INTRODUCTION

East Routledge Unit No. 1 Enhanced Oil Recovery (EOR) Waterflood Project was approved under Board Order No. PM 20 effective May 1972 with Samedan Oil of Canada Ltd. as Operator. Tundra acquired the unit from Topa Resources Ltd. and became operator in April 2002. The EOR project area contains 39 wells in 27 LSDs in Township 9, Range 25 W1 as shown in the figure below. Well list and well status is available in Appendix A.

Figure 1: East Routledge Unit No. 1 Area Outline

In accordance with Section 73 of the Manitoba Drilling and Production Regulation, Tundra hereby submits the 2013 Annual Progress Report for East Routledge Unit No. 1 as required by Broad Order No. PM 20.

DISCUSSION

Production History

For the wells included in East Routledge Unit No. 1, production started January 1964 with the 00/07-11-009-25W1/0 well. Oil production peaked at 140 m³/d in March 1968. The Unit was producing 8.7 m³/d of oil and 794 m³/d of water in December 2013. The water oil ratio (WOR) averaged 78 m³/m³ in 2013. The rates and WOR are plotted in Figure 2.

Figure 2: East Routledge Unit No. 1 Production/Injection Rates and WOR vs. Time

Figure 3 shows the cumulative production for East Routledge Unit No. 1 to the end of December 2013 as 589 E³m³ of oil, and 6101 E³m³ of water. The cumulative water injected is 6370 E³m³.

Figure 3: East Routledge Unit No. 1 Cumulative Oil, Water and Water Injected vs. Time

Waterflood History

As of December 2013 the Unit has 3 active vertical injectors and injector patterns in place. Water injection started in August 1964. The injector in the northernmost pattern 00/06-14-009-25W1 was abandoned in 2003.

An overall summary for each injector pattern is presented in Appendix C.

Any future revisions to the waterflood development or surveillance plan would be based on new production or performance response data, technical studies, or observed reservoir behavior and reserves recovery interpretations.

Waterflood EOR Operating Strategy and Performance

Water Source and Quality

Currently there is no source water being used at East Routledge Unit No. 1. Produced water is re-injected back into the formation after filtration.

Injection Wellhead Pressures

The average monthly wellhead injection pressures, for each injection well, are summarized in Appendix B, and show all injection pressure since 2003. Average pressure for the injectors is as follows: 3800 kPag for 00/14-11-009-25W1/00, 1900 kPag for 00/12-11-009-25W1/00 and 4400 kPag for 00/04-11-009-25W1/00.

Reservoir Pressure

No reservoir pressure measurements were taken at East Routledge Unit No. 1 in 2013.

Well Servicing

No maintenance was required on the 15 wells in East Routledge Unit No. 1 in 2013.

Voidage Replacement

Cumulative voidage for the East Routledge Unit No. 1 was 0.948 in December 2013. Tundra hopes to maintain this cumulative VRR, by keeping water injection at its current rate for the foreseeable future. Calculation, plots and tables of the Voidage replacement ratio on a monthly and cumulative basis for each injection pattern and for the project area are presented in Appendix D.

Waterflood Performance Discussion

OOIP for East Routledge Unit No. 1 is 1,684 E³m³. Current recovery factor within the Unit is approximately 35%. Ultimate recovery factor for the East Routledge Unit No. 1 is estimated to approach 40% by decline analysis. The flood has significantly outperformed the predicted estimated ultimate recovery factor of 31.5% predicted in June 1988.

Overall this waterflood has been extremely effective as evident by the significantly high estimated ultimate recovery factor. Two major factors have contributed to the Unit's high recovery. The first is time; this is a mature waterflood that has been in operation and managed relatively well for nearly 40 years. The unit has been producing at watercuts close to 95% for the last 20 years indicating that the flood is in the late stages of its production life, post water breakthrough, etc. The second major factor that has led to such a high recovery factor has to do with development that occurred in 2002-2003 when horizontal drilling technology was applied to the unit. When horizontal wells were drilled into the unit, unit production increased nearly 10 fold. A portion of the reserves recovered by each horizontal well can be attributed to production acceleration, however, with such a dramatic effect on the units overall production, it is clear that incremental reserves were also encountered when the horizontal wells were drilled. These incremental reserves have also contributed to the Units overall high recovery factor.

Tundra has no definite plans to significantly alter the way in which the waterflood at East Routledge No. 1 is currently operating; i.e. no drilling plans. The focus at this phase in the pools development is really acceleration of long-life post water breakthrough (high WCT) reserves; in the foreseeable future Tundra will focus on smaller capex items such as pump up-sizes and potentially 1-2 electrical submersible pump installations.
