UMA Project No.: 0217-158-03 (4.6.1.1)

Mr. Bob Gill, M.N.R.M.
Senior Environmental Specialist
Manitoba Hydro/Centra Gas
820 Taylor Avenue
Winnipeg, Manitoba
R3C 2P4

Dear Bob:

Re: Toxicity Tests of Groundwater Entering the Red River Report

UMA Engineering Ltd. (UMA) is pleased to provide you with three (3) copies of this letter report documenting the results of the preliminary groundwater toxicity tests at the Sutherland Avenue former Manufactured Gas Plant (MGP) site.

Background

It was earlier estimated by UMA, based on the currently available contaminant hydrogeological data for the Sutherland former MGP site, that about 370 g of naphthalene may be entering the Red River annually as dissolved phase transport in the shallow groundwater system. We noted earlier that on a total mass basis, this is very small relative to the mass of PAHs currently resident in riverbed sediments adjacent to the site, which is best explained by the historical direct deposition of coal tar to the river via land drainage sewers and surface run-off.

UMA's 2004 ecological risk assessment of the contaminated sediments, based on sediment-dwelling invertebrate community composition, showed that the benthos are not appreciably impacted in comparison with other urbanized riverbed areas of the Red and Assiniboine Rivers. However, Manitoba Hydro requested UMA to undertake groundwater toxicity tests at the former Sutherland Avenue MGP as part of the on-going groundwater monitoring program.

UMA initially provided a proposed sampling and analytical plan to directly test the toxicity to aquatic life at the former MGP from areas of the groundwater plume immediately upgradient from the point of entry into the Red River. Based on earlier site characterization involving the installation of groundwater monitoring wells at key locations downgradient from the site and at points along the river bank (west of Rover Ave.), monitoring wells MW-29, MW-23, MW-24 and MW-42 are inferred to occur within the zone of groundwater contamination (Figure 01). Piezometer MW-41 was installed in a location that is outside of the zone of groundwater contamination, based on data from groundwater samples collected in 2003, and was selected as a site reference for the laboratory toxicity tests. Each well location includes 3 to 4 nested piezometers, installed at different depths. The samples for toxicity testing were obtained from piezometers representing groundwater depths where the highest PAH concentrations were documented previously.

We noted our concern that some of the piezometers – especially at sites MW-23 and MW-24 – might have been installed in intimate contact with soils containing free-phase hydrocarbons, and therefore might represent a highly localized condition vis-à-vis groundwater PAH concentrations, relative to those conditions that might prevail over a distance of metres to tens of metres laterally.

PLAN

SCALE 1:2000

This proposed plan also included the installation of drive-point piezometers across the plume trajectory within 1-2 m of the high water mark. This was in light of the above-mentioned concerns. The intent was specifically to capture groundwater samples representative of conditions at the discharge interface into the river, in the absence of highly localized influences in areas farther removed from the river.

The initial proposal included estimates associated with the testing of each sample of groundwater recovered based on mortality over 96-h of rainbow trout fry, as well as longer exposure durations [i.e. a 7-day exposure of embryos (E-test), a 28 d exposure of embryos/alevins (E-A test), and a 90 day exposure of embryos/alevins/fry (EAF-test)]. The 96-h trout fry assay is considered to be a sensitive aquatic toxicity test, even though it is for a short exposure duration, since the test utilizes a highly sensitive life station. Longer term sub-adult tests (28-d and 90-d) are used infrequently in effluent monitoring programs, but are considered highly sensitive.

This proposed level of effort was revised to reflect a phased approach to the Sutherland site toxicity testing of the groundwater entering the Red River as described below.

Scope of Work

The scope of work for the first stage of groundwater toxicity testing included:

- The collection of groundwater samples from the following existing wells along the Red River;

| | |
|-------------------------|----------|
| • MW-41C (Reference) | • MW-23C |
| • MW-29B | • MW-23D |
| • MW-29C | • MW-24D |
| | • MW-42C |

- Conducting 96-hour trout fry toxicity tests for a range of concentrations, at Vizon SciTec, Vancouver, BC;
- Collecting separate groundwater samples for the analysis of PAHs and BTEX; and
- Providing a report assessing the results and recommending the next phase of monitoring.

