.

MR. CAMPBELL ADAMS: Yes, if you want to go to our report we can discuss those.

MS. HELGA VAN IDERSTINE: Yep, well come to that in a minute. And then you've added just a 10 percent contingency to come up with the 9.85?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And one (1_ of the areas that -- that you have in your report that you talked about was GA&O.

Do you recall that?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And GA&O is included on a number of MGS finding within the Keeyask section of your report, including, as I understand it, craft to foreman ratio, the MR. LESLIE BRAND: -- the trade and -- sorry, the increased use of overtime hours, net BBE indirects, earthwork productivity, et cetera; is that fair?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And I think you received and have reviewed the Amending Agreement Number 7, that Manitoba Hydro has with BBE?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And as part of the incentive for BBE to perform the contract, the GA&O is capped at their target price, meaning that they'll not receive GA&O overpayments on costs beyond their target price.

Do you recall that?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And so what that would mean is that GA&O would not be applied on costs beyond the target price?

MR. CAMPBELL ADAMS: Sorry, could you repeat that, please.

MS. HELGA VAN IDERSTINE: The GA&O would not then be applied on costs that exceeded the target price?

MR. CAMPBELL ADAMS: That is correct and Hydro would just pay those costs above that figure.

MS. HELGA VAN IDERSTINE: Yeah, just to clarify, it's -- Hydro would just pay the actual costs but not the GA&O above that number?

MR. CAMPBELL ADAMS: Correct, yes.

MS. HELGA VAN IDERSTINE: And so if we look at the estimate that you've got here: craft to foreman ratio, BBE indirects, earthworks, scaffolding and crane costs, concrete productivity.

You'd already included the GA&O in the numbers you presented?

MR. WILLIAM HAIGHT: I'm going to just jump in here now and remind, Ms. Van Iderstine, what I said about this document when it was introduced as -- as 4.1, and that was, was that it was the understanding, Mr. Adams that he would be addressing this in the CSI. He wasn't fully prepared to be addressing it today. If there's going to be any reference to this document, it should be to the specific portions of the report from which this document summarizes those portions.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: Okay. So -- but let's look at page -- if we can go to the MGF report. That's MGF-2 at page 58 of the report or page 65 of -- on the PDF person.

And if you look there, just below the order of magnitude of 91.6 million. Just roll it up just a little bit further so we can see it.

Note the above figures include GA&O and indirect costs.

MR. CAMPBELL ADAMS: Yes, we see that.

MS. HELGA VAN IDERSTINE: So when you look back at your budget number of 91 mill -- sorry, budget number for craft to foreman, you'd alr -- it appears to us that you included -- had already included the GA&O on that number on the 91 million, so that once you -- once you exceed the target price, GA&O should be deducted from it.

MR. CAMPBELL ADAMS: That is correct. We -- we kept that figure in out of an abundance of caution in case that didn't happen.

MS. HELGA VAN IDERSTINE: And you did that the same with each of the other items on that chart being, sorry, the indirect costs, earthworks, productivity, scaffolding and crane and concrete productivity direct costs?

MR. CAMPBELL ADAMS: Yes. So that -- that to us sets out the -- like the maximum exposure. If you wanted to remove that, that figure, then that would refine the 9.9, assuming there's no amending agreement number something else in the future.

MS. HELGA VAN IDERSTINE: So it would

bring that 9.87 down further?

MR. CAMPBELL ADAMS: It would bring the 9.8 down, yes.

MS. HELGA VAN IDERSTINE: Okay. Now one (1) of the other items you've identified as cash, the trade in cash discounts.

And I have to confess I don't quite understand if -- from the way you've described trade and cash discounts if Manitoba Hydro did what you're suggesting shouldn't that be a negative number?

MR. KIERAN FLANAGAN: No, from the point of that estimates are price on trade discount, they're not priced on this price. So it's actually an addition. Any competent contractor would do a competitive tender based on trade a price -- sorry.

Any -- generally a contractor would do his estimates based on trade price not list price. So it would be after discounts. So this is actually an additional cost to Manitoba Hydro.

MS. HELGA VAN IDERSTINE: Okay, I'm sorry, I'm still not following. If Manitoba Hydro did what you're suggesting and took the approximate 12 percent discount on trade.

MR. KIERAN FLANAGAN: Yes. But I'm doing an estimate it's based on trade prices, not list prices. So if you were paying at list price, you're paying above what you should be on the estimate.

MS. HELGA VAN IDERSTINE: So this is what you're saying that they're paying above by virtue of the 12 percent additional that you're suggesting they're paying?

MR. KIERAN FLANAGAN: Yeah, it would be trade price in an estimate.

MS. HELGA VAN IDERSTINE: So just to be clear, what you're talking about is that you are suggesting that MGF -- that Manitoba Hydro could negotiate with BBE that BBE should seek a 10 percent trade discount with its suppliers and pass that on to Manitoba Hydro?

MR. KIERAN FLANAGAN: I -- any contractor would be getting trade prices. They wouldn't be working off list prices.

MS. HELGA VAN IDERSTINE: Okay, fair enough.

MR. KIERAN FLANAGAN: So it should pass on to the client.

MS. HELGA VAN IDERSTINE: So it should already be passed on to the client. And furt -- and which if it's being done, then the additional 10 percent would be meaningless?

MR. KIERAN FLANAGAN: From the hundreds of invoices we looked at we found one trade discount.

MS. HELGA VAN IDERSTINE: Okay. So if you look -- and if -- and are you aware that in the contract that BBE has with Manitoba Hydro, they have to solicit three (3) competitive bids for all purchases over $500,000?

MR. KIERAN FLANAGAN: Yes.

MS. HELGA VAN IDERSTINE: And so on those items, after getting a competitive bid and low bidder having been selected, what incentive would the low bidder have to further discount their prices by 10 percent?

MR. KIERAN FLANAGAN: If that is done most of the items that -- when we randomly checked the invoices, 99 percent of them were under 500,000, even more than 99 percentage.

MS. HELGA VAN IDERSTINE: Okay. The number of -- the percentages of the invoices might be under 500,000 but the total value of those is not?

MR. KIERAN FLANAGAN: Just to confirm that this has been an issue with Manitoba Hydro as well and you've been looking into it?

MS. HELGA VAN IDERSTINE: Pardon me?

MR. KIERAN FLANAGAN: Manitoba Hydro have been looking into this issue as well and are concerned about it.

MS. HELGA VAN IDERSTINE: And appropriately addressing it?

MR. KIERAN FLANAGAN: I don't know about that. They only recently started looking into it and I think that was kickstarted by MGF.

MS. HELGA VAN IDERSTINE: So if we -- but if we left out the 12 percent or the 10 or 12 percent that you've now included for the -- for all contracts, but we left it out -- left out the tendered contracts, your number here of 74 million would drop?

MR. KIERAN FLANAGAN: In relation to the discounts, is it?

MS. HELGA VAN IDERSTINE: Yes.

MR. KIERAN FLANAGAN: And I don't see why it should drop because we haven't seen any evidence of the discounts being past on to Manitoba Hydro. And to be honest, we're being very conservative. If you look at steel, it could be up to 30 percent discount.

MS. HELGA VAN IDERSTINE: And do you have some data on that, Mr. Flanagan?

MR. KIERAN FLANAGAN: Experience.

I've -- electric work can go up to 50 percent discount.

MS. HELGA VAN IDERSTINE: And you've got --

MR. KIERAN FLANAGAN: It -- it depends on if it's cable, if it's junction boxes, it depends.

MS. HELGA VAN IDERSTINE: And that was built into your estimate how?

MR. KIERAN FLANAGAN: That was built in -- we were being conservative at 10 percent.

MS. HELGA VAN IDERSTINE: Using your experience, but no data?

MR. KIERAN FLANAGAN: Experience, well, I think all of MGF's data is based on experience.

MS. HELGA VAN IDERSTINE: So looking at the craft-to-foreman ratio, you have estimated -- you've looked at and come to the conclusion that it's essentially four (4) workers for every one (1) foreman; is that correct?

MR. KIERAN FLANAGAN: Four (4) craft for one (1) foreman, yes.

MS. HELGA VAN IDERSTINE: The other way around, thanks. And what you seem to be suggesting is that Keeyask has too many foreman for the number of craft labourers?

MR. KIERAN FLANAGAN: Correct.

MS. HELGA VAN IDERSTINE: And this would be something that would be appropriate for Manitoba Hydro and desirable for them to be addressing with the GC?

MR. KIERAN FLANAGAN: Once again it's back to a good estimate. Would not be including. If it was a unit price estimate or a lump sum, they'd be far more craft to foreman. So, it's an overspend that's being passed on to Hydro in relation to the estimate.

MS. HELGA VAN IDERSTINE: Did you review the Hatch report, Mr. Flanagan? That's the one at the back of Manitoba Hydro -- which I think is 117, the rebuttal?

MR. KIERAN FLANAGAN: Yes.

MS. HELGA VAN IDERSTINE: Did you have a chance to review that?

MR. KIERAN FLANAGAN: I personally didn't but the team have.

MS. HELGA VAN IDERSTINE: And did you -- do you note this concern that if the con -- the issue -- and if the issue is that supervision -- more supervision was required in order to get better productivity, that going to a lower foreman to craft might be a detriment?

MR. KIERAN FLANAGAN: Sorry, could you repeat that again, just we'll get it the right way around.

MS. HELGA VAN IDERSTINE: If the root cause turned out to be -- officially, you don't know what the root cause of the productivity issue is, do you?

MR. KIERAN FLANAGAN: It's obviously being badly managed if the productivity isn't being met.

MS. HELGA VAN IDERSTINE: So if the root cause was that there needed to be more supervision to the craft to foreman then reducing the number of foreman is not going to --

MR. KIERAN FLANAGAN: I -- I disagree because the -- under -- the directs the foreman, foreman, by their nature, and especially in the northern territories or northern sections of the provinces and if they're call -- if they're being called a foreman, they're not allowed to work the tools and that's on the majority of jobs.

So your productivity is down by having more foreman to craft than less foreman to craft.

MS. HELGA VAN IDERSTINE: And in -- we've talked about this before, as the site progresses and as the concrete is being installed, you would expect that there will be increases in productivity as they -- the workers start to repeat activities.

