INTRODUCTION

Sinclair Unit No. 3 Enhanced Oil Recovery (EOR) Waterflood Project was approved under Waterflood Order No. 18 effective November 1, 2009 with Tundra Oil and Gas (Tundra) as Operator. The EOR project area contains 98 producing wells and 20 horizontal injectors in 6 sections in Township 8, Range 29 W1 as shown in the figure below.

Figure 1: Sinclair Unit No. 3 Area Outline

In accordance with Section 73 of the Manitoba Drilling and Production Regulation, Tundra hereby submits the 2015 Annual Progress Report for Sinclair Unit No. 3 as required by Waterflood Order No 18.

DISCUSSION

Production History

For the wells included in Sinclair Unit No. 3, production started in November 2004 with the 00/09-10-008-29W1 and 00/16-10-008-29W1 wells. Oil production peaked at 4.9 m³/d in September of 2006. This production was coming from 96 wells and totaled 468.0 m³/d for the whole Unit. Water injection began in July 2010. Water injection rates were

356.8 m³/d in December 2015 through 20 injection wells and the Unit was producing 145.9 m³/d of oil and 86.7 m³/d of water. The rates and WOR are plotted in Figure 2.

Figure 2: Sinclair Unit No. 3 Production/Injection Rates and WOR vs Time

Figure 3 shows the cumulative production for Sinclair Unit No. 3 to the end of December 2015 as 717.4 e³m³ of oil and 253.2 e³m³ of water, representing a 14.7% recovery factor of the OOIP. The cumulative water injected is 685.4 e³m³.

Figure 3: Sinclair Unit No. 3 Cumulative Oil, Water and Water Injected vs Time

Waterflood Development Plan

Sinclair Unit No. 3 Waterflood (WF) Development Plan

Sinclair Unit No. 3 is still in the early stages of water injection, with injection beginning in July 2010. As of December 2015, the Unit has 20 active horizontal injectors. It is currently anticipated that the 02/09-12-008-29W1 well will be converted to an injector Q1 2017. All injection wells are fracture stimulated to improve the injection rates.

Any future revisions to the waterflood development or surveillance plan would be based on new production or performance response data, technical studies, or observed reservoir behavior and reserves recovery interpretations.

Waterflood EOR Operating Strategy and Performance

Water Source and Quality

The injection water for Sinclair Unit No. 3 is sourced from the 16-32-007-29W1 well (Lodgepole formation). The water is treated at the 03-04-008-29W1 battery where it is filtered to 0.5 microns and has scale inhibitor added. The injection water is then distributed to the injectors through the dedicated infrastructure system.

Injection Wellhead Pressures

The monthly wellhead injection pressure, for each injector well, is summarized in Appendix B. Since injection in this Unit is still in the early stages, many of the injectors are still building up to a target injection pressure of 6300 kPaa.

Reservoir Pressure

Where possible, Tundra is committed to collecting pressures from every new injection well drilled. Currently, for Unit 3 the pressure data from 18 locations is available. Appendix A summarizes these results. The pressures were corrected to a common datum of -450 m SS for comparison. The table shows quite a range in pressure, from a low of 2100 kPaa to a high of 4900 kPaa. These values appear reasonable given their location in the pool and the corresponding production voidage in the surrounding area.

Well Servicing

The following table summarizes the well servicing performed within Sinclair Unit No. 3 during 2015:

Table 1: Sinclair Unit No. 3 Well Servicing

100.04-03-008-29W1.00	Pump Change	2/9/2015
100.03-10-008-29W1.00	Pump Change	6/18/2015
100.16-01-008-29W1.00	Pump Change	8/13/2015
100.14-03-008-29W1.00	Pump Change	8/19/2015
100.01-03-008-29W1.00	HCL Acid Stimulation / BHP Change	9/10/2015
102.06-01-008-29W1.00	Pump Change & Acid Job	9/12/2015
100.06-03-008-29W1.00	Pump Change	9/17/2015
100.06-11-008-29W1.00	Pump Change & Acid Job	9/24/2015
100.08-10-008-29W1.00	Pump Change	10/2/2015
100.16-10-008-29W1.00	10 Tonne Re-Frac	11/26/2015

Voidage Replacement

Water is being injected to re-pressurize the reservoir due to cumulative primary production voidage and corresponding pressure depletion. During the initial fill-up period, the instantaneous voidage replacement ratio (VRR) averages approximately 1.25 to 2.0 by individual patterns. The injector pattern VRRs will be discussed in the waterflood performance section of the report.

Waterflood Performance Discussion

At the end of 2015, Sinclair Unit No. 3 waterflood area had 21 injector patterns in place. However, only 20 of these patterns are on active water injection and the remaining pattern should be on injection in 2017. Water injection started in July 2010 at the 02/01-03, 03/01-10 and 02/08-10 injectors. From August 2010 to January 2011, 15 additional wells were converted to injectors. All 21 injection patterns are set up with a single horizontal injection well supporting production from four vertical wells to the north and four vertical wells to the south completing waterflood patterns at an effective 20 acre spacing.

An overall summary for each injector pattern is presented in Appendix C. Plots of the production and injection data along with the VRR information are presented in Appendix D for each of the injector patterns.