Methodology

Prior to groundwater sampling, the above listed monitoring wells were monitored for water levels and purged to remove any accumulated sediment. Approximately 15 to 20 L of water was purged from each well, after which five days were allowed to pass before sampling.

Groundwater sampling was conducted on April 25, 2005. Two 20 L water samples were obtained from each well for toxicity testing. Sample containers consisted of new 20 L flexible plastic water containers which were rinsed with de-ionized water, then sample water prior to sampling. Between the filling of the two 20 L containers, samples were collected for chemical analysis. This included one 1 L amber glass bottle for PAH analysis and three 40 mL vials for BTEX analysis. All of the samples were obtained using low flow sampling techniques with a peristaltic pump. Care was taken not to introduce any sediment or bubbles into the samples. Conductivity and pH

measurements were taken at the beginning, middle and end of sampling each well to ensure consistent sample quality. A blind duplicate sample was also collected from monitoring well MW-29B for PAH analysis and labeled as MW-29D.

Samples for toxicity testing were immediately placed in coolers with ice packs and shipped to Vison SciTec in Vancouver, along with the appropriately completed Chain of Custody forms. Toxicity tests were conducted according to Environment Canada methodology (2000: Reference Method for Determining Acute Lethality of Effluent to Rainbow Trout, EPS 1/RM/13, Second Edition, December 2000).

The groundwater sample from MW-23C exhibited the presence of a Light Non-aqueous Phase Liquid (LNAPL) floating on the surface of the groundwater sample. The sample from MW-24D exhibited the presence of a Dense Non-aqueous Phase Liquid (DNAPL) at the bottom of the sample container. The NAPL in the above monitoring wells was observed during purging of the wells. Accurate measurements of product thickness could not be obtained due to suspected interference of sediment in the case of the DNAPL and product sticking to the probe in the case of the LNAPL. As noted in the Background section, monitoring wells MW-23 and MW-24 might have been installed in intimate contact with soils containing free-phase hydrocarbons, and therefore might represent a highly localized condition vis-à-vis groundwater PAH concentrations, relative to those conditions that might prevail over a distance of metres to tens of metres laterally.

Results

Prior to obtaining the groundwater samples, a brief review was undertaken of the expected sensitivity of freshwater fish species to some of the more water soluble PAH constituents of coal tar. The USEPA "ECOTOX" database was accessed on line. The papers that form the basis of the excerpted data were not reviewed. A summary of the aquatic life toxicity data is provided in Appendix A.

Naphthalenes are the primary PAH of concern in groundwater beneath the Sutherland Site, owing to their abundance in the coal tar historically deposited there as well as the greater solubility of naphthalenes in comparison with higher molecular weight PAHs. The most sensitive response from Appendix A was a 27-d LC50 estimate of 110 µg/L for rainbow trout exposed in flow-through to naphthalene (Black et al., 1983).

Groundwater Toxicity Data

Table 1 provides a summary of the toxicity of the Sutherland Site groundwater samples to rainbow trout fry based on 96-h (4 d) exposures in static test systems. The detailed laboratory groundwater toxicity reports are provided as Appendix B.

The groundwater samples were tested at 100% strength, and at diluted strength (56%, 32%, 18%, 10%) along a roughly geometric series, using as a diluent, Vancouver Tapwater hardened and dechlorinated (EDTA Hardness: 18 mg CaCO₃/L)

Table 1: Summary of Sutherland Site Groundwater Toxicity Results

| Well/ Sample ID | 41C | 42C | 29B | 29C | 24D | 23D | 23C |
|---|-----|-----|-----|-----|-------------------|-------------------|-------------------|
| Sample Concentration (%v/v) | | | | | | | |
| 0% | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 10% | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 18% | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 32% | 0 | 0 | 0 | 0 | 0 | 0 | 90 |
| 56% | 0 | 0 | 0 | 0 | 90 | 100 | 100 |
| 100% | 0 | 70 | 30 | 0 | 100 | 100 | 100 |
| 96-h Estimated LC50: %v/v (95% lower and upper CL) | | | | | 44.9% (32, 56) | 42.3% (32, 56) | 25.5% (18, 32) |

No fry mortality was observed at 100% or lower groundwater concentrations in samples from MW-41C or MW-29C. Mortality was observed only in the undiluted (100% v:v) samples for the remaining wells. For samples from MW-42C and MW-29B no fry mortality was noted at a sample concentration of 56%. For samples from MW-23D and MW-24D, no mortality was observed over the 96-h at a sample concentration of 32% v:v (equivalent to a dilution ratio of about 1:3). In the sample from MW-23C, no fry mortality was observed at a sample concentration of 18% v:v (equivalent to a dilution ratio of about 1:6). For the latter three samples, an estimated LC50 concentration is estimated at a dilution between the groundwater and uncontaminated reference water of about 25% to 45%. In other words, a dilution between the groundwater and uncontaminated reference water of 1:4 or greater dilution would result in a response based on 96-h fry exposure that is less severe than 50% mortality (LC50).