MR. KIERAN FLANAGAN: That hasn't been the case to date, though.

MS. HELGA VAN IDERSTINE: But as you know, they are just moving from one type of -- of -- they're just in -- having just installed the initial units now, and they're going to start completing the further units from now on.

So that would be a repeatable task, wouldn't it be?

MR. KIERAN FLANAGAN: Yeah, and you would to see that there would be lessons learnt; if the same crews were following through, if the same supervision was following through but I'm -- we can only base it on the trend today.

MS. HELGA VAN IDERSTINE: Okay and the trend to date --

MR. KIERAN FLANAGAN: And sorry, excuse me, we didn't into account in the -- in the productivity the more intricate are coming -- are coming up so we're being conservative on that as well.

MS. HELGA VAN IDERSTINE: And the trend to date, as we've talked about, is that the -- there is going to be some repeatability of these units as we move forward?

MR. KIERAN FLANAGAN: Correct, but there's only seven (7) units on an unusual contract.

MS. HELGA VAN IDERSTINE: And if, in fact, they obtain those increases in productivity, that number would decrease?

MR. KIERAN FLANAGAN: We haven't taken into account the more intricate work to be honest. I think we've been conservative on it. We've been conservative on the foreman where we've used 6:1 in our adjustment where documents we've referred to would be over 10:1.

MS. HELGA VAN IDERSTINE: And the documents you referred to that would be?

MR. KIERAN FLANAGAN: That would be Burntwood national agreement and the Alberta oper -- operating engineers. The operating engineers is 1:18.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: But if Manitoba Hydro is able to mitigate that, that would decrease that number?

MR. KIERAN FLANAGAN: I -- I -- to be honest, I don't think so. It's going to -- it's going to improve things for you, but it's -- this is what's been happening to date.

I don't -- 6:1 is being conservative, I suppose that's what I'm trying to say.

MS. HELGA VAN IDERSTINE: So if you look over at the indirect costs.

MR. KIERAN FLANAGAN: Yes.

MS. HELGA VAN IDERSTINE: And you've calculated a -- an increase in that, I take it --

MR. KIERAN FLANAGAN: Yeah, but I have --

MS. HELGA VAN IDERSTINE: -- I understand that to be?

MR. KIERAN FLANAGAN: If we go back to the exhibit today.

(BRIEF PAUSE)

MR. KIERAN FLANAGAN: And yes, but it's not a double up. We done a line item for indir -- indirect costs, which, off the cuff, I think was around the 300 million, then we allowed for the indirect to be included in all of them items and offset it, so that's the net increase on indirects.

MS. HELGA VAN IDERSTINE: And -- and do I understand with indirects that those cost -- those are costs that are required to support the direct work at the site, so including things like temporary buildings, small tools, worker transportation, that kind of thing?

MR. KIERAN FLANAGAN: Supervision as well, yes.

MS. HELGA VAN IDERSTINE: Supervision, yeah. And so for things like the temporary buildings, like a carpentry shed that's been built, that kind of thing, you build it once and you're not building it another time?

MR. KIERAN FLANAGAN: Correct, but if you look at it, it says from amendment 7, so they would have been in place prior to amendment 7.

MS. HELGA VAN IDERSTINE: And so having been in place, as I said, you're not repeating some of those items?

MR. KIERAN FLANAGAN: But we haven't taken them into account, things prior to amendment 7.

MS. HELGA VAN IDERSTINE: And as you move forward on the contract, one (1) of the concerns you've expressed, Mr. Adams, and a number of times is the -- the importance of Manitoba Hydro having appropriate supervision on these things?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And were you aware that in -- in 2017, Manitoba Hydro had an indirect lead at -- at the site of -- who has almost twenty (20) years of experience of project controls and construction experience?

MR. CAMPBELL ADAMS: I -- I wasn't personally aware of that.

MS. HELGA VAN IDERSTINE: And --

MR. CAMPBELL ADAMS: As I said earlier, we're -- having a person doesn't guarantee you're going to be successful. We can only react to the -- to the contractor who has not promised -- hasn't delivered to the promises he's given Hydro.

MS. HELGA VAN IDERSTINE: And -- but having somebody like that on site would be the sort of positive steps that Manitoba Hydro could take to try and ensure that they are addressing some of the costs on site?

MR. CAMPBELL ADAMS: I believe if role that person is to challenge the costs that are being generated in indirect space, then yes. So if the contractor's telling you, This is what I'm going to do, these are indirect costs I will incur, if there's a conversation around the -- the cost benefit of that, or the need of that, then that -- that would be appropriate.

MS. HELGA VAN IDERSTINE: And then looking at scaffolding concrete earthworks project, did they -- did you use a straight-line escalation for calculating those numbers?

MR. KIERAN FLANAGAN: We done three (3) exercise in working it out from three (3) kind of industry standards, and then we put a tapering off factor as the job would slow down, and to include for upfront costs, but it's from amendment 7 as well.

MS. HELGA VAN IDERSTINE: I appreciate --

MR. KIERAN FLANAGAN: And just -- sorry, just in relation to it, the majority costs, if you look at -- I don't have the -- I think it was October, we can check, 90 percent of the costs were labour, not equipment.

MS. HELGA VAN IDERSTINE: Was that scaffolding?

MR. KIERAN FLANAGAN: Scaffold and crane.

MS. HELGA VAN IDERSTINE: And crane, but about earthworks and concrete productivity?

MR. KIERAN FLANAGAN: Concrete productivity? That's -- that's from amendment seven as well.

MS. HELGA VAN IDERSTINE: And again, did you use that number just to use a straight line, continuing outwards?

MR. KIERAN FLANAGAN: We basically used the information that we got from Manitoba Hydro, which showed the accumulative to date. We didn't take into account the further intricate work. We didn't take into account the winter work that was planned just before we produced the report. So as I say again, in our opinion, that's probably conservative too.

MS. HELGA VAN IDERSTINE: And if you look at your report, can you show me where you address the mitigation strategies that Manitoba Hydro has been utilizing to try and bring these costs down?

MR. KIERAN FLANAGAN: I -- unless -- from recollection, I have -- I don't know if the mitigative strategies are talked about it.

MR. CAMPBELL ADAMS: What are they?

MS. HELGA VAN IDERSTINE: No, I'm just

asking you if you addressed any mitigation strategies.

MR. WILLIAM HAIGHT: I think in fairness to the witnesses -- in fairness to the witnesses, this report was prepared in December. The mitigation strategies that this Board has heard about came out through the direct panel -- or through the panel presentation by Manitoba Hydro's capital project. The first we heard of that was last week, so they've seen it in the transcripts, but that's it.

(BRIEF PAUSE)

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: So I'm just -- I appreciate that last comment by your counsel. So as you know, Manitoba Hydro did give evidence this past week, or a week or so ago, provided rebuttal evidence in which they do describe some mitigation strategies that they're implementing, and you have not amended your report subsequently?

MR. WILLIAM HAIGHT: I -- I --

(BRIEF PAUSE)

MR. WILLIAM HAIGHT: Okay. I don't

think that's a fair question.

CONTINUED BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: So the contingency that you've addressed in your report, now that's based on -- you -- you've attributed a 10 percent number to that, and attributed it as 896 million.

Now, can you tell us why you chose 10 percent rather than, say, 5 percent, or 2 percent, or 12 percent?

MR. CAMPBELL ADAMS: Probably the best guess that we have is we don't see the point -- I don't know -- why we would lower it when we've got such an unstable base upon which to predict the future. We considered what those issues might be in going forward, worsening productivity, more intricate concrete to do, expensive interworking, possibly, further claims by contractors who are delayed.

There could be re-work to be paid for. Like Hydro, we don't know what the geotech will be like under the site dam. So that -- that was the -- the sort of thought process we went through, and we -- we landed on 10 percent.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: So just to understand that, the numbers that you've presented, nine point eight-five (9.85), that number is, I think in your words earlier, sort of an order of magnitude number. You've picked nine point eight (9.8). And as we've talked about, there are -- you've also included in that contingency some issues surrounding productivity. So if that contingency includes both productivity there, and you've identified productivity earlier, is that double counting that productivity?

MR. KIERAN FLANAGAN: It includes a worsening productivity. We've taken the accumulative to date. We haven't taken into productivity for winter work. We haven't taken into productivity for the more intricate -- the work that's going on is more intricate, so obviously, there's a good chance productivity will worsen. We've taken the accumulative date, given the benefit of the doubt that it won't worsen, but obviously in a contingency, we have to take into account that it may worsen.

MR. CAMPBELL ADAMS: The other comment I would make is -- was we're trying to come up with the -- the best advice that we could. We -- we shouldn't lose sight of the fact there's four (4) years of this to run. There's plenty of opportunity for other things to go awry, here. You're not within the finish line. You're building a project in the lower Nelson River in Northern Manitoba. That's not easy. That's a fantastic undertaking. There's still plenty of risks to -- to be managed and avoided, hopefully.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: If you just give me a second, I'm just going to look through my notes for a moment, if I may.

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: So just a -- a couple more questions if I may. Mr. -- Mr. Campbell, you were asked by one (1) of my colleagues, who is no longer here, about reporting back to the PUB on progress. Do you recall that line of questioning?

MR. DAN CAMPBELL: Somewhat.

MS. HELGA VAN IDERSTINE: And you had suggested that, I think, that Manitoba Hydro would be the pers -- best situated to say what schedule points it was appropriate to report on, because they would know when they're getting to a -- a point which had a valid report. I think that's the --

MR. DAN CAMPBELL: I think my -- my intent was that the integrated schedule where it shows some of the contractual dates between the civil contractor in Voith, for example, or the spillway gates contractor, plus the information or the -- the start of the fills after the excavations of the -- have been completed, and the geotechnical issues, if there are any, have been identified, are points where it is easier to predict the future.

MS. HELGA VAN IDERSTINE: So using that so it -- those -- that's those sort of examples, and -- and thinking about the amount of work that is required for you and all of your colleagues at the table to put together sort of the information that they've provided here, you would appreciate the amount of interface and time that Manitoba Hydro employees put into helping answer those questions to you. Is that a fair -- there was a lot of -- a lot of interface providing that answers and information to you?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: A lot of time that -- and effort by senior staff to try and answer your questions?

