WILLISTON BASIN ARCHITECTURE AND HYDROCARBON POTENTIAL

Water Driving Force – Birdbear Aquifer  
Sheet 20 of 55

by  
D. Palombi and B.J. Rostron

The water driving force vector map quantifies the apparent hydraulic gradient and horizontal directions of formation water flow. Direction and magnitude of flow are identified by the density-dependent water driving force vectors (black arrows). Contour lines of freshwater hydraulic head are overlain on the water driving force map to show the direction of flow interpreted from the potentiometric surface alone. The azimuthal difference between the density-dependent water driving force (black arrows) and the hydraulic gradient driving force (gray arrows) vectors are highlighted by the coloured contours ranging from light to dark orange as the angle between the two components increases respectively. To model the density-dependent water driving force, grids of *insitu* brine density, salinity, hydraulic head, formation temperature and aquifer structure were required and calculations were performed using a Visual Basic Code. The equation of state was used to calculate brine density across the aquifer. Grids were generated in Golden Software Inc.'s Surfer Version 8.0 using a kriging interpolation algorithm and the results were contoured and projected using Generic Mapping Tools (GMT) with manual modifications when necessary. Areas in which anomalies may be present may not be accurately portrayed and are likely the result of data control, interpolation, and mapping algorithms.

Although the Saskatchewan Ministry of the Economy has exercised all reasonable care in the compilation, interpretation, and production of this map, it is not possible to ensure total accuracy, and all persons who rely on the information contained herein do so at their own risk. The Saskatchewan Ministry of the Economy and the Government of Saskatchewan do not accept liability for any errors, omissions or inaccuracies that may be included in, or derived from, this product.