Groundwater Chemistry Data

Groundwater samples were collected from the study monitoring wells and sent to EnviroTest Laboratories in Winnipeg for chemical analysis. Field testing for pH and conductivity were conducted during sample collection and a summary of the results are provided in Table 2. A summary of the test results of the groundwater for PAH and Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) is provided in Table 3. The detailed laboratory chemistry groundwater test reports are provided as Appendix C.

Table 2 – Groundwater Sampling and Field Results

| Well # | Initial | | Interm ediate | | Final | | Depth to Product (m) | Depth to Water (m) | Depth to Bottom (m) | Comments |
|--------|---------|----------------|---------------|----------------|-------|----------------|----------------------|--------------------|---------------------|-------------------------------------|
| | pH | Cond (mmho/cm) | pH | Cond (mmho/cm) | pH | Cond (mmho/cm) | | | | |
| 23C | 6.7 | 1550 | 6.9 | 1520 | 6.7 | 1530 | 3.37 | 4.87 | 10.18 | Product visible, odour |

Discussion

Groundwater samples from MW-23C and D, and MW-24D, in their undiluted form, were observed to be acutely toxic to rainbow trout fry over a 96-h period. At test initiation, the fish exposed to groundwater from MW-23C appeared to be stressed; i.e., exhibited rapid gill movement in all concentrations. In the top 3 concentrations (100%, 56%, 32%), there was loss of equilibrium, some fry were lying on the bottom, and in the 100% test units they appeared dead. All control fish appeared and behaved normally during the test. Similar results were noted when fry were exposed to groundwater samples from MW-23D and MW-24D, but with less severity.

In the other samples, "At test initiation the fish in the 56 and 100% concentrations were swimming near the surface and gulping. All other fish appeared and behaved normally during the test." This behaviour response, observed in all undiluted groundwater samples might have resulted from groundwater constituents other than associated with coal tar or metal contamination, since it was not correlated with 96-h mortality rates. The electrical conductivity in the sample from MW-41C (beyond the zone of contamination) was 1,730 $\mu\text{mho/cm}$, and in all seven samples ranged from 1,560 to 2,400 $\mu\text{mho/cm}$, without any apparent correlation to degree of PAH or metal contamination.

While acute (96-h) toxicity to rainbow trout fry was observed in 5 of 7 undiluted groundwater samples from the site, it is important to note that no mortalities were recorded at groundwater: reference water dilution ratios of 1:6 or greater dilution. We have not yet estimated the minimum dilution factors that may occur seasonally at the point where the contaminated groundwater plume enters the Red River, but expect dilution factors of 1:1,000 or greater, in light of the range of previously documented saturated zone hydraulic conductivities.

Figures 02 and 03 show the relationships between percent dilution of the groundwater sample corresponding to an interpolated LC50 response and the concentration of naphthalene, benzene, or phenanthrene. It is apparent that the relationship between groundwater chemistry and toxicity is better for more soluble constituents than less soluble PAHs such as fluoranthene. Five- and six-ring PAHs such as benzo[k]fluoranthene were detected in very few of the seven samples (MW-23D and -24D) in spite of their relatively high concentrations in coal tar from the site. MW-24D was noted during the field visit to have DNAPL accumulation at the bottom of the piezometer.