MR. CAMPBELL ADAMS: Yes.

MS. HELGA VAN IDERSTINE: And staff who were otherwise engaged at the time, trying to monitor and continue the Keeyask build?

MR. CAMPBELL ADAMS: Correct, I agree with that.

MS. HELGA VAN IDERSTINE: And so would it be fair when you talk about that sched -- that Mr. Campbell back -- the reporting, that what you're talking about is not the type of hearing that we're talking about here, but something that would be a little bit more focused?

MR. DAN CAMPBELL: What I'm talking about is that the integrated master schedule for the whole project should be established or if it -- or reestablished, I guess, and may it had -- maybe it has been, or is being, right, and that some key points be identified and a plan be put forward whereby those -- those are points where Manitoba Hydro and the contractors sit down, and they go around and they make sure that they -- everybody agrees what's going to happen is reasonable and -- and coherent.

Now, whether that involves this group of people, as a reviewer of the results of that, I'm not at a point to -- I can't comment on it.

MS. HELGA VAN IDERSTINE: Thank you. Oops, I may have pushed that a little further onto than I intended just by the way I described it, but what I was trying to get was that you weren't looking at having -- suggesting that they should be having a hearing every --

MR. DAN CAMPBELL: I believe the proper response would be: God, no.

MS. HELGA VAN IDERSTINE: So just a -- it -- if I can finish off, we had talked about some of the things that Manitoba Hydro's been doing to address some of the issues, and it can be either of you, I think, and fair to say that I think Manitoba Hydro having meetings with the leads between Manitoba Hydro and BBE to identify efficiencies and improvements would be a good step to take?

MR. CAMPBELL ADAMS: Yeah -- yes -- the answer is yes to that. I -- I would have thought in the -- this cost reimbursable price contract, that should be an ongoing activity.

MS. HELGA VAN IDERSTINE: And the -- the more they can push that, and the better those --

that relationship is, then the chances are that they can mitigate some of the expected costs?

MR. CAMPBELL ADAMS: Yes, I believe that to be true.

MS. HELGA VAN IDERSTINE: Thank you. Those are my questions.

THE CHAIRPERSON: Thank you. Mr. Peters...?

CROSS-EXAMINATION BY MR. BOB PETERS:

MR. BOB PETERS: Yes. Thank you. Let's stay with the exhibit MGF-4-1 that's on the screen, please. And I'm going to start with one (1) that -- that My Friend Ms. Van Iderstine dealt with, and I -- I want to make sure the panel understands the position of MGF.

We see on the second line item, Manitoba Hydro's estimated cost to completion, there's a $3.5 billion number, correct?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: Leave your microphone on. Pull it close. We're -- we're good. That 3.5 billion includes the actual costs that Manitoba Hydro is forecasting it's going to have to spend not just on labour, but on equipment, materials, trucks, vehicles, all of that?

MR. CAMPBELL ADAMS: That's our understanding, yes.

MR. BOB PETERS: And then when I drop down two (2) line items for trade and cash discounts, I'm understanding MGF to be saying that Manitoba Hydro has been leaving money on the table when it's buying -- when BBE is buying the goods and services that it's buying?

MR. KIERAN FLANAGAN: From the evidence we've seen, it's not apparent that they're getting trade discounts, because they're not shown on invoices.

MR. BOB PETERS: Okay, your answer was, you don't see the trade discounts on the invoices?

MR. KIERAN FLANAGAN: So that -- that would only lead us, I believe, on your average invoice, it would be normal to see the trade discount on the invoice, so.

MR. BOB PETERS: So -- so what's included in the $3.5 billion number doesn't contain --

MR. KIERAN FLANAGAN: Not --

MR. BOB PETERS: -- a trade discount, is what you're suggesting?

MR. KIERAN FLANAGAN: No. Normally when you do estimates, the difference between a list price, which the average person off the street, if you went into a builder provider, so you get the list price. A contractor goes into a builder provider so he'll get a trade price.

Sorry. The average person going to a builder providers, you get a list price. If the -- a contractor that has an ongoing relationship with them, or a big project ahead, he'll get a trade price. That could range from 10 percent up to 50 percent. And when you're doing a competitive tender, you will always inch -- include a trade price, not the list price, otherwise it wouldn't be competitive.

MR. BOB PETERS: Do you know if BBE is getting the trade discount?

MR. KIERAN FLANAGAN: I -- I've never heard of a of a contractor not to.

MR. BOB PETERS: All right. So then the suggestion is that if BBE is getting the trade discount, it's not being passed on to Manitoba Hydro?

MR. KIERAN FLANAGAN: From the evidence we've seen.

MR. BOB PETERS: And under the agreement that's between Manitoba Hydro and BBE, who was supposed to get the --

MR. KIERAN FLANAGAN: Trade discount --

MR. BOB PETERS: Trade discount?

MR. KIERAN FLANAGAN: Sorry. Sorry. Apologies. Trade discounts, industry practice, it's always passed on to the client. Cash discounts is another thing. It's prompt payment. So if the contractor pays a supplier within thirty (30) days, he gets, on average, around a 2 percent discount. But because in this scenario the contractor is getting paid two (2) months in advance, it's being financed by Manitoba Hydro, the cash discount should all be -- should also be passed on, because it's actual cost.

MR. BOB PETERS: So, Mr. Flanagan, if those trade discounts are not included in the $3.5 billion number, why should they be added in below that?

MR. KIERAN FLANAGAN: No, what I'm saying is that the three point five (3.5), if it's estimated correctly, would allow for the discount, but Manitoba Hydro is paying actual costs based on invoices without trade discounts, so that means they're overpaying over and above what the budget would have been based on.

MR. BOB PETERS: All right. So you're

telling this Board that that $3.5 billion number should be lower by $74 million?

MR. KIERAN FLANAGAN: No, no. I'm -- sorry, correct. Correct.

MR. BOB PETERS: While we're on this exhibit MGF-4-1, and gentlemen, I -- I jumped right in. In my excitement, I should have said at the outset, as we've done, this is a public hearing today, and so none of my questions are to elicit answers that may contain confidential information. You're aware of that?

MR. KIERAN FLANAGAN: Yes.

MR. BOB PETERS: And Ms. Musfelt, likewise? And for Mr. Potter, Mr. Phillips, and Mr. Brand on the phone, if at any time they believe that they can answer and bring some additional information to the Board's attention, they are certainly to interrupt at any time. I'm hoping they're listening.

MR. KIERAN FLANAGAN: Mr. Peters, just one (1) thing --

MR. LESLIE BRAND: Yes.

MR. JIM POTTER: Understood.

MR. DWAYNE PHILLIPS: We understand as well, thank you.

MR. BOB PETERS: All right, and thank

you.

(BRIEF PAUSE)

MR. BOB PETERS: Mr. Brand, Mr. Potter, and Mr. Phillips, in that order.

MR. KIERAN FLANAGAN: Mr. Peters, just one (1) thing, if I can go back on, in relation to the MH spent to date, that doesn't include -- the seventy-four (74) isn't included in that, so there's probably recovery money that could be got in the three point zero-five (3.05) as well for trade and cash discounts.

MR. BOB PETERS: All right. In answer to My Friend, you mentioned that this was something that Manitoba Hydro was now investigating.

Did I hear that correctly?

MR. KIERAN FLANAGAN: That's what we've been advised through meetings in Manitoba Hydro.

MR. BOB PETERS: So is it your understanding that until MGF raised this, Manitoba Hydro wasn't aware of this situation?

MR. KIERAN FLANAGAN: I can't say that, to be honest. I'm -- it was through a discussion that they were looking at it.

MR. BOB PETERS: So after you brought

it to Manitoba Hydro's attention, they're now looking at it?

MR. KIERAN FLANAGAN: I couldn't say that. They could have been looking at it prior.

MR. BOB PETERS: And as a result of Manitoba Hydro's looking at it, have they reported to MGF what, if anything, has happened?

MR. KIERAN FLANAGAN: No, just that they were looking at those.

MR. BOB PETERS: All right. I want to turn to the earthwork productivity line item, and that brings in an additional $88 million of projected costs according to MGF, correct?

MR. KIERAN FLANAGAN: Correct.

MR. BOB PETERS: Help the panel -- the Board understand that number that's 88 million over and above what amending agreement number 7 would call for, correct?

MR. KIERAN FLANAGAN: Correct, based on the accumulative to date.

MR. BOB PETERS: So MGF has taken the productivity of BBE on the earthworks, their actual productivity, and determined that they're -- they're going to be $88 million over the budget that was set out in amending agreement 7?

MR. KIERAN FLANAGAN: Correct.

MR. BOB PETERS: If Manitoba Hydro take steps to -- to improve the earthwork productivity, MGF will acknowledge that that $88 million number will be less?

MR. KIERAN FLANAGAN: It's difficult to say, because we believe because of winter programs and more intricate work, it could rise, but we haven't taken that into account. We've taken into account the accumulative to date, and there's certainly mitigation measures that could reduce it, but that eighty-eight (88) could be a hundred. It could be seventy (70).

MR. BOB PETERS: All right. I think you've answered my question in that answer, Mr. Flanagan, but we're talking here earthworks, not concrete, correct?

MR. KIERAN FLANAGAN: Sorry. Yes, earthworks.

MR. BOB PETERS: All right. Is there intricacies coming up on the earthwork schedule that -- that'll give rise to greater risk?

MR. KIERAN FLANAGAN: Not that I'm aware of, but that's -- the accumulative to date and the trend is that it's been rising, not reducing.

MR. BOB PETERS: All right. And --

and that's probably a matter best left for our discussions tomorrow?

MR. KIERAN FLANAGAN: Yeah, because obviously, I can't get into the man hours and so on.

MR. BOB PETERS: That's -- that's fair.

MR. DAN CAMPBELL: Excuse me. I made -- I made some comments --

MR. BOB PETERS: Mr. Campbell --

MR. DAN CAMPBELL: -- sorry -- sorry to interrupt. I made some comments earlier about the earthworks, and how, as you got closer to the top, you got to narrow zones, which were -- I'll use the word more intricate. And so yes, there are some intricacies as you reach the top of things. It's not very much, as I said in my presentation earlier, but there is -- there is opportunity to be less productive coming forward.

