

1284-435

The image shows a close-up of a rock face with prominent sedimentary structures. The rock is composed of alternating light-colored (tan or grey) and darker (grey or black) layers. The lighter layers appear to be composed of fine-grained material, possibly siltstone or shale, and show some internal layering or bedding. The darker layers are more irregular and textured, possibly representing a different rock type or a zone of weathering or fossilization. A small white label with the number '1284-435' is attached to the left side of the rock, oriented vertically. The overall appearance is that of a geological outcrop in a natural setting.