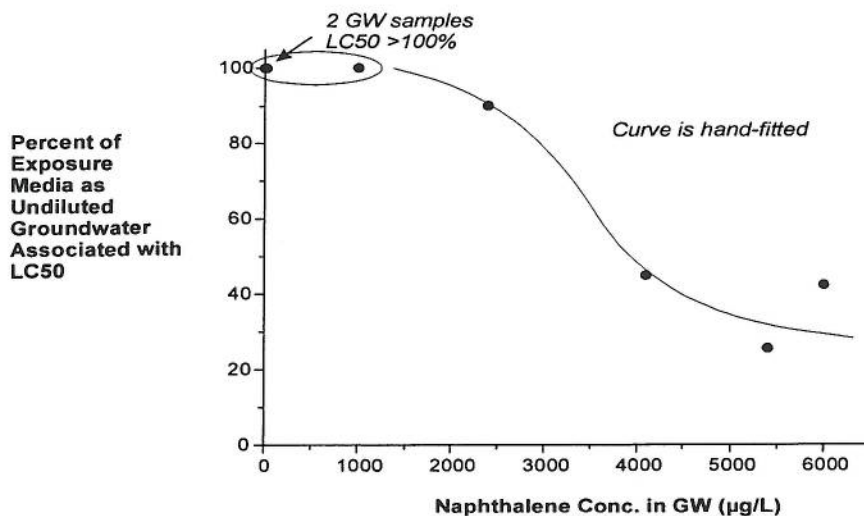

Figure 02: Concentration – response relationship for naphthalene.