MR. BOB PETERS: And, Mr. Campbell, you attached a percentage number to that, did you not?

MR. DAN CAMPBELL: No, I did -- I don't believe I did.

MR. BOB PETERS: All right.

MR. DAN CAMPBELL: I'd have to go back and look in that, because it was done by Garry.

MR. BOB PETERS: The essence of that comment, Mr. Campbell, was as you get to the top of the earthen dike, or the earthen dam, it narrows at the top. And I think it was 500 -- was it 500 millimetres wide at the top? Is that -- is that what I recall?

MR. DAN CAMPBELL: Yes, some portions of it. You can imagine that the -- the way the dams are built, that there's a clay core in the middle, and that there's different zones of filter of different sizes of rock on each side. And as -- and there's -- obviously, it's wide at the bottom, because it's a tapered structure.

And when you get to the top that taper eventually goes to zero, more or less, it goes to 500 millimetres at the top for, I think, the core, so. That's the -- intent of that. As you get up to how -- and becomes more difficult, because your trucks cannot pass each other. You have to you -- there's -- so you may have to use batter boards, or formwork, effectively, to place the materials.

So there's the -- it does become more intricate as you get closer to the top.

MR. BOB PETERS: But Mr. Campbell --

MR. DAN CAMPBELL: That was -- that

was only my -- that was my only point.

MR. BOB PETERS: No, you answered, so let's stay -- let's keep talking. The contractor knows of those intricacies that are forthcoming on the earthworks, correct?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: And so would you expect the contractor would build that intricacy into the contractor's productivity numbers?

MR. DAN CAMPBELL: He should build that into his plan, yes.

MR. BOB PETERS: It's not a surprise that comes out of the --

MR. DAN CAMPBELL: No.

MR. BOB PETERS: All right. Then I want to turn with our friends from MGF and anybody else who wants to offer comments, the concrete productivity line item. You're telling the Board here that based on what MGF has seen from the concrete productivity, the actual productivity, it's going to exceed the amending agreement number 7 by $137 million?

MR. KIERAN FLANAGAN: Correct, based on the accumulative to date, which is not a figure we invented. It's -- it's reported.

MR. BOB PETERS: It's mathematically derived based on actual performance --

MR. KIERAN FLANAGAN: Yeah, it's -- it's reported --

MR. BOB PETERS: -- today?

MR. KIERAN FLANAGAN: -- it's an actual reported on the job.

MR. BOB PETERS: Reported by whom?

MR. KIERAN FLANAGAN: Reported by BBE through Manitoba Hydro.

MR. BOB PETERS: And so what -- what you're telling this Board is that if that concrete productivity is exactly the same as what it has been up until December 31st of 2017, it's going to add an extra $137 million of costs?

MR. KIERAN FLANAGAN: Yeah. I'd have to go to the page in the report, but that was either October or November of the report.

MR. BOB PETERS: Okay. Well, and that was a question I actually had of you. When the Vice Chair was asking questions of Ms. Musfelt, at what point in time did Mani -- did MGF have to put down the Manitoba Hydro information and start drafting the report? You know, what -- what's the vintage of the information that's in the MGF report?

MS. VAL MUSFELT: From a scheduling perspective, the last set of schedules I had for Keeyask was 6th of October, 2017.

MR. BOB PETERS: That's only part of the answer. And so gentlemen, for the rest of the report --

MR. KIERAN FLANAGAN: Yeah, the --

MR. BOB PETERS: Sorry, at what -- what day did -- did you stop adding new information for Manitoba Hydro?

MR. KIERAN FLANAGAN: I suppose it's not as simple as that, that a lot of the reports come out between a month to a month and half after the date, let's say. The -- so if you're working in -- on a the report in November, you might be dealing with information from October or prior, depending on when the information was reported.

MR. BOB PETERS: And that's what I'm trying to get at, is your report was in December, so is it current to the 1st of December? Is it current to the 15th of November?

MR. KIERAN FLANAGAN: It would be closer to October.

MR. CAMPBELL ADAMS: Yeah, it -- we've referenced in the final report that some data comes from the -- a construction weekly report dated the 6th of October, and also the construction reports for the month of September, which were probably received, I don't know, towards the -- the end of -- of October. But by that time, you would had a -- pretty much a full season of the amending agreement, going back over the past twelve (12) months, so that -- that's a source of the -- the data that we've used.

MR. BOB PETERS: You're telling the Board, Mr. Adams, that you've used the data generated under the amending agreement number 7 to forecast the additional costs that are shown on MGF-4-1? On Exhibit MGF-4-1, there's a -- there's a line item for Voith and service contracts, and that's, I believe 46 additional million dol -- million dollars, correct?

MR. KIERAN FLANAGAN: Correct.

MR. BOB PETERS: And is it correct to understand that these contracts haven't yet been called into -- into play? They're not -- they're not due to be performed yet?

MR. KIERAN FLANAGAN: They're not due to be performed, but there's some claim and other issues with Voith. I don't have the details in front of me. And then because of extensions of time, the likes of camp services for roads and so on will be impacted, so that's the makeup of the 46 million.

MR. BOB PETERS: So the 46 million reflects the delay that is being -- the delay claims that are expected as a result of the general civil contractor's being late on delivery of his project?

MR. KIERAN FLANAGAN: From...

(BRIEF PAUSE)

MR. KIERAN FLANAGAN: Yeah, the Voith is based on a trend delay, and the -- the services are based on an extension of time on the overall project.

MR. BOB PETERS: And if we can turn to MGF-4 and look at the -- the scheduling history, this $46 million of delay claims on page -- unnumbered slide 12, this $46 million delay claim by Voith in the service contracts is from which of these dates to which of these dates on -- on the screen in front of you?

MR. KIERAN FLANAGAN: The delay claim with Voith, and I don't have the background here to -- but that's something that's documented. It's not in relation to that schedule.

MR. BOB PETERS: But it's in relation to Manitoba Hydro requiring the services of Voith at a later point in time than initially planned?

MR. KIERAN FLANAGAN: Correct.

MR. BOB PETERS: And so how -- my -- my question -- and maybe it's not very well asked is: What's the delay to Voith? How many months? How many years?

MR. KIERAN FLANAGAN: I don't have the data in front of me, to be honest, to answer that question, but it's not in relation to them schedules. That was a claim between Manitoba Hydro and Voith themselves.

(BRIEF PAUSE)

MR. BOB PETERS: Manitoba Hydro has suggested in their questioning to MGF that MGF is starting to take, or has -- is taking steps to mitigate the impact of the lack of productivity and additional costs to Amending Agreement 7.

Are you generally aware of that?

MR. KIERAN FLANAGAN: We've been made aware of it I think more so today than -- well, today.

MR. BOB PETERS: MGF hasn't assessed the impact of those mitigation steps, have they?

MR. KIERAN FLANAGAN: We weren't aware

of it until today.

MR. DAN CAMPBELL: Excuse me again.

MR. BOB PETERS: Yes, Mr. Campbell...?

MR. DAN CAMPBELL: I don't know if I'm allowed to actually say the number but I --

MR. BOB PETERS: Well, presume you're not.

MR. DAN CAMPBELL: Okay.

MR. BOB PETERS: Presume you're not and -- and maybe --

MR. DAN CAMPBELL: For the -- for the --

MR. BOB PETERS: -- we can chat about this in -- in the confidential in-camera session tomorrow, if that's important --

MR. DAN CAMPBELL: Okay, my only point --

MR. LESLIE BRAND: -- to you providing information to the Board.

MR. DAN CAMPBELL: -- my only point would be that a substantial number of the 49 million that was being discussed a moment ago is a Voith number which is directly related to the delay claim, delay issue.

MR. BOB PETERS: All right and it's 46

million --

MR. DAN CAMPBELL: Sorry.

MR. BOB PETERS: -- if we go back to Exhibit MGF-4-1?

(BRIEF PAUSE)

MR. BOB PETERS: Mr. Campbell, it's the $46 million number?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: And the delay claim, you're saying it's mostly related to the Voith contract as opposed to the service contracts.

Is that what I'm supposed to understand.

MR. KIERAN FLANAGAN: There's exposure on a larger claim from them Voith but we -- that figure is made up of approximately Voith 50 percent and approximately services 50 percent.

MR. BOB PETERS: And can you remind us, Mr. Campbell or Mr. Flanagan, what Voith were doing or what services they were providing?

MR. DAN CAMPBELL: Voith is providing the unit, so they're building the turbines and they're also purchasing the generators and doing other associated items, which actually generate the electricity when it's all said and done.

MR. BOB PETERS: And, Mr. Campbell, your understanding of their delay claim is that they're charging Manitoba Hydro more money on account of delivering the product -- the products later?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: And does that take into account then the -- the interest costs that Voith may have had to incur to build these -- these generators?

MR. DAN CAMPBELL: I don't know the makeup -- of their of their claim, but I'm presuming that some of it is cost of materials, some of it is interest. Who knows. But they -- they asked for and were given a substantial amount of money.

MR. BOB PETERS: Before I leave this slide, just one (1) last question. Do you need a minute, Mr. Flanagan?

MR. KIERAN FLANAGAN: No.

MR. BOB PETERS: We talked about the concrete and the earthworks productivity. And related to that, it's my understanding, from the evidence of Manitoba Hydro, that after 2017, BBE is 20 percent behind in concrete and 25 percent behind on the earthworks.

Do you agree with those numbers?

MR. CAMPBELL ADAMS: Yes, that's what's been -- that's what we've read in reports. Or been advised.

MR. BOB PETERS: Has your investigation been able to confirm that?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: We believe we have because of the -- the productivity calculations we've done.

MR. BOB PETERS: All right. And we're also -- if you can accept that this hearing's been told that BBE's productivity in 2018 will have to improve in order for the Amending Agreement 7 targets to be met on productivity and costs, correct?

MR. CAMPBELL ADAMS: I would agree, yes.

MR. BOB PETERS: And I'm hearing from MGF that, while that's the stated position, that the productivity will have to perform, you've approached it with your project estimated value that's on the screen in front of us, on the assumption that productivity does not improve?

MR. KIERAN FLANAGAN: No, we've based it on a cumulative to date, so that it won't improve from the cumulative to date, bef -- to be honest, we believe there's a good chance that it may worse.

MR. BOB PETERS: Okay. Well, let's -- let's jump to that then, Mr. Flanagan. Why does MGF think that the productivity may worsen.

MR. KIERAN FLANAGAN: Because on the concrete, for example, we have not taken into the winter work coming up, because that was only planned in late -- or sorry, I think it was past. I don't know the exact date in late November.

So it wasn't something we could take into account. And then more intricate work -- if it's an cumulative to date, and the work is getting more intricate, you would assume that the productivity is going to worsen. And we can only base it on the trend to date.

MR. BOB PETERS: But you acknowledge that Manitoba Hydro is suggesting that some of this intricate work that you've identified may be efficiencies because it's repeatable, and that we're going to have to do it more than once?

MR. KIERAN FLANAGAN: I cor -- I

agree. And there may be some offset, but we have to understand there's only seven (7) units. It's not -- it's not you're doing a hundred story building and he drywaller gets better as he goes up.

MR. DAN CAMPBELL: There's also been some opportunities for efficiency gains in the less intricate work to date, which may or may not have occurred.

MR. BOB PETERS: Mr. Campbell, of what -- what are you ref -- referencing?

MR. DAN CAMPBELL: If you look at the -- at the mass concrete work to date, much of it is repeatable. So presumably some of the efficiencies in the crews, et cetera, have been noticed to date, so then I don't -- I have -- should have occurred to date. And I don't know if that's been reflected in the productivity numbers that are being used to date because I didn't analyze those. So, Mr. Flanagan, might have a better answer on that.

MR. KIERAN FLANAGAN: Obviously, we can't get into the -- the man-hours per cube, but the figures we've used are accumulative to date, so they would have taken into simpler concrete pours. What -- sorry, "simple" is probably the -- the wrong word, but less complex.

MR. BOB PETERS: All right. Let's turn to Manitoba Hydro's rebuttal evidence, page 2 of Appendix A. And I'm sorry, I don't have the page of the PDF. I believe it's the KPMG document.

(BRIEF PAUSE)

MR. BOB PETERS: And if we scroll to the bottom of the page, the second last paragraph, in the middle of that. The consulting firm of KPMG came in -- and this is dated January 11th of 2018 -- had given advice to Manitoba Hydro in response to the MGF report, that, in respect of what's happened in the past with BBE, there were essentially three (3) options that Manitoba Hydro had, in terms of dealing with BBE when the productivity wasn't met.

Are you aware that?

(BRIEF PAUSE)

MR. BOB PETERS: All right. And so --

MR. CAMPBELL ADAMS: Sorry, say it again. Sorry.

MR. BOB PETERS: One (1) of the options that Manitoba Hydro's consultant is giving advice on, is that Manitoba Hydro could have the descoped the work from BBE, which would mean, I understand, to limit the amount of work that BBE does going forward.

Is that what descoping means?

MR. CAMPBELL ADAMS: Yes, it's to remove -- sorr -- sorry.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: Can I just clarify. You're asking about the options that Hydro considered in the quar -- end of Quarter 3/Quarter 4, 2016?

MR. BOB PETERS: You're correct.

MR. CAMPBELL ADAMS: Thank you. Yeah.

MR. BOB PETERS: And -- and this was -- this was at a point in time when Manitoba Hydro realized the productivity was a problem, correct?

MR. CAMPBELL ADAMS: Absolutely, yeah.

MR. BOB PETERS: And they'd actually recognized that --

MR. CAMPBELL ADAMS: Well --

MR. BOB PETERS: -- long before that?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And at -- at this time, one (1) of the options was to descope it, Mr. Adams, and that was essentially to take portions of the work away from BBE and give them to some other contractor?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: The other option -- or another option would have been to continue with BBE under some form of a new arrangement?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And of course, that's the option that has come to pass?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And a third option would be to terminate the arrangement with BBE, correct?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: If we go to...

(BRIEF PAUSE)

MR. BOB PETERS: I suppose, slide 23 from MGF Exhibit 4 the -- of this morning...

(BRIEF PAUSE)

MR. BOB PETERS: And we look to see whether the options to terminate BBE were seriously examined by Manitoba Hydro.

First of all, maybe we could put up Tab 2 of Manitoba Hydro's application, page 45, and scroll down to line 14.

This is Manitoba Hydro's application, and they're telling the Board that BBE Hydro Contractors LP -- I'm sorry, I've read it wrong again -- BBE Hydro Constructors LP, or Limited Partnership, was the successful general civil contractor, correct?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And you understand that this limited partnership is a consortium between Bechtel Canada, Barnard Canada, and EllisDon Civil Limited?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: Can you explain, and perhaps, Mr. Campbell, you can provide some help to the Board here, as to why do these construction companies form a consortium to come in on a project like Keeyask? You can answer too, Mr. Campbell -- or, Mr. Adams, sorry.

MR. CAMPBELL ADAMS: Joint ventures tend to come together because of the respective strengths of the -- the parties to the joint venture, or the skills that they have. That can be prior working experience in that industrial sector. It could be experience with the owner. Joint ventures tend to be stronger when they've worked together before and they're not doing it for the first time.

Each company has its own culture, ways of doing things. I've seen some successful JVs. I've also seen some that are quite difficult to -- to manage.

MR. BOB PETERS: When you say "JVs" you're -- you're saying that short form for joint ventures, correct?

MR. CAMPBELL ADAMS: Yes, sorry, joint --

MR. BOB PETERS: When --

MR. CAMPBELL ADAMS: -- ventures.

MR. BOB PETERS: When I say limited partnerships, does that mean the same thing to you, or do you know?

MR. CAMPBELL ADAMS: That's my understanding, although we have not -- I don't we reviewed the joint venture or the -- the agreement between those three (3) parties making up BBE Hydro Constructors LP.

MR. BOB PETERS: So you're not aware that BBE Hydro Constructors GP Incorporated is the general partner in the limited partnership? You -- you didn't go back to look at that?

MR. CAMPBELL ADAMS: Can you repeat the question, please, Mr. Peter?

MR. BOB PETERS: Do you know who the -- the general partner was in this limited partnership?

MR. CAMPBELL ADAMS: I don't believe I do.

MR. BOB PETERS: Do you know whether or not a performance bond was posted by BBE, in terms of this contract with Manitoba Hydro?

MR. CAMPBELL ADAMS: I don't know the answer to that.

MR. BOB PETERS: You're not aware of any surety that was posted by BBE --

MR. CAMPBELL ADAMS: I don't believe -- I don't believe we have reviewed that.

MR. BOB PETERS: In an earlier part of the presentation, I believe it was MGF's view that if the contractor wasn't delivering on its promises, one (1) of the remedies was to sue the contractor

MR. CAMPBELL ADAMS: I think it was in response from Mr. Grant and the panel, that if a contractor, in a lump-sum price doesn't perform, what do you do? Certainly being held to ransom, I don't think is the appropriate way. You've a contract between the parties, and that's what governs their relationship, including performance, and remedies in the event of nonperformance.

MR. BOB PETERS: Does that same answer apply when it's a limited partnership like BBE Hydro Constructors Limited Partnership?

MR. WILLIAM HAIGHT: I think you're asking for a legal opinion, Mr. Peters. It's beyond the scope of the MGF panel. While they have experience in negotiating and viewing contracts, that's a legal question and I don't think it's fair for this panel.

MR. BOB PETERS: You're at a depth on that, Mr. Haight, that I wasn't intending to go. So let's -- let's not ask you for a -- we're not asking for a legal opinion.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: But have you been involved in situations under a limited partnership, where the owner has terminated the arrangement and sued the limited partner?

MR. CAMPBELL ADAMS: Not of a limited partnership, no.

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: If -- if I can just add. The -- this partnership is the contracting entity in the -- with -- with BBE and with Hydro. They -- they share the risk of this nonperformance. They -- they have to stand up to be accounted -- be accountable for that.

MR. BOB PETERS: And I have your point. And -- and Mr. Haight's going to put his hand close to the microphone because even though BBE has to stand up for the contract, Mr. Adams, do you know what Limited Partnership?

MR. WILLIAM HAIGHT: I got -- you're right, Mr. Peters. My hand is close to the mic. And that's well beyond the scope of the work that MGF or KCB.

(BRIEF PAUSE)

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: At Board counsels'

book of documents, Volume VI, on page 43, I want to turn to the -- the MGF response. And the part that's not highlighted is where I want to go.

And it relates to a matter that you were in discussion with Ms. Van Iderstine on. And one (1) of the answers here is:

"MGF believes that a more hands-on construction management approach is required to improve BBE's performance."

Do you see that?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And I want to -- I just want to make sure this panel understands the depth to which you say Manitoba Hydro should be more hands-on on this particular project. Is it more than just having these meetings with the leads for BBE on the various projects?

MR. CAMPBELL ADAMS: Yes, I believe it is.

MR. BOB PETERS: So -- so how --

MR. CAMPBELL ADAMS: You -- sorry, you -- you can have meeting and you -- you work at a certain altitude that you -- you hear but you don't see, and you're not involved in finding better ways of working. I don't know how long you sit back watching a contractor underperform for you before you've got to take some action.

MR. BOB PETERS: Well, when you say that, Mr. Adams, what does that look like on the job site? So does that mean that there's a Manitoba Hydro worker with -- with a foreman from BBE as the craft labour is performing its job?

MR. CAMPBELL ADAMS: I -- I think, to me, it -- it looks like: We've been doing this for however long, you consistently don't deliver your promises. That might suggest that there's issues around how you plan, manage, and execute the works. It's cost reimbursable. You're spending my money. What do we need to do to address this? Help us understand what are you struggling with. If you're planning to do it this way, but you end up doing it this way and it's not working, and it's costing more time, more money, why is it? Is this the best that's going to be achieved? And if that's the case, then we need to re-look at schedule and cost. Are there ways that we can get you back to where you want to be as our contractor and perform as promised?