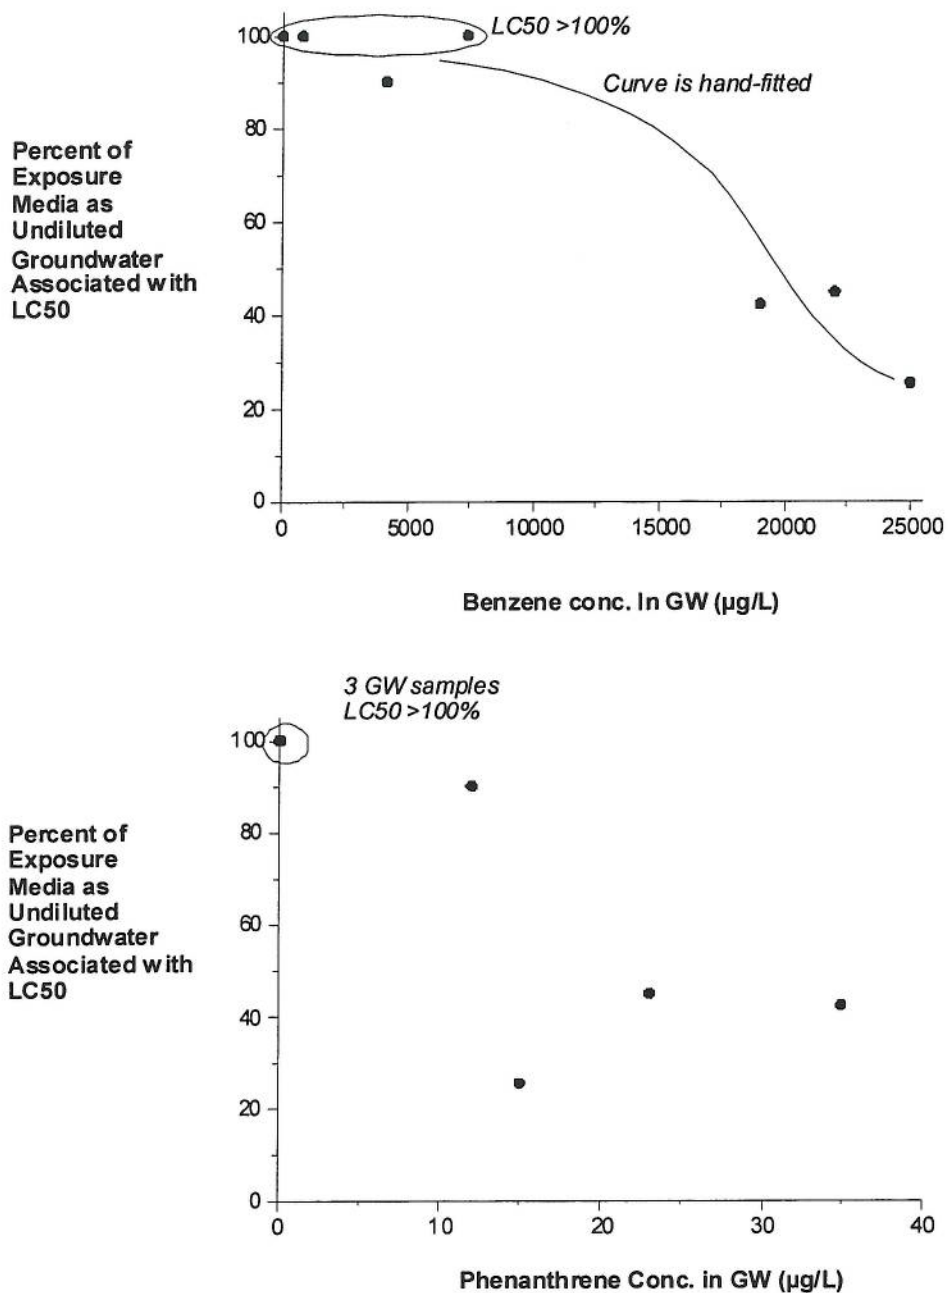

Figure 03: Concentration – response relationships for benzene and phenanthrene.

There are two caveats on the interpretation of this first stage of groundwater toxicity evaluation:

1. MW-23 and MW-24 may be unduly influenced by localized deposits of soils with coal tar contamination, such that the groundwater samples from them may reflect a localized condition that may not be representative of groundwater quality 3 to 10 m away or farther. In particular, these wells may be strongly influenced by local NAPL masses, that would tend to have a limited rate of dissolved-phased transport in groundwater over longer lateral distances, owing to the non-polar nature of many of the constituents (as reflected by very high K_{oc} s) as well as the strong affinity of the contaminants for local soil-bound non-polar organic constituents. **In light of this, it is recommended that the toxicity data for samples from piezometers installed closer to the river bank be gathered at these two locations for comparative purposes.**
2. The 96-h trout fry test may not adequately predict risks to sensitive life stages of fish (eggs, fry, alevins) based on exposure conditions experienced in the receiving environment. There does not appear to be viable spawning or juvenile nursery habitat in the section of the Red River immediately adjacent to the Sutherland Site; therefore, exposures in the groundwater entry zone are likely to be of a transient nature. We have not yet ruled out, however, that a cumulative exposure duration may exceed 96-h, or that potentially more sensitive, sub-lethal responses not examined (e.g. reduced locomotory activity and increased risks of being consumed by a predator) might play a role in the fitness of localized fish sub-populations. A 28-d egg/fry test, on the other hand, would be in excess of expected maximum exposure durations within the Red River adjacent to the site. **It is recommended that the acute 96-hour trout fry toxicity tests for a range of concentrations be conducted for samples from piezometers installed closer to the river bank.**

The groundwater chemistry results are relatively consistent with the 2003 monitoring data for the selected monitoring wells. Naphthalene concentrations were for the most part lower than the 2003 monitoring data with the exception of MW-24D and MW-29C where the concentrations of Naphthalene were higher. The results for the other PAH's were either consistent with or slightly lower than the 2003 data. The naphthalene result for the duplicate sample for monitoring well MW-29B was lower than the result for MW-29B and the 2003 monitoring data. However, all of the other PAH values were consistent. The BTEX results for the selected wells were lower than the 2003 BTEX concentrations. BTEX was not detected in MW-41C. The BTEX results for the duplicate sample for MW-29B were lower, but consistent with the results from the MW-29B sample. Quality Assurance and Quality Control shows the laboratory surrogates ranged from 74% to 84% within the acceptable range. The results of the PAH and BTEX Calibration Verification Standards fall within the 99% Confidence Interval.

The consistent groundwater chemistry results were reflected by similar values of calculated naphthalene and benzene flux for the 2003 and 2005 data. Naphthalene flux was calculated to be 300 g/year using the April 2005 data which is comparable to the flux of 370 g/year calculated using the 2003 data. The calculated benzene flux was 1.2 kg/year using the April 2005 data which is consistent with the flux of 2.3 kg/year calculated using the 2003 data. The flux values were updated using the same calculation procedure as presented in the Supplemental Site Investigation Report. For monitoring wells that were not sampled in 2005, the 2003 results were assumed. The flux calculation tables are included in Appendix D.

The groundwater chemistry results indicate groundwater from MW-23C, MW-23D and MW-24D has been significantly impacted by PAH and BTEX contamination. Monitoring wells MW-29B and MW-42C have also been impacted to a lesser extent. The groundwater chemistry results of the study monitoring wells with the exception of MW-41C, exceed the CCME Freshwater Aquatic Life guidelines for benzene, toluene and ethylbenzene. The groundwater chemistry results for the selected wells support the findings of the toxicity test.