MR. BOB PETERS: What I hear you telling the Board is that Hydro should be giving more guidance and instruction.

If it -- is that what I hear?

MR. CAMPBELL ADAMS: I wouldn't say it like that. It's -- it's about the cost reimbursable pricing mechanism. You have a contractor spending your money, it's not going well, that needs to be arrested. So let's get involved in understanding why you're not performing to how you promised.

There -- there was a -- I got to be careful what I say -- but that there was an assumption in the -- I wouldn't call it even a tender -- but the -- the original target price of what productivity was. That was over -- overly optimistic.

You run into 2016, and it's not working. And Hydro stepped in, did the amending agreement. Let's restart, let's rethink. You go into 2017, and we find that -- that's not being met.

I wouldn't say it's about telling the contractor what to do. It's about understanding what are their challenges and how can we help them get it better. They've got to perform it.

MR. BOB PETERS: And what's the contractor's motivation for even listening to Manitoba Hydro provide that advice?

MR. CAMPBELL ADAMS: Well, I don't

know: reputation, loss of their profit. They're not at risk for cost, that's, in our view, a weakness.

MR. BOB PETERS: Yeah. From a cost perspective, their actual costs are going to be reimbursed by Manitoba Hydro?

MR. CAMPBELL ADAMS: Yeah.

MR. BOB PETERS: And only when Manitoba Hydro encroaches on the target price is the profit at risk for -- the for the contractor, correct?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: So -- so back to my question. Is it the contractor's reputation that's what's -- what -- what is motivating the contractor to pay attention to advice for Manitoba Hydro?

MR. CAMPBELL ADAMS: I think that most contractors are aware of their reputation in the marketplace. I'm sure they -- they want to do a good job. But reputations take long years to build and a few years to lose.

MR. BOB PETERS: But BBE Hydro Constructors Limited Partnership hasn't done previous Hydro projects, has it?

MR. CAMPBELL ADAMS: I would -- I would be referring to the constituent members of that limited partnership who would take pride in what they do.

MR. BOB PETERS: All right. On page 48 of Board counsels' book of documents, Volume VI, we see in the paragraph underneath the bullets at the top:

"Unless and until Manitoba Hydro adopts a hands-on role of construction manager for the general civil contract, the time for completion of this contract and the Keeyask Generating Station Project generally will take longer."

That's in your report?

MR. CAMPBELL ADAMS: Yeah.

MR. BOB PETERS: We're back to the hands-on comment again. But here it's "hands-on role of construction manager."

Is it construction manager or is it contract manager that we're -- we're focusing on?

MR. KIERAN FLANAGAN: What we're inferring there is not for them to be the contract construction manager that -- which is the role of the GCC. We're saying they need to act more like a construction manager, collaborate and get involved with the GCC, and come up with ways to improve.

And get people on site -- and I'm -- I'm not saying they don't have people on site, but maybe get more people on site that come from a craft background, that they work methods. And if the GCC is doing it one (1) way, suggest another way that may improve. And there's no reason why you shouldn't buy into another way, if it can improve productivity.

MR. BOB PETERS: Did MGF see any evidence that Manitoba Hydro was doing that in 2016?

MR. KIERAN FLANAGAN: Yes.

MR. BOB PETERS: Did MGF see any results from those efforts by Manitoba Hydro in 2016?

MR. KIERAN FLANAGAN: We weren't on the job in 2016.

MR. BOB PETERS: Then my -- my second last question to you, Mr. Flanagan, was -- I asked whether you -- MGF had seen Manitoba Hydro trying to do those hands-on approaches that you've talked about in 2016?

MR. KIERAN FLANAGAN: We believe, from our site visit and discussions with people, that issues still exist.

MR. BOB PETERS: Okay. You're going to have to help this Board understand a bit more.

You're saying that whatever efforts

Manitoba Hydro had made, they weren't bearing the fruit that was expected?

MR. KIERAN FLANAGAN: Well, It's all in the -- it's all in the figures. Since the amending agreement, the new man-hours per cube of earthworks or concrete, it's dis-improving; it's not improving. So while we use an example in the report, it's -- it's all in the matter. It's still ongoing.

So you get -- productivity is based on methods of doing work, and if -- if it's still isn't proving, well, I don't know what to say. It's the -- the interaction isn't -- if -- if there isn't improved interaction, it's not helping.

MR. BOB PETERS: All right. So, MGF is saying that you -- you accept that Manitoba Hydro is intent -- is attempting to take steps to motivate the contractor to be more productive? Does --

MR. KIERAN FLANAGAN: We've heard -- we've heard there's mitigation factors today. I can only take that on board as true.

MR. BOB PETERS: And then what you say in response is that the numbers don't bear that there's been an increase in improvement in productivity?

MR. KIERAN FLANAGAN: Correct.

MR. BOB PETERS: On page 49 of Board counsels' document, MGF introduces a different word in the paragraph. It says:

"Unless Manitoba Hydro is prepared to make a step-change in the management of the general civil contract, then it will continue to limp along, and it could result in a range of 9.5 to 10.5 billion."

Correct? Did I --

MR. CAMPBELL ADAMS: Yes, that's, correct.

MR. BOB PETERS: And when you say "a step-change," is that anything different than what you've told me about the hands-on comment?

MR. CAMPBELL ADAMS: I think that's a component of it, Mr. Peters. If things continue the way they are, then this is going to cost more than 8.7 billion. Year after year of not meeting targets is not going to end up in a good place.

MR. BOB PETERS: Does Manitoba Hydro expose itself to risk by doing what you're suggesting, in terms of trying to assist BBE in doing its job?

MR. KIERAN FLANAGAN: I don't believe so if it's collaborative, and whatever suggestions made are -- well, whatever suggestion is made, that they buy into it.

MR. BOB PETERS: All right. On Manitoba Hydro's rebuttal, page -- sorry, Manitoba Hydro Exhibit 117, and this is on page 4 of the KPMG letter, which is Appendix A to the evidence, and at the -- below the bullets, there's a paragraph that starts -- and I'll just let you read that paragraph, if you could.

MR. CAMPBELL ADAMS: Is it the one, "commencing ongoing monitoring"?

MR. BOB PETERS: Correct.

MR. CAMPBELL ADAMS: Thank you.

(BRIEF PAUSE)

MR. BOB PETERS: You've had a chance to read it?

MR. KIERAN FLANAGAN: Yes, but it needs to be weighed up, that's -- it's trending that it's going to cost a lot more than the amended agreement. It -- so much needs to be take -- taken. You can't just stand back and let it trend the way it's going.

MR. BOB PETERS: No, but the -- the

essence of this -- I'm going to assure Mr. Haight for the third time that I'm not seeking a legal opinion -- but the suggestion here, from Manitoba Hydro's consultant, is that if Manitoba Hydro gets aggressive in the direct construction management, it could be opening itself up to legal claims from BBE?

Do you, first of all, see that's --

MR. CAMPBELL ADAMS: On -- on what grounds?

MR. BOB PETERS: Do you see that's being said?

MR. CAMPBELL ADAMS: Yes, but what are the grounds for that?

MR. BOB PETERS: Well, I can tell you what -- what's written here, is they say that that may be frustrating the contract as between Manitoba Hydro and BBE.

(BRIEF PAUSE)

MR. BOB PETERS: Do you accept that's -- that's a risk Manitoba Hydro has to be aware of?

MR. CAMPBELL ADAMS: Yes, I think that is a risk they need to be aware of. It's an extreme one, but I think it's a risk, yes.

MR. BOB PETERS: And so how does Manitoba Hydro ensure they don't cross that line?

MR. CAMPBELL ADAMS: I think that's part of the collaboration with BBE that needs to be had to help them raise their game. If -- if the works were slowed done, I guess I'd have to figure out what are those activities or decisions that would frustrate the BBE consortium.

But the flipside is, if you don't do anything, and you continue down the path that they've been on for the last two (2) years, then where will that take you?

MR. BOB PETERS: On page -- sorry, on Board -- sorry, on MGF -- Exhibit MGF 2-1 -- or maybe even 2(r). It's the report. On page 70, the last paragraph...

(BRIEF PAUSE)

MR. BOB PETERS: BBE -- sorry, MGF is telling this Board that Manitoba Hydro should not accept inconsistent, inaccurate, and unreliable reporting from BBE, correct? So how does -- how does Manitoba Hydro change that?

Did -- did you follow where I am, Mr.

Adams?

MR. CAMPBELL ADAMS: Yes, Mr. Peters. It -- if -- if your contractor is not complying with the contract that you have signed with them, you have the -- the right to have that correct. If there's inaccuracies in the information they provide, that should be corrected.

Owners needs solid information with which to understand where they stand today, and to make decisions going forward. I -- I don't think it's too much to ask that contractors get their reporting accurate.

MR. BOB PETERS: So that's a voluntary compliance then by BBE to meet that standard?

MR. CAMPBELL ADAMS: No, I think it would be a contractual one.

MR. BOB PETERS: And how does Manitoba Hydro enforce that?

MR. BOB PETERS: They point to the contract and say, You've got a report -- there's a section in the contract about monthly reporting, what must be in there?

If they're not getting that, you politely say, Here's the -- the section in the contract, this is not in compliance with that, can you kindly please redo it.

MR. BOB PETERS: Okay. And take it a step further and BBE doesn't redo it, what happens next?

MR. CAMPBELL ADAMS: I wouldn't pay them for their people. It's cost reimbursable. We're paying for a team of 'X' to give me something you don't want.

MR. BOB PETERS: Is it MGF's view that Manitoba Hydro is not taking advantage of all of its powers under the Amending Agreement 7?

MR. CAMPBELL ADAMS: I think that we have seen instances where BBE is not complying with the requirements, its obligations under the contract, and that -- that continues or has continued for a period of time. Negative float is one. The other one that was shared with us was the monthly report always coming in at least seven (7) days after the due date in the contract.

They're -- they're small examples, but I would say they're symptomatic of a bit bigger issue.

MR. BOB PETERS: All right. Let's turn to contract types for a few minutes.

Maybe, Mr. Chair, we could to take a short break.

THE CHAIRPERSON: We'll take -- we'll take a break until ten (10) to 5:00. Thank you.