Recommendations

We would recommend that Manitoba Hydro install a set of piezometers closer to the groundwater outflow face at the Red River in particular down gradient from MW-23 and MW-24, and obtain representative groundwater samples from these for use in the acute 96-hour trout fry laboratory-based toxicity tests for a range of concentrations.

Sincerely,

UMA Engineering Ltd.

Vizon Sample #: 050427B-03

Report #: 2-11-200-114-05-007

| | | | |
|----------------------|------------------------|--------------------------|--------------|
| Sample Taken: | Apr. 26, 2005 12:00 PM | Sample pH: | 7.4 |
| Sample Collected By: | R. Stark | Sample Dissolved Oxygen: | 6.2 mg/L |
| Sample Received: | Apr. 27, 2005 | Sample Temperature: | 15.8 °C |
| Start Date/Time: | Apr. 28, 2005 3:18 PM | Sample Conductance: | 1728 µmho/cm |

| Conc. (%v/v) | Cond. (µmho/cm) | Temp. | | pH | | D.O. | | Percent Mortality | | | | Number of Mortalities |
|-----------------|--------------------|-----------------|---------------|---------|-------|-------------------|-----------------|-------------------|-------|-------|-------|--------------------------|
| | | Initial (°C) | Final (°C) | Initial | Final | Initial (mg/L) | Final (mg/L) | 24 hr | 48 hr | 72 hr | 96 hr | |
| 0 | 54 | 15.3 | 14.5 | 7.3 | 7.3 | 9.6 | 9.6 | 0 | 0 | 0 | 0 | 0 |
| 10 | 251 | 14.6 | 14.3 | 7.5 | 8.0 | 9.9 | 9.0 | 0 | 0 | 0 | 0 | 0 |
| 18 | 405 | 14.6 | 14.1 | 7.4 | 8.2 | 9.5 | 9.4 | 0 | 0 | 0 | 0 | 0 |
| 32 | 645 | 14.6 | 14.2 | 7.4 | 8.4 | 9.3 | 9.4 | 0 | 0 | 0 | 0 | 0 |
| 56 | 1033 | 14.7 | 14.2 | 7.4 | 8.4 | 8.8 | 9.7 | 0 | 0 | 0 | 0 | 0 |
| 100 | 1730 | 15.5 | 14.3 | 7.4 | 8.4 | 7.4 | 9.8 | 0 | 0 | 0 | 0 | 0 |

Comments:

At test initiation the fish in the 100% concentration had rapid gill movement and several fish were swimming at the surface. All other fish appeared and behaved normally during the test.

Test Conditions:

| | | | |
|--------------------------|----------|-------------------|--------------|
| Organisms per Replicate: | 10 | Preaeration Time: | 30 min. |
| Test Volume: | 15 L | Rate of aeration: | 6.5 ml/min/L |
| Loading Density: | 0.30 g/L | | |

Test Organism: Rainbow Trout (*Oncorhynchus mykiss*)

| | | | |
|---------------------|---------------|---------------------|--------------|
| Weight (Mean + SD): | 0.45 ± 0.09 g | Length (Mean + SD): | 3.8 ± 0.2 cm |
| Weight (Range): | 0.32– 0.73 g | Length (Range): | 3.5– 4.3 cm |

Reference Toxicant: Phenol

Test was conducted on: 04/15/2005
Test gave a 96-h LC50 of 11.41 (10.02, 13.09) mg/L

Dilution Water: Vancouver Tapwater hardened and dechlorinated

EDTA Hardness: 18 mg CaCO₃/L Other parameters available on request

Test Method: Biological Test Method: Reference Method for Determining Acute Lethality of Effluent to Rainbow Trout, EPS 1/RM/13, Second Edition, December 2000.

Comments:

At test initiation the fish in the sample were stressed i.e., in the 56 & 100% concentrations the fish were gulping at the surface. After 2.5 hours the fish 100% still had rapid gill movement and were at the surface. All other fish appeared and behaved normally during the remainder of the test. The binomial method was used to determine the LC50 value. Some of the final temperatures were below recommended (14 to 16°C).

Test Conditions:

| | | | |
|--------------------------|----------|-------------------|--------------|
| Organisms per Replicate: | 10 | Preaeration Time: | 30 min. |
| Test Volume: | 15 L | Rate of aeration: | 6.5 ml/min/L |
| Loading Density: | 0.42 g/L | | |

Test Organism: Rainbow Trout (*Oncorhynchus mykiss*)

| | | | |
|---------------------|---------------|---------------------|--------------|
| Weight (Mean + SD): | 0.63 ± 0.14 g | Length (Mean + SD): | 4.1 ± 0.3 cm |
| Weight (Range): | 0.35– 0.92 g | Length (Range): | 3.5– 4.6 cm |

Reference Toxicant: Phenol

Test was conducted on: 04/15/2005
Test gave a 96-h LC50 of 11.41 (10.02, 13.09) mg/L

Dilution Water: Vancouver Tapwater hardened and dechlorinated

EDTA Hardness: 18 mg CaCO₃/L Other parameters available on request

Test Method:

Biological Test Method: Reference Method for Determining Acute Lethality of Effluent to Rainbow Trout, EPS 1/RM/13, Second Edition, December 2000.

Comments:

After 1/2 hour the fish in the sample were stressed i.e., in the 56% concentration the fish were lying on the bottom and were gulping. It was difficult to see the fish in the 100% but at least one was dead after 1/2 hour. After 2.5 hours most fish in the 56 & 100% concentrations were lying on the bottom and several appeared dead and the fish in the 32% concentration were swimming at the surface and had rapid gill movement. The fish in 32% had rapid gill movement at 24 and 96 hours. All other fish appeared and behaved normally during the remainder of the test. The binomial method was used to determine the LC50 value. Some of the final temperatures were below recommended (14 to 16°C).

Test Conditions:

| | | | |
|--------------------------|----------|-------------------|--------------|
| Organisms per Replicate: | 10 | Preaeration Time: | 30 min. |
| Test Volume: | 15 L | Rate of aeration: | 6.5 ml/min/L |
| Loading Density: | 0.42 g/L | | |

Test Organism: Rainbow Trout (*Oncorhynchus mykiss*)

| | | | |

Comments:

At test initiation the fish in the sample were stressed i.e., rapid gill movement in all concentrations. In the top 3 concentration there was loss of equilibrium, some were lying on the bottom and in the 100% they appeared dead. All control fish appeared and behaved normally during the test. The binomial method was used to determine the LC50 value. Some of the final temperatures were below recommended (14 to 16°C).

Test Conditions:

| | | | |
|--------------------------|----------|-------------------|--------------|
| Organisms per Replicate: | 10 | Preaeration Time: | 30 min. |
| Test Volume: | 15 L | Rate of aeration: | 6.5 ml/min/L |
| Loading Density: | 0.42 g/L | | |

Test Organism: Rainbow Trout (*Oncorhynchus mykiss*)

| | | | |
|---------------------|---------------|---------------------|--------------|
| Weight (Mean + SD): | 0.63 ± 0.14 g | Length (Mean + SD): | 4.1 ± 0.3 cm |
| Weight (Range): | 0.35– 0.92 g | Length (Range): | 3.5– 4.6 cm |

Reference Toxicant: Phenol

Test was conducted on: 04/15/2005
Test gave a 96-h LC50 of 11.41 (10.02, 13.09) mg/L

Dilution Water: Vancouver Tapwater hardened and dechlorinated

EDTA Hardness: 18 mg CaCO₃/L Other parameters available on request

Test Method:

Biological Test Method: Reference Method for Determining Acute Lethality of Effluent to Rainbow Trout, EPS 1/RM/13, Second Edition, December 2000.

THIS REPORT SHALL NOT BE REPRODUCED EXCEPT IN FULL WITHOUT THE WRITTEN AUTHORITY OF THE LABORATORY.
ALL SAMPLES WILL BE DISPOSED OF AFTER 30 DAYS FOLLOWING ANALYSIS. PLEASE CONTACT THE LAB IF YOU
REQUIRE ADDITIONAL SAMPLE STORAGE TIME.