MR. BOB PETERS: Thank you.

--- Upon recessing at 4:38 p.m.

--- Upon resuming at 4:53 p.m.

THE CHAIRPERSON: Mr. Peters...?

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Yes, thank you. I'd like to start at page 54 of Board counsels' book of documents, volume 6, Exhibit 42-6 and on page 54, I'm going to the off-cited quote:

> "In construction time is money; in traditional fixed contracts time is the contractor's money; and in cost reimbursable contracts time is the owner's money."

That's a long-standing saying in the construction industry, is it?

MR. CAMPBELL ADAMS: Yeah, pretty much.

MR. BOB PETERS: Mr. Campbell, you're aware of that?

MR. DAN CAMPBELL: I'm going to agree with him pretty much.

MR. BOB PETERS: And, Mr. Adams, we've had a little discussion about cost reimbursable contracts and is it correct that the essence of that is, whatever cost is incurred by the contractor is paid to the contractor?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: Now Manitoba Hydro has said that theirs is not a pure cost reimbursable contract because they have introduced a target price component.

Are you aware of that?

MR. CAMPBELL ADAMS: I am.

MR. BOB PETERS: Does the target price component change the essence of the contract to something other than a cost reimbursable contract?

MR. CAMPBELL ADAMS: No.

MR. BOB PETERS: Can you explain why you say that?

MR. CAMPBELL ADAMS: A cost reimbursable component, as you've said, the contractor gets paid for its cost of performing the work; that is not necessarily coupled with a target price. A target price is a -- it's a target. It's a goal. It's something to attempt to achieve. But it does -- it does not put a cap on the costs that the owner would pay to the contractor in a cost reimbursable basis.

MR. BOB PETERS: So the target price is introduced by Manitoba Hydro to incent the contractor not to exceed the target price?

MR. CAMPBELL ADAMS: I believe that's the intent because if the contractor exceeds the target price, then it loses its profit and the GN&O as opposed to other targets where some owners insist that if the contractor who typically represents and warrants that its estimated price is sufficient for the work, if they go above that ceiling, then the contractor can bear some of that cost overrun.

MR. BOB PETERS: I'm sorry, I didn't -- I didn't follow that last answer, Mr. Adams.

MR. CAMPBELL ADAMS: On some cost reimbursable price contracts, the owners introduce of where you've got the target or the -- the -- the target price. If the actual cost goes above that, the contractor will share in the cost overrun.

So if the contract -- if the target price is 100 and the eventual cost is 110, the owner and the contractor will share in the paying of the $10 in whatever proportion they decide.

MR. BOB PETERS: And you understand, in this arrangement, there is some sharing of the pain up until a certain level?

MR. CAMPBELL ADAMS: Not -- not on cost, there isn't. But on losing profit, yes, and in losing the GN&O, yes.

MR. BOB PETERS: Let's turn to --

THE CHAIRPERSON: Sorry, Mr. Peters, can I just --

MR. BOB PETERS: Yes.

THE CHAIRPERSON: -- can I ask a question?

MR. BOB PETERS: Please.

THE CHAIRPERSON: Mr. Adams, these are categories of contracts, correct? The fixed-price, lump-sum, unit price and cost reimbursable, these -- these are just broad descriptions for contracts.

MR. CAMPBELL ADAMS: These are pricing mechanisms, Mr. Gabor.

THE CHAIRPERSON: Right but in terms of the contract and you can have varieties within the contract, you actually have to look at the specific terms in the contract?

MR. CAMPBELL ADAMS: Yes because they will vary from contract to contract from owner to owner and from contractor to contractor.

THE CHAIRPERSON: Right. So the rights and obligations, while you may have a unit price contractor it's described that way, going from contract to contract, you need to look exactly at what the terms are in that contract because somebody may call a contract a unit price contract and another contract, may call it a units price contract, but depending on what the specific terms are in the contract may actually be different --

MR. CAMPBELL ADAMS: That's -- that's correct.

THE CHAIRPERSON: -- concepts. Thank you.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: I'm going to ask that Manitoba Hydro's Exhibit 120, which was the slidedeck from Manitoba Hydro's witnesses and slide 31 be brought up, if it could.

Mr. Adams, in your discussions just a minute ago with the Chairman, you talked about the different types of contracts. This slide from Manitoba Hydro suggests that different types of contracts were used for different contractors on the job site at Keeyask?

Are you aware of that?

MR. CAMPBELL ADAMS: I see it, yes.

MR. BOB PETERS: In some of these situations, and I'm going to take camp operations services as an example. Was it your evidence today that that's appropriate that that be a cost reimbursable contract?

MR. CAMPBELL ADAMS: That's correct.

MR. BOB PETERS: Why is that appropriate for that to be a cost reimbursable contract?

MR. CAMPBELL ADAMS: One (1) of the defining conditions about -- around pricing is the level of definition or finalization of -- of what the contract is intended to procure. If you have a house and it's fully designed, you can get that in a lump-sum because it's fully designed. The camp operations would be -- would have variability in the number of people, for example, staying on the camp. So you wouldn't get that as a lump-sum because you don't know who is staying when.

So it's more appropriate to have that either as a cost reimbursable pricing mechanism or like in a hotel, a rate per bed per night.

MR. BOB PETERS: Under your example, Manitoba Hydro carries all the risk for the camp, then, is that correct?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: Why is that appropriate?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: We -- we have seen this done in two (2) ways, one is cost reimbursable and the other is on a like a hotel rate per night per bed.

And on the -- on the rate per night per bed, which is unit rate, then the kind of menus and the services is fixed and firm. With cost reimbursable there's more -- there's more scope for flexibility.

A lump-sum, as I've said, would be inappropriate because you don't know. No contractor can predict exactly what kind of occupancy level they would have.

MR. BOB PETERS: We've heard evidence in these -- in this proceeding, that Manitoba Hydro still has to do some work, I think it's been called, the south channel.

Do you know what that is?

MR. CAMPBELL ADAMS: The south dam?

MR. BOB PETERS: Yes.

MR. CAMPBELL ADAMS: Yep.

MR. BOB PETERS: Manitoba Hydro has to put a -- a dam on the south side of the generating station.

Is that your understanding?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And is it your understanding that that hasn't yet been done because the river is still running?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And because the river is still running Manitoba Hydro is not in a position to understand the geotechnical issues under the river?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And, Mr. Campbell, you spoke to this also today so -- so -- so don't sit too far back but -- and Mr. Campbell, your evidence that I remember was to the effect that Manitoba Hydro drilled, was it one (1) hole on that south dam area to test the geotech?

MR. DAN CAMPBELL: No.

MR. BOB PETERS: What was your evidence?

MR. DAN CAMPBELL: My evidence was that the area which I think it's in the river if we're speaking about the same issue that -- and I'm not the geotechnical engineer, is that that fault which they're concerned about extends, according to the information presented, on to land and that the investigations and information there was less or -- or perhaps enabled them to investigate it, right.

So consequently we und -- we -- we agree and understand why they didn't go and play in the river, but we believe that they had the opportunity to do the investigation or do enough investigation to get a reasonable idea about what is under the river.

MR. BOB PETERS: And that reasonable exploration, to your evidence, has -- has generally been done?

MR. DAN CAMPBELL: That -- it was an area where we thought there -- there could have been more work done. I believe that's what -- what I indicated earlier.

MR. BOB PETERS: All right, so -- so why should --

MR. DAN CAMPBELL: There's always a risk.

MR. BOB PETERS: Why should BBE carry the risk for what happens with the geotechnical issues under the river when it comes time to putting in those south dams?

MR. CAMPBELL ADAMS: They -- they shouldn't carry that risk.

MR. BOB PETERS: And they shouldn't carry that risk, Mr. Adams, because they don't know any better than you and I know what's underneath there; correct?

MR. CAMPBELL ADAMS: Exactly.

MR. BOB PETERS: And -- all right. If Manitoba Hydro -- then Manitoba Hydro should carry that risk?

MR. CAMPBELL ADAMS: Manitoba Hydro carries that risk because it's their project, and they -- they don't know either.

MR. BOB PETERS: And so as between BBE and Manitoba Hydro, it is more appropriate that Manitoba Hydro bear 100 percent of that risk?

MR. CAMPBELL ADAMS: That would be correct, yes.

MR. BOB PETERS: And to bear 100

percent of that risk it would be a cost reimbursable contract that would be used?

MR. CAMPBELL ADAMS: Not necessarily. There is -- if you know what the -- the design is and you don't know what the geotech conditions precisely are, you can get rates for concrete rates for excavation, rates for formwork and if you've got to go deeper, for example, than what you put into your tender document, then you would measure more quantities and reimburse your contractor on a unit rate basis.

MR. KIERAN FLANAGAN: Just alternatively, you could have a hybrid contract as well which would be unit rate for everything aboveground, including provision and sums for everything below ground, which will be cost reimbursable belowground and then once you get out of the ground, where you know the design to make it a unit rate or a lump sump.

MR. BOB PETERS: Mr. Campbell, you are in agreement with Mr. Flanagan on that latter point of the hybrid contract?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: Have you se --

MR. DAN CAMPBELL: It's quite common

to actually have multiple -- multiple pieces inside a contract where some are unit rates and some are reimbursable based on what you don't know yet.

MR. BOB PETERS: And that's to the same general civil contractor?

MR. DAN CAMPBELL: Yes.

MR. BOB PETERS: So is it one (1) contractor has more than one (1) con -- sorry.

Is it such then that the general civil contractor has more than one (1) contract with Manitoba Hydro?

MR. DAN CAMPBELL: No.

MR. BOB PETERS: It's one (1) contract with many subcomponents?

MR. DAN CAMPBELL: Yes. There'll be a different payment item for excavation, for example, for the south down. Might be paid on -- in a different manner much the same as the table you have on the screen right now, right, where that would be a cost reimbursable piece but another piece like the construction of the -- of all the fills, et cetera, is paid on the unit rate basis, for example.

MR. BOB PETERS: All right. And your point, Mr. Flanagan, is that if it was belowground Manitoba Hydro should carry a hundred percent of the risk; but if it's aboveground, the contractor should carry the risk in accordance with what Manitoba Hydro has designed?

MR. KIERAN FLANAGAN: Where there isn't a full geotech study, and the contractor can't properly price the work ahead to fix it, yes, generally the risk will be taken by the client.

MR. BOB PETERS: All right. Let's -- let's transfer that answer to the Keeyask generating station. The -- the geotech work or the work below the ground, MGF is saying is properly in a cost reimbursable contract as one example?

MR. KIERAN FLANAGAN: Due to the geotech knowledge at the time of the work, yeah.

MR. BOB PETERS: And, Mr. Adams, you gave us an alternative view that you could use different contracts for the same unknown work.

MR. CAMPBELL ADAMS: You can use different pricing mechanisms that would be contained within the one (1) contract.

MR. BOB PETERS: All right, so --

MR. CAMPBELL ADAMS: Not different contracts.

MR. BOB PETERS: You've corrected me. It's still one (1) contract but it's the pricing mechanism under the contract could be cost reimbursable if it's underground or it could be unit price or fixed price and --

MR. CAMPBELL ADAMS: Yes, and generally, what we do we -- we stratify the scope of work and the scope of work that is, say, cost reimbursable would point to a that section in the pricing schedule that would set out how that scope would be valued and paid to the -- to the contractor.

MR. BOB PETERS: And, Mr. Campbell, you're saying that in major hydro-generating station constructions, the hybrid contract is used regularly?

MR. DAN CAMPBELL: Yes. And not only is the -- is it used that way to price it, but the contingency when you figure out your contingencies on it may be applied differently to the different pieces. Because you're trying to mitigate the risks and if the risks are high, you have -- obviously have a higher contingency.

So if you're -- if you're -- if you know exactly what you're going to build, presumably the contingency would be lower than if you're doing excavation to an unspecified depth.

MR. BOB PETERS: I'm not sure I follow, Mr. Campbell. Does that suggest that the contingency then isn't just a percentage of the overall contract but --

MR. DAN CAMPBELL: Correct.

MR. BOB PETERS: -- it's based on the stratification of the components of the contract?

MR. DAN CAMPBELL: Often, if you have multiple types of -- of payment in there the contingency for the different payment items might be dependent on the payment item or what you're doing.

MR. BOB PETERS: Okay. I think I have your point. So if we rewind the clock and, witnesses, you heard earlier today some of the steps that Manitoba Hydro took dating back to 2012 when they were investigating going to market. I believe the evidence suggests that Manitoba Hydro held meetings with various contractors. And that's what you would expect before they go to -- go to market for a project of this size?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And when they met with various contractors, would you expect those contractors to indicate a preference as to what type of contract they would like to -- or what pricing mechanism under the contract they'd like to work to?

MR. CAMPBELL ADAMS: It -- it's

possible. Typically, when owners go to market they have their preferred contracting strategy and they're trying to test the doability, achievability of that rather than go out and say, well, what would you like?

MR. KIERAN FLANAGAN: I believe the contractors were asked -- or given an opportunity for their opinions what they'd like to see in the contract.

MR. BOB PETERS: Is that right or wrong?

MR. KIERAN FLANAGAN: That's what I bel -- that's what we were advised.

MR. BOB PETERS: No, I'm sorry, but is that -- is that a good thing to do, or a bad thing to do?

MR. KIERAN FLANAGAN: Personally, I haven't come across it before.

MR. BOB PETERS: So the owner doesn't ask the contractors what kind of a contract they'd like?

MR. KIERAN FLANAGAN: No, it was elements what they'd like to see in the contract and then each contractor put forward what they'd like to see and, from my recollection, Manitoba Hydro then took on board what they -- what they agreed was reasonable to see in the contract. So I'm not saying it's wrong or right, I just haven't experienced it before.

MR. BOB PETERS: My understanding of the evidence is that back in 2013 there was an indication to Manitoba Hydro that contractors weren't interested in hard money contracts.

Do you have the same understanding?

MR. KIERAN FLANAGAN: I don't think we can speak to that. We weren't involved in the project in 2013.

MR. BOB PETERS: You were involved in the Alberta market in 2013, were you?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: Was it a hot market in the oil sands?

MR. CAMPBELL ADAMS: Yes, it was busy.

MR. BOB PETERS: Can you indicate to this Board how the contracts in the oil sands projects are structured for payment?

MR. CAMPBELL ADAMS: They -- they use all of the above depending on scope, depending on risk, depending on whether there's a design for the facility, but if there's no design and you want to get out tomorrow and start digging and building then it's cost reimbursable.

If you've got an idea of what your design is, you can take off estimated quantities and tender it unit rates.

MR. BOB PETERS: In your review of the Manitoba Hydro documents, did you go back to the tender documents that applied to the original contract with BBE?

MR. CAMPBELL ADAMS: Yes, I believe.

MR. BOB PETERS: And I'm not asking you to get into any depth or any numbers in respect of these questions, but you're aware that Manitoba Hydro received multiple bids for the work that they were tendering?

MR. CAMPBELL ADAMS: Do you mean bids or responses to prequalification?

MR. BOB PETERS: To me they mean the sa -- oh, sorry, not -- not prequalification, I'm talking about bids in response to the tender for the Keeyask general civil contract?

(BRIEF PAUSE)

MR. CAMPBELL ADAMS: There was more than one (1) and less than six (6). I'm not sure if it's commercially sensitive, so I'm...

MR. BOB PETERS: You know what, I -- I think we'll stick with that answer because I don't think it is CSI, but I'm not the purveyor of all of that knowledge.

So, you're aware that Manitoba Hydro had a number of contractors that responded to its tender?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And as a result, Manitoba Hydro selected one (1) of those contractors that submitted a response, correct?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: Maybe on the screen if we could just go to Manitoba Hydro's Exhibit 120 to slide 34. Yes.

In 2013, there were four (4) proponents prequalified?

MR. CAMPBELL ADAMS: Yep.

MR. BOB PETERS: All right that tells me that it's not necessarily a CSI number.

You had an opportunity to look at the proposals and -- and that -- that were submitted in response to Manitoba Hydro's issuing a tender?

MR. CAMPBELL ADAMS: We looked at the

-- the -- the tabulation of that, the evaluation of what figures were given by each proponent.

MR. BOB PETERS: And did you look at the productivities; is that which you're telling the Board?

MR. CAMPBELL ADAMS: No, I am telling you that the -- each -- if you call it a bid because this is a cost reimbursable contract that they -- they give an assessment of what they thought direct costs would be; what their indirects would be; I believe what their profit was; what -- what contingency they would -- they had included in their -- their target price. They were -- they -- they were very -- they were very different in terms of value and percentage. I'm not sure how else to characterize that without going too far.

MR. BOB PETERS: All right.

(BRIEF PAUSE)

MR. BOB PETERS: In volume 6 on page -- of Board counsels' book of documents, page 44 at the bottom, you make -- MGF makes a finding with respect to Keeyask board recommendation; correct?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: And when you say "board recommendation," you're meaning the Manitoba Hydro Electric Board of Directors?

MR. CAMPBELL ADAMS: I believe so.

MR. BOB PETERS: And in this particular case reference is shown as to -- the information that you were provided from the -- the minutes of those board meetings?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: And in it, Manitoba Hydro was advised that Bechtel was a self-performing contractor on the Limestone project in Manitoba, correct?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: Is it also MGF's view that -- that in and of itself shouldn't have been accepted at face value? Well, first of all, what is a self-performing contractor?

MR. CAMPBELL ADAMS: A self-performing contractor in our world is a contractor who -- who directly employs within their organization the -- the construction disciplines with will -- with which to build a project as opposed to a contractor who predominantly would outsource or subcontract to others or opposed to a construction manager who directs many smaller companies in performing the work.

MR. BOB PETERS: So that suggests that when Bechtel was working on the Limestone project, it had its own employees under the various disciplines needed?

MR. CAMPBELL ADAMS: That is our understanding, yes.

MR. BOB PETERS: And on this project, did BBE have its own employees under the various disciplines or did it go out and hire the sub-trades?

MR. CAMPBELL ADAMS: BBE or Bechtel?

MR. BOB PETERS: BBE.

MR. CAMPBELL ADAMS: I believe the majority are -- are directly employed in accordance with the -- the Burntwood Nelson agreement.

But the -- but the -- I think the difference is, up until they started working for BBE they weren't with BBE; whereas a self-performing contractor moves their direct employees from one contract to the next. So they understand who their supervisors are. They understand the language. They understand the systems of that organization.

In -- in this construct, you've got a joint venture limited partner with three (3) parties, and I don't know the degree to which they've actually worked together before.

MR. BOB PETERS: But you're saying that BBE was not a self-performing contractor then.

MR. CAMPBELL ADAMS: I wouldn't describe BBE as a self-performing contractor. Sorry.

(BRIEF PAUSE)

MR. BOB PETERS: Any comments to add, Mr. Campbell?

MR. DAN CAMPBELL: Both Barnard and EllisDon are self-performing contractors, as far as I'm aware.

MR. BOB PETERS: And do you know if they brought their own resources to the Keeyask site?

MR. DAN CAMPBELL: I believe that they brought some of their own resources to the Keeyask site.

MR. BOB PETERS: Do you have any different information on MGF side?

MR. CAMPBELL ADAMS: No, we're not aware of that.

MR. BOB PETERS: On the top of page 45 there is a -- an observation and a finding by MGF related to the lowest cost and offer best value to the project in description of BBE.

Do you see that?

MR. CAMPBELL ADAMS: Yes.

MR. BOB PETERS: And MGF doesn't agree that that's accurate?

MR. CAMPBELL ADAMS: Correct.

MR. BOB PETERS: And can you explain why not?

MR. CAMPBELL ADAMS: We don't believe that the offer was -- was cost. It was an estimate. There were -- I believe there were -- I think there were -- I think quantities put into the tender documents. The proponents put in unit rates to come up with their initial target price. But that's not the basis upon which the contractors would be compensated.

So to have a -- to -- so four (4) proponents, four (4) very differing initial target price -- prices, they're not firm and fixed. It's a -- it's a -- it's a target. It's a goal. What is clear, that they get compensated on whatever their actual costs will eventually be.