LABORATORY ACCREDITATIONS:

• STANDARDS COUNCIL OF CANADA IN COOPERATION WITH THE CANADIAN ASSOCIATION FOR ENVIRONMENTAL ANALYTICAL LABORATORIES (CAEAL)
FOR SPECIFIC TESTS AS REGISTERED BY THE COUNCIL (EDMONTON, CALGARY, GRANDE PRAIRIE, SASKATOON, WINNIPEG, THUNDER BAY, WATERLOO)

• AMERICAN INDUSTRIAL HYGIENE ASSOCIATION (AIHA) IN THE INDUSTRIAL HYGIENE PROGRAM (EDMONTON, WINNIPEG)

• STANDARDS COUNCIL OF CANADA IN COOPERATION WITH THE CANADIAN FOOD INSPECTION AGENCY (CFIA) FOR FERTILIZER AND FEED TESTING (SASKATOON) AND FOR MICROBIOLOGICAL TESTING IN FOOD (WINNIPEG)

Reference Information

Methods Listed (if applicable):

| ETL Test Code | Matrix | Test Description | Preparation Method Reference(Based On) | Analytical Method Reference(Based On) |
|---------------|--------|------------------|--|---------------------------------------|
| BTX-WP | Water | BTEX | | EPA SW846,5030,8015 |

Volatile organic compounds are extracted (purged) by bubbling nitrogen through a water sample. The purged sample components are trapped in a tube containing a sorbent material. When purging is complete, the tube is heated and back flushed with helium to desorb the trapped compounds onto a gas chromatographic column. The gas chromatograph is temperature programmed to separate the method analytes which are then detected with a photoionization detector (PID) followed by a flame ionization detector (FID).

|--|-------|-----|--|--|
| PAH,PANH-WP | Water | PAH | | EPA SW846 8270B Sep 1994,3510B Sep 1992 |
| Samples are stored in the dark at 4 degrees C until extraction. Samples are partitioned at basic and acidic pH with dichloromethane, concentrated and esterified (if run in conjunction with pentachlorophenol). Extracts are analyzed by Gas Chromatography / Mass Spectrometry in the selected ion monitoring mode. | | | | |

** Laboratory Methods employed follow in-house procedures, which are generally based on nationally or internationally accepted methodologies.

Chain of Custody numbers:

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location | Laboratory Definition Code | Laboratory Location |
|----------------------------|--|----------------------------|---------------------|
| WP | Enviro-Test Laboratories - Winnipeg, Manitoba, Canada | | |

GLOSSARY OF REPORT TERMS

Surr - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds.

The reported surrogate recovery value provides a measure of method efficiency. The Laboratory warning units are determined under column heading D.L.

mg/kg (units) - unit of concentration based on mass, parts per million

mg/L (units) - unit of concentration based on volume, parts per million

< - Less than

D.L. - Detection Limit

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

UNLESS OTHERWISE STATED, SAMPLES ARE NOT CORRECTED FOR CLIENT FIELD BLANKS.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

Enviro-Test Laboratories has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, Enviro-Test Laboratories assumes no liability for the use or interpretation of the results.

ENVIRO-TEST QC REPORT

Page 3 of 3

Workorder # L262481

Legend:

| | |
|-------|---|
| Limit | 95% Confidence Interval (Laboratory Warning Limits) |
| DUP | Duplicate |
| RPD | Relative Percent Difference |
| N/A | Not Available |
| LCS | Laboratory Control Sample |
| SRM | Standard Reference Material |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ADE | Average Desorption Efficiency |
| MB | Method Blank |
| IRM | Internal Reference Material |
| CRM | Certified Reference Material |
| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Qualifier:

| | |
|--------|---|
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |
| A | Method blank exceeds acceptance limit. Blank correction not applied, unless the qualifier "RAMB" (result adjusted for method blank) appears in the Analytical Report. |
| B | Method blank result exceeds acceptance limit, however, it is less than 5% of sample concentration. Blank correction not applied. |
| E | Matrix spike recovery may fall outside the acceptance limits due to high sample background. |
| F | Silver recovery low, likely due to elevated chloride levels in sample. |
| G | Outlier - No assignable cause for nonconformity has been determined. |
| H | Result falls within the 99% Confidence Interval (Laboratory Control Limits) |
| J | Duplicate results and limit(s) are expressed in terms of absolute difference. |
| K | The sample referenced above is of a non-standard matrix type; standard QC acceptance criteria may not be achievable. |

APPENDIX D
NAPTHALENE AND BENZENE FLUX CALCUALTIONS
